57. The amount of work, which can be obtained by supplying 200 *cal* of heat, is [Pb. PET 2001, 03; BHU 2004]

(a) 840 *dyne* (b) 840 *W*
(c) 840 *erg* (d) 840 *J*

58. How many grams of a liquid of specific heat 0.2 at a temperature $40°C$ must be mixed with 100 *gm* of a liquid of specific heat of 0.5 at a temperature $20°C$, so that the final temperature of the mixture becomes $32°C$ [Pb. PET 1999]

(a) 175 *gm* (b) 300 *g*
(c) 295 *gm* (d) 375 *g*

59. 1 *g* of a steam at $100°C$ melt how much ice at $0°C$? (Latent heat of ice = 80 *cal/gm* and latent heat of steam = 540 *cal/gm*)

(a) 1 *gm* (b) 2 *gm*
(c) 4 *gm* (d) 8 *gm*

60. 5 *g* of ice at $0°C$ is dropped in a beaker containing 20 *g* of water at $40°C$. The final temperature will be [Pb. PET 2003]

(a) $32°C$ (b) $16°C$
(c) $8°C$ (d) $24°C$

61. One kilogram of ice at $0°C$ is mixed with one kilogram of water at $80°C$. The final temperature of the mixture is

(Take : specific heat of water $= 4200\ J\ kg^{-1}\ K^{-1}$, latent heat of ice $= 336\ kJ\ kg^{-1}$) [KCET 2002]

(a) $40°C$ (b) $60°C$
(c) $0°C$ (d) $50°C$

62. During constant temperature, we feel colder on a day when the relative humidity will be [Pb. PMT 1996]

(a) 25% (b) 12.5%
(c) 50% (d) 75%

63. Which of the following is the unit of specific heat [MH CET 2004]

(a) $J\ kg\ °C^{-1}$ (b) $J / kg\ °C$
(c) $kg\ °C / J$ (d) $J / kg\ °C^{-2}$

64. 50 *gm* of ice at $0°C$ is mixed with 50 *gm* of water at $80°C$, final temperature of mixture will be [DCE 2002]

(a) $0°C$ (b) $40°C$
(c) $40°C$ (d) $4°C$

65. The freezing point of the liquid decreases when pressure is increased, if the liquid [DCE 1995]

(a) Expands while freezing
(b) Contracts while freezing
(c) Does not change in volume while freezing
(d) None of these

66. The relative humidity on a day, when partial pressure of water vapour is $0.012 \times 10^5\ Pa$ at $12°C$ is (take vapour pressure of water at this temperature as $0.016 \times 10^5\ Pa$) [AIIMS 1998]

(a) 70% (b) 40%
(c) 75% (d) 25%

67. A hammer of mass 1*kg* having speed of 50 *m/s*, hit a iron nail of mass 200 *gm*. If specific heat of iron is 0.105 *cal/gm°C* and half the energy is converted into heat, the raise in temperature of nail is

(a) $7.1°C$ (b) $9.2°C$
(c) $10.5°C$ (d) $12.1°C$

68. Latent heat of 1*gm* of steam is 536 *cal/gm*, then its value in *joule/kg* is [RPMT 1999]

(a) 2.25×10^6 (b) 2.25×10^3
(c) 2.25 (d) None

69. Which of the following has maximum specific heat [RPMT 1999]

(a) Water (b) Alcohol
(c) Glycerine [Pb. PET 2000] (d) Oil

70. 50 *gm* ice at $0°C$ in insulator vessel, 50*g* water of $100°C$ is mixed in it, then final temperature of the mixture is (neglect the heat loss)

(a) $10°C$ (b) $0° << T_m < 20°C$
(c) $20°C$ (d) Above $20°C$

71. A stationary object at $4°C$ and weighing 3.5 *kg* falls from a height of 2000 *m* on a snow mountain at $0°C$. If the temperature of the object just before hitting the snow is $0°C$ and the object comes to rest immediately $(g = 10\ m/s^2)$ and (latent heat of ice $= 3.5 \times 10^5\ joule/\sec$), then the object will melt

(a) 2 *kg* of ice (b) 200 *gm* of ice
(c) 20 *gm* ice (d) 2 *gm* of ice

72. 300 *gm* of water at 25°*C* is added to 100 *gm* of ice at 0°*C*. The final temperature of the mixture is [MP PET 2004]

(a) $-\frac{5}{3}°C$ (b) $-\frac{5}{2}°C$

(c) – 5°*C* (d) 0°*C*

73. Calculate the amount of heat (in calories) required to convert 5 *gm* of ice at 0°*C* to steam at 100°*C* [DPMT 2005]

(a) 3100 (b) 3200

(c) 3600 (d) 4200

74. 2*gm* of steam condenses when passed through 40*gm* of water initially at 25°*C*. The condensation of steam raises the temperature of water to 54.3°*C*. What is the latent heat of steam

(a) 540 *cal/g* (b) 536 *cal/g*

(c) 270 *cal/g* (d) 480 *cal/g*

75. 10 *gm* of ice at 0°*C* is mixed with 100 *gm* of water at 50°*C*. What is the resultant temperature of mixture [AFMC 2005]

(a) 31.2°*C* (b) 32.8°*C*

(c) 36.7°*C* (d) 38.2°*C*

76. Three liquids with masses m_1, m_2, m_3 are thoroughly mixed. If their specific heats are c_1, c_2, c_3 and their temperatures T_1, T_2, T_3 respectively, then the temperature of the mixture is

(a) $\frac{c_1T_1 + c_2T_2 + c_3T_3}{m_1c_1 + m_2c_2 + m_3c_3}$

(b) $\frac{m_1c_1T_1 + m_2c_2T_2 + m_3c_3T_3}{m_1c_1 + m_2c_2 + m_3c_3}$

(c) $\frac{m_1c_1T_1 + m_2c_2T_2 + m_3c_3T_3}{m_1T_1 + m_2T_2 + m_3T_3}$

(d) $\frac{m_1T_1 + m_2T_2 + m_3T_3}{c_1T_1 + c_2T_2 + c_3T_3}$

77. The point on the pressure temperature phase diagram where all the phases co-exist is called [MH CET 2005]

(a) Sublimation (b) Fusion point

(c) Triple point (d) Vaporisation point

78. Boiling water is changing into steam. At this stage the specific heat of water is [UPSEAT 1998]

(a) < 1 (b) ∞

(c) 1 (d) 0

79. A vessel contains 110 *g* of water. The heat capacity of the vessel is equal to 10 *g* of water. The initial temperature of water in vessel is 10°*C*. If 220 *g* of hot water at 70°*C* is poured in the vessel, the final temperature neglecting radiation loss, will be

(a) 70°*C* (b) 80°*C*

(c) 60°*C* (d) 50°*C*

80. The thermal capacity of a body is 80 *cal*, then its water equivalent is [UPSEAT 2001]

(a) 80 *cal / gm* (b) 8 *gm*

(c) 80 *gm* (d) 80 *kg*

81. A liquid of mass *M* and specific heat *S* is at a temperature 2*t*. If another liquid of thermal capacity 1.5 times, at a temperature of $\frac{t}{3}$ is added to it, the resultant temperature will be

(a) $\frac{4}{3}t$ (b) t

(c) $\frac{t}{2}$ (d) $\frac{2}{3}t$

82. Dry ice is [CPMT 2000]

(a) Ice cube (b) Sodium chloride

(c) Liquid nitrogen [J & K CET 2005] (d) Solid carbon dioxide

Critical Thinking

Objective Questions

1. A glass flask is filled up to a mark with 50 *cc* of mercury at 18°*C*. If the flask and contents are heated to 38°*C*, how much mercury will be above the mark ? (α for glass is $9 \times 10^{-6}/°C$ and coefficient of real expansion of mercury is $180 \times 10^{-6}/°C$)

(a) 0.85 *cc* (b) 0.46 *cc*

(c) 0.153 *cc* (d) 0.05 *cc*

2. The coefficient of apparent expansion of mercury in a glass vessel is $153 \times 10^{-6}/°C$ and in a steel vessel is $144 \times 10^{-6}/°C$. If α for steel is $12 \times 10^{-6}/°C$, then that of glass is [EAMCET 1997]

(a) $9 \times 10^{-6}/°C$ (b) $6 \times 10^{-6}/°C$

(c) $36 \times 10^{-6}/°C$ (d) $27 \times 10^{-6}/°C$

3. Solids expand on heating because [CPMT 1990]

(a) Kinetic energy of the atoms increases

(b) Potential energy of the atoms increases

(c) Total energy of the atoms increases

(d) The potential energy curve is asymmetric about the equilibrium distance between neighbouring atoms

4. An iron tyre is to be fitted on to a wooden wheel 1*m* in diameter. The diameter of tyre is 6 *mm* smaller than that of wheel. The tyre should be heated so that its temperature increases by a minimum of (the coefficient of cubical expansion of iron is $3.6 \times 10^{-5}/°C$)[CPMT 1989]

(a) 167°*C* (b) 334°*C*

(c) 500°*C* (d) 1000°*C*

5. A glass flask of volume one *litre* at 0°*C* is filled, level full of mercury at this temperature. The flask and mercury are now heated to 100°*C*. How much mercury will spill out, if coefficient of volume expansion of mercury is $1.82 \times 10^{-4}/°C$ and linear expansion of glass is $0.1 \times 10^{-4}/°C$ respectively [UPSEAT 2000] [MNR 1994]

(a) 21.2 *cc* (b) 15.2 *cc*

(c) 1.52 *cc* (d) 2.12 *cc*

6. A steel scale measures the length of a copper wire as $80.0\,cm$, when both are at $20°C$ (the calibration temperature for scale). What would be the scale read for the length of the wire when both are at $40°C$? (Given $\alpha_{steel} = 11 \times 10^{-6}$ per°C and $\alpha_{copper} = 17 \times 10^{-6}\ per\ °C$) **[CPMT 2004]**

(a) $80.0096\,cm$ (b) $80.0272\,cm$

(c) $1\,cm$ (d) $25.2\,cm$

7. A bimetallic strip is formed out of two identical strips, one of copper and other of brass. The coefficients of linear expansion of the two metals are α_C and α_B. On heating, the temperature of the strip goes up by ΔT and the strip bends to form an arc of radius of curvature *R*. Then *R* is **[IIT-JEE (Screening) 1999]**

(a) Proportional to ΔT

(b) Inversely proportional to ΔT

(c) Proportional to $|\alpha_B - \alpha_C|$

(d) Inversely proportional to $|\alpha_B - \alpha_C|$

8. Two metal strips that constitute a thermostat must necessarily differ in their **[IIT-JEE 1992]**

(a) Mass

(b) Length

(c) Resistivity

(d) Coefficient of linear expansion

9. A metal ball immersed in alcohol weighs W_1 at 0°C and W_2 at 59°C. The coefficient of cubical expansion of the metal is less than that of alcohol. Assuming that the density of metal is large compared to that of alcohol, it can be shown that **[CPMT 1998]**

(a) $W_1 > W_2$ (b) $W_1 = W_2$

(c) $W_1 < W_2$ (d) $W_2 = (W_1 / 2)$

10. The coefficient of volumetric expansion of mercury is 18 × 10^{-5}/°C. A thermometer bulb has a volume 10^{-6} m^3 and cross section of stem is 0.004 cm^2. Assuming that bulb is filled with mercury at 0°C then the length of the mercury column at 100°C is **[Pb. PMT 1998, DPMT 1997, 2001]**

(a) 18.8 *mm* (b) 9.2 *mm*

(c) 7.4 *cm* (d) 4.5 *cm*

11. A piece of metal weight 46 *gm* in air, when it is immersed in the liquid of specific gravity 1.24 at 27°C it weighs 30 *gm*. When the temperature of liquid is raised to 42°C the metal piece weight 30.5 *gm*, specific gravity of the liquid at 42°C is 1.20, then the linear expansion of the metal will be **[BHU 1995]**

(a) 3.316 × 10^{-5}/°C (b) 2.316 × 10^{-5}/°C

(c) 4.316 × 10^{-5}/°C (d) None of these

12. It is known that wax contracts on solidification. If molten wax is taken in a large vessel and it is allowed to cool slowly, then

(a) It will start solidifying from the top downward

(b) It will start solidifying from the bottom upward

(c) It will start solidifying from the middle, upward and downward at equal rates

(d) The whole mass will solidify simultaneously

13. A substance of mass *m* kg requires a power input of *P* watts to remain in the molten state at its melting point. When the power is turned off, the sample completely solidifies in time *t* sec. What is the latent heat of fusion of the substance **[IIT JEE 1992]**

(a) $\frac{Pm}{t}$ (b) $\frac{Pt}{m}$

(c) $\frac{m}{Pt}$ (d) $\frac{t}{Pm}$

14. Steam at 100°C is passed into 1.1 *kg* of water contained in a calorimeter of water equivalent 0.02 *kg* at 15°C till the temperature of the calorimeter and its contents rises to 80°C. The mass of the steam condensed in *kg* is **[IIT 1995]**

(a) 0.130 (b) 0.065

(c) 0.260 (d) 0.135

15. 2 *kg* of ice at – 20°C is mixed with 5 *kg* of water at 20°C in an insulating vessel having a negligible heat capacity. Calculate the final mass of water remaining in the container. It is given that the specific heats of water and ice are 1 *kcal/kg per* °C and 0.5 *kcal/kg/*°C while the latent heat of fusion of ice is 80 *kcal/kg* **[IIT-JEE (Screening) 2003]**

(a) 7 *kg* (b) 6 *kg*

(c) 4 *kg* (d) 2 *kg*

16. Water of volume 2 *litre* in a container is heated with a coil of $1\,kW$ at $27\,°C$. The lid of the container is open and energy dissipates at rate of $160\,J/s$. In how much time temperature will rise from $27\,°C$ to $77\,°C$ [Given specific heat of water is $4.2\,kJ/kg$]

(a) 8 *min* 20 *s* (b) 6 *min* 2 *s*

(c) 7 *min* (d) 14 *min*

17. A lead bullet at 27°C just melts when stopped by an obstacle. Assuming that 25% of heat is absorbed by the obstacle, then the velocity of the bullet at the time of striking (M.P. of lead = 327°C, specific heat of lead = 0.03 *cal/gm*°C, latent heat of fusion of lead = 6 *cal/gm* and *J* = 4.2 *joule/cal*) **[IIT 1981]**

(a) 410 *m/sec* (b) 1230 *m/sec*

(c) 307.5 *m/sec* (d) None of the above

18. If two balls of same metal weighing 5 *gm* and 10 *gm* strike with a target with the same velocity. The heat energy so developed is used for raising their temperature alone, then the temperature will be higher

(a) For bigger ball

(b) For smaller ball

(c) Equal for both the balls

(d) None is correct from the above three

[CBSE PMT 1994]

19. The temperature of equal masses of three different liquids *A*, *B* and *C* are 12°C, 19°C and 28°C respectively. The temperature when *A* and *B* are mixed is 16°C and when *B* and *C* are mixed is 23°C. The temperature when *A* and *C* are mixed is

(a) 18.2°C (b) 22°C

(c) 20.2°C (d) 25.2°C

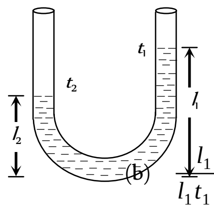
20. In an industrial process 10 *kg* of water per hour is to be heated from 20°C to 80°C. To do this steam at 150°C is passed from a boiler into a copper coil immersed in water. The steam condenses in the coil and is returned to the boiler as water at 90°C. how many *kg* of steam is required per hour.

(Specific heat of steam = 1 *calorie* per *gm*°C, Latent heat of vaporisation = 540 *cal/gm*)

(a) 1 *gm* (b) 1 *kg*

(c) 10 *gm* (d) 10 *kg*

21. In a vertical U-tube containing a liquid, the two arms are maintained at different temperatures t_1 and t_2. The liquid columns in the two arms have heights l_1 and l_2 respectively. The coefficient of volume expansion of the liquid is equal to



(a) $\frac{l_1 - l_2}{l_2 t_1 - l_1 t_2}$ (b) $\frac{l_1 - l_2}{l_1 t_1 - l_2 t_2}$

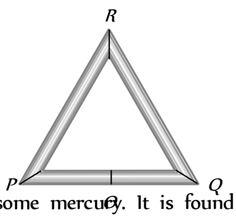
(c) $\frac{l_1 + l_2}{l_2 t_1 + l_1 t_2}$ (d) $\frac{l_1 + l_2}{l_1 t_1 + l_2 t_2}$

22. The coefficient of linear expansion of crystal in one direction is α_1 and that in every direction perpendicular to it is α_2. The coefficient of cubical expansion is

(a) $\alpha_1 + \alpha_2$ (b) $2\alpha_1 + \alpha_2$

(c) $\alpha_1 + 2\alpha_2$ (d) None of these

23. Three rods of equal length l are joined to form an equilateral triangle PQR. O is the mid point of PQ. Distance OR remains same for small change in temperature. Coefficient of linear expansion for PR and RQ is same *i.e.* α_2 but that for PQ is α_1. Then



(a) $\alpha_2 = 3\alpha_1$

(b) $\alpha_2 = 4\alpha_1$

(c) $\alpha_1 = 3\alpha_2$

(d) $\alpha_1 = 4\alpha_2$

24. A one *litre* glass flask contains some mercury. It is found that at different temperatures the volume of air inside the flak remains the same. What is the volume of mercury in this flask if coefficient of linear expansion of glass is $9 \times 10^{-6}/°C$ while of volume expansion of mercury is $1.8 \times 10^{-4}/°C$

(a) 50 *cc* (b) 100 *cc*

(c) 150 *cc* (d) 200 *cc*

25. 10 *gm* of ice at – 20°C is dropped into a calorimeter containing 10 *gm* of water at 10°C; the specific heat of water is twice that of ice. When equilibrium is reached, the calorimeter will contain

(a) 20 *gm* of water

(b) 20 *gm* of ice

(c) 10 *gm* ice and 10 *gm* water

(d) 5 *gm* ice and 15 *gm* water

26. A rod of length 20 *cm* is made of metal. It expands by 0.075*cm* when its temperature is raised from 0°C to 100°C. Another rod of a different metal B having the same length expands by 0.045 *cm* for the same change in temperature. A third rod of the same length is composed of two parts, one of metal A and the other of metal B. This rod expands by 0.060 *cm* for the same change in temperature. The portion made of metal A has the length

(a) 20 *cm* (b) 10 *cm*

(c) 15 *cm* (d) 18 *cm*

27. Steam is passed into 22 *gm* of water at 20°C. The mass of water that will be present when the water acquires a temperature of 90°C (Latent heat of steam is 540 *cal/gm*) is

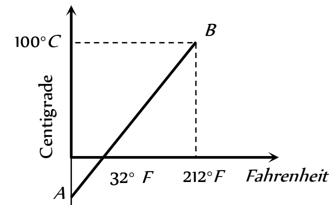
[SCRA 1994]

(a) 24.8 *gm* (b) 24 *gm*

(c) 36.6 *gm* (d) 30 *gm*

GQ Graphical Questions

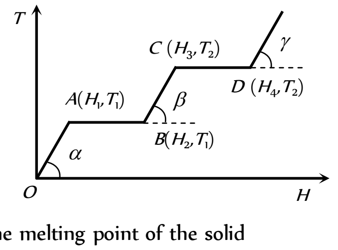
1. The graph AB shown in figure is a plot of temperature of a body in degree celsius and degree Fahrenheit. Then



(a) Slope of line AB is 9/5 (b) Slope of line AB is 5/9

(c) Slope of line AB is 1/9 (d) Slope of line AB is 3/9

2. The graph shows the variation of temperature (T) of one *kilogram* of a material with the heat (H) supplied to it. At O, the substance is in the solid state. From the graph, we can conclude that



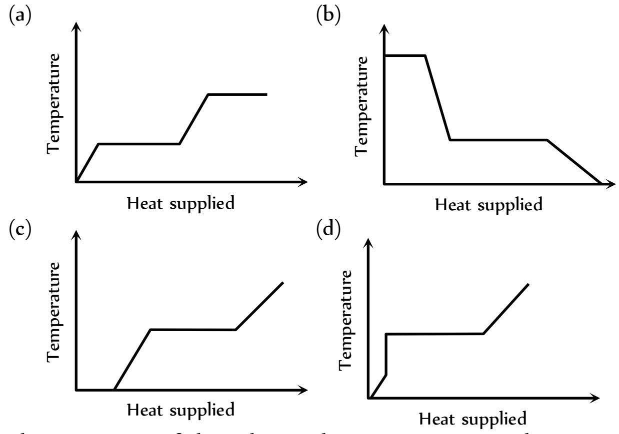
(a) T_2 is the melting point of the solid

(b) BC represents the change of state from solid to liquid

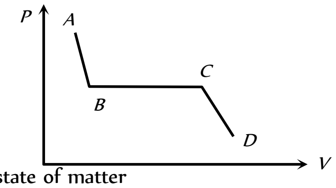
(c) $(H_2 - H_1)$ represents the latent heat of fusion of the substance

(d) $(H_3 - H_1)$ represents the latent heat of vaporization of the liquid

3. A block of ice at $-10°C$ is slowly heated and converted to steam at $100°C$. Which of the following curves represents the phenomenon qualitatively [IIT-JEE (Screening) 2000]



4. The portion AB of the indicator diagram representing the state of matter denotes



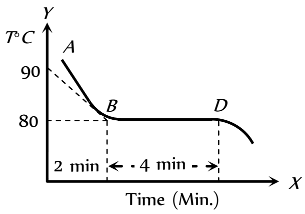
(a) The liquid state of matter

(b) Gaseous state of matter

(c) Change from liquid to gaseous state

(d) Change from gaseous state to liquid state

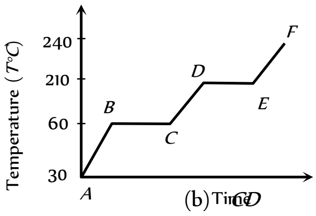
5. The figure given below shows the cooling curve of pure wax material after heating. It cools from A to B and solidifies along BD. If L and C are respective values of latent heat and the specific heat of the liquid wax, the ratio L/C is



(a) 40 (b) 80

(c) 100 (d) 20

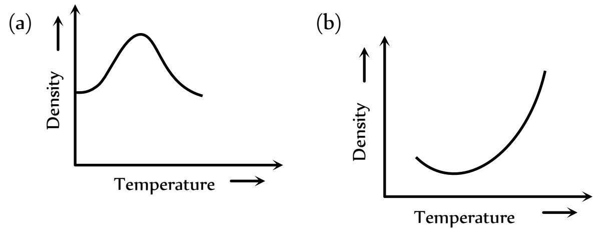
6. A solid substance is at $30°C$. To this substance heat energy is supplied at a constant rate. Then temperature versus time graph is as shown in the figure. The substance is in liquid state for the portion (of the graph) [RPET 1990, 94]

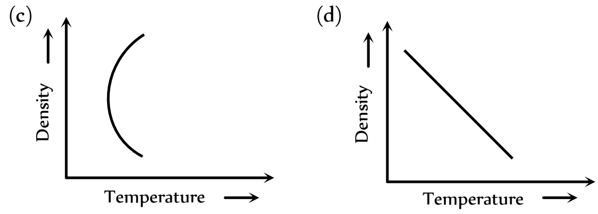


(a) BC (b) CD

(c) ED (d) EF

7. The variation of density of water with temperature is represented by the





8. If a graph is plotted taking the temperature in Fahrenheit along Y-axis and the corresponding temperature in Celsius along the X-axis, it will be a straight line [AIIMS 1997]

(a) Having a $+ve$ intercept on Y-axis

(b) Having a $+ve$ intercept on X-axis

(c) Passing through the origin

(d) Having $a - ve$ intercepts on both the axis

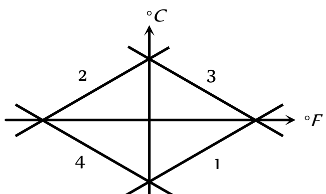
9. Which of the curves in figure represents the relation between Celsius and Fahrenheit temperatures

(a) 1

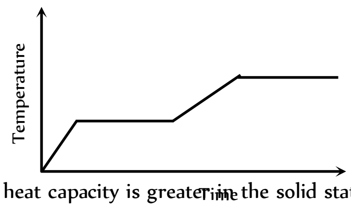
(b) 2

(c) 3

(d) 4



10. Heat is supplied to a certain homogenous sample of matter, at a uniform rate. Its temperature is plotted against time, as shown. Which of the following conclusions can be drawn



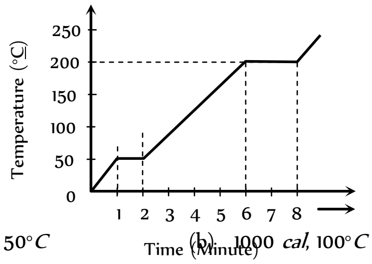
(a) Its specific heat capacity is greater in the solid state than in the liquid state

(b) Its specific heat capacity is greater in the liquid state than in the solid state

(c) Its latent heat of vaporization is greater than its latent heat of fusion

(d) Its latent heat of vaporization is smaller than its latent heat of fusion

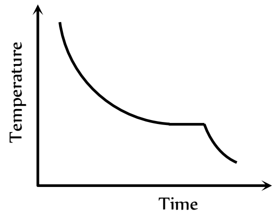
11. A student takes $50gm$ wax (specific heat = 0.6 $kcal/kg°C$) and heats it till it boils. The graph between temperature and time is as follows. Heat supplied to the wax per minute and boiling point are respectively [BHU 1994]



(a) 500 cal, $50°C$ (b) 1000 cal, $100°C$

(c) 1500 cal, $200°C$ (d) $200°C$

12. The graph signifies [JIPMER 1999]



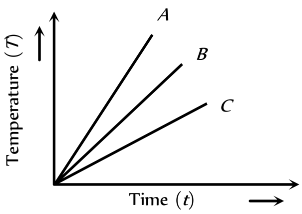
(a) Adiabatic expansion of a gas

(b) Isothermal expansion of a gas

(c) Change of state from liquid to solid

(d) Cooling of a heated solid

13. Which of the substances A, B or C has the highest specific heat ? The temperature *vs* time graph is shown



(a) A (b) B

(c) C (d) All have equal specific heat

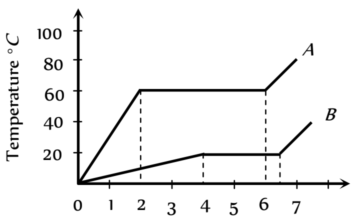
14. Two substances A and B of equal mass m are heated at uniform rate of 6 $cal\ s^{-1}$ under similar conditions. A graph between temperature and time is shown in figure. Ratio of heat absorbed H_A / H_B by them for complete fusion is

(a) $\frac{9}{4}$

(b) $\frac{4}{9}$

(c) $\frac{8}{5}$

(d) $\frac{5}{8}$



Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

(a) *If both assertion and reason are true and the reason is the correct explanation of the assertion.*
(b) *If both assertion and reason are true but reason is not the correct explanation of the assertion.*
(c) *If assertion is true but reason is false.*
(d) *If the assertion and reason both are false.*
(e) *If assertion is false but reason is true.*

1. Assertion : The melting point of ice decreases with increase of pressure.

Reason : Ice contracts on melting. [AIIMS 2004]

2. Assertion : Fahrenheit is the smallest unit measuring temperature.

Reason : Fahrenheit was the first temperature scale used for measuring temperature.

[AIIMS 1999]

3. Assertion : Melting of solid causes no change in internal energy.

Reason : Latent heat is the heat required to melt a unit mass of solid. [AIIMS 1998]

4. Assertion : Specific heat capacity is the cause of formation of land and sea breeze.

Reason : The specific heat of water is more than land.

[AIIMS 1995]

5. Assertion : A brass disc is just fitted in a hole in a steel plate. The system must be cooled to loosen the disc from the hole.

Reason : The coefficient of linear expansion for brass is greater than the coefficient of linear expansion for steel.

6. Assertion : The coefficient of volume expansion has dimension K^{-1}.

Reason : The coefficient of volume expansion is defined as the change in volume per unit volume per unit change in temperature.

7. Assertion : The temperature at which Centigrade and Fahrenheit thermometers read the same is $-40°$.

Reason : There is no relation between Fahrenheit and Centigrade temperature.

8. Assertion : When a solid iron ball is heated, percentage increase is its volume is largest.

Reason : Coefficient of superficial expansion is twice that of linear expansion where as coefficient of volume expansion is three time of linear expansion.

9. Assertion : A beaker is completely filled with water at $4°C$. It will overflow, both when heated or cooled.

Reason : There is expansion of water below and above $4°C$.

10. Assertion : Latent heat of fusion of ice is 336000 J/kg.

Reason : Latent heat refers to change of state without any change in temperature

11. Assertion : Two bodies at different temperatures, if brought in thermal contact do not necessary settle to the mean temperature.

Reason : The two bodies may have different thermal capacities.

12. Assertion : Specific heat of a body is always greater than its thermal capacity.

Reason : Thermal capacity is the required for raising temperature of unit mass of the body through unit degree.

13. Assertion : Water kept in an open vessel will quickly evaporate on the surface of the moon.

Reason : The temperature at the surface of the moon is much higher than boiling point of the water.

14. Assertion : The molecules at $0°C$ ice and $0°C$ water will have same potential energy.

Reason : Potential energy depends only on temperature of the system.

Answers and Solutions

Thermometry

1. (d) $T = 273.15 + t°C \Rightarrow 0 = 273.15 + t°C$
$\Rightarrow t = -273.15°C$

2. (b) $\frac{C}{5} = \frac{F-32}{9} \Rightarrow \frac{-183}{5} = \frac{F-32}{9} \Rightarrow F = -297°F$

3. (a) $\frac{F-32}{9} = \frac{K-273}{5} \Rightarrow \frac{F-32}{9} = \frac{95-273}{5} \Rightarrow F = -288°F$

4. (c) Temperature change in Celsius scale = Temperature change in Kelvin scale = 27 K

5. (b) Change in resistance $3.70 - 2.71 = 0.99\,\Omega$ corresponds to interval of temperature $90°C$.

So change in resistance $3.26 - 2.71 = 0.55\,\Omega$ Corresponds to change in temperature

$$= \frac{90}{0.99} \times 0.55 = 50°C$$

6. (d) – $200°C$ to $600°C$ can be measured by platinum resistance thermometer.

7. (c) Pyrometer can measure temperature from $800°C$ to $6000°C$. Hence temperature of sun is measured with pyrometer.

8. (a) $\overline{v^2} \propto T$

9. (b) Thermoelectric thermometer is based on Seeback Effect.

10. (b) Maximum density of water is at $4°C$

Also $\frac{C}{5} = \frac{F-32}{9} \Rightarrow \frac{4}{5} = \frac{F-32}{9} \Rightarrow F = 39.2°F$

11. (c) Production and measurement of temperature close to $0\,K$ is done in cryogenics

12. (c)

13. (c) At absolute zero (*i.e.* 0 K) v_{rms} becomes zero.

14. (c)

15. (c) We know that $P = P_0(1 + \gamma t)$ and $V = V_0(1 + \gamma t)$

and $\gamma = (1/273)/°C$ for $t = -273°C$, we have $P = 0$ and $V = 0$

Hence, at absolute zero, the volume and pressure of the gas become zero.

16. (d) Zero kelvin $= -273°C$ (absolute temperature). As no matter can attain this temperature, hence temperature can never be negative on Kelvin scale.

17. (b) $\frac{C}{5} = \frac{F-32}{9} \Rightarrow \frac{25}{5} = \frac{F-32}{9} \Rightarrow F = 77°F$.

18. (c) Thermoelectric thermometer is used for finding rapidly varying temperature.

19. (c) Due to evaporation cooling is caused which lowers the temperature of bulb wrapped in wet hanky.

20. (c) $\frac{F-32}{9} = \frac{K-273}{5} \Rightarrow \frac{x-32}{9} = \frac{x-273}{5} \Rightarrow x = 574.25$

21. (c) $\frac{C}{5} = \frac{F-32}{9} \Rightarrow \frac{C}{5} = \frac{(140-32)}{9} \Rightarrow C = 60°$

22. (a) $\frac{C}{5} = \frac{F-32}{9} \Rightarrow \frac{t}{5} = \frac{t-32}{9} \Rightarrow t = -40°$

23. (d) Standardisation of thermometers is done with gas thermometer.

24. (a) For gases γ is more.

25. (c) The boiling point of mercury is 400°C. Therefore, the mercury thermometer can be used to measure the temperature upto 360°C.

26. (a) $t = \frac{(P_t - P_0)}{(P_{100} - P_0)} \times 100°C = \frac{(60-50)}{(90-50)} \times 100 = 25°C$

27. (b) By filling nitrogen gas at high pressure, the boiling point of mercury is increased which extend the range upto 500°C.

28. (a) Pyrometer is used to measure very high temperature.

29. (c) $\frac{F-32}{9} = \frac{K-273}{5} \Rightarrow \frac{F-32}{9} = \frac{0-273}{5}$

$\Rightarrow F = -459.4°F \approx -460°F$

30. (c) Initial volume $V_1 = 47.5$ units

Temperature of ice cold water $T_1 = 0°C = 273\,K$

Final volume of $V_2 = 67$ units

Applying Charle's law, we have $\frac{V_1}{T_1} = \frac{V_2}{T_2}$

(where temperature T_2 is the boiling point)

or $T_2 = \frac{V_2}{V_1} \times T_1 = \frac{67 \times 273}{47.5} = 385\,K = 112°C$

31. (a) Temperature on any scale can be converted into other scale by $\frac{x - LFP}{UFP - LFP}$ = Constant for all scales $\frac{x-20}{150-20} = \frac{60}{100} \Rightarrow$ $x = 98°C$

32. (d) $\frac{C}{5} = \frac{F-32}{9} \Rightarrow \frac{C}{5} = \frac{140-32}{9} \Rightarrow C = 60°C$

33. (a) Rapidly changing temperature is measured by thermocouple thermometers.

34. (d) Difference of $100°C$ = difference of $180°F$

$\therefore$ Difference of $30° = \frac{180}{100} \times 30 = 54°$

35. (a)

Thermal Expansion

1. (c) When a copper ball is heated, it's size increases. As Volume $\propto (\text{radius})^3$ and Area $\propto ((\text{radius})^2$, so percentage increase will be largest in it's volume. Density will decrease with rise in temperature.

2. (a) $\frac{h_1}{h_2} = \frac{\rho_1}{\rho_2} = \frac{(1+\gamma\theta_1)}{(1+\gamma\theta_2)}$ $\left[\because \rho = \frac{\rho_0}{(1+\gamma\theta)}\right]$

$\Rightarrow \frac{50}{60} = \frac{1+\gamma \times 50}{1+\gamma \times 100} \Rightarrow \gamma = 0.005/°C$

3. (b) $\gamma_r = \gamma_a + \gamma_v$; where γ_r = coefficient of real expansion, γ_a = coefficient of apparent expansion and γ_v = coefficient of expansion of vessel.

For copper $\gamma_r = C + 3\alpha_{Cu} = C + 3A$

For silver $\gamma_r = S + 3\alpha_{Ag}$

$\Rightarrow C + 3A = S + 3\alpha_{Ag} \Rightarrow \alpha_{Ag} = \frac{C - S + 3A}{3}$

4. (d) Fractional change in period

$\frac{\Delta T}{T} = \frac{1}{2}\alpha\Delta\theta = \frac{1}{2} \times 2 \times 10^{-6} \times 10 = 10^{-5}$

% change $= \frac{\Delta T}{T} \times 100 = 10^{-5} \times 100 = 10^{-3}$ %

5. (c) $L = L_0(1+\alpha\Delta\theta) \Rightarrow \frac{L_1}{L_2} = \frac{1+\alpha(\Delta\theta)_1}{1+\alpha(\Delta\theta)_2}$

$\Rightarrow \frac{10}{L_2} = \frac{1 + 11 \times 10^{-6} \times 20}{1 + 11 \times 10^{-6} \times 19} \Rightarrow L_2 = 9.99989$

$\Rightarrow$ Length is shorten by

$10 - 9.99989 = 0.00011 = 11 \times 10^{-5}\,cm$

6. (c) Stress $= Y\alpha\Delta\theta$; hence it is independent of length.

7. (c) Solids, liquids and gases all expand on being heated as result density (= mass/volume) decreases.

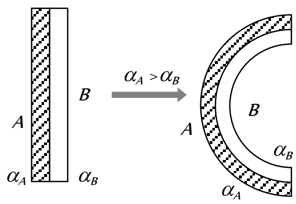
8. (c) As coefficient of cubical expansion of liquid equals coefficient of cubical expansion of vessel, the level of liquid will not change on heating.

9. (b) Loss in time per second $\frac{\Delta T}{T} = \frac{1}{2}\alpha\Delta\theta = \frac{1}{2}\alpha(t-0)$

$\Rightarrow$ loss in time per day

$\Delta t = \left(\frac{1}{2}\alpha t\right)t = \frac{1}{2}\alpha t \times (24 \times 60 \times 60) = \frac{1}{2}\alpha t \times 86400$

10. (c) A bimetallic strip on being heated bends in the form of an arc with more expandable metal (A) outside (as shown) correct.



11. (a) When the ball is heated, expansion of ball and cavity both occurs, hence volume of cavity increases.

12. (b) In summer alcohol expands, density decreases, so 1 litre of alcohol will weigh less in summer than in winter.

13. (b) Similar to previous question, benzene contracts in winter. So 5 litre of benzene will weigh more in winter than in summer.

14. (d) Water has maximum density at $4°C$.

15. (a) Since coefficient of expansion of steel is greater than that of bronze. Hence with small increase in it's temperature the hole expand sufficiently.

16. (d) $A \propto L^2 \Rightarrow \frac{\Delta A}{A} = 2 \cdot \frac{\Delta L}{L} \Rightarrow \frac{\Delta A}{A} = 2 \times 2 = 4\%$.

17. (d) $\frac{V_1}{V_2} = \frac{1+\gamma t_1}{1+\gamma t_2} \Rightarrow \frac{100}{125} = \frac{1+\gamma \times 20}{1+\gamma \times 100} \Rightarrow \gamma = 0.0033/°C$

18. (d) $\alpha = \frac{\beta}{2} = \frac{2 \times 10^{-5}}{2} = 10^{-5}\,/°C$

19. (d) Coefficient of volume expansion

$\gamma = \frac{\Delta\rho}{\rho.\Delta T} = \frac{(\rho_1 - \rho_2)}{\rho.(\Delta\theta)} = \frac{(10-9.7)}{10 \times (100-0)} = 3 \times 10^{-4}$

Hence, coefficient of linear expansion

$\alpha = \frac{\gamma}{3} = 10^{-4}\,/°C$

20. (a) $\rho = \rho_0(1 - \gamma.\Delta\theta) = 13.6[1 - 0.18 \times 10^{-3}(473 - 273)]$

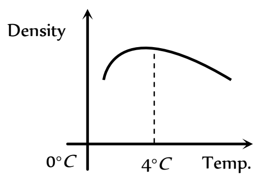
$= 13.6[1 - 0.036] = 13.11\,gm/cc$.

21. (b) As we know $\gamma_{\text{real}} = \gamma_{\text{app.}} + \gamma_{\text{vessel}}$

$\Rightarrow \gamma_{\text{app.}} = \gamma_{\text{glycerine}} - \gamma_{\text{glass}}$

$= 0.000597 - 0.000027 = 0.00057/°C$

22. (c) Water has maximum density at $4°C$, so if the water is heated above $4°C$ or cooled below $4°C$ density decreases *i.e.* volume increases. In other words, it expands so it overflows in both the cases.



23. (a)

$$\gamma = \frac{\Delta V}{V.\Delta T} = \frac{0.24}{100 \times 40} = 6 \times 10^{-5} / °C$$

$$\Rightarrow \alpha = \frac{\gamma}{3} = 2 \times 10^{-5} / °C$$

24. (a) As $\alpha = \frac{\beta}{2} = \frac{\gamma}{3} \Rightarrow \alpha : \beta : \gamma = 1 : 2 : 3$

25. (a) $\gamma_{app.} = \frac{\text{Mass expelled}}{\text{Mass remained } \times \Delta T}$

$$= \frac{x/100}{x \times 80} = \frac{1}{8000} = 1.25 \times 10^{-4} / °C$$

26. (b) In anomalous expansion, water contracts on heating and expands on cooling in the range 0°*C* to 4°*C*. Therefore water pipes sometimes burst, in cold countries.

27. (c) On heating the system; *x, r, d* all increases, since the expansion of isotropic solids is similar to true photographic enlargement.

28. (d) $\alpha = \frac{\Delta L}{L_0 \times \Delta\theta} = \frac{0.01}{5 \times 100} = 2 \times 10^{-5} / °C$

29. (a) $\alpha = \frac{\Delta L}{L_0(\Delta\theta)} = \frac{0.19}{100(100-0)} = 1.9 \times 10^{-5} / °C$

Now $\gamma = 3\alpha = 3 \times 1.9 \times 10^{-5}/°C = 5.7 \times 10^{-5}/°C$

30. (d) Since, the coefficient of linear expansion of brass is greater than that of steel. On cooling, the brass contracts more, so, it get loosened.

31. (b) Increase in length $\Delta L = L_0 \alpha \Delta\theta$

$= 10 \times 10 \times 10^{-6} \times (100 - 0) = 10^{-2}\ m = 1\ cm$

32. (a) $\alpha = \frac{\Delta L}{L_0 \Delta\theta} = \frac{(1-0.9997)}{0.9997 \times 12 \times 10^{-6}} = 25°C$

33. (c) The densest layer of water will be at bottom. The density of water is maximum at 4°*C*. So the temperature of bottom of lake will be 4°*C*.

34. (c) Given $\Delta l_1 = \Delta l_2$ or $l_1 \alpha_a t = l_2 \alpha_s t$

$\therefore \frac{l_1}{l_2} = \frac{\alpha_s}{\alpha_a}$ or $\frac{l_1}{l_1 + l_2} = \frac{\alpha_s}{\alpha_a + \alpha_s}$.

Calorimetry

1. (b) In vapor to liquid phase transition, heat liberates.

2. (b) Pressure inside the mines is greater than that of normal. Pressure. Also we know that boiling point increases with increase in pressure.

3. (c) $Q = m.c.\Delta\theta \Rightarrow c = \frac{Q}{m.\Delta\theta}$; when $\Delta\theta = 0 \Rightarrow c = \infty$

4. (c) Mass and volume of the gas will remain same, so density will also remain same.

5. (d)

6. (a) The latent heat of vaporization is always greater than latent heat of fusion because in liquid to vapour phase change there is a large increase in volume. Hence more heat is required as compared to solid to liquid phase change.

7. (c) When state is not changing $\Delta Q = mc\Delta\theta$.

8. (a) Heat taken by ice to melt at 0°*C* is

$$Q_1 = mL = 540 \times 80 = 43200\,cal$$

Heat given by water to cool upto 0°*C* is

$$Q_2 = ms\Delta\theta = 540 \times 1 \times (80 - 0) = 43200\,cal$$

Hence heat given by water is just sufficient to melt the whole ice and final temperature of mixture is 0°*C*.

Short trick : For these type of frequently asked questions you can remember the following formula

$$\theta_{mix} = \frac{m_W \theta_W - \frac{m_i L_i}{c_W}}{m_i + m_W}$$ (See theory for more details)

If $m_W = m_i$ then $\theta_{mix} = \frac{\theta_W - \frac{L_i}{c_W}}{2} = \frac{80 - \frac{80}{1}}{2} = 0°C$

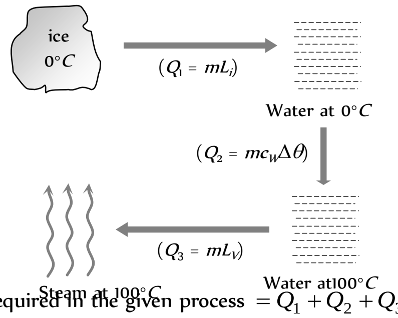
9. (d) Due to large specific heat of water, it releases large heat with very small temperature change.

10. (a) $Q = m.c.\Delta\theta = 5 \times (1000 \times 4.2) \times (100 - 20)$

$$= 1680 \times 10^3\ J = 1680\,kJ$$

11. (b) Melting point of ice decreases with increase in pressure (as ice expands on solidification).

12. (c) Conversion of ice (0°*C*) into steam (100°*C*) is as follows



Heat required in the given process $= Q_1 + Q_2 + Q_3$

$$= 1 \times 80 + 1 \times 1 \times (100 - 0) + 1 \times 536 = 716\,cal$$

13. (a) If *m gm* ice melts then

Heat lost = Heat gain

$$80 \times 1 \times (30 - 0) = m \times 80 \Rightarrow m = 30\,gm$$

14. (c) At boiling point saturation vapour pressure becomes equal to atmospheric pressure. Therefore, at 100°*C* for water. S.V.P. = 760 *mm* of *Hg* (atm pressure).

15. (b) Thermal capacity = Mass × Specific heat

Due to same material both spheres will have same specific heat.

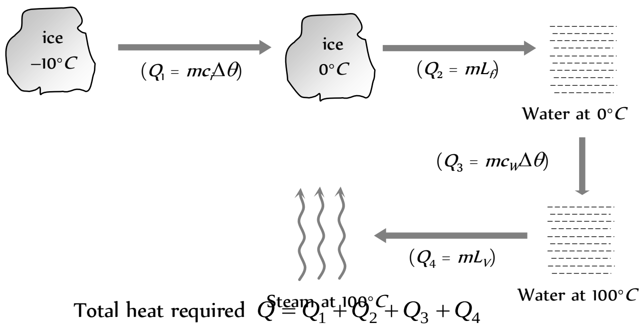
Also mass = Volume (*V*) × Density (ρ)

∴ Ratio of thermal capacity

$$= \frac{m_1}{m_2} = \frac{V_1 \rho}{V_2 \rho} = \frac{\frac{4}{3}\pi r_1^3}{\frac{4}{3}\pi r_2^3} = \left(\frac{r_1}{r_2}\right)^3 = \left(\frac{1}{2}\right)^3 = 1 : 8$$

16. (a) Ice (–10°*C*) converts into steam as follows

(c_i = Specific heat of ice, c_w = Specific heat of water)



Total heat required $Q = Q_1 + Q_2 + Q_3 + Q_4$

$$\Rightarrow Q = 1 \times 0.5(10) + 1 \times 80 + 1 \times 1 \times (100 - 0) + 1 \times 540$$

$$= 725\,cal$$

Hence work done $W = JQ = 4.2 \times 725 = 3045\ J$

17. (b) When water is cooled at 0°C to form ice then 80 *calorie/gm* (latent heat) energy is released. Because potential energy of the molecules decreases. Mass will remain constant in the process of freezing of water.

18. (a) Steam at 100°C contains extra 540 *calorie/gm* energy as compare to water at 100°C. So it's more dangerous to burn with steam then water.

19. (a) Same amount of heat is supplied to copper and water so $m_c c_c \Delta\theta_c = m_W c_W \Delta\theta_W$

$$\Rightarrow \Delta\theta_W = \frac{m_c c_c (\Delta\theta)_c}{m_W c_W} = \frac{50 \times 10^{-3} \times 420 \times 10}{10 \times 10^{-3} \times 4200} = 5°C$$

20. (c) Temperature of mixture $\theta_{mix} = \frac{\theta_A c_A + \theta_B c_B}{c_A + c_B}$

$$\Rightarrow 28 = \frac{32 \times c_A + 24 \times c_B}{c_A + c_B}$$

$$\Rightarrow 28\, c_A + 28 c_B = 32\, c_A + 24\, c_B \Rightarrow \frac{c_A}{c_B} = \frac{1}{1}$$

21. (b) Heat lost by hot water = Heat gained by cold water in beaker + Heat absorbed by beaker

$\Rightarrow 440(92 - \theta) = 200 \times (\theta - 20) + 20 \times (\theta - 20)$

$\Rightarrow \theta = 68°C$

22. (b) $Q = m.c.\Delta\theta$; if $\Delta\theta = 1\,K$ then $Q = mc =$ Thermal capacity.

23. (a) Latent heat is independent of configuration. Ordered energy spent in stretching the spring will not contribute to heat which is disordered kinetic energy of molecules of substance.

24. (d) Temperature of mixture

$$\theta_{mix} = \frac{m_1 c_1 \theta_1 + m_2 c_2 \theta_2}{m_1 c_1 + m_2 c_2} = \frac{m \times c \times 2T + \frac{m}{2}(2c)T}{m.c + \frac{m}{2}(2c)} = \frac{3}{2}T$$

25. (a)

26. (a) $\theta_{mix} = \dfrac{\theta_W - \frac{L_i}{c_W}}{2} = \dfrac{100 - \frac{80}{1}}{2} = 10°C$

27. (b) When pressure decreases, boiling point also decreases.

28. (a) Boiling occurs when the vapour pressure of liquid becomes equal to the atmospheric pressure. At the surface of moon, atmospheric pressure is zero, hence boiling point decreases and water begins to boil at 30°C.

29. (d) Thermal capacity $= mc = 40 \times 0.2 = 8\ cal/°C$.

30. (b) $Q = m.c.\Delta\theta \Rightarrow c = \frac{Q}{m.\Delta\theta}$

In temperature measurement scale $\Delta\theta°F > \Delta\theta°C$ so $(c)_{°F} < (c)_{°C}$.

31. (a) Increasing pressure lowers melting point of ice.

32. (b) Work done changes into heat energy, when the temperature of palm becomes above the atmosphere so it starts losing heat to the surroundings.

33. (b) Firstly the temperature of bullet rises up to melting point, then it melts. Hence according to $W = JQ$.

$$\Rightarrow \frac{1}{2}mv^2 = J.[m.c.\Delta\theta + mL] = J[m\,S\,(475 - 25) + mL]$$

$$\Rightarrow mS(475 - 25) + mL = \frac{mv^2}{2J}$$

34. (a) As $W = JQ \Rightarrow \frac{1}{2}(mgh) = J \times mc\Delta\theta \Rightarrow \Delta\theta = \frac{gh}{2Jc}$

$$\Delta\theta = \frac{9.8 \times 84}{2 \times 4.2 \times 1000} = 0.098°C$$

$$(\because c_{water} = 1000 \frac{cal}{kg \times °C})$$

Short trick : Remember the value of $\frac{g}{Jc_W} = 0.0023$, here

$$\Delta\theta = \frac{1}{2} \times (0.0023)h = \frac{1}{2} \times 0.0023 \times 84 = 0.098°C$$

35. (a) $W = JQ \Rightarrow mgh = J \times Q$

$$\Rightarrow Q = \frac{mgh}{J} = \frac{5 \times 9.8 \times 30}{4.2} = 350\ cal$$

36. (b) $W = JQ = 4.18 \times 400 = 1672\ joule$

37. (c) Energy supplied $= 0.93 \times 3600\ joules = 3348\ joules$

Heat required to melt 10 *gms* of ice

$= 10 \times 80 \times 4.18 = 3344\ joules$

Hence block of ice just melts.

38. (b) Suppose person climbs upto height *h*, then by using

$W = JQ \Rightarrow mgh = JQ$

$$\Rightarrow 60 \times 9.8 \times h = 4.2 \times \left(10^5 \times \frac{28}{100}\right) \Rightarrow h = 200\,m$$

39. (a) When water falls from a height, loss of potential energy causes rise in temperature.

40. (a) $W = JQ \Rightarrow mg\,h = J(m.c.\Delta\theta)$

$$\Rightarrow \Delta\theta = \frac{g\,h}{Jc} = 0.0023\,h = 0.0023 \times 84 = 0.196°C$$

41. (a) Suppose m' *kg* ice melts out of m *kg* then by using

$W = JQ \Rightarrow mgh = J(m'L)$. Hence fraction of ice melts

$$= \frac{m'}{m} = \frac{gh}{JL} = \frac{9.8 \times 1000}{4.18 \times 80} = \frac{1}{33}$$

42. (b) $J = \frac{W}{Q} = \frac{Joule}{cal}$

43. (d) $W = JQ \Rightarrow (2m)gh = J \times m'c\Delta\theta$

$\Rightarrow 2 \times 5 \times 10 \times 10 = 4.2(2 \times 1000 \times \Delta\theta)$

$\Rightarrow \Delta\theta = 0.1190°C = 0.12°C$

44. (b) $W = JQ \Rightarrow \frac{1}{2}\left(\frac{1}{2}mV^2\right) = J \times mS\Delta\theta \Rightarrow \Delta\theta = \frac{V^2}{4\,JS}$

45. (c) 'J' is a conversion

46. (c) $\Delta\theta = 0.0023h = 0.0023 \times 210 = 0.483°C \approx 0.49°C$.

47. (a) According to energy conservation, change in kinetic energy appears in the form of heat (thermal energy).

$\Rightarrow$ *i.e.* Thermal energy $= \frac{1}{2}m(v_1^2 - v_2^2)$ $\left[\because \underset{(\text{Joule})}{W} = \underset{(\text{Joule})}{Q}\right]$

$= \frac{1}{2}(100 \times 10^{-3})(10^2 - 5^2) = 3.75\ J$

48. (b) Work done to raise the temperature of 100 gm water through $10°C$ is

$W = JQ = 4.2 \times (100 \times 10^{-3} \times 1000 \times 10) = 4200\ J$

49. (b) Among all the option, latent heat of steam is highest.

50. (a) $\Delta\theta = 0.0023h = 0.0023 \times 100 = 0.23°C$

51. (c) Since specific heat of lead is given in *Joules*, hence use $W = Q$ instead of $W = JQ$.

$\Rightarrow \frac{1}{2} \times \left(\frac{1}{2}mv^2\right) = m.c.\Delta\theta \Rightarrow \Delta\theta = \frac{v^2}{4c} = \frac{(300)^2}{4 \times 150} = 150°C$.

52. (d) At boiling point, vapour pressure becomes equal to the external pressure.

53. (c) When pressure increases boiling point also increases.

54. (b) Calorimeters are made by conducting materials.

55. (b) Triple point of water is 273.16 K.

56. (a)

57. (d) $W = JQ \Rightarrow W = 4.2 \times 200 = 840\ J$.

58. (d) Temperature of mixture $\theta = \frac{m_1c_1\theta_1 + m_2c_2\theta_2}{m_1c_1 + m_2\theta_2}$

$\Rightarrow 32 = \frac{m_1 \times 0.2 \times 40 + 100 \times 0.5 \times 20}{m_1 \times 0.2 + 100 \times 0.5} \Rightarrow m_1 = 375\ gm$

59. (d) Suppose $m\ gm$ ice melted, then heat required for its melting $= mL = m \times 80\ cal$

Heat available with steam for being condensed and then brought to $0°C$

$= 1 \times 540 + 1 \times 1 \times (100 - 0) = 640\ cal$

$\Rightarrow$ Heat lost = Heat taken

$\Rightarrow 640 = m \times 80 \Rightarrow m = 8\ gm$

Short trick: You can remember that amount of steam (m') at $100°C$ required to melt $m\ gm$ ice at $0°C$ is $m' = \frac{m}{8}$.

Here, $m = 8 \times m' = 8 \times 1 = 8\ gm$

60. (b) For water and ice mixing $\theta_{\text{mix}} = \frac{m_W\theta_W - \frac{m_iL_i}{c_W}}{m_i + m_W}$

$= \frac{20 \times 40 - \frac{5 \times 80}{1}}{5 + 20} = 16°C$

61. (c) $\theta_{\text{mix}} = \frac{m_W\theta_W - \frac{m_iL_i}{c_W}}{m_i + m_W}$

$\because m_i = m_W \Rightarrow \theta_{mix} = \frac{\theta_W - \frac{L_i}{c_W}}{2} = \frac{80 - \frac{336}{4.2}}{2} = 0°C$

62. (a) When the relative humidity is low (approx. 25%), the evaporation from our body is faster. Thus we feel colder.

63. (a) $c = \frac{Q}{m.\Delta\theta} \to \frac{J}{kg \times °C}$

64. (a) $\theta_{\text{mix}} = \frac{\theta_W - \frac{L_i}{c_W}}{2} = \frac{80 - \frac{80}{1}}{2} = 0$

65. (a) Freezing point of water decreases when pressure increases, because water expands on solidification while "except water" for other liquid freezing point increases with increase in pressure.

Since the liquid in question is water. Hence, it expands on freezing.

66. (c) Partial pressure of water vapour $P_W = 0.012 \times 10^5\ Pa$,

Vapour pressure of water $P_V = 0.016 \times 10^5\ Pa$.

The relative humidity at a given temperature is given by

$= \frac{\text{Partial pressure of water vapour}}{\text{Vapour pressure of water}}$

$= \frac{0.012 \times 10^5}{0.016 \times 10^5} = 0.75 = 75\%$

67. (a) $W = JQ \Rightarrow \frac{1}{2}\left(\frac{1}{2}Mv^2\right) = J(m.c.\Delta\theta)$

$\Rightarrow \frac{1}{4} \times 1 \times (50)^2 = 4.2[200 \times 0.105 \times \Delta\theta] \Rightarrow \Delta\theta = 7.1°C$

68. (a) $536\frac{cal}{gm} = \frac{536 \times 4.2\ J}{10^{-3}\ kg} = 2.25 \times 10^6\ J/kg$

69. (a) Water has maximum specific heat.

70. (a) $\theta_{\text{mix}} = \frac{\theta_W - \frac{L_i}{C_W}}{2} = \frac{100 - \frac{80}{1}}{2} = 10°C$

71. (b) Suppose $m\ kg$ of ice melts then by using $\underset{(\text{Joules})}{W} = \underset{(\text{Joules})}{H}$

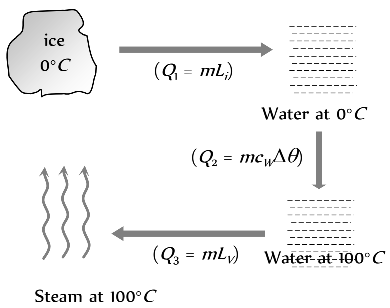
$\Rightarrow Mgh = mL \Rightarrow 3.5 \times 10 \times 2000 = m \times 3.5 \times 10^5$

$\Rightarrow m = 0.2\ kg = 200\ gm$

72. (d) $\theta_{\text{mix}} = \frac{m_W\theta_W - \frac{m_iL_i}{S_W}}{m_i + m_W} = \frac{300 \times 25 - \frac{100 \times 80}{1}}{100 + 300} = -1.25°C$

Which is not possible. Hence $\theta_{mix} = 0°C$

73. (c) Ice ($0°C$) converts into steam ($100°C$) in following three steps.



Total heat required $Q = Q_1 + Q_2 + Q_3$

$= 5 \times 80 + 5 \times 1 \times (100 - 0) + 5 \times 540 = 3600\, cal$

74. (a) Let L be the latent heat and using principle of calorimetry.

$2L + 2\,(100 - 54.3) = 40 \times (54.3 - 25.3)$

$\Rightarrow L = 540.3$ *cal/gm.*

75. (d) $\theta_{\text{mix}} = \dfrac{m_W\theta_W - \dfrac{m_i L_i}{c_W}}{m_i + m_W} = \dfrac{100 \times 50 - 10 \times \dfrac{80}{1}}{10 + 100} \approx 38.2°C$

76. (b) Let the final temperature be $T°C$.

Total heat supplied by the three liquids in coming down to $0°C$ =

$m_1c_1T_1 + m_2c_2T_2 + m_3c_3T_3$ ..... (i)

Total heat used by three liquids in raising temperature from $0°C$ to $T°C$

$= m_1c_1T + m_2c_2T + m_3c_3T$ .....(ii)

By equating (i) and (ii) we get

$(m_1c_1 + m_2c_2 + m_3c_3)T$

$= m_1c_1T_1 + m_2c_2T_2 + m_3c_3T_3$

$\Rightarrow T = \dfrac{m_1c_1T_1 + m_2c_2T_2 + m_3c_3T_3}{m_1c_1 + m_2c_2 + m_3c_3}$.

77. (c) At triple point all the phases co-exist

78. (b) $c = \dfrac{Q}{m.\Delta\theta}$; as $\Delta\theta = 0$, hence c becomes ∞.

79. (d) Let final temperature of water be θ

Heat taken = Heat given

$110 \times 1\,(\theta - 10) + 10\,(\theta - 10) = 220 \times 1\,(70 - \theta)$

$\Rightarrow \theta = 48.8°C \approx 50°C$.

80. (c) We know that thermal capacity of a body expressed in calories is equal to water equivalent of the body expressed in grams.

81. (b) $\theta_{mix} = \dfrac{m_1c_1\theta_1 + m_2c_2\theta_2}{m_1c_1 + m_2c_2} = \dfrac{m\,s\,(2t) + 1.5\,(m\,s) \times \dfrac{t}{3}}{m\,s + 1.5\,(m\,s)} = t$

82. (d) We know that when solid carbondioxide is heated, it becomes vapour directly without passing through its liquid phase. Therefore it is called dry ice.

Critical Thinking Questions

1. (c) Due to volume expansion of both mercury and flask, the change in volume of mercury relative to flask is given by $\Delta V = V_0[\gamma_L - \gamma_g]\Delta\theta = V[\gamma_m - 3\alpha_g]\Delta\theta$

$= 50\,[180 \times 10^{-6} - 3 \times 9 \times 10^{-6}](38 - 18) = 0.153\, cc$

2. (a) $\gamma_{real} = \gamma_{app.} + \gamma_{vessel}$

So $(\gamma_{app.} + \gamma_{vessel})_{glass} = (\gamma_{app.} + \gamma_{vessel})_{steel}$

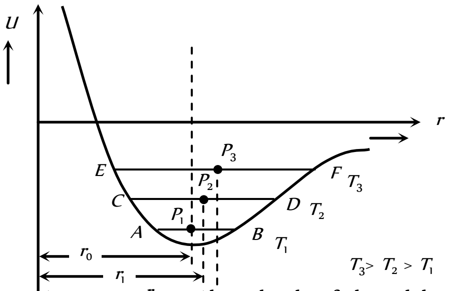
$\Rightarrow 153 \times 10^{-6} + (\gamma_{vessel})_{glass} = (144 \times 10^{-6} + \gamma_{vessel})_{steel}$

Further, $(\gamma_{vessel})_{steel} = 3\alpha = 3 \times (12 \times 10^{-6}) = 36 \times 10^{-6}/°C$

$\Rightarrow 153 \times 10^{-6} + (\gamma_{vessel})_{glass} = 144 \times 10^{-6} + 36 \times 10^{-6}$

$\Rightarrow (\gamma_{vessel})_{glass} = 3\alpha = 27 \times 10^{-6}/°C \Rightarrow \alpha = 9 \times 10^{-6}/°C$

3. (d) The expansion of solids can be well understood by potential energy curve for two adjacent atoms in a crystalline solid as a function of their internuclear separation (r).



At ordinary temperature : Each molecule of the solid vibrate about it' s equilibrium position P_1 between A and B (r_0 is the equilibrium distance of it from some other molecule)

At high temperature : Amplitude of vibration increase ($C \leftrightarrow D$ and $E \leftrightarrow F$). Due to asymmetry of the curve, the equilibrium positions (P_2 and P_3) of molecule displaced. Hence it's distance from other molecule increases ($r_2 > r_1 > r_0$).

Thus, on raising the temperature, the average equilibrium distance between the molecules increases and the solid as a whole expands.

4. (c) Initial diameter of tyre = (1000 – 6) *mm* = 994 *mm*, so initial radius of tyre $R = \dfrac{994}{2} = 497\, mm$

and change in diameter $\Delta D = 6$ *mm* so $\Delta R = \dfrac{6}{2} = 3\, mm$

After increasing temperature by $\Delta\theta$ tyre will fit onto wheel

Increment in the length (circumference) of the iron tyre

$\Delta L = L \times \alpha \times \Delta\theta = L \times \dfrac{\gamma}{3} \times \Delta\theta$ [As $\alpha = \dfrac{\gamma}{3}$]

$2\pi\,\Delta R = 2\pi R\left(\dfrac{\gamma}{3}\right)\Delta\theta \Rightarrow \Delta\theta = \dfrac{3}{\gamma}\dfrac{\Delta R}{R} = \dfrac{3 \times 3}{3.6 \times 10^{-5} \times 497}$

$\Rightarrow \Delta\theta = 500^o C$

5. (b) Due to volume expansion of both liquid and vessel, the change in volume of liquid relative to container is given by $\Delta V = V_0[\gamma_L - \gamma_g]\Delta\theta$

Given $V_0 = 1000$ *cc*, $\alpha_g = 0.1 \times 10^{-4}/°C$

$\therefore \gamma_g = 3\alpha_g = 3 \times 0.1 \times 10^{-4}\,/°C = 0.3 \times 10^{-4}\,/°C$

$\therefore \Delta V = 1000\,[1.82 \times 10^{-4} - 0.3 \times 10^{-4}] \times 100 = 15.2$ *cc*

6. (a) With temperature rise (same $25°C$ for both), steel scale and copper wire both expand. Hence length of copper wire *w.r.t.* steel scale or apparent length of copper wire after rise in temperature

$L_{app} = L'_{cu} - L'_{steel} = [L_0(1 + \alpha_{Cu}\Delta\theta) - L_0(1 + \alpha_s\Delta\theta)$

$\Rightarrow L_{app} = L_0(\alpha_{Cu} - \alpha_s)\Delta\theta$

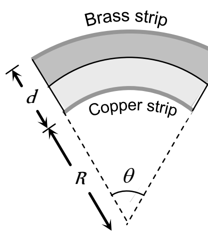
$= 80(17 \times 10^{-6} - 11 \times 10^{-6}) \times 20 = 80.0096$ *cm*

7. (b, d) Let L_0 be the initial length of each strip before heating.

Length after heating will be

$L_B = L_0(1 + \alpha_B\Delta T) = (R + d)\theta$

$L_C = L_0(1 + \alpha_C\Delta T) = R\theta$



$$\Rightarrow \frac{R+d}{R} = \frac{1+\alpha_B \Delta T}{1+\alpha_C \Delta T}$$

$$\Rightarrow 1+\frac{d}{R} = 1+(\alpha_B-\alpha_C)\Delta T$$

$$\Rightarrow R = \frac{d}{(\alpha_B-\alpha_C)\Delta T} \Rightarrow R \propto \frac{1}{\Delta T} \text{ and } R \propto \frac{1}{(\alpha_B-\alpha_C)}$$

8. (d) Thermostat is used in electric apparatus like refrigerator, Iron *etc* for automatic cut off. Therefore for metallic strips to bend on heating their coefficient of linear expansion should be different.

9. (c) As the coefficient of cubical expansion of metal is less as compared to the coefficient of cubical expansion of liquid, we may neglect the expansion of metal ball. So when the ball is immersed in alcohol at 0°C, it displaces some volume V of alcohol at 0°C and has weight W_1.

$\therefore \quad W_1 = W_0 - V\rho_0 g$

where W_0 = weight of ball in air

Similarly, $W_2 = W_0 - V\rho_{50} g$

where ρ_0 = density of alcohol at 0°C

and ρ_{50} = density of alcohol at 50°C

As $\rho_{50} < \rho_0$, $\Rightarrow W_2 > W_1$ or $W_1 < W_2$

10. (d) $V = V_0(1 + \gamma\,\Delta\theta) \Rightarrow$ Change in volume

$$V - V_0 = \Delta V = A.\Delta l = V_0 \gamma \Delta\theta$$

$$\Rightarrow \Delta l = \frac{V_0.\Delta\theta}{A} = \frac{10^{-6}\times 18\times 10^{-5}\times(100-0)}{0.004\times 10^{-4}}$$

$= 45 \times 10^{-3}\ m = 4.5\ cm$

11. (b) Loss of weight at 27°C is

$= 46 - 30 = 16 = V_1 \times 1.24\ \rho_l \times g \quad$ ...(i)

Loss of weight at 42°C is

$= 46 - 30.5 = 15.5 = V_2 \times 1.2\ \rho_l \times g \quad$ ...(ii)

Now dividing (i) by (ii), we get $\frac{16}{15.5} = \frac{V_1}{V_2}\times\frac{1.24}{1.2}$

But $\frac{V_2}{V_1} = 1 + 3\alpha\,(t_2 - t_1) = \frac{15.5\times 1.24}{16\times 1.2} = 1.001042$

$\Rightarrow 3\alpha\,(42° - 27°) = 0.001042 \Rightarrow \alpha = 2.316 \times 10^{-5}/°C.$

12. (b) Substances are classified into two categories

(i) water like substances which expand on solidification.

(ii) CO_2 like (Wax, Ghee *etc.*) which contract on solidification.

Their behaviour regarding solidification is opposite.

Melting point of ice decreases with rise of temp but that of wax etc increases with increase in temperature. Similarly ice starts forming from top downwards whereas wax starts its formation from bottom.

13. (b) Heat lost in t sec = mL or heat lost per sec = $\frac{mL}{t}$. This must be the heat supplied for keeping the substance in molten state per sec.

$\therefore \quad \frac{mL}{t} = P$ or $L = \frac{Pt}{m}$

14. (a) Heat is lost by steam in two stages (i) for change of state from steam at 100°C to water at 100°C is m × 540 (ii) to change water at 100°C to water at 80°C is m × 1 × (100 – 80), where m is the mass of steam condensed.

Total heat lost by steam is m × 540 + m × 20 = 560 m (*cals*)

Heat gained by calorimeter and its contents is

= (1.1 + 0.02) × (80 – 15) = 1.12 × 65 *cals.*

using Principle of calorimetery, Heat gained = heat lost

$\therefore$ 560 m = 1.12 × 65, m = 0.130 *gm*

15. (b) Initially ice will absorb heat to raise it's temperature to 0°C then it's melting takes place

If m_i = Initial mass of ice, m_i' = Mass of ice that melts and m_W = Initial mass of water

By Law of mixture Heat gained by ice = Heat lost by water $\Rightarrow$ $m_i \times c\times(20) + m_i'\times L = m_W c_W[20]$

$\Rightarrow 2\times 0.5(20) + m_i'\times 80 = 5\times 1\times 20 \Rightarrow m_i' = 1kg$

So final mass of water = Initial mass of water + Mass of ice that melts = 5 + 1= 6 *kg.*

16. (a) Heat gained by the water = (Heat supplied by the coil) – (Heat dissipated to environment)

$\Rightarrow mc\ \Delta\theta = P_{Coil}\ t - P_{Loss}\ t$

$\Rightarrow 2\times 4.2\times 10^3\times(77-27) = 1000\,t - 160\,t$

$\Rightarrow t = \frac{4.2\times 10^5}{840} = 500\ sec = 8\ min\ 20\ sec$

17. (a) If mass of the bullet is *m gm,*

then total heat required for bullet to just melt down

$Q_1 = m\ c\ \Delta\theta + m\ L = m \times 0.03\ (327 - 27) + m \times 6$

$= 15\ m\ cal = (15m\times 4.2)J$

Now when bullet is stopped by the obstacle, the loss in its mechanical energy $= \frac{1}{2}(m\times 10^{-3})v^2 J$

(As $m\ gm = m\times 10^{-3} kg$)

As 25% of this energy is absorbed by the obstacle,

The energy absorbed by the bullet

$$Q_2 = \frac{75}{100}\times\frac{1}{2}mv^2\times 10^{-3} = \frac{3}{8}mv^2\times 10^{-3}\ J$$

Now the bullet will melt if $Q_2 \geq Q_1$

i.e. $\frac{3}{8}mv^2\times 10^{-3} \geq 15m\times 4.2 \Rightarrow v_{min} = 410\ m/s$

18. (c) Energy = $\frac{1}{2}mv^2 = mc\,\Delta\theta; \Rightarrow \Delta\theta \propto v^2$

Temperature does not depend upon the mass of the balls.

19. (c) Heat gain = heat lost

$C_A(16 - 12) = C_B\ (19 - 16) \Rightarrow \frac{C_A}{C_B} = \frac{3}{4}$

and $C_B(23 - 19) = C_C\ (28 - 23) \Rightarrow \frac{C_B}{C_C} = \frac{5}{4}$

$\Rightarrow \frac{C_A}{C_C} = \frac{15}{16}$ ...(i)

If θ is the temperature when A and C are mixed then,

$C_A(\theta - 12) = C_C(28 - \theta) \Rightarrow \frac{C_A}{C_C} = \frac{28-\theta}{\theta - 12}$ ...(ii)

On solving equation (i) and (ii) $\theta = 20.2°C$.

20. (b) Suppose m kg steam required per hour

Heat released by steam in following three steps

(i) When 150°C steam $\xrightarrow[Q_1]{} 100°C$ steam

$Q_1 = mc_{steam}\Delta\theta = m \times 1\ (150 - 100) = 50\ m\ cal$

(ii) When 150°C steam $\xrightarrow[Q_2]{} 100°C$ water

$Q_2 = mL_v = m \times 540 = 540\ m\ cal$

(iii) When 100°C water $\xrightarrow[Q_2]{} 90°C$ water

$Q_3 = mc_w\Delta\theta = m \times 1 \times (100 - 90) = 10\ m\ cal$

Hence total heat given by the steam $Q = Q_1 + Q_2 + Q_3 = 600\ mcal$ ... (i)

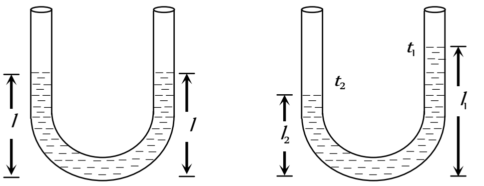
Heat taken by 10 kg water

$Q' = mc_W\Delta\theta = 10 \times 10^3 \times 1 \times (80 - 20) = 600 \times 10^3\ cal$

Hence $Q = Q' \Rightarrow 600\ m = 600 \times 10^3$

$\Rightarrow m = 10^3\ gm = 1 kg.$

21. (a) Suppose, height of liquid in each arm before rising the temperature is l.



With temperature rise height of liquid in each arm increases i.e. $l_1 > l$ and $l_2 > l$

Also $l = \frac{l_1}{1 + \gamma t_1} = \frac{l_2}{1 + \gamma t_2}$

$\Rightarrow l_1 + \gamma l_1 t_2 = l_2 + \gamma l_2 t_1 \Rightarrow \gamma = \frac{l_1 - l_2}{l_2 t_1 - l_1 t_2}$

22. (c) $V = V_0(1 + \gamma\Delta\theta)$

$L^3 = L_0(1 + \alpha_1\Delta\theta)L_0^2(1 + \alpha_2\Delta\theta)^2 = L_0^3(1 + \alpha_1\Delta\theta)(1 + \alpha_2\Delta\theta)^2$

Since $L_0^3 = V_0$ and $L^3 = V$

Hence $1 + \gamma\Delta\theta = (1 + \alpha_1\Delta\theta)(1 + \alpha_2\Delta\theta)^2$

$\cong (1 + \alpha_1\Delta\theta)(1 + 2\alpha_2\Delta\theta) \cong (1 + \alpha_1\Delta\theta + 2\alpha_2\Delta\theta)$

$\Rightarrow \gamma = \alpha_1 + 2\alpha_2$

23. (d) $(OR)^2 = (PR)^2 - (PO)^2 = l^2 - \left(\frac{l}{2}\right)^2$

$= [l(1 + \alpha_2 t)]^2 - \left[\frac{l}{2}(1 + \alpha_1 t)\right]^2$

$l^2 - \frac{l^2}{4} = l^2(1 + \alpha_2^2 t^2 + 2\alpha_2 t) - \frac{l^2}{4}(1 + \alpha_1^2 t^2 + 2\alpha_1 t)$

Neglecting $\alpha_2^2 t^2$ and $\alpha_1^2 t^2$

$0 = l^2(2\alpha_2 t) - \frac{l^2}{4}(2\alpha_1 t) \Rightarrow 2\alpha_2 = \frac{2\alpha_1}{4} \Rightarrow; \alpha_1 = 4\alpha_2$

24. (c) It is given that the volume of air in the flask remains the same. This means that the expansion in volume of the vessel is exactly equal to the volume expansion of mercury.

i.e., $\Delta V_g = \Delta V_L$ or $V_g\gamma_g\Delta\theta = V_L\gamma_L\Delta\theta$

$\therefore V_L = \frac{V_g\gamma_g}{\gamma_L} = \frac{1000 \times (3 \times 9 \times 10^{-6})}{1.8 \times 10^{-4}} = 150\ cc$

25. (c) Heat given by water $Q_1 = 10 \times 10 = 100\ cal.$

Heat taken by ice to melt

$Q_2 = 10 \times 0.5 \times [0 - (-20)] + 10 \times 80 = 900\ cal$

As $Q_1 < Q_2$, so ice will not completely melt and final temperature = 0°C.

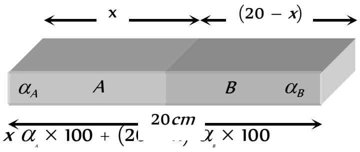
As heat given by water in cooling up to 0°C is only just sufficient to increase the temperature of ice from – 20°C to 0°C, hence mixture in equilibrium will consist of 10 gm ice and 10 gm water at 0°C.

26. (b) $\Delta L = L_0\ \alpha\Delta\theta$

Rod A : 0.075 = 20 × α_A × 100 $\Rightarrow \alpha_A = \frac{75}{2} \times 10^{-6} / °C$

rod B : 0.045 = 20 × α_B × 100 $\Rightarrow \alpha_B = \frac{45}{2} \times 10^{-6} / °C$

For composite rod : x cm of A and (20 – x) cm of B we have

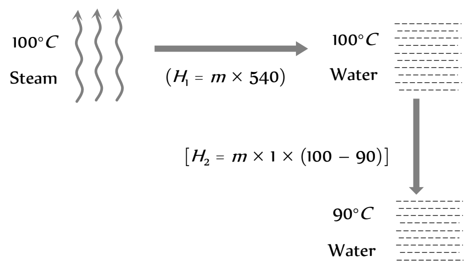


0.060 = $x\ \alpha_A \times 100 + (20 - x)\ \alpha_B \times 100$

$= x\left[\frac{75}{2} \times 10^{-6} \times 100 + (20 - x) \times \frac{45}{2} \times 10^{-6} \times 100\right]$

On solving we get x = 10 cm.

27. (a) Let m gm of steam get condensed into water (By heat loss). This happens in following two steps.



Heat gained by water (20°C) to raise it's temperature upto 90° $= 22 \times 1 \times (90 - 20)$

Hence, in equilibrium heat lost = Heat gain

$\Rightarrow m \times 540 + m \times 1 \times (100 - 90) = 22 \times 1 \times (90 - 20)$

$\Rightarrow m = 2.8\ gm$

The net mass of the water present in the mixture $= 22 + 2.8 = 24.8\ gm$.

Graphical Questions

1. (b) Relation between Celsius and Fahrenheit scale of temperature is $\frac{C}{5} = \frac{F-32}{9} \Rightarrow C = \frac{5}{9}F - \frac{160}{9}$

Equating above equation with standard equation of line

$y = mx + c$ we get slope of the line *AB* is $m = \frac{5}{9}$

2. (c) Since in the region *AB* temperature is constant therefore at this temperature phase of the material changes from solid to liquid and $(H_2 - H_1)$ heat will be absorb by the material. This heat is known as the heat of melting of the solid.

Similarly in the region *CD* temperature is constant therefore at this temperature phase of the material changes from liquid to gas and $(H_4 - H_3)$ heat will be absorb by the material. This heat as known as the heat of vaporisation of the liquid.

3. (a) Initially, on heating temperature rises from $-10°C$ to $0°C$. Then ice melts and temperature does not rise. After the whole ice has melted, temperature begins to rise until it reaches $100°C$. Then it becomes constant, as at the boiling point will not rise.

4. (a) The volume of matter in portion *AB* of the curve is almost constant and pressure is decreasing. These are the characteristics of liquid state.

5. (d) Let the quantity of heat supplied per minute be *Q*. Then quantity of heat supplied in 2 *min* $= mC(90-80)$

In 4 *min*, heat supplied $= 2m\,C(90-80)$

$\therefore\ 2m\,C(90-80) = m\,L \Rightarrow \frac{L}{C} = 20$

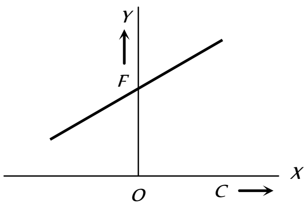
6. (b) In the given graph *CD* represents liquid state.

7. (a) Density of water is maximum at $4°C$ and is less on either side of this temperature.

8. (a) We know that, $\frac{C}{100} = \frac{F-32}{180}$ or $F = \frac{9}{5}C + 32$

Equation of straight line is, $y = mx + c$

Hence, $m = (9/5)$, positive and $c = 32$ positive. The graph is shown in figure.



9. (a)

$$\frac{C}{5} = \frac{F-32}{9} \Rightarrow$$

$C = \left(\frac{5}{9}\right)F - \frac{20}{3}$. Hence graph between $°C$ and $°F$ will be a straight line with positive slope and negative intercept.

10. (bc) The horizontal parts of the curve, where the system absorbs heat at constant temperature must depict changes of state. Here the latent heats are proportional to lengths of the horizontal parts. In the sloping parts, specific heat capacity is inversely proportional to the slopes.

11. (c) Since specific heat = 0.6 $kcal/gm \times °C$ = 0.6 $cal/gm \times °C$

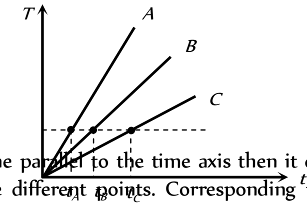
From graph it is clear that in a minute, the temperature is raised from $0°C$ to $50°C$.

$\Rightarrow$ Heat required for a minute = 50 × 0.6 × 50 = 1500 *cal.*

Also from graph, Boiling point of wax is $200°C$.

12. (c)

13. (c) Substances having more specific heat take longer time to get heated to a higher temperature and longer time to get cooled.



If we draw a line parallel to the time axis then it cuts the given graphs at three different points. Corresponding points on the times axis shows that

$t_C > t_B > t_A \Rightarrow C_C > C_B > C_A$

14. (c) From given curve,

Melting point for $A = 60°C$

and melting point for $B = 20°C$

Time taken by *A* for fusion $= (6-2) = 4$ minute

Time taken by *B* for fusion $= (6.5-4) = 2.5$ minute

Then $\frac{H_A}{H_B} = \frac{6 \times 4 \times 60}{6 \times 2.5 \times 60} = \frac{8}{5}$.

Assertion and Reason

1. (a) With rise in pressure melting point of ice decreases. Also ice contracts on melting

2. (c) Celsius scale was the first temperature scale and Fahrenheit is the smallest unit measuring temperature.

3. (e) Melting is associated with increasing of internal energy without change in temperature. In view of the reason being correct the amount of heat absorbed or given out during change of state is expressed $Q = mL$, where *m* is the mass of the substance and *L* is the latent heat of the substance.

4. (a) The temperature of land rises rapidly as compared to sea because of specific heat of land is five times less than that of sea water. Thus, the air above the land become hot and light so rises up so because of pressure drops over land. To compensate the drop of pressure, the cooler air starts from sea starts blowing towards lands, so, setting up sea breeze. During night land as well sea radiate heat energy. The temperature of land falls more rapidly as compared to sea water, as sea water consists of higher specific heat capacity. The air above sea water being warm and light rises up and to take its place the cold air from land starts blowing towards sea and so et up breeze.

5. (a) Linear expansion for brass $(19 \times 10^{-4}) >$ linear expansion for steel (11×10^{-4}). On cooling the disk shrinks to a greater extent than the hole and hence it will get loose.

6. (a) As, $\gamma = \frac{\Delta V}{V \Delta T}$ *i.e.*, units of coefficient of volume expansion is K.

7. (c) The relation between *F* and *C* scale is, $\frac{C}{5} = \frac{F-32}{9}$. If $F = C$

$\Rightarrow C = -40°C$ *i.e.*, at $-40°$ the Centigrade and Fahrenheit thermometers reads the same.

8. (a) As $\beta = 2\alpha$ and $\gamma = 3\alpha$, *i.e.*, coefficient of volume expansion of solid is three time coefficient of linear expansion and 1.5 times the coefficient of superficial expansion, on heating a solid iron ball, percentage increase in its volume is largest.

9. (a) Water has maximum density at $4°C$. On heating above $4°C$ or cooling below $4°C$, density of water decreases and its volume increases. Therefore, water overflows in both the cases.

10. (b) The Latent heat of fusion of ice is amount of heat required to convert unit mass of ice at $0°C$ into water at $0°C$. For fusion of ice

$$L = 80\, cal/gm = 80000\, cal/gm = 8000 \times 4.2\ J/kg$$

$$= 336000\ J/kg\ .$$

11. (a) When two bodies at temperature T_1 and T_2 are brought in thermal contact, they do settle to the mean temperature $(T_1 + T_2)/2$. They will do so, in case the two bodies were of same mass and material *i.e.*, same thermal capacities. In other words, the two bodies may be having different thermal capacities, that's why they do not settle to the mean temperature, when brought together.

12. (d) Specific heat of a body is the amount of heat required to raise the temperature of unit mass of the body through unit degree. When mass of a body is less than unity, then its thermal capacity is less than its specific heat and vice-versa.

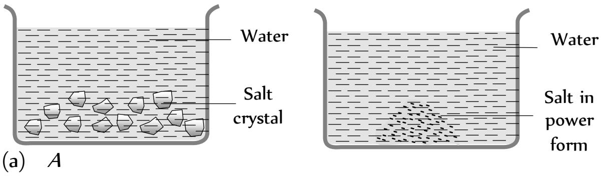
13. (a) Water would evaporate quickly because there is no atmosphere on moon, due to which surface temperature of moon is much higher than earth (Maximum surface temperature of moon is $123°C$).

14. (d) The potential energy of water molecules is more. The heat given to melt the ice at $0°C$ is used up in increasing the potential energy of water molecules formed at $0°C$.

Thermometry, Thermal Expansion and Calorimetry

SET Self Evaluation Test -12

1. Out of the following, in which vessel will the temperature of the solution be higher after the salt is completely dissolved.



(a) A
(b) B
(c) Equal in both
(d) Information is not sufficient

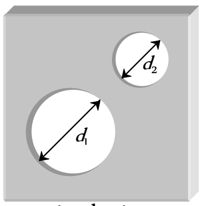
2. Fire is extinguished more effectively by
(a) Hot water (b) Cold water
(c) Equally by both (d) Ice

3. An ideal thermometer should have
(a) Large heat capacity (b) Medium heat capacity
(c) Small heat capacity (d) Variable heat capacity

4. A steel meter scale is to be ruled so that millimeter intervals are accurate within about 5×10^{-5} *mm* at a certain temperature. The maximum temperature variation allowable during the ruling is (Coefficient of linear expansion of steel $= 10 \times 10^{-6} K^{-1}$)
(a) $2°C$ (b) $5°C$
(c) $7°C$ (d) $10°C$

5. During illness an 80 *kg* man ran a fever of $102.2°F$ instead of normal body temperature of $98.6°F$. Assuming that human body is mostly water, how much heat is required to raise his temperature by that amount
(a) 100 *kcal* (b) 160 *kcal*
(c) 50 *kcal* (d) 92 *kcal*

6. Two holes of unequal diameters d_1 and d_2 $(d_1 > d_2)$ are cut in a metal sheet. If the sheet is heated
(a) Both d_1 and d_2 will decrease
(b) Both d_1 and d_2 will increase
(c) d_1 will increase, d_2 will decrease
(d) d_1 will decrease, d_2 will increase



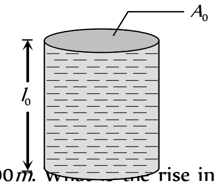
7. If earth suddenly stops rotating about its own axis, the increase in it's temperature will be
(a) $\frac{R^2\omega^2}{5Js}$ (b) $\frac{R^2\omega^2}{Js}$
(c) $\frac{Rm\omega^2}{5Js}$ (d) None of these

8. Latent heat of ice is 80 *cal/gm*. A man melts 60 *g* of ice by chewing in 1 *minute*. His power is
(a) 4800 W (b) 336 W
(c) 1.33 W (d) 0.75 W

9. A faulty thermometer has its lower fixed point marked as $-10°C$ and upper fixed point marked as 110° and upper fixed point marked as 110°. If the temperature of the body shown in this scale is 62°, the temperature shown on the Celsius scale is
(a) 72° C (b) 82° C
(c) 60° C (d) 42° C

10. If there are no heat losses, the heat released by the condensation of x *gm* of steam at $100°C$ into water at $100°C$ can be used to convert y *gm* of ice at $0°C$ into water at $100°C$. Then the ratio $y : x$ is nearly
(a) 1 : 1 (b) 2.5 : 1
(c) 2 : 1 (d) 3 : 1

11. The figure shows a glass tube (linear co-efficient of expansion is α) completely filled with a liquid of volume expansion co-efficient γ. On heating length of the liquid column does not change. Choose the correct relation between γ and α
(a) $\gamma = \alpha$
(b) $\gamma = 2\alpha$
(c) $\gamma = 3\alpha$ **[EAMCET 2001]**
(d) $\gamma = \frac{\alpha}{3}$



12. Water falls from a height 500 m. What is the rise in temperature of water at bottom if whole energy remains in the water
(a) $0.96°C$ (b) $1.02°C$
(c) $1.16°C$ (d) $0.23°C$

13. A steel ball of mass 0.1 *kg* falls freely from a height of 10 *m* and bounces to a height of 5.4 m from the ground. If the dissipated energy in this process is absorbed by the ball, the rise in its temperature is
(Specific heat of steel $= 460\ Joule - kg^{-1}°C^{-1}$, $g = 10\ ms^{-2}$)
[EAMCET (Med.) 2000]
(a) $0.01°C$ (b) $0.1°C$
(c) $1°C$ (d) $1.1°C$

14. 1 *gm* of ice at $0°C$ is mixed with 1 *gm* of water at $100°C$ the resulting temperature will be **[AIIMS 1994]**
(a) $5°C$ (b) $0°C$
(c) $10°C$ (d) ∞

15. The amount of heat required to change 1 *gm* ($0°C$) of ice into water of $100°C$, is **[RPMT 1999]**
(a) 716 *cal* (b) 500 *cal*
(c) 180 *cal* (d) 100 *cal*

AS Answers and Solutions

(SET -12)

1. (b) When salt crystals dissolves, crystal lattice is destroyed. The process requires a certain amount of energy (latent heat) which is taken from the water.

In vessel (B), a part of intermolecular bonds has already been destroyed in crushing the crystal. Hence less energy is require to dissolve the powder and the water will be at higher temperature.

2. (a) Fire is extinguished by the vaporisation do water which lowers the temperature of the burning body. Further, the water vapour envelops the body, keeping oxygen away. Hot water evaporates more than cold water as

3. (c) The thermometer has to attain the temperature of the body. To do this, it should draw as little heat from the body as possible, so that the existing temperature of the body is not disturbed.

4. (b) As we know $\alpha = \frac{\Delta L}{L_0 \Delta\theta} \Rightarrow \Delta\theta = \frac{\Delta L}{\alpha L_0} = \frac{5\times10^{-5}}{10\times10^{-6}\times1} = 5°C$

5. (b) Since $102.2°F \rightarrow 39°C$ and $98.6°F \rightarrow 39°C$

Hence ΔQ = m. s. ΔQ = 80 × 1000 × (39 − 37)

= 16 × 10^4 cal = 160 $kcal$.

6. (b) If the sheet is heated then both d_1 and d_2 will increase since the thermal expansion of isotropic solid is similar to true photographic enlargement.

7. (a) $W = JQ \Rightarrow \frac{1}{2} I\omega^2 = J(MS\Delta\theta) \Rightarrow \frac{1}{2}\left(\frac{2}{5}MR^2\right)\omega^2$

$= J(MS\Delta\theta) \Rightarrow \Delta\theta = \frac{R^2\omega^2}{5Js}$

8. (b) $W = JQ = J(mL) \Rightarrow P\times t = J(mL) \Rightarrow P = J\left(\frac{m}{t}\right)L$;

where $\frac{m}{t}$ = rate of melting of ice by chewing

$= \frac{60\,gm}{min} = \frac{1\,gm}{sec} \Rightarrow P$ = 4.2 × 1 × 80 = 336 W.

9. (c) $\frac{X-L}{U-L} = \frac{C}{100} \Rightarrow \frac{62-(10)}{110-(-10)} = \frac{C}{100}$ (C = 60°C)

***

10. (d) Heat released to convert x gm of steam at 100°C to water at 100°C is x × 540 $cals$.

If y gm of ice is converted from 0°C to water at 100°C it requires heat y × 80 + y × 1 × 100 = 180 y

$\therefore\; x\times540 = 180y$ or $\frac{y}{x} = \frac{540}{180} = \frac{3}{1}$

11. (b) When length of the liquid column remains constant, then the level of liquid moves down with respect to the container, thus γ must be less than 3α.

Now we can write $V = V_0(1+\gamma\Delta T)$

Since $V = Al = [A_0(1+2\alpha\Delta T)]l = V_0(1+2\alpha\Delta T)$

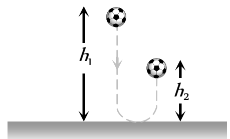
Hence $V_0(1+\gamma\Delta T) = V_0(1+2\alpha\Delta T) \Rightarrow \gamma = 2\alpha$.

12. (c) By using

$\Delta\theta = 0.0023h = 0.0023\times500 = 1.15°C \approx 1.16°C$

13. (b) According to energy conservation, change in potential energy of the ball, appears in the form of heat which raises the temperature of the ball.

i.e. $mg(h_1 - h_2) = m.c.\Delta\theta$

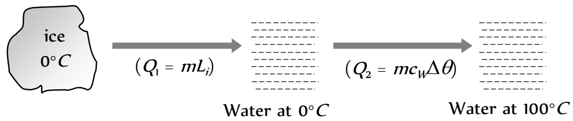


$\Rightarrow \Delta\theta = \frac{g(h_1-h_2)}{c}$

$= \frac{10(10-5.4)}{460} = 0.1°C$

14. (c) $\theta_{mix} = \frac{\theta_w - \frac{L_i}{C_W}}{2} = \frac{100-\frac{80}{1}}{2} = 10°C$

15. (c) Ice (0°C) converts into water (100°C) in following two steps.



Total heat required

$Q = Q_1 + Q_2 = 1\times80 + 1\times1\times(100-0) = 180\,cal$

Chapter 13
Kinetic Theory of Gases

Gas

In gases the intermolecular forces are very weak and its molecule may fly apart in all directions. So the gas is characterized by the following properties.

(i) It has no shape and size and can be obtained in a vessel of any shape or size.

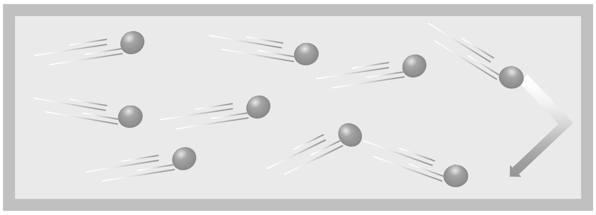
(ii) It expands indefinitely and uniformly to fill the available space.

(iii) It exerts pressure on its surroundings.

(iv) Intermolecular forces in a gas are minimum.

(v) They can easily compressed and expand.

Assumption of Ideal Gases (or Kinetic Theory of Gases)



Kinetic theory of gases relates the macroscopic properties of gases (such as pressure, temperature *etc.*) to the microscopic properties of the gas molecules (such as speed, momentum, kinetic energy of molecule *etc.*)

Actually it attempts to develop a model of the molecular behaviour which should result in the observed behaviour of an ideal gas. It is based on following assumptions :

(1) Every gas consists of extremely small particles known as molecules. The molecules of a given gas are all identical but are different than those of another gas.

(2) The molecules of a gas are identical, spherical, rigid and perfectly elastic point masses.

(3) Their size is negligible in comparison to intermolecular distance (10^{-9} *m*)

(4) The volume of molecules is negligible in comparison to the volume of gas. (The volume of molecules is only 0.014% of the volume of the gas).

(5) Molecules of a gas keep on moving randomly in all possible direction with all possible velocities.

(6) The speed of gas molecules lie between zero and infinity

(7) The gas molecules keep on colliding among themselves as well as with the walls of containing vessel. These collisions are perfectly elastic.

(8) The time spent in a collision between two molecules is negligible in comparison to time between two successive collisions.

(9) The number of collisions per unit volume in a gas remains constant.

(10) No attractive or repulsive force acts between gas molecules.

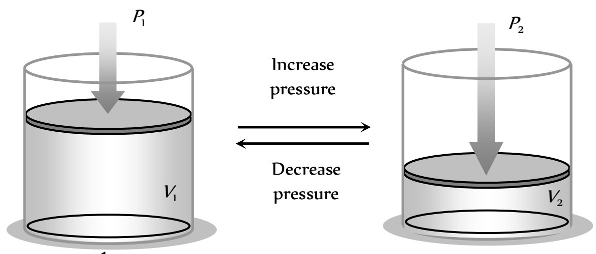
(11) Gravitational attraction among the molecules is ineffective due to extremely small masses and very high speed of molecules.

(12) Molecules constantly collide with the walls of container due to which their momentum changes. The change in momentum is transferred to the walls of the container. Consequently pressure is exerted by gas molecules on the walls of container.

(13) The density of gas is constant at all points of the container.

Gas Laws

(1) **Boyle's law :** For a given mass of an ideal gas at constant temperature, the volume of a gas is inversely proportional to its pressure.



i.e. $V \propto \frac{1}{P}$ or PV = constant $\Rightarrow P_1V_1 = P_2V_2$

Fig. 13.1

(i) $PV = P\left(\frac{m}{\rho}\right)$ = constant $\Rightarrow$ $\frac{P}{\rho}$ = constant or $\frac{P_1}{\rho_1} = \frac{P_2}{\rho_2}$

(As volume $= \frac{m}{\rho(\text{Density of the gas})}$ and m = constant)

(ii) $PV = P\left(\frac{N}{n}\right)$ = constant $\Rightarrow \frac{P}{n}$ = constant or $\frac{P_1}{n_1} = \frac{P_2}{n_2}$

(iii) As number of molecules per unit volume $n = \frac{N}{V}$

$\Rightarrow V = \frac{N}{n}$ also N = constant

(iv) Graphical representation : If m and T are constant

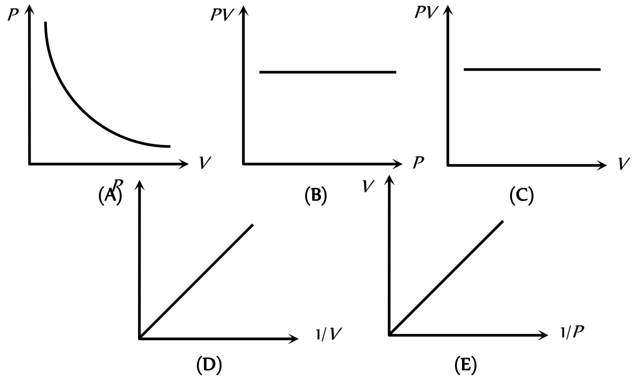


Fig. 13.2

(2) **Charle's law :** If the pressure remaining constant, the volume of the given mass of a gas is directly proportional to its absolute temperature.

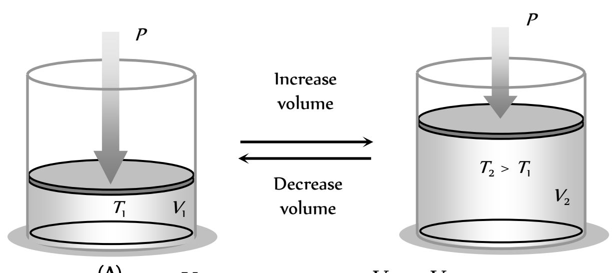

Fig. 13.3

i.e., $V \propto T$ $\Rightarrow \frac{V}{T}$ = constant $\Rightarrow \frac{V_1}{T_1} = \frac{V_2}{T_2}$

(i) $\frac{V}{T} = \frac{m}{\rho T}$ = constant (As volume $V = \frac{m}{\rho}$)

or ρT = constant $\Rightarrow \rho_1 T_1 = \rho_2 T_2$

(ii) If the pressure remains constant, the volume of the given mass of a gas increases or decreases by $\frac{1}{273.15}$ of its volume at 0°C for each 1°C rise or fall in temperature.

$$V_t = V_0\left(1 + \frac{1}{273.15}t\right).$$

This is Charle's law for centigrade scale.

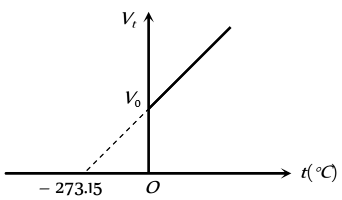

Fig. 13.4

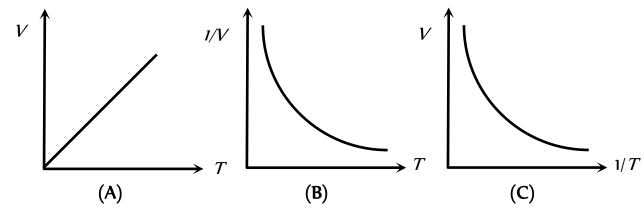
(v) Graphical representation: If m and P are constant



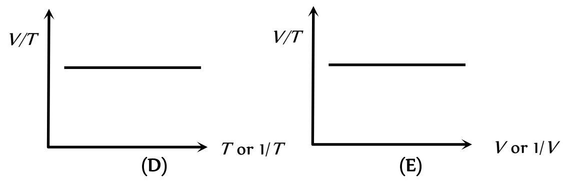


Fig. 13.5

(3) **Gay-Lussac's law or pressure law :** The volume remaining constant, the pressure of a given mass of a gas is directly proportional to its absolute temperature.

$P \propto T$ or $\frac{P}{T}$ = constant $\Rightarrow \frac{P_1}{T_1} = \frac{P_2}{T_2}$

(i) The volume remaining constant, the pressure of a given mass of a gas increases or decreases by $\frac{1}{273.15}$ of its pressure at 0°C for each 1°C rise or fall in temperature.

$$P_t = P_0\left[1 + \frac{1}{273.15}t\right]$$

This is pressure law for centigrade scale.

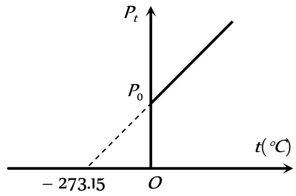

Fig. 13.5

(ii) **Graphical representation :** If m and V are constants

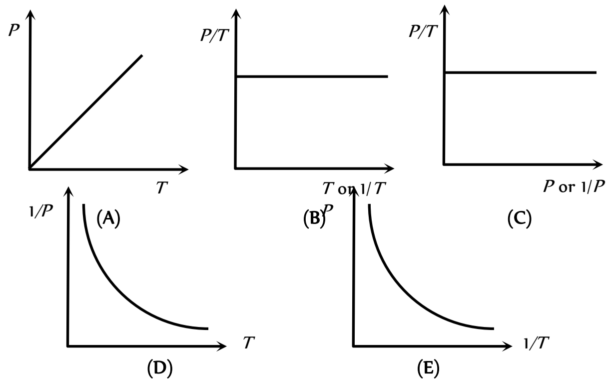

Fig. 13.6

(4) **Avogadro's law :** Equal volume of all the gases under similar conditions of temperature and pressure contain equal number of molecules *i.e.* $N_1 = N_2$.

(5) **Grahm's law of diffusion :** When two gases at the same pressure and temperature are allowed to diffuse into each other, the rate of diffusion of each gas is inversely proportional to the square root of the density of the gas *i.e.* $r \propto \frac{1}{\sqrt{\rho}} \propto \frac{1}{\sqrt{M}}$ (M is the molecular weight of the gas) $\Rightarrow$

$$\frac{r_1}{r_2} = \sqrt{\frac{\rho_2}{\rho_1}} = \sqrt{\frac{M_2}{M_1}}$$

If V is the volume of gas diffused in t *sec* then

$$r = \frac{V}{t} \Rightarrow \frac{r_1}{r_2} = \frac{V_1}{V_2} \times \frac{t_2}{t_1}$$

(6) **Dalton's law of partial pressure :** The total pressure exerted by a mixture of non-reacting gases occupying a vessel is equal to the sum of the

individual pressures which each gases exert if it alone occupied the same volume at a given temperature.

For n gases $P = P_1 + P_2 + P_3 + ... P_n$

where P = Pressure exerted by mixture and $P_1, P_2, P_3, ... P_n$ = Partial pressure of component gases.

Equation of State or Ideal Gas Equation

The equation which relates the pressure (P) volume (V) and temperature (T) of the given state of an ideal gas is known as ideal gas equation or equation of state.

For 1 mole of gas $\frac{PV}{T} = R$ (constant) $\Rightarrow PV = RT$

where R = universal gas constant.

Table 13.1 : Different forms of gas equation

Quantity of gas	Equation	Constant
1 mole gas	$PV = RT$	R = universal gas constant
μ mole gas	$PV = \mu RT$	
1 molecule of gas	$PV = \left(\frac{R}{N_A}\right)T = kT$	k = Boltzmann's constant
N molecules of gas	$PV = NkT$	
1 *gm* of gas	$PV = \left(\frac{R}{M}\right)T = rT$	r = Specific gas constant
m gm of gas	$PV = mrT$	

(1) **Universal gas constant (R) :** Universal gas constant signifies the work done by (or on) a gas per mole per kelvin.

$$R = \frac{PV}{\mu T} = \frac{\text{Pressure} \times \text{Volume}}{\mu \times \text{Temperature}} = \frac{\text{Work done}}{\mu \times \text{Temperature}}$$

(i) At S.T.P. the value of universal gas constant is same for all gases $R = 8.31 \frac{J}{mole \times kelvin} = 1.98 \frac{cal}{mole \times kelvin} \simeq 2 \frac{cal}{mol \times kelvin}$

$$= 0.8221 \frac{litre \times atm}{mole \times kelvin}.$$

(ii) Dimension : $[ML^2T^{-2}\theta^{-1}]$

(2) **Boltzman's constant (k) :** It is represented by per mole gas constant *i.e.,* $k = \frac{R}{N} = \frac{8.31}{6.023 \times 10^{23}} = 1.38 \times 10^{-23}\ J/K$

It's dimension : $[ML^2T^{-2}\theta^{-1}]$

(3) **Specific gas constant (r) :** It is represented by per gram gas constant *i.e.,* $r = \frac{R}{M}$. It's unit is $\frac{Joule}{gm \times kelvin}$ and dimension $[L^2T^{-2}\theta^{-1}]$

Since the value of M is different for different gases. Hence the value of r is different for different gases. *e.g.* It is maximum for hydrogen $r_{H_2} = \frac{R}{2}$

Real Gases

(1) The gases actually found in nature are called real gases.

(2) They do not obeys gas Laws.

(3) For exactly one mole of an ideal gas $\frac{PV}{RT} = 1$. Plotting the experimentally determined value of $\frac{PV}{RT}$ for exactly one mole of various real gases as a function of pressure P, shows a deviation from identity.

(4) The quantity $\frac{PV}{RT}$ is called the compressibility factor and should be unit for an ideal gas.

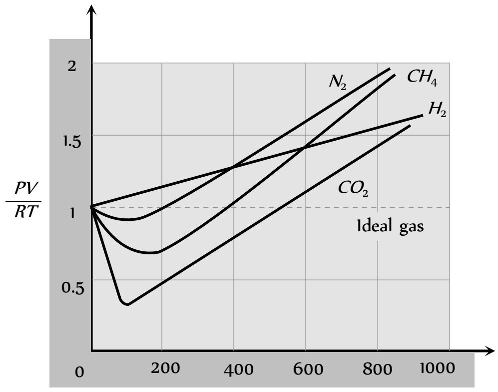

Fig. 13.7

(5) Deviation from ideal behaviour as a function of temperature

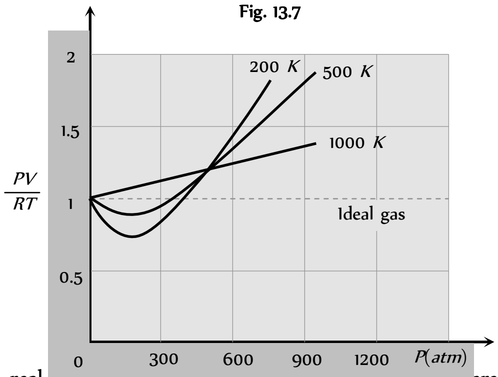

Fig. 13.8

(6) A real gas behaves as ideal gas most closely at low pressure and high temperature. Also can actual gas can be liquefied most easily which deviates most from ideal gas behaviour at low temperature and high pressure.

(7) **Equation of state for real gases :** It is given by Vander Waal's with two correction in ideal gas equation. The it know as Vander Waal's gas equation.

(i) **Volume correction :** Due to finite size of molecule, a certain portion of volume of a gas is covered by the molecules themselves. Therefore the space available for the free motion of molecules of gas will be slightly less than the volume V of a gas. Hence the effective volume becomes ($V - b$).

(ii) **Pressure correction :** Due to intermolecular force in real gases, molecule do not exert that force on the wall which they would have exerted in the absence of intermolecular force. Therefore the observed pressure P of the gas will be less than that present in the absence of intermolecular force. Hence the effective pressure becomes $\left(P + \frac{a}{V^2}\right)$.

(iii) **Vander Waal's gas equations**

For 1 *mole* of gas $\left(P + \frac{a}{V^2}\right)(V - b) = RT$

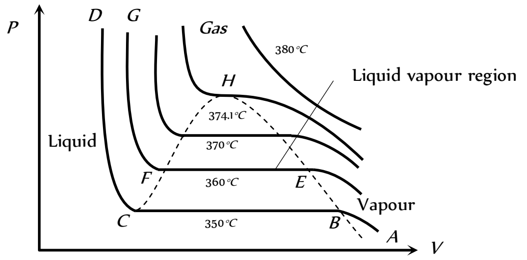
For μ *moles* of gas $\left(P+\frac{a\mu^2}{V^2}\right)(V-\mu b)=\mu RT$

Here a and b are constant called Vander Waal's constant.

Dimension : $[a]$ = $[ML^5T^{-2}]$ and $[b]$ = $[L]$

Units : $a = N \times m$ and $b = m$.

(8) **Andrews curves** : The pressure (P) versus volume (V) curves for actual gases are called Andrews curves.



Andrews curve for water

Fig. 13.9

(i) At 350°C, part AB represents vapour phase of water, in this part Boyle's law is obeyed $\left(P \propto \frac{1}{V}\right)$. Part BC represents the co-existence of vapour and liquid phases. At point C, vapours completely change to liquid phase. Part CD is parallel to pressure axis which shows that compressibility of the water is negligible.

(ii) At 360°C portion representing the co-existence of liquid vapour phase is shorter.

(iii) At 370°C this portion is further decreased.

(iv) At 374.1°C, it reduces to point (H) called critical point and the temperature 374.1°C is called critical temperature (T) of water.

(v) The phase of water (at 380°C) above the critical temperature is called gaseous phase.

(9) **Critical temperature, pressure and volume :** The point on the P-V curve at which the matter gets converted from gaseous state to liquid state is known as critical point. At this point the difference between the liquid and vapour vanishes *i.e.* the densities of liquid and vapour become equal.

(i) **Critical temperature (T_c) :** The maximum temperature below which a gas can be liquefied by pressure alone is called critical temperature and is characteristic of the gas. A gas cannot be liquefied if its temperature is more than critical temperature.

CO_2 (31.1°C), O_2(–118°C), N_2 (–147.1°C) and H_2O (374.1°C)

(ii) **Critical pressure (P_c) :** The minimum pressure necessary to liquify a gas at critical temperature is defined as critical pressure CO_2 (73.87 *bar*) and O_2 (49.7*atm*)

(iii) **Critical volume (V_c) :** The volume of 1 mole of gas at critical pressure and critical temperature is defined as critical volume CO_2 (95 ×10 *m*)

(iv) **Relation between Vander Waal's constants and T_c, P_c, V_c**

$$T_c=\frac{8a}{27Rb},\ P_c=\frac{a}{27b^2},\ V_c=3b,$$

$$a=\frac{27R^2}{64}\frac{T_c^2}{P_c},\ b=\frac{R}{8}\left(\frac{T_c}{P_c}\right) \text{ and } \frac{P_cV_c}{T_c}=\frac{3}{8}R$$

Pressure of an Ideal Gas

Consider an ideal gas (consisting of N molecules each of mass m) enclosed in a cubical box of side L.

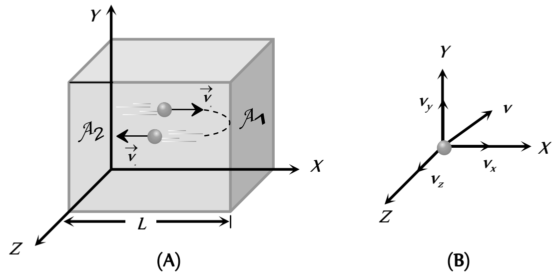


Fig. 13.10

(1) **Instantaneous velocity :** Any molecule of gas moves with velocity $\vec{v}$ in any direction

where $\vec{v}=v_x\hat{i}+v_y\hat{j}+v_z\hat{k} \Rightarrow v=\sqrt{v_x^2+v_y^2+v_z^2}$. Due to random motion of molecule $v_x=v_y=v_z \Rightarrow v^2=3v_x^2=3v_y^2=3v_z^2$

(2) **Time during collision :** Time between two successive collision with the wall A_1.

$$\Delta t=\frac{\text{Distance travelled by molecule between two successive collision}}{\text{Velocity of molecule}}$$

$$=\frac{2L}{v_x}$$

(3) **Collision frequency (n) :** It means the number of collision per second. Hence $n=\frac{1}{\Delta t}=\frac{v_x}{2L}$

(4) **Change in momentum :** This molecule collides with the shaded wall (A_1) with velocity v_x and rebounds with velocity $-v_x$.

The change in momentum of the molecule

$$\Delta p=(-mv_x)-(mv_x)=-2mv_x$$

As the momentum remains conserved in a collision, the change in momentum of the wall A_1 is $\Delta p=2mv_x$

After rebound this molecule travel toward opposite wall A_2 with velocity $-v_x$, collide to it and again rebound with velocity v_x towards wall A_1.

(5) **Force on wall :** Force exerted by a single molecule on shaded wall is equal to rate at which the momentum is transferred to the wall by this molecule.

i.e. $F_{\text{Single molecule}}=\frac{\Delta p}{\Delta t}=\frac{2mv_x}{(2L/v_x)}=\frac{mv_x^2}{L}$

The total force on the wall A_1 due to all the molecules

$$F_x=\frac{m}{L}\sum v_x^2=\frac{m}{M}(v_{x_1}^2+v_{x_2}^2+v_{x_3}^2+...)=\frac{mN}{L}\overline{v_x^2}$$

$\overline{v_x^2}$ = mean square of x component of the velocity.

(6) **Pressure :** Now pressure is defined as force per unit area, hence pressure on shaded wall $P_x=\frac{F_x}{A}=\frac{mN}{AL}\overline{v_x^2}=\frac{mN}{V}\overline{v_x^2}$

For any molecule, the mean square velocity $\overline{v^2}=\overline{v_x^2}+\overline{v_y^2}+\overline{v_z^2}$; by symmetry $\overline{v_x^2}=\overline{v_y^2}=\overline{v_z^2} \Rightarrow \overline{v_x^2}=\overline{v_y^2}=\overline{v_z^2}=\frac{\overline{v^2}}{3}$

Total pressure inside the container

$$P=\frac{1}{3}\frac{mN}{V}\overline{v^2}=\frac{1}{3}\frac{mN}{V}v_{rms}^2 \qquad \text{(where } v_{rms}=\sqrt{\overline{v^2}}\text{)}$$

(7) **Relation between pressure and kinetic energy :** As we know $P=\frac{1}{3}\frac{mN}{V}v_{rms}^2=\frac{1}{3}\frac{M}{V}v_{rms}^2 \Rightarrow P=\frac{1}{3}\rho v_{rms}^2$ ... (i)

[As $M = mN$ = Total mass of the gas and $\rho=\frac{M}{V}$]

$\therefore$ K.E. per unit volume $E=\frac{1}{2}\left(\frac{M}{V}\right)v_{rms}^2=\frac{1}{2}\rho v_{rms}^2$ ...(ii)

From (i) and (ii), we get $P=\frac{2}{3}E$

i.e. the pressure exerted by an ideal gas is numerically equal to the two third of the mean kinetic energy of translation per unit volume of the gas.

(8) **Effect of mass, volume and temperature on pressure :** $P=\frac{1}{3}\frac{mN}{V}v_{rms}^2$ or $P\propto\frac{(mN)T}{V}$ [As $v_{rms}^2\propto T$]

(i) If volume and temperature of a gas are constant $P\propto mN$ *i.e.* Pressure $\propto$ (Mass of gas).

i.e. if mass of gas is increased, number of molecules and hence number of collision per second increases *i.e.* pressure will increase.

(ii) If mass and temperature of a gas are constant. $P\propto(1/V)$, *i.e.*, if volume decreases, number of collisions per second will increase due to lesser effective distance between the walls resulting in greater pressure.

(iii) If mass and volume of gas are constant, $P\propto(v_{rms})^2\propto T$

i.e., if temperature increases, the mean square speed of gas molecules will increase and as gas molecules are moving faster, they will collide with the walls more often with greater momentum resulting in greater pressure.

Various Speeds of Gas Molecules

The motion of molecules in a gas is characterised by any of the following three speeds.

(1) **Root mean square speed :** It is defined as the square root of mean of squares of the speed of different molecules

i.e. $v_{rms}=\sqrt{\frac{v_1^2+v_2^2+v_3^2+v_4^2+....}{N}}=\sqrt{\overline{v^2}}$

(i) From the expression of pressure $P=\frac{1}{3}\rho v_{rms}^2$

$\Rightarrow v_{rms}=\sqrt{\frac{3P}{\rho}}=\sqrt{\frac{3PV}{\text{Mass of gas}}}=\sqrt{\frac{3RT}{M}}=\sqrt{\frac{3kT}{m}}$

where $\rho=\frac{\text{Mass of gas}}{V}$ = Density of the gas, $M=\mu\times$ (mass of gas), $pV=\mu RT$, $R=kN_A$, $k=$ Boltzmann's constant,

$m=\frac{M}{N_A}$ = mass of each molecule.

(ii) With rise in temperature *rms* speed of gas molecules increases as $v_{rms}\propto\sqrt{T}$.

(iii) With increase in molecular weight *rms* speed of gas molecule decreases as $v_{rms}\propto\frac{1}{\sqrt{M}}$. *e.g.*, *rms* speed of hydrogen molecules is four times that of oxygen molecules at the same temperature.

(iv) *rms* speed of gas molecules is of the order of *km/s* *e.g.*, at NTP for hydrogen gas

$(v_{rms})=\sqrt{\frac{3RT}{M}}=\sqrt{\frac{3\times8.31\times273}{2\times10^3}}=1840\ m/s$.

(v) *rms* speed of gas molecules is $\sqrt{\frac{3}{\gamma}}$ times that of speed of sound in gas, as $v_{rms}=\sqrt{\frac{3RT}{M}}$ and $v_s=\sqrt{\frac{\gamma RT}{M}} \Rightarrow v_{rms}=\sqrt{\frac{3}{\gamma}}v_s$

(vi) *rms* speed of gas molecules does not depends on the pressure of gas (if temperature remains constant) because $P\propto\rho$ (Boyle's law) if pressure is increased *n* times then density will also increases by *n* times but v_{rms} remains constant.

(vii) Moon has no atmosphere because v_{rms} of gas molecules is more than escape velocity (v_e).

A planet or satellite will have atmosphere only if $v_{rms}<v_e$

(viii) At $T=0$; $v_{rms}=0$ *i.e.* the *rms* speed of molecules of a gas is zero at 0 *K*. This temperature is called absolute zero.

(2) **Most probable speed :** The particles of a gas have a range of speeds. This is defined as the speed which is possessed by maximum fraction of total number of molecules of the gas. *e.g.*, if speeds of 10 molecules of a gas are 1, 2, 2, 3, 3, 3, 4, 5, 6, 6 *km/s*, then the most probable speed is 3 *km/s*, as maximum fraction of total molecules possess this speed.

Most probable speed $v_{mp}=\sqrt{\frac{2P}{\rho}}=\sqrt{\frac{2RT}{M}}=\sqrt{\frac{2kT}{m}}$

(3) **Average speed :** It is the arithmetic mean of the speeds of molecules in a gas at given temperature.

$$v_{av}=\frac{v_1+v_2+v_3+v_4+.....}{N}$$

and according to kinetic theory of gases

Average speed $v_{av}=\sqrt{\frac{8P}{\pi\rho}}=\sqrt{\frac{8}{\pi}\frac{RT}{M}}=\sqrt{\frac{8}{\pi}\frac{kT}{m}}$

Maxwell's Law (or the Distribution of Molecular Speeds

(1) The v_{rms} gives us a general idea of molecular speeds in a gas at a given temperature. This doesn't mean that the speed of each molecule is v_{rms}. Many of the molecules have speed less than v_{rms} and many have speeds greater than v_{rms}.

(2) Maxwell derived as equation given the distribution of molecules in different speed as follow

$$dN=4\pi N\left(\frac{m}{2\pi kT}\right)^{3/2}v^2e^{-\frac{mv^2}{2kT}}dv$$

where dN = Number of molecules with speeds between v and $v+dv$.

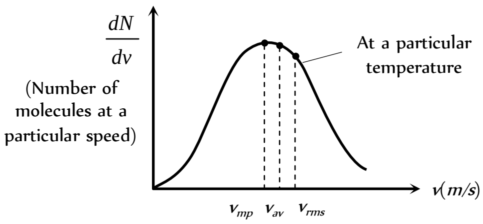

Fig. 13.11

(3) Graph between $\frac{dN}{dv}$ (number of molecules at a particular speed) and v (speed of these molecules). From the graph it is seen that $\frac{dN}{dv}$ is maximum at most probable speed.

This graph also represent that $v_{rms} > v_{av} > v_{mp}$

(Order remember trick RAM)

$$\Rightarrow \sqrt{\frac{3RT}{M}} > \sqrt{\frac{8RT}{\pi M}} > \sqrt{\frac{2RT}{M}} \Rightarrow$$

$$1.77\sqrt{\frac{RT}{M}} > 1.6\sqrt{\frac{RT}{M}} > 1.41\sqrt{\frac{RT}{M}}$$

Area bonded by this curve with speed axis represents the number of molecules corresponds to that velocity range. This curve is asymmetric curve.

Effect of temperature on velocity distribution : With temperature rise the $\frac{dN}{dv}$ vs v. Curve shift towards right and becomes broader.

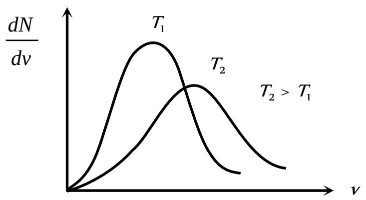

Fig. 13.12

(Because with temperature rise average molecular speed increases).

Mean Free Path

(1) The distance travelled by a gas molecule between two successive collisions is known as free path.

$$\lambda = \frac{\text{Total distance travelled by a gas molecule between successive collisions}}{\text{Total number of collisions}}$$

During two successive collisions, a molecule of a gas moves in a straight line with constant velocity and

Let $\lambda_1, \lambda_2, \lambda_3.....$ be the distance travelled by a gas molecule during n collisions respectively, then the mean free path of a gas molecule is given by

$$\lambda = \frac{\lambda_1 + \lambda_2 + \lambda_3 + ... + \lambda_n}{n}$$

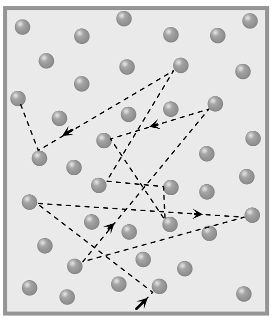

Fig. 13.13

(2) $\lambda = \frac{1}{\sqrt{2}\pi n d^2}$

where d = Diameter of the molecule,

n = Number of molecules per unit volume

(3) As $PV = \mu RT = \mu NkT \Rightarrow \frac{N}{V} = \frac{P}{kT} = n =$ Number of molecule per unit volume so $\lambda = \frac{1}{\sqrt{2}} \frac{kT}{\pi d^2 P}$.

(4) From $\lambda = \frac{1}{\sqrt{2}\pi n d^2} = \frac{m}{\sqrt{2}\pi (mn) d^2} = \frac{m}{\sqrt{2}\pi d^2 \rho}$

[As m = Mass each molecule, mn = Mass per unit volume = Density = ρ]

(5) If average speed of molecule is v then $\lambda = v \times \frac{t}{N} = v \times T$

[As N = Number of collision in time t, T = time interval between two collisions].

(i) As $\lambda \propto \frac{1}{\rho}$ and $\lambda \propto m$ *i.e.* the mean free path is inversely proportional to the density of a gas and directly proportional to the mass of each molecule.

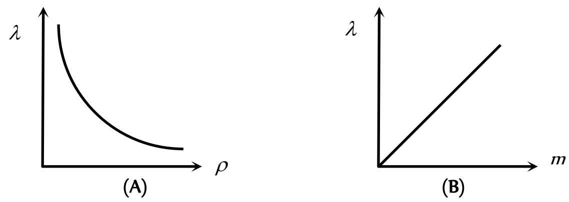

Fig. 13.14

(ii) As $\lambda = \frac{1}{\sqrt{2}} \frac{kT}{\pi d^2 P}$. For constant volume and hence constant number density n of gas molecules, $\frac{P}{T}$ is constant so that λ will not depend on P and T. But if volume of given mass of a gas is allowed to change with P or T then $\lambda \propto T$ at constant pressure and $\lambda \propto \frac{1}{P}$ at constant temperature.

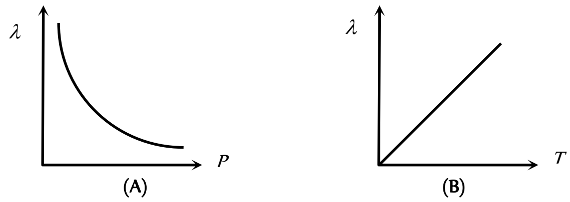

Fig. 13.15

Degree of Freedom

The term degree of freedom of a system refers to the possible independent motions, systems can have. or

The total number of independent modes (ways) in which a system can possess energy is called the degree of freedom (f).

The independent motions can be translational, rotational or vibrational or any combination of these.

So the degree of freedom are of three types :

(i) Translational degree of freedom

(ii) Rotational degree of freedom

(iii) Vibrational degree of freedom

General expression for degree of freedom

$f = 3A - B$; where A = Number of independent particles,

B = Number of independent restriction

(1) **Monoatomic gas :** Molecule of monoatomic gas can move in any direction in space so it can have three independent motions and hence 3 degrees of freedom (all translational)

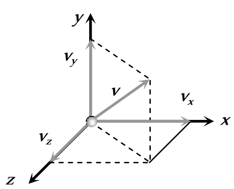

Fig. 13.16

(2) **Diatomic gas :** Molecules of diatomic gas are made up of two atoms joined rigidly to one another through a bond. This cannot only move bodily, but also rotate about one of the three co-ordinate axes. However its moment of inertia about the axis joining the two atoms is negligible compared to that about the other two axes.

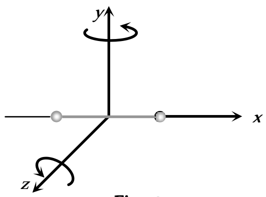

Fig. 13.17

Hence it can have only two rotational motion. Thus a diatomic molecule has 5 degree of freedom : 3 translational and 2 rotational.

(3) **Triatomic gas (Non-linear) :** A non-linear molecule can rotate about any of three co-ordinate axes. Hence it has 6 degrees of freedom : 3 translational and 3 rotational.

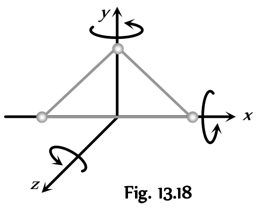

Fig. 13.18

Table 13.2 ; Degree of freedom for different gases

Atomicity of gas	Example	A	*B*	*f* = 3 *A* – *B*	Figure
Monoatomic	*He, Ne, Ar*	1	0	*f* = 3	Diatomic	H_2, O_2, N_2, Cl_2 *etc.*	2	1	*f* = 5	Triatomic non linear	H_2O	3	3	*f* = 6	Triatomic linear	CO_2, $BeCl_2$	3	2	*f* = 7	
The above degrees of freedom are shown at room temperature. Further at high temperature, in case of diatomic or polyatomic molecules, the atoms with in the molecule may also vibrate with respect to each other. In such cases, the molecule will have an additional degrees of freedom, due to vibrational motion.

An object which vibrates in one dimension has two additional degree of freedom. One for the potential energy and one for the kinetic energy of vibration.

A diatomic molecule that is free to vibrate (in addition to translation and rotation) will have $7\,(2+3+2)$ degrees of freedom.

Kinetic Energy of Ideal Gas

In ideal gases, the molecules are considered as point particles. For point particles, there is no internal excitation, no vibration and no rotation. The point particles can have only translational motion and thus only translational energy. For an ideal gas the internal energy can only be tranlational kinetic energy.

Hence kinetic energy (or internal energy) of 1 mole ideal gas

$$E = \frac{1}{2}Mv_{rms}^2 = \frac{1}{2}M \times \frac{3RT}{M} = \frac{3}{2}RT$$

Table 13.3 : Various Translational kinetic energies

Quantity of gas	Kinetic energy
1 mole gas	$\frac{3}{2}RT$; R = Universal gas constant
μ mole gas	$\frac{3}{2}\mu RT$
1 molecule	$\frac{3}{2}kT$; k = Boltzmann's constant
N molecule	$\frac{3}{2}NkT$
1 *gm* gas	$\frac{3}{2}rT$; r = Specific gas constant
m gm gas	$\frac{3}{2}mrT$

(1) Kinetic energy per molecule of gas does not depends upon the mass of the molecule but only depends upon the temperature of the gas. As $E = \frac{3}{2}kT$ or $E \propto T$ *i.e.* molecules of different gases say *He*, H_2 and O_2 *etc.* at same temperature will have same translational kinetic energy though their *r.m.s.* speed are different.

(2) For two gases at the same temperature $m_1(v_{rms})_1^2 = m_2(v_{rms})_2^2$

(3) Kinetic energy per mole of gas depends only upon the temperature of gas.

(4) Kinetic energy per *gram* of gas depend upon the temperature as well as molecular weight (or mass of one molecule) of the gas. $E_{gram} = \frac{3}{2}\frac{k}{m}T \Rightarrow E_{gram} \propto \frac{T}{m}$

(5) From the above expressions it is clear that higher the temperature of the gas, more will be the average kinetic energy possessed by the gas molecules at *T* = 0, *E* = 0 *i.e.* at absolute zero the molecular motion stops.

Law of Equipartition of Energy

According to this law, for any system in thermal equilibrium, the total energy is equally distributed among its various degree of freedom. And each degree of freedom is associated with energy $\frac{1}{2}kT$ (where $k = 1.38 \times 10^{-23}\ J/K$, *T* = absolute temperature of the system).

(1) At a given temperature *T*, all ideal gas molecules no matter what their mass have the same average translational kinetic energy; namely, $\frac{3}{2}kT$. When measure the temperature of a gas, we are also measuring the average translational kinetic energy of it' s molecules.

(2) At same temperature gases with different degrees of freedom (*e.g.*, *He* and H_2) will have different average energy or internal energy namely $\frac{f}{2}kT$. (*f* is different for different gases)

(3) Different energies of a system of degree of freedom *f* are as follows

(i) Total energy associated with each molecule = $\frac{f}{2}kT$

(ii) Total energy associated with *N* molecules = $\frac{f}{2}NkT$

(iii) Total energy associated with μ mole = $\frac{f}{2}RT$

(iv) Total energy associated with μ molen = $\frac{f}{2}\mu RT$

(v) Total energy associated with each gram = $\frac{f}{2}rT$

(iv) Total energy associated with m gram = $\frac{f}{2}mrT$

Specific Heat (C_P and C_V) of a Gas

The specific heat of gas can have many values, but out of them following two values are very important

(1) **Specific heat at constant volume (c_V) :** The specific heat of a gas at constant volume is defined as the quantity of heat required to raise the temperature of unit mass of gas through 1°C or 1 K when its volume is kept constant, *i.e.*, $c_V = \frac{(\Delta Q)_V}{m\Delta T}$

If instead of unit mass, 1 mole of gas is considered, the specific heat is called molar specific heat at constant volume and is represented by capital C_V.

$$C_V = Mc_V = \frac{M(\Delta Q)_V}{m\Delta T} = \frac{1}{\mu}\frac{(\Delta Q)_V}{\Delta T} \qquad \left[\text{As}\,\mu = \frac{m}{M}\right]$$

(2) **Specific heat at constant from (c_P) :** The specific heat of a gas at constant pressure is defined as the quantity of heat required to raise the temperature of unit mass of gas through 1 K when its pressure is kept constant, *i.e.*, $c_P = \frac{(\Delta Q)_p}{m\Delta T}$

If instead of unit mass, 1 mole of gas is considered, the specific heat is called molar specific heat at constant pressure and is represented by C_P.

$$C_p = MC_p = \frac{M(\Delta Q)_p}{m\Delta T} = \frac{1}{\mu}\frac{(\Delta Q)_p}{\Delta T} \qquad \left[\text{As}\,\mu = \frac{m}{M}\right]$$

Mayer's Formula

(1) Out of two principle specific heats of a gas, C_P is more than C_V because in case of C_V volume of gas is kept constant and heat is required only for raising the temperature of one gram mole of the gas through 1°C or 1 K. Hence no heat, what so ever, is spent in expansion of the gas.

It means that heat supplied to the gas increases its internal energy only *i.e.* $(\Delta Q)_V = \Delta U = \mu C_V \Delta T$ .....(i)

(2) While in case of C_P the heat is used in two ways

(i) In increasing the temperature of the gas by ΔT

(ii) In doing work, due to expansion at constant pressure (ΔW)

So $(\Delta Q)_P = \Delta U + \Delta W = \mu C_P \Delta T$ .....(ii)

From equation (i) and (ii) $\mu C_P \Delta T - \mu C_V \Delta T = \Delta W$

$$\Rightarrow \quad \mu \Delta T(C_P - C_V) = P\Delta V \Rightarrow \quad C_P - C_V = \frac{P\Delta V}{\mu \Delta T} = R$$

[For constant pressure, $\Delta W = P\Delta V$ also from $PV = \mu RT$, $P\Delta V = \mu R\Delta T$]

This relation is called Mayer's formula and shows that $C_P > C_V$ *i.e.* molar specific heat at constant pressure is greater than that at constant volume.

Specific Heat in Terms of Degree of Freedom

(1) C_V **:** For a gas at temperature T, the internal energy $U = \frac{f}{2}\mu RT \Rightarrow$ Change in energy $\Delta U = \frac{f}{2}\mu R\Delta T$ ... (i)

Also, as we know for any gas heat supplied at constant volume $(\Delta Q)_V = \mu C_V \Delta T = \Delta U$ ... (ii)

From equation (i) and (ii) $C_V = \frac{1}{2}fR$

(2) C_P **:** From the Mayer's formula $C_p - C_v = R$

$$\Rightarrow \quad C_P = C_V + R = \frac{f}{2}R + R = \left(\frac{f}{2} + 1\right)R$$

(3) **Ratio of C_P and C_V (γ) :** $\gamma = \frac{C_P}{C_V} = \frac{\left(\frac{f}{2}+1\right)R}{\frac{f}{2}R} = 1 + \frac{2}{f}$

(i) Value of γ is different for monoatomic, diatomic and triatomic gases. $\gamma_{mono} = \frac{5}{3} = 1.6, \gamma_{di} = \frac{7}{5} = 1.4, \gamma_{tri} = \frac{4}{3} = 1.33$

(ii) Value of γ is always more than 1. So we can say that always $C_P > C_V$.

Gaseous Mixture

If two non-reactive gases are enclosed in a vessel of volume V. In the mixture μ_1 moles of one gas are mixed with μ_2 moles of another gas. If N_A is Avogadro's number then

Number of molecules of first gas $N_1 = \mu_1 N_A$

and number of molecules of second gas $N_2 = \mu_2 N_A$

(1) Total mole fraction $\mu = (\mu_1 + \mu_2)$.

(2) If M_1 is the molecular weight of first gas and M_2 that of second gas.

Then molecular weight of mixture $M = \frac{\mu_1 M_1 + \mu_2 M_2}{\mu_1 + \mu_2}$

(3) Specific heat of the mixture at constant volume will be

$$C_{V_{mix}} = \frac{\mu_1 C_{V_1} + \mu_2 C_{V_2}}{\mu_1 + \mu_2} = \frac{\frac{m_1}{M_1}C_{V_1} + \frac{m_2}{M_2}C_{V_2}}{\frac{m_1}{M_1} + \frac{m_2}{M_2}}$$

(4) Specific heat of the mixture at constant pressure will be

$$C_{P_{mix}} = \frac{\mu_1 C_{P_1} + \mu_2 C_{P_2}}{\mu_1 + \mu_2} = \frac{\mu_1\left(\frac{\gamma_1}{\gamma_1 - 1}\right)R + \mu_2\left(\frac{\gamma_2}{\gamma_2 - 1}\right)R}{\mu_1 + \mu_2}$$

$$= \frac{R}{\mu_1 + \mu_2}\left[\mu_1\left(\frac{\gamma_1}{\gamma_1 - 1}\right) + \mu_2\left(\frac{\gamma_2}{\gamma_2 - 1}\right)\right]$$

$$= \frac{R}{\frac{m_1}{M_1} + \frac{m_2}{M_2}}\left[\frac{m_1}{M_1}\left(\frac{\gamma_1}{\gamma_1 - 1}\right) + \frac{m_2}{M_2}\left(\frac{\gamma_2}{\gamma_2 - 1}\right)\right]$$

(5) $$\gamma_{\text{mixture}} = \frac{C_{P_{mix}}}{C_{V_{mix}}} = \frac{\frac{(\mu_1 C_{P_1} + \mu_2 C_{P_2})}{\mu_1 + \mu_2}}{\frac{(\mu_1 C_{V_1} + \mu_2 C_{V_2})}{\mu_1 + \mu_2}}$$

$$= \frac{\mu_1 C_{P_1} + \mu_2 C_{P_2}}{\mu_1 C_{V_1} + \mu_2 C_{V_2}} = \frac{\left\{\mu_1\left(\frac{\gamma_1}{\gamma_1 - 1}\right)R + \mu_2\left(\frac{\gamma_2}{\gamma_2 - 1}\right)R\right\}}{\left\{\mu_1\left(\frac{R}{\gamma_1 - 1}\right) + \mu_2\left(\frac{R}{\gamma_2 - 1}\right)\right\}}$$

$$\therefore\ \gamma_{\text{mixture}} = \frac{\frac{\mu_1\gamma_1}{\gamma_1 - 1} + \frac{\mu_2\gamma_2}{\gamma_2 - 1}}{\frac{\mu_1}{\gamma_1 - 1} + \frac{\mu_2}{\gamma_2 - 1}} = \frac{\mu_1\gamma_1(\gamma_2 - 1) + \mu_2\gamma_2(\gamma_1 - 1)}{\mu_1(\gamma_2 - 1) + \mu_2(\gamma_1 - 1)}$$

Tips & Tricks

✍ The cooking gas cylinder contains L.P.G. (Liquid Petroleum gas) which is saturated. And as pressure of saturated vapours is independent of volume (at constant temperature). the pressure of gas coming out of the cylinder remains constant till the cylinder becomes empty.

✍ If the number of molecules in a gas increases, then the temperature, kinetic energy and pressure of the gas increases because $P \propto n$, $T \propto n$ and kinetic energy $\propto T \propto n$.

✍ At constant volume if T increases then $\overline{v}$, v_{rms}, P and collision frequency increases.

✍ If two gases are filled in vessel then nothing can be predicted about the pressure of gases. However their mean molecular energies will be same but their *rms* velocities will be different.

✍ The average distance between two gas molecules at NTP is 10^{-9} *m*.

✍ The space available for a single gas molecule at NTP is 37.2×10^{-2} *m*.

✍ The molecules of gases will escape out from a planet if the temperature of planet $T \le \frac{Mv_e^2}{3R}$; where v_e = escape velocity from the planet, R = universal, gas constant and M = Molecular mass of the gas.

✍ As f (degree of freedom) increases then $C_p\uparrow$, $C_v\uparrow$ and $\gamma\uparrow$.

✍ The number of molecules present in 1 *gm mole* of a gas is defined as Avogadro number (N).

$$N_A = 6.023\times10^{23} \text{ per } gm\ mole = 6.023\times10^{26} \text{ per } kg\ mole.$$

At S.T.P. or N.T.P. (T = 273 *K* and P = 1 *atm*) 22.4 *litre* of each gas has 6.023×10^{23} molecule

✍ One mole of any gas at S.T.P. occupy 22.4 *litre* of volume

e.g. 32 *gm* oxygen, 28 *gm* nitrogen and 2*gm* hydrogen occupy the same volume at S.T.P.

✍ For any gas 1 *mole* = *M gram* = 22.4 *litre* = 6.023×10^{23} molecule.

✍ $v_{rms} : v_{av} : v_{mp} = \sqrt{3} : \sqrt{\frac{8}{\pi}} : \sqrt{2} = \sqrt{3} : \sqrt{2.5} : \sqrt{2}$

✍ For oxygen gas molecules v_{rms} = 461 *m/s*, v_{av} = 424.7 *m/s* and v_{rms} = 376.4 *m/s*

✍ An atom in a solid though has no degree of freedom for translational and rotational motion, due to vibration along 3 axes has 3 × 2 = 6 degrees of freedom (and not like an ideal gas molecule). When a diatomic or polyatomic gas dissociates into atoms it behaves as monoatomic gas whose degree of freedom are changed accordingly

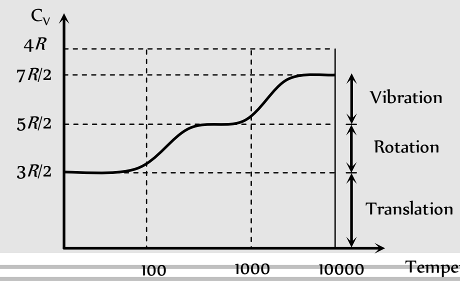
✍ In General a polyatmic molecule has 3 translational, 3 rotational degree of freedom and a certain number of vibration mode f_{vib}. Hence $\gamma_{poly} = \frac{4 + f_{vib}}{3 + f_{vib}}$.

✍ Only average translational kinetic energy of a gas contributes to its temperature. Two gases with the same average translational kinetic energy have the same temperature even if one has grater rotational energy and thus greater internal energy.

✍ Unsaturated vapours obey gas laws while saturated vapours don't.

✍ For real gases effective volume is considered as $(V - \mu b)$ where $b = 4N_A\left(\frac{4}{3}\pi r^3\right)$; r = radius of each molecule and N_A = avogrado number.

✍ Variation of degree of freedom of a diatomic gas (H) with temperature. At very low temperature only translation is possible. as the temperature increases rotational motion can begin. At still higher temperatures vibratory motion can begin.



Ordinary Thinking

Objective Questions

Gas Laws

1. The temperature of a gas at pressure P and volume V is 27°*C*. Keeping its volume constant if its temperature is raised to 927°*C*, then its pressure will be [MP PMT 1985]
   (a) 2 *P* (b) 3 *P*
   (c) 4 *P* (d) 6 *P*

2. 4 moles of an ideal gas is at 0°*C*. At constant pressure it is heated to double its volume, then its final temperature will be
   (a) 0°*C* (b) 273°*C*
   (c) 546°*C* (d) 136.5°*C*

3. Every gas (real gas) behaves as an ideal gas
   [CPMT 1997; RPMT 2000; MP PET 2001]

(a) At high temperature and low pressure
(b) At low temperature and high pressure
(c) At normal temperature and pressure
(d) None of the above

4. Boyle's law holds for an ideal gas during [AFMC 1994; KCET 1999]
(a) Isobaric changes (b) Isothermal changes
(c) Isochoric changes (d) Isotonic changes

5. S.I. unit of universal gas constant is [MNR 1988; MP PMT 1994; UPSEAT 1999]
(a) $cal/°C$ (b) J/mol
(c) $J\,mol^{-1}\,K^{-1}$ (d) J/kg

6. Molecules of a gas behave like [J & K CET 2000]
(a) Inelastic rigid sphere
(b) Perfectly elastic non-rigid sphere
(c) Perfectly elastic rigid sphere
(d) Inelastic non-rigid sphere

Ordinary Thinking

Objective Questions

Communication

1. In short wave communication waves of which of the following frequencies will be reflected back by the ionospheric layer, having electron density 10^{11} per m

[AIIMS 2003]

(a) 2 *MHz* (b) 10 *MHz*

(c) 12 *MHz* (d) 18 *MHz*

2. In an amplitude modulated wave for audio frequency of 500 *cycle/second*, the appropriate carrier frequency will be

[AMU 1996]

(a) 50 *cycles/sec* (b) 100 *cycles/sec*

(c) 500 *cycles/sec* (d) 50,000 *cycles/sec*

3. AM is used for broadcasting because

(a) It is more noise immune than other modulation systems

(b) It requires less transmitting power compared with other systems

(c) Its use avoids receiver complexity

(d) No other modulation system can provide the necessary bandwidth faithful transmission

4. Range of frequencies allotted for commercial FM radio broadcast is

(a) 88 to 108 *MHz* (b) 88 to 108 *kHz*

(c) 8 to 88 *MHz* (d) 88 to 108 *GHz*

5. The velocity factor of a transmission line *x*. If dielectric constant of the medium is 2.6, the value of *x* is

[AFMC 1995]

(a) 0.26 (b) 0.62

(c) 2.6 (d) 6.2

6. The process of superimposing signal frequency (*i.e.* audio wave) on the carrier wave is known as [AIIMS 1987]

(a) Transmission (b) Reception

(c) Modulation (d) Detection

7. Long distance short-wave radio broadcasting uses

[AFMC 1996]

(a) Ground wave (b) Ionospheric wave

(c) Direct wave (d) Sky wave

8. A step index fibre has a relative refractive index of 0.88%. What is the critical angle at the corecladding interface

[Manipal 2003]

(a) 60° (b) 75°

(c) 45° (d) None of these

9. The characteristic impedance of a coaxial cable is of the order of

(a) 50 Ω (b) 200 Ω

(c) 270 Ω (d) None of these

10. In which frequency range, space waves are normally propagated

(a) HF (b) VHF

(c) UHF (d) SHF

11. If μ_1 and μ_2 are the refractive indices of the materials of core and cladding of an optical fibre, then the loss of light due to its leakage can be minimised by having [BVP 2003]

(a) $\mu_1 > \mu_2$ (b) $\mu_1 < \mu_2$

(c) $\mu_1 = \mu_2$ (d) None of these

12. Through which mode of propagation, the radio waves can be sent from one place to another [JIPMER 2003]

(a) Ground wave propagation

(b) Sky wave propagation

(c) Space wave propagation

(d) All of them

13. A laser beam of pulse power 10^{12} *watt* is focussed on an object are 10^{-4} cm^2. The energy flux in *watt*/ cm^2 at the point of focus is

(a) 10^{20} (b) 10^{16}

(c) 10^{8} (d) 10^{4}

14. The carrier frequency generated by a tank circuit containing 1 *nF* capacitor and 10 μH inductor is [AFMC 2003]

(a) 1592 *Hz* (b) 1592 *MHz*

(c) 1592 *kHz* (d) 159.2 *Hz*

15. Broadcasting antennas are generally [AFMC 2003]

(a) Omnidirectional type (b) Vertical type

(c) Horizontal type (d) None of these

16. For television broadcasting, the frequency employed is normally

(a) 30-300 *MHz* (b) 30-300 *GHz*

(c) 30-300 *KHz* (d) 30-300 *Hz*

17. The radio waves of frequency 300 *MHz* to 3000 *MHz* belong to [MNR 1997]

(a) High frequency band

(b) Very high frequency band

(c) Ultra high frequency band

(d) Super high frequency band

18. An antenna behaves as resonant circuit only when its length is

(a) $\frac{\lambda}{2}$

(b) $\frac{\lambda}{4}$

(c) λ

(d) $\frac{\lambda}{2}$ or integral multiple of $\frac{\lambda}{2}$

19. Maximum useable frequency (MUF) in *F*-region layer is *x*, when the critical frequency is 60 *MHz* and the angle of incidence is 70°. Then *x* is [Himachal PMT 2003]

(a) 150 *MHz* (b) 170 *MHz*

(c) 175 *MHz* (d) 190 *MHz*

20. The electromagnetic waves of frequency 2 *MHz* to 30 *MHz* are [CPMT 2003]

(a) In ground wave propagation

(b) In sky wave propagation

(c) In microwave propagation

(d) In satellite communication

21. A laser is a coherent source because it contains

[JIPMER 2003] [EAMCET 2002]

(a) Many wavelengths

(b) Uncoordinated wave of a particular wavelength

(c) Coordinated wave of many wavelengths

(d) Coordinated waves of a particular wavelength

22. The attenuation in optical fibre is mainly due to [AFMC 2003]

(a) Absorption

(b) Scattering

(c) Neither absorption nor scattering

(d) Both (a) and (b)

23. The maximum distance upto which TV transmission from a TV tower of height h can be received is proportional to [AIIMS 2003]

(a) $h^{1/2}$ (b) h

(c) $h^{3/2}$ (d) h^2

24. A laser beam is used for carrying out surgery because it [AIIMS 2003]

(a) Is highly monochromatic (b) Is highly coherent

(c) Is highly directional (d) Can be sharply focussed

25. Laser beams are used to measure long distances because [DCE 2002, 03]

(a) They are monochromatic

(b) They are highly polarised

(c) They are coherent

(d) They have high degree of parallelism

26. An oscillator is producing FM waves of frequency 2 *kHz* with a variation of 10 *kHz*. What is the modulating index [DCE 2004]

(a) 0.20 (b) 5.0

(c) 0.67 (d) 1.5

27. The maximum peak to peak voltage of an AM wire is 24 *mV* and the minimum peak to peak voltage is 8 *mV*. The modulation factor is

(a) 10% (b) 20%

(c) 25% (d) 50%

28. Sinusoidal carrier voltage of frequency 1.5 *MHz* and amplitude 50 *V* is amplitude modulated by sinusoidal voltage of frequency 10 *kHz* producing 50% modulation. The lower and upper side-band frequencies in *kHz* are

(a) 1490, 1510 (b) 1510, 1490

(c) $\frac{1}{1490}, \frac{1}{1510}$ (d) $\frac{1}{1510}, \frac{1}{1490}$

29. What is the modulation index of an over modulated wave

(a) 1 (b) Zero

(c) < 1 (d) > 1

30. Basically, the product modulator is

(a) An amplifier (b) A mixer

(c) A frequency separator (d) A phase separator

31. If f_a and f_f represent the carrier wave frequencies for amplitude and frequency modulations respectively, then

(a) $f_a > f_f$ (b) $f_a < f_f$

(c) $f_a \approx f_f$ (d) $f_a \geq f_f$

32. Which of the following is the disadvantage of FM over AM

(a) Larger band width requirement

(b) Larger noise

(c) Higher modulation power

(d) Low efficiency

33. If a number of sine waves with modulation indices n_1, n_2, n_3 .... modulate a carrier wave, then total modulation index (n) of the wave is

(a) $n_1 + n_2 .... + 2(n_1 + n_2.....)$

(b) $\sqrt{n_1 - n_2 + n_3..........}$

(c) $\sqrt{n_1^2 + n_2^2 + n_3^2.........}$

(d) None of these

34. An AM wave has 1800 *watt* of total power content, For 100% modulation the carrier should have power content equal to

(a) 1000 *watt* (b) 1200 *watt*

(c) 1500 *watt* (d) 1600 *watt*

35. The frequency of a FM transmitter without signal input is called

(a) Lower side band frequency

(b) Upper side band frequency

(c) Resting frequency

(d) None of these

36. What type of modulation is employed in India for radio transmission

(a) Amplitude modulation (b) Frequency modulation

(c) Pulse modulation (d) None of these

37. When the modulating frequency is doubled, the modulation index is halved and the modulating voltage remains constant, the modulation system is

(a) Amplitude modulation (b) Phase modulation

(c) Frequency modulation (d) All of the above

38. An antenna is a device

(a) That converts electromagnetic energy into radio frequency signal

(b) That converts radio frequency signal into electromagnetic energy

(c) That converts guided electromagnetic waves into free space electromagnetic waves and vice-versa

(d) None of these

39. While tuning in a certain broadcast station with a receiver, we are actually

(a) Varying the local oscillator frequency

(b) Varying the frequency of the radio signal to be picked up

(c) Tuning the antenna

(d) None of these

40. Indicate which one of the following system is digital

(a) Pulse position modulation

(b) Pulse code modulation

(c) Pulse width modulation

(d) Pulse amplitude modulation

41. In a communication system, noise is most likely to affect the signal

(a) At the transmitter

(b) In the channel or in the transmission line

(c) In the information source

(d) At the receiver

42. The waves used in telecommunication are

(a) IR (b) UV

(c) Microwave (d) Cosmic rays

43. In an FM system a 7 *kHz* signal modulates 108 *MHz* carrier so that frequency deviation is 50 *kHz*. The carrier swing is

(a) 7.143 (b) 8

(c) 0.71 (d) 350

44. Consider telecommunication through optical fibres. Which of the following statements is not true [AIEEE 2003]

(a) Optical fibres may have homogeneous core with a suitable cladding

(b) Optical fibres can be of graded refractive index

(c) Optical fibres are subject to electromagnetic interference from outside

(d) Optical fibres have extremely low transmission loss

45. The phenomenon by which light travels in an optical fibres is

(a) Reflection (b) Refraction

(c) Total internal reflection (d) Transmission

46. Television signals on earth cannot be received at distances greater than 100 *km* from the transmission station. The reason behind this is that [DCE 1995]

(a) The receiver antenna is unable to detect the signal at a distance greater than 100 *km*

(b) The TV programme consists of both audio and video signals

(c) The TV signals are less powerful than radio signals

(d) The surface of earth is curved like a sphere

47. Advantage of optical fibre [DCE 2005]

(a) High bandwidth and EM interference

(b) Low bandwidth and EM interference

(c) High band width, low transmission capacity and no EM interference

(d) High bandwidth, high data transmission capacity and no EM interference

48. In frequency modulation [Kerala PMT 2005]

(a) The amplitude of modulated wave varies as frequency of carrier wave

(b) The frequency of modulated wave varies as amplitude of modulating wave

(c) The amplitude of modulated wave varies as amplitude of carrier wave

(d) The frequency of modulated wave varies as frequency of modulating wave

(e) The frequency of modulated wave varies as frequency of carrier wave

49. Audio signal cannot be transmitted because

[Kerala PMT 2005]

(a) The signal has more noise

(b) The signal cannot be amplified for distance communication

(c) The transmitting antenna length is very small to design

(d) The transmitting antenna length is very large and impracticable

(e) The signal is not a radio signal

50. In which of the following remote sensing technique is not used

(a) Forest density (b) Pollution

(c) Wetland mapping (d) Medical treatment

51. For sky wave propagation of a 10 *MHz* signal, what should be the minimum electron density in ionosphere

[AIIMS 2005]

(a) $\sim 1.2 \times 10^{12}\ m^{-3}$ (b) $\sim 10^{6}\ m^{-3}$

(c) $\sim 10^{14}\ m^{-3}$ (d) $\sim 10^{22}\ m^{-3}$

52. What should be the maximum acceptance angle at the aircore interface of an optical fibre if n_1 and n_2 are the refractive indices of the core and the cladding, respectively

[AIIMS 2005]

(a) $\sin^{-1}(n_2 / n_1)$ (b) $\sin^{-1}\sqrt{n_1^2 - n_2^2}$

(c) $\left[\tan^{-1}\frac{n_2}{n_1}\right]$ (d) $\left[\tan^{-1}\frac{n_1}{n_2}\right]$

[DCE 2001]

Critical Thinking

Objective Questions

1. A sky wave with a frequency 55 *MHz* is incident on *D*-region of earth's atmosphere at 45°. The angle of refraction is (electron density for *D*-region is 400 $electron/cm^3$)

[Haryana PMT 2003]

(a) 60° (b) 45°

(c) 30° (d) 15°

2. In a diode AM-detector, the output circuit consist of $R = 1k\Omega$ and $C = 10\ pF$. A carrier signal of 100 *kHz* is to be detected. Is it good

(a) Yes

(b) No

(c) Information is not sufficient

(d) None of these

3. Consider an optical communication system operating at $\lambda \sim 800\ nm$. Suppose, only 1% of the optical source frequency is the available channel bandwidth for optical communication. How many channels can be accommodated for transmitting audio signals requiring a bandwidth of 8 *kHz*

(a) 4.8×10^{8} (b) 48

(c) 6.2×10^{8} (d) 4.8×10^{5}

4. A photodetector is made from a semiconductor $In_{0.53}Ga_{0.47}As$ with E_g = 0.73 *eV*. What is the maximum wavelength, which it can detect

(a) 1000 *nm* (b) 1703 *nm*

(c) 500 *nm* (d) 173 *nm*

5. A transmitter supplies 9 kW to the aerial when unmodulated. The power radiated when modulated to 40% is

(a) 5 kW (b) 9.72 kW

(c) 10 kW (d) 12 kW

6. The antenna current of an AM transmitter is 8 A when only carrier is sent but increases to 8.96 A when the carrier is sinusoidally modulated. The percentage modulation is

(a) 50% (b) 60%

(c) 65% (d) 71%

7. The total power content of an AM wave is 1500 W. For 100% modulation, the power transmitted by the carrier is

(a) 500 W (b) 700 W

(c) 750 W (d) 1000 W

8. The total power content of an AM wave is 900 W. For 100% modulation, the power transmitted by each side band is

(a) 50 W (b) 100 W

(c) 150 W (d) 200 W

9. The modulation index of an FM carrier having a carrier swing of 200 kHz and a modulating signal 10 kHz is

(a) 5 (b) 10

(c) 20 (d) 25

10. A 500 Hz modulating voltage fed into an FM generator produces a frequency deviation of 2.25 kHz. If amplitude of the voltage is kept constant but frequency is raised to 6 kHz then the new deviation will be

(a) 4.5 kHz (b) 54 kHz

(c) 27 kHz (d) 15 kHz

11. The audio signal used to modulate 60 sin $(2\pi \times 10^6 \; t)$ is $15 \sin 300\pi t$. The depth of modulation is

(a) 50% (b) 40%

(c) 25% (d) 15%

12. The bit rate for a signal, which has a sampling rate of 8 kHz and where 16 quantisation levels have been used is

(a) 32000 *bits/sec* (b) 16000 *bits/sec*

(c) 64000 *bits/sec* (d) 72000 *bits/sec*

13. An amplitude modulated wave is modulated to 50%. What is the saving in power if carrier as well as one of the side bands are suppressed

(a) 70% (b) 65.4%

(c) 94.4% (d) 25.5%

14. In AM, the centpercent modulation is achieved when

(a) Carrier amplitude = signal amplitude

(b) Carrier amplitude ≠ signal amplitude

(c) Carrier frequency = signal frequency

(d) Carrier frequency ≠ signal frequency

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : Diode lasers are used as optical sources in optical communication.

Reason : Diode lasers consume less energy. [AIIMS 2005]

2. Assertion : Television signals are received through sky-wave propagation.

Reason : The ionosphere reflects electromagnetic waves of frequencies greater than a certain critical frequency. [AIIMS 2005]

3. Assertion : In high latitude one sees colourful curtains of light hanging down from high altitudes.

Reason : The high energy charged particles from the sun are deflected to polar regions by the magnetic field of the earth. [AIIMS 2003]

4. Assertion : Short wave bands are used for transmission of radio waves to a large distance.

Reason : Short waves are reflected by ionosphere [AIIMS 1994]

5. Assertion : The electrical conductivity of earth's atmosphere decreases with altitude.

Reason : The high energy particles (*i.e.* γ-rays and cosmic rays) coming from outer space and entering our earth's atmosphere cause ionisation of the atoms of the gases present there and the pressure of gases decreases with increase in altitude.

6. Assertion : The electromagnetic waves of shorter wavelength can travel longer distances on earth's surface than those of longer wavelengths.

Reason : Shorter the wavelength, the larger is the velocity of wave propagation.

7. Assertion : The surface wave propagation is used for medium wave band and for television broadcasting.

Reason : The surface waves travel directly from transmitting antenna to receiver antenna through atmosphere.

8. Assertion : The television broadcasting becomes weaker with increasing distance.

Reason : The power transmitted from TV transmitter varies inversely as the distance of the receiver

9. Assertion : Microwave propagation is better than the sky wave propagation.

Reason : Microwaves have frequencies 100 to 300 GHz, which have very good directional properties.

10. Assertion : Satellite is an ideal platform for remote sensing.

Reason : Satellite in polar orbit can provide global coverage or continuous coverage of the fixed area in geostationary configuration.

11. Assertion : Fax is a modulating and demodulating device.

Reason : It is necessary for exact reproduction of a document.

12. Assertion : A dish antenna is highly directional.

Reason : This is because a dipole antenna is omni directional.

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) *If both assertion and reason are true and the reason is the correct explanation of the assertion.*
(b) *If both assertion and reason are true but reason is not the correct explanation of the assertion.*
(c) *If assertion is true but reason is false.*
(d) *If the assertion and reason both are false.*
(e) *If assertion is false but reason is true.*

1. Assertion : In pressure-temperature (*P-T*) phase diagram of water, the slope of the melting curve is found to be negative.
Reason : Ice contracts on melting to water. [AIIMS 2005]

2. Assertion : For gas atom the number of degrees of freedom is 3.
Reason : $\frac{C_P}{C_V} = \gamma$ [AIIMS 2000]

3. Assertion : A gas have a unique value of specific heat.
Reason : Specific heat is defined as the amount of heat required to raise the temperature of unit mass of the substance through unit degree.

4. Assertion : A gas can be liquified at any temperature by increase of pressure alone.
Reason : On increasing pressure the temperature of gas decreases.

5. Assertion : Equal masses of helium and oxygen gases are given equal quantities of heat. There will be a greater rise in the temperature of helium compared to that of oxygen.
Reason : The molecular weight of oxygen is more than the molecular weight of helium.

6. Assertion : Absolute zero is the temperature corresponding to zero energy.
Reason : The temperature at which no molecular motion cease is called absolute zero temperature.

7. Assertion : The ratio of specific heat gas at constant pressure and specific heat at constant volume for a diatomic gas is more than that for a monatomic gas.
Reason : The molecules of a monatomic gas have more degree of freedom than those of a diatomic gas.

8. Assertion : At room temperature, water does not sublimate from water to steam.
Reason : The critical point of water is much above the room temperature.

9. Assertion : Specific heat of a gas at constant pressure (*C*) is greater than its specific heat at constant volume (*C*).
Reason : At constant pressure, some heat is spent in expansion of the gas.

10. Assertion : The internal energy of a real gas is function of both, temperature and volume.
Reason : Internal kinetic energy depends on temperature and internal potential energy depends on volume.

11. Assertion : For an ideal gas, at constant temperature, the product of the pressure and volume is constant.
Reason : The mean square velocity of the molecules is inversely proportional to mass. [AIIMS 1998]

12. Assertion : If a gas container in motion is suddenly stopped, the temperature of the gas rises.
Reason : The kinetic energy of ordered mechanical motion is converted in to the kinetic energy of random motion of gas molecules.

13. Assertion : Internal energy of an ideal gas does not depend upon volume of the gas
Reason : Internal energy of ideal gas depends on temperature of gas.

14. Assertion : At low density, variables of gases *P, V* and *T* follows the equation $PV = \mu RT$
Reason : At low density real gases are more closely to ideal gases

15. Assertion : Maxwell speed distribution graph is symmetric about most probable speed
Reason : *rms* speed of ideal gas, depends upon it's type (monoatomic, diatomic and polyatomic)

Answers and Solutions

Gas Laws

1. (c) Using Charle's law $\frac{P_1}{P_2} = \frac{T_1}{T_2}$

or $P_2 = \frac{P_1 T_2}{T_1} = \frac{P(273+927)}{(273+27)} = 4P.$

2. (b) $\frac{V_1}{V_2} = \frac{T_1}{T_2} \Rightarrow T_2 = 2 \times T_1 = 2 \times (273+0) = 546K$

$\Rightarrow T_2 = 273 \times 2 = 546K \Rightarrow 273°C \Rightarrow 273° C$

Kinetic Theory of Gases

SET Self Evaluation Test -13

1. An ideal gas has an initial pressure of 3 pressure units and an initial volume of 4 volume units. The table gives the final pressure and volume of the gas (in those same units) in four, processes. Which processes start and end on the same isotherm

(a) A

(b) B

(c) C

(d) D

	A	B	C	D
P	5	4	12	6
V	7	6	1	3

2. Suppose ideal gas equation follows VP^3 = constant. Initial temperature and volume of the gas are T and V respectively. If gas expand to $27V$ then its temperature will be come

(a) T (b) $9T$

(c) $27T$ (d) $T/9$

3. One mole of a monoatomic ideal gas is mixed with one mole of a diatomic ideal gas. The molar specific heat of the mixture at constant volume is

(a) 8 (b) $\frac{3}{2}R$

(c) $2R$ (d) $2.5\ R$

4. When the temperature of a gas is raised from 27°C to 90°C, the percentage increase in the *r.m.s.* velocity of the molecules will be

(a) 10% (b) 15%

(c) 20% (d) 17.5%

5. A gas is enclosed in a closed pot. On keeping this pot in a train moving with high speed, the temperature of the gas

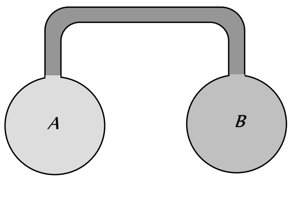
(a) Will increase

(b) Will decrease

(c) Will remain the same

(d) Will change according to the nature of the gas

6. Two spherical vessel of equal volume, are connected by *a n* arrow tube. The apparatus contains an ideal gas at one atmosphere and 300K. Now if one vessel is immersed in a bath of constant temperature 600K and the other in a bath of constant temperature 300K. Then the common pressure will be



(a) 1 *atm*

(b) $\frac{4}{5}$ *atm*

(c) $\frac{4}{3}$ *atm*

(d) $\frac{3}{4}$ *atm*

7. The *r.m.s.* velocity of a gas at a certain temperature is $\sqrt{2}$ times than that of the oxygen molecules at that temperature. The gas can be

(a) H_2 (b) *He*

(c) CH_4 (d) SO_2

8. At what temperature, the mean kinetic energy of O_2 will be the same for H_2 molecules at – 73°C

(a) 127°C (b) 527°C

(c) – 73°C (d) – 173°C

9. The volume of a gas at pressure $21\times10^4\ N/m^2$ and temperature 27°C is 83 *litres*. If R = 8.3 *J/mol/K*, then the quantity of gas in *gm-mole* will be

(a) 15 (b) 42

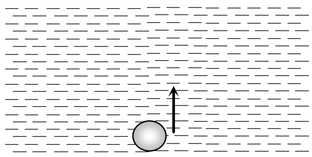
(c) 7 (d) 14

10. The pressure and temperature of an ideal gas in a closed vessel are 720 *kPa* and 40°C respectively. If $\frac{1}{4}$ th of the gas is released from the vessel and the temperature of the remaining gas is raised to 353°C, the final pressure of the gas is **[EAMCET (Med.) 2000]**

(a) 1440 *kPa* (b) 1080 *kPa*

(c) 720 *kPa* (d) 540 *kPa*

11. An air bubble doubles its radius on raising from the bottom of water reservoir to be the surface of water in it. If the atmospheric pressure is equal to 10 m of water, the height of water in the reservoir is **[EAMCET Med.1999]**



(a) 10 m

(b) 20 m

(c) 70 m

(d) 80 m

12. If the *r.m.s.* velocity of a gas at a given temperature (Kelvin scale) is 300 *m/sec*. What will be the *r.m.s.* velocity of a gas having twice the molecular weight and half the temperature on Kelvin scale =

(a) 300 *m/sec* (b) 600 *m/sec*

(c) 75 *m/sec* (d) 150 *m/sec*

13. The ratio of two specific heats $\frac{C_P}{C_V}$ of CO is

(a) 1.33 (b) 1.40

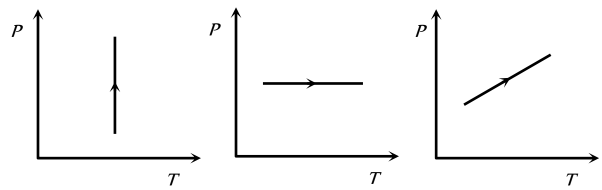
(c) 1.29 (d) 1.66

14. The energy of a *gas/litre* is 300 joules, then its pressure will be

(a) $3\times10^5\ N/m^2$ (b) $6\times10^5\ N/m^2$

(c) $10^5\ N/m^2$ (d) $2\times10^5\ N/m^2$

15. Pressure versus temperature graphs of an ideal gas are as shown in figure. Choose the wrong statement



(i) (ii) (iii)

(a) Density of gas is increasing in graph (i)

(b) Density of gas is decreasing in graph (ii)

(c) Density of gas is constant in graph (iii)

(d) None of these

16. If pressure of CO_2 (real gas) in a container is given by $P = \frac{RT}{2V-b} - \frac{a}{4b^2}$ then mass of the gas in container is

(a) 11 *gm* (b) 22 *gm*

(c) 33 *gm* (d) 44 *gm*

17. A cylinder of fixed capacity 44.8 *litre*. contains a monatomic gas at standard temperature and pressure. The amount of heat required to cylinder by 10°*C* will be.

(*R*= universal gas constant)

(a) *R* (b) 10*R*

(c) 20*R* (d) 30*R*

18. A pressure cooker contains air at 1 *atm* and 30°*C*. If the safety value of the cooler blows when the inside pressure ≥ 3 *atm*, then the maximum temperature of the air, inside the cooker can be

(a) 90°*C* (b) 636°*C*

(c) 909°*C* (d) 363°*C*

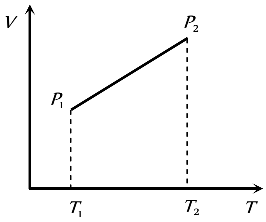
19. One mole of an ideal monatomic gas requires 210 *J* heat to raise the temperature by 10 *K*, when heated at constant temperature. If the same gas is heated at constant volume to raise the temperature by 10 *K* then heat required is

[Pb. PET 2000]

(a) 238 *J* (b) 126 *J*

(c) 210 *J* (d) 350 *J*

20. From the following *V-T* diagram we can conclude



(a) $P_1 = P_2$

(b) $P_1 > P_2$

(c) $P_1 < P_2$

(d) None of these

21. A cylinder contains 10 *kg* of gas at pressure of $10^7\ N/m^2$. The quantity of gas taken out of the cylinder, if final pressure is $2.5 \times 10^6\ N/m^2$, will be (Temperature of gas is constant)

[EAMCET 1998; Pb. PMT 1999; 2003; DPMT 199, 2003]

(a) 15.2 *kg* (b) 3.7 *kg*

(c) Zero (d) 7.5 *kg*

22. Certain amount of an ideal gas are contained in a closed vessel. The vessel is moving with a constant velocity *v*. The molecular mass of gas is *M*. The rise in temperature of the gas when the vessel is suddenly stopped is $(\gamma = C_P / C_V)$

(a) $\frac{Mv^2}{2R(\gamma+1)}$ (b) $\frac{Mv^2(\gamma-1)}{2R}$

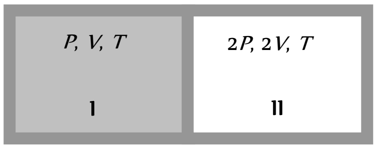
(c) $\frac{Mv^2}{2R(\gamma+1)}$ (d) $\frac{Mv^2}{2R(\gamma+1)}$

23. Air is filled at 60°*C* in a vessel of open mouth. The vessel is heated to a temperature *T* so that 1/4th part of air escapes. Assuming the volume of the vessel remaining constant, the value of *T* is

(a) 80°*C* (b) 444°*C*

(c) 333°*C* (d) 171°*C*

24. A partition divides a container having insulated walls into two compartments I and II. the same gas fills the two compartments. The ratio of the number of molecules in compartments I and II is



(a) 1 : 6

(b) 6 : 1

(c) 4 : 1

(d) 1 : 4

25. Considering the gases to be ideal, the value of $\gamma = \frac{C_P}{C_V}$ for a gaseous mixture consisting of = 3 moles of carbon dioxide and 2 moles of oxygen will be $(\gamma_{O_2} = 1.4, \gamma_{CO_2} = 1.3)$

[UPSEAT 2000; Pb. PET 2004]

(a) 1.37 (b) 1.34

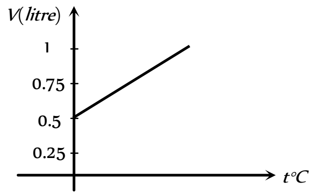
(c) 1.55 (d) 1.63

26. A jar has a mixture of hydrogen and oxygen gas in the ratio of 1 : 5. The ratio of mean kinetic energies of hydrogen and oxygen molecules is [CPMT 1977]

(a) 1 : 16 (b) 1 : 4

(c) 1 : 5 (d) 1 : 1

27. Graph between volume and temperature for a gas is shown in figure. If α = volume coefficient of gas = $\frac{1}{273}$ *per °C*, then what is the volume of gas at a temperature of 819°*C*



(a) $1 \times 10^{-3}\ m^3$

(b) $2 \times 10^{-3}\ m^3$

(c) $3 \times 10^{-3}\ m^3$

(d) $4 \times 10^{-3}\ m^3$

Answers and Solutions

(SET -13)

1. (c) For same isotherm ; $T \to$ constant

$\therefore\ P \propto \frac{1}{V} \Rightarrow P_1V_1 = P_2V_2$

2. (b) VP^3 = constant = $k \Rightarrow P = \frac{k}{V^{1/3}}$

Also $PV = \mu RT \Rightarrow \frac{k}{V^{1/3}}.V = \mu RT \Rightarrow V^{2/3} = \frac{\mu RT}{k}$

Hence $\left(\frac{V_1}{V_2}\right)^{2/3} = \frac{T_1}{T_2} \Rightarrow \left(\frac{V}{27V}\right)^{2/3} = \frac{T}{T_2} \Rightarrow T_2 = 9T$

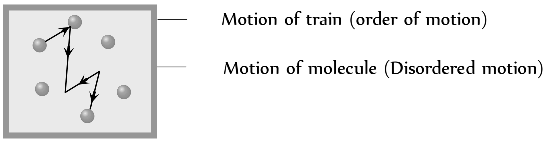
3. (c) $(C_V)_{mix} = \frac{\mu_1 C_{V_1} + \mu_2 C_{V_2}}{\mu_1 + \mu_2} = \frac{1 \times \frac{3}{2}R + 1 \times \frac{5}{2}R}{1+1} = 2R$

$\left((C_V)_{mono} = \frac{3}{2}R,\ (C_V)_{di} = \frac{5}{2}R\right)$

4. (a) $v_{rms} = \sqrt{\frac{3RT}{M}} \Rightarrow \frac{v_2}{v_1} = \sqrt{\frac{T_2}{T_1}} = \sqrt{\frac{(273+90)}{(273+30)}} = 1.1$

% increase $= \left(\frac{v_2}{v_1} - 1\right) \times 100 = 0.1 \times 100 = 10\%$

5. (c) Temperature of the gas is concerned only with it's disordered motion. It is no way concerned with it's ordered motion.



6. (c) $\mu = \mu_1 + \mu_2$

$$\frac{P(2V)}{RT_1} = \frac{P'v}{RT_1} + \frac{P'V}{RT_2} \Rightarrow \frac{2P}{RT_1} = \frac{P'}{R}\left[\frac{T_2 + T_1}{T_1 T_2}\right]$$

$$P' = \frac{2PT_2}{(T_1 + T_2)} = \frac{2 \times 1 \times 600}{(300 + 600)} = \frac{4}{3} atm$$

7. (c) $v_{rms} \propto \frac{1}{\sqrt{M}} \Rightarrow \frac{v_1}{v_2} = \sqrt{\frac{M_2}{M_1}}$

$\therefore \frac{1}{\sqrt{2}} = \sqrt{\frac{M_2}{32}} \Rightarrow M_2 = 16$. Hence the gas is CH_4.

8. (c) Mean kinetic energy of molecule depends upon temperature only. For O_2 it is same as that of H_2 at the same temperature of $-73°C$.

9. (c) $PV = \mu RT \Rightarrow \mu = \frac{PV}{RT} = \frac{21 \times 10^4 \times 83 \times 10^{-3}}{8.3 \times 300} = 7$

10. (b) $P_1 = 720 kpa, \ T_1 = 40°C = 273 + 40 = 313K$

$$P \propto mT \Rightarrow \frac{P_2}{P_1} = \frac{m_2}{m_1}\frac{T_2}{T_1} = \frac{3}{4} \times \frac{626}{313} = 1.5$$

$$\Rightarrow P_2 = 1.5P_1 = 1.5 \times 720 = 1080 kPa$$

11. (c) According to Boyle's law $(P_1V_1)_{\text{bottom}} = (P_2V_2)_{\text{top}}$

$(10 + h) \times \frac{4}{3}\pi r_1^3 = 10 \times \frac{4}{3}\pi r_2^3$ but $r_2 = 2r_1$

$\therefore (10 + h)r_1^3 = 10 \times 8r_1^3 \Rightarrow 10 + h = 80 \ \therefore h = 70m$

12. (d) $v_{rms} = \sqrt{\frac{3RT}{M}} \Rightarrow v_{rms} \propto \sqrt{\frac{T}{M}}$

$$\frac{v_2}{v_1} = \sqrt{\frac{M_1}{M_2} \times \frac{T_2}{T_1}} = \sqrt{\frac{1}{2} \times \frac{1}{2}} \Rightarrow v_2 = \frac{v_1}{2} = \frac{300}{2} = 150 \text{ m/sec}$$

13. (bc) *Co* is diatomic gas, for diatomic gas

$$C_P = \frac{7}{2}R \text{ and } C_V = \frac{5}{2}R \Rightarrow \gamma_{di} = \frac{C_P}{C_V} = \frac{7R/2}{5R/2} = 1.4$$

14. (d) Energy $= 300 J/litre = 300 \times 10^3 J/m^3$

$$P = \frac{2}{3}E = \frac{2 \times 300 \times 10^3}{3} = 2 \times 10^5 N/m^2$$

15. (c) $\rho = \frac{PM}{RT}$

Density ρ remains constant when P/T or volume remains constant.

In graph (i) Pressure is increasing at constant temperature hence volume is decreasing so density is increasing. Graphs (ii) and (iii) volume is increasing hence, density is decreasing. Note that volume would had been constant in case the straight line in graph (iii) had passed through origin.

16. (b) Vander wall's gas equation for μ mole of real gas

$$\left(P + \frac{\mu^2 a}{V^2}\right)(V - \mu b) = \mu RT \Rightarrow P = \frac{\mu RT}{V - \mu b} - \frac{\mu^2 a}{V^2}$$

on comparing the given equation with this standard equation we get $\mu = \frac{1}{2}$. Hence $\mu = \frac{m}{M} \Rightarrow$ mass of gas

$$m = \mu m = \frac{1}{2} \times 44 = 22gm.$$

17. (d) As we know 1 *mol* of any ideal gas at *STP* occupies a volume of 22.4 *litres*.

Hence number of moles of gas $\mu = \frac{44.8}{22.4} = 2$

Since the volume of cylinder is fixed,

Hence $(\Delta Q)_V = \mu \omega \Delta T$

$$= 2 \times \frac{3}{2}R \times 10 = 30R \qquad \left(\because (C_V)_{mono} = \frac{3}{2}R\right)$$

18. (b) Since volume is constant,

Hence $\frac{P_1}{P_2} = \frac{T_1}{T_2} \Rightarrow \frac{1}{3} = \frac{(273+30)}{T_2}$

$$\Rightarrow T_2 = 909K = 636°C$$

19. (b) $(\Delta Q)_P = \mu C_P \Delta T$ and $(\Delta Q)_V = \mu C_V \Delta T$

$$\Rightarrow \frac{(\Delta Q)_V}{(\Delta Q)_P} = \frac{C_V}{C_P} = \frac{\frac{3}{2}R}{\frac{5}{2}R} = \frac{3}{5}$$

$$\left[\because (C_V)_{mono} = \frac{3}{2}R, (C_P)_{mono} = \frac{5}{2}R\right]$$

$$\Rightarrow (\Delta Q)_V = \frac{3}{5} \times (\Delta Q)_P = \frac{3}{5} \times 210 = 126 J$$

20. (b) In case of given graph, V and T are related as $V = aT - b$, where a and b are constants.

From ideal gas equation, $PV = \mu RT$

We find $P = \frac{\mu RT}{aT - b} = \frac{\mu R}{a - b/T}$

Since $T_2 > T_1$, therefore $P_2 < P_1$.

21. (d) $PV = mrT \Rightarrow P \propto m \qquad [\because V, r, T \rightarrow \text{constant}]$

$$\Rightarrow \frac{m_1}{m_2} = \frac{P_1}{P_2} \Rightarrow \frac{10}{m_2} = \frac{10^7}{2.5 \times 10^6} \Rightarrow m_2 = 2.5 \ kg.$$

Hence mass of the gas taken out of the cylinder

$$= 10 - 2.5 = 7.5kg.$$

22. (b) If m is the total mass of the gas then its kinetic energy $= \frac{1}{2}mv^2$

When the vessel is suddenly stopped then total kinetic energy will increase the temperature of the gas. Hence

$$\frac{1}{2}mv^2 = \mu C_v \Delta T = \frac{m}{M}C_v\Delta T \qquad \left[\text{As } C_v = \frac{R}{\gamma - 1}\right]$$

$$\Rightarrow \frac{m}{M}\frac{R}{\gamma-1}\Delta T = \frac{1}{2}mv^2 \Rightarrow \Delta T = \frac{Mv^2(\gamma-1)}{2R}.$$

23. (d) For open mouth vessel, pressure is constant.
Volume is also given constant

Hence from $PV = \mu RT = \left(\frac{m}{M}\right)RT \Rightarrow T \propto \frac{1}{m} \Rightarrow \frac{T_1}{T_2} = \frac{m_2}{m_1}$

$\because$ $\frac{1}{4}th$ part escapes, so remaining mass in the vessel

$$m_2 = \frac{3}{4}m_1 \Rightarrow \frac{(273+60)}{T} = \frac{3/4\, m_1}{m_1}$$

$\Rightarrow T = 444K = 171°C$

24. (d) $n = \frac{PV}{kT}$ Now, $n' = \frac{(2P)(2V)}{kT} = 4\frac{PV}{kT} = 4n$ or $\frac{n}{n'} = \frac{1}{4}$.

25. (b) $$\gamma_{\text{mix}} = \frac{\frac{\mu_1\gamma_1}{\gamma_1 - 1} + \frac{\mu_2\gamma_2}{\gamma_2 - 1}}{\frac{\mu_1}{\gamma_1 - 1} + \frac{\mu_2}{\gamma_2 - 1}} = \frac{\frac{3\times 1.3}{(1.3-1)} + \frac{2\times 1.4}{(1.4-1)}}{\frac{3}{(1.3-1)} + \frac{2}{(1.4-1)}} = 1.33$$

26. (d) In mixture gases will acquire thermal equilibrium (*i.e.*, same temperature) so their kinetic energies will also be same.

27. (b) $V_t = V_0(1+\alpha t) = 0.5\left(1 + \frac{1}{273}\times 819\right) = 2$ *litre* $= 2\times 10^{-3}\ m^3$

Chapter

14

Thermodynamics

Thermodynamics is a branch of science which deals with exchange of heat energy between bodies and conversion of the heat energy into mechanical energy and vice-versa.

Some Definitions

(1) **Thermodynamic system**

(i) It is a collection of an extremely large number of atoms or molecules

(ii) It is confined with in certain boundaries.

(iii) Anything outside the thermodynamic system to which energy or matter is exchanged is called its surroundings.

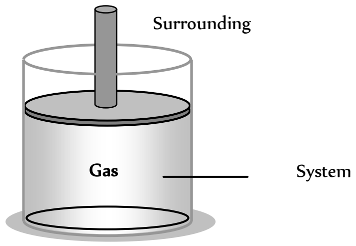


Fig. 14.1

(iv) Thermodynamic system may be of three types

(a) Open system : It exchange both energy and matter with the surrounding.

(b) Closed system : It exchange only energy (not matter) with the surroundings.

(c) Isolated system : It exchange neither energy nor matter with the surrounding.

(2) **Thermodynamic variables and equation of state :** A thermodynamic system can be described by specifying its pressure, volume, temperature, internal energy and the number of moles. These parameters are called thermodynamic variables. The relation between the thermodynamic variables (P, V, T) of the system is called equation of state.

For μ moles of an ideal gas, equation of state is $PV = \mu RT$ and for 1 mole of an it ideal gas is $PV = RT$

(3) **Thermodynamic equilibrium :** In steady state thermodynamic variables are independent of time and the system is said to be in the state of thermodynamic equilibrium. For a system to be in thermodynamic equilibrium, the following conditions must be fulfilled.

(i) Mechanical equilibrium : There is no unbalanced force between the system and its surroundings.

(ii) Thermal equilibrium : There is a uniform temperature in all parts of the system and is same as that of surrounding.

(iii) Chemical equilibrium : There is a uniform chemical composition through out the system and the surrounding.

(4) **Thermodynamic process :** The process of change of state of a system involves change of thermodynamic variables such as pressure P, volume V and temperature T of the system. The process is known as thermodynamic process. Some important processes are

(i) Isothermal process : Temperature remain constant

(ii) Adiabatic process : No transfer of heat

(iii) Isobaric process : Pressure remains constant

(iv) Isochoric (isovolumic process) : Volume remains constant

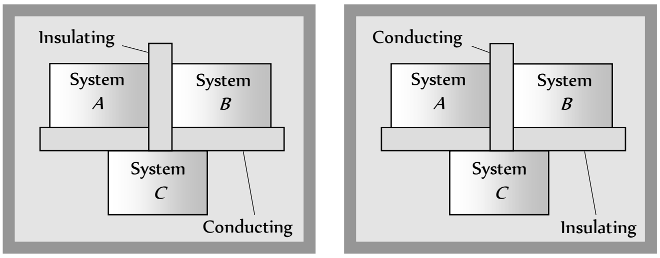
(v) Cyclic and non-cyclic process : Incyclic process Initial and final states are same while in non-cyclic process these states are different.

(vi) Reversible and irreversible process :

(5) **Indicator diagram :** Whenever the state of a gas (*P*, *V*, *T*) is changed, we say the gaseous system is undergone a thermodynamic process. The graphical representation of the change in state of a gas by a thermodynamic process is called indicator diagram. Indicator diagram is plotted generally in pressure and volume of gas.

Zeroth Law of Thermodynamics

If systems *A* and *B* are each in thermal equilibrium with a third system *C*, then *A* and *B* are in thermal equilibrium with each other.



(A) (B)

Fig. 14.3

(1) The zeroth law leads to the concept of temperature. All bodies in thermal equilibrium must have a common property which has the same value for all of them. This property is called the temperature.

(2) The zeroth law came to light long after the first and seconds laws of thermodynamics had been discovered and numbered. It is so named because it logically precedes the first and second laws of thermodynamics.

Heat, Internal Energy and Work in Thermodynamics

(1) **Heat (ΔQ) :** It is the energy that is transferred between a system and its environment because of the temperature difference between them.

(i) Heat is a path dependent quantity *e.g.* Heat required to change the temperature of a given gas at a constant pressure is different from that required to change the temperature of same gas through same amount at constant volume.

(ii) For gases when heat is absorbed and temperature changes $\Rightarrow$ $\Delta Q = \mu C \Delta T$

At constant pressure $(\Delta Q)_P = \mu C_P \Delta T$

At constant volume $(\Delta Q)_V = \mu C_V \Delta T$

(2) **Internal energy (U) :** Internal energy of a system is the energy possessed by the system due to molecular motion and molecular configuration.

The energy due to molecular motion is called internal kinetic energy U_K and that due to molecular configuration is called internal potential energy U_P *i.e.* Total internal energy $U = U_K + U_P$

(i) For an ideal gas, as there is no molecular attraction $U_p = 0$

i.e. internal energy of an ideal gas is totally kinetic and is given by $U = U_K = \frac{3}{2}\mu RT$ and change in internal energy $\Delta U = \frac{3}{2}\mu R\,\Delta T$

(ii) In case of gases whatever be the process

$$\Delta U = \mu\frac{f}{2}R\Delta T = \mu C_V \Delta T = \mu\frac{R}{(\gamma-1)}\Delta T = \frac{\mu R(T_f - T_i)}{\gamma - 1}$$

$$= \frac{\mu RT_f - \mu RT_i}{\gamma - 1} = \frac{(P_f V_f - P_i V_i)}{\gamma - 1}$$

(iii) Change in internal energy does not depend on the path of the process. So it is called *a* point function *i.e.* it depends only on the initial and final states of the system, *i.e.* $\Delta U = U_f - U_i$

(3) **Work (ΔW) :** Suppose a gas is confined in a cylinder that has a movable piston at one end. If *P* be the pressure of the gas in the cylinder, then force exerted by the gas on the piston of the cylinder *F* = *PA* (*A* = Area of cross-section of piston)

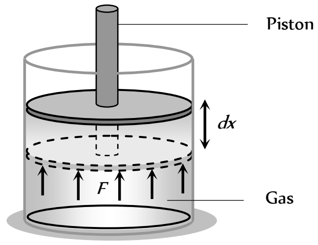


Fig. 14.4

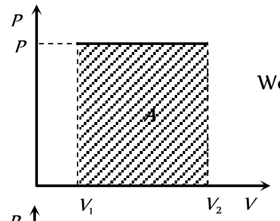
When the piston is pushed outward an infinitesimal distance *dx*, the work done by the gas $dW = F.dx = P(A\,dx) = P\,dV$

For a finite change in volume from V_i to V_f

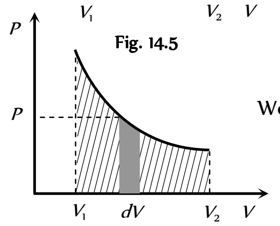
Total amount of work done $W = \int_{Vi}^{V_f} P\,dV = P(V_f - V_i)$

(i) If we draw indicator diagram, the area bounded by *PV*-graph and volume axis represents the work done



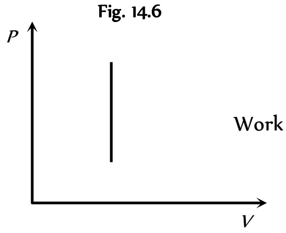
Work = Area = $P(V_2 - V_1)$

Fig. 14.5



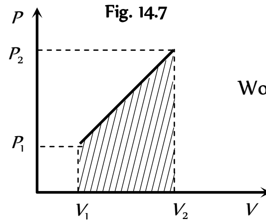
Work $= \int_{V_1}^{V_2} PdV = P(V_2 - V_1)$

Fig. 14.6



Work = 0

Fig. 14.7



Work = Area of the shown trapezium

$= \frac{1}{2}(P_1 + P_2)(V_2 - V_1)$

Fig. 14.8

(ii) From $\Delta W = P\Delta V = P(V_f - V_i)$

If system expands against some external force then $V_f > V_i$

$\Rightarrow$ ΔW = positive

If system contracts because of external force then $V_f < V_i$

$\Rightarrow$ ΔW = negative

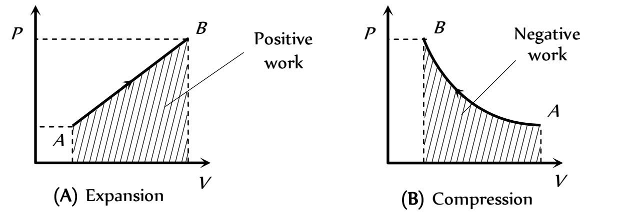


Fig. 14.9

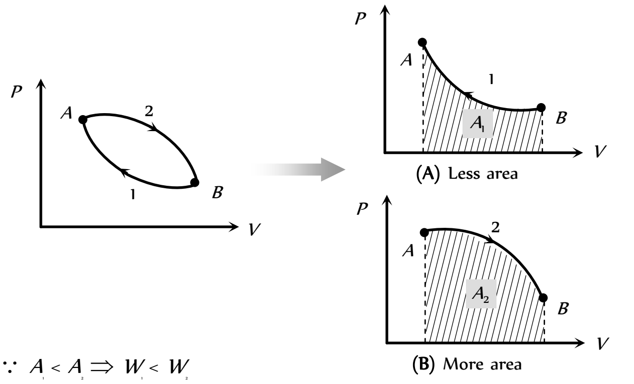
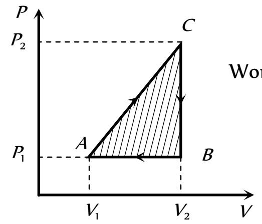
(iii) Like heat, work done is also depends upon initial and final state of the system and path adopted for the process



$\because$ $A_1 < A_2 \Rightarrow W_1 < W_2$

Fig. 14.10

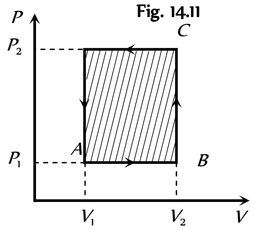
(iv) In cyclic process, work done is equal to the area of closed curve. It is positive if the cycle is clockwise and it is negative if the cycle is anticlockwise.



Work = Area of triangle *ABC*

$$= \frac{1}{2} \times (V_2 - V_1) \times (P_2 - P_1)$$

Fig. 14.11

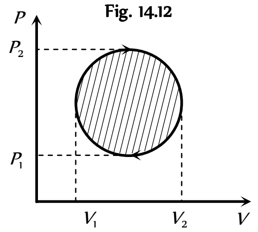


Work = Area of rectangle *ABCD*

= $AB \times AD$

= $(V_2 - V_1)\,(P_2 - P_1)$

Fig. 14.12



Work = $\frac{\pi}{4}(P_2 - P_1)(V_2 - V_1)$

Fig. 14.13

First Law of Thermodynamics (FLOT)

(1) It is a statement of conservation of energy in thermodynamical process.

(2) According to it heat given to a system (ΔQ) is equal to the sum of increase in its internal energy (ΔU) and the work done (ΔW) by the system against the surroundings.

$$\Delta Q = \Delta U + \Delta W$$

(3) It makes no distinction between work and heat as according to it the internal energy (and hence temperature) of a system may be increased either by adding heat to it or doing work on it or both.

(4) ΔQ and ΔW are the path functions but ΔU is the point function.

(5) In the above equation all three quantities ΔQ, ΔU and ΔW must be expressed either in *Joule* or in *calorie*.

(6) The first law introduces the concept of internal energy.

(7) Limitation : First law of thermodynamics does not indicate the direction of heat transfer. It does not tell anything about the conditions, under which heat can be transformed into work and also it does not indicate as to why the whole of heat energy cannot be converted into mechanical work continuously.

Table 14.1 : Useful sign convention in thermodynamics

Quantity	Sign	Condition
ΔQ	+	When heat is supplied to a system
	–	When heat is drawn from the system
ΔW	+	When work done by the gas (expansion)
	–	When work done on the gas (compression)
ΔU	+	With temperature rise, internal energy increases
	–	With temperature fall, internal energy decreases

Isobaric Process

When a thermodynamic system undergoes a physical change in such a way that its pressure remains constant, then the change is known as isobaric process.

(1) **Equation of state :** In this process V and T changes but P remains constant. Hence Charle's law is obeyed in this process.

Hence if pressure remains constant $V \propto T \Rightarrow \frac{V_1}{T_1} = \frac{V_2}{T_2}$

(2) **Indicator diagram :** Graph 1 represent isobaric expansion, graph 2 represent isobaric compression.

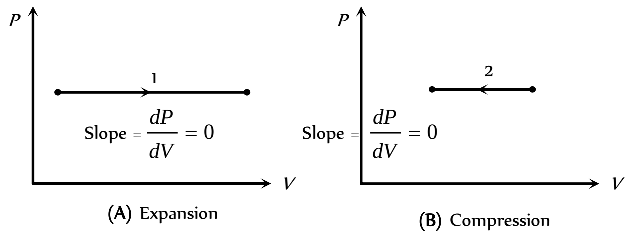


Fig. 14.14

(i) In isobaric expansion (Heating)

Temperature $\longrightarrow$ increases so ΔU is positive

Volume $\longrightarrow$ increases so ΔW is positive

Heat $\longrightarrow$ flows into the system so ΔQ is positive

(ii) In isobaric compression (Cooling)

Temperature $\longrightarrow$ decreases so ΔU is negative

Volume $\longrightarrow$ decreases so ΔW is negative

Heat $\longrightarrow$ flows out from the system so ΔQ is negative

(3) **Specific heat :** Specific heat of gas during isobaric process $C_P = \left(\frac{f}{2}+1\right)R$

(4) **Bulk modulus of elasticity :** $K = \frac{\Delta P}{-\Delta V / V} = 0$ [As $\Delta P = 0$]

(5) **Work done in isobaric process**

$$\Delta W = \int_{V_i}^{V_f} P\,dV = P\int_{V_i}^{V_f} dV = P[V_f - V_i] \qquad \text{[As } P = \text{constant]}$$

$$\Rightarrow \Delta W = P(V_f - V_i) = \mu R[T_f - T_i] = \mu R\,\Delta T$$

(6) **FLOT in isobaric process :** From $\Delta Q = \Delta U + \Delta W$

$$\because \Delta U = \mu C_V\,\Delta T = \mu\frac{R}{(\gamma-1)}\Delta T \text{ and } \Delta W = \mu R\,\Delta T$$

$$\Rightarrow (\Delta Q)_P = \mu\frac{R}{(\gamma-1)}\Delta T + \mu R\,\Delta T = \mu\left(\frac{\gamma}{\gamma-1}\right)R\,\Delta T = \mu C_P\,\Delta T$$

(7) **Examples of isobaric process :** All state changes occurs at constant temperature and pressure.

Boiling of water

(i) Water $\longrightarrow$ vapours

(ii) Temperature $\longrightarrow$ constant

(iii) Volume $\longrightarrow$ increases

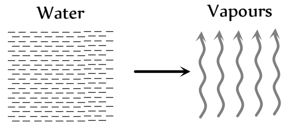

Fig. 14.15

(iv) A part of heat supplied is used to change volume (expansion) against external pressure and remaining part is used to increase it's potential energy (kinetic energy remains constant)

(v) From FLOT $\Delta Q = \Delta U + \Delta W \Rightarrow mL = \Delta U + P(V_f - V_i)$

Freezing of water

(i) Water $\longrightarrow$ ice

(ii) Temperature $\longrightarrow$ constant

(iii) Volume $\longrightarrow$ increases

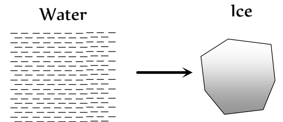

Fig. 14.16

(iv) Heat is given by water it self. It is used to do work against external atmospheric pressure and to decreases the internal potential energy.

(v) From FLOT $\Delta Q = \Delta U + \Delta W \Rightarrow -mL = \Delta U + P(V_f - V_i)$

Isochoric or Isometric Process

When a thermodynamic process undergoes a physical change in such a way that its volume remains constant, then the change is known as isochoric process.

(1) **Equation of state :** In this process P and T changes but V = constant. Hence Gay-Lussac's law is obeyed in this process *i.e.* $P \propto T \Rightarrow \frac{P_1}{T_1} = \frac{P_2}{T_2} = \text{constant}$

(2) **Indicator diagram :** Graph 1 and 2 represent isometric increase in pressure at volume V_1 and isometric decrease in pressure at volume V_2 respectively and slope of indicator diagram $\frac{dP}{dV} = \infty$

(i) Isometric heating

(a) Pressure $\longrightarrow$ increases

(b) Temperature $\longrightarrow$ increases

(c) $\Delta Q \longrightarrow$ positive

(d) $\Delta U \longrightarrow$ positive

(ii) Isometric cooling

(a) Pressure $\longrightarrow$ decreases

(b) Temperature $\longrightarrow$ decreases

(c) $\Delta Q \longrightarrow$ negative

(d) $\Delta U \longrightarrow$ negative

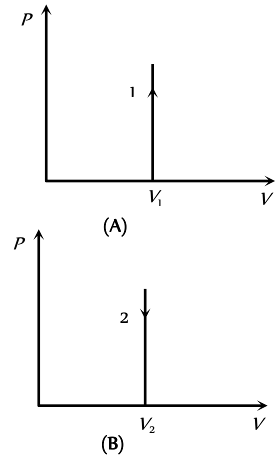

Fig. 14.17

(3) **Specific heat :** Specific heat of gas during isochoric process $C_V = \frac{f}{2}R$

(4) **Bulk modulus of elasticity :** $K = \frac{\Delta P}{-\Delta V / V} = \frac{\Delta P}{0} = \infty$

(5) **Work done in isochoric process**

$\Delta W = P\Delta V = P[V_f - V_i] = 0$ [As V = constant]

(6) **FLOT in isochoric process :** From $\Delta Q = \Delta U + \Delta W$

$$\because \Delta W = 0 \Rightarrow (\Delta Q)_V = \Delta U = \mu C_V\,\Delta T = \mu\frac{R}{\gamma-1}\Delta T = \frac{P_fV_f - P_iV_i}{\gamma-1}$$

Isothermal Process

When a thermodynamic system undergoes a physical change in such a way that its temperature remains constant, then the change is known as isothermal changes.

(1) **Essential condition for isothermal process**

(i) The walls of the container must be perfectly conducting to allow free exchange of heat between the gas and its surrounding.

(ii) The process of compression or expansion should be so slow so as to provide time for the exchange of heat.

Since these two conditions are not fully realised in practice, therefore, no process is perfectly isothermal.

(2) **Equation of state :** In this process, P and V change but T = constant *i.e.* change in temperature $\Delta T = 0$.

Boyle's law is obeyed *i.e.* PV = constant $\Rightarrow P_1V_1 = P_2V_2$

(3) **Example of isothermal process :** Melting of ice (at 0°*C*) and boiling of water (at 100°*C*) are common example of this process.

(4) **Indicator diagram :** According to PV = constant, graph between P and V is a part of rectangular hyperbola. The graphs at different temperature are parallel to each other are called isotherms.

$T_1 < T_2 < T_3$

Two isotherms never intersect

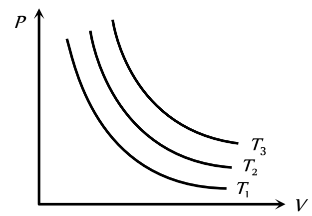

Fig. 14.18

(i) Slope of isothermal curve : By differentiating PV = constant. We get

$$P\,dV + V\,dP = 0$$

$$\Rightarrow PdV = -VdP$$

$$\Rightarrow \text{Slope} = \tan\theta = \frac{dP}{dV} = -\frac{P}{V}$$

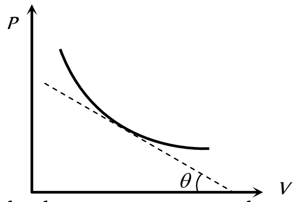

Fig. 14.19

(ii) Area between the isotherm and volume axis represents the work done in isothermal process.

If volume increases ΔW = + (Area under curve) and if volume decreases ΔW = – (Area under curve)

(5) **Specific heat :** Specific heat of gas during isothermal change is infinite. As $C = \frac{Q}{m\Delta T} = \frac{Q}{m \times 0} = \infty$ [As ΔT = 0]

(6) **Isothermal elasticity (E_θ) :** For this process PV = constant.

$$\Rightarrow P\,dV = -V\,dP \Rightarrow P = \frac{dP}{-dV/V} = \frac{\text{Stress}}{\text{Strain}} = E_\theta$$

$\Rightarrow E_\theta = P$ *i.e.* isothermal elasticity is equal to pressure

At N.T.P., E_θ = Atmospheric pressure = $1.01 \times 10^5\ N/m^2$

(7) **Work done in isothermal process**

$$W = \int_{V_i}^{V_f} P\,dV = \int_{V_i}^{V_f} \frac{\mu RT}{V}\,dV \qquad [\text{As } PV = \mu RT]$$

$$W = \mu RT \log_e\left(\frac{V_f}{V_i}\right) = 2.303\ \mu RT \log_{10}\left(\frac{V_f}{V_i}\right)$$

or $$W = \mu RT \log_e\left(\frac{P_i}{P_f}\right) = 2.303 \mu RT \log_{10}\left(\frac{P_i}{P_f}\right)$$

(8) **FLOT in isothermal process :** From $\Delta Q = \Delta U + \Delta W$

$\because\ \Delta U = 0$ [As ΔT = 0] $\Rightarrow \Delta Q = \Delta W$

i.e. heat supplied in an isothermal change is used to do work against external surrounding.

or if the work is done on the system than equal amount of heat energy will be liberated by the system.

Adiabatic Process

When a thermodynamic system undergoes a change in such a way that no exchange of heat takes place between System and surroundings, the process is known as adiabatic process.

In this process P, V and T changes but ΔQ = 0.

(1) **Essential conditions for adiabatic process**

(i) There should not be any exchange of heat between the system and its surroundings. All walls of the container and the piston must be perfectly insulating.

(ii) The system should be compressed or allowed to expand suddenly so that there is no time for the exchange of heat between the system and its surroundings.

Since, these two conditions are not fully realised in practice, so no process is perfectly adiabatic.

(2) **Some examples of adiabatic process**

(i) Sudden compression or expansion of a gas in a container with perfectly non-conducting walls.

(ii) Sudden bursting of the tube of bicycle tyre.

(iii) Propagation of sound waves in air and other gases.

(iv) Expansion of steam in the cylinder of steam engine.

(3) **FLOT in adiabatic process :** From $\Delta Q = \Delta U + \Delta W$

For adiabatic process $\Delta Q = 0 \Rightarrow \Delta U = -\Delta W$

If ΔW = positive then ΔU = negative so temperature decreases *i.e.* adiabatic expansion produce cooling.

If ΔW = negative then ΔU = positive so temperature increases *i.e.* adiabatic compression produce heating.

(4) **Equation of state :** In adiabatic change ideal gases do not obeys Boyle's law but obeys Poisson's law. According to it

PV^γ **= constant**; where $\gamma = \frac{C_P}{C_V}$

(i) For temperature and volume

$TV^{\gamma-1}$ = constant $\Rightarrow T_1V_1^{\gamma-1} = T_2V_2^{\gamma-1}$ or $T \propto V^{1-\gamma}$

(ii) For temperature and pressure

$\frac{T^\gamma}{P^{\gamma-1}}$ = const. $\Rightarrow T_1^\gamma P_1^{1-\gamma} = T_2^\gamma P_2^{1-\gamma}$ or $T \propto P^{\frac{\gamma-1}{\gamma}}$ or $P \propto T^{\frac{\gamma}{\gamma-1}}$

Table 14.2 : Special cases of adiabatic process

Type of gas	$P \propto \frac{1}{V^\gamma}$	$P \propto T^{\frac{\gamma}{\gamma-1}}$	$T \propto \frac{1}{V^{\gamma-1}}$
Monoatomic γ = 5/3	$P \propto \frac{1}{V^{5/3}}$	$P \propto T^{5/2}$	$T \propto \frac{1}{V^{2/3}}$
Diatomic γ = 7/5	$P \propto \frac{1}{V^{7/5}}$	$P \propto T^{7/2}$	$T \propto \frac{1}{V^{2/5}}$
Polyatomic γ = 4/3	$P \propto \frac{1}{V^{4/3}}$	$P \propto T^4$	$T \propto \frac{1}{V^{1/3}}$

(5) **Indicator diagram**

(i) Curve obtained on PV graph are called adiabatic curve.

(ii) Slope of adiabatic curve : From PV^γ = constant

By differentiating, we get

$$dP\,V^\gamma + P\gamma V^{\gamma-1}\,dV = 0$$

$$\frac{dP}{dV} = -\gamma \frac{PV^{\gamma-1}}{V^\gamma} = -\gamma\left(\frac{P}{V}\right)$$

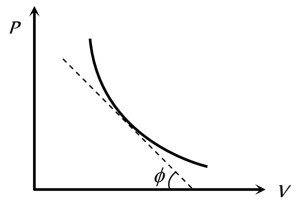

Fig. 14.20

$\therefore$ Slope of adiabatic curve $\tan\phi = -\gamma\left(\frac{P}{V}\right)$

(iii) But we also know that slope of isothermal curve $\tan\theta = \frac{-P}{V}$

Hence $(\text{Slope})_{Adi} = \gamma \times (\text{Slope})_{Iso}$ or $\frac{(\text{Slope})_{Adi}}{(\text{Slope})_{Iso}} > 1$

(6) **Specific heat :** Specific heat of a gas during adiabatic change is zero As $C = \frac{Q}{m\Delta T} = \frac{0}{m\Delta T} = 0$ [As $Q = 0$]

(7) **Adiabatic elasticity (E_ϕ) :** PV^γ = constant

Differentiating both sides $d\,PV^\gamma + P\gamma V^{\gamma-1}dV = 0$

$$\gamma P = \frac{dP}{-dV/V} = \frac{\text{Stress}}{\text{Strain}} = E_\phi \Rightarrow E_\phi = \gamma P$$

i.e. adiabatic elasticity is γ times that of pressure

Also isothermal elasticity $E_\theta = P \Rightarrow \frac{E_\phi}{E_\theta} = \gamma = \frac{C_P}{C_V}$

i.e. the ratio of two elasticity of gases is equal to the ratio of two specific heats.

(8) **Work done in adiabatic process**

$$W = \int_{V_i}^{V_f} P\,dV = \int_{V_i}^{V_f} \frac{K}{V^\gamma}dV \Rightarrow W = \frac{[P_iV_i - P_fV_f]}{(\gamma-1)} = \frac{\mu R(T_i - T_f)}{(\gamma-1)}$$

(As $PV^\gamma = K$, $P_iV_i = \mu RT_i$ and $P_fV_f = \mu RT_f$)

(i) $W \propto$ quantity of gas (either M or μ)

(ii) $W \propto$ temperature difference $(T_i - T_f)$

(iii) $W \propto \frac{1}{\gamma - 1}$ $\because \gamma_{mono} > \gamma_{di} > \gamma_{tri} \Rightarrow W_{mono} < W_{di} < W_{tri}$

(9) **Comparison between isothermal and adiabatic indicator diagrams :** Always remember that adiabatic curves are more steeper than isothermal curves

(i) Equal expansion : Graph 1 represent isothermal process and 2 represent adiabatic process

$W_{isothermal} > W_{adiabatic}$

$P_{isothermal} > P_{adiabatic}$

$T_{isothermal} > T_{adiabatic}$

$(\text{Slope})_{isothermal} < (\text{Slope})_{Adiabatic}$

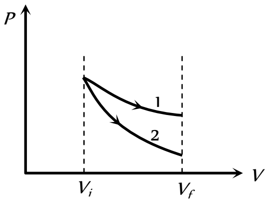

Fig. 14.21

(ii) Compression : Graph 1 represent adiabatic process and 2 represent isothermal process

$W_{Adiabatic} > W_{Isothermal}$

$P_{Adiabatic} > P_{Isothermal}$

$T_{Adiabatic} > T_{Isothermal}$

$(\text{Slope})_{Isothermal} < (\text{Slope})_{Adiabatic}$

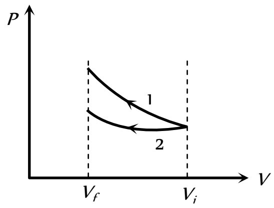

Fig. 14.22

(10) **Free expansion :** Free expansion is adiabatic process in which no work is performed on or by the system. Consider two vessels placed in a system which is enclosed with thermal insulation (asbestos-covered). One vessel contains a gas and the other is evacuated. When suddenly the stopcock is opened, the gas rushes into the evacuated vessel and expands freely.

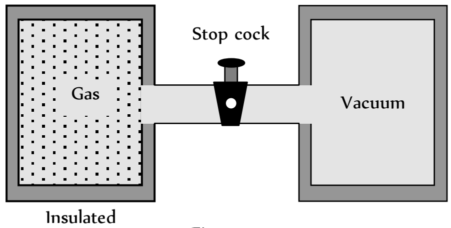

Fig. 14.23

$\Delta W = 0$ (Because walls are rigid)

$\Delta Q = 0$ (Because walls are insulated)

$\Delta U = U_f - U_i = 0$ (Because ΔQ and ΔW are zero. Thus the final and initial energies are equal in free expansion.

Cyclic and Non-cyclic Process

A cyclic process consists of a series of changes which return the system back to its initial state.

In non-cyclic process the series of changes involved do not return the system back to its initial state.

(1) In case of cyclic process as $U_f = U_i \Rightarrow \Delta U = U_f - U_i = 0$

i.e. change in internal energy for cyclic process is zero and also $\Delta U \propto \Delta T \Rightarrow \Delta T = 0$ *i.e.* temperature of system remains constant.

(2) From FLOT $\Delta Q = \Delta U + \Delta W \Rightarrow \Delta Q = \Delta W$

i.e. heat supplied is equal to the work done by the system.

(3) For cyclic process *P-V* graph is a closed curve and area enclosed by the closed path represents the work done.

If the cycle is clockwise work done is positive and if the cycle is anticlockwise work done is negative.

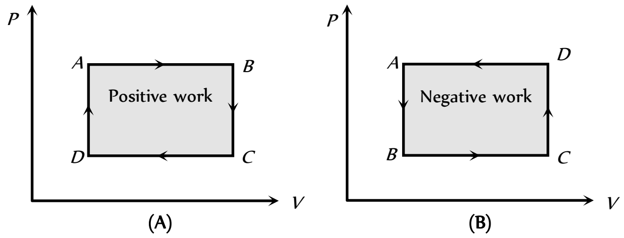

Fig. 14.24

(4) Work done in non cyclic process depends upon the path chosen or the series of changes involved and can be calculated by the area covered between the curve and volume axis on *PV* diagram.

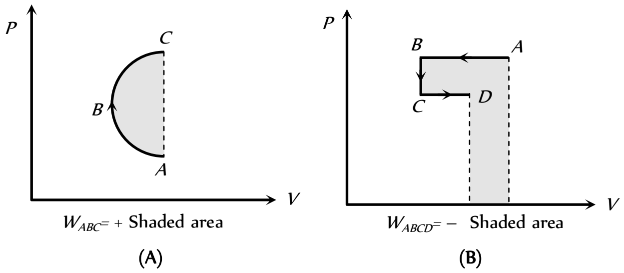

Fig. 14.25

Quasi Static Process

When we perform a process on a given system, its state is, in general, changed. Suppose the initial state of the system is described by the values P_1, V_1, T_1 and the final state by P_2, V_2, T_2. If the process is performed in such a way that at any instant during the process, the system is very nearly in thermodynamic equilibrium, the process is called quasi-static. This means, we can specify the parameters *P*, *V*, *T* uniquely at any instant during such a process.

Actual processes are not quasi-static. To change the pressure of a gas, we can move a piston inside the enclosure. The gas near the piston is acted upon by piston. The pressure of the gas may not be uniform everywhere while the piston is moving. However, we can move the piston very slowly to make the process as close to quasi-static as we wish. Thus, a quasi-static process is an idealised process in which all changes take place infinitely slowly.

Reversible and Irreversible Process

(1) **Reversible process :** A reversible process is one which can be reversed in such a way that all changes occurring in the direct process are exactly repeated in the opposite order and inverse sense and no change is left in any of the bodies taking part in the process or in the surroundings. For example if heat is absorbed in the direct process, the same amount of heat should be given out in the reverse process, if work is done on the working substance in the direct process then the same amount of work should be done by the working substance in the reverse process. The conditions for reversibility are

(i) There must be complete absence of dissipative forces such as friction, viscosity, electric resistance etc.

(ii) The direct and reverse processes must take place infinitely slowly.

(iii) The temperature of the system must not differ appreciably from its surroundings.

Some examples of reversible process are

(a) All isothermal and adiabatic changes are reversible if they are performed very slowly.

(b) When a certain amount of heat is absorbed by ice, it melts. If the same amount of heat is removed from it, the water formed in the direct process will be converted into ice.

(c) An extremely slow extension or contraction of a spring without setting up oscillations.

(d) When a perfectly elastic ball falls from some height on a perfectly elastic horizontal plane, the ball rises to the initial height.

(e) If the resistance of a thermocouple is negligible there will be no heat produced due to Joule's heating effect. In such a case heating or cooling is reversible. At a junction where a cooling effect is produced due to Peltier effect when current flows in one direction and equal heating effect is produced when the current is reversed.

(f) Very slow evaporation or condensation.

It should be remembered that the conditions mentioned for a reversible process can never be realised in practice. Hence, a reversible process is only an ideal concept. In actual process, there is always loss of heat due to friction, conduction, radiation *etc.*

(2) **Irreversible process :** Any process which is not reversible exactly is an irreversible process. All natural processes such as conduction, radiation, radioactive decay *etc.* are irreversible. All practical processes such as free expansion, Joule-Thomson expansion, electrical heating of a wire are also irreversible. Some examples of irreversible processes are given below

(i) When a steel ball is allowed to fall on an inelastic lead sheet, its kinetic energy changes into heat energy by friction. The heat energy raises the temperature of lead sheet. No reverse transformation of heat energy occurs.

(ii) The sudden and fast stretching of a spring may produce vibrations in it. Now a part of the energy is dissipated. This is the case of irreversible process.

(iii) Sudden expansion or contraction and rapid evaporation or condensation are examples of irreversible processes.

(iv) Produced by the passage of an electric current through a resistance is irreversible.

(v) Heat transfer between bodies at different temperatures is also irreversible.

(vi) Joule-Thomson effect is irreversible because on reversing the flow of gas a similar cooling or heating effect is not observed.

Mixed Graphical Representation

(1) ***PV*-graphs**

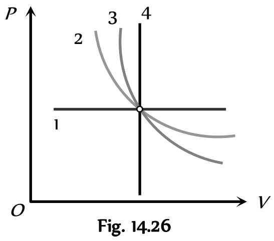

Fig. 14.26

1 ⟶ Isobaric (*P*-constant)

2 ⟶ Isothermal (Because $P \propto \frac{1}{V}$)

3 ⟶ Adiabatic (Because $P \propto \frac{1}{V^{\gamma}}$)

4 ⟶ Isochoric (*V*-constant)

(2) ***PT*-graphs**

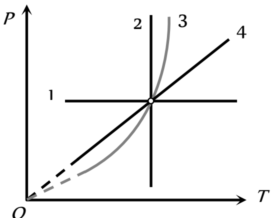

Fig. 14.27

1 ⟶ Isobaric (*P*-constant)

2 ⟶ Isothermal (*T*-constant)

3 ⟶ Adiabatic (Because $P \propto T^{\frac{\gamma}{\gamma-1}}$)

4 ⟶ Isochoric (In isochoric $P \propto T$)

(3) ***VT*-graphs**

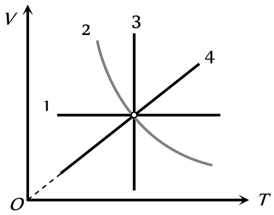

Fig. 14.28

1 ⟶ Isochoric (*V*-constant)

2 ⟶ Adiabatic (Because $V \propto T^{\frac{1}{1-\gamma}}$)

3 ⟶ Isothermal (*T*-constant)

4 ⟶ Isobaric (In isobaric $V \propto T$)

Heat Engine

Heat engine is a device which converts heat into work continuously through a cyclic process.

The essential parts of a heat engine are

(1) **Source :** It is a reservoir of heat at high temperature and infinite thermal capacity. Any amount of heat can be extracted from it.

(2) **Working substance :** Steam, petrol *etc.*

(3) **Sink :** It is a reservoir of heat at low temperature and infinite thermal capacity. Any amount of heat can be given to the sink.

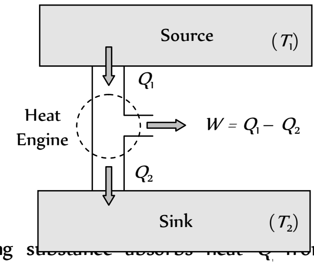

Fig. 14.29

The working substance absorbs heat Q_1 from the source, does an amount of work *W*, returns the remaining amount of heat to the sink and comes back to its original state and there occurs no change in its internal energy.

By repeating the same cycle over and over again, work is continuously obtained.

The performance of heat engine is expressed by means of "efficiency" η which is defined as the ratio of useful work obtained from the engine to the heat supplied to it.

$$\eta = \frac{\text{Work done}}{\text{Heat input}} = \frac{W}{Q_1}$$

For cyclic process $\Delta U = 0$ hence from FLOT $\Delta Q = \Delta W$

So $W = Q_1 - Q_2 \Rightarrow \eta = \frac{Q_1 - Q_2}{Q_1} = 1 - \frac{Q_2}{Q_1}$

A perfect heat engine is one which converts all heat into work *i.e.* $W = Q_1$ so that $Q_2 = 0$ and hence $\eta = 1$.

But practically efficiency of an engine is always less than 1.

Refrigerator or Heat Pump

A refrigerator or heat pump is basically a heat engine run in reverse direction.

It essentially consists of three parts

(1) **Source :** At higher temperature T_1

(2) **Working substance :** It is called refrigerant liquid ammonia and freon works as a working substance.

(3) **Sink :** At lower temperature T_2

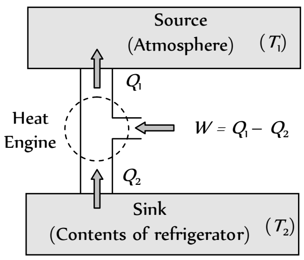

Fig. 14.30

The working substance takes heat Q_2 from a sink (contents of refrigerator) at lower temperature, has a net amount of work done W on it by an external agent (usually compressor of refrigerator) and gives out a larger amount of heat Q_1 to a hot body at temperature T_1 (usually atmosphere). Thus, it transfers heat from a cold to a hot body at the expense of mechanical energy supplied to it by an external agent. The cold body is thus cooled more and more.

The performance of a refrigerator is expressed by means of "coefficient of performance" β which is defined as the ratio of the heat extracted from the cold body to the work needed to transfer it to the hot body.

i.e. $\beta = \frac{\text{Heat extracted}}{\text{Work done}} = \frac{Q_2}{W} = \frac{Q_2}{Q_1 - Q_2}$

A perfect refrigerator is one which transfers heat from cold to hot body without doing work

i.e. $W = 0$ so that $Q_1 = Q_2$ and hence $\beta = \infty$

(1) **Carnot refrigerator :** For Carnot refrigerator $\frac{Q_1}{Q_2} = \frac{T_1}{T_2}$

$$\Rightarrow \frac{Q_1 - Q_2}{Q_2} = \frac{T_1 - T_2}{T_2} \text{ or } \frac{Q_2}{Q_1 - Q_2} = \frac{T_2}{T_1 - T_2}$$

So coefficient of performance $\beta = \frac{T_2}{T_1 - T_2}$

where T_1 = temperature of surrounding, T_2 = temperature of cold body. It is clear that $\beta = 0$ when $T_2 = 0$

i.e. the coefficient of performance will be zero if the cold body is at the temperature equal to absolute zero.

(2) **Relation between coefficient of performance and efficiency of refrigerator**

We know $\beta = \frac{Q_2}{Q_1 - Q_2} = \frac{Q_2 / Q_1}{1 - Q_2 / Q_1}$ ..... (i)

But the efficiency $\eta = 1 - \frac{Q_2}{Q_1}$ or $\frac{Q_2}{Q_1} = 1 - \eta$ .....(ii)

From (i) and (ii) we get, $\beta = \frac{1 - \eta}{\eta}$

Second Law of Thermodynamics

First law of thermodynamics merely explains the equivalence of work and heat. It does not explain why heat flows from bodies at higher temperatures to those at lower temperatures. It cannot tell us why the converse is possible. It cannot explain why the efficiency of a heat engine is always less than unity. It is also unable to explain why cool water on stirring gets hotter whereas there is no such effect on stirring warm water in a beaker. Second law of thermodynamics provides answers to these questions. Statement of this law is as follows

(1) **Clausius statement :** It is impossible for a self acting machine to transfer heat from a colder body to a hotter one without the aid of an external agency.

From Clausius statement it is clear that heat cannot flow from a body at low temperature to one at higher temperature unless work is done by an external agency. This statement is in fair agreement with our experiences in different branches of physics. For example, electrical current cannot flow from a conductor at lower electrostatic potential to that at higher potential unless an external work is done. Similarly, a body at a lower gravitational potential level cannot move up to higher level without work done by an external agency.

(2) **Kelvin's statement :** It is impossible for a body or system to perform continuous work by cooling it to a temperature lower than the temperature of the coldest one of its surroundings. A Carnot engine cannot work if the source and sink are at the same temperature because work done by the engine will result into cooling the source and heating the surroundings more and more.

(3) **Kelvin-Planck's statement :** It is impossible to design an engine that extracts heat and fully utilises into work without producing any other effect.

From this statement it is clear that any amount of heat can never be converted completely into work. It is essential for an engine to return some amount of heat to the sink. An engine essentially requires a source as well as sink. The efficiency of an engine is always less than unity because heat cannot be fully converted into work.

Carnot Engine

(1) Carnot designed a theoretical engine which is free from all the defects of a practical engine. This engine cannot be realised in actual practice, however, this can be taken as a standard against which the performance of an actual engine can be judged.

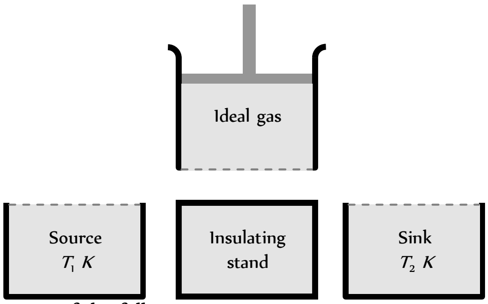

Fig. 14.31

It consists of the following parts

(i) A cylinder with perfectly non-conducting walls and a perfectly conducting base containing a perfect gas as working substance and fitted with a non-conducting frictionless piston

(ii) A source of infinite thermal capacity maintained at constant higher temperature T_1

(iii) A sink of infinite thermal capacity maintained at constant lower temperature T_2.

(iv) A perfectly non-conducting stand for the cylinder.

(2) **Carnot cycle :** As the engine works, the working substance of the engine undergoes a cycle known as Carnot cycle. The Carnot cycle consists of the following four strokes

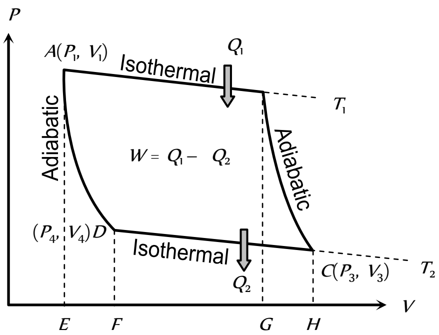

Fig. 14.32

(i) First stroke (Isothermal expansion) (curve AB) :

The cylinder containing ideal gas as working substance allowed to expand slowly at this constant temperature T_1.

Work done = Heat absorbed by the system

$$W_1 = Q_1 = \int_{V_1}^{V_2} P\,dV = RT_1 \log_e\left(\frac{V_2}{V_1}\right) = \text{Area } ABGE$$

(ii) Second stroke (Adiabatic expansion) (curve BC) :

The cylinder is then placed on the non conducting stand and the gas is allowed to expand adiabatically till the temperature falls from T_1 to T_2.

$$W_2 = \int_{V_2}^{V_3} P\,dV = \frac{R}{(\gamma-1)}[T_1 - T_2] = \text{Area } BCHG$$

(iii) Third stroke (Isothermal compression) (curve CD) :

The cylinder is placed on the sink and the gas is compressed at constant temperature T_2.

Work done = Heat released by the system

$$W_3 = Q_2 = -\int_{V_3}^{V_4} P\,dV = -RT_2 \log_e \frac{V_4}{V_3}$$

$$= RT_2 \log_e \frac{V_3}{V_4} = \text{Area } CDFH$$

(iv) Fourth stroke (adiabatic compression) (curve DA) : Finally the cylinder is again placed on non-conducting stand and the compression is continued so that gas returns to its initial stage.

$$W_4 = -\int_{V_4}^{V_1} P\,dV = -\frac{R}{\gamma-1}(T_2 - T_1) = \frac{R}{\gamma-1}(T_1 - T_2) = \text{Area } ADFE$$

(3) **Efficiency of Carnot cycle :** The efficiency of engine is defined as the ratio of work done to the heat supplied *i.e.*

$$\eta = \frac{\text{Work done}}{\text{Heat input}} = \frac{W}{Q_1}$$

Net work done during the complete cycle

$$W = W_1 + W_2 + (-W_3) + (-W_4) = W_1 - W_3 = \text{Area } ABCD$$

[As $W_2 = W_4$]

$$\therefore \quad \eta = \frac{W}{Q_1} = \frac{W_1 - W_3}{W_1} = \frac{Q_1 - Q_2}{Q_1} = 1 - \frac{W_3}{W_1} = 1 - \frac{Q_2}{Q_1}$$

or $$\eta = 1 - \frac{RT_2 \log_e(V_3/V_4)}{RT_1 \log_e(V_2/V_1)}$$

Since points B and C lie on same adiabatic curve

$$\therefore \quad T_1 V_2^{\gamma-1} = T_2 V_3^{\gamma-1} \text{ or } \frac{T_1}{T_2} = \left(\frac{V_3}{V_2}\right)^{\gamma-1} \qquad \text{.....(i)}$$

Also point D and A lie on the same adiabatic curve

$$\therefore \quad T_1 V_1^{\gamma-1} = T_2 V_4^{\gamma-1} \text{ or } \frac{T_1}{T_2} = \left(\frac{V_4}{V_1}\right)^{\gamma-1} \qquad \text{.....(ii)}$$

From (i) and (ii), $\dfrac{V_3}{V_2} = \dfrac{V_4}{V_1}$ or $\dfrac{V_3}{V_4} = \dfrac{V_2}{V_1} \Rightarrow \log_e\left(\dfrac{V_3}{V_4}\right) = \log_e\left(\dfrac{V_2}{V_1}\right)$

So efficiency of Carnot engine $\eta = 1 - \dfrac{T_2}{T_1}$

(i) Efficiency of a heat engine depends only on temperatures of source and sink and is independent of all other factors.

(ii) All reversible heat engines working between same temperatures are equally efficient and no heat engine can be more efficient than Carnot engine (as it is ideal).

(iii) As on Kelvin scale, temperature can never be negative (as 0 K is defined as the lowest possible temperature) and T_1 and T_2 are finite, efficiency of a heat engine is always lesser than unity, *i.e.*, whole of heat can never be converted into work which is in accordance with second law.

(4) **Carnot theorem :** The efficiency of Carnot's heat engine depends only on the temperature of source (T_1) and temperature of sink (T_2), *i.e.*, $\eta = 1 - \dfrac{T_2}{T_1}$.

Carnot stated that no heat engine working between two given temperatures of source and sink can be more efficient than a perfectly reversible engine (Carnot engine) working between the same two temperatures. Carnot's reversible engine working between two given temperatures is considered to be the most efficient engine.

Table 14.3 : Difference Between Petrol Engine and Diesel Engine

Petrol engine	Diesel engine
Working substance is a mixture of petrol vapour and air.	Working substance in this engine is a mixture of diesel vapour and air.
Efficiency is smaller (~47%).	Efficiency is larger (~55%).
It works with a spark plug.	It works with an oil plug.
It is associated with the risk of explosion, because petrol vapour and air is compressed. So, low compression ratio is kept.	No risk of explosion, because only air is compressed. Hence compression ratio is kept large.
Petrol vapour and air is created with spark plug.	Spray of diesel is obtained through the jet.

Entropy

Entropy is a measure of disorder of molecular motion of a system. Greater is the disorder, greater is the entropy.

The change in entropy *i.e.*

$$dS = \frac{\text{Heat absorbed by system}}{\text{Absolute temperature}} \text{ or } dS = \frac{dQ}{T}$$

The relation is called the mathematical form of Second Law of Thermodynamics.

(1) **For solids and liquids**

(i) When heat given to a substance changes its state at constant temperature, then change in entropy $dS = \frac{dQ}{T} = \pm\frac{mL}{T}$

where positive sign refers to heat absorption and negative sign to heat evolution.

(ii) When heat given to a substance raises its temperature from T_1 to T_2, then change in entropy

$$dS = \int\frac{dQ}{T} = \int_{T_1}^{T_2} mc\frac{dT}{T} = mc\log_e\left(\frac{T_2}{T_1}\right)$$

$$\Rightarrow \Delta S = 2.303\, mc\log_{10}\left(\frac{T_2}{T_1}\right).$$

(2) **For a perfect gas :** Perfect gas equation for n moles is $PV = nRT$

$$\Delta S = \int\frac{dQ}{T} = \int\frac{\mu C_V dT + P\,dV}{T} \qquad [\text{As } dQ = dU + dW]$$

$$\Rightarrow \Delta S = \int\frac{\mu C_V dT + \frac{\mu RT}{V}dV}{T}$$

$$= \mu C_V\int_{T_1}^{T_2}\frac{dT}{T} + \mu R\int_{V_1}^{V_2}\frac{dV}{V} \qquad [\text{As } PV = \mu RT]$$

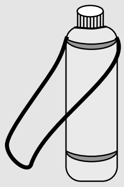
$$\therefore \quad \Delta S = \mu C_V\log_e\left(\frac{T_2}{T_1}\right) + \mu R\log_e\left(\frac{V_2}{V_1}\right)$$

In terms of T and P, $\Delta S = \mu C_P\log_e\left(\frac{T_2}{T_1}\right) - \mu R\log_e\left(\frac{P_2}{P_1}\right)$

and in terms of P and V $\Delta S = \mu C_V\log_e\left(\frac{P_2}{P_1}\right) + \mu C_P\log_e\left(\frac{V_2}{V_1}\right)$

Tips & Tricks

✍ When a thermos bottle is vigorously shaken :



Heat transferred to the coffee $\Rightarrow \Delta Q = 0$

[As thermos flask is insulated from the surrounding]

Work is done on the coffee against viscous force

$\Delta W = (-)$

Internal energy of the coffee increases $\Delta U = (+)$

and temperature of the coffee also increases $\Delta T = (+)$

✍ **Work done without the volume limits**

$$W = \int_{V_i}^{V_f} P\,dV$$

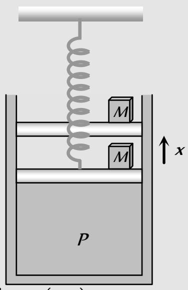
From this equation it seems as if work done can be calculated only when P-V equation is known and limits V_i and V_f are known to us. But it is not so. We can calculate work done if we know the limits of temperature.

For μ moles of an ideal gas if $P = \frac{\alpha}{T}$ with temperature limits T_0 and $2T_0$.

From $PV = \mu RT \Rightarrow V = \frac{\mu RT}{P} = \frac{\mu RT^2}{\alpha} \Rightarrow dV = \frac{2\mu RT}{\alpha}dT$

$$\therefore \quad W = \int_{V_i}^{V_f} P\,dV = \int_{T_0}^{2T_0}\left(\frac{\alpha}{T}\right)\left(\frac{2\mu RT}{\alpha}\right)dT = 2\mu RT_0$$

✍ **Work done with spring :** If mass less piston is attached to a spring of force constant K and a mass m is placed over the piston. If the external pressure is P_0 and due to expansion of gas the piston moves up through a distance x then



Total work done by the gas

$W = W_1 + W_2 + W_3$

where W_1 = Work done against external pressure (P_0)

W_2 = Work done against spring force (Kx)

W_3 = Work done against gravitational force (mg)

$$\therefore \quad W = P_0V + \frac{1}{2}Kx^2 + mgx$$

✍ The efficiency of an actual engine is much lesser than that of an ideal engine. Actually the practical efficiency of a steam engine is about (8-15)% while that of a petrol engine is 40%. The efficiency of a diesel engine is maximum and is about (50-55)%.

✍ When P and V bear the relation PV^x = constant, where $x \neq 1$ or γ the process is called a polytropic one. In this process the molar heat capacity is, $C = C_V + \frac{R}{1-x} = \frac{R}{\gamma-1} + \frac{R}{1-x}$

✍ **Enthalpy :** Four quantities called "thermodynamic potentials" are useful in the chemical thermodynamics of reactions and non-cyclic processes. They are internal energy, the enthalpy, the Helmoltz free energy and the Gibbs free energy. Enthalpy is defined by

$$H = U + PV$$

where P and V are the pressure and volume, and U is internal energy, Enthalpy is somewhat parallel to the first law of thermodynamics for a constant pressure system $Q = \Delta U + P\Delta V$ since in this case $Q = \Delta H$.

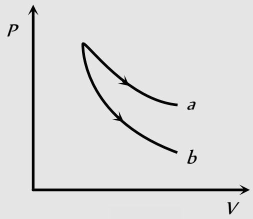
✍ **Confusion about FLOT**

It is typical for chemistry texts to write the first law as

$$\Delta U = \Delta Q + \Delta W$$

It is the same law, of course the thermodynamic expression of the conservation of energy principle. It is just that W is defined as the work done on the system instead of work done by the system. In the context of physics, the common scenario is one of adding heat to a volume of gas and using the expansion of that gas to do work, as in the pushing down of a piston in an internal combustion engine. In the context of chemical reactions and process, it may be more common to deal with situations where work is done on the system rather than by it.

✍ **Possibilities**



If $a \longrightarrow$ Isothermal then $b \longrightarrow$ Must be adiabatic

But If $b \longrightarrow$ adiabatic then it is not compulsory that a must be isothermal, it may be adiabatic also.

Ordinary Thinking

Objective Questions

First Law of Thermodynamics ($\Delta Q = \Delta U + \Delta W$)

1. First law of thermnodynamics is given by [CPMT 1977, 91]

(a) $dQ = dU + PdV$ (b) $dQ = dU \times PdV$

(c) $dQ = (dU + dV)P$ (d) $dQ = PdU + dV$

2. The internal energy of an ideal gas depends upon [RPMT 1997; MP PMT 1999; CPMT 2003]

(a) Specific volume (b) Pressure

(c) Temperature (d) Density

3. In changing the state of thermodynamics from A to B state, the heat required is Q and the work done by the system is W. The change in its internal energy is [MP PMT 1986; AMU (Med.) 2001]

(a) $Q + W$ (b) $Q - W$

(c) Q (d) $\frac{Q-W}{2}$

4. Heat given to a system is 35 joules and work done by the system is 15 *joules*. The change in the internal energy of the system will be

(a) – 50 J (b) 20 J

(c) 30 J (d) 50 J

5. The temperature of an ideal gas is kept constant as it expands. The gas does external work. During this process, the internal energy of the gas [MP PMT 1990]

(a) Decreases

(b) Increases

(c) Remains constant

(d) Depends on the molecular motion

6. The first law of thermodynamics is concerned with the conservation of [MP PMT 1987; CBSE PMT 1990, 92; AFMC 1997; CPMT 1999; BHU 1999; DCE 2000; BCECE 2003]

(a) Momentum (b) Energy

(c) Mass (d) Temperature

7. A thermodynamic system goes from states (i) P_1, V to $2P_1$, V (ii) P, V to P, $2V$. Then work done in the two cases is [MP PMT 1990]

(a) Zero, Zero (b) Zero, PV_1

(c) PV_1, Zero (d) PV_1, P_1V_1

8. If the amount of heat given to a system be 35 *joules* and the amount of work done by the system be -15 *joules*, then the change in the internal energy of the system is [MP PMT 1989]

(a) -50 *joules* (b) 20 *joules*

(c) 30 *joules* (d) 50 *joules*

9. A system is given 300 calories of heat and it does 600 *joules* of work. How much does the internal energy of the system change in this process

(J = 4.18 *joules/cal*) [MP PET 1991]

(a) 654 *Joule* (b) 156.5 *Joule*

(c) – 300 *Joule* (d) – 528.2 *Joule*

10. Work done on or by a gas, in general depends upon the

(a) Initial state only

(b) Final state only

(c) Both initial and final states only

(d) Initial state, final state and the path

11. If R = universal gas constant, the amount of heat needed to raise the temperature of 2 mole of an ideal monoatomic gas from 273K to 373K when no work is done [MP PET 1990]

(a) 100 R (b) 150 R

(c) 300 R (d) 500 R

12. Find the change in internal energy of the system when a system absorbs 2 *kilocalorie* of heat and at the same time does 500 *joule* of work [EAMCET 1984]

(a) 7900 J (b) 8200 J

(c) 5600 J (d) 6400 J

[MP PET/PMT 1988]

13. A system performs work ΔW when an amount of heat is ΔQ added to the system, the corresponding change in the internal energy is ΔU. A unique function of the initial and final states (irrespective of the mode of change) is

[CPMT 1981; J & KCET 2004]

(a) ΔQ (b) ΔW

(c) ΔU and ΔQ (d) ΔU

14. A container of volume $1m^3$ is divided into two equal compartments by a partition. One of these compartments contains an ideal gas at 300 *K*. The other compartment is vacuum. The whole system is thermally isolated from its surroundings. The partition is removed and the gas expands to occupy the whole volume of the container. Its temperature now would be [Manipal MEE 1995]

(a) 300 *K* (b) 239 *K*

(c) 200 *K* (d) 100 *K*

15. 110 *J* of heat is added to a gaseous system, whose internal energy change is 40 *J*, then the amount of external work done is [CBSE PMT 1993; DPMT 1996, 03; AFMC 1999; JIPMER 2000; MH CET 2000; Pb. PMT 2003]

(a) 150 *J* (b) 70 *J*

(c) 110 *J* (d) 40 *J*

16. Which of the following is not thermodynamical function

[CBSE PMT 1993; CPMT 2001; DCE 1996; 2001]

(a) Enthalpy (b) Work done

(c) Gibb's energy (d) Internal energy

17. When the amount of work done is 333 *cal* and change in internal energy is 167 *cal*, then the heat supplied is

[AFMC 1998]

(a) 166 *cal* (b) 333 *cal*

(c) 500 *cal* (d) 400 *cal*

18. First law thermodynamics states that [KCET 1999]

(a) System can do work

(b) System has temperature

(c) System has pressure

(d) Heat is a form of energy

19. A thermo-dynamical system is changed from state (P_1, V_1) to (P_2, V_2) by two different process. The quantity which will remain same will be [RPET 1999]

(a) ΔQ (b) ΔW

(c) $\Delta Q + \Delta W$ (d) $\Delta Q - \Delta W$

20. In thermodynamic process, 200 *Joules* of heat is given to a gas and 100 *Joules* of work is also done on it. The change in internal energy of the gas is [AMU (Engg.) 1999]

(a) 100 *J* (b) 300 *J*

(c) 419 *J* (d) 24 *J*

21. A perfect gas contained in a cylinder is kept in vacuum. If the cylinder suddenly bursts, then the temperature of the gas

[MH CET 1999]

(a) Remains constant (b) Becomes zero

(c) Increases (d) Decreases

22. If 150 *J* of heat is added to a system and the work done by the system is 110 *J*, then change in internal energy will be

[AMU (Engg.) 1999; BHU 2000]

(a) 260 *J* (b) 150 *J*

(c) 110 *J* (d) 40 *J*

23. If ΔQ and ΔW represent the heat supplied to the system and the work done on the system respectively, then the first law of thermodynamics can be written as [Roorkee 2000]

(a) $\Delta Q = \Delta U + \Delta W$ (b) $\Delta Q = \Delta U - \Delta W$

(c) $\Delta Q = \Delta W - \Delta U$ (d) $\Delta Q = -\Delta W - \Delta U$

where ΔU is the internal energy

24. For free expansion of the gas which of the following is true

[AMU (Med.) 2000]

(a) $Q = W = 0$ and $\Delta E_{int} = 0$

(b) $Q = 0, W > 0$ and $\Delta E_{int} = -W$

(c) $W = 0, Q > 0,$ and $\Delta E_{int} = Q$

(d) $W > 0, Q < 0$ and $\Delta E_{int} = 0$

25. Which of the following can not determine the state of a thermodynamic system [AFMC 2001]

(a) Pressure and volume

(b) Volume and temperature

(c) Temperature and pressure

(d) Any one of pressure, volume or temperature

26. Which of the following is not a thermodynamics co-ordinate

[AIIMS 2001]

(a) *P* (b) *T*

(c) *V* (d) *R*

27. In a given process for an ideal gas, $dW = 0$ and $dQ < 0$. Then for the gas [IIT-JEE (Screening) 2001]

(a) The temperature will decrease

(b) The volume will increase

(c) The pressure will remain constant

(d) The temperature will increase

28. The specific heat of hydrogen gas at constant pressure is $C_P = 3.4 \times 10^3 cal/kg\ ^oC$ and at constant volume is $C_V = 2.4 \times 10^3 cal/kg\ ^oC$. If one kilogram hydrogen gas is heated from 10^oC to 20^oC at constant pressure, the external work done on the gas to maintain it at constant pressure is

(a) 10^5 *cal* (b) 10^4 *cal*

(c) 10^3 *cal* (d) 5×10^3 *cal*

29. Which of the following parameters does not characterize the thermodynamic state of matter [CPMT 2001; AIEEE 2003]

(a) Volume (b) Temperature

(c) Pressure (d) Work

30. In a thermodynamic system working substance is ideal gas, its internal energy is in the form of **[MP PMT 2003]**

(a) Kinetic energy only

(b) Kinetic and potential energy

(c) Potential energy

(d) None of these

31. Which of the following statements is correct for any thermodynamic system **[AIEEE 2004]**

(a) The internal energy changes in all processes

(b) Internal energy and entropy are state functions

(c) The change in entropy can never be zero

(d) The work done in an adiabatic process is always zero

32. A system is provided with 200 cal of heat and the work done by the system on the surrounding is 40 *J*. Then its internal energy

(a) Increases by 600 *J* (b) Decreases by 800 *J*

(c) Increases by 800 *J* (d) Decreases by 50 *J*

33. In a thermodynamic process, pressure of a fixed mass of a gas is changed in such a manner that the gas molecules gives out 20 *J* of heat and 10 *J* of work is done on the gas. If the initial internal energy of the gas was 40 *J*, then the final internal energy will be

(a) 30 *J* (b) 20 *J*

(c) 60 *J* (d) 40 *J*

34. Heat is not being exchanged in a body. If its internal energy is increased, then **[RPMT 2002]**

(a) Its temperature will increase

(b) Its temperature will decrease

(c) Its temperature will remain constant

(d) None of these

35. Out of the following which quantity does not depend on path

(a) Temperature (b) Energy

(c) Work (d) None of these

36. First law of thermodynamics is a special case of **[CPMT 1985; RPET 2000; DCE 2000; CBSE PMT 2000; AIEEE 2002; AFMC 2002]**

(a) Newton's law

(b) Law of conservation of energy

(c) Charle's law

(d) Law of heat exchange

37. One mole of an ideal monoatomic gas is heated at a constant pressure of one atmosphere from 0^oC to 100^oC. Then the change in the internal energy is **[Pb. PMT 2001]**

(a) 6.56 *joules* (b) 8.32×10^2 *joules*

(c) 12.48×10^2 *joules* (d) 20.80 *joules*

38. If the ratio of specific heat of a gas at constant pressure to that at constant volume is γ, the change in internal energy of a mass of gas, when the volume changes from *V* to 2V constant pressure *p*, is

(a) $R/(\gamma-1)$ (b) pV

(c) $pV/(\gamma-1)$ (d) $\gamma pV/(\gamma-1)$

39. If $C_V = 4.96 cal/mole$ *K*, then increase in internal energy when temperature of 2 moles of this gas is increased from 340 *K* to 342 *K* **[RPET 1997]**

(a) 27.80 *cal* (b) 19.84 *cal*

(c) 13.90 *cal* (d) 9.92 *cal*

40. Temperature is a measurement of coldness or hotness of an object. This definition is based on **[RPET 2003]**

(a) Zeroth law of thermodynamics

(b) First law of thermodynamics

(c) Second law of thermodynamics

(d) Newton's law of cooling

41. When heat energy of 1500 *Joules*, is supplied to a gas at constant pressure $2.1\times10^5 N/m^2$, there was an increase in its volume equal to $2.5\times10^{-3} m^3$. The increase in internal energy of the gas in Joules is **[EAMCET (Engg.) 1999]**

[Orissa PMT 2004]

(a) 450 (b) 525

(c) 975 (d) 2025

42. If heat given to a system is 6 *kcal* and work done is 6 k*J*. Then change in internal energy is **[BHU Med. 2000]**

[DPMT 2004]

(a) 19.1 *kJ* (b) 12.5 *kJ*

(c) 25 *kJ* (d) Zero

43. In a thermodynamics process, pressure of a fixed mass of a gas is changed in such a manner that the gas releases 20 *J* of heat and 8*J* of work is done on the gas. If the initial internal energy of the gas was 30*J*. The final internal energy will be

(a) 18*J* (b) 9*J*

(c) 4.5*J* (d) 36*J*

44. A monoatomic gas of *n*-moles is heated from temperature *T* to *T* under two different conditions (i) at constant volume and (ii) at constant pressure. The change in internal energy of the gas is

[RPET 2002]

(a) More for (i)

(b) More for (ii)

(c) Same in both cases

(d) Independent of number of moles

45. The state of a thermodynamic system is represented by **[MH CET 2004]**

(a) Pressure only

(b) Volume only

(c) Pressure, volume and temperature

(d) Number of moles

46. A perfect gas goes from state *A* to another state *B* by absorbing $8\times10^5 J$ of heat and doing $6.5\times10^5 J$ of external work. It is now transferred between the same two states in another process in which it absorbs $10^5 J$ of heat. Then in the second process

[CBSE PMT 1998]

(a) Work done on the gas is $0.5\times10^5 J$

(b) Work done by gas is $0.5\times10^5 J$

(c) Work done on gas is $10^5 J$

(d) Work done by gas is $10^5 J$

47. If a system undergoes contraction of volume then the work done by the system will be **[BHU 1999]**

(a) Zero (b) Negligible

(c) Negative (d) Positive

48. Which of the following is *incorrect* regarding the first law of thermodynamics [AIEEE 2005]

(a) It introduces the concept of the internal energy

(b) It introduces the concept of the entropy

(c) It is not applicable to any cyclic process

(d) None of the above

Isothermal Process

1. For an ideal gas, in an isothermal process [BHU 1998]

(a) Heat content remains constant

(b) Heat content and temperature remain constant

(c) Temperature remains constant

(d) None of the above

2. Can two isothermal curves cut each other

(a) Never

(b) Yes

(c) They will cut when temperature is $0°C$

(d) Yes, when the pressure is critical pressure

3. In an isothermal expansion [KCET 2000; AFMC 2001]

(a) Internal energy of the gas increases

(b) Internal energy of the gas decreases

(c) Internal energy remains unchanged

(d) Average kinetic energy of gas molecule decreases

4. In an isothermal reversible expansion, if the volume of 96 *gm* of oxygen at $27°C$ is increased from 70 *litres* to 140 *litres*, then the work done by the gas will be

(a) $300\,R\log_{10}2$ (b) $81\,R\log_e 2$

(c) $900\,R\log_{10}2$ (d) $2.3\times900\,R\log_{10}2$

5. A vessel containing 5 *litres* of a gas at 0.8 *m* pressure is connected to an evacuated vessel of volume 3 *litres*. The resultant pressure inside will be (assuming whole system to be isolated)

(a) 4/3 *m* (b) 0.5 *m*

(c) 2.0 *m* (d) 3/4 *m*

6. For an isothermal expansion of a perfect gas, the value of $\frac{\Delta P}{P}$ is equal [CPMT 1980]

(a) $-\gamma^{1/2}\frac{\Delta V}{V}$ (b) $-\frac{\Delta V}{V}$

(c) $-\gamma\frac{\Delta V}{V}$ (d) $-\gamma^2\frac{\Delta V}{V}$

7. The gas law $\frac{PV}{T}=$ constant is true for

[MNR 1974; MP PMT 1984; BHU 1995, 98, 2000]

(a) Isothermal changes only

(b) Adiabatic changes only

(c) Both isothermal and adiabatic changes

(d) Neither isothermal nor adiabatic changes

8. One mole of O_2 gas having a volume equal to 22.4 *litres* at 0^oC and 1 atmospheric pressure in compressed isothermally so that its volume reduces to 11.2 *litres*. The work done in this process is

(a) $1672.5\,J$ (b) 1728 J

(c) $-1728J$ (d) $-1572.5\,J$

9. If a gas is heated at constant pressure, its isothermal compressibility

(a) Remains constant

(b) Increases linearly with temperature

(c) Decreases linearly with temperature

(d) Decreases inversely with temperature

10. Work done per mol in an isothermal change is

[RPMT 2004; BCECE 2005]

(a) $RT\log_{10}\frac{V_2}{V_1}$ (b) $RT\log_{10}\frac{V_1}{V_2}$

(c) $RT\log_e\frac{V_2}{V_1}$ (d) $RT\log_e\frac{V_1}{V_2}$

11. The isothermal Bulk modulus of an ideal gas at pressure P is

[CPMT 1974, 81; UPSEAT 1998; IIT 1998]

(a) P (b) γP

(c) $P/2$ (d) P/γ

12. In isothermal expansion, the pressure is determined by

[AFMC 1995]

(a) Temperature only

(b) Compressibility only

(c) Both temperature and compressibility

(d) None of these

13. The isothermal bulk modulus of a perfect gas at normal pressure is

(a) $1.013\times10^5\,N/m^2$ (b) $1.013\times10^6\,N/m^2$

(c) $1.,013\times10^{-11}\,N/m^2$ (d) $1.013\times10^{11}\,N/m^2$

14. In an isothermal change, an ideal gas obeys

[MP PMT 1993] [EAMCET 1994; CPMT 1999]

(a) Boyle's law (b) Charle's law

(c) Gaylussac law (d) None of the above

15. In isothermic process, which statement is wrong

[RPMT 1997]

(a) Temperature is constant

(b) Internal energy is constant

(c) No exchange of energy

(d) (a) and (b) are correct

16. An ideal gas A and a real gas B have their volumes increased from V to 2 V under isothermal conditions. The increase in internal energy

[CBSE PMT 1993; JIPMER 2001, 02]

(a) Will be same in both A and B

(b) Will be zero in both the gases

(c) Of B will be more than that of A

(d) Of A will be more than that of B

17. The specific heat of a gas in an isothermal process is

[AFMC 1998]

(a) Infinite (b) Zero

(c) Negative (d) Remains constant

18. A thermally insulated container is divided into two parts by a screen. In one part the pressure and temperature are P and T for an ideal gas filled. In the second part it is vacuum. If now a small hole is created in the screen, then the temperature of the gas will

(a) Decrease (b) Increase
(c) Remain same (d) None of the above

19. A container that suits the occurrence of an isothermal process should be made of [Pb. PMT 2000]

(a) Copper (b) Glass
(c) Wood (d) Cloth

20. In an isothermal process the volume of an ideal gas is halved. One can say that [MP PMT 2004]

(a) Internal energy of the system decreases
(b) Work done by the gas is positive
(c) Work done by the gas is negative
(d) Internal energy of the system increases

21. A thermodynamic process in which temperature T of the system remains constant though other variable P and V may change, is called [Pb. PMT 2004]

(a) Isochoric process (b) Isothermal process
(c) Isobaric process (d) None of these

22. If an ideal gas is compressed isothermally then [RPMT 2003]

(a) No work is done against gas
(b) Heat is relased by the gas
(c) The internal energy of gas will increase
(d) Pressure does not change

23. When an ideal gas in a cylinder was compressed isothermally by a piston, the work done on the gas was found to be 1.5×10^4 *joules*. During this process about

[MP PMT 1987]

(a) 3.6×10^3 *cal* of heat flowed out from the gas
(b) 3.6×10^3 *cal* of heat flowed into the gas
(c) 1.5×10^4 *cal* of heat flowed into the gas
(d) 1.5×10^4 *cal* of heat flowed out from the gas

24. When heat is given to a gas in an isothermal change, the result will be [MP PET 1995; RPMT 1997]

(a) External work done
(b) Rise in temperature
(c) Increase in internal energy
(d) External work done and also rise in temp.

25. When 1 *gm* of water at 0^oC and $1 \times 10^5\ N/m^2$ pressure is converted into ice of volume $1.091\ cm^2$, the external work done will be

(a) 0.0091 *joule* (b) 0.0182 *joule*
(c) – 0.0091 *joule* (d) – 0.0182 *joule*

26. The latent heat of vaporisation of water is 2240 *J/gm*. If the work done in the process of expansion of 1 *g* is 168 *J*, then increase in internal energy is [Pb. PET 1998; CPMT 2000]

(a) 2408 *J* (b) 2240 *J*
(c) 2072 *J* (d) 1904 *J*

27. 540 *calories* of heat convert 1 cubic centimeter of water at 100^oC into 1671 cubic centimeter of steam at 100^oC at a pressure of one atmosphere. Then the work done against the atmospheric pressure is nearly [RPET 1999]

(a) 540 *cal* (b) 40 *cal*
(c) Zero *cal* (d) 500 *cal*

28. One mole of an ideal gas expands at a constant temperature of 300 *K* from an initial volume of 10 *litres* to a final volume of 20 *litres*. The work done in expanding the gas is

(R = 8.31 *J/mole-K*) [MP PMT 1995; UPSEAT 2000]

(a) 750 *joules* (b) 1728 *joules*
(c) 1500 *joules* (d) 3456 *joules*

29. A cylinder fitted with a piston contains 0.2 *moles* of air at temperature 27°*C*. The piston is pushed so slowly that the air within the cylinder remains in thermal equilibrium with the surroundings. Find the approximate work done by the system if the final volume is twice the initial volume

[BHU (Med.) 2000]

(a) 543 *J* (b) 345 *J*
(c) 453 *J* (d) 600 *J*

30. The volume of an ideal gas is 1 litre and its pressure is equal to 72*cm* of mercury column. The volume of gas is made 900 *cm* by compressing it isothermally. The stress of the gas will be

(a) 8 *cm* (mercury) (b) 7 *cm* (mercury)
(c) 6 *cm* (mercury) (d) 4 *cm* (mercury)

31. During an isothermal expansion of an ideal gas

[UPSEAT 2005]

(a) Its internal energy decreases
(b) Its internal energy does not change
(c) The work done by the gas is equal to the quantity of heat absorbed by it
(d) Both (b) and (c) are correct

Adiabatic Process

1. If a cylinder containing a gas at high pressure explodes, the gas undergoes [MP PET/PMT 1988]

(a) Reversible adiabatic change and fall of temperature
(b) Reversible adiabatic change and rise of temperature
(c) Irreversible adiabatic change and fall of temperature
(d) Irreversible adiabatic change and rise of temperature

2. The work done in an adiabatic change in a gas depends only on [CPMT 1971; MP

(a) Change is pressure (b) Change is volume
(c) Change in temperature (d) None of the above

3. In adiabatic expansion [DPMT 1999]

(a) $\Delta U = 0$ (b) $\Delta U =$ negative
(c) $\Delta U =$ positive (d) $\Delta W =$ zero

4. The pressure in the tyre of a car is four times the atmospheric pressure at 300 *K*. If this tyre suddenly bursts, its new temperature will be $(\gamma = 1.4)$

[RPMT 1996; MP PMT 1990]

(a) $300\,(4)^{1.4/0.4}$ (b) $300\left(\frac{1}{4}\right)^{-0.4/1.4}$
(c) $300\,(2)^{-0.4/1.4}$ (d) $300\,(4)^{-0.4/1.4}$

5. A gas at NTP is suddenly compressed to one-fourth of its original volume. If γ is supposed to be $\frac{3}{2}$, then the final pressure is

(a) 4 atmosphere (b) $\frac{3}{2}$ atmosphere

(c) 8 atmosphere (d) $\frac{1}{4}$ atmosphere

6. A monoatomic gas $(\gamma = 5/3)$ is suddenly compressed to $\frac{1}{8}$ of its original volume adiabatically, then the pressure of the gas will change to [CPMT 1976, 83; MP PMT 1994; DPMT 1996; Roorkee 2000; KCET 2000; Pb. PMT 1999, 2001]

(a) $\frac{24}{5}$

(b) 8

(c) $\frac{40}{3}$

(d) 32 times its initial pressure

7. The pressure and density of a diatomic gas $(\gamma = 7/5)$ change adiabatically from (P, d) to (P', d'). If $\frac{d'}{d} = 32$, then $\frac{P'}{P}$ should be [CPMT 1982; EAMCET 2001]

(a) 1/128 (b) 32

(c) 128 (d) None of the above

8. An ideal gas at 27^oC is compressed adiabatically to $\frac{8}{27}$ of its original volume. If $\gamma = \frac{5}{3}$, then the rise in temperature is [CPMT 1984; CBSE PMT 1999; DPMT 2000; BHU 2001; Pb. PET 2001; UPSEAT 2002, 03; KCET 2003;]

(a) 450 K (b) 375 K

(c) 225 K (d) 405 K

9. Two identical samples of a gas are allowed to expand (i) isothermally (ii) adiabatically. Work done is [MNR 1998]

(a) More in the isothermal process

(b) More in the adiabatic process

(c) Neither of them

(d) Equal in both processes

10. Which is the correct statement [MP PMT 1993]

(a) For an isothermal change PV = constant

(b) In an isothermal process the change in internal energy must be equal to the work done

(c) For an adiabatic change $\frac{P_2}{P_1} = \left(\frac{V_2}{V_1}\right)^\gamma$, where γ is the ratio of specific heats

(d) In an adiabatic process work done must be equal to the heat entering the system

11. The slopes of isothermal and adiabatic curves are related as [CPMT 1971; BHU 1996; MH CET 1999; UPSEAT 2000; RPET 2003]

(a) Isothermal curve slope = adiabatic curve slope

(b) Isothermal curve slope = $\gamma \times$ adiabatic curve slope

(c) Adiabatic curve slope = $\gamma \times$ isothermal curve slope

(d) Adiabatic curve slope = $\frac{1}{2} \times$ isothermal curve slope [BHU 1995]

12. Pressure-temperature relationship for an ideal gas undergoing adiabatic change is $(\gamma = C_p / C_v)$

[CPMT 1992; MP PMT 1986, 87, 94, 97; Pb. PET 1998; DCE 2001; MP PET 2001; UPSEAT 1999, 2001; AFMC 2002]

(a) PT^γ = constant (b) $PT^{-1+\gamma}$ = constant

(c) $P^{\gamma-1}T^\gamma$ = constant (d) $P^{1-\gamma}T^\gamma$ = constant

13. The amount of work done in an adiabatic expansion from temperature T to T_1 is [MP PMT 1989]

(a) $R(T - T_1)$ (b) $\frac{R}{\gamma - 1}(T - T_1)$

(c) RT (d) $R(T - T_1)(\gamma - 1)$

14. During the adiabatic expansion of 2 moles of a gas, the internal energy of the gas is found to decrease by 2 *joules*, the work done during the process on the gas will be equal to

[CPMT 1988]

(a) $+1\ J$ (b) $-1\ J$

(c) $2\ J$ (d) $-2\ J$

15. The adiabatic elasticity of hydrogen gas $(\gamma = 1.4)$ at NTP is

[MP PMT 1990]

(a) $1 \times 10^5\ N/m^2$ (b) $1 \times 10^{-8}\ N/m2$

(c) $1.4\ N/m^2$ (d) $1.4 \times 10^5\ N/m^2$

16. If γ denotes the ratio of two specific heats of a gas, the ratio of slopes of adiabatic and isothermal PV curves at their point of intersection is

[NCERT 1990; MH CET 1999; MP PMT 2000]

(a) $1/\gamma$ (b) γ

(c) $\gamma - 1$ (d) $\gamma + 1$

17. Air in a cylinder is suddenly compressed by a piston, which is then maintained at the same position. With the passage of time [NCERT 1971; DPMT 1

KCET 2000; AIIMS 2000; MH CET 2001]

(a) The pressure decreases

(b) The pressure increases

(c) The pressure remains the same

(d) The pressure may increase or decrease depending upon the nature of the gas

18. When a gas expands adiabatically [CPMT 1990]

(a) No energy is required for expansion

(b) Energy is required and it comes from the wall of the container of the gas

(c) Internal energy of the gas is used in doing work

(d) Law of conservation of energy does not hold

19. One *gm* mol of a diatomic gas $(\gamma = 1.4)$ is compressed adiabatically so that its temperature rises from 27^oC to 127^oC. The work done will be

(a) 2077.5 *joules* (b) 207.5 *joules*

(c) 207.5 *ergs* (d) None of the above

20. Compressed air in the tube of a wheel of a cycle at normal temperature suddenly starts coming out from a puncture. The air inside [NCERT 1970]

(a) Starts becoming hotter
(b) Remains at the same temperature
(c) Starts becoming cooler
(d) May become hotter or cooler depending upon the amount of water vapour present

21. The adiabatic Bulk modulus of a perfect gas at pressure is given by [CPMT 1982; MH CET 2001]

(a) P (b) $2P$
(c) $P/2$ (d) γP

22. An adiabatic process occurs at constant [MNR 1985; AFMC 1996; AIIMS 1999; UPSEAT 1999, 2000; Pb. PET 2004]

(a) Temperature
(b) Pressure
(c) Heat
(d) Temperature and pressure

23. A polyatomic gas $\left(\gamma = \frac{4}{3}\right)$ is compressed to $\frac{1}{8}$ of its volume adiabatically. If its initial pressure is P_o, its new pressure will be [MP PET 1994; BHU 1995]

(a) $8P_o$ (b) $16P_0$
(c) $6P_o$ (d) $2P_o$

24. For adiabatic processes $\left(\gamma = \frac{C_p}{C_v}\right)$ [KCET 1999; MP PET 1995; CPMT 2003]

(a) $P^{\gamma}V$ = constant (b) $T^{\gamma}V$ = constant
(c) $TV^{\gamma-1}$ =constant (d) TV^{γ} = constant

25. An ideal gas is expanded adiabatically at an initial temperature of 300 *K* so that its volume is doubled. The final temperature of the hydrogen gas is $(\gamma = 1.40)$ [MP PMT 1995; DPMT 1999]

(a) 227.36 *K* (b) 500.30 *K*
(c) 454.76 *K* (d) $-47^o C$

26. A given system undergoes a change in which the work done by the system equals the decrease in its internal energy. The system must have undergone an [Haryana CEE 1996; UPSEAT 2003]

(a) Isothermal change (b) Adiabatic change
(c) Isobaric change (d) Isochoric change

27. During the adiabatic expansion of 2 moles of a gas, the internal energy was found to have decreased by 100 *J*. The work done by the gas in this process is [MP PET 1996, 97]

(a) Zero (b) –100 *J*
(c) 200 *J* (d) 100 *J*

28. In an adiabatic expansion of a gas initial and final temperatures are T_1 and T_2 respectively, then the change in internal energy of the gas is [MP PET 1997]

(a) $\frac{R}{\gamma-1}(T_2 - T_1)$ (b) $\frac{R}{\gamma-1}(T_1 - T_2)$
(c) $R(T_1 - T_2)$ (d) Zero

29. Helium at $27^o C$ has a volume of 8 *litres*. It is suddenly compressed to a volume of 1 *litre*. The temperature of the gas will be $[\gamma = 5/3]$ [CBSE PMT 1993; MP PMT 1999; Pb. PMT 2002]

(a) $108^o C$ (b) $9327^o C$
(c) $1200^o C$ (d) $927^o C$

30. A cycle tyre bursts suddenly. This represents an [SCRA 1994]

(a) Isothermal process (b) Isobaric process
(c) Isochoric process (d) Adiabatic process

31. One mole of helium is adiabatically expanded from its initial state (P_i, V_i, T_i) to its final state (P_f, V_f, T_f). The decrease in the internal energy associated with this expansion is equal to [SCRA 1994; BHU 2002]

(a) $C_V(T_i - T_f)$ (b) $C_P(T_i - T_f)$
(c) $\frac{1}{2}(C_P + C_V)(Ti - T_f)$ (d) $(C_P - C_V)(T_i - T_f)$

32. At N.T.P. one mole of diatomic gas is compressed adiabatically to half of its volume $\gamma = 1.41$. The work done on gas will be

(a) 1280 *J* (b) 1610 *J*
(c) 1815 *J* (d) 2025 *J*

33. For adiabatic process, wrong statement is [RPMT 1997]

(a) $dQ = 0$ (b) $dU = -dW$
(c) Q = constant (d) Entropy is not constant

34. A diatomic gas initially at 18°*C* is compressed adiabatically to one-eighth of its original volume. The temperature after compression will be [Pb. PET 1995; CBSE PMT 1996; CPMT 1999]

(a) $10^o C$ (b) $887^o C$
(c) $668K$ (d) $144^o C$

35. A gas is being compressed adiabatically. The specific heat of the gas during compression is [SCRA 1996]

(a) Zero (b) Infinite
(c) Finite but non-zero (d) Undefined

36. The process in which no heat enters or leaves the system is termed as [Pb. PET 1996; BHU 1998; BCECE 2003]

(a) Isochoric (b) Isobaric
(c) Isothermal (d) Adiabatic

37. Two moles of an ideal monoatomic gas at $27^o C$ occupies a volume of *V*. If the gas is expanded adiabatically to the volume $2V$, then the work done by the gas will be $[\gamma = 5/3, R = 8.31 J/mol\,K]$ [RPET 1999]

(a) $-2767.23J$ (b) $2767.23J$
(c) $2500J$ (d) $-2500J$

38. At $27^o C$ a gas is suddenly compressed such that its pressure becomes $\frac{1}{8}th$ of original pressure. Temperature of the gas will be $(\gamma = 5/3)$ [BHU 2000]

(a) $420K$ (b) $327^o C$

(c) $300K$ (d) $-142^o C$

39. $\Delta U + \Delta W = 0$ is valid for [RPMT 2000]

(a) Adiabatic process (b) Isothermal process

(c) Isobaric process (d) Isochoric process

40. An ideal gas at a pressures of 1 atmosphere and temperature of $27^o C$ is compressed adiabatically until its pressure becomes 8 times the initial pressure, then the final temperature is (γ = 3/2) [EAMCET (Engg.)2000]

(a) $627^o C$ (b) $527^o C$

(c) $427^o C$ (d) $327^o C$

41. Air is filled in a motor tube at $27^o C$ and at a pressure of 8 atmospheres. The tube suddenly bursts, then temperature of air is [Given γ of air $= 1.5$] [MP PMT 2002]

(a) $27.5^o C$ (b) $75^o K$

(c) $150 K$ (d) $150^o C$

42. If $\gamma = 2.5$ and volume is equal to $\frac{1}{8}$ times to the initial volume then pressure P' is equal to (Initial pressure = P) [RPET 2003]

(a) $P' = P$ (b) $P' = 2P$

(c) $P' = P \times (2)^{15/2}$ (d) $P' = 7P$

43. In an adiabatic process, the state of a gas is changed from $P_1, V_1, T_1,$ to P_2, V_2, T_2. Which of the following relation is correct [Orissa JEE 2003]

(a) $T_1 V_1^{\gamma-1} = T_2 V_2^{\gamma-1}$ (b) $P_1 V_1^{\gamma-1} = P_2 V_2^{\gamma-1}$

(c) $T_1 P_1^{\gamma} = T_2 P_2^{\gamma}$ (d) $T_1 V_1^{\gamma} = T_2 V_2^{\gamma}$

44. During an adiabatic process, the pressure of a gas is found to be proportional to the cube of its absolute temperature. The ratio C_p / C_v for the gas is [AIEEE 2003]

(a) $\frac{3}{2}$ (b) $\frac{4}{3}$

(c) 2 (d) $\frac{5}{3}$

45. In adiabatic expansion of a gas [BCECE 2001; MP PET 2003]

(a) Its pressure increases

(b) Its temperature falls

(c) Its density increases

(d) Its thermal energy increases

46. One mole of an ideal gas at an initial temperature of T K does 6 R joules of work adiabatically. If the ratio of specific heats of this gas at constant pressure and at constant volume is 5/3, the final temperature of gas will be [CBSE PMT 2004]

(a) $(T + 2.4)K$ (b) $(T - 2.4)K$

(c) $(T + 4)K$ (d) $(T - 4)K$

47. A gas is suddenly compressed to 1/4 th of its original volume at normal temperature. The increase in its temperature is $(\gamma = 1.5)$

(a) 273 K (b) 573 K

(c) 373 K (d) 473 K

48. A gas $(\gamma = 1.3)$ is enclosed in an insulated vessel fitted with insulating piston at a pressure of $10^5 \, N/m^2$. On suddenly pressing the piston the volume is reduced to half the initial volume. The final pressure of the gas is [RPET 2002]

(a) $2^{0.7} \times 10^5$ (b) $2^{1.3} \times 10^5$

(c) $2^{1.4} \times 10^5$ (d) None of these

49. The internal energy of the gas increases In [MP PMT 1989; RPMT 2001]

(a) Adiabatic expansion (b) Adiabatic compression

(c) Isothermal expansion (d) Isothermal compression

50. We consider a thermodynamic system. If ΔU represents the increase in its internal energy and W the work done by the system, which of the following statements is true [CBSE PMT 1998]

(a) $\Delta U = -W$ in an adiabatic process

(b) $\Delta U = W$ in an isothermal process

(c) $\Delta U = -W$ in an isothermal process

(d) $\Delta U = W$ in an adiabatic process

51. A gas is suddenly compressed to one fourth of its original volume. What will be its final pressure, if its initial pressure is P [Pb. PET 2002]

(a) Lesss than P (b) More than P

(c) P (d) Either (a) or (c)

52. A gas for which $\gamma = 1.5$ is suddenly compressed to $\frac{1}{4}th$ of the initial volume. Then the ratio of the final to the initial pressure is [EAMCET 200

(a) 1 : 16 (b) 1 : 8

(c) 1 : 4 (d) 8 : 1

53. One mole of an ideal gas with $\gamma = 1.4$, is adiabatically compressed so that its temperature rises from 27°C to 35°C. The change in the internal energy of the gas is $(R = 8.3 \, J/mol.K)$ [EAMCET 2001]

(a) –166 J (b) 166 J

(c) –168 J (d) 168 J

54. The volume of a gas is reduced adiabatically to $\frac{1}{4}$ of its volume at 27°C, if the value of $\gamma = 1.4$, then the new temperature will be

(a) $350 \times 4^{0.4} K$ (b) $300 \times 4^{0.4} K$

(c) $150 \times 4^{0.4} K$ (d) None of these

55. During an adiabatic expansion of 2 moles of a gas, the change in internal energy was found –50J. The work done during the process is [Pb. PET 1996]

(a) Zero (b) 100J

(c) – 50J (d) 50J

56. Adiabatic modulus of elasticity of a gas is $2.1 \times 10^5 \, N/m^2$. What will be its isothermal modulus of elasticity $\left(\frac{C_p}{C_v} = 1.4\right)$

[UPSEAT 1999]

(a) $1.8\times10^5\,N/m^2$ (b) $1.5\times10^5\,N/m^2$

(c) $1.4\times10^5\,N/m^2$ (d) $1.2\times10^5\,N/m^2$

57. For an adiabatic expansion of a perfect gas, the value of $\frac{\Delta P}{P}$ is equal to [CPMT 1983; MP PMT 1990]

(a) $-\sqrt{\gamma}\,\frac{\Delta V}{V}$ (b) $-\frac{\Delta V}{V}$

(c) $-\gamma\,\frac{\Delta V}{V}$ (d) $-\gamma^2\,\frac{\Delta V}{V}$

Isobaric and Isochoric Processes

1. A gas expands under constant pressure P from volume V_1 to V_2. The work done by the gas is

[CBSE PMT 1990; RPMT 2003]

(a) $P(V_2-V_1)$ (b) $P(V_1-V_2)$

(c) $P(V_1^\gamma-V_2^\gamma)$ (d) $P\,\frac{V_1V_2}{V_2-V_1}$

2. When heat in given to a gas in an isobaric process, then

[DPMT 2001]

(a) The work is done by the gas

(b) Internal energy of the gas increases

(c) Both (a) and (b)

(d) None from (a) and (b)

3. One mole of a perfect gas in a cylinder fitted with a piston has a pressure *P*, volume *V* and temperature *T*. If the temperature is increased by 1 *K* keeping pressure constant, the increase in volume is

(a) $\frac{2V}{273}$ (b) $\frac{V}{91}$

(c) $\frac{V}{273}$ (d) V

4. A gas is compressed at a constant pressure of $50N/m^2$ from a volume of $10m^3$ to a volume of $4m^3$. Energy of 100 *J* then added to the gas by heating. Its internal energy is

[MNR 1994]

(a) Increased by 400 *J* (b) Increased by 200 *J*

(c) Increased by 100 *J* (d) Decreased by 200 *J*

5. Work done by air when it expands from 50 *litres* to 150 *litres* at a constant pressure of 2 atmosphere is

(a) 2×10^4 *joules* (b) 2×100 *joules*

(c) $2\times10^5\times100$ *joules* (d) $2\times10^{-5}\times100$ joules

6. Work done by 0.1 mole of a gas at 27^oC to double its volume at constant pressure is (R = 2 *cal mol*$^{-1}$ *C*$^{-1}$)

[EAMCET 1994]

(a) 54 *cal* (b) 600 *cal*

(c) 60 *cal* (d) 546 *cal*

7. Unit mass of a liquid with volume V_1 is completely changed into a gas of volume V_2 at a constant external pressure P and temperature *T*. If the latent heat of evaporation for the given mass is *L*, then the increase in the internal energy of the system is

(a) Zero (b) $P(V_2-V_1)$

(c) $L-P(V_2-V_1)$ (d) L

8. A gas expands $0.25m^3$ at constant pressure $10^3\,N/m^2$, the work done is

[CPMT 1997; UPSEAT 1999; JIPMER 2001, 02]

(a) 2.5 *ergs* (b) 250 *J*

(c) 250 *W* (d) 250 *N*

9. Two kg of water is converted into steam by boiling at atmospheric pressure. The volume changes from $2\times10^{-3}\,m^3$ to $3.34m^3$. The work done by the system is about

(a) – 340 *kJ* (b) – 170 *kJ*

(c) 170 *kJ* (d) 340 *kJ*

10. An ideal gas has volume V_0 at 27^oC. It is heated at constant pressure so that its volume becomes $2V_0$. The final temperature is

[BCECE 2003]

(a) 54^oC (b) 32.6^oC

(c) $327\,°C$ (d) 150 *K*

11. If 300 *ml* of a gas at 27^oC is cooled to 7^oC at constant pressure, then its final volume will be

[Pb. PET 1999; BHU 2003; CPMT 2004]

(a) 540 *ml* (b) 350 *ml*

(c) 280 *ml* (d) 135 *ml*

12. Which of the following is correct in terms of increasing work done for the same initial and final state [RPMT 1996]

(a) Adiabatic < Isothermal < Isobaric

(b) Isobaric < Adiabatic < Isothermal

(c) Adiabatic < Isobaric < Isothermal

(d) None of these

13. A sample of gas expands from volume V_1 to V_2. The amount of work done by the gas is greatest when the expansion is

[CBSE PMT 1997; AIIMS 1998; JIPMER 2000]

(a) Isothermal (b) Isobaric

(c) Adiabatic (d) Equal in all cases

14. Which of the following is a slow process [J & K CET 2000]

(a) Isothermal (b) Adiabatic

(c) Isobaric (d) None of these

15. How much work to be done in decreasing the volume of and ideal gas by an amount of $2.4\times10^{-4}m^3$ at normal temperature and constant normal pressure of $1\times10^5\,N/m^2$

[UPSEAT 1999]

(a) 28 *joule* (b) 27 *joule*

(c) 25 *joule* (d) 24 *joule*

16. A Container having 1 mole of a gas at a temperature 27°*C* has a movable piston which maintains at constant pressure in container of 1 *atm*. The gas is compressed until temperature becomes 127°*C*. The work done is (C_p for gas is 7.03 *cal/mol K*)

(a) 703 *J* (b) 814 *J*

(c) 121 *J* (d) 2035 *J*

17. In a reversible isochoric change [NCERT 1990]

[Roorkee 1999]

(a) $\Delta W = 0$ (b) $\Delta Q = 0$

(c) $\Delta T = 0$ (d) $\Delta U = 0$

18. Entropy of a thermodynamic system does not change when this system is used for [AIIMS 1995]

(a) Conduction of heat from a hot reservoir to a cold reservoir

(b) Conversion of heat into work isobarically

(c) Conversion of heat into internal energy isochorically

(d) Conversion of work into heat isochorically

19. The work done in which of the following processes is zero [UPSEAT 2003]

(a) Isothermal process (b) Adiabatic process

(c) Isochoric process (d) None of these

20. In which thermodynamic process, volume remains same [Orissa PMT 2004]

(a) Isobaric (b) Isothermal

(c) Adiabatic (d) Isochoric

21. In an isochoric process if $T_1 = 27^o C$ and $T_2 = 127^o C$, then P_1 / P_2 will be equal to [RPMT 2003]

(a) 9 / 59 (b) 2 / 3

(c) 3 / 4 (d) None of these

22. Which is incorrect [DCE 2001]

(a) In an isobaric process, $\Delta p = 0$

(b) In an isochoric process, $\Delta W = 0$

(c) In an isothermal process, $\Delta T = 0$

(d) In an isothermal process, $\Delta Q = 0$

23. Which relation is correct for isometric process [RPMT 2001; BCECE 2003]

(a) $\Delta Q = \Delta U$ (b) $\Delta W = \Delta U$

(c) $\Delta Q = \Delta W$ (d) None of these

Heat Engine, Refrigerator and Second Law of Thermodynamics

1. A Carnot engine working between $300\ K$ and 600*K* has work output of 800 *J* per cycle. What is amount of heat energy supplied to the engine from source per cycle [DPMT 1999; Pb. PMT 2002, 05; Kerala PMT 2004]

(a) 1800 *J/cycle* (b) 1000 *J/cycle*

(c) 2000 *J/cycle* (d) 1600 *J/cycle*

2. The coefficient of performance of a Carnot refrigerator working between $30^o C$ and $0^o C$ is [UPSEAT 2002]

(a) 10 (b) 1

(c) 9 (d) 0

3. If the door of a refrigerator is kept open, then which of the following is true [DPMT 2001; BHU 2001; JIPMER 2002; AIEEE 2002; CPMT 2003]

(a) Room is cooled

(b) Room is heated

(c) Room is either cooled or heated

(d) Room is neither cooled nor heated

4. In a cyclic process, the internal energy of the gas

(a) Increases (b) Decreases

(c) Remains constant (d) Becomes zero

5. Irreversible process is

(a) Adiabatic process

(b) Joule-Thomson expansion

(c) Ideal isothermal process

(d) None of the above

6. For a reversible process, necessary condition is

(a) In the whole cycle of the system, the loss of any type of heat energy should be zero

(b) That the process should be too fast

(c) That the process should be slow so that the working substance should remain in thermal and mechanical equilibrium with the surroundings

(d) The loss of energy should be zero and it should be *quasistatic*

7. In a cyclic process, work done by the system is [BHU 2002]

(a) Zero

(b) Equal to heat given to the system

(c) More than the heat given to system

(d) Independent of heat given to the system

8. An ideal gas heat engine operates in a Carnot's cycle between $227^o C$ and $127^o C$. It absorbs 6×10^4 *J* at high temperature. The amount of heat converted into work is .... [KCET 2004]

(a) $4.8 \times 10^4\ J$ (b) $3.5 \times 10^4\ J$

(c) $1.6 \times 10^4\ J$ (d) $1.2 \times 10^4\ J$

9. An ideal heat engine exhausting heat at $77^o C$ is to have a 30% efficiency. It must take heat at [BCECE 2004]

(a) $127^o C$ (b) $227^o C$

(c) $327^o C$ (d) $673^o C$

10. Efficiency of Carnot engine is 100% if [Pb. PET 2000]

(a) $T_2 = 273\ K$ (b) $T_2 = 0\ K$

(c) $T_1 = 273\ K$ (d) $T_1 = 0\ K$

11. A Carnot's engine used first an ideal monoatomic gas then an ideal diatomic gas. If the source and sink temperature are $411^o C$ and $69^o C$ respectively and the engine extracts 1000 *J* of heat in each cycle, then area enclosed by the *PV* diagram is

(a) 100 *J* (b) 300 *J*

(c) 500 *J* (d) 700 *J*

12. A Carnot engine absorbs an amount Q of heat from a reservoir at an absolute temperature T and rejects heat to a sink at a temperature of *T*/3. The amount of heat rejected is [UPSEAT 2004]

(a) $Q / 4$ (b) $Q / 3$

(c) $Q / 2$ (d) $2Q / 3$

13. The temperature of sink of Carnot engine is $27^o C$. Efficiency of engine is 25%. Then temperature of source is

[DCE 2002; CPMT 2002]

(a) $227^o C$ (b) $327^o C$

(c) $127^o C$ (d) $27^o C$

14. The temperature of reservoir of Carnot's engine operating with an efficiency of 70% is 1000*K*. The temperature of its sink is

(a) 300 *K* (b) 400 *K*

(c) 500 *K* (d) 700 *K*

15. In a Carnot engine, when $T_2 = 0^o C$ and $T_1 = 200^o C$, its efficiency is η_1 and when $T_1 = 0\ ^o C$ and $T_2 = -200\ ^o C$, Its efficiency is η_2, then what is η_1 / η_2 [DCE 2004]

(a) 0.577 (b) 0.733

(c) 0.638 (d) Can not be calculated

16. The efficiency of Carnot's engine operating between reservoirs, maintained at temperatures $27^o C$ and $-123^o C$, is

(a) 50% (b) 24%

(c) 0.75% (d) 0.4%

17. A Carnot engine operates between $227^o C$ and $27^o C$. Efficiency of the engine will be [DCE 1999; BHU 2004]

(a) $\frac{1}{3}$ (b) $\frac{2}{5}$

(c) $\frac{3}{4}$ (d) $\frac{3}{5}$

18. A measure of the degree of disorder of a system is known as

[Pb. PET 1997; MH CET 1999]

(a) Isobaric (b) Isotropy

(c) Enthalpy (d) Entropy

19. A carnot engine has the same efficiency between 800 *K* to 500 *K* and *x K* to 600 *K*. The value of *x* is

[Pb. PMT 1996; CPMT 1996]

(a) 1000 *K* (b) 960 *K*

(c) 846 *K* (d) 754 *K*

20. A scientist says that the efficiency of his heat engine which operates at source temperature 127°*C* and sink temperature 27°*C* is 26%, then [CBSE PMT 2001]

(a) It is impossible

(b) It is possible but less probable

(c) It is quite probable

(d) Data are incomplete

21. A Carnot's engine is made to work between 200°*C* and 0°*C* first and then between 0°*C* and –200°*C*. The ratio of efficiencies of the engine in the two cases is [KCET 2002]

(a) 1.73 : 1 (b) 1 : 1.73

(c) 1 : 1 (d) 1 : 2

22. Efficiency of a Carnot engine is 50% when temperature of outlet is 500 *K*. In order to increase efficiency up to 60% keeping temperature of intake the same what is temperature of outlet [CBSE PMT 2002]

(a) 200 *K* (b) 400 *K*

(c) 600 *K* (d) 800 *K*

23. Even Carnot engine cannot give 100% efficiency because we cannot[AIEEE 2002]

(a) Prevent radiation

(b) Find ideal sources

(c) Reach absolute zero temperature

(d) Eliminate friction

24. "Heat cannot by itself flow from a body at lower temperature to a body at higher temperature" is a statement or consequence of [AIEEE 2003, EAM

(a) Second law of thermodynamics

(b) Conservation of momentum [DCE 2003]

(c) Conservation of mass

(d) First law of thermodynamics

25. A Carnot engine takes $3 \times 10^6\ cal.$ of heat from a reservoir at 627°*C*, and gives it to a sink at 27°*C*. The work done by the engine is [AIEEE 2003]

(a) $4.2 \times 10^6\ J$ (b) $8.4 \times 10^6\ J$

(c) $16.8 \times 10^6\ J$ (d) Zero

26. The first operation involved in a Carnot cycle is

[AFMC 1998]

[DPMT 2002, 03; BVP 2004]

(a) Isothermal expansion (b) Adiabatic expansion

(c) Isothermal compression (d) Adiabatic compression

27. For which combination of working temperatures the efficiency of Carnot's engine is highest [KCET 2000]

(a) 80 *K*, 60 *K* (b) 100 *K*, 80 *K*

(c) 60 *K*, 40 *K* (d) 40 *K*, 20 *K*

28. The efficiency of Carnot engine when source temperature is *T* and sink temperature is *T* will be [DCE 2000]

(a) $\frac{T_1 - T_2}{T_1}$ (b) $\frac{T_2 - T_1}{T_2}$

(c) $\frac{T_1 - T_2}{T_2}$ (d) $\frac{T_1}{T_2}$

29. An ideal heat engine working between temperature *T* and *T* has an efficiency η, the new efficiency if both the source and sink temperature are doubled, will be [DPMT 2000]

(a) $\frac{\eta}{2}$ (b) η

(c) 2η (d) 3η

30. An ideal refrigerator has a freezer at a temperature of $-13°C$. The coefficient of performance of the engine is 5. The temperature of the air (to which heat is rejected) will be

[BHU 2000; CPMT 2002]

(a) 325°*C* (b) 325*K*

(c) 39°*C* (d) 320°*C*

31. In a mechanical refrigerator, the low temperature coils are at a temperature of – 23°*C* and the compressed gas in the condenser has a temperature of 27°*C*. The theoretical coefficient of performance is [UPSEAT 2001]

(a) 5 (b) 8

(c) 6 (d) 6.5

32. An engine is supposed to operate between two reservoirs at temperature 727°*C* and 227°*C*. The maximum possible efficiency of such an engine is [UPSEAT 2005]

(a) 1/2 (b) 1/4

(c) 3/4 (d) 1

33. An ideal gas heat engine operates in Carnot cycle between 227°*C* and 127°*C*. It absorbs 6×10^4 *cals* of heat at higher temperature. Amount of heat converted to work is

[CBSE PMT 2005]

(a) 2.4×10^4 *cal* (b) 6×10^4 *cal*

(c) 1.2×10^4 *cal* (d) 4.8×10^4 *cal*

34. Which of the following processes is reversible

[CBSE PMT 2005]

(a) Transfer of heat by radiation
(b) Electrical heating of a nichrome wire
(c) Transfer of heat by conduction
(d) Isothermal compression

Critical Thinking
Objective Questions

1. When an ideal diatomic gas is heated at constant pressure, the fraction of the heat energy supplied which increases the internal energy of the gas, is

[IIT 1990; UPSEAT 1998; RPET 2000]

(a) $\frac{2}{5}$ (b) $\frac{3}{5}$

(c) $\frac{3}{7}$ (d) $\frac{5}{7}$

2. $1cm^3$ of water at its boiling point absorbs 540 calories of heat to become steam with a volume of $1671cm^3$.If the atmospheric pressure = $1.013x10^5 N/m^2$ and the mechanical equivalent of heat = $4.19 J/calorie$, the energy spent in this process in overcoming intermolecular forces is

[MP PET 1999, 2001; Orissa JEE 2002]

(a) 540 *cal* (b) 40 *cal*
(c) 500 *cal* (d) Zero

3. During the melting of a slab of ice at 273 *K* at atmospheric pressure

(a) Positive work is done by ice-water system on the atmosphere
(b) Positive work is done on the ice-water system by the atmosphere
(c) The internal energy of the ice-water system increases
(d) The internal energy of the ice-water system decreases

4. Two identical containers *A* and *B* with frictionless pistons contain the same ideal gas at the same temperature and the same volume *V*. The mass of the gas in *A* is m_A and that in *B* is m_B. The gas in each cylinder is now allowed to expand isothermally to the same final volume 2*V*. The changes in the pressure in *A* and *B* are found to be ΔP and 1.5 ΔP respectively. Then

(a) $4m_A = 9m_B$ (b) $2m_A = 3m_B$

(c) $3m_A = 2m_B$ (d) $9m_A = 3m_B$

5. A monoatomic ideal gas, initially at temperature T_1, is enclosed in a cylinder fitted with a frictionless piston. The gas is allowed to expand adiabatically to a temperature. T_2 by releasing the piston suddenly. If L_1 and L_2 are the lengths of the gas column before and after expansion respectively, then T_1/T_2 is given by

[IIT-JEE (Screening) 2000]

(a) $\left(\frac{L_1}{L_2}\right)^{2/3}$ (b) $\frac{L_1}{L_2}$

(c) $\frac{L_2}{L_1}$ (d) $\left(\frac{L_2}{L_1}\right)^{2/3}$

6. A closed hollow insulated cylinder is filled with gas at $0^o C$ and also contains an insulated piston of negligible weight and negligible thickness at the middle point. The gas on one side of the piston is heated to $100^o C$. If the piston moves $5\,cm$, the length of the hollow cylinder is [EAMCET 2001]

(a) 13.65 *cm* (b) 27.3 *cm*
(c) 38.6 *cm* (d) 64.6 *cm*

7. A mono atomic gas is supplied the heat *Q* very slowly keeping the pressure constant. The work done by the gas will be

(a) $\frac{2}{3}Q$ (b) $\frac{3}{5}Q$

(c) $\frac{2}{5}Q$ (d) $\frac{1}{5}Q$

8. A gas mixture consists of 2 moles of oxygen and 4 moles argon at temperature *T*. Neglecting all vibrational modes, the total internal energy of the system is

[IIT 1999; UPSEAT 2003]

(a) 4 *RT* (b) 15 *RT*
(c) 9 *RT* (d) 11 *RT*

9. An ideal gas expands isothermally from a volume V_1 to V_2 and then compressed to original volume V_1 adiabatically. Initial pressure is P_1 and final pressure is P_3. The total work done is *W*. Then

(a) $P_3 > P_1, W > 0$ (b) $P_3 < P_1, W < 0$

(c) $P_3 > P_1, W < 0$ [IIT 1998] (d) $P_3 = P_1, W = 0$

10. Work done by a system under isothermal change from a volume V_1 to V_2 for a gas which obeys Vander Waal's equation $(V - \beta n)\left(P + \frac{\alpha n^2}{V}\right) = nRT$

[IIT 1998]

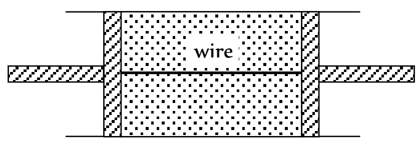
(a) $nRT \log_e\left(\frac{V_2 - n\beta}{V_1 - n\beta}\right) + \alpha n^2 \left(\frac{V_1 - V_2}{V_1 V_2}\right)$

(b) $nRT \log_{10}\left(\frac{V_2 - \alpha\beta}{V_1 - \alpha\beta}\right) + \alpha n^2 \left(\frac{V_1 - V_2}{V_1 V_2}\right)$

(c) $nRT \log_e\left(\frac{V_2 - n\alpha}{V_1 - n\alpha}\right) + \beta n^2 \left(\frac{V_1 - V_2}{V_1 V_2}\right)$

(d) $nRT \log_e\left(\frac{V_1 - n\beta}{V_2 - n\beta}\right) + \alpha n^2 \left(\frac{V_1 V_2}{V_1 - V_2}\right)$

11. A cylindrical tube of uniform cross-sectional area *A* is fitted with two air tight frictionless pistons. The pistons are connected to each other by a metallic wire. Initially the pressure of the gas is P_0 and temperature is T_0, atmospheric pressure is also P_0. Now the temperature of the gas is increased to $2T_0$, the tension in the wire will be



(a) $2P_0A$ (b) P_0A

(c) $\frac{P_0A}{2}$ (d) $4P_0A$

12. The molar heat capacity in a process of a diatomic gas if it does a work of $\frac{Q}{4}$ when a heat of Q is supplied to it is

(a) $\frac{2}{5}R$ (b) $\frac{5}{2}R$

(c) $\frac{10}{3}R$ (d) $\frac{6}{7}R$

13. An insulator container contains 4 moles of an ideal diatomic gas at temperature *T*. Heat *Q* is supplied to this gas, due to which 2 moles of the gas are dissociated into atoms but temperature of the gas remains constant. Then

(a) $Q = 2RT$ (b) $Q = RT$

(c) $Q = 3RT$ (d) $Q = 4RT$

14. The volume of air increases by 5% in its adiabatic expansion. The percentage decrease in its pressure will be

(a) 5% (b) 6%

(c) 7% (d) 8%

15. The temperature of a hypothetical gas increases to $\sqrt{2}$ times when compressed adiabatically to half the volume. Its equation can be written as

(a) $PV^{3/2}$ = constant (b) $PV^{5/2}$ = constant

(c) $PV^{7/3}$ = constant (d) $PV^{4/3}$ = constant

16. Two Carnot engines *A* and *B* are operated in succession. The first one, *A* receives heat from a source at $T_1 = 800K$ and rejects to sink at T_2K. The second engine *B* receives heat rejected by the first engine and rejects to another sink at $T_3 = 300K$. If the work outputs of two engines are equal, then the value of T_2 is

(a) 100*K* (b) 300*K*

(c) 550*K* (d) 700*K*

17. When an ideal monoatomic gas is heated at constant pressure, fraction of heat energy supplied which increases the internal energy of gas, is [AIIMS 1995]

(a) $\frac{2}{5}$ (b) $\frac{3}{5}$

(c) $\frac{3}{7}$ (d) $\frac{3}{4}$

18. When an ideal gas ($\gamma = 5/3$) is heated under constant pressure, then what percentage of given heat energy will be utilised in doing external work [RPET 1999]

(a) 40 % (b) 30 %

(c) 60 % (d) 20 %

19. Which one of the following gases possesses the largest internal energy [SCRA 1998]

(a) 2 moles of helium occupying $1m^3$ at 300 *K*

(b) 56 *kg* of nitrogen at $107 Nm^{-2}$ and 300 *K*

(c) 8 grams of oxygen at 8 atm and 300 *K*

(d) 6×10^{26} molecules of argon occupying $40m^3$ at 900 *K*

20. Two samples *A* and *B* of a gas initially at the same pressure and temperature are compressed from volume *V* to *V/2* (A isothermally and adiabatically). The final pressure of *A* is

[MP PET 1996, 99; MP PMT 1997, 99]

(a) Greater than the final pressure of *B*

(b) Equal to the final pressure of *B*

(c) Less than the final pressure of *B*

(d) Twice the final pressure of *B*

21. Initial pressure and volume of a gas are *P* and *V* respectively. First it is expanded isothermally to volume $4V$ and then compressed adiabatically to volume *V*. The final pressure of gas will be [CBSE PMT 1999]

(a) 1*P* (b) 2*P*

(c) 4*P* (d) 8*P*

22. A thermally insulated rigid container contains an ideal gas heated by a filament of resistance 100 Ω through a current of 1*A* for 5 min then change in internal energy is

[IIT-JEE (Screening) 2005]

(a) 0 *kJ* (b) 10 *kJ*

(c) 20 *kJ* (d) 30 *kJ*

23. A reversible engine converts one-sixth of the heat input into work. When the temperature of the sink is reduced by 62°*C*, the efficiency of the engine is doubled. The temperatures of the source and sink are [CBSE PMT 2000]

(a) 80°*C*, 37°*C* (b) 95°*C*, 28°*C*

(c) 90°*C*, 37°*C* (d) 99°*C*, 37°*C*

24. An engineer claims to have made an engine delivering 10 *kW* power with fuel consumption of 1 *g/sec*. The calorific value of the fuel is 2 *kcal/g*. Is the claim of the engineer

[J & K CET 2000]

(a) Valid

(b) Invalid

(c) Depends on engine design

(d) Depends of the load

25. Find the change in the entropy in the following process 100 *gm* of ice at 0°*C* melts when dropped in a bucket of water at 50°*C* (Assume temperature of water does not change) [BHU (Med.) 2000]

(a) – 4.5 *cal/K* (b) + 4.5 *cal/K*

(c) +5.4 *cal/K* (d) – 5.4 *cal/K*

26. An ideal gas expands in such a manner that its pressure and volume can be related by equation PV^2 = constant. During this process, the gas is [UPSEAT 2002]

(a) Heated

(b) Cooled

(c) Neither heated nor cooled

(d) First heated and then cooled

27. A Carnot engine whose low temperature reservoir is at 7°C has an efficiency of 50%. It is desired to increase the efficiency to 70%. By how many degrees should the temperature of the high temperature reservoir be increased

[UPSEAT 2005]

(a) 840 K (b) 280 K

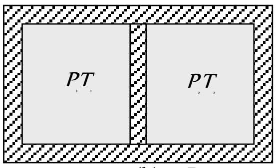
(c) 560 K (d) 380 K

28. P-V diagram of a diatomic gas is a straight line passing through origin. The molar heat capacity of the gas in the process will be

(a) 4 R (b) 2.5 R

(c) 3 R (d) $\frac{4R}{3}$

29. Following figure shows on adiabatic cylindrical container of volume V_0 divided by an adiabatic smooth piston (area of cross-section = A) in two equal parts. An ideal gas $(C_P / C_V = \gamma)$ is at pressure P_1 and temperature T_1 in left part and gas at pressure P_2 and temperature T_2 in right part. The piston is slowly displaced and released at a position where it can stay in equilibrium. The final pressure of the two parts will be (Suppose x = displacement of the piston)



(a) P_2 (b) P_1

(c) $\frac{P_1\left(\frac{V_0}{2}\right)^{\gamma}}{\left(\frac{V_0}{2}+Ax\right)^{\gamma}}$ (d) $\frac{P_2\left(\frac{V_0}{2}\right)^{\gamma}}{\left(\frac{V_0}{2}+Ax\right)^{\gamma}}$

30. Two cylinders A and B fitted with pistons contain equal amounts of an ideal diatomic gas at 300 K. The piston of A is free to move while that of B is held fixed. The same amount of heat is given to the gas in each cylinder. If the rise in temperature of the gas in A is 30 K, then the rise in temperature of the gas in B is

[IIT 1998]

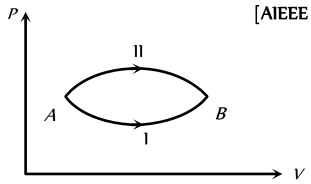
(a) 30 K (b) 18 K

(c) 50 K (d) 42 K

GQ Graphical Questions

1. A system goes from A to B via two processes I and II as shown in figure. If ΔU_1 and ΔU_2 are the changes in internal energies in the processes I and II respectively, then

[AIEEE 2005]



(a) $\Delta U_{II} > \Delta U_I$

(b) $\Delta U_{II} < \Delta U_I$

(c) $\Delta U_I = \Delta U_{II}$

(d) Relation between ΔU_I and ΔU_{II} can not be determined

2. A thermodynamic system is taken through the cycle $PQRSP$ process. The net work done by the system is

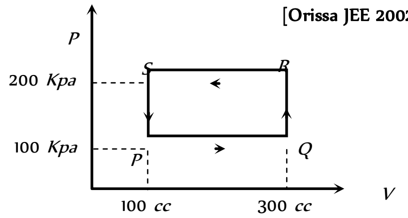
[Orissa JEE 2002]

(a) 20 J

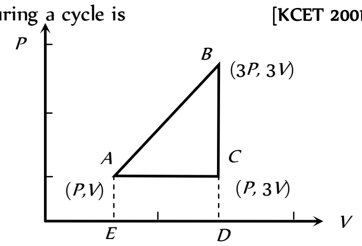
(b) – 20 J

(c) 400 J

(d) – 374 J



3. An ideal gas is taken around *ABCA* as shown in the above *P-V* diagram. The work done during a cycle is [KCET 2001]



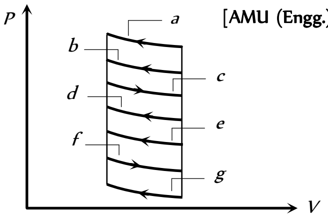
(a) $2PV$

(b) PV

(c) $1/2PV$

(d) Zero

4. The *P-V* diagram shows seven curved paths (connected by vertical paths) that can be followed by a gas. Which two of them should be parts of a closed cycle if the net work done by the gas is to be at its maximum value [AMU (Engg.) 2000]



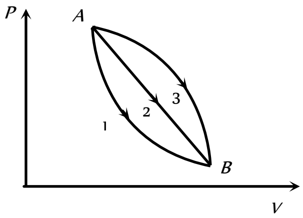
(a) *ac*

(b) *cg*

(c) *af*

(d) *cd*

5. An ideal gas of mass *m* in a state *A* goes to another state *B* via three different processes as shown in figure. If Q_1, Q_2 and Q_3 denote the heat absorbed by the gas along the three paths, then



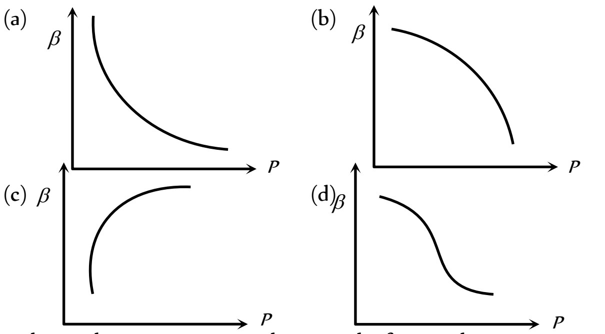
(a) $Q_1 < Q_2 < Q_3$

(b) $Q_1 < Q_2 = Q_3$

(c) $Q_1 = Q_2 > Q_3$

(d) $Q_1 > Q_2 > Q_3$

6. Which of the following graphs correctly represents the variation of $\beta = -(dV/dP)/V$ with P for an ideal gas at constant temperature [IIT-JEE (Screening) 2002]

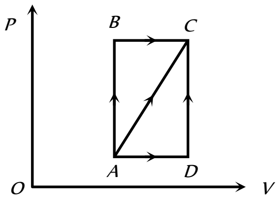


7. A thermodynamic process is shown in the figure. The pressures and volumes corresponding to some points in the figure are :

$P_A = 3\times 10^4\ Pa, P_B = 8\times 10^4\ Pa$ and

$V_A = 2\times 10^{-3} m^3, V_D = 5\times 10^{-3} m^3$

In process *AB*, 600 *J* of heat is added to the system and in process *BC*, 200 *J* of heat is added to the system. The change in internal energy of the system in process *AC* would be



(a) 560 *J*

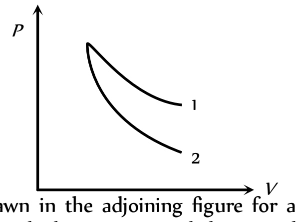
(b) 800 *J*

(c) 600 *J*

(d) 640 *J*

8. *P-V* plots for two gases during adiabatic process are shown in the figure. Plots 1 and 2 should correspond respectively to

[IIT-JEE (Screening) 2001]



(a) *He* and O_2

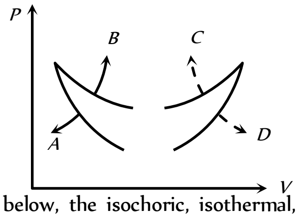
(b) O_2 and *He*

(c) *He* and *Ar*

(d) O_2 and N_2

9. Four curves *A*, *B*, *C* and *D* are drawn in the adjoining figure for a given amount of gas. The curves which represent adiabatic and isothermal changes are

[CPMT 1986; UPSEAT 1999]



(a) *C* and *D* respectively

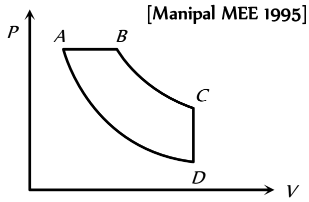
(b) *D* and *C* respectively

(c) *A* and *B* respectively

(d) *B* and *A* respectively

10. In pressure-volume diagram given below, the isochoric, isothermal, and isobaric parts respectively, are

[Manipal MEE 1995]



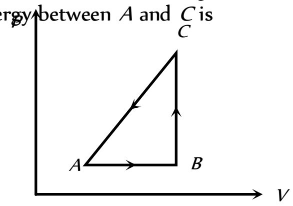
(a) *BA, AD, DC* [MP PET 1992]

(b) *DC, CB, BA*

(c) *AB, BC, CD*

(d) *CD, DA, AB*

11. The *P-V* diagram of a system undergoing thermodynamic transformation is shown in figure. The work done on the system in going from $A \to B \to C$ is 50 *J* and 20 *cal* heat is given to the system. The change in internal energy between *A* and *C* is



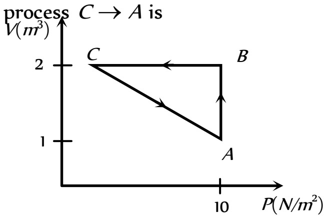
(a) 34 *J*

(b) 70 *J*

(c) 84 *J*

(d) 134 *J*

12. An ideal gas is taken through the cycle $A \to B \to C \to A$, as shown in the figure. If the net heat supplied to the gas in the cycle is 5 *J*, the work done by the gas in the process $C \to A$ is



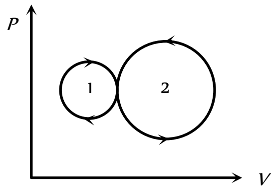
(a) – 5 *J*

(b) – 10 *J*

(c) – 15 *J*

(d) – 20 *J*

13. In the following indicator diagram, the net amount of work done will be



(a) Positive

(b) Negative [CBSE PMT 1992]

(c) Zero

(d) Infinity

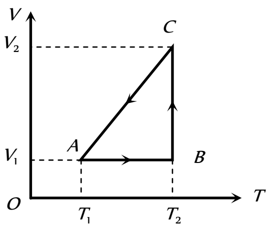
14. A cyclic process for 1 mole of an ideal gas is shown in figure in the *V-T*, diagram. The work done in *AB*, *BC* and *CA* respectively

(a) $0, RT_2 \ln\left(\frac{V_1}{V_2}\right), R(T_1 - T_2)$

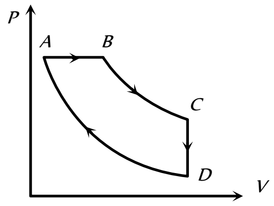
(b) $R(T_1 - T_2), 0, RT_1 \ln\frac{V_1}{V_2}$

(c) $0, RT_2 \ln\left(\frac{V_2}{V_1}\right), R(T_1 - T_2)$

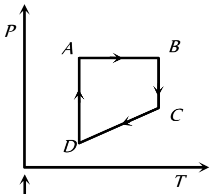
(d) $0, RT_2 \ln\left(\frac{V_2}{V_1}\right), R(T_2 - T_1)$



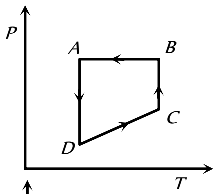
15. A cyclic process *ABCD* is shown in the figure *P-V* diagram. Which of the following curves represent the same process



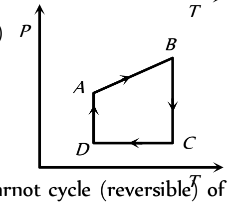
(a)



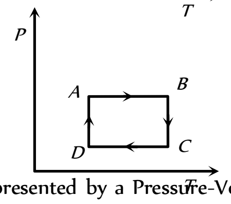
(b)



(c)



(d)



16. Carnot cycle (reversible) of a gas represented by a Pressure-Volume curve is shown in the diagram

Consider the following statements

I. Area *ABCD* = Work done on the gas

II. Area *ABCD* = Net heat absorbed

III. Change in the internal energy in cycle = 0

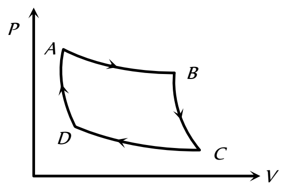
Which of these are correct [AMU (Med.) 2001]

(a) I only

(b) II only

(c) II and III

(d) I, II and III



17. The temperature-entropy diagram of a reversible engine cycle is given in the figure. Its efficiency is

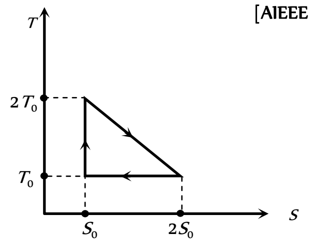
[AIEEE 2005]

(a) $1/3$

(b) $2/3$

(c) $1/2$

(d) $1/4$



18. Work done in the given *P-V* diagram in the cyclic process is

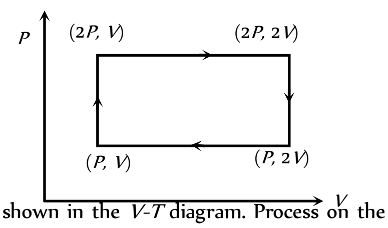
[UPSEAT 1998; RPET 2000; Kerala PMT 2002]

(a) *PV*

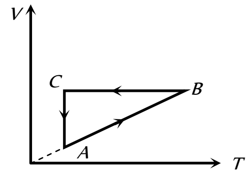
(b) 2*PV*

(c) *PV*/2

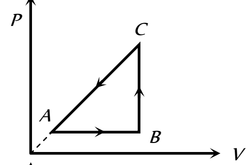
(d) 3*PV*



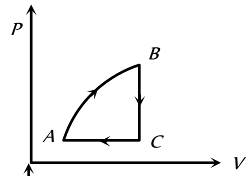
19. A cyclic process *ABCA* is shown in the *V-T* diagram. Process on the *P-V* diagram is



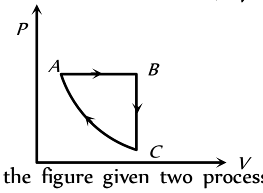
(a)



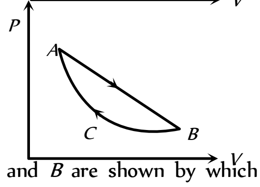
(b)



(c)



(d)



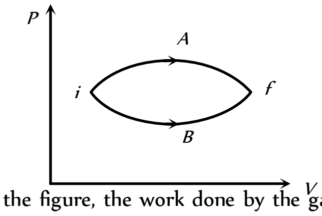
20. In the figure given two processes *A* and *B* are shown by which a thermo-dynamical system goes from initial to final state *F*. If ΔQ_A and ΔQ_B are respectively the heats supplied to the systems then

(a) $\Delta Q_A = \Delta Q_B$

(b) $\Delta Q_A \geq \Delta Q_B$

(c) $\Delta Q_A < \Delta Q_B$

(d) $\Delta Q_A > \Delta Q_B$



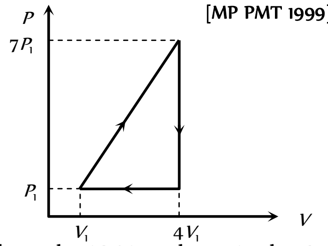
21. In the cyclic process shown in the figure, the work done by the gas in one cycle is [MP PMT 1999]

(a) $28\ P_1V_1$

(b) $14\ P_1V_1$

(c) $18\ P_1V_1$

(d) $9\ P_1V_1$



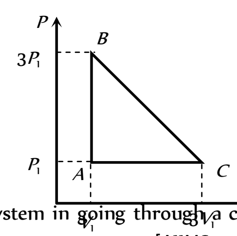
22. An ideal gas is taken around the cycle *ABCA* as shown in the *P-V* diagram. The net work done by the gas during the cycle is equal to

(a) $12\ P_1V_1$

(b) $6\ P_1V_1$

(c) $3\ P_1V_1$

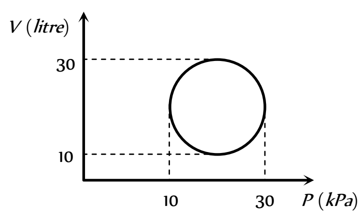
(d) $2P_1V_1$



23. Heat energy absorbed by a system in going through a cyclic process shown in figure is [AIIMS 1995; BHU 2002]

(a) $10^7\ \pi J$

(b) $10^4\ \pi J$



(c) $10\pi\, J$

(d) $10^{-3}\,\pi J$

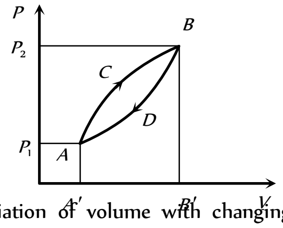
24. A thermodynamic system is taken from state A to B along ACB and is brought back to A along BDA as shown in the PV diagram. The net work done during the complete cycle is given by the area

(a) $P_1ACBP_2P_1$

(b) $ACBB'A'A$

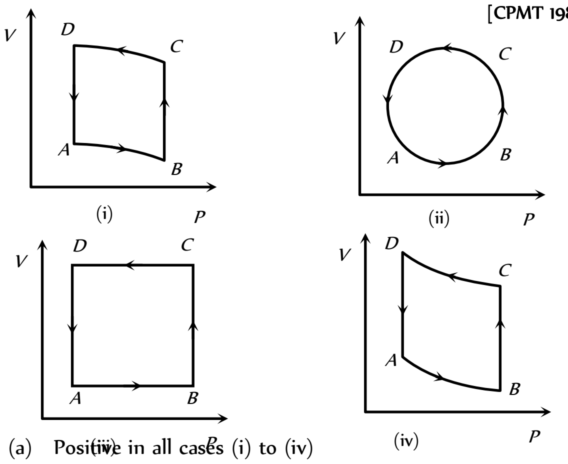
(c) $ACBDA$

(d) $ADBB'A'A$



25. In the diagrams (i) to (iv) of variation of volume with changing pressure is shown. A gas is taken along the path $ABCD$. The change in internal energy of the gas will be

[CPMT 1986, 88]



(a) Positive in all cases (i) to (iv)

(b) Positive in cases (i), (ii) and (iii) but zero in (iv) case

(c) Negative in cases (i), (ii) and (iii) but zero in (iv) case

(d) Zero in all four cases

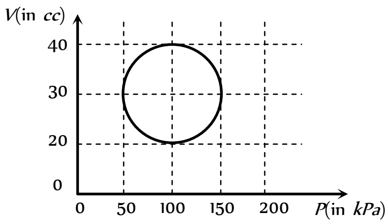
26. A system is taken through a cyclic process represented by a circle as shown. The heat absorbed by the system is

(a) $\pi \times 10^3\, J$

(b) $\frac{\pi}{2}\, J$

(c) $4\pi \times 10^2\, J$

(d) $\pi\, J$



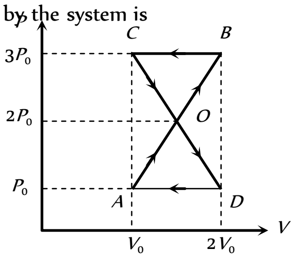
27. A thermodynamic system undergoes cyclic process $ABCDA$ as shown in figure. The work done by the system is

(a) P_0V_0

(b) $2P_0V_0$

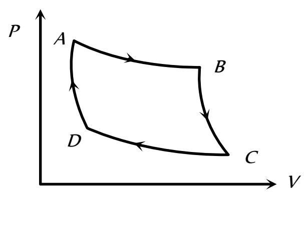
(c) $\frac{P_0V_0}{2}$

(d) Zero



28. The P-V graph of an ideal gas cycle is shown here as below. The adiabatic process is described by

[CPMT 1985; UPSEAT 2003]



(a) AB and BC

(b) AB and CD

(c) BC and DA

(d) BC and CD

[CBSE PMT 1992]

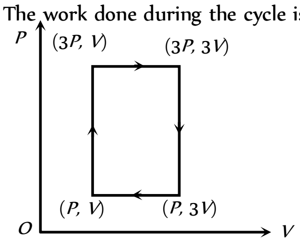
29. An ideal monoatomic gas is taken round the cycle ABCDA as shown in following P-V diagram. The work done during the cycle is [IIT 1983; CPMT 19

(a) PV

(b) $2\ PV$

(c) $4\ PV$

(d) Zero



30. A system changes from the state (P_1, V_1) to (P_2V_2) as shown in the figure. What is the work done by the system

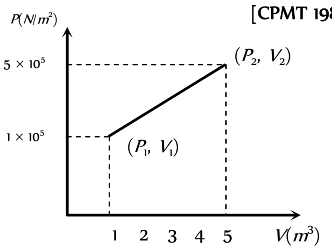
[CPMT 1981]

(a) 7.5×10^5 *joule*

(b) 7.5×10^5 *erg*

(c) 12×10^5 *joule*

(d) 6×10^5 *joule*



31. Carbon monoxide is carried around a closed cycle abc in which bc is an isothermal process as shown in the figure. The gas absorbs 7000 J of heat as its temperature increases from 300 K to 1000 K in going from a to b. The quantity of heat rejected by the gas during the process ca is

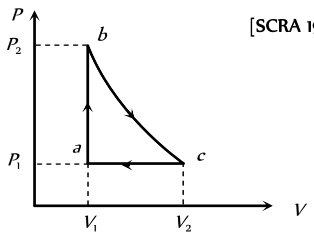
[SCRA 1994]

(a) 4200 J

(b) 5000 J

(c) 9000 J

(d) 9800 J



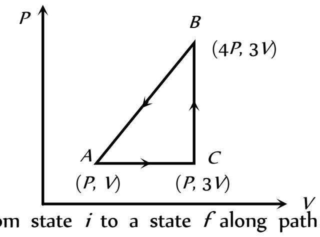
32. A sample of ideal monoatomic gas is taken round the cycle $ABCA$ as shown in the figure. The work done during the cycle is

(a) Zero

(b) $3\ PV$

(c) $6\ PV$

(d) $9PV$



33. When a system is taken from state i to a state f along path iaf, $Q = 50\ J$ and $W = 20 J$. Along path ibf, $Q = 35 J$. If $W = -13 J$ for the curved return path fi, Q for this path is

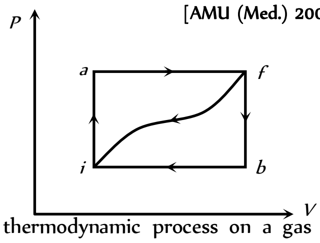
[AMU (Med.) 2000]

(a) 33 J

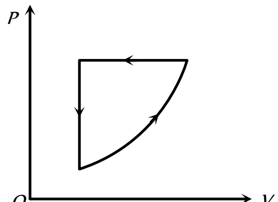
(b) 23 J

(c) – 7 J

(d) – 43 J



34. For one complete cycle of a thermodynamic process on a gas as shown in the P-V diagram, Which of following is correct



(a) $\Delta E_{\text{int}} = 0, Q < O$

(b) $\Delta E_{\text{int}} = 0, Q > 0$

(c) $\Delta E_{\text{int}} > 0, Q < 0$

(d) $\Delta E_{\text{int}} < 0, Q > 0$

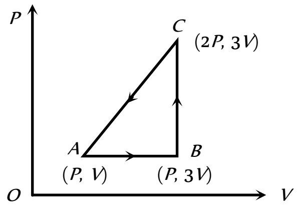
35. An ideal gas is taken around *ABCA* as shown in the above *P-V* diagram. The work done during a cycle is **[UPSEAT 2001]**

(a) Zero

(b) $\frac{1}{2}PV$

(c) 2 *PV*

(d) *PV*



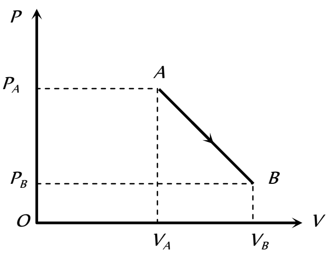
36. An ideal gas is taken from point *A* to the point *B*, as shown in the *P-V* diagram, keeping the temperature constant. The work done in the process is **[UPSEAT 2005]**

(a) $(P_A - P_B)(V_B - V_A)$

(b) $\frac{1}{2}(P_B - P_A)(V_B + V_A)$

(c) $\frac{1}{2}(P_B - P_A)(V_B - V_A)$

(d) $\frac{1}{2}(P_B + P_A)(V_B - V_A)$



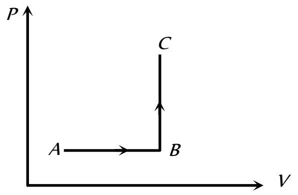
37. The *P-V* diagram of a system undergoing thermodynamic transformation is shown in figure. The work done by the system in going from $A \to B \to C$ is 30*J* and 40*J* heat is given to the system. The change in internal energy between *A* and *C* is

(a) 10 *J*

(b) 70 *J*

(c) 84 *J*

(d) 134 *J*



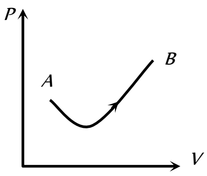
38. Consider a process shown in the figure. During this process the work done by the system

(a) Continuously increases

(b) Continuously decreases

(c) First increases, then decreases

(d) First decreases, then increases



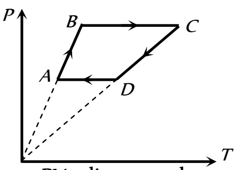
39. Six moles of an ideal gas perfomrs a cycle shown in figure. If the temperature are T_A = 600 *K*, T_B = 800 *K*, T_C = 2200 *K* and T_D = 1200 *K*, the work done per cycle is **[BCECE 2005]**

(a) 20 *kJ*

(b) 30 *kJ*

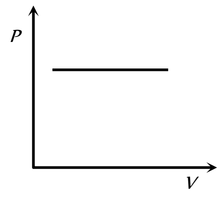
(c) 40 *kJ*

(d) 60 *kJ*

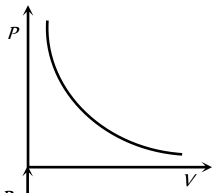


40. Which of the accompanying *PV*, diagrams best represents an isothermal process **[MP PET 2005]**

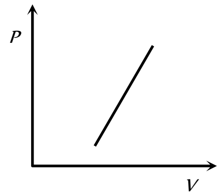
(a)



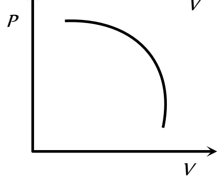
(b)



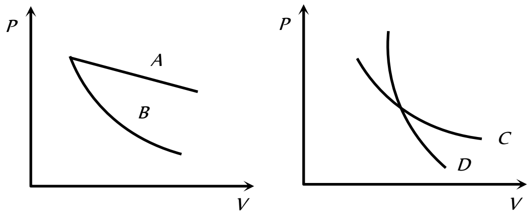
(c)



(d)



41. In the following figure, four curves *A*, *B*, *C* and *D* are shown. The curves are **[DCE 2003]**



(a) Isothermal for *A* and *D* while adiabatic for *B* and *C*

(b) Adiabatic for *A* and *C* while isothermal for *B* and *D*

(c) Isothermal for *A* and *B* while adiabatic for *C* and *D*

(d) Isothermal for *A* and *C* while adiabatic for *B* and *D*

42. *P-V* diagram of a cyclic process *ABCA* is as shown in figure. Choose the correct statement

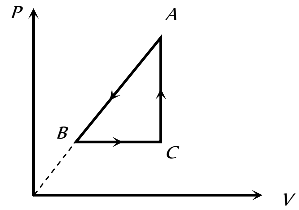
(a) $\Delta Q_{A \to B}$ = negative

(b) $\Delta U_{B \to C}$ = positive

[BCECE 2005]

(c) ΔW_{CAB} = negative

(d) All of these



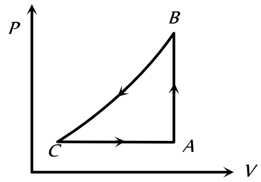
43. A sample of an ideal gas is taken through a cycle a shown in figure. It absorbs 50*J* of energy during the process *AB*, no heat during *BC*, rejects 70*J* during *CA*. 40*J* of work is done on the gas during *BC*. Internal energy of gas at *A* is 1500*J*, the internal energy at *C* would be

(a) 1590 *J*

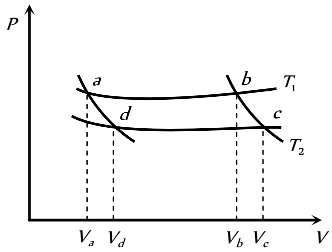
(b) 1620 *J*

(c) 1540 *J*

(d) 1570 *J*



44. In the following *P-V* diagram two adiabatics cut two isothermals at temperatures T_1 and T_2 (fig.). The value of $\frac{V_a}{V_d}$ will be



(a) $\frac{V_b}{V_c}$ (b) $\frac{V_c}{V_b}$

(c) $\frac{V_d}{V_a}$ (d) $V_b V_c$

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : Reversible systems are difficult to find in real world.
Reason : Most processes are dissipative in nature [AIIMS 2005]

2. Assertion : Air quickly leaking out of a balloon becomes coolers
Reason : The leaking air undergoes adiabatic expansion.[AIIMS 2005]

3. Assertion : Thermodynamic process in nature are irreversible.
Reason : Dissipative effects can not be eliminated. [AIIMS 2004]

4. Assertion : When a bottle of cold carbonated drink is opened, a slight fog forms around the opening.
Reason : Adiabatic expansion of the gas causes lowering of temperature and condensation of water vapours.[AIIMS 2003]

5. Assertion : The isothermal curves intersect each other at a certain point.
Reason : The isothermal change takes place slowly, so the isothermal curves have very little slope. [AIIMS 2001]

6. Assertion : In adiabatic compression, the internal energy and temperature of the system get decreased.
Reason : The adiabatic compression is a slow process [AIIMS 2001]

7. Assertion : In isothermal process whole of the heat energy supplied to the body is converted into internal energy.
Reason : According to the first law of thermodynamics $\Delta Q = \Delta U + p\Delta V$. [AIIMS 1997]

8. Assertion : We can not change the temperature of a body without giving (or taking) heat to (or from) it.
Reason : According to principle of conservation of energy, total energy of a system should remains conserved.

9. Assertion : The specific heat of a gas is an adiabatic process is zero and in an isothermal process is infinite.
Reason : Specific heat of a gas in directly proportional to change of heat in system and inversely proportional to change in temperature.

10. Assertion : Work and heat are two equivalent form of energy.
Reason : Work is the transfer of mechanical energy irrespective of temperature difference, whereas heat is the transfer of thermal energy because of temperature difference only.

11. Assertion : The heat supplied to a system is always equal to the increase in its internal energy.
Reason : When a system changes from one thermal equilibrium to another, some heat is absorbed by it.

12. Assertion : A room can be cooled by opening the door of a refrigerator in a closed room.
Reason : Heat flows from lower temperature (refrigerator) to higher temperature (room).

13. Assertion : It is not possible for a system, unaided by an external agency to transfer heat from a body at lower temperature to another body at higher temperature.
Reason : According to Clausius statement, " No process is possible whose sole result is the transfer of heat from a cooled object to a hotter object.

14. Assertion : If an electric fan be switched on in a closed room, the air of the room will be cooled.
Reason : Fan air decrease the temperature of the room.

15. Assertion : The internal energy of an isothermal process does not change.
Reason : The internal energy of a system depends only on pressure of the system.

16. Assertion : In an adiabatic process, change in internal energy of a gas is equal to work done on or by the gas in the process.
Reason : Temperature of gas remains constant in a adiabatic process.

17. Assertion : An adiabatic process is an isoentropic process.
Reason : Change in entropy is zero in case of adiabatic process.

18. Assertion : Work done by a gas in isothermal expansion is more than the work done by the gas in the same expansion, adiabatically.
Reason : Temperature remains constant in isothermal expansion and not in adiabatic expansion.

19. Assertion : First law of thermodynamics is a restatement of the principle of conservation
Reason : Energy is fundamental quantity.

20. Assertion : Zeroth law of thermodynamic explain the concept of energy.
Reason : Energy is dependent on temperature.

21. Assertion : Efficiency of a Carnot engine increase on reducing the temperature of sink.
Reason : The efficiency of a Carnot engine is defined as ratio of net mechanical work done per cycle by the gas to the amount of heat energy absorbed per cycle from the source.

22. Assertion : The entropy of the solids is the highest
Reason : Atoms of the solids are arranged in orderly manner.

Answers and Solutions

First Law of Thermodynamics ($\Delta Q = \Delta U + \Delta W$)

1. (a) $\Delta Q = \Delta U + \Delta W$ and $\Delta W = P\Delta V$
2. (c)
3. (b) $\Delta Q = \Delta U + \Delta W$

   $\Rightarrow \Delta U = \Delta Q - \Delta W = Q - W$ (using proper sign)
4. (b) $\Delta U = \Delta Q - W = 35 - 15 = 20\ J$
5. (c) Internal energy depends only on the temperature of the gas.
6. (b)

7. (b) (i) Case $\rightarrow$ Volume = constant $\Rightarrow \int PdV = 0$

(ii) Case $\rightarrow P$ = constant $\Rightarrow \int_{V_1}^{2V_1} PdV = P\int_{V_1}^{2V_1} dV = PV_1$

8. (d) $\Delta Q = \Delta W + \Delta U \Rightarrow 35 = -15 + \Delta U \Rightarrow \Delta U = 50J$

9. (a) $J\Delta Q = \Delta U + \Delta W,\ \Delta U = J\Delta Q - \Delta W$

$\Delta U = 4.18 \times 300 - 600 = 654\ Joule$

10. (d) Work done $= \int_1^2 PdV$, which is state dependent as well as path dependent.

11. (c) $\Delta Q = \Delta U + \Delta W \because \Delta W = 0 \Rightarrow \Delta Q = \Delta U = \frac{f}{2}\mu R\Delta T$

$= \frac{3}{2} \times 2R(373 - 273) = 300R.$

12. (a) $\Delta Q = 2k\,cal = 2 \times 10^3 \times 4.2J = 8400J$ and $\Delta W = 500J$.

Hence from $\Delta Q = \Delta U + \Delta W,\ \Delta W = \Delta Q - \Delta U$ = 8400 – 500 = 7900 J

13. (d) Change in internal energy (ΔU) depends upon initial an find state of the function while ΔQ and ΔW are path dependent also.

14. (a) This is the case of free expansion and in this case $\Delta W = 0$, $\Delta U = 0$ so temperature remains same *i.e.* 300 K.

15. (b) $\Delta Q = \Delta U + \Delta W \Rightarrow \Delta W = \Delta Q - \Delta U = 100 - 40 = 70J$

16. (b) Work done is not a thermodynamical function.

17. (c) $\Delta Q = \Delta U + \Delta W = 167 + 333 = 500\ cal$

18. (d) Heat always refers to energy in transit from one body to another because of temperature difference.

19. (d) Change in internal energy does not depend upon path so $\Delta U = \Delta Q - \Delta W$ remain constant.

20. (b) $\Delta Q = \Delta U + \Delta W$; $\Delta Q = 200J$ and $\Delta W = -100J$

$\Rightarrow \Delta U = \Delta Q - \Delta W = 200 - (-100) = 300J$

21. (a) During free expansion of a perfect gas no, work is done and also no heat is supplied from outside. Therefore, no change in internal energy. Hence, temperature remain constant.

22. (d) $\Delta Q = \Delta U + \Delta W \Rightarrow \Delta U = \Delta Q - \Delta W = 150 - 110 = 40\ J$

23. (b) From FLOT $\Delta Q = \Delta U + \Delta W$

$\because$ Heat supplied to the system so $\Delta Q \rightarrow$ Positive

and work is done on the system so $\Delta W \rightarrow$ Negative

Hence $+\Delta Q = \Delta U - \Delta W$

24. (a)

25. (d) State of a thermodynamic state cannot determine by a single variable (P or V or T)

26. (d) R is the universal gas constant.

27. (a) From FLOT

$\Rightarrow dU = dQ - dW \Rightarrow dU = dQ (< 0)$ $(\because dW = 0)$

$\Rightarrow dU < 0$ So temperature will decrease.

28. (b) From FLOT $\Delta Q = \Delta U + \Delta W$

Work done at constant pressure $(\Delta W)_P = (\Delta Q)_P - \Delta U$

$(\Delta Q)_P - (\Delta Q)_V$ (As we know $(\Delta Q)_V = \Delta U$)

Also $(\Delta Q)_P = mc_P \Delta T$ and $(\Delta Q)_V = mc_V \Delta T$

$\Rightarrow (\Delta W)_P = m(c_P - c_V)\Delta T$

$\Rightarrow (\Delta W)_P = 1 \times (3.4 \times 10^3 - 2.4 \times 10^3) \times 10 = 10^4\, cal$

29. (d)

30. (a) Ideal gas possess only kinetic energy.

31. (b) The internal energy and entropy depend only on the initial and final states of the system and not on the path followed to attain that state.

32. (c) $\Delta Q = \Delta U + \Delta W$

$\because \Delta Q = 200 cal = 200 \times 4.2 = 840J$ and $\Delta W = 40J$

$\Rightarrow \Delta U = \Delta Q - \Delta W = 840 - 40 = 800J$

33. (c) $\Delta Q = \Delta U + \Delta W = (U_f - U_i) + \Delta W$

$\Rightarrow 30 = (U_f - 40) + 10 \Rightarrow U_f = 60J$

34. (a) With rise in temperature, internal energy also increases.

35. (a)

36. (b) Heat supplied to a gas raise its internal energy and does some work against expansion, so it is a special case of law of conservation of energy.

37. (c) Change in internal energy is always equal to the heat supplied at constant volume.

i.e. $\Delta U = (\Delta Q)_V = \mu C_V \Delta T.$

For monoatomic gas $C_V = \frac{3}{2}R$

$\Rightarrow \Delta U = \mu\left(\frac{3}{2}R\right)\Delta T = 1 \times \frac{3}{2} \times 8.31 \times (100 - 0)$

$= 12.48 \times 10^2\, J$

38. (c) $\Delta U = \mu C_V \Delta T = n\left(\frac{R}{\gamma - 1}\right)\Delta T$

$\Rightarrow \Delta U = \frac{P\Delta V}{(\gamma - 1)} = \frac{P(2V - V)}{\gamma - 1} = \frac{PV}{(\gamma - 1)}$

39. (b) $\Delta U = \mu C_V \Delta T = 2 \times 4.96 \times (342 - 340) = 19.84\ cal$

40. (a)

41. (c) According to FLOT

$\Delta Q = \Delta U + P(\Delta V) \Rightarrow \Delta U = \Delta Q - P(\Delta V)$

$= 1500 - (2.1 \times 10^5)(2.5 \times 10^{-3}) = 975$ *Joule*

42. (a) $\Delta Q = \Delta U + \Delta W \Rightarrow \Delta U = \Delta Q - \Delta W$

$= 6 \times 4.18 - 6 = 19.08 kJ \approx 19.1\, kJ$

43. (a) Given $\Delta Q = -20J$, $\Delta W = -8J$ and $U_i = 30J$

$\Delta Q = \Delta U + \Delta W \Rightarrow \Delta U = (\Delta Q - \Delta W)$

$\Rightarrow (U_f - U_i) = (U_f - 30) = -20 - (-8) \Rightarrow U_f = 18J$

44. (c) Change in internal energy $\Delta U = \mu C_V \Delta T$

it doesn't depend upon type of process. Actually it is a state function

45. (c)

46. (a) In first process using $\Delta Q = \Delta U + \Delta W$

$\Rightarrow 8 \times 10^5 = \Delta U + 6.5 \times 10^5 \Rightarrow \Delta U = 1.5 \times 10 J$

Since final and initial states are same in both process

So ΔU will be same in both process

For second process using $\Delta Q = \Delta U + \Delta W$

$\Rightarrow 10^5 = 1.5 \times 10^5 + \Delta W \Rightarrow \Delta W = -0.5 \times 10^5\ J$

47. (c) $\Delta W = P\Delta V$; here ΔV is negative so ΔW will be negative

48. (b) Entropy is related to second law of thermodynamics.

Isothermal Process

1. (c) In isothermal process temperature remains constant.

2. (a) If isothermal curves cut each other then at equilibrium two temperature will be there which is impossible.

3. (c) In isothermal expansion temperature remains constant, hence no change in internal energy.

4. (d) $W = \mu RT \log_e \frac{V_2}{V_1}$

$= \left(\frac{m}{M}\right) RT \log_e \frac{V_2}{V_1} = 2.3 \times \frac{m}{M} RT \log_{10} \frac{V_2}{V_1}$

$= 2.3 \times \frac{96}{32} R\ (273 + 27) \log_{10} \frac{140}{70} = 2.3 \times 900 R \log_{10} 2$

5. (b) $0.8 \times 5 = P \times (3 + 5) \Rightarrow P = 0.5\ m$

6. (b) Differentiate $PV =$ constant *w.r.t* V

$\Rightarrow P\Delta V + V\Delta P = 0 \Rightarrow \frac{\Delta P}{P} = -\frac{\Delta V}{V}$

7. (c)

8. (d) $W = -\mu RT \log_e \frac{V_2}{V_1} = -1 \times 8.31 \times (273+0) \log_e \left(\frac{22.4}{11.2}\right)$

$= -8.31 \times 273 \times \log_e 2 = -1572.5J$ [$\because \log_e 2 = 0.693$]

9. (a) $E_\theta = P$, if $P =$ constant, $E_\theta =$ constant

10. (c) For isothermal process $PV = RT \Rightarrow P = \frac{RT}{V}$

$\therefore W = PdV = \int_{V_1}^{V_2} \frac{RT}{V} dV = RT \log_e \frac{V_2}{V_1}$

11. (a) $E_\theta = P$

12. (b) For such a case, pressure $= \frac{1}{\text{Compressibility}}$

13. (a) $E_\theta = P = 1.013 \times 10^5 \, N/m^2$

14. (a) In isothermal process, compressibility $E_\theta = \rho$.

15. (c) In isothermal process, exchange of energy takes place between system and surrounding to maintain the system temperature constant.

16. (c) No change in the internal energy of ideal gas but for real gas internal energy increases because work is done against intermolecular forces.

17. (a) In isothermal process temperature remains constant. *i.e.*, $\Delta T = 0$. Hence according to $C = \frac{Q}{m\Delta T} \Rightarrow C_{iso} = \infty$

18. (c) This is the case of free expansion of gas. In free expansion $\Delta U = 0 \Rightarrow$ Temp. remains same.

19. (a) An isothermal process takes place at constant temperature, must be carried out in a vessel with conducting wall so that heat generated should go out at once.

20. (c) For isothermal process

$dU = 0$ and work done $= dW = P(V_2 - V_1)$

$\because V_2 = \frac{V_1}{2} = \frac{V}{2} \; \therefore \; dW = -\frac{PV}{2}$

21. (b) In isothermal process, temperature remains constant.

22. (b) In isothermal process, heat is released by the gas to maintain the constant temperature.

23. (a) In isothermal compression, there is always an increase of heat. which must flow out the gas.

$\Delta Q = \Delta U + \Delta W \Rightarrow \Delta Q = \Delta W \;\; (\because \Delta U = 0)$

$\Rightarrow \Delta Q = -1.5 \times 10^4 J = \frac{1.5 \times 10^4}{4.18} cal = -3.6 \times 10^3 cal$

24. (a) In isothermal change, temperature remains constant, Hence $\Delta U = 0$.

Also from $\Delta Q = \Delta U + \Delta W \Rightarrow \Delta Q = \Delta W$

25. (a) It is an isothermal process. Hence work done $= P(V_2 - V_1)$

$= 1 \times 10^5 \times (1.091 - 1) \times 10^{-6} = 0.0091 \, J$

26. (c) $\Delta Q = \Delta U + \Delta W \Rightarrow \Delta U = \Delta Q - \Delta W = 2240 - 168 = 2072 \, J$.

27. (b) Amount of heat given $= 540 \, calories$

Change in volume $\Delta V = 1670 \, c.c$

Atmospheric pressure $P = 1.01 \times 10^6 \, dyne/cm^2$

Work done against atmospheric pressure

$W = P\Delta V = \frac{1.01 \times 10^6 \times 1670}{4.2 \times 10^7} \approx 40 \, cal$

28. (b) $W_{iso} = \mu RT \log_e \frac{V_2}{V_1} = 1 \times 8.31 \times 300 \log_e \frac{20}{10} = 1728 J$

29. (b) $W = \mu RT \log_e \left(\frac{V_2}{V_1}\right) = 0.2 \times 8.3 \times \log_e 2 \times (27 + 273)$

$= 0.2 \times 8.3 \times 300 \times 0.693 = 345 J$

30. (a) For isothermal process $P_1 V_1 = P_2 V_2$

$\Rightarrow P_2 = \frac{P_1 V_1}{V_2} = \frac{72 \times 1000}{900} = 80 \, cm$

Stress $\Delta P = P_2 - P_1 = 80 - 72 = 8 cm$

31. (d) During isothermal change $T =$ constant $\Rightarrow \Delta U = 0$

also from FLOT, $\Delta Q = \Delta W$.

Adiabatic Process

1. (c) Gas cylinder suddenly explodes is an irreversible adiabatic change and work done against expansion reduces the temperature.

2. (c) Work done in adiabatic change $= \frac{\mu R(T_1 - T_2)}{\gamma - 1}$

3. (b) In case of adiabatic expansion $\Delta W =$ positive and $\Delta Q = 0$

from FLOT $\Delta Q = \Delta U + \Delta W \Rightarrow \Delta U = -\Delta W$ *i.e.*, ΔU will be negative.

4. (d) For adiabatic process $\frac{T^\gamma}{P^{\gamma-1}} =$ constant

$\Rightarrow \frac{T_2}{T_1} = \left(\frac{P_1}{P_2}\right)^{\frac{1-\gamma}{\gamma}} \Rightarrow \frac{T_2}{300} = \left(\frac{4}{1}\right)^{\frac{(1-1.4)}{1.4}} \Rightarrow T_2 = 300(4)^{-\frac{0.4}{1.4}}$

5. (c) $PV^\gamma =$ constant $\Rightarrow \frac{P_2}{P_1} = \left(\frac{V_1}{V_2}\right)^\gamma \Rightarrow \frac{P_2}{1} = \left(\frac{V_1}{V_1/4}\right)^{3/2} = 8$

$\Rightarrow P_2 = 8 \, atm.$

6. (d) $PV^\gamma =$ constant $\Rightarrow \frac{P_2}{P_1} = \left(\frac{V_1}{V_2}\right)^\gamma \Rightarrow P_2 = (8)^{5/3} P_1 = 32 \, P_1$

7. (c) Volume of the gas $V = \frac{m}{d}$ and using $PV^\gamma =$ constant

We get $\frac{P'}{P} = \left(\frac{V}{V'}\right)^\gamma = \left(\frac{d'}{d}\right)^\gamma = (32)^{7/5} = 128$

8. (b) $\frac{T_2}{T_1} = \left(\frac{V_1}{V_2}\right)^{\gamma - 1} \Rightarrow T_2 = 300\left(\frac{27}{8}\right)^{\frac{5}{3}-1} = 300\left(\frac{27}{8}\right)^{\frac{2}{3}}$

$= 300\left\{\left(\frac{27}{8}\right)^{1/3}\right\}^2 = 800\left(\frac{3}{2}\right)^2 = 675K$

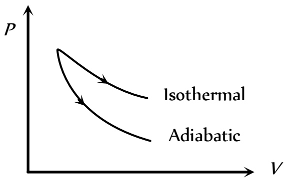
$\Rightarrow \Delta T = 675 - 300 = 375 \, K$

9. (a) In thermodynamic processes.

Work done = Area covered by PV diagram with V-axis

From graph it is clear that $(\text{Area})_{iso} > (\text{Area})_{adi}$

$\Rightarrow W_{iso} > W_{adi}$



10. (a) Since $PV = RT$ and $T =$ constant; $\therefore PV =$ constant.

11. (c) For Isothermal process $PV =$ constant

$\Rightarrow \left(\frac{dP}{dV}\right) = \frac{-P}{V} =$ Slope of Isothermal curve

For adiabatic $PV^\gamma =$ constant

$\Rightarrow \frac{dP}{dV} = \frac{-\gamma P}{V} =$ Slop of adiabatic curve slope

Clearly, $\left(\frac{dP}{dV}\right)_{\text{adiabatic}} = \gamma\left(\frac{dP}{dV}\right)_{\text{Isothermal}}$

12. (d) $PV^\gamma =$ constant $\Rightarrow P\left(\frac{RT}{P}\right)^\gamma =$ constant

$\Rightarrow P^{1-\gamma}T^\gamma =$ constant.

13. (b) $W_{adi} = \frac{R}{\gamma-1}(T_i - T_f) = \frac{R}{\gamma-1}(T - T_1)$

14. (d) $dQ = 0 = -2 + dW \Rightarrow dW = 2\ J$

$\Rightarrow$ Work done by the gas $= 2\ J$

$\Rightarrow$ Work done on the gas $= -2\ J$

15. (d) $E_\phi = \gamma P = 1.4 \times (1\times10^5) = 1.4\times10^5\ N/m^2$

16. (b) Slope of adiabatic curve = $\gamma \times$ (Slope of isothermal curve)

17. (a) Due to compression the temperature of the system increases to a very high value. This causes the flow of heat from system to the surroundings, thus decreasing the temperature. This decrease in temperature results in decrease in pressure.

18. (c) $\Delta Q = \Delta U + \Delta W = 0 \Rightarrow \Delta W = -\Delta U$

if ΔW is positive *i.e.,* gas does work then ΔU should be negative meaning internal energy is used in doing work.

19. (a) $W = \frac{R}{\gamma-1}(T_1 - T_2)$

$= \frac{8.31\times\{(273+27)-(273+127)\}}{1.4-1} = -2077.5\ joules$

20. (c) Pressure is reduced, so the temperature falls.

21. (d) Adiabatic Bulk modulus $E_\phi = \gamma P$

22. (c) In adiabatic process, no heat transfers between system and surrounding.

23. (b) $\frac{P_2}{P_1} = \left(\frac{V_1}{V_2}\right)^\gamma \Rightarrow P_2 = P_1\left(\frac{V_1}{V_2}\right)^\gamma = P_0(8)^{4/3} = 16P_0$.

24. (c) In adiabatic process $PV^\gamma =$ constant

$\Rightarrow \left(\frac{RT}{V}\right).V^\gamma =$ constant $\Rightarrow TV^{\gamma-1} =$ constant

25. (a) $TV^{\gamma-1} =$ constant $\Rightarrow \frac{T_2}{T_1} = \left(\frac{V_1}{V_2}\right)^\gamma \Rightarrow T_2 = T_1\left(\frac{V_1}{V_2}\right)^\gamma$

$\Rightarrow T_2 = 300\left(\frac{1}{2}\right)^{0.4} = 227.36\ K$

26. (b) In adiabatic change $Q =$ constant $\Rightarrow \Delta Q = 0$

So $\Delta W = -\Delta U$ ($\because \Delta Q = \Delta U + \Delta W$)

27. (d) For adiabatic process from FLOT

$\Delta W = -\Delta U$ $(\because \Delta Q = 0)$

$\Rightarrow \Delta W = -(-100) = +100\,J$

28. (a) $\Delta U = -\Delta W = -\frac{R(T_1 - T_2)}{(\gamma-1)} = \frac{R(T_2 - T_1)}{\gamma-1}$

29. (d) $TV^{\gamma-1} =$ constant $\Rightarrow T_2 = T_1\left(\frac{V_1}{V_2}\right)^{\gamma-1} = 927^o C$

30. (d) The process is very fast, so the gas fails to gain or lose heat. Hence this process in adiabatic

31. (a) $\Delta U = \mu C_V \Delta T = 1\times C_V(T_f - T_i) = -C_V(T_i - T_f)$

$\Rightarrow |\Delta U| = C_V(T_i - T_f)$

32. (c) $T_2 = T_1\left(\frac{V_1}{V_2}\right)^{\gamma-1} = 273(2)^{0.41} = 273\times1.328 = 363K$

$W = \frac{R(T_1 - T_2)}{\gamma-1} = \frac{8.31(273-363)}{1.41-1} = -1824$

$\Rightarrow |W| \approx 1815\ J$

33. (d)

34. (c) $TV^{\gamma-1} =$ constant

$\Rightarrow T_2 = T_1\left(\frac{V_1}{V_2}\right)^{\gamma-1} = (273+18)\left(\frac{V}{V/8}\right)^{0.4} = 668K$

35. (a) $\Delta Q = mc\Delta\theta$. Here $\Delta Q = 0$, hence $c = 0$

36. (d) In adiabatic process, no transfer of heat takes place between system and surrounding.

37. (b) $W = \frac{\mu R(T_1 - T_2)}{(\gamma-1)} = \frac{\mu RT_1}{(\gamma-1)}\left[1 - \frac{T_2}{T_1}\right]$

$= \frac{\mu RT_1}{(\gamma-1)}\left[1 - \left(\frac{V_1}{V_2}\right)^{\gamma-1}\right]$

$= \frac{2\times8.31\times300}{\left(\frac{5}{3}-1\right)}\left[1 - \left(\frac{1}{2}\right)^{\frac{5}{3}-1}\right] = +2767.23\ J$

38. (d) $T^\gamma P^{1-\gamma} =$ constant $\Rightarrow T \propto P^{\frac{\gamma-1}{\gamma}}$

$\Rightarrow \frac{T_2}{T_1} = \left(\frac{P_2}{P_1}\right)^{\frac{\gamma-1}{\gamma}} = \left(\frac{1}{8}\right)^{\frac{5/3-1}{5/3}}$

$$T_2 = 300 \times \left(\frac{1}{8}\right)^{0.4} = 131K = -142°C$$

39. (a) In adiabatic process $\Delta Q = 0 \Rightarrow \Delta U + \Delta W = 0$
$(\because \Delta Q = \Delta U + \Delta W)$

40. (d) Using relation $\frac{T_2}{T_1} = \left(\frac{P_2}{P_1}\right)^{\frac{\gamma-1}{\gamma}} = (8)^{\frac{3/2-1}{3/2}} = 2$.

$\Rightarrow T_2 = 2T_1 \Rightarrow T_2 = 2(273+27) = 600K = 327°C$

41. (c) $\frac{T_2}{T_1} = \left(\frac{P_2}{P_1}\right)^{\frac{\gamma-1}{\gamma}} \Rightarrow \frac{T_2}{T_1} = \left(\frac{1}{8}\right)^{\frac{1.5-1}{1.5}} = \left(\frac{1}{8}\right)^{\frac{1}{3}} = \frac{1}{2}$

$\Rightarrow T_2 = \frac{T_1}{2} = \frac{300}{2} = 150K$.

42. (c) $\frac{P_2}{P_1} = \left(\frac{V_1}{V_2}\right)^{\gamma} \Rightarrow \frac{P'}{P} = (8)^{5/2} \Rightarrow P' = P \times (2)^{15/2}$

43. (a)

44. (a) Given $P \propto T^3$, but we know for an adiabatic process, the pressure $P \propto T^{\gamma/\gamma-1}$

So $\frac{\gamma}{\gamma-1} = 3 \Rightarrow \gamma = \frac{3}{2} \Rightarrow \frac{C_P}{C_V} = \frac{3}{2}$

45. (b)

46. (d) $W = \frac{R(T_i - T_f)}{\gamma - 1} \Rightarrow 6R = \frac{R(T-T_f)}{\left(\frac{5}{3}-1\right)} \Rightarrow T_f = (T-4)K.$

47. (a) $\because TV^{\gamma-1} =$ constant $\Rightarrow T_1V_1^{\gamma-1} = T_2V_2^{\gamma-1}$

$\Rightarrow T_2 = T_1\left(\frac{V_1}{V_2}\right)^{\gamma-1} = T_1(4)^{1.5-1} = 2T_1$

$\therefore$ change in temperature

$= T_2 - T_1 = 2T_1 - T_1 = T_1 = 273\,K$

48. (b) $\because PV^{\gamma} = k$ (constant) $\Rightarrow P_1V_1^{\gamma} = P_2V_2^{\gamma}$

$\Rightarrow P_2 = P_1\left(\frac{V_1}{V_2}\right)^{\gamma} = 10^5 \times (2)^{1.3}$ $\quad (\because V_2 = \frac{V_1}{2})$

49. (b) In adiabatic process $\Delta U = -\Delta W$. In compression ΔW is negative, so ΔU is positive *i.e.* internal energy increases.

50. (a) According to the first law of thermodynamics

$\Delta Q = \Delta U + \Delta W$

In adiabatic process $\Delta Q = 0$, hence $\Delta U = -\Delta W$

51. (b) $PV^{\gamma} =$ constant $\Rightarrow \frac{P_2}{P_1} = \left(\frac{V_1}{V_2}\right)^{\gamma} = \left(\frac{V_1}{V_1/4}\right)^{\gamma} = 4^{\gamma}$

$\Rightarrow P_2 = 4^{\gamma}P$

As γ is always greater than one so $4^{\gamma} > 4 \Rightarrow P_2 > 4P$

52. (d) $P_1V_1^{\gamma} = P_2V_2^{\gamma} \Rightarrow \frac{P_2}{P_1} = \left[\frac{V_1}{V_2}\right]^{\gamma} = \left[\frac{4}{1}\right]^{3/2} = \frac{8}{1}$

53. (b) Change in internal energy of the gas

$\Delta U = -\Delta W \frac{R}{\gamma-1}[T_2 - T_1] = \frac{8.3}{(1.4-1)}[308-300] = 166J$

54. (b) For adiabatic change $TV^{\gamma-1} =$ constant

$\Rightarrow \frac{T_2}{T_1} = \left(\frac{V_1}{V_2}\right)^{\gamma-1} \Rightarrow T_2 = \left(\frac{V_1}{V_2}\right)^{\gamma-1} \times T_1$

$\Rightarrow T_2 = \left(\frac{V}{V/4}\right)^{1.4-1} \times 300 = 300 \times (4)^{0.4}K$

55. (d) For adiabatic forces $\Delta W = -\Delta U$ $\quad (\because \Delta Q = 0)$

$\Rightarrow \Delta W = -(-50) = +50J$

56. (b) $\frac{\text{Adiabatic elasticicty}(E_\phi)}{\text{Isothermal elasticicty}(E_\theta)} = \gamma \Rightarrow E_\theta = \frac{E_\phi}{\gamma}$

$\Rightarrow E_\theta = \frac{2.1 \times 10^5}{1.4} = 1.5 \times 10^5\,N/m^2$

57. (c) $PV^{\gamma} =$ constant : Differentiating both sides

$P\gamma V^{\gamma-1}dV + V^{\gamma}dP = 0 \Rightarrow \frac{dP}{P} = -\gamma\frac{dV}{V}$

Isobaric and Isochoric Processes

1. (a) Work done $= P\Delta V = P(V_2 - V_1)$

2. (c) When heat is supplied at constant pressure, a part of it goes in the expansion of gas and remaining part is used to increase the temperature of the gas which in turn increases the internal energy.

3. (c) For isobaric process $\frac{V_2}{V_1} = \frac{T_2}{T_1} \Rightarrow V_2 = V \times \frac{274}{273}$

Increase $= \frac{274\,V}{273} - V = \frac{V}{273}$

4. (a) From FLOT $\Delta Q = \Delta U + \Delta W = \Delta U + P\Delta V$

$\Rightarrow 100 = \Delta U + 50 \times (4-10) \Rightarrow \Delta U = 400\,J$

5. (a) $W = P \times \Delta V = 2 \times 10^5(150-50) \times 10^{-3} = 2 \times 10^4\,J$

6. (c) $W = P\Delta V = nR\Delta T = 0.1 \times 2 \times 300 = 60\,cal$

7. (c) $\Delta Q = \Delta V + P\Delta V \Rightarrow mL = \Delta U + P(V_2 - V_1)$

$\Rightarrow \Delta U = L - P(V_2 - V_1)$ $\quad (\because m = 1)$

8. (b) $\Delta W = P\Delta V = 10^3 \times 0.25 = 250\,J$

9. (d) $W = P\Delta V = 1.01 \times 10^5(3.34 - 2 \times 10^{-3})$

$= 337 \times 10^3\,J \approx 340\,KJ$

10. (c) $\frac{T_2}{T_1} = \frac{V_2}{V_1} = 2 \Rightarrow T_2 = 2 \times T_1 = 2 \times 300 = 600\,K = 327^o C$

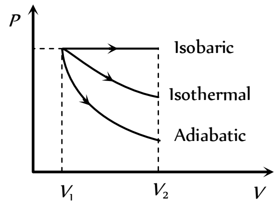
11. (c) $V \propto T$ at constant pressure

$\Rightarrow \frac{V_1}{V_2} = \frac{T_1}{T_2} \Rightarrow V_2 = \frac{V_1T_2}{T_1} = \frac{300 \times 280}{300} = 280\,ml.$

12. (a) In thermodynamic process, work done is equal to the area covered by the PV curve with volume axis.

Hence, according to graph shown

$W_{adiabatic} < W_{isothermal} < W_{isobaric}$



13. (b) (Similar to previous question)

14. (a)

15. (d) $W = P\Delta V = 2.4\times10^{-4}\times1\times10^{5} = 24 J$

16. (b) At constant pressure

$W = P\Delta V = \mu R\Delta T = 1\times8.31\times100 = 831 \approx 814 J$

17. (a) $\Delta V = 0 \Rightarrow P\Delta V = 0 \Rightarrow \Delta W = 0$

18. (d) Entropy of a reversible process does not change.

19. (c) $W = P\Delta V = 0$ (As $\Delta V = 0$)

20. (d)

21. (d) At constant volume $P \propto T \Rightarrow \frac{P_1}{P_2} = \frac{T_1}{T_2} \Rightarrow \frac{P_1}{P_2} = \frac{300}{400} = \frac{3}{4}$

22. (d) In isothermal process $\Delta Q \neq 0$.

23. (a) For isochoric process $\Delta V = 0 \Rightarrow \Delta W = 0$

From FLOT $\Delta Q = \Delta U + \Delta W \Rightarrow \Delta Q = \Delta U$

Heat Engine, Refrigerator and Second Law of Thermodynamics

1. (d) $\eta = \frac{T_1 - T_2}{T_1} - \frac{W}{Q} \Rightarrow Q = \left(\frac{T_1}{T_1 - T_2}\right)W$

$= \frac{600}{(600-300)}\times800 = 1600 J$

2. (c) Coefficient of performance

$K = \frac{T_2}{T_1 - T_2} = \frac{273}{303-273} = \frac{273}{30} = 9$

3. (b) In a refrigerator, the heat dissipated in the atmosphere is more than that taken from the cooling chamber, therefore the room is heated if the door of a refrigerator is kept open.

4. (c) Internal energy is a state function.

5. (b)

6. (d) For a reversible process $\int \frac{dQ}{T} = 0$

7. (b) For cyclic forces $\Delta U = 0$ So, $\Delta Q = \Delta W$

8. (d) $\eta = 1 - \frac{T_2}{T_1} = 1 - \frac{400}{500} = \frac{1}{5}$ $\because \eta = \frac{W}{Q} \Rightarrow \frac{1}{5} = \frac{W}{Q}$

$\Rightarrow W = \frac{Q}{5} = \frac{6}{5}\times10^4 = 1.2\times10^4 J$

9. (b) $\eta = 1 - \frac{T_2}{T_1} \Rightarrow \frac{30}{100} = 1 - \frac{350}{T_1}$

$\Rightarrow \frac{350}{T_1} = 1 - \frac{50}{100} = \frac{70}{100} = \frac{7}{10} \Rightarrow T_1 = 500 K = 227°C$

10. (b) $\eta = 1 - \frac{T_2}{T_1}$ for 100% efficiency $\eta = 1$ which gives $T_2 = 0 K$

11. (c) $\eta = 1 - \frac{T_2}{T_1} = 1 - \frac{(273+69)}{(273+411)} = 0.5$

$\Rightarrow$ Work done $= \eta\times Q = 0.5\times1000 = 500 J$

12. (b) $\because \eta = 1 - \frac{T_2}{T_1} = \frac{W}{Q_1} = \frac{Q_1 - Q_2}{Q_1}$

where $Q_1 =$ heat absorbed, $Q_2 =$ heat rejected

$\Rightarrow 1 - \frac{T/3}{T} = \frac{W}{Q_1} \Rightarrow \frac{2}{3} = \frac{W}{Q_1} = \frac{Q_1 - Q_2}{Q_1}$

$\Rightarrow \frac{2}{3} = 1 - \frac{Q_2}{Q_1} \Rightarrow \frac{Q_2}{Q_1} = \frac{1}{3} \Rightarrow Q_2 = \frac{Q_1}{3} = \frac{Q}{3}$

13. (c) $\eta = 1 - \frac{T_2}{T_1} \Rightarrow \frac{25}{100} = 1 - \frac{300}{T_1} \Rightarrow \frac{1}{4} = 1 - \frac{300}{T_1}$

$T_1 = 400 K = 127°C$

14. (a) $\eta = 1 - \frac{T_2}{T_1} \Rightarrow \frac{70}{100} = 1 - \frac{T_2}{1000} \Rightarrow T_2 = 300 K$

15. (a) $\eta = 1 - \frac{T_2}{T_1} = \frac{T_1 - T_2}{T_1} \Rightarrow \eta_1 = \frac{(473-273)}{473} = \frac{200}{473}$

and $\eta_2 = \frac{273-73}{273} = \frac{200}{273}$

So required ratio $\frac{\eta_1}{\eta_2} = \frac{273}{473} = 0.577$

16. (a) $\eta = 1 - \frac{T_2}{T_1} = 1 - \frac{(273+123)}{(273+27)} = 1 - \frac{150}{300} = \frac{1}{2} = 50\%$

17. (b) $\eta = 1 - \frac{T_2}{T_1} = 1 - \frac{300}{500} = \frac{2}{5}$

18. (d)

19. (b) In first case, $(\eta_1) = 1 - \frac{500}{800} = \frac{3}{8}$

and in second case, $(\eta_2) = 1 - \frac{600}{x}$

Since $\eta_1 = \eta_2$, therefore $\frac{3}{8} = 1 - \frac{600}{x}$

or $\frac{600}{x} = 1 - \frac{3}{8} = \frac{5}{8}$ or $x = \frac{600\times8}{5} = 960K$

20. (a) $\eta_{max} = 1 - \frac{T_2}{T_1} = 1 - \frac{300}{400} = \frac{1}{4} = 25\%$

So 26% efficiency is impossible

21. (b) In first case $\eta_1 = 1 - \frac{T_2}{T_1} = 1 - \frac{(273+0)}{(273+200)} = \frac{200}{473}$

In second case $\eta_2 = 1 - \frac{(273-200)}{(273+0)} = \frac{200}{273}$

$\Rightarrow \frac{\eta_1}{\eta_2} = \frac{1}{\left(\frac{473}{273}\right)} = 1:1.73$

22. (b) $\eta = 1 - \frac{T_2}{T_1} \Rightarrow \frac{1}{2} = 1 - \frac{500}{T_1} \Rightarrow \frac{500}{T_1} = \frac{1}{2}$ .....(i)

$\frac{60}{100} = 1 - \frac{T_2'}{T_1} \Rightarrow \frac{T_2'}{T_1} = \frac{2}{5}$ .....(ii)

Dividing equation (i) by (ii), $\frac{500}{T_2'} = \frac{5}{4} \Rightarrow T_2' = 400K$

23. (c)

24. (a)

25. (b) $\eta = 1 - \frac{T_2}{T_1} = \frac{W}{Q} \Rightarrow W = \left(1 - \frac{T_1}{T_2}\right) Q = \left\{1 - \frac{(273+27)}{(273+627)}\right\}$

$\Rightarrow W = \left(1 - \frac{300}{900}\right) \times 3 \times 10^6 = 2 \times 10^6 \times 4.2\ J = 8.4 \times 10^6\ J$

26. (a)

27. (d) $\eta = 1 - \frac{T_2}{T_1}$; for η to be max. ratio $\frac{T_2}{T_1}$ should be min.

28. (a)

29. (b) In first case $\eta_1 = \frac{T_1 - T_2}{T_1}$

In second case $\eta_2 = \frac{2T_1 - 2T_2}{2T_1} = \frac{T_1 - T_2}{T_1} = \eta$

30. (c) Coefficient of performance

$K = \frac{T_2}{T_1 - T_2} \Rightarrow 5 = \frac{(273-13)}{T_1 - (273-13)} = \frac{260}{T_1 - 260}$

$\Rightarrow 5T_1 - 1300 = 260 \Rightarrow 5T_1 = 1560$

$\Rightarrow T_1 = 312K \to 39°C$

31. (a) Coefficient of performance $K = \frac{T_2}{T_1 - T_2}$

$= \frac{(273-23)}{(273+27)-(273-23)} = \frac{250}{300-250} = \frac{250}{20} = 5$

32. (a) $\eta = \frac{T_1 - T_2}{T_1} = \frac{(273+727)-(273+227)}{273+727} = \frac{1000-500}{1000} = \frac{1}{2}$

33. (c) $\eta = \frac{T_1 - T_2}{T_1} = \frac{W}{Q} \Rightarrow W = \frac{Q(T_1 - T_2)}{T_1}$

$= \frac{6 \times 10^4 [(227+273)-(273+127)]}{(227+273)}$

$= \frac{6 \times 10^4 \times 100}{500} = 1.2 \times 10^4\ cal$

34. (d) Slow isothermal expansion or compression of an ideal gas is reversible process, while the other given process are irreversible in nature.

Critical Thinking Questions

1. (d) Fraction of supplied energy which in creases the internal energy is given by

$$f = \frac{\Delta U}{(\Delta Q)_P} = \frac{(\Delta Q)_V}{(\Delta Q)_P} = \frac{\mu C_V \Delta T}{\mu C_P \Delta T} = \frac{1}{\gamma}$$

For diatomic gas $\gamma = \frac{7}{5} \Rightarrow f = \frac{5}{7}$

2. (c) $\Delta Q = \Delta U + \Delta W$

$\therefore \Delta U = \Delta Q - \Delta W = 540 - \frac{P(V_2 / V_1)}{J}$

$= 540 - \frac{1.013 \times 10^5 \times [(1671-1) \times 10^{-6}]}{4.2}$

$= 540 - 39.7 = 500\ calories$

3. (b,c) There is a decrease in volume during melting on an ice slab at $273K$. Therefore, negative work is done by ice-water system on the atmosphere or positive work is done on the ice-water system by the atmosphere. Hence option (b) is correct. Secondly heat is absorbed during melting (*i.e.* ΔQ is positive) and as we have seen, work done by ice-water system is negative (ΔW is negative). Therefore, from first law of thermodynamics $\Delta U = \Delta Q - \Delta W$.

Change in internal energy of ice-water system, ΔU will be positive or internal energy will increase.

4. (c) Process is isothermal. There fore, T = constant, $\left(P \propto \frac{1}{V}\right)$ volume is increasing, therefore pressure will decreases.

In chamber A :

$$\Delta P = P_i - P_f = \frac{\mu_A RT}{V} - \frac{\mu_A RT}{2V} = \frac{\mu_A RT}{2V} \quad .....(i)$$

In chamber B :

$$1.5\Delta P = P_i - P_f = \frac{\mu_B RT}{V} - \frac{\mu_B RT}{2V} = \frac{\mu_B RT}{2V} \quad .....(ii)$$

from equations (i) and (ii) $\frac{\mu_A}{\mu_B} = \frac{1}{1.5} = \frac{2}{3}$

$\Rightarrow \frac{m_A / M}{m_B / M} = \frac{2}{3} \Rightarrow 3m_A = 2m_B$.

5. (d) $T_1 V_1^{\gamma-1} = T_2 V_2^{\gamma-1} \Rightarrow \frac{T_1}{T_2} = \left(\frac{V_2}{V_1}\right)^{\gamma-1} = \left(\frac{L_2 A}{L_1 A}\right)^{\frac{5}{3}-1} = \left(\frac{L_2}{L_1}\right)^{\frac{2}{3}}$

6. (d) Using Boyle's law, we have $\frac{V}{T}$ = constant

$\Rightarrow \frac{\frac{l}{2}+5}{373} = \frac{\frac{l}{2}-5}{273}$

As the piston moves 5 cm, the length of one side will be $\left(\frac{l}{2}+5\right)$ and other side $\left(\frac{l}{2}-5\right)$. On solving this equation, we get l = 64.6 cm.

7. (c) $\Delta Q = \Delta U + \Delta W \Rightarrow \Delta W = (\Delta Q)_P - \Delta U = (\Delta Q)_P\left[1 - \frac{(\Delta Q)_V}{(\Delta Q)_P}\right]$

$$= (\Delta Q)_P\left[1 - \frac{C_V}{C_P}\right] = Q = \left[1 - \frac{3}{5}\right] = \frac{2}{5}Q$$

$\because (\Delta Q)_P = Q$ and $\gamma = \frac{5}{3}$ for monatomic gas

8. (d) Oxygen is diatomic gas, hence its energy of two moles $= 2 \times \frac{5}{2}RT = 5RT$

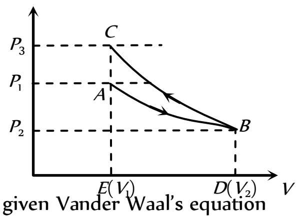
Argon is a monoatomic gas, hence its internal energy of 4 moles $= 4 \times \frac{3}{2}RT = 6RT$

Total Internal energy $= (6+5)RT = 11RT$

9. (c) From graph it is clear that $P_3 > P_1$.

Since area under adiabatic process (*BCED*) is greater than that of isothermal process (*ABDE*). Therefore net work done

$W = W_i + (-W_A)$ $\because W_A > W_i$ $\Rightarrow$ $W < 0$



10. (a) According to given Vander Waal's equation

$$P = \frac{nRT}{V - n\beta} - \frac{\alpha n^2}{V^2}$$

Work done, $W = \int_{V_1}^{V_2} P dV = nRT\int_{V_1}^{V_2}\frac{dV}{V - n\beta} - \alpha n^2\int_{V_1}^{V_2}\frac{dV}{V^2}$

$$= nRT\left[\log_e(V - n\beta)\right]_{V_1}^{V_2} + \alpha n^2\left[\frac{1}{V}\right]_{V_1}^{V_2}$$

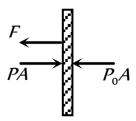
$$= nRT\log_e\frac{V_2 - n\beta}{V_1 - n\beta} + \alpha n^2\left(\frac{V_1 - V_2}{V_1 V_2}\right)$$

11. (b) Volume of the gas is constant V = constant $\therefore$ $P \propto T$

i.e., pressure will be doubled if temperature is doubled

$\therefore$ $P = 2P_0$

Now let F be the tension in the wire. Then equilibrium of any one piston gives



$F = (P - P_0)A = (2P_0 - P_0)A = P_0 A$

12. (c) $dU = C_V dT = \left(\frac{5}{2}R\right)dT$ or $dT = \frac{2(dU)}{5R}$

From first law of thermodynamics

$dU = dQ - dW = Q - \frac{Q}{4} = \frac{3Q}{4}$. Now molar heat capacity

$$C = \frac{dQ}{dT} = \frac{Q}{\frac{2(dU)}{5R}} = \frac{5RQ}{2\left(\frac{3Q}{4}\right)} = \frac{10}{3}R.$$

13. (b) $Q = \Delta U = U_f - U_i$ = [internal energy of 4 moles of a monoatomic gas + internal energy of 2 moles of a diatomic gas] – [internal energy of 4 moles of a diatomic gas]

$$= \left(4 \times \frac{3}{2}RT + 2 \times \frac{5}{2}RT\right) - \left(4 \times \frac{5}{2}RT\right) = RT$$

Note : (a) 2 moles of diatomic gas becomes 4 moles of a monoatomic gas when gas dissociated into atoms.

(b) Internal energy of μ moles of an ideal gas of degrees of freedom F is given by $U = \frac{f}{2}\mu RT$

F = 3 for a monoatomic gas and 5 for diatomic gas.

14. (c) $PV^\gamma = K$ or $P\gamma V^{\gamma-1}dV + dP.\, V^\gamma = 0$

or $\frac{dP}{P} = -\gamma\frac{dV}{V}$ or $\frac{dP}{P} \times 100 = -\gamma\left(\frac{dV}{V} \times 100\right)$

$$= -1.4 \times 5 = 7\%$$

15. (a) $TV^{\gamma-1}$ = constant

$\therefore$ $\frac{T_1}{T_2} = \left(\frac{V_2}{V_1}\right)^{\gamma-1}$ or $\left(\frac{1}{2}\right)^{\gamma-1} = \sqrt{\frac{1}{2}}$

$\therefore$ $\gamma - 1 = \frac{1}{2}$ or $\gamma = \frac{3}{2}$ $\therefore$ $PV^{3/2}$ = constant

16. (c) $\eta_A = \frac{T_1 - T_2}{T_1} = \frac{W_A}{Q_1} \Rightarrow \eta_B = \frac{T_2 - T_3}{T_2} = \frac{W_B}{Q_2}$

$\therefore$ $\frac{Q_1}{Q_2} = \frac{T_1}{T_2} \times \frac{T_2 - T_3}{T_1 - T_2} = \frac{T_1}{T_2}$ $\therefore$ $W_A = W_B$

$\therefore$ $T_2 = \frac{T_1 + T_3}{2} = \frac{800 + 300}{2} = 550K$

17. (b) For monoatomic gas

$\gamma = \frac{C_P}{C_V} = \frac{5}{3}$ we know $\Delta Q = nC_P\Delta T$

and $\Delta U = nC_V\Delta T \Rightarrow \frac{\Delta U}{\Delta Q} = \frac{C_V}{C_P} = \frac{3}{5}$

i.e. fraction of heat energy to increase the internal energy be 3/5.

18. (a) $\Delta Q = \Delta U + \Delta W \Rightarrow \frac{\Delta W}{\Delta Q} = 1 - \frac{\Delta U}{\Delta Q} = 1 - \frac{nC_V dT}{nC_P dT}$

$$\Rightarrow \frac{\Delta W}{\Delta Q} = 1 - \frac{C_V}{C_P} = 1 - \frac{3}{5} = \frac{2}{5} = 0.4$$

19. (b) $\Delta U = \mu C_V\Delta T = \frac{m}{M}C_V\Delta T = \frac{N}{N_A}C_V\Delta T$

$$\Rightarrow (\Delta U)_N = \frac{56 \times 10^3}{14} \times \frac{5}{2}R \times 300$$

and $(\Delta U)_A = \frac{6 \times 10^{26}}{6 \times 10^{23}} \times \frac{3}{2}R \times 900 \Rightarrow (\Delta U)_N > (\Delta U)_A$

20. (c) A is compressed isothermally, hence

$P_1 V = P_2\frac{V}{2} \Rightarrow P_2 = 2P_1$

and B is compressed adiabatically, hence

$P_1 V^\gamma = P_2\left(\frac{V}{2}\right)^\gamma \Rightarrow P_2 = (2)^\gamma P_1$

Since $\gamma > 1$, hence $P_2' > P_2$ or $P_2 < P_2'$

21. (b) In isothermal process $P_1 V_1 = P_2 V_2$

or $PV = P_2 \times 4V$ $\therefore$ $P_2 = \frac{P}{4}$

In adiabatic process

$$P_2V_2^{\gamma} = P_3V_3^{\gamma} \Rightarrow \frac{P}{4} \times (4V)^{1.5} = P_2V^{1.5} \Rightarrow P_3 = 2P$$

22. (d) Volume of the ideal gas is constant so $W = P\Delta V = 0$ using FLOT $\Delta Q = \Delta U \Rightarrow \Delta U = i^2Rt = 1^2 \times 100 \times 5 \times 60$

$= 30 \times 10^3 = 30KJ$

23. (d) Initially $\eta = \left(1 - \frac{T_2}{T_1}\right) = \frac{W}{Q} = \frac{1}{6}$ ...(i)

Finally $\eta' = \left(1 - \frac{T_2'}{T_1}\right) = \left(1 - \frac{(T_2 - 62)}{T_1}\right) = 1 - \frac{T_2}{T_1} + \frac{62}{T_1}$

$= \eta + \frac{62}{T_1}$ ....(ii)

It is given that $\eta' = 2\eta$. Hence solving equation (i) and (ii)

$\Rightarrow T_1 = 372\,K = 99°C$ and $T_2 = 310K = 37°C$

24. (b) Input energy $= \frac{1g}{\sec} \times \frac{2kcal}{g} = 2kcal/\sec$.

Output energy $= 10\ KW = 10\ K\ J/S = \frac{10}{4.2} kcal/\sec$.

$\Rightarrow \eta = \frac{\text{output energy}}{\text{input energy}} = \frac{10}{4.2 \times 2} > 1$, it is impossible.

25. (b) Gain of entropy of ice

$$S_1 = \frac{\Delta Q}{T} = \frac{mL}{T} = \frac{80 \times 100}{(0 + 273)} = \frac{8 \times 10^3}{273} cal/K$$

Loss of entropy of water $= S_2 = -\frac{\Delta Q}{T} = -\frac{mL}{T}$

$$= \frac{80 \times 100}{(273 + 50)} = \frac{8 \times 10^3}{323} cal/K$$

Total change of entropy

$$S_1 + S_2 = \frac{8 \times 10^3}{273} - \frac{8 \times 10^3}{323} = +4.5\ cal/K$$

26. (b) $PV^2 =$ constant represents adiabatic equation. So during the expansion of ideal gas internal energy of gas decreases and temperature falls.

27. (d) Initially $\eta = \frac{T_1 - T_2}{T_1} \Rightarrow 0.5 = \frac{T_1 - (273 + 7)}{T_1}$

$\Rightarrow \quad \frac{1}{2} = \frac{T_1 - 280}{T_1} \Rightarrow T_1 = 560K$

Finally $\eta_1' = \frac{T_1' - T_2}{T_1'} \Rightarrow 0.7 = \frac{T_1' - (273 + 7)}{T_1'} \Rightarrow T_1' = 933K$

$\therefore$ increase in temperature $= 933 - 560 = 373K \approx 380K$

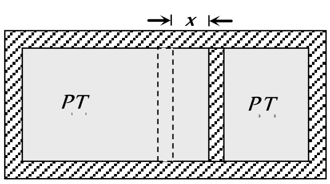
28. (c) P-V diagram of the gas is a straight line passing through origin. Hence $P \propto V$ or $PV^{-1} =$ constant

Molar heat capacity in the process $PV^x =$ constant is

$C = \frac{R}{\gamma - 1} + \frac{R}{1 - x}$; Here $\gamma = 1.4$ (For diatomic gas)

$\Rightarrow C = \frac{R}{1.4 - 1} + \frac{R}{1 + 1} \Rightarrow C = 3R$

29. (c) As finally the piston is in equilibrium, both the gases must be at same pressure P_f. It is given that displacement of piston be in final state x and if A is the area of cross-section of the piston. Hence the final volumes of the left and right part finally can be given by figure as



$V_L = \frac{V_0}{2} + Ax$ and $V_R = \frac{V_0}{2} - Ax$

As it is given that the container walls and the piston are adiabatic in left side and the gas undergoes adiabatic expansion and on the right side the gas undergoes adiabatic compressive. Thus we have for initial and final state of gas on left side

$$P_1\left(\frac{V_0}{2}\right)^{\gamma} = P_f\left(\frac{V_0}{2} + Ax\right)^{\gamma} \quad .....(i)$$

Similarly for gas in right side, we have

$$P_2\left(\frac{V_0}{2}\right)^{\gamma} = P_f\left(\frac{V_0}{2} - Ax\right)^{\gamma} \quad .....(ii)$$

From eq. (i) and (ii)

$$\frac{P_1}{P_2} = \frac{\left(\frac{V_0}{2} + Ax\right)^{\gamma}}{\left(\frac{V_0}{2} - Ax\right)^{\gamma}} \Rightarrow Ax = \frac{V_0}{2}\frac{\left[P_1^{1/\gamma} - P_2^{1/\gamma}\right]}{\left[P_1^{1/\gamma} + P_2^{1/\gamma}\right]}$$

Now from equation (i) $P_f = \frac{P_1\left(\frac{V_0}{2}\right)^{\gamma}}{\left[\frac{V_0}{2} + Ax\right]^{\gamma}}$

30. (d) In both cylinders A and B the gases are diatomic (γ = 1.4). Piston A is free to move *i.e.* it is isobaric process. Piston B is fixed *i.e.* it is isochoric process. If same amount of heat ΔQ is given to both then

$(\Delta Q)_{\text{isobaric}} = (\Delta Q)_{\text{isochoric}} \Rightarrow \mu C_p(\Delta T)_A = \mu C_v(\Delta T)_B$

$\Rightarrow (\Delta T)_B = \frac{C_p}{C_v}(\Delta T)_A = \gamma(\Delta T)_A = 1.4 \times 30 = 42\ K.$

Graphical Questions

1. (c) As internal energy is a point function therefore change in internal energy does not depends upon the path followed i.e. $\Delta U_{\text{I}} = \Delta U_{\text{II}}$

2. (b) Work done by the system = Area of shaded portion on P-V diagram

$= (300 - 100)10^{-6} \times (200 - 10) \times 10^3 = 20\ J$

3. (a) Work done = Area enclosed by triangle $ABC = \frac{1}{2} AC \times BC = \frac{1}{2} \times (3V - V) \times (3P - P) = 2\ PV$

4. (c) Area enclosed between a and f is maximum. So work done in closed cycles follows a and f is maximum.

5. (a) Initial and final states are same in all the process.

Hence $\Delta\ U = 0$; in each case.

By FLOT; $\Delta Q = \Delta W =$ Area enclosed by curve with volume axis.

$\because$ (Area)$_1$ < (Area)$_2$ < (Area)$_1$ $\Rightarrow Q_1 < Q_2 < Q_3$.

6. (a) For an isothermal process $PV =$ constant

$$\Rightarrow PdV + VdP = 0 \Rightarrow -\frac{1}{V}\left(\frac{dV}{dP}\right) = \frac{1}{P}$$

So, $\beta = \frac{1}{P}$ $\therefore$ graph will be rectangular hyperbola.

7. (a) By adjoining graph $W_{AB} = 0$ and

$W_{BC} = 8 \times 10^4 [5-2] \times 10^{-3} = 240\, J$

$\therefore\ W_{AC} = W_{AB} + W_{BC} = 0 + 240 = 240\, J$

Now, $\Delta Q_{AC} = \Delta Q_{AB} + \Delta Q_{BC} = 600 + 200 = 800\, J$

From FLOT $\Delta Q_{AC} = \Delta U_{AC} + \Delta W_{AC}$

$\Rightarrow 800 = \Delta U_{AC} + 240 \Rightarrow \Delta U_{AC} = 560\, J.$

8. (b) In adiabatic process, slope of *PV*-graph.

$$\frac{dP}{dV} = -\gamma \frac{P}{V} \Rightarrow |\text{Slope}| \propto \gamma$$

From the given graph $(\text{Slope})_2 > (\text{Slope})_1 \Rightarrow \gamma_2 > \gamma_1$

therefore 1 should correspond to O_2 (γ = 1.4) and 2 should correspond to *He* (γ = 1.66)

9. (c) As we know that slope of isothermal and adiabatic curves are always negative and slope of adiabatic curve is always greater than that of isothermal curve

Hence in the given graph curve *A* and *B* represents adiabatic and isothermal changes respectively.

10. (d) Process *CD* is isochoric as volume is constant, Process *DA* is isothermal as temperature constant and Process *AB* is isobaric as pressure is constant.

11. (d) Heat given $\Delta Q = 20\, cal = 20 \times 4.2 = 84\, J$.

Work done ΔW = – 50 *J* [As process is anticlockwise]

By first law of thermodynamics

$\Rightarrow \Delta U = \Delta Q - \Delta W = 84 - (-50) = 134\, J$

12. (a) For cyclic process. Total work done $= W_{AB} + W_{BC} + W_{CA}$

$\Delta W_{AB} = P\Delta V = 10(2-1) = 10J$ and $\Delta W_{BC} = 0$

(as V = constant)

From FLOT, $\Delta Q = \Delta U + \Delta W$

$\Delta U = 0$ (Process *ABCA* is cyclic)

$\Rightarrow \Delta Q = \Delta W_{AB} + \Delta W_{BC} + \Delta W_{CA}$

$\Rightarrow\ 5 = 10 + 0 + \Delta W_{CA} \Rightarrow \Delta W_{CA} = -5\, J$

13. (b) The cyclic process 1 is clockwise where as process 2 is anticlockwise. Clockwise area represents positive work and anticlockwise area represents negative work. Since negative area (2) > positive area (1), hence net work done is negative.

14. (c) Process *AB* is isochoric, $\therefore\ W_{AB} = P\,\Delta V = 0$

Process *BC* is isothermal $\therefore\ W_{BC} = RT_2 . \ln\left(\frac{V_2}{V_1}\right)$

Process *CA* is isobaric

$\therefore\ W_{CA} = -P\Delta V = -R\Delta T = -R(T_1 - T_2) = R(T_2 - T_1)$

(Negative sign is taken because of compression)

15. (a) *AB* is isobaric process, *BC* is isothermal process, *CD* is isometric process and *DA* is isothermal process

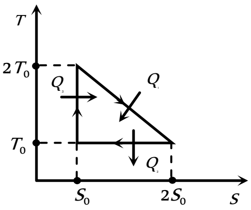
These process are correctly represented by graph (a).

16. (c) Work done by the gas (as cyclic process is clockwise) $\therefore\ \Delta W$ = Area *ABCD*

So from the first law of thermodynamics ΔQ (net heat absorbed) = ΔW = Area *ABCD*

As change in internal energy in cycle $\Delta U = 0$.

17. (a) $Q_1 = T_0 S_0 + \frac{1}{2} T_0 S_0 = \frac{3}{2} T_0 S_0$



$Q_2 = T_0 S_0$ and $Q_3 = 0$

$\eta = \frac{W}{Q_1} = \frac{Q_1 - Q_2}{Q_1}$

$= 1 - \frac{Q_2}{Q_1} = 1 - \frac{2}{3} = \frac{1}{3}$

18. (a) Work done = Area of closed *PV* diagram

$= (2V - V) \times (2P - P) = PV$

19. (c) From the given *VT* diagram,

In process *AB*, $V \propto T \Rightarrow$ Pressure is constant (As quantity of the gas remains same)

In process *BC*, V = Constant and in process *CA*, T = constant

$\therefore$ These processes are correctly represented on *PV* diagram by graph (c).

20. (d) $\Delta Q = \Delta U + \Delta W$; ΔU does not depend upon path.

$\because\ \Delta W_A > \Delta W_B \Rightarrow \Delta Q_A > \Delta Q_B$

21. (d) Work done = Area under curve $= \frac{6P_1 \times 3V_1}{2} = 9\, P_1 V_1$

22. (d) Work done $= \frac{1}{2} \times 2P_1 \times 2V_1 = 2P_1 V_1$

23. (c) In a cyclic, $\Delta U = 0$

From FLOT, $\Delta Q = \Delta U + \Delta W = 0 + \Delta W$ = Area of closed curve

$\Rightarrow \Delta Q = \pi r\ \pi\left(\frac{20}{2}\right)^2 kP_a \times litre$

$= 100\,\pi \times 10^3 \times 10^{-3}\, J = 100\,\pi J$

24. (c) The work done in cyclic process is equal to the area enclosed by the *PV* diagram

25. (d) In all given cases, process is cyclic and in cyclic process $\Delta U = 0$.

26. (b) In cyclic process ΔQ = Work done = Area inside the closed curve.

Treat the circle as an ellipse of area $= \frac{\pi}{4}(P_2 - P_1)(V_2 - V_1)$

$\Rightarrow\ \Delta Q = \frac{\pi}{4}\{(150 - 50) \times 10^3\} = \frac{\pi}{2}\, J$

27. (d) W_{BCOB} = – Area of triangle $BCO = -\frac{P_0 V_0}{2}$

W_{AODA} = + Area of triangle $AOD = +\frac{P_0 V_0}{2}$

28. (c) *AD* and *BC* represent adiabatic process (more slope)

AB and *DC* represent isothermal process (less slope)

29. (c) Work done = Area of curve enclosed

$= 2V \times 2P = 4PV$

30. (c) Work done = Area of *PV* graph (here trapezium)

$= \frac{1}{2}(1 \times 10^5 + 5 \times 10^5) \times (5 - 1) = 12 \times 10^5\, J$

31. (d) For path *ab* : $(\Delta U)_{ab} = 7000\, J$

By using $\Delta U = \mu C_V \Delta T$

$7000 = \mu \times \frac{5}{2} R \times 700 \Rightarrow \mu = 0.48$

For path *ca* :

$(\Delta Q)_{ca} = (\Delta U)_{ca} + (\Delta W)_{ca}$ ....(i)

$\because (\Delta U)_{ab} + (\Delta U)_{bc} + (\Delta U)_{ca} = 0$

$\therefore 7000 + 0 + (\Delta U)_{ca} = 0 \Rightarrow (\Delta U)_{ca} = -7000\ J$ ....(ii)

Also $(\Delta W)_{ca} = P_1(V_1 - V_2) = \mu R(T_1 - T_2)$

$= 0.48 \times 8.31 \times (300 - 1000) = -2792.16\ J$ ....(iii)

on solving equations (i), (ii) and (iii)

$(\Delta Q)_{ca} = -7000 - 2792.16 = -9792.16\ J = -9800\ J$

32. (b) Work done = Area enclosed by indicator diagram

$$= \frac{1}{2} \times (3V - V)(4P - P) = 3PV$$

33. (d) ΔU, remains same for both path

For path iaf: $\Delta U = \Delta Q - \Delta W = 50 - 20 = 30J$.

For path fi : $\Delta U = -30\ J$ and $\Delta W = -13J$

$\Rightarrow \Delta Q = -30 - 13 = -43\ J$.

34. (a) $\Delta E_{\text{int}} = 0$, for a complete cycle and for given cycle work done is negative, so from first law of thermodynamics Q will be negative *i.e.* $Q < 0$.

35. (d) Work done = Area enclosed by the curve

$$= \frac{1}{2}(3V - V)(2P - P) = PV$$

36. (d) W = Area bonded by the indicator diagram with V-axis)

$$= \frac{1}{2}(P_A + P_B)(V_B - V_A)$$

37. (a) Heat given ΔQ = 40 J and Work done ΔW = 30 J

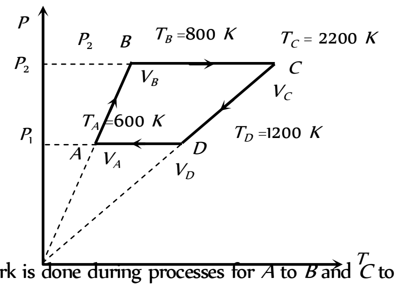
$\Rightarrow \Delta U = \Delta Q - \Delta W = 40 - 30 = 10\ J$.

38. (a) As the volume is continuously increasing and the work of expansion is always positive, so the work done by the system continuously increases.

39. (c) Processes A to B and C to D are parts of straight line graphs of the form $y = mx$

Also $P = \frac{\mu R}{V} T$ (μ = 6)

$\Rightarrow P \propto T$. So volume remains constant for the graphs AB and CD



So no work is done during processes for A to B and C to D *i.e.*, W_{AB} = W_{CD} = 0 and $W_{BC} = P_2(V_C - V_B) = \mu R(T_C - T_B)$

$= 6R\,(2200 - 800) = 6R \times 1400\ J$

Also $W_{DA} = P_1(V_A - V_D) = \mu R(T_A - T_B)$

$= 6R\,(600 - 1200) = -6R \times 600\ J$

Hence work done in complete cycle

$W = W_{AB} + W_{BC} + W_{CD} + W_{DA}$

$= 0 + 6R \times 1400 + 0 - 6R \times 600$

$= 6R \times 900 = 6 \times 8.3 \times 800 \approx 40\ kJ$

40. (b) In isothermal process $P \propto \frac{1}{V}$.

Hence graph between P and V is a hyperbola.

41. (d) Adiabatic curves are more stepper than isothermal curves.

42. (d) During process A to B, pressure and volume both are decreasing. Therefore, temperature and hence, internal energy of the gas will decrease ($T \propto PV$) or $\Delta U_{A\to B}$ = negative. Further $\Delta W_{A\to B}$ is also negative as the volume of the gas is decreasing. Thus $\Delta Q_{A\to B}$ is negative.

In process B to C pressure of the gas is constant while volume is increasing. Hence temperature should increase or $\Delta U_{B\to C}$ = positive. During C to A volume is constant while pressure is increasing. Therefore, temperature and hence, internal energy of the gas should increase or $\Delta U_{C\to A}$ = positive. During process CAB volume of the gas is decreasing. Hence, work done by the gas is negative.

43. (a) $\Delta W_{AB} = 0$ as V = constant

$\therefore \Delta Q_{AB} = \Delta U_{AB} = 50J$ (Given)

$U_A = 1500J \ \therefore \ U_B = (1500 + 50)J = 1550J$

$\Delta W_{BC} = -\Delta U_{BC} = -40J$ (Given)

$\therefore \Delta U_{BC} = 40J \ \therefore \ U_C = (1550 + 40)J = 1590J$

44. (a) For adiabatic process $T_1 V_b^{\gamma-1}$ = Constant

For bc curve $T_1 V_b^{\gamma-1} = T_2 V_c^{\gamma-1}$ or $\frac{T_2}{T_1} = \left(\frac{V_b}{V_c}\right)^{\gamma-1}$ .....(i)

For ad curve $T_1 V_a^{\gamma-1} = T_2 V_d^{\gamma-1}$ or $\frac{T_2}{T_1} = \left(\frac{V_a}{V_d}\right)^{\gamma-1}$ .....(ii)

From equation (i) and (ii) $\frac{V_b}{V_c} = \frac{V_a}{V_d}$

Assertion and Reason

1. (a) In a perfectly reversible system, there is no loss of energy. Losses can be minimised, friction can be reduced, the resistance in L-C oscillating system can also be negligible. But one cannot completely eliminate energy losses. This makes a perfectly reversible system, an ideal.

2. (a) Adiabatic expansion produces cooling.

3. (a) In reversible process, there always occurs some loss of energy. This is because energy spent in working against the dissipative force is not recovered back. Some irreversible process occur in nature such as friction where extra work to cancel the effect of friction. Salt dissolves in water but a salt does not separate by itself into pure salt and pure water.

4. (a) When a bottle of cold carbonated drink is opened. A slight fog forms around the opening. This is because of adiabatic expansion of gas causes lowering of temperature and condensation of water vapours.

5. (e) As isothermal processes are very slow and so the different isothermal curves have different slopes so they cannot intersect each other.

6. (d) Adiabatic compression is a rapid action and both the internal energy and the temperature increases.

7. (e) As there is no change in internal energy of the system during an isothermal change. Hence, the energy taken by the gas is utilised by doing work against external pressure. According to FLOT $\Delta Q = \Delta U + P\Delta V$

Hence $\Delta Q = \Delta U = P\Delta V$

Therefore, reason is true and assertion is false.

8. (d) We can change the temperature of a body without giving (or taking) heat to (or from) it. For example in an adiabatic compression temperature rises and in an adiabatic expansion temperature false, although no heat is given or taken from the system in the respective changes.

9. (a) $c = \dfrac{Q}{m.\Delta\theta}$; a gas may be heated by putting pressure, so it can have values for 0 to ∞.

C_P and C_V are it's two principle specific heats, out of infinite possible values.

In adiabatic process $C = 0$ and in isothermal process $C = \infty$.

10. (a) Heat is similar to work in that both represent ways of transferring energy. Neither heat nor work is an intrinsic property of a system, that is, we cannot say that a system contains a certain amount of heat or work.

11. (d) According to first law of thermodynamics, $\Delta Q = \Delta U + \Delta W = \Delta U + P\Delta V$. If heat is supplies in such a manner that volume does not change $\Delta V = 0$ *i.e.*, isochoric process, then whole of the heat energy supplied to the system will increase internal energy only. But, in any other process it is not possible.

Also heat may absorbed or evolved when state of thermal equilibrium changes.

12. (d) When the door of refrigerator is kept open, heat rejected by the refrigerator to the room will be more than the heat taken by the refrigerator from the room (by an amount equal to work done by the compressor). Therefore, temperature of room will increase and so it will be warmed gradually. As according to 2nd law of thermodynamics, heat cannot be transferred on its own, from a body at lower temperature to another at higher temperature.

13. (a) Second law of thermodynamics can be explained with the help of example of refrigerator, as we know that refrigerator, the working substance extracts heat from colder body and rejects a large amount of heat to a hotter body with the help of an external agency i.e., the electric supply of the refrigerator. No refrigerator can ever work without external supply of electric energy to it.

14. (d) If an electric fan is switched on in a closed room, the air will be heated because due to motion of the fan, the speed of air molecules will increase. In fact, we feel cold due to evaporation of our sweat.

15. (c) The internal energy of system depends only on its temperature. In isothermal process temperature does not change, therefore, internal energy of the system remains the same.

16. (c) In an adiabatic process, no exchange of heat is permissible i.e., $\Delta Q = 0$.

As, $\Delta Q = \Delta U + \Delta W = 0 \Rightarrow \Delta U = -\Delta W$.

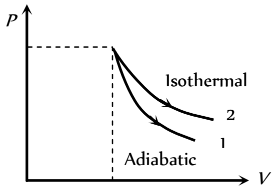
Also in adiabatic process, temperature of gas changes.

17. (a) Change in entropy, $\Delta S = \dfrac{\Delta Q}{T}$. In an adiabatic change, heat transfer $\Delta Q = 0$. $\therefore$ $\Delta S = 0$, or $S =$ constant i.e., entropy remains constant in an adiabatic process, or an adiabatic process is an isoentropic process.

18. (b) As we know, in thermodynamic processes work done = Area covered by *P-V* diagram with volume axis.

Hence, according to following graph.

$(\text{Area})_1 < (\text{Area})_2 \Rightarrow W_{adi} < W_{iso}$



Also in isothermal changes temperature remains same but in adiabatic changes temperature also changes.

19. (c) First law of thermodynamics is restatement of the principal of conservation of energy as applied to heat energy.

20. (e) Zeroth law of thermodynamics explain the concept of temperature. According to which there exist a scalar quantity called temperature which is property of all thermodynamic system.

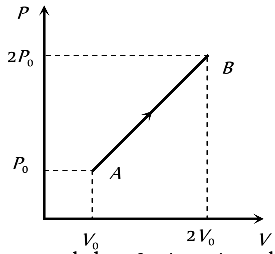
21. (b) Efficiency of cannot cycle $\eta = \dfrac{W}{Q_1} = 1 - \dfrac{T_2}{T_1}$, for Carnot engine when T_2 decrease η increases.

22. (a) Entropy is a measure of the disorder or randomness of the system. Greater the randomness, greater the entropy.

Thermodynamics

SET Self Evaluation Test -14

1. The P-V diagram of 2 gm of helium gas for a certain process $A \rightarrow B$ is shown in the figure. what is the heat given to the gas during the process $A \rightarrow B$



(a) $4P_oV_o$

(b) $6P_oV_o$

(c) $4.5P_oV_o$

(d) $2P_oV_o$

2. A certain mass of gas at 273 K is expanded to 81 times its volume under adiabatic condition. If $\gamma = 1.25$ for the gas, then its final temperature is [Pb. PET 1997]

(a) $-235°C$ (b) $-182°C$

(c) $-91°C$ (d) $0°C$

3. In an adiabatic process $90J$ of work is done on the gas. The change in internal energy of the gas is [CPMT 1996]

(a) $-90\ J$

(b) $+90\ J$

(c) $0\ J$

(d) Depends on initial temperature

4. If a Carnot's engine functions at source temperature 127°C and at sink temperature 87°C, what is its efficiency [DCE 1997]

(a) 10% (b) 25%

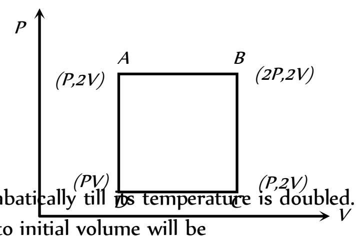
(c) 40% (d) 50%

5. In the case of diatomic gas, the heat given at constant pressure is that part of energy which is used for the expansion of gas, is

(a) $\frac{2}{5}$ (b) $\frac{3}{7}$

(c) $\frac{2}{7}$ (d) $\frac{5}{7}$

6. An ideal monoatomic gas is taken round the cycle $ABCDA$ shown in the PV diagram in the given fig. The work done during the cycle is



(a) $\frac{1}{2}PV$

(b) $2\ PV$

(c) PV

(d) Zero

7. A gas is compressed adiabatically till its temperature is doubled. The ratio of its final volume to initial volume will be [BHU 1997]

(a) 1 / 2 (b) More than 1 / 2

(c) Less than 1 / 2 (d) Between 1 and 2

8. A tyre filled with air (27^oC, and 2 atm) bursts, then what is temperature of air ($\gamma = 1.5$) [RPMT 2002]

(a) -33^oC (b) 0^oC

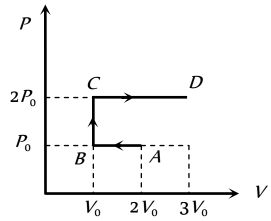
(c) 27^oC (d) 240^oC

9. A gas expands adiabatically at constant pressure such that its temperature $T \propto \frac{1}{\sqrt{V}}$, the value of C_P / C_V of gas is [RPMT 2002; MHCET 2004]

(a) 1.30 (b) 1.50

(c) 1.67 (d) 2.00

10. P-V diagram of an ideal gas is as shown in figure. Work done by the gas in process $ABCD$ is



(a) $4\ P_0V_0$

(b) $2\ P_0V_0$

(c) $3\ P_0V_0$

(d) P_0V_0

11. An engineer claims to have made an engine delivering 10 kW power with fuel consumption of $1\,g\,s^{-1}$. The calorific value of fuel is 2k cal/g. His claim [J & K CET 2000]

(a) Is non-valid (b) Is valid

(c) Depends on engine (d) Depends on load

12. An ideal gas heat engine operates in a Carnot cycle between 27°C and 127°C. It absorbs 6 $kcal$ at the higher temperature. The amount of heat (in $kcal$) converted into work is equal to

(a) 3.5 (b) 1.6

(c) 1.2 (d) 4.8

13. A gas expands with temperature according to the relation $V = kT^{2/3}$. What is the work done when the temperature changes by 30^oC [UPSEAT 1998]

(a) 10 R (b) 20 R

(c) 30 R (d) 40 R

14. An ideal gas ($\gamma = 1.5$) is expanded adiabatically. How many times has the gas to be expanded to reduce the root mean square velocity of molecules 2.0 times

(a) 4 times (b) 16 times

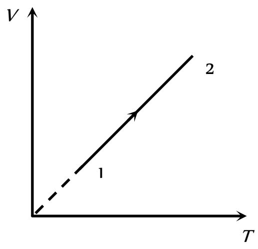
(c) 8 times (d) 2 times

15. Three samples of the same gas A, B and $C(\gamma = 3/2)$ have initially equal volume. Now the volume of each sample is doubled. The process is adiabatic for A isobaric for B and isothermal for C. If the final pressures are equal for all three samples, the ratio of their initial pressures are

(a) $2\sqrt{2}:2:1$ (b) $2\sqrt{2}:1:2$

(c) $\sqrt{2}:1:2$ (d) $2:1:\sqrt{2}$

16. Volume versus temperature graph of two moles of helium gas is as shown in figure. The ratio of heat absorbed and the work done by the gas in process 1-2 is



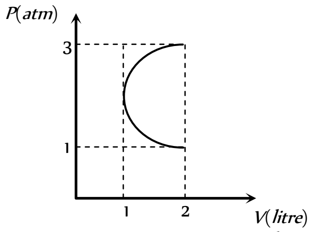
(a) 3

(b) $\frac{5}{2}$

(c) $\frac{5}{3}$

(d) $\frac{7}{2}$

17. In the *P-V* diagram shown in figure *ABC* is a semicircle. The work done in the process *ABC* is



(a) Zero

(b) $\frac{\pi}{2}atm-lt$

(c) $-\frac{\pi}{2}atm-lt$

(d) 4 *atm-lt*

18. Heat is supplied to a diatomic gas at constant pressure. The ratio of $\Delta Q:\Delta U:\Delta W$ is

(a) 5 : 3 : 2 (b) 5 : 2 : 3

(c) 7 : 5 : 2 (d) 7 : 2 : 5

19. A gas undergoes a change of state during which 100 *J* of heat is supplied to it and it does 20 *J* of work. The system is brought back to its original state through a process during which 20 *J* of heat is released by the gas. The work done by the gas in the second process is

(a) 60 *J* (b) 40 *J*

(c) 80 *J* (d) 20 *J*

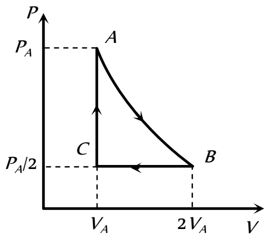
20. *N* moles of an ideal diatomic gas are in a cylinder at temperature *T*. suppose on supplying heat to the gas, its temperature remain constant but *n* moles get dissociated into atoms. Heat supplied to the gas is

(a) Zero (b) $\frac{1}{2}nRT$

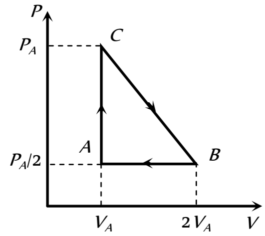
(c) $\frac{3}{2}nRT$ (d) $\frac{3}{2}(N-n)RT$

21. Three moles of an ideal gas $\left(C_P=\frac{7}{2}R\right)$ at pressure P_A and temperature T_A is isothermally expanded to twice its initial volume. It is then compressed at constant pressure to its original volume. Finally the gas is compressed at constant volume to its original pressure P_A. The correct *P-V* and *P-T* diagrams indicating the process are

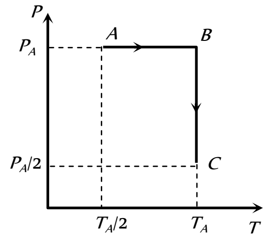
(a)



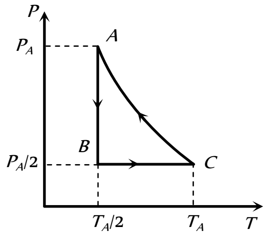
(b)



(c)



(d)



22. A cylinder of mass 1*kg* is given heat of 20000 *J* at atmospheric pressure. If initially temperature of cylinder is 20°*C*, then work done by the cylinder will be (Given that Specific heat of cylinder = 400 *J kg*, Coefficient of volume expansion = 9 × 10 °*C*, Atmospheric pressure = 10 *N/m* and density of cylinder 9000 *kg/m*)

(a) 0.02 *J* (b) 0.05 *J*

(c) 0.08 *J* (d) 0.1 *J*

23. In a thermodynamic process pressure of a fixed mass of a gas is changed in such a manner that the gas releases 30 *joules* of heat and 10 joules of work was done on the gas. If the initial internal energy of the gas was 30 *joules*, then the final internal energy will be [**CPMT 1986**]

(a) 2 *J* (b) – 18 *J*

(c) 10 *J* (d) 58 *J*

24. In an adiabatic change, the pressure *P* and temperature *T* of a monoatomic gas are related by the relation $P\propto T^C$, where *c* equals [**CBSE PMT 1994; BHU 1997; AIIMS 2001; MH CET 2000**]

(a) 5 / 3 (b) 2 / 5

(c) 3 / 5 (d) 5 / 2

25. The internal energy of an ideal gas increases during an isothermal process when the gas is [**SCRA 1998**]

(a) Expanded by adding more molecules to it

(b) Expanded by adding more heat to it

(c) Expanded against zero pressure

(d) Compressed by doing work on it

Answers and Solutions

(SET -14)

1. (b) Change in internal energy from $A\rightarrow B$ is

$$\Delta U=\frac{f}{2}\mu R\Delta T=\frac{f}{2}(P_fV_f-P_iV_i)$$

$= \frac{3}{2}(2P_0 \times 2V_0 - P_0 \times V_0) = \frac{9}{2}P_0V_0$

Work done in process $A \to B$ is equal to the Area covered by the graph with volume axis i.e.,

$W_{A\to B} = \frac{1}{2}(P_0 + 2P_0) \times (2V_0 - V_0) = \frac{3}{2}P_0V_0$

Hence, $\Delta Q = \Delta U + \Delta W = \frac{9}{2}P_0V_0 + \frac{3}{2}P_0V_0 = 6P_0V_0$

2. (b) For adiabatic process $TV^{\gamma-1}$ = constant

$\Rightarrow \frac{T_2}{T_1} = \left(\frac{V_1}{V_2}\right)^{\gamma-1} \Rightarrow T_2 = \left(\frac{V_1}{V_2}\right)^{\gamma-1} \times T_1$

$\Rightarrow T_2 = \left(\frac{1}{81}\right)^{1.25-1} \times 273 = \left(\frac{1}{81}\right)^{0.25} \times 273$

$= \frac{273}{3} = 91K \to -182°C$

3. (b) For adiabatic process $\Delta Q = 0$

From $\Delta Q = \Delta U + \Delta W \Rightarrow 0 = \Delta U - 90 \Rightarrow \Delta U = +90J$

4. (d) $\eta = \frac{T_1 - T_2}{T_1} = \frac{(127+273)-(87+273)}{(127+273)}$

$= \frac{400-360}{400} = 0.1 \to 10\%$

5. (c) $\Delta W =$ energy used for expansion $= PdV = RdT$

$\Delta Q =$ heat supplied to diatomic gas at constant P

$= C_p dT = \frac{7}{2}RdT \ (\because C_p = \frac{7}{2}R) \ \therefore \frac{\Delta W}{\Delta Q} = \frac{RdT}{\frac{7}{2}RdT} = \frac{2}{7}$

6. (c)

7. (c) $\frac{T_2}{T_1} = \left(\frac{V_1}{V_2}\right)^{\gamma-1} = 2 \Rightarrow \left(\frac{V_2}{V_1}\right)^{\gamma-1} = \frac{1}{2} \Rightarrow \frac{V_2}{V_1} = \left(\frac{1}{2}\right)^{\frac{1}{\gamma-1}} < \frac{1}{2}$

$\Rightarrow V_2 < \frac{V_1}{2}$

8. (a) $\frac{T_2}{T_1} = \left(\frac{P_2}{P_1}\right)^{\frac{\gamma-1}{\gamma}} \Rightarrow \frac{T_2}{(273+27)} = \left(\frac{1}{2}\right)^{\frac{1.5-1}{1.5}} = \left(\frac{1}{2}\right)^{\frac{1}{3}} = \frac{1}{2.5}$

$\Rightarrow T_2 = \frac{T_1}{1.25} = \frac{(273+27)}{1.25} = 238\,K = -34.8°C$

9. (b) $TV^{\gamma-1} =$ constant $\Rightarrow T \propto V^{1-\gamma}$

According to question $T \propto V^{-\frac{1}{2}}$

Hence $1-\gamma = -\frac{1}{2} \Rightarrow \gamma \frac{3}{2} = 1.5$

10. (c) $W_{AB} = -P_0V_0$, $W_{BC} = 0$ and $W_{CD} = 4P_0V_0$

$\Rightarrow W_{ABCD} = -P_0V_0 + 0 + 4P_0V_0 = 3P_0V_0$

11. (a) Power $= 10\,KW = 10000\,J/s = \frac{10000}{4.2} = 2.38\,k\,cal/gm$

But the calorific value of fuel is only 2 *k cal/gm*. Hence claim is invalid.

12. (c) Efficiency of a carnot engine is given by $\eta = 1 - \frac{T_2}{T_1}$

or $\frac{W}{Q} = 1 - \frac{T_2}{T_1} \Rightarrow \frac{W}{6} = 1 - \frac{(273+127)}{(273+227)} \Rightarrow W = 1.2\,k\,cal$

13. (b) $W = \int PdV = \int \frac{RT}{V}dV$

Since $V = kT^{2/3} \Rightarrow dV = \frac{2}{3}KT^{-1/3}dT$

Eliminating K, we find $\frac{dV}{V} = \frac{2}{3}\frac{dT}{T}$

Hence $W = \int_{T_1}^{T_2} \frac{2}{3}\frac{RT}{T}dT = \frac{2}{3}R(T_2 - T_1) = \frac{2}{3}R(30) = 20\,R$

14. (b) $v_{rms} = \sqrt{\frac{3RT}{M}} \Rightarrow v_{rms} \propto \sqrt{T}$

v_{rms} is to reduce two times *i.e.* temperature of the gas will have to reduce four times or $\frac{T'}{T} = \frac{1}{4}$

During adiabatic process $TV^{\gamma-1} = T'V'^{\gamma-1}$

$\Rightarrow \frac{V'}{V} = \left(\frac{T}{T'}\right)^{\frac{1}{\gamma-1}} = (4)^{\frac{1}{1.5-1}} = (4)^2 = 16 \Rightarrow V' = 16V$

15. (b) Let the initial pressure of the three samples be P_A, P_B and P_C, then $P_A(V)^{3/2} = (2V)^{3/2}P$, $P_B = P$ and $P_C(V) = P(2V)$

$\Rightarrow P_A : P_B : P_C = (2)^{3/2} : 1 : 2 = 2\sqrt{2} : 1 : 2$

16. (b) *V-T* graph is a straight line passing through origin. Hence, $V \propto T$ or $P =$ constant

$\therefore \quad \Delta Q = nC_P\Delta T$ and $\Delta U = nC_V\Delta T$

Also $\Delta W = \Delta Q - \Delta U = \mu(C_P - C_V)\Delta T$

$\therefore \quad \frac{\Delta Q}{\Delta W} = \frac{nC_P\Delta T}{n(C_P - C_V)\Delta T} = \frac{C_P}{C_P - C_V} = \frac{1}{1 - \frac{C_V}{C_P}}$

$\frac{C_V}{C_P} = \frac{3}{5}$ for helium gas. Hence $\frac{\Delta Q}{\Delta W} = \frac{1}{1 - 3/5} = \frac{5}{2}$

17. (b) W_{AB} is negative (volume is decreasing) and

W_{BC} is positive (volume is increasing) and

since, $|W_{BC}| > |W_{AB}|$

$\therefore$ net work done is positive and area between semicircle which is equal to $\frac{\pi}{2} atm - lt.$

18. (c) $\Delta Q = \mu C_P\Delta T = \frac{7}{2}\mu R\Delta T \quad \left(C_P = \frac{7}{2}R\right)$

$\Delta U = \mu C_V\Delta T = \frac{5}{2}\mu R\Delta T \quad \left(C_V = \frac{5}{2}R\right)$

and $\Delta W = \Delta Q - \Delta U = \mu R\Delta T$

$\Rightarrow \Delta Q : \Delta U : \Delta W = 7 : 5 : 2$

19. (a) In a cyclic process $\Delta U = 0 \Rightarrow \Delta Q = \Delta W$

$\Rightarrow (100 - 20) = 20 + W_2 \Rightarrow W_2 = 60\ J$

20. (b) Since the gas is enclosed in a vessel, therefore, during heating process, volume of the gas remains constant. Hence, no work is done by the gas. It means heat supplied to the gas is used to increase its internal energy only.

Initial internal energy of the gas is $U_1 = N\left(\frac{5}{2}R\right)T$

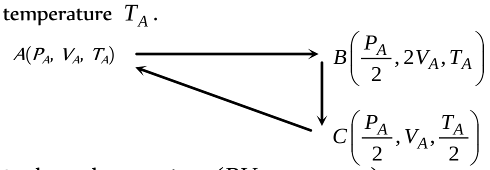
Since n moles get dissociated into atoms, therefore, after heating, vessel contains $(N - n)$ moles of diatomic gas and $2n$ moles of a mono-atomic gas. Hence the internal energy for the gas, after heating, will be equal to

$$U_2 = (N - n)\left(\frac{5}{2}R\right)T + 2n\left(\frac{3}{2}R\right)T = \frac{5}{2}NRT + \frac{1}{2}nRT$$

Hence, the heat supplied = increase in internal energy

$$=(U_2 - U_1) = \frac{1}{2}nRT$$

21. (a) Let the process start from initial pressure P_A, volume V_A and temperature T_A.



(i) Isothermal expansion $(PV = \text{constant})$ at temperature T_A to twice the initial volume V_A

(ii) Compression at constant pressure $\frac{P_A}{2}$ to original volume V_A $(i.e. V \propto T)$

(iii) Isochoric process (at volume V_A) to initial condition $(i.e. P \propto T)$

22. (b) $\Delta Q = mc\Delta T \Rightarrow \Delta T = \frac{20000J}{1kg \times (400J/kg°C)} = 50°C$

$\Rightarrow T_{Final} = 70°C$

Hence $W = P_{atm}\Delta V = P_{atm}V_0\gamma\,\Delta T$

$$= (10^5\,N/m^2)\left(\frac{1}{9\times 10^3}m^3\right)(9\times 10^{-5}/°C)(50°C) = 0.05J$$

23. (c) $\Delta Q = \Delta U + \Delta W = (U_f - U_i) + \Delta W$

$\Rightarrow -30 = (U_f - 30) - 10 \Rightarrow U_f = 10\ J$

24. (d) $T^{\gamma}P^{1-\gamma}$ = constant $\Rightarrow P \propto T^{\frac{\gamma}{\gamma - 1}}$

Comparing above equation with given equation

$$P \propto T^C \Rightarrow C = \frac{\gamma}{\gamma - 1} = \frac{5/3}{5/3 - 1} = \frac{5}{2}$$

25. (a) Internal energy of an ideal gas is given by

$$U = \frac{f}{2}\mu RT = \frac{f}{2}\left(\frac{N}{N_A}\right)RT \Rightarrow U \propto NT.$$

In isothermal process T = constant $\Rightarrow U \propto N$.

i.e. internal energy increases by increasing number of molecules (N).

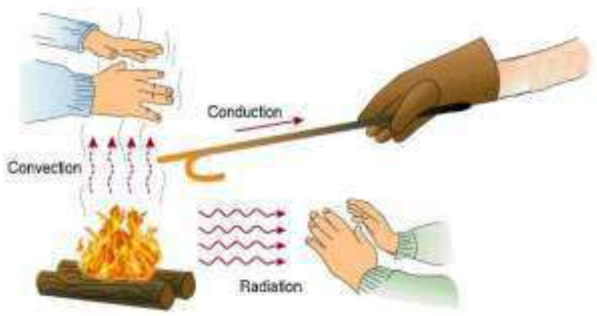
***

Chapter 15

Transmission of Heat

Heat energy transfers from a body at higher temperature to a body at lower temperature. The transfer of heat from one body to another may take place by one of the following modes.

Conduction, Convection and **Radiation**



Conduction

The process of transmission of heat energy in which the heat is transferred from one particle to other particle without dislocation of the particle from their equilibrium position is called conduction.

(1) Heat flows from hot end to cold end. Particles of the medium simply oscillate but do not leave their place.

(2) Medium is necessary for conduction

Fig. 15.1

(3) It is a slow process

(4) The temperature of the medium increases through which heat flows

(5) Conduction is a process which is possible in all states of matter.

(6) When liquid and gases are heated from the top, they conduct heat from top to bottom.

(7) In solids only conduction takes place

(8) In non-metallic solids and fluids the conduction takes place only due to vibrations of molecules, therefore they are poor conductors.

(9) In metallic solids free electrons carry the heat energy, therefore they are good conductor of heat.

Conduction in Metallic Rod

When one end of a metallic rod is heated, heat flows by conduction from the hot end to the cold end.

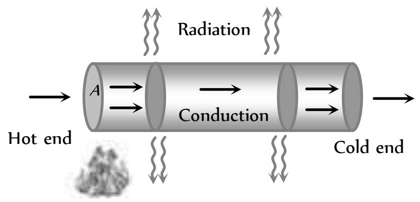


Fig. 15.2

(1) **Variable state :** In this state temperature of every part of the rod increases

Heat received by each cross-section of the rod from hotter end used in three ways.

(i) A part increases temperature of itself.

(ii) Another part transferred to neighbouring cross-section.

(iii) Remaining part radiates.

- $\theta_1 > \theta_2 > \theta_3 > \theta_4 > \theta_5$
- $\theta \rightarrow$ Changing

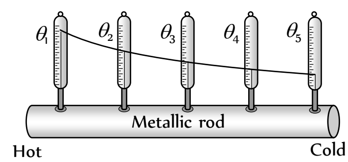

Fig. 15.3

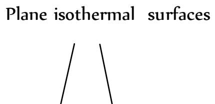
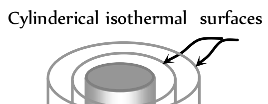
(2) **Steady state :** After sometime, a state is reached when the temperature of every cross-section of the rod becomes constant. In this state, no heat is absorbed by the rod. The heat that reaches any cross-section is transmitted to the next except that a small part of heat is lost to surrounding from the sides by convection & radiation. This state of the rod is called steady state.

(3) **Isothermal surface :** Any surface (within a conductor) having its all points at the same temperature, is called isothermal surface. The direction





of flow of heat through a conductor at any point is perpendicular to the isothermal surface passing through that point.

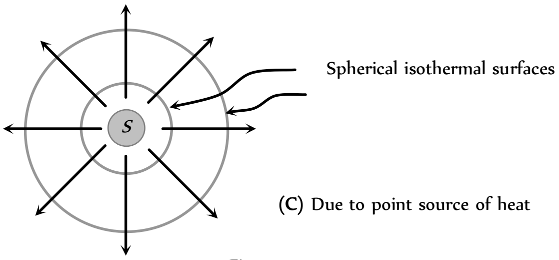


Fig. 15.4

(4) **Temperature gradient (T.G.) :** The rate of change of temperature with distance between two isothermal surfaces is called temperature gradient. Hence

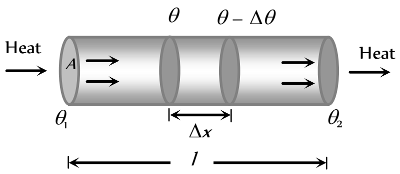

Fig. 15.5

(i) Temperature gradient = $\frac{-\Delta\theta}{\Delta x}$

(ii) The negative sign show that temperature θ decreases as the distance *x* increases in the direction of heat flow.

(iii) For uniform temperature fall $\frac{\theta_1 - \theta_2}{l} = \frac{\Delta\theta}{\Delta x}$

(iv) Unit : *K/m* or *°C/m* (S.I.) and Dimensions $[L^{-1}\theta]$

(5) **Law of thermal conductivity :** Consider a rod of length *l* and area of cross-section *A* whose faces are maintained at temperature θ and θ respectively. The curved surface of rod is kept insulated from surrounding to avoid leakage of heat

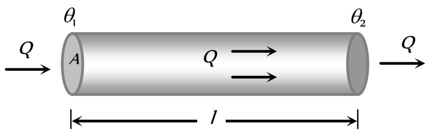

Fig. 15.6

(i) In steady state the amount of heat flowing from one face to the other face in time *t* is given by $Q = \frac{KA(\theta_1 - \theta_2)t}{l}$

where *K* is coefficient of thermal conductivity of material of rod.

(ii) Rate of flow of heat *i.e.* heat current $\frac{Q}{t} = H = \frac{KA(\theta_1 - \theta_2)}{l}$

(iii) In case of non-steady state or variable cross-section, a more general equation can be used to solve problems.

$$\frac{dQ}{dt} = -KA\frac{d\theta}{dx}$$

(6) **More about *K* :** It is the measure of the ability of a substance to conduct heat through it.

(i) Units : *Cal/cm-sec °C* (in C.G.S.), *kcal/m-sec-K* (in M.K.S.) and *W/m- K* (in S.I.). Dimension : $[MLT^{-3}\theta^{-1}]$

(ii) The magnitude of *K* depends only on nature of the material.

(iii) Substances in which heat flows quickly and easily are known as good conductor of heat. They possesses large thermal conductivity due to large number of free electrons *e.g.* Silver, brass *etc.* For perfect conductors, $K = \infty$.

(iv) Substances which do not permit easy flow of heat are called bad conductors. They possess low thermal conductivity due to very few free electrons *e.g.* Glass, wood *etc.* and for perfect insulators, $K = 0$.

(v) The thermal conductivity of pure metals decreases with rise in temperature but for alloys thermal conductivity increases with increase of temperature.

(vi) Human body is a bad conductor of heat (but it is a good conductor of electricity).

(vii) **Decreasing order of conductivity :** For some special cases it is as follows

(a) $K_{Ag} > K_{Cu} > K_{Al}$

(b) $K_{Solid} > K_{Liquid} > K_{Gas}$

(c) $K_{Metals} > K_{Non-metals}$

Table 15.1 : Thermal conductivity of some material

Substance	Thermal conductivity (*W/m-K*)	Substance	Thermal conductivity (*W/m-K*)
Aluminium	240	Concrete	0.9
Copper	400	Water	0.6
Gold	300	Glass wool	0.04
Iron	80	Air	0.024
Lead	35	Helium	0.14
Glass	0.9	Hydrogen	0.17
Wood	0.1-0.2	Oxygen	0.024

(7) **Relation between temperature gradient and thermal conductivity :** In steady state, rate of flow of heat $\frac{dQ}{dt} = -KA\frac{d\theta}{dx} = -KA \times$ (T.G.) $\Rightarrow$

(T.G.) $\propto \frac{1}{K}$ ($\frac{dQ}{dt}$ = constant)

Temperature difference between the hot end and the cold end in steady state is inversely proportional to *K*, *i.e.* in case of good conductors temperature of the cold end will be very near to hot end.

In ideal conductor where $K = \infty$, temperature difference in steady state will be zero.

(8) **Thermal resistance (*R*) :** The thermal resistance of a body is a measure of its opposition to the flow of heat through it.

It is defined as the ratio of temperature difference to the heat current (= Rate of flow of heat)

(i) Hence $R = \frac{\theta_1 - \theta_2}{H} = \frac{\theta_1 - \theta_2}{KA(\theta_1 - \theta_2)/l} = \frac{l}{KA}$

(ii) **Unit :** $^oC \times sec/cal$ or $K \times sec/kcal$ and Dimension : $[M^{-1}L^{-2}T^3\theta]$

(9) **Wiedmann-Franz law :** At a given temperature *T*, the ratio of thermal conductivity to electrical conductivity is constant *i.e.*, $(K/\sigma T)$ = constant, *i.e.,* a substance which is a good conductor of heat (*e.g.,* silver) is also a good conductor of electricity. Mica is an exception to above law.

(10) **Thermometric conductivity or diffusivity :** It is a measure of rate of change of temperature (with time) when the body is not in steady state (*i.e.,* in variable state)

It is defined as the ratio of the coefficient of thermal conductivity to the thermal capacity per unit volume of the material. Thermal capacity per unit volume = $\frac{mc}{V}$ = ρc

(ρ = density of substance) $\Rightarrow$ Diffusivity (*D*) = $\frac{K}{\rho c}$

Unit : *m/sec* and Dimension : $[L^2T^{-1}]$

Table 15.2 : Electrical Analogy for Thermal Conduction

Electrical conduction	Thermal conduction
Electric charge flows from higher potential to lower potential	Heat flows from higher temperature to lower temperature
The rate of flow of charge is called the electric current, *i.e.* $I = \frac{dq}{dt}$	The rate of flow of heat may be called as heat current *i.e.* $H = \frac{dQ}{dt}$
The relation between the electric current and the potential difference is given by Ohm's law, that is $I = \frac{V_1 - V_2}{R}$ where *R* is the electrical resistance of the conductor	Similarly, the heat current may be related with the temperature difference as $H = \frac{\theta_1 - \theta_2}{R}$ where *R* is the thermal resistance of the conductor
The electrical resistance is defined as $R = \frac{\rho l}{A} = \frac{l}{\sigma A}$ where ρ = Resistivity and σ = Electrical conductivity	The thermal resistance may be defined as $R = \frac{l}{KA}$ where *K* = Thermal conductivity of conductor
$\frac{dq}{dt} = I = \frac{V_1 - V_2}{R} = \frac{\sigma A}{l}(V_1 - V_2)$	$\frac{dQ}{dt} = H = \frac{\theta_1 - \theta_2}{R} = \frac{KA}{l}(\theta_1 - \theta_2)$

Applications of Conductivity in Daily Life

(1) Cooking utensils are provided with wooden handles, because wood is a poor conductor of heat. The hot utensils can be easily handled from the wooden handles and our hands are saved from burning.

Fig. 15.7

(2) We feel warmer in a fur coat. The air enclosed in the fur coat being bad conductor heat does not allow the body heat to flow outside. Hence we feel warmer in a fur coat.

(3) Eskimos make double walled houses of the blocks of ice. Air enclosed in between the double walls prevents transmission of heat from the house to the cold surroundings.

Fig. 15.8

For exactly the same reason, two thin blankets are warmer than one blanket of their combined thickness. The layer of air enclosed in between the two blankets makes the difference.

(4) Wire gauze is placed over the flame of Bunsen burner while heating the flask or a beaker so that the flame does not go beyond the gauze and hence there is no direct contact between the flame and the flask. The wire gauze being a good conductor of heat, absorb the heat of the flame and transmit it to the flask.

Fig. 15.9

Davy's safety lamp has been designed on this principle. The gases in the mines burn inside the gauze placed around the flame of the lamp. The temperature outside the gauze is not high, so the gases outside the gauze do not catch fire.

(5) Birds often swell their feathers in winter. By doing so, they enclose more air between their bodies and the feathers. The air, being bad conductor of heat prevents the out flow of their body heat. Thus, birds feel warmer in winter by swelling their feathers.

Combination of Metallic Rods

(1) **Series combination :** Let *n* slabs each of cross-sectional area *A*, lengths $l_1, l_2, l_3, ...\ l_n$ and conductivities $K_1, K_2, K_3 ......\ K_n$ respectively be connected in the series

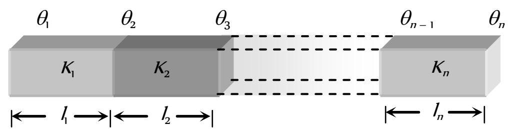

Fig. 15.10

(i) **Heat current :** Heat current is the same in all the conductors.*i.e.,*

$$\frac{Q}{t} = H_1 = H_2 = H_3 .... = H_n$$

$$\frac{K_1 A(\theta_1 - \theta_2)}{l_1} = \frac{K_2 A(\theta_2 - \theta_3)}{l_2} = \frac{K_n A(\theta_{n-1} - \theta_n)}{l_n}$$

(ii) **Equivalent thermal resistance :** $R = R_1 + R_2 + ...\ R_n$

(iii) **Equivalent thermal conductivity :** It can be calculated as follows

From $R_S = R_1 + R_2 + R_3 + ...$

$$\frac{l_1 + l_2 + ...l_n}{K_s} = \frac{l_1}{K_1 A} + \frac{l_2}{K_2 A} + ... + \frac{l_n}{K_n A}$$

$$\Rightarrow K_s = \frac{l_1 + l_2 + ...\ l_n}{\frac{l_1}{K_1} + \frac{l_2}{K_2} + ... \frac{l_n}{K_n}}$$

(a) For *n* slabs of equal length $K_s = \frac{n}{\frac{1}{K_1} + \frac{1}{K_2} + \frac{1}{K_3} + ... \frac{1}{K_n}}$

(b) For two slabs of equal length, $K_s = \frac{2K_1 K_2}{K_1 + K_2}$

(iv) **Temperature of interface of composite bar** : Let the two bars are arranged in series as shown in the figure.

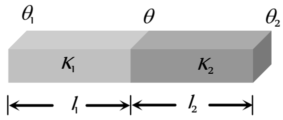

Fig. 15.11

Then heat current is same in the two conductors.

i.e., $\dfrac{Q}{t} = \dfrac{K_1 A(\theta_1 - \theta)}{l_1} = \dfrac{K_2 A(\theta - \theta_2)}{l_2}$

By solving we get $\theta = \dfrac{\dfrac{K_1}{l_1}\theta_1 + \dfrac{K_2}{l_2}\theta_2}{\dfrac{K_1}{l_1} + \dfrac{K_2}{l_2}}$

(a) If $l_1 = l_2$ then $\theta = \dfrac{K_1\theta_1 + K_2\theta_2}{K_1 + K_2}$

(b) If $K_1 = K_2$ and $l_1 = l_2$ then $\theta = \dfrac{\theta_1 + \theta_2}{2}$

(2) **Parallel Combination :** Let *n* slabs each of length *l*, areas $A_1, A_2, A_3, \ldots\ldots A_n$ and thermal conductivities $K_1, K_2, K_3, \ldots\ldots K_n$ are connected in parallel then

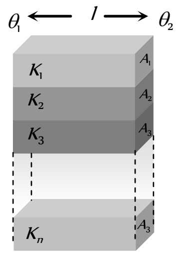

Fig. 15.12

(i) **Equivalent resistance :** $\dfrac{1}{R_s} = \dfrac{1}{R_1} + \dfrac{1}{R_2} + \dfrac{1}{R_3} + \ldots\ldots \dfrac{1}{R_n}$

For two slabs $R_s = \dfrac{R_1 R_2}{R_1 + R_2}$

(ii) **Temperature gradient :** Same across each slab.

(iii) **Heat current :** in each slab will be different. Net heat current will be the sum of heat currents through individual slabs. *i.e.,* $H = H_1 + H_2 + H_3 + \ldots. H_n$

$$\frac{K(A_1 + A_2 + \ldots\ldots + A_n)(\theta_1 - \theta_2)}{l}$$

$$= \frac{K_1 A_1(\theta_1 - \theta_2)}{l} + \frac{K_2 A_2(\theta_1 - \theta_2)}{l} + \ldots + \frac{K_n A_n(\theta_1 - \theta_2)}{l}$$

$$\Rightarrow K = \frac{K_1 A_1 + K_2 A_2 + K_3 A_3 + \ldots\ldots K_n A_n}{A_1 + A_2 + A_3 + \ldots\ldots A_n}$$

(a) For *n* slabs of equal area $K = \dfrac{K_1 + K_2 + K_3 + \ldots\ldots K_n}{n}$

(b) For two slabs of equal area $K = \dfrac{K_1 + K_2}{2}$.

Ingen-Hauz Experiment

It is used to compare thermal conductivities of different materials. If l_1, l_2 and l_3 are the lengths of wax melted on rods as shown in the figure, then the ratio of thermal conductivities is $K_1 : K_2 : K_3 = l_1^2 : l_2^2 : l_3^2$

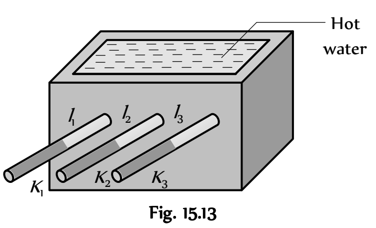

Fig. 15.13

$\Rightarrow$ Thermal conductivity (*K*) $\propto$ (Melted length l)^2

Searle's Experiment

It is a method of determination of *K* of a metallic rod.

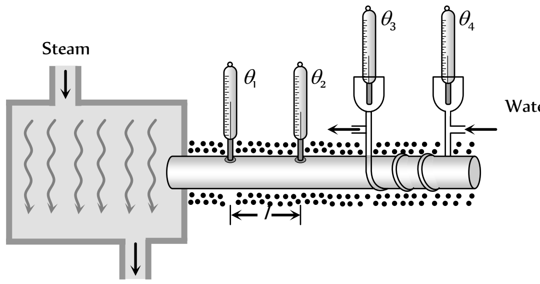

Fig. 15.14

(1) In this experiment a temperature difference $(\theta_1 - \theta_2)$ is maintained across a rod of length *l* and area of cross section A. If the thermal conductivity of the material of the rod is *K*, then the amount of heat transmitted by the rod from the hot end to the cold end in time *t* is given by, $Q = \dfrac{KA(\theta_1 - \theta_2)t}{l}$ ......(i)

(2) In Searle's experiment, this heat reaching the other end is utilized to raise the temperature of certain amount of water flowing through pipes circulating around the other end of the rod. If temperature of the water at the inlet is θ_3 and at the outlet is θ_4, then the amount of heat absorbed by water is given by, $Q = mc(\theta_4 - \theta_3)$ ......(ii)

(3) Where, *m* is the mass of the water which has absorbed this heat and temperature is raised and *c* is the specific heat of the water

Equating (i) and (ii), *K* can be determined *i.e.,* $K = \dfrac{mc(\theta_4 - \theta_3)l}{A(\theta_1 - \theta_2)t}$

(4) In numericals we may have the situation where the amount of heat travelling to the other end may be required to do some other work *e.g.,* it may be required to melt the given amount of ice. In that case equation (i) will have to be equated to *mL*.

i.e. $mL = \dfrac{KA(\theta_1 - \theta_2)t}{l}$

Growth of Ice on Lake

(1) Water in a lake starts freezing if the atmospheric temperature drops below $0^o C$. Let *y* be the thickness of ice layer in the lake at any instant *t* and atmospheric temperature is $-\theta^o C$.

(2) The temperature of water in contact with lower surface of ice will be zero.

(3) If *A* is the area of lake, heat escaping through ice in time *dt* is $dQ_1 = \dfrac{KA[0 - (-\theta)]dt}{y}$

(4) Suppose the thickness of ice layer increases by *dy* in time *dt*, due to escaping of above heat. Then $dQ_2 = mL = \rho(dy\, A)L$

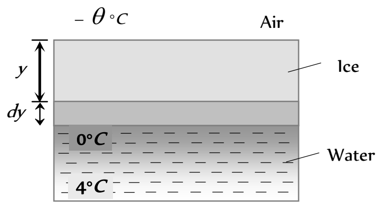

Fig. 15.15

(5) As $dQ_1 = dQ_2$, hence, rate of growth of ice will be $(dy/dt) = (K\theta / \rho L y)$

So, the time taken by ice to grow to a thickness y is

$$t = \frac{\rho L}{K\theta}\int_0^y y\,dy = \frac{\rho L}{2K\theta}y^2$$

(6) If the thickness is increased from y_1 to y_2 then time taken $t = \frac{\rho L}{K\theta}\int_{y_1}^{y_2} y dy = \frac{\rho L}{2K\theta}(y_2^2 - y_1^2)$

(7) Take care and do not apply a negative sign for putting values of temperature in formula and also do not convert it to absolute scale.

(8) Ice is a poor conductor of heat, therefore the rate of increase of thickness of ice on ponds decreases with time.

(9) It follows from the above equation that time taken to double and triple the thickness, will be in the ratio of

$$t_1 : t_2 : t_3 :: 1^2 : 2^2 : 3^2, \text{ i.e., } t_1 : t_2 : t_3 :: 1 : 4 : 9$$

(10) The time intervals to change the thickness from 0 to y, from y to $2y$ and so on will be in the ratio

$$\Delta t_1 : \Delta t_2 : \Delta t_3 :: (1^2 - 0^2) : (2^2 - 1^2) : (3^2 : 2^2)$$

$$\Rightarrow \Delta t_1 : \Delta t_2 : \Delta t_3 :: 1 : 3 : 5$$

Convection

Mode of transfer of heat by means of migration of material particles of medium is called convection. It is of two types.

(1) **Natural convection :** This arise due to difference of densities at two places and is a consequence of gravity because on account of gravity the hot light particles rise up and cold heavy particles try setting down. It mostly occurs on heating a liquid/fluid.

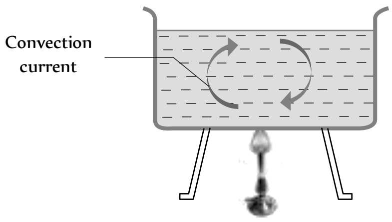

Fig. 15.16

(2) **Forced convection :** If a fluid is forced to move to take up heat from a hot body then the convection process is called forced convection. In this case Newton's law of cooling holds good. According to which rate of loss of heat from a hot body due to moving fluid is directly proportional to the surface area of body and excess temperature of body over its surroundings *i.e.*

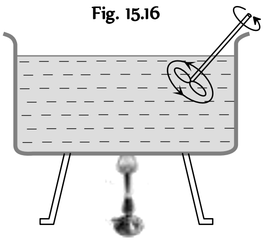

Fig. 15.17

$$\frac{Q}{t} \propto A(T - T_0) \Rightarrow \frac{Q}{t} = h\,A(T - T_0)$$

where h = Constant of proportionality called convection coefficient, T = Temperature of body and T_0 = Temperature of surrounding

Convection coefficient (h) depends on properties of fluid such as density, viscosity, specific heat and thermal conductivity.

(3) Natural convection takes place from bottom to top while forced convection in any direction.

(4) In case of natural convection, convection currents move warm air upwards and cool air downwards. That is why heating is done from base, while cooling from the top.

(5) Natural convection plays an important role in ventilation, in changing climate and weather and in forming land and sea breezes and trade winds.

(6) Natural convection is not possible in a gravity free region such as a free falling lift or an orbiting satellite.

(7) The force of blood in our body by heart helps in keeping the temperature of body constant.

(8) If liquids and gases are heated from the top (so that convection is not possible) they transfer heat (from top to bottom) by conduction.

(9) Mercury though a liquid is heated by conduction and not by convection.

Radiation

(1) The process of the transfer of heat from one place to another place without heating the intervening medium is called radiation.

Fig. 15.18

(2) Precisely it is electromagnetic energy transfer in the form of electromagnetic wave through any medium. It is possible even in vacuum *e.g.* the heat from the sun reaches the earth through radiation.

(3) The wavelength of thermal radiations ranges from $7.8 \times 10^{-7}\,m$ to $4 \times 10^{-4}\,m$. They belong to *infra-red* region of the electromagnetic spectrum. That is why thermal radiations are also called *infra-red* radiations.

(4) Medium is not required for the propagation of these radiations.

(5) They produce sensation of warmth in us but we can't see them.

(6) Every body whose temperature is above zero Kelvin emits thermal radiation.

(7) Their speed is equal to that of light *i.e.* $(= 3 \times 10^8\,m/s)$.

(8) Their intensity is inversely proportional to the square of distance of point of observation from the source (*i.e.* $I \propto 1/d^2$).

(9) Just as light waves, they follow laws of reflection, refraction, interference, diffraction and polarisation.

(10) When these radiations fall on a surface then exert pressure on that surface which is known as radiation pressure.

(11) While travelling these radiations travel just like photons of other electromagnetic waves. They manifest themselves as heat only when they are absorbed by a substance.

(12) Spectrum of these radiations can not be obtained with the help of glass prism because it absorbs heat radiations. It is obtained by quartz or rock salt prism because these materials do not have free electrons and interatomic vibrational frequency is greater than the radiation frequency, hence they do not absorb heat radiations.

(13) **Diathermanous Medium :** A medium which allows heat radiations to pass through it without absorbing them is called diathermanous medium. Thus the temperature of a diathermanous medium does not increase irrespective of the amount of the thermal radiations passing through it *e.g.*, dry air, SO_2, rock salt (*NaCl*).

(i) Dry air does not get heated in summers by absorbing heat radiations from sun. It gets heated through convection by receiving heat from the surface of earth.

(ii) In winters heat from sun is directly absorbed by human flesh while the surrounding air being diathermanous is still cool. This is the reason that sun's warmth in winter season appears very satisfying to us.

(14) **Athermanous medium :** A medium which partly absorbs heat rays is called a thermous medium As a result temperature of an athermanous medium increases when heat radiations pass through it *e.g.*, wood, metal, moist air, simple glass, human flesh *etc*.

Colour of Heated Object

When a body is heated, all radiations having wavelengths from zero to infinity are emitted.

(1) Radiations of longer wavelengths are predominant at lower temperature.

(2) The wavelength corresponding to maximum emission of radiations shifts from longer wavelength to shorter wavelength as the temperature increases. Due to this the colour of a body appears to be changing.

(3) A blue flame is at a higher temperature than a yellow flame

Table 15.3 : Variation of colour of a body on heating

Temperature	Colour
525°*C*	Dull red
900°*C*	Cherry red
1100°*C*	Orange red
1200°*C*	Yellow
1600°*C*	White

Interaction of Radiation with Matter

When thermal radiations (*Q*) fall on a body, they are partly reflected, partly absorbed and partly transmitted.

(1) $Q = Q_a + Q_r + Q_t$

(2) $\frac{Q_a}{Q} + \frac{Q_r}{Q} + \frac{Q_t}{Q} = a + r + t = 1$

(3) $a = \frac{Q_a}{Q}$ = Absorptance or absorbing power

$r = \frac{Q_r}{Q}$ = Reflectance or reflecting power

$t = \frac{Q_t}{Q}$ = Transmittance or transmitting power

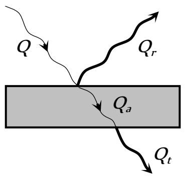

Fig. 15.19

(4) *r*, *a* and *t* all are the pure ratios so they have no unit and dimension.

(5) **Different bodies**

(i) If $a = t = 0$ and $r = 1 \rightarrow$ body is perfect reflector

(ii) If $r = t = 0$ and $a = 1 \rightarrow$ body is perfectly black body

(iii) If, $a = r = 0$ and $t = 1 \rightarrow$ body is perfect transmitter

(iv) If $t = 0 \Rightarrow r + a = 1$ or $a = 1 - r$ *i.e.* good reflectors are bad absorbers.

Emissive Power, Absorptive Power and Emissivity

If temperature of a body is more than it's surrounding then body emits thermal radiation

(1) **Monochromatic Emittance or Spectral emissive power (e_λ) :** For a given surface it is defined as the radiant energy emitted per sec per unit area of the surface with in a unit wavelength around λ *i.e.* lying between $\left(\lambda - \frac{1}{2}\right)$ to $\left(\lambda + \frac{1}{2}\right)$.

Spectral emissive power $(e_\lambda) = \frac{\text{Energy}}{\text{Area} \times \text{time} \times \text{wavelength}}$

Unit : $\frac{Joule}{m^2 \times sec \times Å}$ and Dimension : $[ML^{-1}T^{-3}]$

(2) **Total emittance or total emissive power (*e*) :** It is defined as the total amount of thermal energy emitted per unit time, per unit area of the body for all possible wavelengths.

$$e = \int_0^\infty e_\lambda d\lambda$$

Unit : $\frac{Joule}{m^2 \times \sec}$ or $\frac{Watt}{m^2}$ and Dimension : $[MT^{-3}]$

(3) **Monochromatic absorptance or spectral absorptive power (a_λ) :** It is defined as the ratio of the amount of the energy absorbed in a certain time to the total heat energy incident upon it in the same time, both in the unit wavelength interval. It is dimensionless and unit less quantity. It is represented by a_λ.

(4) **Total absorptance or total absorpting power (*a*):** It is defined as the total amount of thermal energy absorbed per unit time, per unit area of the body for all possible wavelengths.

$$a = \int_0^\infty a_\lambda d\lambda$$

(5) **Emissivity (ε) :** Emissivity of a body at a given temperature is defined as the ratio of the total emissive power of the body (*e*) to the total emissive power of a perfect black body (*E*) at that temperature *i.e.* $\varepsilon = \frac{e}{E}$

($\varepsilon \rightarrow$ read as epsilon)

(i) For perfectly black body $\varepsilon = 1$

(ii) For highly polished body $\varepsilon = 0$

(iii) But for practical bodies emissivity (ε) lies between zero and one ($0 < \varepsilon < 1$).

Perfectly Black Body

(1) A perfectly black body is that which absorbs completely the radiations of all wavelengths incident on it.

(2) As a perfectly black body neither reflects nor transmits any radiation, therefore the absorptance of a perfectly black body is unity *i.e.* $t = 0$ and $r = 0 \Rightarrow a = 1$.

(3) We know that the colour of an opaque body is the colour (wavelength) of radiation reflected by it. As a black body reflects no wavelength so, it appears black, whatever be the colour of radiations incident on it.

(4) When perfectly black body is heated to a suitable high temperature, it emits radiation of all possible wavelengths. For example, temperature of the sun is very high (6000 K approx.) it emits all possible radiation so it is an example of black body.

(5) **Ferry's black body :** A perfectly black body can't be realised in practice. The nearest example of an ideal black body is the Ferry's black body. It is a doubled walled evacuated spherical cavity whose inner wall is blackened. The space between the wall is evacuated to prevent the loss of heat by conduction and radiation. There is a fine hole in it. All the radiations incident upon this hole are absorbed by this black body. If this black body is heated to high temperature then it emits radiations of all wavelengths. It is the hole which is to be regarded as a black body and not the total enclosure

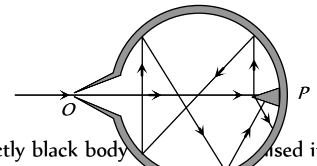

Fig. 15.20

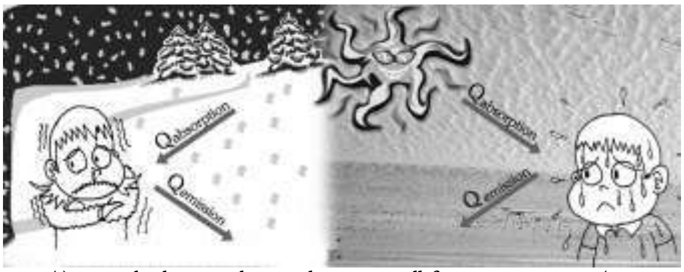
(6) A perfectly black body [illegible]sed in practice but materials like Platinum black or Lamp black come close to being ideal black bodies. Such materials absorbs 96% to 85% of the incident radiations.

Prevost Theory of Heat Exchange



(1) Every body emits heat radiations at all finite temperature (Except 0 K) as well as it absorbs radiations from the surroundings.

(2) Exchange of energy along various bodies takes place via radiation.

(3) The process of heat exchange among various bodies is a continuous phenomenon.

(4) At absolute zero temperature (0 K or – 273°C) this law is not applicable because at this temperature the heat exchange among various bodies ceases.

(5) If $Q_{emission} > Q_{absorbed} \rightarrow$ temperature of body decreases and consequently the body appears colder.

If $Q_{emission} < Q_{absorbed} \rightarrow$ temperature of body increases and it appears hotter.

If $Q_{emission} = Q_{absorbed} \rightarrow$ temperature of body remains constant (thermal equilibrium)

Kirchoff's Law

According to this law the ratio of emissive power to absorptive power is same for all surfaces at the same temperature and is equal to the emissive power of a perfectly black body at that temperature. Hence $\frac{e_1}{a_1} = \frac{e_2}{a_2} = ... \left(\frac{E}{A}\right)_{\text{Perfectly black body}}$

But for perfectly black body $A = 1$ *i.e.* $\frac{e}{a} = E$

If emissive and absorptive powers are considered for a particular wavelength λ, $\left(\frac{e_\lambda}{a_\lambda}\right) = (E_\lambda)_{\text{black}}$

Now since $(E_\lambda)_{black}$ is constant at a given temperature, according to this law if a surface is a good absorber of a particular wavelength it is also a good emitter of that wavelength.

This in turn implies that a good absorber is a good emitter (or radiator)

Applications of Kirchoff's Law

(1) Sand is rough black, so it is a good absorber and hence in deserts, days (when radiation from the sun is incident on sand) will be very hot. Now in accordance with Kirchoff's law, good absorber is a good emitter so nights (when sand emits radiation) will be cold. This is why days are hot and nights are cold in desert.

(2) Sodium vapours, on heating, emit two bright yellow lines. These are called D_1, D_2 lines of sodium. When continuos white light from an arc lamp is made to pass through sodium vapours at low temperature, the continuous spectrum is intercepted by two dark lines exactly in the same places as D_1 and D_2 lines. Hence sodium vapours when cold, absorbs the same wavelength, as they emit while hot. This is in accordance with Kirchoff's law.

(3) When a shining metal ball having some black spots on its surface is heated to a high temperature and is seen in dark, the black spots shine brightly and the shining ball becomes dull or invisible. The reason is that the black spots on heating absorb radiation and so emit these in dark while the polished shining part reflects radiations and absorb nothing and so does not emit radiations and becomes invisible in the dark.

(4) When a green glass is heated in furnace and taken out, it is found to glow with red light. This is because red and green are complimentary colours. At ordinary temperatures, a green glass appears green, because it transmits green colour and absorb red colour strongly. According to Kirchoff's law, this green glass, on heating must emit the red colour, which is absorbed strongly. Similarly when a red glass is heated to a high temperature it will glow with green light.

(5) A person with black skin experiences more heat and more cold as compared to a person of white skin because when the outside temperature is greater, the person with black skin absorbs more heat and when the outside temperature is less the person with black skin radiates more energy.

(6) **Kirchoff' law also explains the Fraunhoffer lines :**

(i) Sun's inner most part (photosphere) emits radiation of all wavelength at high temperature.

(ii) When these radiation enters in outer part (chromosphere) of sun, few wavelength are absorbed by some terrestrial elements (present in vapour form at lower temperature)

(iii) These absorbed wavelengths, which are missing appear as dark lines in the spectrum of the sun called **Fraunhoffer lines.**

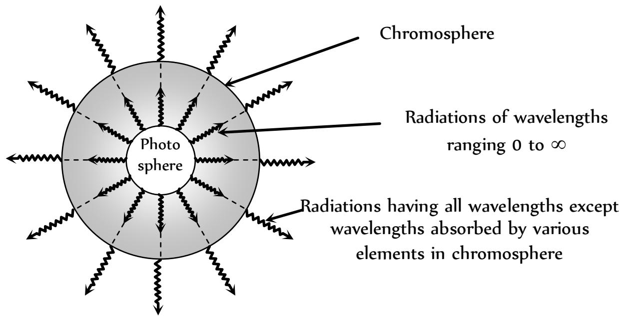


Fig. 15.21

(iv) During total solar eclipse these lines appear bright because the gases and vapour present in the chromosphere start emitting those radiation which they had absorbed.

Stefan's Law

According to it the radiant energy emitted by a perfectly black body per unit area per sec (*i.e.* emissive power of black body) is directly proportional to the fourth power of its absolute temperature, *i.e.* $E \propto T^4$ $\Rightarrow$ $E = \sigma T^4$

where σ is a constant called Stefan's constant having dimension $[MT^{-3}\theta^{-4}]$ and value $5.67 \times 10^{-8} W/m^2K^4$.

(i) For ordinary body : $e = \varepsilon E = \varepsilon\sigma T^4$

(ii) Radiant energy : If Q is the total energy radiated by the ordinary body then $e = \dfrac{Q}{A \times t} = \varepsilon\sigma T^4 \Rightarrow Q = A\varepsilon\sigma T^4 t$

(iii) Radiant power (P) : It is defined as energy radiated per unit area *i.e.* $P = \dfrac{Q}{t} = A\varepsilon\sigma T^4$.

(iv) If an ordinary body at temperature T is surrounded by a body at temperature T_0, then Stefan's law may be put as

$$e = \varepsilon\,\sigma(T^4 - T_0^4)$$

Rate of Loss of Heat (R_H) and Rate of Cooling (R_C)

(1) **Rate of loss of heat (or initial rate of loss of heat) :** If an ordinary body at temperature T is placed in an environment of temperature T_0 (T_0 < T) then heat loss by radiation is given by

$$\Delta Q = Q_{\text{emission}} - Q_{\text{absorption}} = A\varepsilon\,\sigma(T^4 - T_0^4)$$

(2) Rate of loss of heat $(R_H) = \dfrac{dQ}{dt} = A\varepsilon\,\sigma(T^4 - T_0^4)$

(i) If two bodies are made of same material, have same surface finish and are at the same initial temperature then $\dfrac{dQ}{dt} \propto A \Rightarrow \dfrac{\left(\dfrac{dQ}{dt}\right)_1}{\left(\dfrac{dQ}{dt}\right)_2} = \dfrac{A_1}{A_2}$

(3) **Initial rate of fall in temperature (Rate of cooling):** If m is the body and c is the specific heat then

$$\frac{dQ}{dt} = mc.\frac{dT}{dt} = mc\,\frac{d\theta}{dt} \qquad (\because Q = mc\,\Delta T \text{ and } dT = d\theta)$$

(i) Rate of cooling $(R_c) = \dfrac{d\theta}{dt} = \dfrac{(dQ/dt)}{mc} = \dfrac{A\varepsilon\,\sigma}{mc}(T^4 - T_0^4)$

$= \dfrac{A\varepsilon\,\sigma}{V\rho\,c}(T^4 - T_0^4)$; where m = density (ρ) × volume (V)

(ii) for two bodies of the same material under identical environments, the ratio of their rate of cooling is $\dfrac{(R_c)_1}{(R_c)_2} = \dfrac{A_1}{A_2}.\dfrac{V_2}{V_1}$

(4) **Dependence of rate of cooling :** When a body cools by radiation the rate of cooling depends on

(i) Nature of radiating surface *i.e.* greater the emissivity, faster will be the cooling.

(ii) Area of radiating surface, *i.e.* greater the area of radiating surface, faster will be the cooling.

(iii) Mass of radiating body *i.e.* greater the mass of radiating body slower will be the cooling.

(iv) Specific heat of radiating body *i.e.* greater the specific heat of radiating body slower will be cooling.

(v) Temperature of radiating body *i.e.* greater the temperature of body faster will be cooling.

(vi) Temperature of surrounding *i.e.* greater the temperature of surrounding slower will be cooling.

Table 15.4 : Comparison of rate of heat loss (R_H) and rate of cooling (R_c) for different bodies

Body	Condition	Rate of heat loss $R_H = \dfrac{dQ}{dt}$	Rate of cooling $R_c = \dfrac{dT}{dt}$ or $\dfrac{d\theta}{dt}$
Two solid sphere	T, T_0 , c, ρ are same	$R_H \propto A \propto r^2$ $\Rightarrow \dfrac{(R_H)_1}{(R_H)_2} = \dfrac{r_1^2}{r_2^2}$	$R_c \propto \dfrac{A}{V} \propto$ $\propto \dfrac{r^2}{r^3} \propto \dfrac{1}{r}$
Two solid sphere of diff. material	T, T_0 – same	$R_H \propto A \propto r^2$	$R_c \propto \dfrac{A}{V\rho c}$ $\propto \dfrac{1}{r\rho c}$
Different shape bodies like cube, sphere plate	T, T_0, c, ρ - same	$R_H \propto A$ $A_{\max} \rightarrow$ Plate $A_{\min} \rightarrow$ sphere	$R_c \propto \dfrac{A}{V}$
Bodies of different materials	T, T_0, m, A are same but c diff.	$R_H \rightarrow$ same for all. bodies	$R_c \propto \dfrac{1}{c}$

Newton's Law of Cooling

When the temperature difference between the body and its surrounding is not very large *i.e.* $T - T_0 = \Delta T$ then $T^4 - T_0^4$ may be approximated as $4T_0^3\Delta T$

By Stefan's law, $\frac{dT}{dt} = \frac{A\varepsilon\sigma}{mc}[T^4 - T_0^4]$

Hence $\frac{dT}{dt} = \frac{A\varepsilon\sigma}{mc} 4T_0^3\Delta T \Rightarrow \frac{dT}{dt} \propto \Delta T$ or $\frac{d\theta}{dt} \propto \theta - \theta_0$

i.e., if the temperature of body is not very different from surrounding, **rate of cooling is proportional to temperature difference** between the body and its surrounding. This law is called Newton's law of cooling.

(1) Greater the temperature difference between body and its surrounding greater will be the rate of cooling.

(2) If $\theta = \theta_0$, $\frac{d\theta}{dt} = 0$ *i.e.* a body can never be cooled to a temperature lesser than its surrounding by radiation.

(3) If a body cools by radiation from $\theta_1^o C$ to $\theta_2^o C$ in time *t*, then $\frac{d\theta}{dt} = \frac{\theta_1 - \theta_2}{t}$ and $\theta = \theta_{av} = \frac{\theta_1 + \theta_2}{2}$. The Newton's law of cooling becomes $\left[\frac{\theta_1 - \theta_2}{t}\right] = K\left[\frac{\theta_1 + \theta_2}{2} - \theta_0\right]$.

This form of law helps in solving numericals.

(4) Practical examples

(i) Hot water loses heat in smaller duration as compared to moderate warm water.

(ii) Adding milk in hot tea reduces the rate of cooling.

Cooling Curves

(1) **Curve between log(θ – θ_0) and time**

As $\frac{d\theta}{dt} \propto -(\theta - \theta_0) \Rightarrow \frac{d\theta}{(\theta - \theta_0)} = -Kdt$

Integrating $\log_e(\theta - \theta_0) = -Kt + C$

$\log_e(\theta - \theta_0) = -Kt + \log_e A$

This is a straight line with negative slope

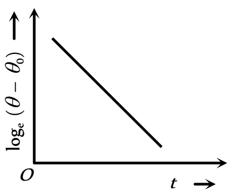

Fig. 15.22

(2) **Curve between temperature of body and time**

As $\log_e(\theta - \theta_0) = -Kt + \log_e A \Rightarrow \log_e \frac{\theta - \theta_0}{A} = -Kt$

$\Rightarrow \theta - \theta_0 = Ae^{-kt}$

which indicates temperature decreases exponentially with increasing time.

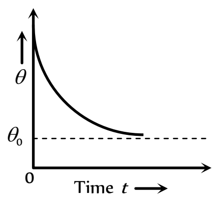

Fig. 15.23

(3) **Curve between the rate of cooling** (*R*) and body temperature (θ).

$R = K(\theta - \theta_0) = K\theta - K\theta_0$

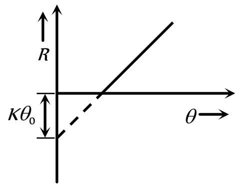

Fig. 15.24

This is a straight line intercept *R*-axis at $-K\theta_0$

(4) **Curve between rate of cooling (*R*)** and temperature difference between body (θ) and surrounding (θ_0)

$R \propto (\theta - \theta_0)$. This is a straight line passing through origin.

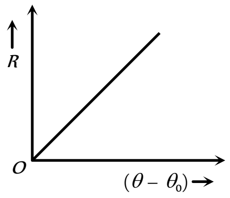

Fig. 15.25

Determination of Specific Heat of Liquid

If volume, radiating surface area, nature of surface, initial temperature and surrounding of water and given liquid are equal and they are allowed to cool down (by radiation) then rate of loss of heat and fall in temperature of both will be same.

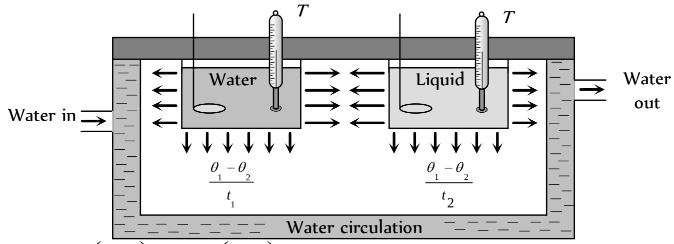

Fig. 15.26

i.e. $\left(\frac{dQ}{dt}\right)_{water} = \left(\frac{dQ}{dt}\right)_{liquid}$

$$(m_W c_W + W)\frac{(\theta_1 - \theta_2)}{t_1} = (m_l c_l + W)\frac{(\theta_1 - \theta_2)}{t_2}$$

or $\left[\frac{m_W c_W + W}{t_1}\right] = \left[\frac{m_l c_l + W}{t_2}\right]$

$W = m_c c_c$ = Water equivalent of calorimeter, where m_c and c_c are mass and specific heat of calorimeter.

If density of water and liquid is ρ and ρ' respectively then $m_W = V\rho_W$ and $m_l = V\rho_l$

Specific heat of liquid $c_l = \frac{1}{m_l}\left[\frac{t_l}{t_W}(m_W c_W + W) - W\right]$

Distribution of Energy in the Spectrum of Black Body

A perfectly black body emits radiation of all possible wavelength.

Langley and later on Lummer and Pringsheim investigated the distribution of energy amongst the different wavelengths in the thermal spectrum of a black body radiation. The results obtained are shown in figure. From these curves it is clear that

(1) At a given temperature energy is not uniformly distributed among different wavelengths.

(2) At a given temperature intensity of heat radiation increases with wavelength, reaches a maximum at a particular wavelength and with further increase in wavelength it decreases.

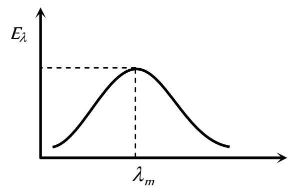

Fig. 15.27

(3) For all wavelengths an increase in temperature causes an increase in intensity.

(4) The area under the curve will represent the total intensity of radiation at a particular temperature *i.e.* Area = $E = \int E_\lambda d\lambda$

From Stefan's law $E = \sigma T \Rightarrow$ Area under E_λ - λ curve $(A) \propto T$

(5) The energy (E_m) emitted corresponding to the wavelength of maximum emission (λ_m) increases with fifth power of the absolute temperature of the black body *i.e.*, $E_{max} \propto T^5$

Wien's Displacement Law

According to Wien's law the product of wavelength corresponding to maximum intensity of radiation and temperature of body (in Kelvin) is constant, *i.e.* $\lambda_m T = b = \text{constant}$

where b is Wien's constant and has value $2.89 \times 10^{-3} m\text{-}K$.

As the temperature of the body increases, the wavelength at which the spectral intensity (E_λ) is maximum shifts towards left. Therefore it is also called Wien's displacement law.

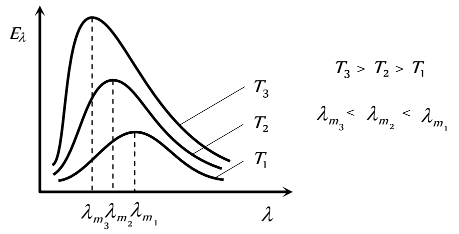

Fig. 15.28

This law is of great importance in 'Astrophysics' as through the analysis of radiations coming from a distant star, by finding λ_m the temperature of the star $T(= b/\lambda_m)$ is determined.

Law of Distribution of Energy (Plank's Hypothesis)

(1) The theoretical explanation of black body radiation was done by Planck.

(2) According to Plank's atoms of the walls of a uniform temperature enclosure behave as oscillators, each with a characteristic frequency of oscillation.

(3) These oscillations emits electromagnetic radiations in the form of photons (The radiation coming out from a small hole in the enclosure are called black body radiation). The energy of each photon is $h\nu$. Where ν is the frequency of oscillator and h is the Plank's constant. Thus emitted energies may be $h\nu$, $2h\nu$, $3h\nu$ ... $nh\nu$ but not in between.

According to Planck's law $E_\lambda d\lambda = \dfrac{8\pi hc}{\lambda^5} \dfrac{1}{[e^{hc/\lambda KT} - 1]} d\lambda$

where c = speed of light and k = Boltzmann's constant. This equation is known as Plank's radiation law. It is correct and complete law of radiation

(4) This law is valid for radiations of all wavelengths ranging from zero to infinite.

(5) For radiations of short wavelength $\left(\lambda << \dfrac{hc}{KT}\right)$ Planck's law reduces to *Wien's energy distribution law* $E_\lambda d\lambda = \dfrac{A}{\lambda^5} e^{-B/\lambda T} d\lambda$

(6) For radiations of long wavelength $\left(\lambda >> \dfrac{hc}{KT}\right)$ Planck's law reduces to *Rayleigh-Jeans energy distribution law* $E_\lambda d\lambda = \dfrac{8\pi KT}{\lambda^4} d\lambda$

Temperature of the Sun and Solar Constant

If R is the radius of the sun and T its temperature, then the energy emitted by the sun per sec through radiation in accordance with Stefan's law will be given by

$$P = A\sigma T^4 = 4\pi R^2 \sigma T^4$$

In reaching earth this energy will spread over a sphere of radius r (= average distance between sun and earth); so the intensity of solar radiation at the surface of earth (called solar constant S) will be given by

$$S = \frac{P}{4\pi r^2} = \frac{4\pi R^2 \sigma T^4}{4\pi r^2}$$

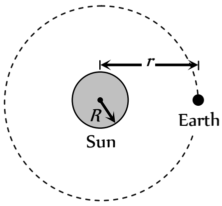

Fig. 15.29

$$i.e.\ T = \left[\left(\frac{r}{R}\right)^2 \frac{S}{\sigma}\right]^{1/4}$$

$$= \left[\left(\frac{1.5 \times 10^8}{7 \times 10^5}\right)^2 \times \frac{1.4 \times 10^3}{5.67 \times 10^{-8}}\right]^{1/4} \simeq 5800\,K$$

As $r = 1.5 \times 10^8$ *km*, $R = 7 \times 10^5$ *km*,

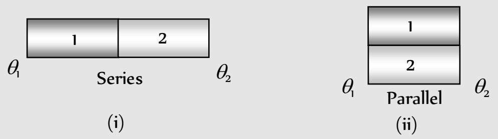
$$S = 2\frac{cal}{cm^2 min} = 1.4\frac{kW}{m^2} \text{ and } \sigma = 5.67 \times 10^{-8} \frac{W}{m^2 K^4}$$

This result is in good agreement with the experimental value of temperature of sun, *i.e.*, 6000 *K*.

Tips & Tricks

✍ Glass and water vapours transmit shorter wavelengths through them but reflects longer wavelengths. This concept is utilised in Green house effect. Glass transmits those waves which are emitted by a source at a temperature greater than 100°*C*. So, heat rays emitted from sun are able to enter through glass enclosure but heat emitted by small plants growing in the nursery gets trapped inside the enclosure.

✍ Suppose two metallic rods are first connected in series then in parallel.



If Q_s heat flows in time t_s in series combination and Q_p heat flows in time t_p in parallel combine, then $\dfrac{Q_p}{Q_s} = \dfrac{t_p}{t_s} \times \dfrac{R_s}{R_p}$

If Rods are identical then $R_S = \frac{R}{2}$ and $R_p = 2R \Rightarrow \frac{Q_p}{Q_s} = 4\left(\frac{t_p}{t_s}\right)$

✍ If temperature of a body becomes θ_1 to θ_2 in t time and it becomes θ_2 to θ_3 in next time then use

$$\frac{\theta_2 - \theta_0}{\theta_1 - \theta_0} = \frac{\theta_3 - \theta_0}{\theta_2 - \theta_0}$$ (θ_0 = temperature of enviroment)

✍ Newton's law of cooling can be used to compare the specific heat of the two liquids.

If equal masses of two liquids having same surface are and finish cools from same initial temperature to same final temperature with same surrounding then $\frac{t_1}{t_2} = \frac{K_2}{K_1} = \frac{C_1}{C_2}$

✍ Radiations from sun take 8 *min* and 20 *sec* to reach earth.

✍ Suppose temperature of a body decreases $\theta_1°C$ to $\theta_2°C$ in time t_1 and $\theta_2°C$ to $\theta_3°C$ in time t_2 in the same invirment

If $(\theta_1 - \theta_2) \geq (\theta_2 - \theta_3)$ then $t_2 > t_1$

✍ Green glass is a good absorber of red light and a good reflector of green light. Consequently at lower temperature it is a good emitter of red light.

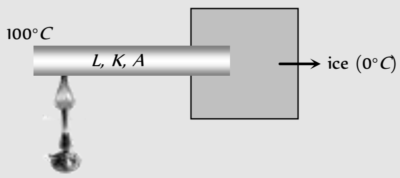
Hence Green $\rightleftharpoons$ Red

Also Yellow $\rightleftharpoons$ Blue

✍ While solving the problems of heat flow, remember the following equation

e.g. If we are interested in finding the mass of ice which transfoms into water in unit time. For this we will take

$$\frac{T.D.}{R} = L_f.\frac{dm}{dt}$$



$$\Rightarrow \frac{dm}{dt} = \frac{T.D.}{(L_f)(R)}$$

✍ **Confusion**

The rate of cooling has been used in many books, with double meanings. At some places. Rate of cooling $= \frac{dQ}{dt}$ and at other places, rate of cooling $= \frac{d\theta}{dt}$. Our suggestion is that look for the units, if the rate of cooling is in *cal/m* in or *J/sec etc.*, then it is $\frac{dQ}{dt}$. But if rate of cooling is in °*C/min* it means $\frac{d\theta}{dt}$.

Ordinary Thinking

Objective Questions

Conduction

1. In which case the thermal conductivity increases from left to right[NCERT 1974

(a) *Al, Cu, Ag* (b) *Ag, Cu, Al*

(c) *Cu, Ag, Al* (d) *Al, Ag, Cu*

2. Which of the following cylindrical rods will conduct most heat, when their ends are maintained at the same steady temperature [CPMT 1981; NCERT 19

MP PMT 1987; CBSE PMT 1995]

(a) Length 1 *m*; radius 1 *cm*

(b) Length 2 *m*; radius 1 *cm*

(c) Length 2 *m*; radius 2 *cm*

(d) Length 1 *m*; radius 2 *cm*

3. The heat is flowing through two cylindrical rods of same material. The diameters of the rods are in the ratio 1 : 2 and their lengths are in the ratio 2 : 1. If the temperature difference between their ends is the same, the ratio of rate of flow of heat through them will be

[NCERT 1982; CBSE PMT 1995; EAMCET 1997]

(a) 1 : 1 (b) 2 : 1

(c) 1 : 4 (d) 1 : 8

4. Two identical square rods of metal are welded end to end as shown in figure (i), 20 calories of heat flows through it in 4 minutes. If the rods are welded as shown in figure (ii), the same amount of heat will flow through the rods in

[NCERT 1982]

(i) (ii)

(a) 1 minute (b) 2 minutes

(c) 4 minutes (d) 16 minutes

5. For cooking the food, which of the following type of utensil is most suitable

[MNR 1986; MP PET 1990; CPMT 1991;

SCRA 1998; MP PMT/PET 1998, 2000; RPET 2001]

(a) High specific heat and low conductivity

(b) High specific heat and high conductivity

(c) Low specific heat and low conductivity

(d) Low specific heat and high conductivity

6. Under steady state, the temperature of a body [CPMT 1978]
(a) Increases with time
(b) Decreases with time
(c) Does not change with time and is same at all the points of the body
(d) Does not change with time but is different at different points of the body

7. The coefficient of thermal conductivity depends upon
[MP PET/PMT 1984; AFMC 1996; Orissa JEE 2005]
(a) Temperature difference of two surfaces
(b) Area of the plate
(c) Thickness of the plate
(d) Material of the plate

8. When two ends of a rod wrapped with cotton are maintained at different temperatures and after some time every point of the rod attains a constant temperature, then
[MP PET/PMT 1988]
(a) Conduction of heat at different points of the rod stops because the temperature is not increasing
(b) Rod is bad conductor of heat
(c) Heat is being radiated from each point of the rod
(d) Each point of the rod is giving heat to its neighbour at the same rate at which it is receiving heat

9. The length of the two rods made up of the same metal and having the same area of cross-section are 0.6 *m* and 0.8 *m* respectively. The temperature between the ends of first rod is 90^oC and 60^oC and that for the other rod is 150 and 110^oC. For which rod the rate of conduction will be greater
(a) First (b) Second
(c) Same for both (d) None of the above

10. The ratio of thermal conductivity of two rods of different material is 5 : 4. The two rods of same area of cross-section and same thermal resistance will have the lengths in the ratio
(a) 4 : 5 (b) 9 : 1
(c) 1 : 9 (d) 5 : 4

11. The thermal conductivity of a material in CGS system is 0.4. In steady state, the rate of flow of heat 10 *cal/sec-cm*, then the thermal gradient will be [MP PMT 1989]
(a) $10°C/cm$ (b) $12°C/cm$
(c) $25°C/cm$ (d) $20°C/cm$

12. Two rectangular blocks *A* and *B* of different metals have same length and same area of cross-section. They are kept in such a way that their cross-sectional area touch each other. The temperature at one end of *A* is 100°*C* and that of *B* at the other end is 0°*C*. If the ratio of their thermal conductivity is 1 : 3, then under steady state, the temperature of the junction in contact will be
(a) 25°*C* (b) 50°*C*
(c) 75°*C* (d) 100°*C*

13. Two vessels of different materials are similar in size in every respect. The same quantity of ice filled in them gets melted in 20 minutes and 30 minutes. The ratio of their thermal conductivities will be [MP PMT 1989; CMEET Bihar 1995]
(a) 1.5 (b) 1
(c) 2/3 (d) 4

14. Two rods *A* and *B* are of equal lengths. Their ends are kept between the same temperature and their area of cross-sections are A_1 and A_2 and thermal conductivities K_1 and K_2. The rate of heat transmission in the two rods will be equal, if [MP PMT 1991; CBSE PMT 2002]
(a) $K_1A_2 = K_2A_1$ (b) $K_1A_1 = K_2A_2$
(c) $K_1 = K_2$ (d) $K_1A_1^2 = K_2A_2^2$

15. In variable state, the rate of flow of heat is controlled by
(a) Density of material (b) Specific heat
(c) Thermal conductivity (d) All the above factors

16. If the ratio of coefficient of thermal conductivity of silver and copper is 10 : 9, then the ratio of the lengths upto which wax will melt in Ingen Hausz experiment will be
[DPMT 2001]
(a) 6 : 10 (b) $\sqrt{10}:3$
(c) 100 : 81 (d) 81 : 100

17. The thickness of a metallic plate is 0.4 cm. The temperature between its two surfaces is 20^oC. The quantity of heat flowing per second is 50 calories from $5cm^2$ area. In CGS system, the coefficient of thermal conductivity will be
(a) 0.4 (b) 0.6
(c) 0.2 (d) 0.5

18. In Searle's method for finding conductivity of metals, the temperature gradient along the bar [MP PMT 1984]
(a) Is greater nearer the hot end
(b) Is greater nearer to the cold end
(c) Is the same at all points along the bar
(d) Increases as we go from hot end to cold end

19. The dimensions of thermal resistance are
[MP PET 1984; BVP 2003]
(a) $M^{-1}L^{-2}T^3K$ (b) $ML^2T^{-2}K^{-1}$
(c) $ML^2T^{-3}K$ (d) $ML^2T^{-2}K^{-2}$

20. A piece of glass is heated to a high temperature and then allowed to cool. If it cracks, a probable reason for this is the following property of glass [CPMT 1985]
(a) Low thermal conductivity
(b) High thermal conductivity
(c) High specific heat
(d) High melting point

21. Two walls of thicknesses d_1 and d_2 and thermal conductivities k_1 and k_2 are in contact. In the steady state, if the temperatures at the outer surfaces are T_1 and T_2, the temperature at the common wall is [MP PMT 1985]
[MP PMT 1990; CBSE PMT 1999]
(a) $\frac{k_1T_1d_2+k_2T_2d_1}{k_1d_2+k_2d_1}$ (b) $\frac{k_1T_1+k_2d_2}{d_1+d_2}$
(c) $\left(\frac{k_1d_1+k_2d_2}{T_1+T_2}\right)T_1T_2$ (d) $\frac{k_1d_1T_1+k_2d_2T_2}{k_1d_1+k_2d_2}$

22. A slab consists of two parallel layers of copper and brass of the same thickness and having thermal conductivities in the ratio 1 : 4. If

the free face of brass is at $100^o C$ and that of copper at $0^o C$, the temperature of interface is

[IIT 1981; MP PMT 1987, 2001]

(a) $80°C$ (b) $20°C$

(c) $60°C$ (d) $40°C$

23. The temperature gradient in a rod of 0.5 m long is $80^o C/m$. If the temperature of hotter end of the rod is $30^o C$, then the temperature of the cooler end is

(a) $40^o C$ (b) $-10^o C$

(c) $10^o C$ (d) $0^o C$

24. On heating one end of a rod, the temperature of whole rod will be uniform when

(a) $K = 1$ (b) $K = 0$

(c) $K = 100$ (d) $K = \infty$

25. Snow is more heat insulating than ice, because

(a) Air is filled in porous of snow

(b) Ice is more bad conductor than snow

(c) Air is filled in porous of ice

(d) Density of ice is more

26. Two thin blankets keep more hotness than one blanket of thickness equal to these two. The reason is

(a) Their surface area increases

(b) A layer of air is formed between these two blankets, which is bad conductor

(c) These have more wool

(d) They absorb more heat from outside

27. Ice formed over lakes has

(a) Very high thermal conductivity and helps in further ice formation

(b) Very low conductivity and retards further formation of ice

(c) It permits quick convection and retards further formation of ice

(d) It is very good radiator

28. Two rods of same length and material transfer a given amount of heat in 12 seconds, when they are joined end to end. But when they are joined lengthwise, then they will transfer same heat in same conditions in

[BHU 1998; UPSEAT 2002]

(a) 24 *s* (b) 3 *s*

(c) 1.5 *s* (d) 48 *s*

29. Wires *A* and *B* have identical lengths and have circular cross-sections. The radius of *A* is twice the radius of *B* *i.e.* $r_A = 2r_B$. For a given temperature difference between the two ends, both wires conduct heat at the same rate. The relation between the thermal conductivities is given by

(a) $K_A = 4K_B$ (b) $K_A = 2K_B$

(c) $K_A = K_B/2$ (d) $K_A = K_B/4$

30. Two identical plates of different metals are joined to form a single plate whose thickness is double the thickness of each plate. If the coefficients of conductivity of each plate are 2 and 3 respectively, then the conductivity of composite plate will be

(a) 5 (b) 2.4

(c) 1.5 (d) 1.2

31. If the radius and length of a copper rod are both doubled, the rate of flow of heat along the rod increases

(a) 4 times (b) 2 times

(c) 8 times (d) 16 times

32. The coefficients of thermal conductivity of copper, mercury and glass are respectively *K*, *K* and *K* such that *K* > *K* > *K*. If the same quantity of heat is to flow per second per unit area of each and corresponding temperature gradients are *X*, *X* and *X*, then

(a) $X_c = X_m = X_g$ (b) $X_c > X_m > X_g$

(c) $X_c < X_m < X_g$ (d) $X_m < X_c < X_g$

33. If two metallic plates of equal thicknesses and thermal conductivities K_1 and K_2 are put together face to face and a common plate is constructed, then the equivalent thermal conductivity of this plate will be [MP PMT 1991]

(a) $\dfrac{K_1K_2}{K_1+K_2}$ (b) $\dfrac{2K_1K_2}{K_1+K_2}$

(c) $\dfrac{(K_1^2+K_2^2)^{3/2}}{K_1K_2}$ (d) $\dfrac{(K_1^2+K_2^2)^{3/2}}{2K_1K_2}$

34. The quantity of heat which crosses unit area of a metal plate during conduction depends upon

[MP PMT 1992; JIPMER 1997]

(a) The density of the metal

(b) The temperature gradient perpendicular to the area

(c) The temperature to which the metal is heated

(d) The area of the metal plate

35. The ends of two rods of different materials with their thermal conductivities, radii of cross-sections and lengths all are in the ratio 1 : 2 are maintained at the same temperature difference. If the rate of flow of heat in the larger rod is 4 $4\ cal/\sec$, that in the shorter rod in $cal/\sec$ will be

[EAMCET 1986]

(a) 1 (b) 2

(c) 8 (d) 16

36. Two spheres of different materials one with double the radius and one-fourth wall thickness of the other, are filled with ice. If the time taken for complete melting ice in the large radius one is 25 *minutes* and that for smaller one is 16 *minutes*, the ratio of thermal conductivities of the materials of larger sphere to the smaller sphere is [EAMCET 1991]

(a) 4 : 5 (b) 5 : 4

(c) 25 : 1 (d) 1 : 25

37. The ratio of the diameters of two metallic rods of the same material is 2 : 1 and their lengths are in the ratio 1 : 4. If the temperature difference between their ends are equal, the rate of flow of heat in them will be in the ratio [MP PET 1994]

(a) 2 : 1 (b) 4 : 1

(c) $8:1$ (d) 16 : 1

38. Two cylinders P and Q have the same length and diameter and are made of different materials having thermal conductivities in the ratio 2 : 3. These two cylinders are combined to make a cylinder. One end of P is kept at $100°C$ and another end of Q at $0°C$. The temperature at the interface of P and Q is [MP PMT 1994; EAMCET 2000]

(a) 30^oC (b) 40^oC

(c) 50^oC (d) 60^oC

39. Two identical rods of copper and iron are coated with wax uniformly. When one end of each is kept at temperature of boiling water, the length upto which wax melts are $8.4 cm$ and $4.2 cm$ respectively. If thermal conductivity of copper is 0.92, then thermal conductivity of iron is [MP PET 1995]

(a) 0.23 (b) 0.46

(c) 0.115 (d) 0.69

40. Mud houses are cooler in summer and warmer in winter because [BVP 2003]

(a) Mud is superconductor of heat

(b) Mud is good conductor of heat

(c) Mud is bad conductor of heat

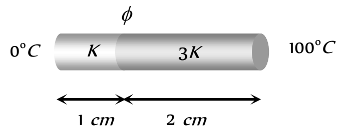
(d) None of these

41. The temperature of hot and cold end of a $20 cm$ long rod in thermal steady state are at 100^oC and 20^oC respectively. Temperature at the centre of the rod is [MP PMT 1996]

(a) 50^oC (b) 60^oC

(c) 40^oC (d) 30^oC

42. Two bars of thermal conductivities K and $3K$ and lengths $1 cm$ and $2 cm$ respectively have equal cross-sectional area, they are joined lengths wise as shown in the figure. If the temperature at the ends of this composite bar is 0^oC and 100^oC respectively (see figure), then the temperature ϕ of the interface is



(a) 50^oC (b) $\frac{100}{3}\,^oC$

(c) 60^oC (d) $\frac{200}{3}\,^oC$

43. A heat flux of $4000\ J/s$ is to be passed through a copper rod of length $10\ cm$ and area of cross-section $100\ cm^2$. The thermal conductivity of copper is $400\ W/m\ ^oC$. The two ends of this rod must be kept at a temperature difference of

(a) 1^oC (b) 10^oC

(c) 100^oC (d) 1000^oC

44. On a cold morning, a metal surface will feel colder to touch than a wooden surface because [AIIMS 1998]

(a) Metal has high specific heat

(b) Metal has high thermal conductivity

(c) Metal has low specific heat

(d) Metal has low thermal conductivity

45. In order that the heat flows from one part of a solid to another part, what is required [Pb. PMT 1999; EAMCET 1998]

(a) Uniform density (b) Density gradient

(c) Temperature gradient (d) Uniform temperature

46. At a common temperature, a block of wood and a block of metal feel equally cold or hot. The temperatures of block of wood and block of metal are [AIIMS 1999]

(a) Equal to temperature of the body

(b) Less than the temperature of the body

(c) Greater than temperature of the body

(d) Either (b) or (c)

47. According to the experiment of Ingen Hausz the relation between the thermal conductivity of a metal rod is K and the length of the rod whenever the wax melts is [UPSEAT 1999]

(a) K/l = constant (b) K^2/l = constant

(c) K/l^2 = constant (d) Kl = constant

48. Temperature of water at the surface of lake is -20^oC. Then temperature of water just below the lower surface of ice layer is

(a) -4^oC (b) 0^oC

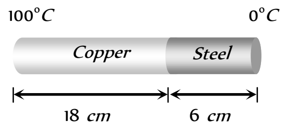
(c) 4^oC (d) -20^oC

49. One end of a metal rod of length 1.0 m and area of cross section $100 cm^2$ is maintained at 100^oC. If the other end of the rod is maintained at 0^oC, the quantity of heat transmitted through the rod per minute is (Coefficient of thermal conductivity of material of rod = 100 W/m-K) [EAMCET (Engg.) 2000]

(a) $3\times10^3 J$ (b) $6\times10^3 J$

(c) $9\times10^3 J$ (d) $12\times10^3 J$

50. The coefficient of thermal conductivity of copper is nine times that of steel. In the composite cylindrical bar shown in the figure. What will be the temperature at the junction of copper and steel



(a) 75^oC

(b) 67^oC

(c) 33^oC

(d) 25^oC

51. The lengths and radii of two rods made of same material are in the ratios 1 : 2 and 2 : 3 [MP PMT 1999] respectively. If the temperature difference between the ends for the two rods be the same, then in the steady state, the amount of heat flowing per second through them will be in the ratio [MP PET 2000]

(a) 1 : 3 (b) 4 : 3

(c) 8 : 9 (d) 3 : 2

52. A slab consists of two parallel layers of two different materials of same thickness having thermal conductivities K_1 and K_2. The equivalent conductivity of the combination is [BHU 2001]

(a) $K_1 + K_2$ (b) $\frac{K_1 + K_2}{2}$

(c) $\frac{2K_1K_2}{K_1 + K_2}$ (d) $\frac{K_1 + K_2}{2K_1K_2}$

53. There are two identical vessels filled with equal amounts of ice. The vessels are of different metals., If the ice melts in the two vessels in 20 and 35 minutes respectively, the ratio of the coefficients of thermal conductivity of the two metals is [AFMC 1998; MP PET 2001]

(a) 4 : 7 (b) 7 : 4

(c) 16 :49 (d) 49 : 16

54. Surface of the lake is at $2°C$. Find the temperature of the bottom of the lake [Orissa JEE 2002]

(a) $2^o C$ (b) $3^o C$

(c) $4^o C$ (d) $1^o C$

55. The heat is flowing through a rod of length 50 *cm* and area of cross-section $5cm^2$. Its ends are respectively at $25^o C$ and $125^o C$. The coefficient of thermal conductivity of the material of the rod is 0.092 *kcal/m×s×C*. The temperature gradient in the rod is [MP PET 2002]

(a) $2^o C / cm$ (b) $2^o C / m$

(c) $20^o C / cm$ (d) $20^o C / m$

56. In the Ingen Hauz's experiment the wax melts up to lengths 10 and 25 *cm* on two identical rods of different materials. The ratio of thermal conductivities of the two materials is [MP PET 2002]

(a) $1 : 6.25$ (b) 6.25 : 1

(c) $1 : \sqrt{2.5}$ (d) 1 : 2.5

57. Heat current is maximum in which of the following (rods are of identical dimension) [Orissa JEE 2003]

(a) 

(b) 

(c) 

(d) 

58. Two rods of same length and cross section are joined along the length. Thermal conductivities of first and second rod are K_1 and K_2. The temperature of the free ends of the first and second rods are maintained at θ_1 and θ_2 respectively. The temperature of the common junction is [MP PET 2003]

(a) $\frac{\theta_1 + \theta_2}{2}$ (b) $\frac{K_2K_2}{K_1 + K_2}(\theta_1 + \theta_2)$

(c) $\frac{K_1\theta_1 + K_2\theta_2}{K_1 + K_2}$ (d) $\frac{K_2\theta_1 + K_1\theta_2}{K_1 + K_2}$

59. Consider a compound slab consisting of two different materials having equal thickness and thermal conductivities K and $2K$ respectively. The equivalent thermal conductivity of the slab is [CBSE PMT 2003]

(a) $\sqrt{2K}$ (b) $3K$

(c) $\frac{4}{3}K$ (d) $\frac{2}{3}K$

60. Two rods having thermal conductivity in the ratio of 5 : 3 having equal lengths and equal cross-sectional area are joined by face to face. If the temperature of the free end of the first rod is $100° C$ and free end of the second rod is $20° C$. Then temperature of the junction is [CPMT 1996; DPMT 1997, 03; BVP 2004]

(a) $70° C$ (b) $50° C$

(c) $50° C$ (d) $90° C$

61. Woollen clothes are used in winter season because woolen clothes[EAMCET 1978

(a) Are good sources for producing heat

(b) Absorb heat from surroundings

(c) Are bad conductors of heat

(d) Provide heat to body continuously

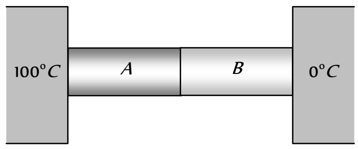
62. Two metal cubes A and B of same size are arranged as shown in the figure. The extreme ends of the combination are maintained at the indicated temperatures. The arrangement is thermally insulated. The coefficients of thermal conductivity of A and B are $300\, W/m\, ^oC$ and $200\, W/m\, ^oC$, respectively. After steady state is reached, the temperature of the interface will be [IIT 1996]

(a) $45^o C$

(b) $90^o C$

(c) $30^o C$

(d) $60^o C$



63. A cylindrical rod having temperature T_1 and T_2 at its ends. The rate of flow of heat is Q_1 *cal/sec*. If all the linear dimensions are doubled keeping temperature constant then rate of flow of heat Q_2 will be [CBSE PMT 2001]

(a) $4Q_1$ (b) $2Q_1$

(c) $\frac{Q_1}{4}$ (d) $\frac{Q_1}{2}$

64. A body of length 1*m* having cross sectional area 0.75*m* has heat flow through it at the rate of 6000 *Joule/sec*. Then find the temperature difference if $K = 200 Jm^{-1}K^{-1}$ [CPMT 2001]

(a) $20°C$ (b) $40°C$

(c) $80°C$ (d) $100°C$

65. A wall has two layers *A* and *B* made of different materials. The thickness of both the layers is the same. The thermal conductivity of *A* and *B* are *K* and *K* such that *K* = 3*K*. The temperature across the wall is $20°C$. In thermal equilibrium

(a) The temperature difference across $A = 15°C$

(b) The temperature difference across $A = 5°C$

(c) The temperature difference across *A* is $10°C$

(d) The rate of transfer of heat through *A* is more than that through *B*.

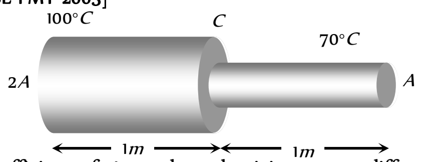
66. A metal rod of length 2*m* has cross sectional areas 2*A* and *A* as shown in figure. The ends are maintained at temperatures $100°C$ and $70°C$. The temperature at middle point *C* is [CPMT 2000]

(a) $80°C$

(b) $85°C$

(c) $90°C$

(d) $95°C$



67. The ratio of the coefficient of thermal conductivity of two different materials is 5 : 3. If the thermal resistance of the rod of same thickness resistance of the rods of same thickness of these materials is same, then the ratio of the length of these rods will be

(a) 3 : 5 (b) 5 : 3

(c) 3 : 4 (d) 3 : 2

68. Which of the following circular rods. (given radius r and length l) each made of the same material as whose ends are maintained at the same temperature will conduct most heat [CBSE PMT 2005]

(a) $r = 2r_0; l = 2l_0$ (b) $r = 2r_0; l = l_0$

(c) $r = r_0; l = l_0$ (d) $r = r_0; l = 2l_0$

Convection

1. It is hotter for the same distance over the top of a fire than it is in the side of it, mainly because [NCERT 1976, 79, 80; AIIMS 2000]

(a) Air conducts heat upwards

(b) Heat is radiated upwards

(c) Convection takes more heat upwards

(d) Convection, conduction and radiation all contribute significantly transferring heat upwards

2. One likes to sit under sunshine in winter season, because

(a) The air surrounding the body is hot by which body gets heat

(b) We get energy by sun

(c) We get heat by conduction by sun

(d) None of the above

3. Air is bad conductor of heat or partly conducts heat, still vacuum is to be placed between the walls of the thermos flask because

(a) It is difficult to fill the air between the walls of thermos flask

(b) Due to more pressure of air, the thermos can get crack

(c) By convection, heat can flow through air

(d) On filling the air, there is no advantage

4. While measuring the thermal conductivity of a liquid, we keep the upper part hot and lower part cool, so that [CPMT 1985; MP PMT/PET 1988]

(a) Convection may be stopped

(b) Radiation may be stopped

(c) Heat conduction is easier downwards

(d) It is easier and more convenient to do so

5. For proper ventilation of building, windows must be open near the bottom and top of the walls so as to let pass

(a) In more air

(b) In cool air near the bottom and hot air out near the roof

(c) In hot air near the roof and cool air out near the bottom

(d) Out hot air near the roof

6. The layers of atmosphere are heated through [MP PET 1986]

(a) Convection (b) Conduction

(c) Radiation (d) (b) and (c) both

7. Mode of transmission of heat, in which heat is carried by the moving particles, is [KCET 1999]

(a) Radiation (b) Conduction

(c) Convection (d) Wave motion

[BHU 2000]

8. In a closed room, heat transfer takes place by [BHU 2001]

(a) Conduction (b) Convection

(c) Radiation (d) All of these

9. In heat transfer, which method is based on gravitation [CBSE PMT 2000]

(a) Natural convection (b) Conduction

(c) Radiation (d) Stirring of liquids

10. When fluids are heated from the bottom, convection currents are produced because [UPSEAT 2000]

(a) Molecular motion of fluid becomes aligned

(b) Molecular collisions take place within the fluid

(c) Heated fluid becomes more dense than the cold fluid above it

(d) Heated fluid becomes less dense than the cold fluid above it

11. If a liquid is heated in weightlessness, the heat is transmitted through [RPMT1996]

(a) Conduction

(b) Convection

(c) Radiation

(d) Neither, because the liquid cannot be heated in weightlessness

12. The rate of loss of heat from a body cooling under conditions of forced convection is proportional to its (A) heat capacity (B) surface area (C) absolute temperature (D) excess of temperature over that of surrounding : state if [NCERT 1982]

(a) A, B, C are correct (b) Only A and C are correct

(c) Only B and D are correct (d) Only D is correct

13. In which of the following process, convection does not take place primarily [IIT-JEE (Screening) 2005]

(a) Sea and land breeze

(b) Boiling of water

(c) Warming of glass of bulb due to filament

(d) Heating air around a furnace

Radiation (General, Kirchoff's law, Black body)

1. On a clear sunny day, an object at temperature T is placed on the top of a high mountain. An identical object at the same temperature is placed at the foot of mountain. If both the objects are exposed to sun-rays for two hours in an identical manner, the object at the top of the mountain will register a temperature

(a) Higher than the object at the foot

(b) Lower than the object at the foot

(c) Equal to the object at the foot

(d) None of the above

2. The velocity of heat radiation in vacuum is [EAMCET 1982; KCET 1998]

(a) Equal to that of light (b) Less than that of light

(c) Greater than that of light (d) Equal to that of sound

3. In which process, the rate of transfer of heat is maximum [EAMCET 1977; MP PMT 1994; MH CET 2001]

(a) Conduction

(b) Convection

(c) Radiation

(d) In all these, heat is transferred with the same velocity

4. Which of the following is the correct device for the detection of thermal radiation [Manipal MEE 1995, UPSEAT 2000]
(a) Constant volume thermometer
(b) Liquid-in-glass thermometer
(c) Six's maximum and minimum thermometer
(d) Thermopile

5. A thermos flask is polished well [AFMC 1996]
(a) To make attractive
(b) For shining
(c) To absorb all radiations from outside
(d) To reflect all radiations from outside

6. Heat travels through vacuum by [AIIMS 1998; CPMT 2003]
(a) Conduction (b) Convection
(c) Radiation (d) Both (a) and (b)

7. The energy supply being cut-off, an electric heater element cools down to the temperature of its surroundings, but it will not cool further because [CPMT 2001]
(a) Supply is cut off
(b) It is made of metal
(c) Surroundings are radiating
(d) Element & surroundings have same temp.

8. We consider the radiation emitted by the human body. Which of the following statements is true [CBSE PMT 2003]
(a) The radiation is emitted only during the day
(b) The radiation is emitted during the summers and absorbed during the winters
(c) The radiation emitted lies in the ultraviolet region and hence is not visible
(d) The radiation emitted is in the infra-red region

9. The earth radiates in the infra-red region of the spectrum. The spectrum is correctly given by [RPET 2002; AIEEE 2003]
(a) Wien's law (b) Rayleigh jeans law
(c) Planck's law of radiation (d) Stefan's law of radiation

10. Infrared radiation is detected by [AIEEE 2002]
(a) Spectrometer (b) Pyrometer
(c) Nanometer (d) Photometer

11. Pick out the statement which is not true [KCET 2002]
(a) *IR* radiations are used for long distance photography
(b) *IR* radiations arise due to inner electron transitions in atoms
(c) *IR* radiations are detected by using a bolometer
(d) Sun is the natural source of *IR* radiation

12. A hot and a cold body are kept in vacuum separated from each other. Which of the following cause decrease in temperature of the hot body [AFMC 2005]
(a) Radiation
(b) Convection
(c) Conduction
(d) Temperature remains unchanged

13. Good absorbers of heat are [J & K CET 2002]
(a) Poor emitters (b) Non-emitters
(c) Good emitters (d) Highly polished

14. For a perfectly black body, its absorptive power is [MP PMT 1989, 92; RPMT 2001; RPET 2001, 03; AFMC 2003]
(a) 1 (b) 0.5
(c) 0 (d) Infinity

15. Certain substance emits only the wavelengths $\lambda_1, \lambda_2, \lambda_3$ and λ_4 when it is at a high temperature. When this substance is at a colder temperature, it will absorb only the following wavelengths
(a) λ_1 (b) λ_2
(c) λ_1 and λ_2 (d) $\lambda_1, \lambda_2, \lambda_3$ and λ_4

16. As compared to the person with white skin, the person with black skin will experience [CPMT 1988]
(a) Less heat and more cold (b) More heat and more cold
(c) More heat and less cold (d) Less heat and less cold

17. Relation between emissivity e and absorptive power a is (for black body)
(a) $e = a$ (b) $e = \frac{1}{a}$
(c) $e = a^2$ (d) $a = e^2$

18. Which of the following statements is wrong [BCECE 2001]
(a) Rough surfaces are better radiators than smooth surface
(b) Highly polished mirror like surfaces are very good radiators
(c) Black surfaces are better absorbers than white ones
(d) Black surfaces are better radiators than white

19. Half part of ice block is covered with black cloth and rest half is covered with white cloth and then it is kept in sunlight. After some time clothes are removed to see the melted ice. Which of the following statements is correct
(a) Ice covered with white cloth will melt more
(b) Ice covered with black cloth will melt more
(c) Equal ice will melt under both clothes
(d) It will depend on the temperature of surroundings of ice

20. If between wavelength λ and $\lambda + d\lambda$, e_λ and a_λ be the emissive and absorptive powers of a body and E_λ be the emissive power of a perfectly black body, then according to Kirchoff's law, which is true [RPMT 1998; MP PET 1991]
(a) $e_\lambda = a_\lambda = E_\lambda$ (b) $e_\lambda E_\lambda = a_\lambda$
(c) $e_\lambda = a_\lambda E_\lambda$ (d) $e_\lambda a_\lambda E_\lambda$ = constant

21. When p calories of heat is given to a body, it absorbs q calories; then the absorbtion power of body will be
(a) p/q (b) q/p
(c) p^2/q^2 (d) q^2/p^2

22. Distribution of energy in the spectrum of a black body can be correctly represented by [MP PMT 1989]
(a) Wien's law (b) Stefan's law
(c) Planck's law (d) Kirchhoff's law

23. In rainy season, on a clear night the black seat of a bicycle becomes wet because

(a) It absorbs water vapour
(b) Black seat is good absorber of heat
(c) Black seat is good radiator of heat energy
(d) None of the above

24. There is a rough black spot on a polished metallic plate. It is heated upto 1400 K approximately and then at once taken in a dark room. Which of the following statements is true [NCERT 1984; CPMT 1998]

(a) In comparison with the plate, the spot will shine more
(b) In camparison with the plate, the spot will appear more black
(c) The spot and the plate will be equally bright
(d) The plate and the black spot can not be seen in the dark room

25. At a certain temperature for given wave length, the ratio of emissive power of a body to emissive power of black body in same circumstances is known as [RPMT 1997]

(a) Relative emissivity (b) Emissivity
(c) Absorption coefficient (d) Coefficient of reflection

26. The cause of Fraunhoffer lines is [RPMT 1996; EAMCET 2001]

(a) Reflection of radiations by chromosphere
(b) Absorption of radiations by chromosphere
(c) Emission of radiations by chromosphere
(d) Transmission of radiations by chromosphere

27. Two thermometers A and B are exposed in sun light. The valve of A is painted black, But that of B is not painted. The correct statement regarding this case is [BHU (Med.) 1999; MH CET 1999]

(a) Temperature of A will rise faster than B but the final temperature will be the same in both
(b) Both A and B show equal rise in beginning
(c) Temperature of A will remain more than B
(d) Temperature of B will rise faster

28. There is a black spot on a body. If the body is heated and carried in dark room then it glows more. This can be explained on the basis of [RPET 2000]

(a) Newton's law of cooling (b) Wien's law
(c) Kirchoff's law (d) Stefan's

29. When red glass is heated in dark room it will seem [RPET 2000]

(a) Green (b) Purple
(c) Black (d) Yellow

30. A hot body will radiate heat most rapidly if its surface is [UPSEAT 1999, 2000]

(a) White & polished (b) White & rough
(c) Black & polished (d) Black & rough

31. A body, which emits radiations of all possible wavelengths, is known as [CPMT 2001; Pb. PET 2002]

(a) Good conductor (b) Partial radiator
(c) Absorber of photons (d) Perfectly black-body

32. Which of the following is the example of ideal black body [AIEEE 2002; CBSE PMT 2002]

(a) Kajal (b) Black board
(c) A pin hole in a box (d) None of these

33. An ideal black body at room temperature is thrown into a furnace. It is observed that [IIT-JEE (Screening) 2002]

(a) Initially it is the darkest body and at later times the brightest
(b) It is the darkest body at all times
(c) It cannot be distinguished at all times
(d) Initially it is the darkest body and at later times it cannot be distinguished

34. Absorption co-efficient of an open window is... [KCET 2004]

(a) Zero (b) 0.5
(c) 1 (d) 0.25

35. Which of the prism is used to see infra-red spectrum of light [RPMT 2000]

(a) Rock-salt (b) Nicol
(c) Flint (d) Crown

36. Which of the following statement is correct [RPMT 2001]

(a) A good absorber is a bad emitter
(b) Every body absorbs and emits radiations at every temperature
(c) The energy of radiations emitted from a black body is same for all wavelengths
(d) The law showing the relation of temperatures with the wavelength of maximum emission from an ideal black body is Plank's law

37. A piece of blue glass heated to a high temperature and a piece of red glass at room temperature, are taken inside a dimly lit room then [KCET 2005]

(a) The blue piece will look blue and red will look as usual
(b) Red look brighter red and blue look ordinary blue
(c) Blue shines like brighter red compared to the red piece
(d) Both the pieces will look equally red.

38. Which of the following law states that "good absorbers of heat are good emitters" [Orissa JEE 2005]

(a) Stefan's law (b) Kirchoff's law
(c) Planck's law (d) Wein's law

Radiation (Wein's law)

1. According to Wein's law [DCE 1995, 96; MP PET/PMT 1988 DPMT 1999; AIIMS 2002; CBSE PMT 2004]

(a) $\lambda_m T$ = constant (b) $\frac{\lambda_m}{T}$ = constant
(c) $\frac{T}{\lambda_m}$ = constant (d) $T + \lambda_m$ = constant

2. On investigation of light from three different stars A, B and C, it was found that in the spectrum of A the intensity of red colour is maximum, in B the intensity of blue colour is maximum and in C the intensity of yellow colour is maximum. From these observations it can be concluded that [CPMT 1989]

(a) The temperature of A is maximum, B is minimum and C is intermediate

(b) The temperature of A is maximum, C is minimum and B is intermediate

(c) The temperature of B is maximum, A is minimum and C is intermediate

(d) The temperature of C is maximum, B is minimum and A is intermediate

3. If wavelengths of maximum intensity of radiations emitted by the sun and the moon are $0.5\times10^{-6}m$ and $10^{-4}m$ respectively, the ratio of their temperatures is [MP PMT 1990]

(a) 1/100 (b) 1/200

(c) 100 (d) 200

4. The wavelength of radiation emitted by a body depends upon

(a) The nature of its surface

(b) The area of its surface

(c) The temperature of its surface

(d) All the above factors

5. If black wire of platinum is heated, then its colour first appear red, then yellow and finally white. It can be understood on the basis of

(a) Wien's displacement law

(b) Prevost theroy of heat exchange

(c) Newton's law of cooling

(d) None of the above

6. Colour of shining bright star is an indication of its [AIIMS 2001; RPMT 1999; BCECE 2005]

(a) Distance from the earth (b) Size

(c) Temperature (d) Mass

7. The wavelength of maximum emitted energy of a body at 700 K is 4.08 μm. If the temperature of the body is raised to 1400 K, the wavelength of maximum emitted energy will be

(a) $1.02\ \mu m$ (b) 16.32 μm

(c) 8.16 μm (d) 2.04 μm

8. A black body at 200 K is found to exit maximum energy at a wavelength of $14\mu m$. When its temperature is raised to 1000K, the wavelength at which maximum energy is emitted is[RPMT 1998; MP PET 1991; BVP 2003]

(a) $14\mu m$ (b) $70\mu F$

(c) $2.8\mu m$ (d) $2.8mm$

9. Two stars emit maximum radiation at wavelength 3600 $\mathring{A}$ and 4800 $\mathring{A}$ respectively. The ratio of their temperatures is [MP PMT 1991]

(a) 1 : 2 (b) 3 : 4

(c) 4 : 3 (d) 2 : 1

10. A black body emits radiations of maximum intensity at a wavelength of $5000\mathring{A}$, when the temperature of the body is 1227^oC. If the temperature of the body is increased by 1000^oC, the maximum intensity of emitted radiation would be observed at

(a) $2754.8\mathring{A}$ (b) $3000\mathring{A}$

(c) $3500\mathring{A}$ (d) $4000\mathring{A}$

11. Four pieces of iron heated in a furnace to different temperatures show different colours listed below. Which one has the highest temperature [MP PET 1992]

(a) White (b) Yellow

(c) Orange (d) Red

12. If a black body is heated at a high temperature, it seems to be

(a) Blue (b) White

(c) Red (d) Black

13. If the temperature of the sun becomes twice its present temperature, then [MP PET 1989; RPMT 1996]

(a) Radiated energy would be predominantly in infrared

(b) Radiated energy would be predominantly in ultraviolet [MP PMT 1992]

(c) Radiated energy would be predominantly in X-ray region

(d) Radiated energy would become twice the present radiated energy

14. The maximum energy in the thermal radiation from a hot source occurs at a wavelength of $11\times10^{-5}cm$. According to Wein's law, the temperature of the source (on Kelvin scale) will be n times the temperature of another source (on Kelvin scale) for which the [MP PMT 1984] wavelength at maximum energy is $5.5\times10^{-5}cm$. The value n is [CPMT 1991]

(a) 2 (b) 4

(c) $\frac{1}{2}$ (d) 1

15. The wavelength of maximum energy released during an atomic explosion was $2.93\times10^{-10}m$. Given that Wein's constant is $2.93\times10^{-3}m-K$, the maximum temperature attained must be of the order of [Haryana CEE 1996; MH CET 2002; Pb. PET 2000]

(a) $10^{-7}K$ [MP PET 1990] (b) $10^{7}K$

(c) $10^{-13}K$ (d) $5.86\times10^{7}K$

16. The maximum wavelength of radiation emitted at $2000\ K$ is $4\mu m$. What will be the maximum wavelength of radiation emitted at [MP PMT/PET 1998; DPMT 2000]

(a) 3.33 μm (b) 0.66 μm

(c) 1 μm (d) 1 m

17. How is the temperature of stars determined by [BHU 1999, 02; DCE 2000, 03]

(a) Stefan's law (b) Wein's displacement law

(c) Kirchhoff's law (d) Ohm's law

18. On increasing the temperature of a substance gradually, which of the following colours will be noticed by you [Pb. PMT 1995; Pb. PET 1996; CPMT 1995, 98; KCET 2000]

(a) White (b) Yellow

(c) Green (d) Red

19. A black body has maximum wavelength λ_m at temperature 2000 K. Its corresponding wavelength at temperature 3000 K will be [CBSE PMT 2001; K [MP PET 1992]

(a) $\frac{3}{2}\lambda_m$ (b) $\frac{2}{3}\lambda_m$

(c) $\frac{4}{9}\lambda_m$ (d) $\frac{9}{4}\lambda_m$

20. Relation between the colour and the temperature of a star is given by **[Kerala PET 2001]**

(a) Wein's displacement law

(b) Planck's law

(c) Hubble's law

(d) Fraunhofer diffraction law

21. A black body at a temperature of 1640 K has the wavelength corresponding to maximum emission equal to 1.75 μ. Assuming the moon to be a perfectly black body, the temperature of the moon, if the wavelength corresponding to maximum emission is 14.35 μ is **[Kerala (Med.) 2002]**

(a) 100 K (b) 150 K

(c) 200 K (d) 250 K

22. The maximum wavelength of radiations emitted at 900 K is $4\mu m$. What will be the maximum wavelength of radiations emitted at 1200 K **[BHU 2002]**

(a) $3\mu m$ (b) $0.3\mu m$

(c) $1\mu m$ (d) $1\ m$

23. Solar radiation emitted by sun resembles that emitted by a black body at a temperature of 6000 K. Maximum intensity is emitted at a wavelength of about 4800Å. If the sun were to cool down from 6000 K to 3000 K then the peak intensity would occur at a wavelength **[UPSEAT 2002]**

(a) 4800Å (b) 9600Å

(c) 7200Å (d) 6400Å

24. What will be the ratio of temperatures of sun and moon if the wavelengths of their maximum emission radiations rates are 140 Å and 4200 Å respectively **[J & K CET 2004]**

(a) 1 : 30 (b) 30 : 1

(c) 42 : 14 (d) 14 : 42

25. The radiation energy density per unit wavelength at a temperature T has a maximum at a wavelength λ. At temperature $2T$, it will have a maximum at a wavelength **[UPSEAT 2004]**

(a) 4λ (b) 2λ

(c) $\lambda/2$ (d) $\lambda/4$

26. The absolute temperatures of two black bodies are 2000 K and 3000 K respectively. The ratio of wavelengths corresponding to maximum emission of radiation by them will be

(a) 2 : 3 (b) 3 : 2

(c) 9 : 4 (d) 4 : 9

27. The temperature of sun is 5500 K and it emits maximum intensity radiation in the yellow region $(5.5\times10^{-7}m)$. The maximum radiation from a furnace occurs at wavelength $11\times10^{-7}m$. The temperature of furnace is **[J & K CET 2000]**

(a) 1125 K (b) 2750 K

(c) 5500 K (d) 11000 K

28. A particular star (assuming it as a black body) has a surface temperature of about $5\times10^4 K$. The wavelength in nanometers at which its radiation becomes maximum is (b = 0.0029 mK) **[EAMCET (Med.) 2003]**

(a) 48 (b) 58

(c) 60 (d) 70

29. The maximum energy in thermal radiation from a source occurs at the wavelength 4000Å. The effective temperature of the source is

(a) $7000\,K$ (b) 80000 K

(c) $10^4\ K$ (d) $10^6\ K$

30. The intensity of radiation emitted by the sun has its maximum value at a wavelength of $510\ nm$ and that emitted by the north star has the maximum value at $350\ nm$. If these stars behave like black bodies, then the ratio of the surface temperature of the sun and north star is **[IIT 1997 Cancelled; JIPMER 2000; AIIMS 2000]**

(a) 1.46 (b) 0.69

(c) 1.21 (d) 0.83

Radiation (Stefan's law)

1. The amount of radiation emitted by a perfectly black body is proportional to **[AFMC 1995; Pb. PMT 1997; CPMT 1974, 98, 02; AIIMS 2000; DPMT 1995, 98, 02]**

(a) Temperature on ideal gas scale

(b) Fourth root of temperature on ideal gas scale

(c) Fourth power of temperature on ideal gas scale

(d) Source of temperature on ideal gas scale

2. A metal ball of surface area $200\ cm^2$ and temperature 527^oC is surrounded by a vessel at 27^oC. If the emissivity of the metal is 0.4, then the rate of loss of heat from the ball is $(\sigma = 5.67\times10^{-8}\ J/m^2 - s - k^4)$ **[MP PMT/PET 1988]**

(a) 108 joules approx. (b) 168 joules approx.

(c) 182 joules approx. (d) 192 joules approx.

3. The rate of radiation of a black body at 0°C is E J/sec. The rate of radiation of this black body at 273^oC will be **[MP PMT 1989; Kerala PET 2002; UPSEAT 2001]**

(a) $16\ E$ (b) $8\ E$

(c) $4\ E$ (d) E

4. A black body radiates energy at the rate of E W/m at a high temperature TK. When the temperature is reduced to $\frac{T}{2}K$, the radiant energy will be **[RPMT 2003]** **[CPMT 1988; UPSEAT 1998; MNR 1993; SCRA 1996; MP PMT 1992; DPMT 2001; MH CET 2001]**

(a) $\frac{E}{16}$ (b) $\frac{E}{4}$

(c) $4E$ (d) $16E$

5. An object is at a temperature of 400^oC. At what temperature would it radiate energy twice as fast? The temperature of the surroundings may be assumed to be negligible **[MP PMT 1990; DPMT 2002]**

(a) 200^oC (b) $200\ K$

(c) 800^oC (d) 800 K

6. A black body at a temperature of 227^oC radiates heat energy at the rate of 5 cal/cm-sec. At a temperature of 727^oC, the rate of heat radiated per unit area in cal/cm will be

(a) 80 (b) 160

(c) 250 (d) 500

7. Energy is being emitted from the surface of a black body at 127^oC temperature at the rate of $1.0\times10^6 J/\sec-m^2$. Temperature of the black body at which the rate of energy emission is $16.0\times10^6 J/\sec-m^2$ will be

[MP PMT 1991; AFMC 1998]

(a) 254^oC (b) 508^oC

(c) 527^oC (d) 727^oC

8. In MKS system, Stefan's constant is denoted by σ. In CGS system multiplying factor of σ will be

(a) 1 (b) 10^3

(c) 10^5 (d) 10^2

9. If temperature of a black body increases from 7^oC to 287^oC, then the rate of energy radiation increases by

[AIIMS 1997; Haryana PMT 2000; RPMT 2003]

(a) $\left(\frac{287}{7}\right)^4$ (b) 16

(c) 4 (d) 2

10. The temperature of a piece of iron is 27^oC and it is radiating energy at the rate of $Q\,kWm^{-2}$. If its temperature is raised to 151^oC, the rate of radiation of energy will become approximately

(a) $2Q\,kWm^{-2}$ (b) $4Q\,kWm^{-2}$

(c) $6Q\,kWm^{-2}$ (d) $8Q\,kWm^{-2}$

11. The temperatures of two bodies *A* and *B* are 727^oC and 127^oC. The ratio of rate of emission of radiations will be

[MP PET 1986]

(a) 727/127 (b) 625/16

(c) 1000/400 (d) 100/16

12. The temperature at which a black body of unit area loses its energy at the rate of 1 *joule/second* is

(a) -65^oC (b) 65^oC

(c) 65 *K* (d) None of these

13. The area of a hole of heat furnace is $10^{-4} m^2$. It radiates 1.58×10^5 calories of heat per hour. If the emissivity of the furnace is 0.80, then its temperature is

(a) 1500 *K* (b) 2000 *K*

(c) 2500 *K* (d) 3000 *K*

14. Two spheres P and Q, of same colour having radii $8\,cm$ and $2\,cm$ are maintained at temperatures 127^oC and 527^oC respectively. The ratio of energy radiated by P and Q is

(a) 0.054 (b) 0.0034

(c) 1 (d) 2

15. A body radiates energy $5W$ at a temperature of 127^oC. If the temperature is increased to 927^oC, then it radiates energy at the rate of

[MP PET 1994;BHU 1995; CPMT 1998; AFMC 2000]

(a) $410W$ (b) $81\,W$

(c) $405\,W$ (d) $200\,W$

16. A thin square steel plate with each side equal to 10 *cm* is heated by a blacksmith. The rate of radiated energy by the heated plate is 1134 *W*. The temperature of the hot steel plate is (Stefan's constant $\sigma = 5.67\times10^{-8} watt\,m^{-2}K^{-4}$, emissivity of the plate = 1)

(a) $1000\,K$ (b) $1189\,K$

(c) $2000\,K$ (d) $2378\,K$

17. The temperatures of two bodies A and B are respectively 727^oC and 327^oC. The ratio $H_A : H_B$ of the rates of heat radiated by them is [UPSEAT 1999;

MP PET 1999; MH CET 2000; AIIMS 2000]

(a) $727:327$ (b) 5 : 3

(c) 25 : 9 (d) 625 : 81

18. The energy emitted per second by a black body at 27^oC is $10\,J$. If the temperature of the black body is increased to 327^oC, the energy emitted per second will be

[CPMT 1999; DCE 1999]

(a) $20\,J$ (b) $40\,J$

(c) $80\,J$ [MP PET 1992] (d) $160\,J$

19. The radiant energy from the sun incident normally at the surface of earth is $20\,kcal/m^2 min$. What would have been the radiant energy incident normally on the earth, if the sun had a temperature twice of the present one

[CBSE PMT 1998; Pb. PET 2001]

(a) $160\,kcal/m^2\,min$ (b) $40\,kcal/m^2\,min$

(c) $320\,kcal/m^2\,min$ (d) $80\,kcal/m^2\,min$

20. A spherical black body with a radius of $12\,cm$ radiates $440\,W$ power at $500\,K$. If the radius were halved and the temperature doubled, the power radiated in watt would be

[IIT 1997 Re-Exam]

(a) 225 (b) 450

(c) 900 (d) 1800

21. If the temperature of the sun (black body) is doubled, the rate of energy received on earth will be increased by a factor of [CBSE PMT 1993; BHU 2

(a) 2 (b) 4

(c) 8 (d) 16

22. The ratio of energy of emitted radiation of a black body at 27^oC and 927^oC is [MP PMT 1994] [Pb. PMT 1995;

CPMT 1997, 2000; CBSE PMT 2000; DPMT 1998, 02, 03]

(a) 1 : 4 (b) 1 : 16

(c) 1 : 64 (d) 1 : 256

23. If the temperature of a black body be increased from 27^oC to 327^oC the radiation emitted increases by a fraction of

[Pb. PET 1997; JIPMER 1999]

(a) 16 (b) 8
(c) 4 (d) 2

24. The rectangular surface of area 8 $cm \times 4 cm$ of a black body at a temperature of $127^o C$ emits energy at the rate of E per second. If the length and breadth of the surface are each reduced to half of the initial value and the temperature is raised to $327^o C$, the rate of emission of energy will become [MP PET 2000]

(a) $\frac{3}{8}E$ (b) $\frac{81}{16}E$
(c) $\frac{9}{16}E$ (d) $\frac{81}{64}E$

25. At temperature T, the power radiated by a body is Q *watts*. At the temperature $3T$ the power radiated by it will be [MP PET 2000]

(a) 3 Q (b) 9 Q
(c) 27 Q (d) 81 Q

26. Two spherical black bodies of radii r_1 and r_2 and with surface temperature T_1 and T_2 respectively radiate the same power. Then the ratio of r_1 and r_2 will be [KCET 2001; UPSEAT 2001]

(a) $\left(\frac{T_2}{T_1}\right)^2$ (b) $\left(\frac{T_2}{T_1}\right)^4$
(c) $\left(\frac{T_1}{T_2}\right)^2$ (d) $\left(\frac{T_1}{T_2}\right)^4$

27. Temperature of a black body increases from $327^o C$ to $927^o C$, the initial energy possessed is 2 *KJ*, what is its final energy

(a) 32 *KJ* (b) 320 *KJ*
(c) 1200 *KJ* (d) None of these

28. The original temperature of a black body is $727^o C$. The temperature at which this black body must be raised so as to double the total radiant energy, is [Pb. PMT 2001]

(a) 971 K (b) 1190 K
(c) 2001 K (d) 1458 K

29. Two black metallic spheres of radius 4m, at 2000 K and 1m at 4000 K will have ratio of energy radiation as [RPET 2000; AIEEE 2002]

(a) 1 : 1 (b) 4 : 1
(c) 1 : 4 (d) 2 : 1

30. The energy spectrum of a black body exhibits a maximum around a wavelength λ_o. The temperature of the black body is now changed such that the energy is maximum around a wavelength $\frac{3\lambda_o}{4}$. The power radiated by the black body will now increase by a factor of [KCET 2002]

(a) 256/81 (b) 64/27
(c) 16/9 (d) 4/3

31. A black body is at a temperature 300 K. It emits energy at a rate, which is proportional to [Pb. PMT 1998; AIIMS 2002; MH CET 2003]

(a) 300 (b) $(300)^2$
(c) $(300)^3$ (d) $(300)^4$

32. If the temperature of a hot body is increased by 50% then the increase in the quantity of emitted heat radiation will be [RPET 1998; EAMCET 2001; MP PMT 2003]

(a) 125% (b) 200%
(c) 300% (d) 400%

33. Two identical metal balls at temperature $200^o C$ and $400^o C$ kept in air at $27^o C$. The ratio of net heat loss by these bodies is

(a) 1/4 (b) 1/2
(c) 1/16 (d) $\frac{473^4 - 300^4}{673^4 - 300^4}$

34. Two spheres made of same material have radii in the ratio 1: 2 Both are at same temperature. Ratio of heat radiation energy emitted per second by them is [MP PMT 2002; MH CET 2004]

(a) 1 : 2 (b) 1 : 8
(c) 1 : 4 (d) 1 : 16

35. A black body at a temperature of 127°C radiates heat at the rate of 1 *cal/cm* × *sec*. At a temperature of 527°C the rate of heat radiation from the body in (*cal/cm* × *sec*) will be [MP PET 2002]

(a) 16.0 (b) 10.45
(c) 4.0 (d) 2.0

36. A black body radiates 20 W at temperature $227^o C$. If temperature of the black body is changed to $727^o C$ then its radiating power will be [DCE 2001] [CBSE PMT 2002; DCE 1999, 03; AIIMS 2003]

(a) 120 W (b) 240 W
(c) 320 W (d) 360 W

37. Two spheres of same material have radius 1 m and 4 m and temperature 4000 K and 2000 K respectively. The energy radiated per second by the first sphere is [Pb. PMT 2002]

(a) Greater than that by the second
(b) Less than that by the second
(c) Equal in both cases
(d) The information is incomplete

38. The radiation emitted by a star A is 10,000 times that of the sun. If the surface temperatures of the sun and the star A are 6000 K and 2000 K respectively, the ratio of the radii of the star A and the sun is

(a) 300 : 1 (b) 600 : 1
(c) 900 : 1 (d) 1200 : 1

39. A black body radiates at the rate of W watts at a temperature T. If the temperature of the body is reduced to $T/3$, it will radiate at the rate of (in *Watts*) [BHU 1998; MP PET 2003]

(a) $\frac{W}{81}$ (b) $\frac{W}{27}$
(c) $\frac{W}{9}$ (d) $\frac{W}{3}$

40. Star A has radius r surface temperature T while star B has radius $4r$ and surface temperature $T/2$. The ratio of the power of two starts, $P_A : P_B$ is [MP PMT 2004]

(a) 16 : 1 (b) 1 : 16

(c) 1 : 1 (d) 1 : 4

41. Suppose the sun expands so that its radius becomes 100 times its present radius and its surface temperature becomes half of its present value. The total energy emitted by it then will increase by a factor of [AIIMS 2004]

(a) 10^4 (b) 625

(c) 256 (d) 16

42. If the temperature of the sun were to be increased from T to $2T$ and its radius from R to $2R$, then the ratio of the radiant energy received on the earth to what it was previously will be

(a) 4 (b) 16

(c) 32 (d) 64

43. At 127° C radiates energy is 2.7×10^3 J/s. At what temperature radiated energy is 4.32×10^6 J/s [BCECE 2004]

(a) 400 K (b) 4000 K

(c) 80000 K (d) 40000 K

44. If the initial temperatures of metallic sphere and disc, of the same mass, radius and nature are equal, then the ratio of their rate of cooling in same environment will be

[J & K CET 2004]

(a) 1 : 4 (b) 4 : 1

(c) 1 : 2 (d) 2 : 1

45. A black body radiates energy at the rate of 1×10^5 $J/s \times m^2$ at temperature of 227° C. The temperature to which it must be heated so that it radiates energy at rate of 1×10^9 J/sm², is

(a) 5000 K (b) 5000°C

(c) 500 K (d) 500°C

46. The temperature of the body is increased from –73° C to 327° C, the ratio of energy emitted per second is :

[CPMT 2001; Pb. PET 2001]

(a) 1 : 3 (b) 1 : 81

(c) 1 : 27 (d) 1 : 9

47. If the temperature of the body is increased by 10%, the percentage increase in the emitted radiation will be

[RPMT 2001, 02]

(a) 46% (b) 40%

(c) 30% (d) 80%

48. If the sun's surface radiates heat at $6.3 \times 10^7 Wm^{-2}$. Calculate the temperature of the sun assuming it to be a black body $(\sigma = 5.7 \times 10^{-8} Wm^{-2}K^{-4})$ [BHU (Med.) 2000]

(a) $5.8 \times 10^3 K$ (b) $8.5 \times 10^3 K$

(c) $3.5 \times 10^8 K$ (d) $5.3 \times 10^8 K$

49. A sphere at temperature 600K is placed in an environment of temperature is 200K. Its cooling rate is H. If its temperature reduced to 400K then cooling rate in same environment will become [CBSE PMT 1999; BHU 2001]

(a) (3/16)H (b) (16/3)H

(c) (9/27)H (d) (1/16)H

50. The value of Stefan's constant is [RPMT 2002]

(a) $5.67 \times 10^{-8} W/m^2\text{-}K^4$ (b) $5.67 \times 10^{-5} W/m^2\text{-}K^4$

(c) $5.67 \times 10^{-11} W/m^2\text{-}K^4$ (d) None of these

51. Rate of cooling at 600K, if surrounding temperature is 300K is R. The rate of cooling at 900K is [DPMT 2002]

(a) $\frac{16}{3}R$ (b) $2R$

(c) $3R$ (d) $\frac{2}{3}R$

52. A black body of surface area 10cm^2 is heated to 127°C and is suspended in a room at temperature 27°C. The initial rate of loss of heat from the body at the room temperature will be [AIEEE 2004]

(a) 2.99 W (b) 1.89 W

(c) 1.18 W (d) 0.99 W

53. Two identical objects A and B are at temperatures T_A and T_B respectively. Both objects are placed in a room with perfectly absorbing walls maintained at temperatures T $(T_A > T > T_B)$. The objects A and B attain temperature T eventually which one of the following is correct statement

[CPMT 1997]

(a) 'A' only emits radiations while B only absorbs them until both attain temperature

(b) A loses more radiations than it absorbs while B absorbs more radiations that it emits until temperature T is attained

(c) Both A and B only absorb radiations until they attain temperature T

(d) Both A and B only emit radiations until they attain temperature T

[DPMT 2004]

54. When the body has the same temperature as that of surroundings [UPSEAT 199

(a) It does not radiate heat

(b) It radiates the same quantity of heat as it absorbs

(c) It radiates less quantity of heat as it receives from surroundings

(d) It radiates more quantity of heat as it receives heat from surroundings

55. The ratio of radiant energies radiated per unit surface area by two bodies is 16 : 1, the temperature of hotter body is 1000K, then the temperature of colder body will be

[UPSEAT 2001]

(a) 250 K (b) 500 K

(c) 1000 K (d) 62.5 K

56. The spectral energy distribution of star is maximum at twice temperature as that of sun. The total energy radiated by star is

(a) Twice as that of the sun

(b) Same as that of the sun

(c) Sixteen times as that of the sun

(d) One sixteenth of sun

Radiation (Newton's Law of Cooling)

1. Hot water cools from $60^o C$ to $50^o C$ in the first 10 minutes and to $42^o C$ in the next 10 minutes. The temperature of the surrounding is [MP PET 1993]

(a) $5^o C$ (b) $10^o C$

(c) $15^o C$ (d) $20^o C$

2. A bucket full of hot water cools from $75^o C$ to $70^0 C$ in time T_1, from $70^o C$ to $65^o C$ in time T_2 and from $65^o C$ to $60^o C$ in time T_3, then [NCERT 1980; MP PET 1989; CBSE PMT 1995; KCET 2003; MH CET 1999]

(a) $T_1 = T_2 = T_3$ (b) $T_1 > T_2 > T_3$

(c) $T_1 < T_2 < T_3$ (d) $T_1 > T_2 < T_3$

3. Consider two hot bodies B_1 and B_2 which have temperatures $100^o C$ and $80^o C$ respectively at $t = 0$. The temperature of the surroundings is $40^o C$. The ratio of the respective rates of cooling R_1 and R_2 of these two bodies at $t = 0$ will be

(a) $R_1 : R_2 = 3 : 2$ (b) $R_1 : R_2 = 5 : 4$

(c) $R_1 : R_2 = 2 : 3$ (d) $R_1 : R_2 = 4 : 5$

4. Newton's law of cooling is a special case of

(a) Stefan's law (b) Kirchhoff's law

(c) Wien's law (d) Planck's law

5. Equal masses of two liquids are filled in two similar calorimeters. The rate of cooling will [MP PMT 1987]

(a) Depend on the nature of the liquids

(b) Depend on the specific heats of liquids

(c) Be same for both the liquids

(d) Depend on the mass of the liquids

6. In Newton's experiment of cooling, the water equivalent of two similar calorimeters is 10 *gm* each. They are filled with 350 *gm* of water and 300 *gm* of a liquid (equal volumes) separately. The time taken by water and liquid to cool from $70^o C$ to $60^o C$ is 3 *min* and 95 *sec* respectively. The specific heat of the liquid will be

(a) 0.3 $Cal/gm \times ^\circ C$ (b) 0.5 $Cal/gm \times ^\circ C$

(c) 0.6 $Cal/gm \times ^\circ C$ (d) 0.8 $Cal/gm \times ^\circ C$

7. Newton's law of cooling is used in laboratory for the determination of the [CPMT 1973; CPMT 2002]

(a) Specific heat of the gases (b) The latent heat of gases

(c) Specific heat of liquids (d) Latent heat of liquids

8. A body cools from $60^o C$ to $50^o C$ in 10 *minutes* when kept in air at $30^o C$. In the next 10 *minutes* its temperature will be

(a) Below $40^o C$ (b) $40^o C$

(c) Above $40^o C$ (d) Cannot be predicted

9. Liquid is filled in a vessel which is kept in a room with temperature $20^o C$. When the temperature of the liquid is $80^o C$, then it loses heat at the rate of $60\ cal/\sec$. What will be the rate of loss of heat when the temperature of the liquid is $40^o C$

(a) $180\ cal/\sec$ (b) $40\ cal/\sec$

(c) $30\ cal/\sec$ (d) $20\ cal/\sec$

10. Which of the following statements is true/correct [Manipal MEE 1995]

(a) During clear nights, the temperature rises steadily upward near the ground level

(b) Newton's law of cooling, an approximate form of Stefan's law, is valid only for natural convection

(c) The total energy emitted by a black body per unit time per unit area is proportional to the square of its temperature in the Kelvin scale

(d) Two spheres of the same material have radii $1m$ and $4m$ and temperatures 4000 *K* and 2000 *K* respectively. The energy radiated per second by the first sphere is greater than that radiated per second by the second sphere

11. A body takes 4 *minutes* to cool from $100^o C$ to $70^o C$. To cool from $70^o C$ to $40^o C$ it will take (room temperature is $15^o C$)

(a) 7 *minutes* (b) 6 *minutes*

(c) 5 *minutes* (d) 4 *minutes*

12. A cup of tea cools from $80^0 C$ to $60^o C$ in one minute. The ambient temperature is $30^o C$. In cooling from $60^o C$ to $50^o C$ it will take [MP PET 1990] [MP PMT 1995; UPSEAT 2000; MH CET 2002]

(a) 30 seconds (b) 60 seconds

(c) 90 seconds (d) 50 seconds

13. A liquid cools down from $70^o C$ to $60^o C$ in 5 *minutes*. The time taken to cool it from $60^o C$ to $50^o C$ will be [MP PET 1992, 2000; MP PMT 1996]

(a) 5 *minutes*

(b) Lesser than 5 *minutes*

(c) Greater than 5 *minutes*

(d) Lesser or greater than 5 *minutes* depending upon the density of the liquid

14. If a metallic sphere gets cooled from $62^o C$ to $50^o C$ in 10 minutes and in the next 10 minutes gets cooled to $42^o C$, then the temperature of the surroundings is [MP PET 1997]

(a) $30^o C$ (b) $36^o C$

(c) $26^o C$ (d) $20^o C$

15. The rates of cooling of two different liquids put in exactly similar calorimeters and kept in identical surroundings are the same if

(a) The masses of the liquids are equal

(b) Equal masses of the liquids at the same temperature are taken

(c) Different volumes of the liquids at the same temperature are taken [MP PET 1994]

(d) Equal volumes of the liquids at the same temperature are taken

16. A body cools from $60^o C$ to $50^o C$ in 10 *minutes*. If the room temperature is $25^o C$ and assuming Newton's law of cooling to hold good, the temperature of the body at the end of the next 10 *minutes* will be [MP PMT 1994] [MP PMT/PET 1998; BHU 2000; Pb. PMT 2001]

(a) $38.5^o C$ (b) $40^o C$

(c) $42.85^o C$ (d) $45^o C$

17. The temperature of a liquid drops from $365 K$ to 361 *K* in 2 *minutes*. Find the time during which temperature of the liquid drops from $344\ K$ to $342 K$. Temperature of room is $293\ K$

(a) 84 *sec* (b) 72 *sec*

(c) 66 *sec* (d) 60 *sec*

18. A body cools from 50.0^oC to 49.9^oC in $5\ s$. How long will it take to cool from 40.0^oC to 39.9^oC? Assume the temperature of surroundings to be 30.0^oC and Newton's law of cooling to be valid [CBSE PMT 1994]

(a) 2.5 *s* (b) 10 *s*

(c) 20 *s* (d) 5 *s*

19. A container contains hot water at 100^oC. If in time T_1 temperature falls to 80^oC and in time T_2 temperature falls to 60^oC from 80^oC, then [CPMT 1997]

(a) $T_1 = T_2$ (b) $T_1 > T_2$

(c) $T_1 < T_2$ (d) None

20. Hot water kept in a beaker placed in a room cools from 70^oC to $60^\circ C$ in 4 *minutes*. The time taken by it to cool from 69^oC to 59^oC will be [JIPMER 1999]

(a) The same 4 minutes (b) More than 4 minutes

(c) Less than 4 minutes (d) We cannot say definitely

21. Newton's law of cooling, holds good only if the temperature difference between the body and the surroundings is [BHU 2000]

(a) Less than 10^oC (b) More than 10^oC

(c) Less than 100^oC (d) More than 100^oC

22. In a room where the temperature is 30^oC, a body cools from 61^oC to 59^oC in 4 minutes. The time (in min.) taken by the body to cool from 51^0C to 49^0C will be [UPSEAT 2000]

(a) 4 *min* (b) 6 *min*

(c) 5 *min* (d) 8 *min*

23. According to 'Newton's Law of cooling', the rate of cooling of a body is proportional to the [MP PET 2001]

(a) Temperature of the body

(b) Temperature of the surrounding

(c) Fourth power of the temperature of the body

(d) Difference of the temperature of the body and the surroundings

24. A body cools in 7 minutes from 60^oC to 40^oC What time (in minutes) does it take to cool from 40^oC to 28^oC if the surrounding temperature is 10^oC? Assume Newton's Law of cooling holds [Kerala (Engg.) 2001]

(a) 3.5 (b) 11

(c) 7 (d) 10

25. A body takes 5 minutes for cooling from 50^oC to 40^oC. Its temperature comes down to 33.33^oC in next 5 minutes. Temperature of surroundings is [MP PMT 2002]

(a) 15^oC (b) 20^oC

(c) 25^oC (d) 10^oC

26. The temperature of a body falls from 50^oC to 40^oC in 10 minutes. If the temperature of the surroundings is 20^oC Then temperature of the body after another 10 minutes will be

(a) 36.6^oC (b) 33.3^oC

(c) 35^oC (d) 30^oC

27. It takes 10 minutes to cool a liquid from $61^\circ C$ to $59^\circ C$. If room temperature is $30^\circ C$ then time taken in cooling from $51^\circ C$ to $49^\circ C$ is

(a) 10 *min* (b) 11 *min*

(c) 13 *min* (d) 15 *min*

28. A calorimeter of mass 0.2 *kg* and specific heat 900 *J/kg-K*. Containing 0.5 *kg* of a liquid of specific heat 2400*J* /*kg-K*. Its temperature falls from $60^\circ C$ to $55^\circ C$ in one minute. The rate of cooling is [MP PET 2003]

(a) 5 *J/s* (b) 15 *J/s*

(c) 100 *J/s* (d) 115 *J/s*

29. According to Newton's law of cooling, the rate of cooling of a body is proportional to $(\Delta\theta)^n$, where $\Delta\theta$ is the difference of the temperature of the body and the surroundings, and *n* is equal to

(a) One (b) Two

(c) Three (d) Four

30. The initial temperature of a body is $80^\circ C$. If its temperature falls to $64^\circ C$ in 5 *minutes* and in 10 *minutes* to $52^\circ C$ then the temperature of surrounding will be [MP PMT 2003]

(a) $26^\circ C$ (b) $49^\circ C$

(c) $35^\circ C$ (d) $42^\circ C$

31. A liquid cools from $50^\circ C$ to $45^\circ C$ in 5 minutes and from $45^\circ C$ to $41.5^\circ C$ in the next 5 minutes. The temperature of the surrounding is

(a) $27^\circ C$ (b) $40.3^\circ C$

(c) $23.3^\circ C$ (d) $33.3^\circ C$

32. A cup of tea cools from $65.5^\circ C$ to $62.5^\circ C$ in one minute in a room of $22.5^\circ C$. How long will the same cup of tea take, in............. minutes, to cool from $46.50^\circ C$ to $40.5^\circ C$ in the same room ? (choose nearest value) [Kerala PMT 2004]

(a) 1 (b) 2

(c) 3 (d) 4

33. The temperature of a body falls from $62^\circ C$ to $50^\circ C$ in 10 *minutes*. If the temperature of the surroundings is $26^\circ C$, the temperature in next 10 *minutes* will become [RPMT 2002]

(a) $42^\circ C$ (b) $40^\circ C$

(c) $56^\circ C$ (d) $55^\circ C$

34. A body takes 5 *minutes* to cool from $90^\circ C$ to $60^\circ C$. If the temperature of the surroundings is $20^\circ C$, the time taken by it to cool from $60^\circ C$ to $30^\circ C$ will be. [RPMT 2003]

(a) 5 *min* (b) 8 *min*

(c) 11 *min* (d) 12 *min*

35. An object is cooled from $75^\circ C$ to $65^\circ C$ in 2 minutes in a room at $30^\circ C$. The time taken to cool another object from $55^\circ C$ to $45^\circ C$ in the same room in minutes is [EAMCET (Med.) 1996]

(a) 4 (b) 5

(c) 6 (d) 7

36. A body takes 5 minute to cool from 80°*C* to 50°*C*. How much time it will take to cool from 60°*C* to 30°*C*, if room temperature is 20°*C*.

(a) 40 minute (b) 9 minute

(c) 30 minute (d) 20 minute

37. A cane is taken out from a refrigerator at 0°*C*. The atmospheric temperature is 25°*C*. If t is the time taken to heat from 0°*C* to 5°*C* and t is the time taken from 10°*C* to 15°*C*, then

(a) $t_1 > t_2$ (b) $t_1 < t_2$

(c) $t_1 = t_2$ (d) There is no relation

Critical Thinking

Objective Questions

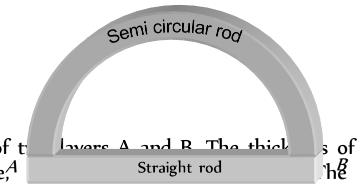
1. Two rods (one semi-circular and other straight) of same material and of same cross-sectional area are joined as shown in the figure. The points A and B are maintained at different temperature. The ratio of the heat transferred through a cross-section of a semi-circular rod to the heat transferred through a cross section of the straight rod in a given time is [UPSEAT 2002]

(a) 2 : π

(b) 1 : 2

(c) π : 2

(d) 3 : 2



2. A wall is made up of two layers A and B. The thickness of the two layers is the same, but materials are different. The thermal conductivity of A is double than that of B. In thermal equilibrium the temperature difference between the two ends is 36^oC. Then the difference of temperature at the two surfaces of A will be

BHU 1997; MP PET 1996, 99; DPMT 2000]

(a) 6^oC (b) 12^oC

(c) 18^oC (d) 24^oC

3. Ice starts forming in lake with water at 0^oC and when the atmospheric temperature is -10^oC. If the time taken for 1 *cm* of ice be 7 *hours*, then the time taken for the thickness of ice to change from 1 *cm* to 2 *cm* is

[NCERT 1971; MP PMT/PET 1988; UPSEAT 1996]

(a) 7 *hours* (b) 14 *hours*

(c) Less than 7 *hours* (d) More than 7 *hours*

4. A cylinder of radius R made of a material of thermal conductivity K_1 is surrounded by a cylindrical shell of inner radius R and outer radius 2R made of material of thermal conductivity K_2. The two ends of the combined system are maintained at two different temperatures. There is no loss of heat across the cylindrical surface and the system is in steady state. The effective thermal conductivity of the system is

[IIT 1988; MP PMT 1994, 97; SCRA 1998]

(a) $K_1 + K_2$ (b) $\frac{K_1K_2}{K_1+K_2}$

(c) $\frac{K_1+3K_2}{4}$ (d) $\frac{3K_1+K_2}{4}$

5. Three rods made of the same material and having the same cross section have been joined as shown in the figure. Each rod is of the same length. The left and right ends are kept at 0^oC and 90^oC respectively. The temperature of the junction of the three rods will be [IIT-JEE (Screening) 2001]

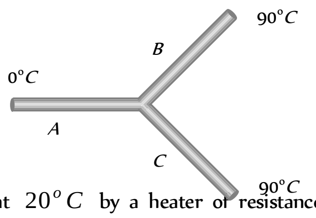
[RPET 1998]

(a) 45^oC

(b) 60^oC

(c) 30^oC

(d) 20^oC



[Orissa JEE 2005]

6. A room is maintained at 20^oC by a heater of resistance 20 *ohm* connected to 200 *volt* mains. The temperature is uniform through out the room and heat is transmitted through a glass window of area $1m^2$ and thickness 0.2 *cm*. What will be the temperature outside? Given that thermal conductivity *K* for glass is $0.2\ cal/m/^oC/sec$ and *J* = 4.2 *J/cal*

[IIT 1978]

(a) 15.24^oC (b) 15.00°*C*

(c) 24.15^oC (d) None of the above

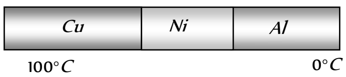
7. There is formation of layer of snow $x\,cm$ thick on water, when the temperature of air is $-\theta^oC$ (less than freezing point). The thickness of layer increases from x to y in the time t, then the value of t is given by

(a) $\frac{(x+y)(x-y)\rho L}{2k\theta}$ (b) $\frac{(x-y)\rho L}{2k\theta}$

(c) $\frac{(x+y)(x-y)\rho L}{k\theta}$ (d) $\frac{(x-y)\rho Lk}{2\theta}$

[IIT 1980; CPMT 1991;

8. A composite metal bar of uniform section is made up of length 25 *cm* of copper, 10 *cm* of nickel and 15 *cm* of aluminium. Each part being in perfect thermal contact with the adjoining part. The copper end of the composite rod is maintained at 100^oC and the aluminium end at 0^oC. The whole rod is covered with belt so that there is no heat loss occurs at the sides. If $K_{Cu} = 2K_{Al}$ and $K_{Al} = 3K_{Ni}$, then what will be the temperatures of $Cu-Ni$ and $Ni-Al$ junctions respectively



(a) 23.33^oC and 78.8^oC (b) 83.33^oC and 20^oC

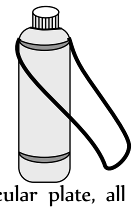
(c) 50^oC and 30^oC (d) 30^oC and 50^oC

9. Three rods of identical area of cross-section and made from the same metal form the sides of an isosceles triangle ABC, right angled at B. The points A and B are maintained at temperatures T and $\sqrt{2}T$ respectively. In the steady state the temperature of the point C is T_C. Assuming that only heat conduction takes place, $\frac{T_C}{T}$ is equal to [IIT 1995]

(a) $\frac{1}{(\sqrt{2}+1)}$ (b) $\frac{3}{(\sqrt{2}+1)}$

(c) $\frac{1}{2(\sqrt{2}-1)}$ (d) $\frac{1}{\sqrt{3}(\sqrt{2}-1)}$

10. The only possibility of heat flow in a thermos flask is through its cork which is 75 *cm* in area and 5 *cm* thick. Its thermal conductivity is 0.0075 *cal/cmsec°C*. The outside temperature is 40°C and latent heat of ice is 80 *cal/g*. Time taken by 500 *g* of ice at 0°C in the flask to melt into water at 0°C is [CPMT 1974, 78; MNR 1983]



(a) 2.47 *hr*
(b) 4.27 *hr*
(c) 7.42 *hr*
(d) 4.72 *hr*

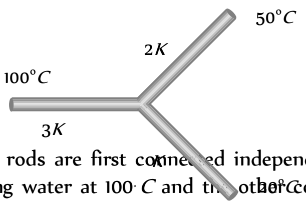
11. A sphere, a cube and a thin circular plate, all made of the same material and having the same mass are initially heated to a temperature of 1000°*C*. Which one of these will cool first

J & K CET 2000 MH CET 2000; UPSEAT 2001]

(a) Plate (b) Sphere
(c) Cube (d) None of these

12. Three rods of the same dimension have thermal conductivities 3*K*, 2*K* and *K*. They are arranged as shown in fig. Given below, with their ends at 100°*C*, 50°*C* and 20°*C*. The temperature of their junction is

(a) $60^o\ C$
(b) $70^o\ C$
(c) 50° *C*
(d) 35° *C*



13. Two identical conducting rods are first connected independently to two vessels, one containing water at 100°*C* and the other containing ice at 0°*C*. In the second case, the rods are joined end to end and connected to the same vessels. Let q_1 and q_2 g / s be the rate of melting of ice in two cases respectively. The ratio of q_1/q_2 is

[IIT-JEE (Screening) 2004]

(a) $\frac{1}{2}$ (b) $\frac{2}{1}$

(c) $\frac{4}{1}$ (d) $\frac{1}{4}$

14. A solid cube and a solid sphere of the same material have equal surface area. Both are at the same temperature $120^o C$, then [MP PET 1992, 96; MP PMT 2000]

(a) Both the cube and the sphere cool down at the same rate
(b) The cube cools down faster than the sphere
(c) The sphere cools down faster than the cube
(d) Whichever is having more mass will cool down faster

15. Two bodies A and B have thermal emissivities of 0.01 and 0.81 respectively. The outer surface areas of the two bodies are the same. The two bodies emit total radiant power at the same rate. The wavelength λ_B corresponding to maximum spectral radiancy in the radiation from B is shifted from the wavelength corresponding to maximum spectral radiancy in the radiation from A, by $1.00\mu m$. If the temperature of A is $5802\ K$

(a) The temperature of B is $1934\ K$
(b) $\lambda_B = 1.5\mu m$
(c) The temperature of B is $11604\ K$
(d) The temperature of B is $2901\ K$

16. A black body is at a temperature of $2880\ K$. The energy of radiation emitted by this object with wavelength between $499\ nm$ and $500\ nm$ is U_1, between $999\ nm$ and $1000\ nm$ is U_2 and between $1499\ nm$ and $1500\ nm$ is U_3. The Wein's constant $b = 2.88\times10^6\ nm\,K$. Then

[IIT 1998]

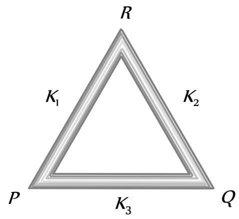
(a) $U_1 = 0$ (b) $U_3 = 0$
(c) $U_1 > U_2$ [IIT 1972; MP PMT 1993; (d) $U_2 > U_1$

17. A black metal foil is warmed by radiation from a small sphere at temperature T and at a distance d. It is found that the power received by the foil is *P*. If both the temperature and the distance are doubled, the power received by the foil will be

(a) 16*P* (b) 4*P*
[UPSEAT 2002]
(c) 2*P* (d) *P*

18. Three rods of same dimensions are arranged as shown in figure they have thermal conductivities K_1, K_2 and K_3 The points *P* and *Q* are maintained at different temperatures for the heat to flow at the same rate along *PRQ* and *PQ* then which of the following option is correct [KCET 2001]

(a) $K_3 = \frac{1}{2}(K_1 + K_2)$
(b) $K_3 = K_1 + K_2$
(c) $K_3 = \frac{K_1K_2}{K_1 + K_2}$
(d) $K_3 = 2(K_1 + K_2)$



19. Two metallic spheres S_1 and S_2 are made of the same material and have identical surface finish. The mass of S_1 is three times that of S_2. Both the spheres are heated to the same high temperature and placed in the same room having lower temperature but are thermally insulated from each other. The ratio of the initial rate of cooling of S_1 to that of S_2 is [IIT 1995]

(a) $1/3$ (b) $(1/3)^{1/3}$

(c) $1/\sqrt{3}$ (d) $\sqrt{3}/1$

20. Three discs *A*, *B* and *C* having radii 2*m*, 4*m*, and 6*m* respectively are coated with carbon black on their other surfaces. The wavelengths corresponding to maximum intensity are 300 *nm*, 400 *nm* and 500 *nm*, respectively. The power radiated by them are Q_1, Q_2 and Q_3 respectively

[IIT-JEE (Screening) 2004]

(a) Q is maximum (b) Q is maximum

(c) Q is maximum (d) $Q = Q = Q$

21. The total energy radiated from a black body source is collected for one minute and is used to heat a quantity of water. The temperature of water is found to increase form $20^o C$ to $20.5^o C$. If the absolute temperature of the black body is doubled and the experiment is repeated with the same quantity of water at $20^o C$, the temperature of water will be [UPSEAT 2004]

(a) $21^o C$ (b) $22^o C$

(c) $24^o C$ (d) $28^o C$

22. A solid sphere and a hollow sphere of the same material and size are heated to the same temperature and allowed to cool in the same surroundings. If the temperature difference between each sphere and its surroundings is T, then

[Manipal MEE 1995]

(a) The hollow sphere will cool at a faster rate for all values of T

(b) The solid sphere will cool at a faster rate for all values of T

(c) Both spheres will cool at the same rate for all values of T

(d) Both spheres will cool at the same rate only for small values of T

23. A solid copper cube of edges $1\,cm$ is suspended in an evacuated enclosure. Its temperature is found to fall from $100^o C$ to $99^o C$ in $100\,s$. Another solid copper cube of edges $2\,cm$, with similar surface nature, is suspended in a similar manner. The time required for this cube to cool from $100^o C$ to $99^o C$ will be approximately [MP PMT 1997]

(a) $25\,s$ (b) $50\,s$

(c) $200\,s$ (d) $400\,s$

24. A body initially at $80^\circ C$ cools to $64^\circ C$ in 5 *minutes* and to $52^\circ C$ in 10 *minutes*. The temperature of the body after 15 *minutes* will be [UPSEAT 2000; Pb. PET 2004]

(a) $42.7^\circ C$ (b) $35^\circ C$

(c) $47^\circ C$ (d) $40^\circ C$

25. A 5*cm* thick ice block is there on the surface of water in a lake. The temperature of air is –10°*C*; how much time it will take to double the thickness of the block

(L = 80 *cal/g*, K = 0.004 *Erg/s-k*, d = 0.92 *g cm*$^{-3}$)

[RPET 1998]

(a) 1 *hour* (b) 191 *hours*

(c) 19.1 *hours* (d) 1.91 *hours*

26. Four identical rods of same material are joined end to end to form a square. If the temperature difference between the ends of a diagonal is $100^o C$, then the temperature difference between the ends of other diagonal will be

[MP PET 1989; RPMT 2002]

(a) $0^o C$

(b) $\frac{100}{l}\,^o C$; where l is the length of each rod

(c) $\frac{100}{2l}\,^o C$

(d) $100^o C$

27. A cylindrical rod with one end in a steam chamber and the other end in ice results in melting of 0.1*gm* of ice per second. If the rod is replaced by another with half the length and double the radius of the first and if the thermal conductivity of material of second rod is $\frac{1}{4}$ that of first, the rate at which ice melts in $gm/\sec$ will be [EAMCET 1987]

(a) 3.2 (b) 1.6

(c) 0.2 (d) 0.1

28. One end of a copper rod of length $1.0\,m$ and area of cross-section 10^{-3} is immersed in boiling water and the other end in ice. If the coefficient of thermal conductivity of copper is $92\,cal/m\text{-}s\text{-}^oC$ and the latent heat of ice is $8 \times 10^4\,cal/kg$, then the amount of ice which will melt in one minute is

[MNR 1994]

(a) $9.2 \times 10^{-3}\,kg$ (b) $8 \times 10^{-3}\,kg$

(c) $6.9 \times 10^{-3}\,kg$ (d) $5.4 \times 10^{-3}\,kg$

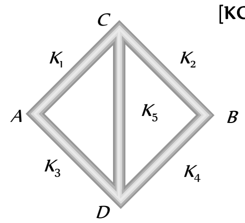
29. An ice box used for keeping eatable cold has a total wall area of $1\,metre^2$ and a wall thickness of $5.0\,cm$. The thermal conductivity of the ice box is $K = 0.01\,joule/metre-^oC$. It is filled with ice at $0^o C$ along with eatables on a day when the temperature is 30°*C*. The latent heat of fusion of ice is $334 \times 10^3\,joules/kg$. The amount of ice melted in one day is ($1\,day = 86{,}400\,seconds$) [MP PMT 1995]

(a) $776\,gms$ (b) $7760\,gms$

(c) $11520\,gms$ (d) $1552\,gms$

30. Five rods of same dimensions are arranged as shown in the figure. They have thermal conductivities K, K, K, K and K. When points A and B are maintained at different temperatures, no heat flows through the central rod if

[KCET 2002]



(a) $K_1 = K_4$ and $K_2 = K_3$

(b) $K_1 K_4 = K_2 K_3$

(c) $K_1 K_2 = K_3 K_4$

(d) $\frac{K_1}{K_4} = \frac{K_2}{K_3}$

31. A hot metallic sphere of radius r radiates heat. It's rate of cooling is

(a) Independent of r (b) Proportional to r

(c) Proportional to r^2 (d) Proportional to $1/r$

32. A solid copper sphere (density ρ and specific heat capacity c) of radius r at an initial temperature 200*K* is suspended inside a chamber whose walls are at almost 0*K*. The time required (in μ s) for the temperature of the sphere to drop to 100 *K* is

(a) $\frac{72}{7}\frac{r\rho c}{\sigma}$ (b) $\frac{7}{72}\frac{r\rho c}{\sigma}$

(c) $\frac{27}{7}\frac{r\rho c}{\sigma}$ (d) $\frac{7}{27}\frac{r\rho c}{\sigma}$

33. One end of a copper rod of uniform cross-section and of length 3.1 *m* is kept in contact with ice and the other end with water at 100°*C*. At what point along it's length should a temperature of 200°*C* be maintained so that in steady state, the mass of ice melting be equal to that of the steam produced in the same interval of time. Assume that the whole system is insulated from the surroundings. Latent heat of fusion of ice and vaporisation of water are 80 *cal/gm* and 540 *cal/gm* respectively

(a) 40 cm from 100°C end (b) 40 cm from 0°C end

(c) 125 cm from 100°C end (d) 125 cm from 0°C end

34. A sphere and a cube of same material and same volume are heated upto same temperature and allowed to cool in the same surroundings. The ratio of the amounts of radiations emitted will be

(a) 1 : 1 (b) $\frac{4\pi}{3} : 1$

(c) $\left(\frac{\pi}{6}\right)^{1/3} : 1$ (d) $\frac{1}{2}\left(\frac{4\pi}{3}\right)^{2/3} : 1$

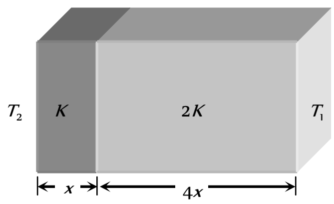
35. The temperature of the two outer surfaces of a composite slab, consisting of two materials having coefficients of thermal conductivity K and $2K$ and thickness x and $4x$, respectively are T_2 and T_1 ($T_2 > T_1$). The rate of heat transfer through the slab, in a steady state is $\left(\frac{A(T_2 - T_1)K}{x}\right)f$, with f which equal to**[AIEEE 2004]**

(a) 1

(b) $\frac{1}{2}$

(c) $\frac{2}{3}$

(d) $\frac{1}{3}$



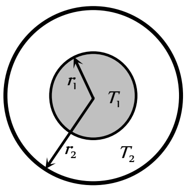
36. The figure shows a system of two concentric spheres of radii r_1 and r_2 and kept at temperatures T_1 and T_2 respectively. The radial rate of flow of heat in a substance between the two concentric spheres is proportional to **[AIEEE 2005]**

(a) $\frac{r_1 r_2}{(r_1 - r_2)}$

(b) $(r_2 - r_1)$

(c) $(r_2 - r_1)(r_1 r_2)$

(d) $\ln\left(\frac{r_2}{r_1}\right)$



37. Four rods of identical cross-sectional area and made from the same metal form the sides of square. The temperature of two diagonally opposite points and T and $\sqrt{2}\ T$ respective in the steady state. Assuming that only heat conduction takes place, what will be the temperature difference between other two points

(a) $\frac{\sqrt{2}+1}{2}T$ (b) $\frac{2}{\sqrt{2}+1}T$

(c) 0 (d) None of these

Graphical Questions

1. The graph. Shown in the adjacent diagram, represents the variation of temperature (T) of two bodies, x and y having same surface area, with time (t) due to the emission of radiation. Find the correct relation between the emissivity (e) and absorptivity (a) of the two bodies

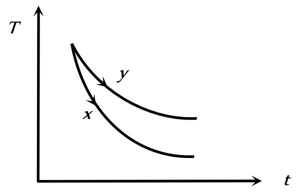
[IIT-JEE (Screening) 2003]

(a) $e_x > e_y$ & $a_x < a_y$

(b) $e_x < e_y$ & $a_x > a_y$

(c) $e_x > e_y$ & $a_x > a_y$

(d) $e_x < e_y$ & $a_x < a_y$



2. The plots of intensity versus wavelength for three black bodies at temperatures T_1, T_2 and T_3 respectively are as shown. Their temperature are such that

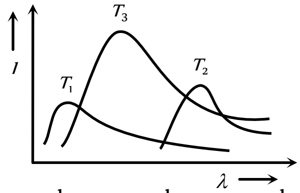
[IIT-JEE (Screening) 2000]

(a) $T_1 > T_2 > T_3$

(b) $T_1 > T_3 > T_2$

(c) $T_2 > T_3 > T_1$

(d) $T_3 > T_2 > T_1$



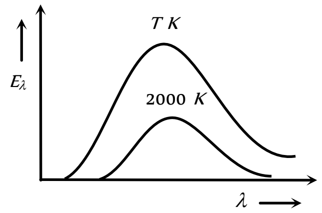
3. The adjoining diagram shows the spectral energy density distribution E_λ of a black body at two different temperatures. If the areas under the curves are in the ratio 16 : 1, the value of temperature T is **[DCE 1999]**

(a) 32,000 K

(b) 16,000 K

(c) 8,000 K

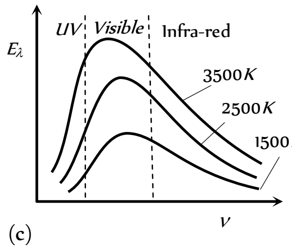
(d) 4,000 K



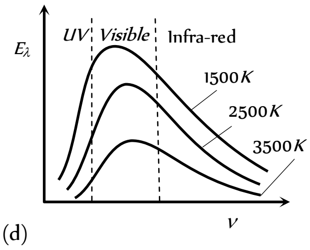
[BCECE 2005]

4. Following graph shows the correct variation in intensity of heat radiations by black body and frequency at a fixed temperature

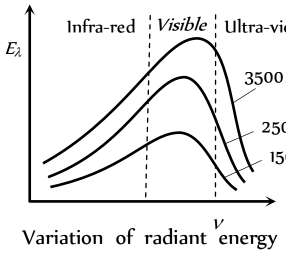
(a)



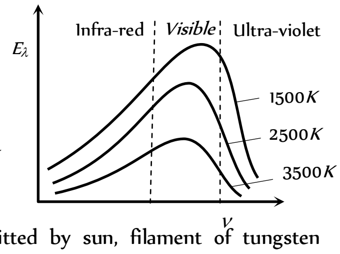
(b)



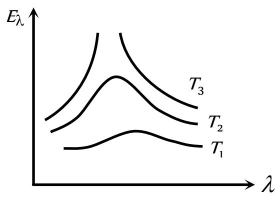
(c)



(d)



5. Variation of radiant energy emitted by sun, filament of tungsten lamp and welding arc as a function of its wavelength is shown in figure. Which of the following option is the correct match



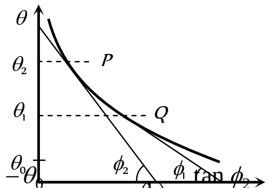
(a) Sun- T_1, tungsten filament $-T_2$, welding arc $-T_3$

(b) Sun $-T_2$, tungsten filament $-T_1$, welding arc $-T_3$

(c) Sun $-T_3$, tungsten filament $-T_2$, welding arc $-T_1$

(d) Sun $-T_1$, tungsten filament $-T_3$, welding arc $-T_2$

6. A body cools in a surrounding which is at a constant temperature of θ_0. Assume that it obeys Newton's law of cooling. Its temperature θ is plotted against time *t*. Tangents are drawn to the curve at the points $P(\theta=\theta_1)$ and $Q(\theta=\theta_2)$. These tangents meet the time axis at angles of ϕ_2 and ϕ_1, as shown

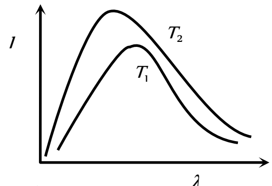


(a) $\frac{\tan\phi_2}{\tan\phi_1}=\frac{\theta_1-\theta_0}{\theta_2-\theta_0}$ (b) $\frac{\tan\phi_2}{\tan\phi_1}=\frac{\theta_2-\theta_0}{\theta_1-\theta_0}$

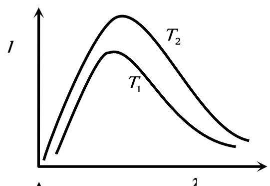
(c) $\frac{\tan\phi_1}{\tan\phi_2}=\frac{\theta_1}{\theta_2}$ (d) $\frac{\tan\phi_1}{\tan\phi_2}=\frac{\theta_2}{\theta_1}$

7. Shown below are the black body radiation curves at temperatures T_1 and T_2 ($T_2>T_1$). Which of the following plots is correct

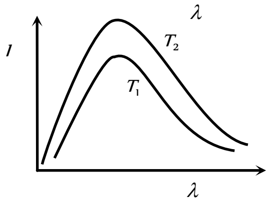
(a)



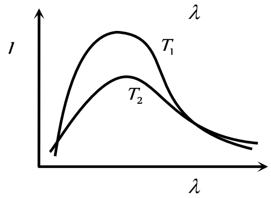
(b)



(c)



(d)



[IIT-JEE (Screening) 2005]

8. The spectrum of a black body at two temperatures 27°C and 327°C is shown in the figure. Let A_1 and A_2 be the areas under the two curves respectively. The value of $\frac{A_2}{A_1}$ is

(a) 1 : 16

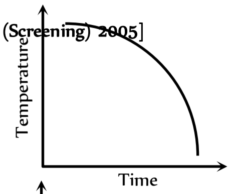
(b) 4 : 1

(c) 2 : 1

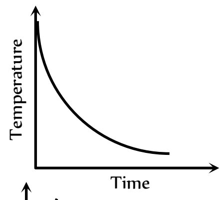
(d) 16 : 1

9. A block of metal is heated to a temperature much higher than the room temperature and allowed to cool in a room free from air currents. Which of the following curves correctly represents the rate of cooling [Manipal MEE 1995]

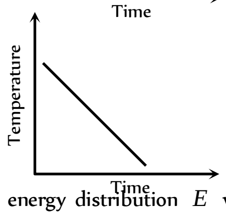
(a)



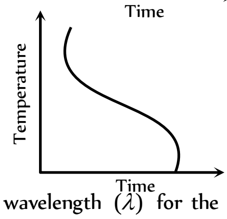
(b)



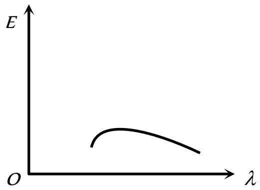
(c)



(d)



10. The energy distribution E with the wavelength (λ) for the black body radiation at temperature T *Kelvin* is shown in the figure. As the temperature is increased the maxima will



(a) Shift towards left and become higher

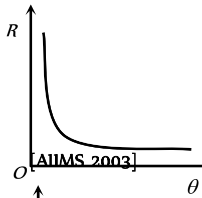
(b) Rise high but will not shift

(c) Shift towards right and become higher

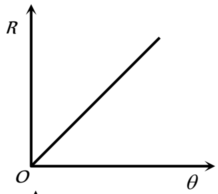
(d) Shift towards left and the curve will become broader

11. For a small temperature difference between the body and the surroundings the relation between the rate of loss heat R and the temperature of the body is depicted by [AIIMS 2003]

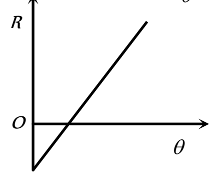
(a)



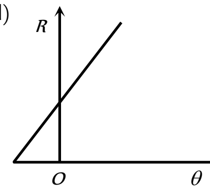
(b)



(c)

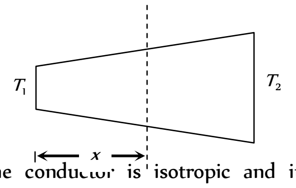


(d)



12. Heat is flowing through a conductor of length l from $x = 0$ to $x = l$. If its thermal resistance per unit length is uniform, which of the following graphs is correct

(a) 
(b) 
(c) 
(d) 
13. Radius of a conductor increases uniformly from left end to right end as shown in fig.

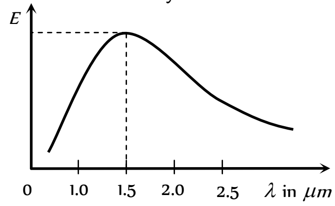


Material of the conductor is isotropic and its curved surface is thermally isolated from surrounding. Its ends are maintained at temperatures T_1 and T_2 ($T_1 > T_2$): If, in steady state, heat flow rate is equal to H, then which of the following graphs is correct

(a) 
(b) 
(c) 
(d) 
14. Which of the following graphs correctly represents the relation between ln E and ln T where E is the amount of radiation emitted per unit time from unit area of a body and T is the absolute temperature **[DCE 2002]**

(a) 
(b) 
(c) 
(d) 
15. A hollow copper sphere S and a hollow copper cube C, both of negligible thin walls of same area, are filled with water at 90°C and allowed to cool in the same environment. The graph that correctly represents their cooling is

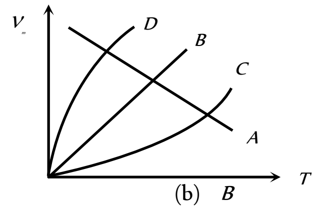
(a) 
(b) 
(c) 
(d) 
16. In the figure, the distribution of energy density of the radiation emitted by a black body at a given temperature is shown. The possible temperature of the black body is



(a) 1500 K (b) 2000 K

(c) 2500 K (d) 3000 K

17. Which of the following is the $\nu_m = T$ graph for a perfectly black body (ν_m =maximum frequency of radiation) **[RPMT 1996]**



(a) A (b) B

(c) C (d) D

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) *If both assertion and reason are true and the reason is the correct explanation of the assertion.*
(b) *If both assertion and reason are true but reason is not the correct explanation of the assertion.*
(c) *If assertion is true but reason is false.*
(d) *If the assertion and reason both are false.*
(e) *If assertion is false but reason is true.*

1. Assertion : A body that is a good radiator is also a good absorber of radiation at a given wavelength.
Reason : According to Kirchoff's law the absorptivity of a body is equal to its emissivity at a given wavelength. [AIIMS 2005]

2. Assertion : For higher temperature, the peak emission wavelength of a black body shifts to lower wavelengths.
Reason : Peak emission wavelength of a blackbody is proportional to the fourth power of temperature. [AIIMS 2005]

3. Assertion : Temperatures near the sea coast are moderate.
Reason : Water has a high thermal conductivity. [AIIMS 2003]

4. Assertion : It is hotter over the top of a fire than at the same distance on the sides.
Reason : Air surrounding the fire conducts more heat upwards. [AIIMS 2003]

5. Assertion : Bodies radiate heat at all temperatures.
Reason : Rate of radiation of heat is proportional to the fourth power of absolute temperature. [AIIMS 1999, 2002]

6. Assertion : Woolen clothes keep the body warm in winter.
Reason : Air is a bad conductor of heat. [AIIMS 2002]

7. Assertion : The equivalent thermal conductivity of two plates of same thickness in contact (series) is less than the smaller value of thermal conductivity.
Reason : For two plates of equal thickness in contact (series) the equivalent thermal conductivity is given by [AIIMS 1997]

$$\frac{1}{K}=\frac{1}{K_1}+\frac{1}{K_2}$$

8. Assertion : A hollow metallic closed container maintained at a uniform temperature can act as a source of black body radiation.
Reason : All metals acts as a black body [AIIMS 1996]

9. Assertion : If the temperature of a star is doubled then the rate of loss of heat from it becomes 16 times.
Reason : Specific heat varies with temperature. [AIIMS 1996]

10. Assertion : The radiation from the sun's surface varies as the fourth power of its absolute temperature.
Reason : The sun is not a black body. [AIIMS 1999]

11. Assertion : Blue star is at high temperature than red star.
Reason : Wein's displacement law states that $T\propto(1/\lambda_m)$. [AIIMS 2002]

12. Assertion : The S.I. unit of thermal conductivity is watt $m^{-1}\ K^{-1}$.
Reason : Thermal conductivity is a measure of ability of the material to allow the passage of heat through it.

13. Assertion : A brass tumbler feels much colder than a wooden tray on a chilly day.
Reason : The thermal conductivity of brass is less than that of wood.

14. Assertion : Like light radiations, thermal radiations are also electromagnetic radiation.
Reason : The thermal radiations require no medium for propagation.

15. Assertion : Snow is better insulator than ice.
Reason : Snow contain air packet and air is good insulator of heat.

16. Assertion : Water can be boiled inside satellite by convection.
Reason : Convection is the process in which heat is transmitted from a place of higher temperature to a place of lower temperature by means of particles with their migrations from one place to another.

17. Assertion : The absorbance of a perfect black body is unity.
Reason : A perfect black body when heated emits radiations of all possible wavelengths at that temperature.

18. Assertion : A man would feel iron or wooden balls equally hot at $98.4°F$.
Reason : At $98.4°F$ both iron and wood have same thermal conductivity.

19. Assertion : As temperature of a black body is raised, wavelength corresponding to maximum energy reduces.
Reason : Higher temperature would mean higher energy and hence higher wavelength.

20. Assertion : All black coloured objects are considered black bodies.
Reason : Black colour is a good absorber of heat.

21. Assertion : Greater is the coefficient of thermal conductivity of a material, smaller is the thermal resistance of a rod of that material.
Reason : Thermal resistance is the ratio of temperature difference between the ends of the conductor and rate of flow of heat.

22. Assertion : Radiation is the speediest mode of heat transfer.
Reason : Radiation can be transmitted in zig-zag motion.

23. Assertion : Two thin blankets put together are warmer than a single blanket of double the thickness.

Reason : Thickness increases because of air layer enclosed between the two blankets.

24. Assertion : Animals curl into a ball, when they feel very cold.

Reason : Animals by curling their body reduces the surface area.

Answers and Solutions

Conduction

1. (a) Cu is better conductor than Al and Ag is better conductor than Cu. Hence conductivity in increasing order is $Al < Cu < Ag$.

2. (d) $\frac{Q}{t} = \frac{KA\,\Delta\theta}{l} \Rightarrow \frac{Q}{t} \propto \frac{A}{l} \propto \frac{r^2}{l}$

$\because \frac{r^2}{l}$ is maximum in option (d), hence it will conduct more heat.

3. (d) $\frac{Q}{t} = \frac{KA\,\Delta\theta}{l} \Rightarrow \frac{Q}{t} \propto \frac{A}{l} \propto \frac{d^2}{l}$ (d = Diameter of rod)

$\Rightarrow \frac{(Q/t)_1}{(Q/t)_2} = \left(\frac{d_1}{d_2}\right)^2 \times \frac{l_2}{l_1} = \left(\frac{1}{2}\right)^2 \times \left(\frac{1}{2}\right) = \frac{1}{8}$

4. (a) $\frac{Q}{t} = \frac{KA\,\Delta\theta}{l} = \frac{\Delta\theta}{(l/KA)} = \frac{\Delta\theta}{R}$ (R = Thermal resistance)

$\Rightarrow t \propto R$ ($\because$ Q and $\Delta\theta$ are same)

$\Rightarrow \frac{t_P}{t_S} = \frac{R_P}{R_S} = \frac{R/2}{2R} = \frac{1}{4} \Rightarrow t_P = \frac{t_S}{4} = \frac{4}{4} = 1\text{ min}$.

(Series resistance $R_S = R_1 + R_2$ and parallel resistance $R_P = \frac{R_1 R_2}{R_1 + R_2}$)

5. (d) For cooking utensils, low specific heat is preferred for it's material as it should need less heat to raise it's temperature and it should have high conductivity, because, it should transfer heat quickly.

6. (d) In steady state there is no absorption of heat in any position. Heat passes on or is radiated from it's surface. Therefore, in steady state the temperature of the body does not change with time but can be different at different points of the body.

7. (d) It is the property of material.

8. (d) Because steady state has been reached.

9. (c) $\frac{Q_1}{t} = \frac{KA(90-60)}{0.6} = 50\,KA$

and $\frac{Q_2}{t} = \frac{KA(150-110)}{0.8} = 50\,KA$

10. (d) Given $A_1 = A_2$ and $\frac{K_1}{K_2} = \frac{5}{4}$

$\because R_1 = R_2 \Rightarrow \frac{l_1}{K_1 A} = \frac{l_2}{K_2 A} \Rightarrow \frac{l_1}{l_2} = \frac{K_1}{K_2} = \frac{5}{4}$.

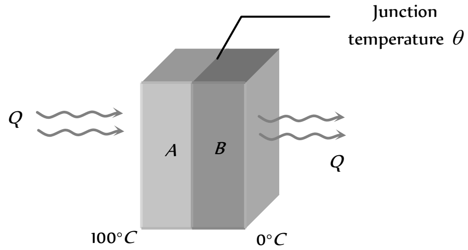
11. (c) $\frac{\Delta Q}{\Delta t} = \frac{KA\,\Delta\theta}{\Delta x} \Rightarrow$ Thermal gradient $\frac{\Delta\theta}{\Delta x}$

$= \frac{(\Delta Q/\Delta t)}{KA} = \frac{10}{0.4} = 25°C/cm$

12. (a) It is given that $\frac{K_1}{K_2} = \frac{1}{3} \Rightarrow K_1 = K$ then $K_2 = 3K$

the temperature of the junction in contact

$\theta = \frac{K_1\theta_1 + K_2\theta_2}{K_1 + K_2} = \frac{1\times 100 + 3\times 0}{1+3} = \frac{100}{4} = 25°C$



13. (a) $Q = \frac{KA(\theta_1 - \theta_2)t}{l}$; in both the cases, A, l and $(\theta_1 - \theta_2)$ are same so Kt = constant $\Rightarrow \frac{K_1}{K_2} = \frac{t_1}{t_2} = \frac{30}{20} = \frac{3}{2} = 1.5$.

14. (b) $\left(\frac{Q}{t}\right)_1 = \frac{K_1A_1(\theta_1-\theta_2)}{l}$ and $\left(\frac{Q}{t}\right)_2 = \frac{K_2A_2(\theta_1-\theta_2)}{l}$

given $\left(\frac{Q}{t}\right)_1 = \left(\frac{Q}{t}\right)_2 \Rightarrow K_1A_1 = K_2A_2$

15. (d) In variable state $\frac{Q}{t} \propto K$ and $\frac{Q}{t} \propto \frac{1}{\rho c} \Rightarrow \frac{Q}{t} \propto \frac{K}{\rho c}$

(K = thermal conductivity, ρ = density, c = specific heat)

16. (b) $K_1 : K_2 = l_1^2 : l_2^2 \Rightarrow \frac{l_1}{l_2} = \sqrt{\frac{K_1}{K_2}} = \sqrt{\frac{10}{9}} = \frac{\sqrt{10}}{3}$

17. (c) $\frac{Q}{t} = \frac{KA(\Delta\theta)}{l} \Rightarrow 50 = \frac{5\times 20\ K}{0.4} \Rightarrow K = \frac{1}{5} = 0.2$

18. (c)

19. (a) Thermal resistance

$= \frac{l}{KA} = \left[\frac{L}{MLT^{-3}K^{-1}\times L^2}\right] = [M^{-1}L^{-2}T^3K]$

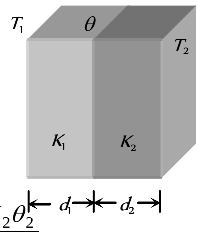
20. (a) When a piece of glass is heated, due to low thermal conductivity it does not conduct heat fast. Hence unequal expansion of it's layers crack the glass.

21. (a) In series both walls have same rate of heat flow. Therefore

$\frac{dQ}{dt} = \frac{K_1A(T_1-\theta)}{d_1} = \frac{K_2A(\theta-T_2)}{d_2}$

$\Rightarrow K_1d_2(T_1-\theta) = K_2d_1(\theta-T_2)$

$\Rightarrow \theta = \frac{K_1d_2T_1+K_2d_1T_2}{K_1d_2+K_2d_1}$



22. (a) Temperature of interface $\theta = \frac{K_1\theta_1+K_2\theta_2}{K_1+K_2}$

$(\because \frac{K_1}{K_2} = \frac{1}{4} \Rightarrow$ If $K_1 = K$ then $K_2 = 4K)$

$\Rightarrow \theta = \frac{K\times 0+4K\times 100}{5K} = 80°C$

23. (b) $\frac{\theta_1-\theta_2}{l} = 80 \Rightarrow \frac{30-\theta_2}{0.5} = 80 \Rightarrow \theta_2 = -10^oC$

24. (d) $\frac{dQ}{dt} = -KA\frac{d\theta}{dx}$; when $K = \infty$, $\frac{d\theta}{dx} = 0$

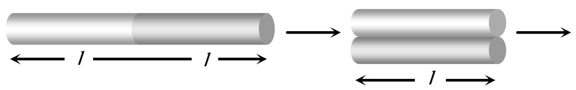
i.e. θ is independent of x *i.e.* constant or uniform.

25. (a) Air is poor conductor of heat.

26. (b)

27. (b)

28. (d) Let the heat transferred be Q.



When rods are joined end to end. Heat transferred by each rod $= Q = \frac{KA\Delta\theta}{l}\times 12$ .....(i)

When rods are joined lengthwise, $Q = \frac{KA\Delta\theta}{2l}t$ .....(ii)

From equation (i) and (ii) we get $t = 48\ s$

29. (d) $\frac{Q}{t} = \frac{KA\Delta\theta}{l} \Rightarrow \frac{K_A}{K_B} = \frac{A_B}{A_A} = \left(\frac{r_B}{r_B}\right)^2 = \frac{1}{4} \Rightarrow K_A = \frac{K_B}{4}$

30. (b) Thermal conductivity of composite plate

$K_{eq} = \frac{2K_1K_2}{K_1+K_2} = \frac{2\times 2\times 3}{2+3} = \frac{12}{5} = 2.4$

31. (b) $Q \propto \frac{A}{l} \propto \frac{r^2}{l} \Rightarrow \frac{Q_2}{Q_1} = \frac{r_2^2}{r_1^2}\times\frac{l_1}{l_2}$

$\Rightarrow \frac{Q_2}{Q_1} = \frac{4}{1}\times\frac{1}{2} \Rightarrow Q_2 = 2Q_1$

32. (c) $\frac{Q}{At} = K\frac{\Delta\theta}{l} \Rightarrow K\frac{\Delta\theta}{l}$ = constant $\Rightarrow \frac{\Delta\theta}{l} \propto \frac{1}{K}$

Hence If $K_c > K_m > K_g$, then

$\left(\frac{\Delta\theta}{l}\right)_c < \left(\frac{\Delta\theta}{l}\right)_m < \left(\frac{\Delta\theta}{l}\right)_g \Rightarrow X_c < X_m < X_g$

because higher K implies lower value of the temperature gradient.

33. (b) In series $R_{eq} = R_1 + R_2 \Rightarrow \frac{2l}{K_{eq}A} = \frac{l}{K_1A} + \frac{l}{K_2A}$

$\Rightarrow \frac{2}{K_{eq}} = \frac{1}{K_1} + \frac{1}{K_2} \Rightarrow K_{eq} = \frac{2K_1K_2}{K_1+K_2}$

34. (b) $\frac{dQ}{dt} = KA\frac{d\theta}{dl} \Rightarrow \frac{dQ}{dt} \propto \frac{d\theta}{dl}$ (Temperature gradient)

35. (a) $\frac{dQ}{dt} = \frac{K(\pi r^2)d\theta}{dl} \Rightarrow \frac{\left(\frac{dQ}{dt}\right)_s}{\left(\frac{dQ}{dt}\right)_l} = \frac{K_s\times r_s^2\times l_l}{K_l\times r_l^2\times l_s} = \frac{1}{2}\times\frac{1}{4}\times\frac{2}{1}$

$\Rightarrow \left(\frac{dQ}{dt}\right)_s = \frac{\left(\frac{dQ}{dt}\right)_l}{4} = \frac{4}{4} = 1$

36. (d) $Q = \frac{KA(\Delta\theta)t}{l}$

$\because$ Q and $\Delta\theta$ are same for both spheres hence

$K \propto \frac{l}{At} \propto \frac{l}{r^2t} \Rightarrow \frac{K_{\text{larger}}}{K_{\text{smaller}}} = \frac{l_l}{l_s}\times\left(\frac{r_s}{r_l}\right)^2\times\frac{t_s}{t_l}$. It is given that $r_l = 2r_s$, $l_l = \frac{1}{4}l_s$ and $t_1 = 25$ *min*, $t_s = 16$ *min.*

$\Rightarrow \frac{K_{\text{larger}}}{K_{\text{smaller}}} = \left(\frac{1}{4}\right)\left(\frac{1}{2}\right)^2\times\frac{16}{25} = \frac{1}{25}$

37. (d) $\frac{Q}{t} = \frac{KA(\Delta\theta)}{l} \Rightarrow \frac{Q}{t} \propto \frac{A}{l} \propto \frac{r^2}{l}$

$\Rightarrow \frac{(Q/t)_1}{(Q/t)_2} = \left(\frac{r_1}{r_2}\right)^2\times\frac{l_2}{l_1} = \left(\frac{2}{1}\right)^2\times\left(\frac{4}{1}\right) = \frac{16}{1}$

38. (b) Temperature of interface $\theta = \frac{K_1\theta_1+K_2\theta_2}{K_1+K_2}$

where $K_1 = 2K$ and $K_2 = 3K$ $\left(\because \frac{K_1}{K_2} = \frac{2}{3}\right)$

$\Rightarrow \theta = \frac{2K\times 100+3K\times 0}{2K+3K} = \frac{200K}{5K} = 40°C$

39. (a) $\frac{K_1}{K_2} = \frac{l_1^2}{l_2^2}$ $\therefore K_2 = \frac{K_1 l_2^2}{l_1^2} = \frac{0.92 \times (4.2)^2}{(8.4)^2} = 0.23$

40. (c) Mud is bad conductor of heat. So it prevents the flow of heat between surroundings and inside.

41. (b) Temperature gradient $= \frac{100-20}{20} = 4°C/cm$

temperature at centre $= 100 - 4 \times 10 = 60°C$

42. (c) Temperature of interface

$$\theta = \frac{K_1\theta_1 l_2 + K_2\theta_2 l_1}{K_1 l_2 + K_2 l_1} = \frac{K \times 0 \times 2 + 3K \times 100 \times 1}{K \times 2 + 3K \times 1}$$

$$= \frac{300K}{5K} = 60°C$$

43. (c) $\Delta\theta = \frac{Q \times l}{KAt} = \frac{4000 \times 0.1}{400 \times 10^{-2}} = 100^o C$

44. (b) Heat passes quickly from the body into the metal which leads to a cold feeling.

45. (c) Heat energy always flow from higher temperature to lower temperature. Hence, temperature difference *w.r.t.* length (temperature gradient) is required to flow heat from one part of a solid to other part.

46. (a) When the temperature of an object is equal to that of human body, no heat is transferred from the object to body and vice versa, Therefore block of wood and block of metal feel equally cold and hot if they have same temperature as human body.

47. (c)

48. (b) Temperature of water just below the lower surface of ice layer is $0°C$.

49. (b) $\frac{Q}{t} = \frac{KA(\theta_1 - \theta_2)}{l} = \frac{100 \times 100 \times 10^{-4}(100-0)}{1}$

$$\Rightarrow \frac{Q}{t} = 100\ Joule/sec = 6 \times 10^3\ Joule/min$$

50. (a) Temperature of interface $\theta = \frac{K_1\theta_1 l_2 + K_2\theta_2 l_1}{K_1 l_2 + K_2 l_1}$

It is given that $K_{Cu} = 9K_S$. So if $K_S = K_1 = K$ then

$K_{Cu} = K_2 = 9K$

$$\Rightarrow \theta = \frac{9K \times 100 \times 6 + K \times 0 \times 18}{9K \times 6 + K \times 18} = \frac{5400K}{72K} = 75°C$$

51. (c) $\frac{Q}{t} = \frac{KA(\theta_1 - \theta_2)}{l} \Rightarrow \frac{Q}{t} \propto \frac{A}{l} \propto \frac{r^2}{l}$

[As $(\theta_1 - \theta_2)$ and K are constants]

$$\Rightarrow \frac{\left(\frac{Q}{t}\right)_1}{\left(\frac{Q}{t}\right)_2} = \frac{r_1^2}{r_2^2} \times \frac{l_2}{l_1} = \frac{4}{9} \times \frac{2}{1} = \frac{8}{9}$$

52. (b) In parallel combination equivalent conductivity

$$K = \frac{K_1A_1 + K_2A_2}{A_1 + A_2} = \frac{K_1 + K_2}{2} \text{ (As } A_1 = A_2\text{)}$$

53. (b) $Q = \frac{KA(\theta_1 - \theta_2)}{l} t \Rightarrow K_1 t_1 = K_2 t_2 \Rightarrow \frac{K_1}{K_2} = \frac{t_2}{t_1} = \frac{35}{20} = \frac{7}{4}$

(As Q, l, A and $(\theta_1 - \theta_2)$ are same)

54. (c) A lake cools from the surface down. Above $4°C$, the cooled water at the surface flows to the bottom because of it's greater density. But when the surface temperature drops below $4°C$ (here it is $2°C$), the water near the surface is less dense than the warmer water below. Hence the downward flow ceases, the water at the bottom remains at $4°C$ until nearly the entire lake, is frozen.

55. (a) Temperature gradient $\frac{d\theta}{dx} = \frac{(125-25)^o C}{50\ cm} = 2°C/cm$

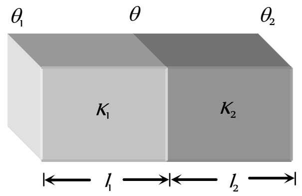
56. (a) $K \propto l^2 \Rightarrow \frac{K_1}{K_2} = \frac{l_1^2}{l_2^2} = \left(\frac{10}{25}\right)^2 = \frac{1}{6.25}$

57. (a) Thermal resistance of Cu is lesser than the thermal resistance of steel. Hence only in option (*a*) thermal resistance is minimum so heat current is maximum.

58. (c) At steady state, rate of heat flow for both blocks will be same

i.e., $\frac{K_1A(\theta_1 - \theta)}{l_1} = \frac{K_2A(\theta - \theta_2)}{l_2}$ (given $l_1 = l_2$)

$$\Rightarrow K_1A(\theta_1 - \theta) = K_2A(\theta - \theta_2) \Rightarrow \theta = \frac{K_1\theta_1 + K_2\theta_2}{K_1 + K_2}$$



59. (c) $K = \frac{2K_1K_2}{K_1 + K_2} = \frac{2.K.2K}{K + 2K} = \frac{4}{3}K$

60. (a) Temperature of interface $\theta = \frac{K_1\theta_1 + K_2\theta_2}{K_1 + K_2}$

It is given that $\frac{K_1}{K_2} = \frac{5}{3} \Rightarrow K_1 = 5K$ and $K_2 = 3K$

$$\theta = \frac{5K \times 100 + 3K \times 20}{5K + 3K} = \frac{560K}{8K} = 70°C$$

61. (c) In winter, the temperature of surrounding is low compared to the body temperature $(37.4^o C)$. Since woolen clothes are bad conductors of heat, so they keep the body warm.

62. (d) Temperature of interface $T = \frac{K_1\theta_1 + K_2\theta_2}{K_1 + K_2}$

$$= \frac{300 \times 100 + 200 \times 0}{300 + 200} = 60°C$$

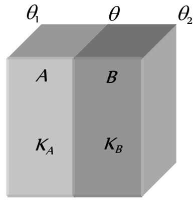
63. (b) Rate of heat flow $\left(\frac{Q}{t}\right) = \frac{k\pi r^2(\theta_1 - \theta_2)}{L} \propto \frac{r^2}{L}$

$$\therefore \frac{Q_1}{Q_2} = \left(\frac{r_1}{r_2}\right)^2\left(\frac{l_2}{l_1}\right) = \left(\frac{1}{2}\right)^2 \times \left(\frac{2}{1}\right) = \frac{1}{2} \Rightarrow Q_2 = 2Q_1$$

64. (b) $\frac{Q}{t} = \frac{KA\Delta\theta}{l} \Rightarrow 6000 = \frac{200 \times 0.75 \times \Delta\theta}{1}$

$$\therefore \Delta\theta = \frac{6000 \times 1}{200 \times 0.75} = 40°C$$

65. (b) In series rate of flow of heat is same



$\Rightarrow \dfrac{K_A A(\theta_1 - \theta)}{l} = \dfrac{K_B A(\theta - \theta_2)}{l}$

$\Rightarrow 3K_B(\theta_1 - \theta) = K_B(\theta - \theta_2)$

$\Rightarrow 3(\theta_1 - \theta) = (\theta - \theta_2)$

$\Rightarrow 3\theta_1 - 3\theta = \theta - \theta_2 \Rightarrow 4\theta_1 - 4\theta = \theta_1 - \theta_2$

$\Rightarrow 4(\theta_1 - \theta) = (\theta_1 - \theta_2)$

$\Rightarrow 4(\theta_1 - \theta) = 20 \Rightarrow (\theta_1 - \theta) = 5°C$

66. (c) Let θ be temperature middle point C and in series rate of heat flow is same $\Rightarrow K(2A)(100 - \theta) = KA(\theta - 70)$

$\Rightarrow 200 - 2\theta = \theta - 70 \Rightarrow 3\theta = 270 \Rightarrow \theta = 90°C$

67. (b) Thermal resistances are same

$\Rightarrow \dfrac{l_1}{K_1 A_1} = \dfrac{l_2}{K_2 A_2} \Rightarrow \dfrac{l_1}{K_1} = \dfrac{l_2}{K_2}$ $(\because A_1 = A_2)$

$\Rightarrow \dfrac{l_1}{l_2} = \dfrac{K_1}{K_2} = \dfrac{5}{3}$

68. (b) $\dfrac{Q}{t} \propto \dfrac{r^2}{l}$; from the given options, option (b) has higher value of $\dfrac{r^2}{l}$.

Convection

1. (c) Convection significantly transferring heat upwards (Gravity effect).

2. (a) Heat flows from hot air to cold body so person feels comfort.

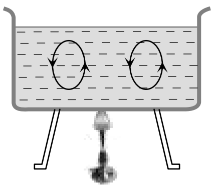
3. (c) No flow of heat by convection in vacuum.

4. (a)

5. (b) Density of hot air is lesser than the density of cold air so hot air rises up.

6. (a)

7. (c) In convection hot particles moves up ward (due to low density) and light particle moves downward (due to high density).



8. (b)

9. (a) Natural convection arises due to difference of density at two places and is a consequence of gravity.

10. (d)

11. (a) Convection is not possible in weightlessness. So the liquid will be heated through conduction.

12. (c) In forced convection rate of loss of heat $\dfrac{Q}{t} \propto A(T - T_0)$

13. (c)

Radiation (General, Kirchoff's law, Black body)

1. (b) Because of uneven surfaces of mountains, most of it's parts remain under shadow. So, most of the mountains. Land is not heated up by sun rays. Besides this, sun rays fall slanting on the mountains and are spread over a larger area. So, the heat received by the mountains top per unit area is less and they are less heated compared to planes (Foot).

2. (a) The velocity of heat radiation in vacuum is equal to that of light.

3. (c) Radiation is the fastest mode of heat transfer.

4. (d) A thermopile is a sensitive instrument, used for detection of heat radiation and measurement of their intensity.

5. (d) The polished surface reflects all the radiation.

6. (c) Heat radiations are electromagnetic waves of high wavelength.

7. (d) When element and surrounding have same temperature. There will be no temperature difference, hence heat will not flow from the filament and it's temperature remains constant.

8. (d) Every body at all time, at all temperatures emits radiation (except at $T = 0$). The radiation emitted by the human body is in the infra-red region.

9. (c)

10. (b) Infrared radiations are detected by pyrometer.

11. (b)

12. (a) In vacuum heat flows by the radiation mode only.

13. (c) Good absorbers are always good emitters of heat.

14. (a) A perfectly black body is a good absorber of radiations falls on it. So it's absorptive power is 1.

15. (d) According to Kirchoff's law in spectroscopy. If a substance emit certain wavelengths at high temperature, it absorbs the same wavelength at comparatively lower temperature.

16. (b) A person with dark skin absorbs more heat radiation and feels more heat. It also radiates more heat and feels more cold.

17. (a) For a black body emissivity = absorptive power.

18. (b) Highly polished mirror like surfaces are good reflectors, but not good radiators.

19. (b) Black cloth is a good absorber of heat, therefore ice covered by black cloth melts more as compared to that covered by white cloth.

20. (c) According to Kirchoff's law, the ratio of emissive power to absorptive power is same for all bodies is equal to the emissive power of a perfectly black body *i.e.,*

$\left(\dfrac{e}{a}\right)_{body} = E_{\text{Blackbody}}$ for a particular wave length

$\left(\dfrac{e_\lambda}{a_\lambda}\right)_{\text{body}} = (E_\lambda)_{\text{Blackbody}} \Rightarrow e_\lambda = a_\lambda E_\lambda$

21. (b) Absorption power $= \dfrac{\text{Heat absorbed}}{\text{Total heat given}}$

22. (c) Because Planck's law explains the distribution of energy correctly at low temperature as well as at high temperature.

23. (c)

24. (a) The black spot on heating absorbs radiations and so emits them in the dark room while the polished shining part reflects radiation and absorbs nothing and so does not emit radiations and becomes invisible in the dark.

25. (b)

26. (b) When the light emitted from the sun's photosphere passes through it's outer part Chromosphere, certain wave lengths are absorbed. In the spectrum of sunlight, a large number of dark lines are seen called Fraunhoffer lines.

27. (a) As for a black body rate of absorption of heat is more. Hence thermometer A shows faster rise in temperature but finally both will acquire the atmospheric temperature.

28. (c) According to Kirchoff's law, a good emitter is also a good absorber.

29. (a) Red and green colours are complementary to each other. When red glass is heated it absorbs green light strongly, hence according to Kirchoff's law, the emissive power of red glass should be maximum for green light. That's why when this heated red glass is taken in dark room it strongly emits green light and looks greenish.

30. (d) Black and rough surfaces are good absorber that's why they emit well. (Kirchoff's law).

31. (d)

32. (c) When light incident on pin hole, enters into the box and suffers successive reflection at the inner wall. At each reflection some energy is absorbed. Hence the ray once it enters the box can never come out and pin hole acts like a perfect black body.

33. (a) Initially black body absorbs all the radiant energy incident on it, So it is the darkest one. Black body radiates maximum energy if all other condition are same. So when the temperature of the black body becomes equal to the temperature of furnace it will be brightest of all.

34. (c) Open window behaves like a perfectly black body.

35. (a) Ordinary glass prism (crown, flint) absorbs the infrared radiation but rock salt prism transmit them. Hence it is used to obtain the spectrum of infrared radiation.

36. (d) A good absorber is a good emitter hence option (a) is wrong. Every body stops absorbing and emitting radiation at 0 K hence option (b) is wrong.

The energy of radiation emitted from a black body is not same for all wavelength hence option (c) is wrong.

Plank's law relates the wavelength (λ) and temperature (T) according to the relation $E_\lambda d_\lambda = \frac{8\pi hc}{\lambda^5}\frac{1}{[e^{hc/kT}-1]}d_\lambda$. Hence option (d) is correct.

37. (c) When blue glass is heated at high temperature, it absorbs all the radiation of, higher wavelength except blue. If it is taken inside a dark room, it emits all the radiation of higher wavelength, hence it looks brighter red as compared to the red piece.

38. (b)

Radiation (Wein's law)

1. (a)

2. (c) According to Wein's law, $\lambda_m T$ = constant

$\lambda_r > \lambda_y > \lambda_b \Rightarrow T_r < T_y < T_b$ or $T_A < T_C < T_B$

3. (d) $\lambda_m T$ =constant $\Rightarrow \frac{T_1}{T_2} = \frac{\lambda_2}{\lambda_1} \Rightarrow \frac{10^{-4}}{0.5\times10^{-5}}$ =200.

4. (c) $\lambda_m T$ = constant

5. (a) According to Wein's law $\lambda_m T$ = constant, on heating up to ordinary temperatures, only long wavelength (red) radiation is emitted. As the temperature rises, shorter wavelengths are also emitted in more and more quantity. Hence the colour of radiation emitted by the hot wire shifts from red to yellow, then to blue and finally to white.

6. (c) According to Wein's displacement law.

7. (d) $\lambda_{m_1}T_1 = \lambda_{m_2}T_2 \Rightarrow \lambda_{m_2} = \frac{\lambda_{m_1}T_1}{T_2} = 4.08\times\frac{700}{1400} = 2.04\,m$

8. (c) $\lambda_{m_1}T_1 = \lambda_{m_2}T_2 \Rightarrow \lambda_{m_2} = \frac{\lambda_{m_1}T_1}{T_2} = \frac{14\times200}{1000} = 2.8\ \mu m$

9. (c) $\frac{T_1}{T_2} = \frac{\lambda_{m_2}}{\lambda_{m_1}} = \frac{4800}{3600} \Rightarrow \frac{48}{36} = \frac{4}{3}$

10. (b) $\lambda_{m_2} = \frac{T_1}{T_2}\times\lambda_{m_1} = \frac{1500}{2500}\times5000 = 3000\text{Å}$

11. (a) At low temperature short wavelength radiation is emitted. As the temperature rise colour of emitted radiation are in the following order

Red→Yellow→Blue→White (at highest temperature)

12. (b) Similar to Q. 11

13. (b) The wavelength corresponding to maximum emission of radiation from the sun is $\lambda_{\max} = 4753\text{Å}$ (close to the wavelength of violet colour of visible region). Hence if temperature is doubled λ is decreased $\left(\lambda_m \propto \frac{1}{T}\right)$ *i.e.* mostly ultraviolet radiations emits.

14. (c) $\frac{T_1}{T_2} = \frac{\lambda_{m_2}}{\lambda_{m_1}} = \frac{5.5\times10^5}{11\times10^5} = \frac{1}{2} \Rightarrow n = \frac{1}{2}$.

15. (b) $\therefore T = \frac{b}{\lambda_m} = \frac{2.93\times10^{-3}}{2.93\times10^{-10}} = 10^7\ K$

16. (a) $\therefore \frac{\lambda_{m_2}}{\lambda_{m_1}} = \frac{T_1}{T_2} \Rightarrow \lambda_{m_2} = \frac{2000}{2400}\times4 = 3.33\ \mu m$

17. (b)

18. (a)

19. (b) $\lambda_{m_2} = \frac{T_1}{T_2}\times\lambda_{m_1} = \frac{2000}{3000}\times\lambda_{m_1} = \frac{2}{3}\lambda_{m_1} = \frac{2}{3}\lambda_m$

20. (a)

21. (c) $\frac{T_2}{T_1} = \frac{\lambda_{m_1}}{\lambda_{m_2}} = \frac{1.75}{14.35} \Rightarrow T_2 = \frac{1.75}{14.35}\times1640 = 200\ K$

22. (a) $\frac{\lambda_2}{\lambda_1} = \frac{T_1}{T_2} \Rightarrow \lambda_2 = \frac{T_1}{T_2}\times\lambda_1 = \frac{900}{1200}\times4 = 3\mu m$

23. (b) $\lambda_{m_2} = \frac{\lambda_{m_1}T_1}{T_2} = \frac{4800\times6000}{3000} = 9600\text{Å}$

24. (b) $\frac{T_1}{T_2} = \frac{\lambda_{m_2}}{\lambda_{m_1}} = \frac{4200}{140} = \frac{30}{1}$

25. (c) $\because \lambda_m T = \lambda'_m T' \Rightarrow \lambda_0 T = \lambda'\times2T \Rightarrow \lambda' = \frac{\lambda_0}{2}$

26. (b) $\lambda_m T = \lambda'_m T' \Rightarrow \frac{\lambda_m}{\lambda'_m} = \frac{T'}{T} = \frac{3000}{2000} = \frac{3}{2}$

27. (b) $\lambda_{m_1}T = \lambda_{m_2}T_2 \Rightarrow 5.5\times10^{-7}\times5500 = 11\times10^{-7}T$

$T = 550\times5K = 2750K$

28. (b) According to Wein's displacement law

$\lambda_m T = b$ or $\lambda_m = \frac{b}{T} = \frac{0.0029}{5\times10^4} = 58\times10^{-9}m = 58nm$

29. (a) $\lambda_m = \frac{b}{T} \Rightarrow T = \frac{b}{\lambda_m} = \frac{2.93\times10^{-3}}{4000\times10^{-10}} = 7325\ K$

30. (b) $\frac{T_S}{T_N} = \frac{(\lambda_N)_{\max}}{(\lambda_S)_{\max}} = \frac{350}{510} = 0.69$

Radiation (Stefan's law)

1. (c) $E \propto T^4$ (Stefan's law)

2. (c) Rate of heat loss $E = \sigma e A(T^4 - T_0^4)$

$= 5.67\times10^{-8}\times0.4\times200\times10^{-4}\times[(273+527)^4-(273+27)^4]$

$= 5.67\times10^{-8}\times0.4\times200\times10^{-4}\times(800)^4-(300)^4 = 182 J/sec$

3. (a) $\frac{E_1}{E_2} = \left(\frac{T_1}{T_2}\right)^4 \Rightarrow \frac{E}{E_2} = \left(\frac{273+0}{273+273}\right)^4 \Rightarrow E_2 = 16\ E.$

4. (a) $E \propto T^4 \Rightarrow \frac{E_1}{E_2} = \frac{T^4}{T^4}\times2^4 \Rightarrow E_2 = \frac{E}{16}$

5. (d) $\frac{E_2}{E_1} = \left(\frac{T_2}{T_1}\right)^4 \Rightarrow \frac{2}{1} = \left(\frac{420+273}{T}\right)^4 = \left(\frac{673}{T}\right)^4$

$\Rightarrow T = 2^{1/4}\times673 = 800K.$

6. (a) $\frac{E_2}{E_1} = \left(\frac{T_2}{T_1}\right)^4 = \left(\frac{273+727}{237+227}\right) = \frac{(1000)^4}{(500)^4} = 16 \Rightarrow E_2 = 80$

7. (c) $\frac{E_2}{E_1} = \left(\frac{T_2}{T_1}\right)^4 \Rightarrow T_2 = \left(\frac{E_2}{E_1}\right)^{1/4}\times T_1 = (16)^{1/4}\times(273+127)$

$\Rightarrow T = 800\ K = 527^oC$

8. (b) In M.K.S. system unit of σ is $\frac{J}{m^2\times sec\times K^4}$

$\Rightarrow 1\frac{J}{m^2\times sec\times K^4} = \frac{10^7 erg}{10^4 cm^2\times sec\times K^4}$

$= 10^3\frac{erg}{cm^2\times sec\times K^4}$

9. (b) For a block body rate of energy $\frac{Q}{t} = P = A\sigma T^4$

$\Rightarrow P \propto T^4 \Rightarrow \frac{P_1}{P_2} = \left(\frac{T_1}{T_2}\right)^4 = \left\{\frac{(273+7)}{(273+287)}\right\}^4 = \frac{1}{16}$

10. (b) $E_2 = E_1\frac{T_2^4}{T_1^4} = Q\times\frac{(273+151)^4}{(273+27)^4} = \left(\frac{424}{300}\right)^4 = 3.99Q \approx 4Q$

11. (b) $\frac{E_1}{E_2} = \left(\frac{T_1}{T_2}\right)^4 = \left(\frac{727+273}{127+273}\right)^4 = \frac{(1000)^4}{(400)^4} = \frac{10^4}{4^4} = \frac{625}{16}$

12. (c) $E = \sigma T^4 \Rightarrow 5.6\times10^{-8}\times T^4 = 1$

$\Rightarrow T = \left[\frac{1}{5.6\times10^{-8}}\right]^{1/4} = 65\ K$

13. (c) According to Stefen's law $E = \sigma\varepsilon AT^4$

$\Rightarrow \frac{1.58\times10^5\times4.2}{60\times60} = 5.6\times10^{-8}\times10^{-4}\times0.8\times T^4$

$T \approx 2500\,K$

14. (c) Total energy radiated from a body $Q = A\varepsilon\sigma T^4 t$

$\Rightarrow Q \propto AT^4 \propto r^2T^4$ $(\because\ A = 4\pi r^2)$

$\Rightarrow \frac{Q_P}{Q_Q} = \left(\frac{r_P}{r_Q}\right)^2\left(\frac{T_P}{T_Q}\right)^4 = \left(\frac{8}{2}\right)^2\left\{\frac{(273+127)}{(273+527)}\right\}^4 = 1$

15. (c) Rate of energy $\frac{Q}{t} = P = A\varepsilon\sigma T^4 \Rightarrow P \propto T^4$

$\Rightarrow \frac{P_1}{P_2} = \left(\frac{T_1}{T_2}\right)^4 = \left(\frac{927+273}{127+273}\right)^4 \Rightarrow P_1 = 405\ W$

16. (b) The rate of radiated energy $\frac{Q}{t} = P = A\varepsilon\sigma T^4$

$\Rightarrow 1134 = 5.67\times10^{-8}\times(0.1)^2T^4 \Rightarrow T = 1189\ K$

17. (d) $Q \propto T^4 \Rightarrow \frac{H_A}{H_B} = \left(\frac{273+727}{273+327}\right)^4 = \left(\frac{10}{6}\right)^4 = \left(\frac{5}{3}\right)^4 = \frac{625}{81}$

18. (d) $(Q)_{Blackbody} = A\sigma T^4 t \Rightarrow Q \propto T^4$

$\Rightarrow Q_2 = Q_1\left(\frac{T_2}{T_1}\right)^4 = 10\left(\frac{273+327}{273+27}\right)^4 = 10\left(\frac{600}{300}\right)^4 = 160J$

19. (c) $\frac{E_2}{E_1} = \left(\frac{T_2}{T_1}\right)^4 \Rightarrow \frac{E_2}{20} = \left(\frac{2T}{T}\right)^4 = 16 \Rightarrow E_2 = 320\ kcal/m^2\ min.$

20. (d) Radiated power by blackbody $P = \frac{Q}{t} = A\sigma T^4$

$\Rightarrow P \propto AT^4 \propto r^2T^4 \Rightarrow \frac{P_1}{P_2} = \left(\frac{r_1}{r_2}\right)^2\left(\frac{T_1}{T_2}\right)^4$

$\Rightarrow \frac{440}{P_2} = \left(\frac{12}{6}\right)^2\left(\frac{500}{1000}\right)^4 \Rightarrow P_2 = 1760\,W \approx 1800\,W$

21. (d) Amount of energy radiated $\propto$ (Temperature)^4.

22. (d) $\frac{Q_1}{Q_2} = \left(\frac{T_1}{T_2}\right)^4 = \left(\frac{273+27}{273+927}\right)^4 = \left(\frac{1}{4}\right)^4 = \frac{1}{256}$

23. (a) $\frac{E_2}{E_1} = \frac{T_2^4}{T_1^4} = \left(\frac{237+227}{273+27}\right)^4 = \left(\frac{600}{300}\right)^4 = 16$

24. (d) $(Q)_{Blackbody} = A\sigma T^4 t \Rightarrow \frac{Q}{t} \propto P = A\sigma T^4$

Breadth are halved so area becomes one fourth.

$\Rightarrow \frac{P_1}{P_2} = \frac{A_1}{A_2}\times\left(\frac{T_1}{T_2}\right)^4 \Rightarrow \frac{A_1}{(A_1/4)}\times\left(\frac{273+327}{273+127}\right)$

$\Rightarrow P_2 = \frac{81}{64}E$

25. (d) Power radiated $P \propto T^4 \Rightarrow \frac{P_1}{P_2} = \left(\frac{T_1}{T_2}\right)^4$

$\Rightarrow \frac{Q}{P_2} = \left(\frac{T}{3T}\right)^4 \Rightarrow P_2 = 81Q$

26. (a) For black body, $P = A\varepsilon\sigma T^4$. For same power $A \propto \frac{1}{T^4}$

$\Rightarrow \left(\frac{r_1}{r_2}\right)^2 = \left(\frac{T_2}{T_1}\right)^4 \Rightarrow \frac{r_1}{r_2} = \left(\frac{T_2}{T_1}\right)^2$

27. (a) $\frac{Q_2}{Q_1} = \left(\frac{T_2}{T_1}\right)^4 = \left(\frac{273+927}{273+327}\right)^4 = \left(\frac{1200}{600}\right)^4 = 16$

$\Rightarrow Q = 32\ KJ$

28. (b) $\frac{Q_2}{Q_1} = \left(\frac{T_2}{T_1}\right)^4 \Rightarrow \frac{2}{1} = \left(\frac{T_2}{T_1}\right)^4$

$\Rightarrow T_2^4 = 2 \times T_1^4 = 2 \times (273 + 727)^4 \Rightarrow T_2 = 1190K$.

29. (a) $\frac{Q_1}{Q_2} = \frac{r_1^2 T_1^4}{r_2^2 T_2^4} = \frac{4^2}{1^2} \times \left(\frac{2000}{4000}\right)^4 = 1$

30. (a) According to Wein's law λT = constant

$\Rightarrow \lambda_{m_1} T_1 = \lambda_{m_2} T_2 \Rightarrow T_2 = \frac{\lambda_{m_1}}{\lambda_{m_2}} T_1 = \frac{\lambda_0}{3\lambda_0 / 4} \times T_1 = \frac{4}{3} T_1$

Now $P \propto T^4 \Rightarrow \frac{P_2}{P_1} = \left(\frac{T_2}{T_1}\right)^4 \Rightarrow \frac{P_2}{P_1} = \left(\frac{4/3\ T_1}{T_1}\right)^4 = \frac{256}{81}$

31. (d) $E \propto T^4$

32. (d) $Q \propto T^4 \Rightarrow \frac{Q_1}{Q_2} = \left(\frac{T_1}{T_2}\right)^4$

$\Rightarrow \frac{Q_1}{Q_2} = \left(\frac{T}{T + T/2}\right)^4 = \frac{16}{81} \Rightarrow Q_2 = \frac{81}{16} Q_1$

% increase in energy $= \frac{Q_2 - Q_1}{Q_1} \times 100 = 400\%$

33. (d) If temperature of surrounding is considered then net loss of energy of a body by radiation

$Q = A\varepsilon\sigma(T^4 - T_0^4)t \Rightarrow Q \propto (T^4 - T_0^4) \Rightarrow \frac{Q_1}{Q_2} = \frac{T_1^4 - T_0^4}{T_2^4 - T_0^4}$

$= \frac{(273+200)^4 - (273+27)^4}{(273+400)^4 - (273+27)^4} = \frac{(473)^4 - (300)^4}{(673)^4 - (300)^4}$

34. (c) $Q = A\varepsilon\sigma T^4 \Rightarrow Q \propto A \propto r^2$ ($\because T$ = constant)

$\Rightarrow \frac{Q_1}{Q_2} = \frac{r_1^2}{r_2^2} = \left(\frac{1}{2}\right)^2 = \frac{1}{4}$

35. (a) $\frac{Q_2}{Q_1} = \frac{T_2^4}{T_1^4} = \left(\frac{273+527}{273+127}\right)^4 = \left(\frac{800}{400}\right)^4 \Rightarrow Q_2 = 16 \frac{cal}{cm^2 \times s}$

36. (c) For a black body $\frac{Q}{t} = P = A\sigma T^4$

$\Rightarrow \frac{P_2}{P_1} = \left(\frac{T_2}{T_1}\right)^4 \Rightarrow \frac{P_2}{20} = \left(\frac{273+727}{273+227}\right)^4$

$\Rightarrow \frac{P_2}{20} = (2)^4 \Rightarrow P_2 = 320W$

37. (c) Energy radiated per sec $\frac{Q}{t} = P = A\varepsilon\sigma T^4$

$P \propto r^2 T^4 \Rightarrow \frac{P_2}{P_1} = \frac{r_2^2}{r_1^2} . \frac{T_2^4}{T_1^4} = \frac{4^2}{1^2} \times \left(\frac{2000}{4000}\right)^4 = 1$

38. (c) $Q \propto AT^4 \propto r^2 T^4 \Rightarrow \frac{Q_{star}}{Q_{sun}} = \frac{r^2_{star} . T^4_{star}}{r^2_{sun} \times T^4_{sun}}$

$\Rightarrow \frac{10000}{1} = \frac{r_{star}^2}{r_{sun}^2} \times \left(\frac{6000}{2000}\right)^4 \Rightarrow \frac{r_{star}}{r_{sun}} = \frac{100 \times 9}{1} = \frac{900}{1}$

39. (a) $P = \left(\frac{Q}{t}\right) \propto T^4 \Rightarrow \frac{W}{P_2} = \left(\frac{T}{T/3}\right)^4 \Rightarrow P_2 = \frac{W}{81}$.

40. (c) Power $P \propto AT^4 \propto r^2 T^4$

$\Rightarrow \frac{P_2}{P_1} = \left(\frac{r_2}{r_1}\right)^2 \times \left(\frac{T_2}{T_1}\right)^4 = \left(\frac{4r}{r}\right)^2 \times \left(\frac{T/2}{T}\right)^4 = 1.$

41. (b) $\frac{Q_2}{Q_1} = \left(\frac{r_2^2}{r_1^2}\right)^2 \times \left(\frac{T_2}{T_1}\right)^4 = \left(\frac{100}{1}\right)^2 \times \left(\frac{1}{2}\right)^4 = 625$

42. (d) $Q \propto r^2 T^4 \Rightarrow \frac{Q_2}{Q_1} = \left(\frac{r_2}{r_1}\right)^2 \times \left(\frac{T_2}{T_1}\right)^4 = (2)^2 \times (2)^4 = 64$

43. (c) Energy radiated from a body $Q = A\varepsilon\sigma T^4 t$

$\Rightarrow \frac{Q_2}{Q_1} = \left(\frac{T_2}{T_1}\right)^4 \Rightarrow \frac{T_2}{T_1} = \left(\frac{Q_2}{Q_1}\right)^{1/4} = \left(\frac{4.32 \times 10^6}{2.7 \times 10^{-3}}\right)^{1/4}$

$= \left(\frac{16 \times 27}{27} \times 10^8\right)^{1/4} = 2 \times 10^2$

$\Rightarrow T_2 = 200 \times T_1 = 80000\,K$

44. (d) $E \propto AT^4 \Rightarrow \frac{E_{sphere}}{E_{Disc}} = \frac{4\pi r^2}{2\pi r^2} \times \left(\frac{T}{T}\right)^4 = \frac{2}{1}$

45. (a) $\frac{E_2}{E_1} = \left(\frac{T_2}{T_1}\right)^4 \Rightarrow \frac{T_2}{T_1} = \left(\frac{E_2}{E_1}\right)^{1/4} = \left(\frac{10^9}{10^5}\right)^{1/4} = 10$

$\Rightarrow T_2 = 10T_1 = 10 \times (273 + 227) = 5000\,K$

46. (b) Energy per second $P\left(= \frac{Q}{t}\right) \propto T^4$

$\frac{P_1}{P_2} = \left(\frac{T_1}{T_2}\right)^4 = \left(\frac{273-73}{273+327}\right)^4 = \left(\frac{200}{600}\right)^4 = \frac{1}{81}$

47. (a) $Q \propto T^4 \Rightarrow \frac{Q_1}{Q_2} = \left(\frac{T_1}{T_2}\right)^4$

If $T_1 = T$ then $T_2 = T + \frac{10}{100} T = 1.1T$

$\Rightarrow \frac{Q_1}{Q_2} = \left(\frac{T}{1.1T}\right)^4 \Rightarrow Q_2 = 1.46\,Q_1$

$\Rightarrow$ % increase in energy $= \frac{Q_2 - Q_1}{Q_1} \times 100 = 46\%$

48. (a) From Stefan's law $E = \sigma T^4$

$T^4 = \frac{E}{\sigma} = \frac{6.3 \times 10^7}{5.7 \times 10^8} = 1.105 \times 10^{15} = 0.1105 \times 10^{16}$

$T = 0.58 \times 10^4\,K = 5.8 \times 10^3\,K$

49. (a) Rate of cooling $\propto (T^4 - T_0^4)$

$\Rightarrow \frac{H}{H'} = \frac{(T_1^4 - T_0^4)}{(T_2^4 - T_0^4)} = \frac{400^4 - 200^4}{600^4 - 200^4}$

or $H' = \frac{(16+4)(16-4)H}{(36+4)(36-4)} = \frac{3}{16}H$

50. (a)

51. (a) Rate of cooling $\propto (T^4 - T_0^4) \Rightarrow \frac{R_1}{R_2} = \frac{(T_1^4 - T_0^4)}{(T_2^4 - T_0^4)}$

$\Rightarrow \frac{R}{R_2} = \frac{(600)^4 - (300)^4}{(900)^4 - (300)^4}$ or $R_2 = \frac{16}{3}R$

52. (d) Loss of heat $\Delta Q = A\varepsilon\sigma(T^4 - T_0^4)t$

$\Rightarrow$ Rate of loss of heat $\frac{\Delta Q}{t} = A\varepsilon\sigma(T^4 - T_0^4)$

$= 10\times10^{-4}\times1\times5.67\times10^{-8}\{273+127)^4 - (273+27)^4\}$

= 0.99 *W*.

53. (b) According to Prevost theory every body radiate heat at all temperature (except 0*K*) and also absorbs heat from surroundings.

$\because$ $T_A > T$ $\Rightarrow$ Object *A* emits radiations more than the radiations it absorbs.

and $T_B < T$ $\Rightarrow$ Object *B* absorbs more radiations than it emits.

After a certain time all bodies attains a common temperature.

54. (b) According to Prevost theory

55. (b) $Q \propto T^4 \Rightarrow \frac{Q_1}{Q_2} = \frac{T_1^4}{T_2^4} \Rightarrow T_2^4 = \left(\frac{E_2}{E_1}\right)T_1^4$

$\Rightarrow T_2^4 = \frac{1}{16}\times(1000)^4 = \left(\frac{1000}{2}\right)^4 \Rightarrow T_2 = 500K$

56. (c) $Q \propto T^4$

Radiation (Newton's Law of Cooling)

1. (b) According to Newton's law of cooling

$\frac{\theta_1 - \theta_2}{t} = K\left[\frac{\theta_1+\theta_2}{2} - \theta_0\right]$

In the first case, $\frac{(60-50)}{10} = K\left[\frac{60+50}{2} - \theta_0\right]$

$1 = K(55-\theta)$ ....(i)

In the second case, $\frac{(50-42)}{10} = K\left[\frac{50+42}{2} - \theta_0\right]$

$0.8 = K(46-\theta_0)$ ....(ii)

Dividing (i) by (ii), we get $\frac{1}{0.8} = \frac{55-\theta_0}{46-\theta_0}$

or $46 - \theta_0 = 44 - 0.8\theta_0 \Rightarrow \theta_0 = 10^oC$

2. (c) According to Newton's law of cooling

Rate of cooling $\propto$ Mean temperature difference

$\Rightarrow \frac{\text{Fall in temperature}}{\text{Time}} \propto \left(\frac{\theta_1+\theta_2}{2} - \theta_0\right)$

$\because \left(\frac{\theta_1+\theta_2}{2}\right)_1 > \left(\frac{\theta_1+\theta_2}{2}\right)_2 > \left(\frac{\theta_1+\theta_2}{2}\right)_3$

$\Rightarrow T_1 < T_2 < T_3$

3. (a) Initially at $t = 0$

Rate of cooling (*R*) $\propto$ Fall in temperature of body ($\theta - \theta$)

$\Rightarrow \frac{R_1}{R_2} = \frac{\theta_1 - \theta_0}{\theta_2 - \theta_0} = \frac{100-40}{80-40} = \frac{3}{2}$

4. (a) For small difference of temperature, it is the special case of Stefan's law.

5. (b) Liquid having more specific heat has slow rate of cooling because for equal masses rate of cooling $\frac{d\theta}{dt} \propto \frac{1}{c}$.

6. (c) $S_l = \frac{1}{m_l}\left[\frac{t_l}{t_W}(m_W C_W + W) - W\right]$

$= \frac{1}{300}\left[\frac{95}{3\times60}(350\times1+10) - 10\right]$ =0.6 $Cal/gm\times^\circ C$

7. (c) Newton's law of cooling is used for the determination of specific heat of liquids.

8. (c) By Newton's law of cooling.

9. (d) Rate of loss of heat $\left(\frac{\Delta Q}{t}\right) \propto$ temperature difference $\Delta\theta$

$\frac{\left(\frac{\Delta Q}{t}\right)_1}{\left(\frac{\Delta Q}{t}\right)_2} = \frac{\Delta\theta_2}{\Delta\theta_1} \Rightarrow \frac{60}{\left(\frac{\Delta Q}{t}\right)_2} = \frac{80-60}{40-20} \Rightarrow \left(\frac{\Delta Q}{t}\right)_2 = \frac{20\,cal}{sec}$

10. (b) During clear nights object on surface of earth radiate out heat and temperature falls. Hence option (a) is wrong.

The total energy radiated by a body per unit time per unit area $E \propto T$. Hence option (*c*) is wrong.

Energy radiated per second is given by $\frac{Q}{t} = PA\varepsilon\sigma T^4$

$\Rightarrow \frac{P_1}{P_2} = \frac{A_1}{A_2}\cdot\left(\frac{T_1}{T_2}\right)^4 = \left(\frac{r_1}{r_2}\right)^2\cdot\left(\frac{T_1}{T_2}\right)^4 = \left(\frac{1}{4}\right)^2\left(\frac{4000}{200}\right) = \frac{1}{1}$

$\because P = P$, hence option (d) is wrong.

Newton's law is an approximate form of Stefan's law of radiation and works well for natural convection. Hence option (b) is correct.

11. (b) $\frac{\theta_1 - \theta_2}{t} = K\left(\frac{\theta_1+\theta_2}{2} - \theta_0\right)$

$\therefore \frac{100-70}{4} = K\left(\frac{100+70}{2} - 15\right)$ = 60$K \Rightarrow K = \frac{1}{8}$

Again $\frac{70-40}{t} = \frac{1}{8}\left(\frac{70+40}{2} - 15\right)$ = 5 $\Rightarrow$ t = 6 *min*.

12. (d) $\frac{80-60}{1} = K\left(\frac{80+60}{2} - 30\right) \Rightarrow K = \frac{1}{2}$

Again $\frac{60-50}{t} = \frac{1}{2}\left(\frac{60+50}{2} - 30\right) \Rightarrow t = 0.8\times60 = 48$ *sec.*

13. (c) According to Newton's law of cooling

Rate of cooling $\propto$ mean temperature difference.

Initially, mean temperature difference

$=\left(\frac{70+60}{2}-\theta_0\right)=(65-\theta_0)$

Finally, mean temperature difference

$=\left(\frac{60+50}{2}-\theta_0\right)=(55-\theta_0)$

In second case mean temperature difference decreases, so rate of fall of temperature decreases, so it takes more time to cool through the same range.

14. (c) $\frac{\theta_1-\theta_2}{t}=K\left[\frac{\theta_1+\theta_2}{2}-\theta_0\right]$

In the first 10 minute

$\frac{62-50}{10}=K\left[\frac{62+50}{2}-\theta_0\right]\Rightarrow 1.2=K[56-\theta_0]$ .... (i)

$\frac{50-42}{10}=K\left[\frac{50+42}{2}-\theta_0\right]\Rightarrow 0.8=K[46-\theta_0]$ .... (ii)

from equations (i) and (ii) $\frac{1.2}{0.8}=\frac{(56-\theta_0)}{(46-\theta_0)}\Rightarrow \theta_0=26°C$

15. (d) $\frac{d\theta}{dt}=\frac{\sigma A}{mc}(T^4-T_0^4)$. If the liquids put in exactly similar calorimeters and identical surrounding then we can consider T and A constant then $\frac{d\theta}{dt}\propto\frac{(T^4-T_0^4)}{mc}$ ......(i)

If we consider that equal masses of liquid (m) are taken at the same temperature then $\frac{d\theta}{dt}\propto\frac{1}{c}$

So for same rate of cooling c should be equal which is not possible because liquids are of different nature. Again from equation (i)

$\frac{d\theta}{dt}\propto\frac{(T^4-T_0^4)}{mc}\Rightarrow\frac{d\theta}{dt}\propto\frac{(T^4-T_0^4)}{V\rho c}$

Now if we consider that equal volume of liquid (V) are taken at the same temperature then $\frac{d\theta}{dt}\propto\frac{1}{\rho c}$.

So for same rate of cooling multiplication of $\rho\times c$ for two liquid of different nature can be possible. So option (d) may be correct.

16. (c) $\frac{60-50}{10}=K\left(\frac{60+50}{2}-25\right)$ .....(i)

$\frac{50-\theta}{10}=K\left[\frac{50+\theta}{2}-25\right]$ .....(ii)

On dividing, we get $\frac{10}{50-\theta}=\frac{60}{\theta}\Rightarrow\theta=42.85^o C$

17. (a) $\frac{365-361}{2}=K\left[\frac{365+361}{2}-293\right]$ = 70 $K\Leftrightarrow K=\frac{1}{35}$

Again $\frac{344-342}{t}=\frac{1}{35}\left[\frac{344-342}{2}-293\right]=\frac{10}{7}$

$\Rightarrow t=\frac{14}{10}\text{min}=\frac{14}{10}\times 60=84$ *sec.*

18. (b) $\frac{50-49.9}{5}=K\left(\frac{50+49.9}{2}-30\right)$ .....(i)

$\frac{40-39.9}{t}=K\left[\frac{40+39.9}{2}-30\right]$ .....(ii)

from equations (i) and (ii) we get $t\approx 10$ *sec.*

19. (c) Rate of loss of heat is directly proportional to the temperature difference between water and the surroundings.

20. (b) Rate of cooling $=\frac{-d\theta}{dt}\propto\left(\frac{\theta_1+\theta_2}{2}-\theta_0\right)$

In second case average temperature will be less hence rate of cooling will be less. Therefore time taken will be more than 4 minutes.

21. (a)

22. (b) First case, $\frac{61-59}{4}=K\left[\frac{61+59}{2}-30\right]$ .....(i)

Second case, $\frac{51-49}{t}=K\left[\frac{51+49}{2}-30\right]$ .....(ii)

By solving equation (i) and (ii) we get $t=6$ *min.*

23. (d)

24. (c) In first case $\frac{60-40}{7}=K\left[\frac{60+40}{2}-10\right]$ ....(i)

In second case $\frac{40-28}{t}=K\left[\frac{40+28}{2}-10\right]$ ....(ii)

By solving $t=7$ *minutes*

25. (b) In first case $\frac{50-40}{5}=K\left[\frac{50+40}{2}-\theta_0\right]$ ....(i)

In second case $\frac{40-33.33}{5}=K\left[\frac{40+33.33}{2}-\theta_0\right]$ ....(ii)

By solving $\theta_0=20^o C$.

26. (b) In first case $\frac{50-40}{10}=K\left[\frac{50+40}{2}-20\right]$ ....(i)

In second case $\frac{40-\theta_2}{10}=K\left[\frac{40+\theta_2}{2}-20\right]$ ....(ii)

By solving $\theta_2=33.3^o C$.

27. (d) In first case $\frac{61-59}{10}=K\left[\frac{61+59}{2}-30\right]$ ....(i)

In second case $\frac{51-49}{10}=K\left[\frac{51+49}{2}-30\right]$ ....(ii)

By solving $t=15$ *min.*

28. (d) Rate of cooling (here it is rate of loss of heat)

$\frac{dQ}{dt}=(mc+W)\frac{d\theta}{dt}=(m_lc_l+m_cc_c)\frac{d\theta}{dt}$

$\Rightarrow\frac{dQ}{dt}=(0.5\times 2400+0.2\times 900)\left(\frac{60-55}{60}\right)=115\frac{J}{\text{sec}}$.

29. (a) According to Newton's law

Rate of cooling $\propto$ temperature difference $\Delta\theta$

30. (b) According to Newton's law $\frac{\theta_1-\theta_2}{t}=k\left[\frac{\theta_1+\theta_2}{2}-\theta_0\right]$

Initially,

$$\frac{(80-64)}{5}=K\left(\frac{80+64}{2}-\theta_0\right) \Rightarrow 3.2=K[72-\theta_0] \;\ldots\text{(i)}$$

Finally

$$\frac{(64-52)}{10}=K\left[\frac{64+52}{2}-\theta_0\right] \Rightarrow 1.2=K[58-\theta_0]\ldots\text{(ii)}$$

On solving equation (i) and (ii) $\theta_0=49°C$.

31. (d) $\frac{50-45}{5}=K\left(\frac{50+45}{2}-\theta_0\right)$ .....(i)

$\frac{45-41.5}{5}=K\left(\frac{45+41.5}{2}-\theta_0\right)$ .....(ii)

Solving equation (i) and (ii) we set $\theta_0=33.3\ °C$.

32. (d) $\frac{65.5-62.5}{1}=K\left(\frac{65.5+62.5}{2}-22.5\right) \Rightarrow K=\frac{3}{41.5}$

And again $\frac{46.5-40.5}{t}=\frac{3}{41.5}\left(\frac{46.5+40.5}{2}-22.5\right)$

$\Rightarrow \frac{6}{t}=\frac{3}{41.5}\times 21 \Rightarrow t=\frac{82}{21}\simeq 4$ minute.

33. (a) $\frac{62-50}{10}=K\left(\frac{62+50}{2}-26\right) \Rightarrow \frac{6}{5}=K\times 30 \Rightarrow K=\frac{1}{25}$

And, $\frac{50-\theta}{10}=\frac{1}{25}\left(\frac{50+\theta}{2}-26\right) \Rightarrow \theta=42°\ C.$

34. (c) $\frac{90-60}{5}=K\left(\frac{90+60}{2}-20\right) \Rightarrow 6=K\times 55 \Rightarrow K=\frac{6}{55}$

And, $\frac{60-30}{t}=\frac{6}{55}\left(\frac{60+30}{2}-20\right) \Rightarrow t$ = 11 minute.

35. (a) According to Newton's law of cooling

in first case, $\frac{75-65}{t}=K\left[\frac{75+65}{2}-30\right]$ .....(i)

in second case, $\frac{55-45}{t}=K\left[\frac{55+45}{2}-30\right]$ .....(ii)

Dividing eq. (i) by (ii) we get $\frac{5t}{10}=\frac{40}{20} \Rightarrow t=4$ minutes

36. (b) According to Newton's law of cooling

in first case, $\frac{80-50}{5}=K\left[\frac{80+50}{2}-20\right]$ .....(i)

in second case, $\frac{60-30}{t}=K\left[\frac{60+30}{2}-20\right]$ (ii)

Dividing equation (i) by (ii) we get, $\frac{t}{2}=\frac{45}{25} \Rightarrow t=9$ min.

37. (b) According to Newton's law of cooling.

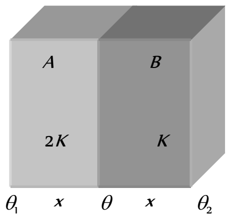
Critical Thinking Questions

1. (a) $\frac{dQ}{dt}=\frac{KA\Delta\theta}{l}$, For both rods K, A and $\Delta\theta$ are same $\Rightarrow$ $\frac{dQ}{dt}\propto\frac{1}{l}$ So $\frac{(dQ/dt)_{semi\ circular}}{(dQ/dt)_{straight}}=\frac{l_{straight}}{l_{semicircular}}=\frac{2r}{\pi r}=\frac{2}{\pi}$.

2. (b) Suppose thickness of each wall is x then $\left(\frac{Q}{t}\right)_{combination}=\left(\frac{Q}{t}\right)_A \Rightarrow \frac{K_S A(\theta_1-\theta_2)}{2x}=\frac{2KA(\theta_1-\theta)}{x}$

$\because K_S=\frac{2\times 2K\times K}{(2K+K)}=\frac{4}{3}K$ and $(\theta_1-\theta_2)=36°$

$\Rightarrow \frac{\frac{4}{3}KA\times 36}{2x}=\frac{2KA(\theta_1-\theta)}{x}$



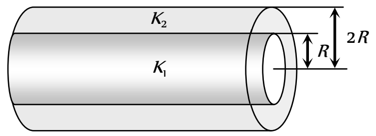
Hence temperature difference across wall A is

$(\theta_1-\theta)=12^oC$

3. (d) $t=\frac{\rho L}{2K\theta}(x_2^2-x_1^2) \Rightarrow t\propto(x_2^2-x_1^2)$

$\Rightarrow \frac{t}{t'}=\frac{(x_2^2-x_1^2)}{(x'_2{}^2-x'_1{}^2)} \Rightarrow \frac{9}{t'}=\frac{(1^2-0^2)}{(2^2-1^2)} \Rightarrow t'=21\,hours$

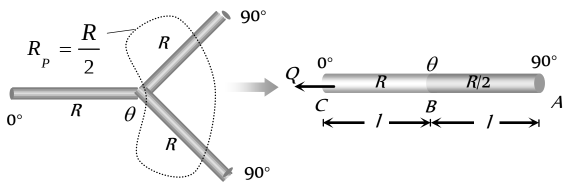
4. (c) Both the cylinders are in parallel, for the heat flow from one end as shown.



Hence $K_{eq}=\frac{K_1A_1+K_2A_2}{A_1+A_2}$; where A = Area of cross-section of inner cylinder = πR and A_2 = Area of cross-section of cylindrical shell $=\pi\{(2R)^2-(R)^2\}=3\pi R^2$

$\Rightarrow K_{eq}=\frac{K_1(\pi R^2)+K_2(3\pi R^2)}{\pi R^2+3\pi R^2}=\frac{K_1+3K_2}{4}$

5. (b) Let the temperature of junction be θ. Since roads B and C are parallel to each other (because both having the same temperature difference). Hence given figure can be redrawn as follows



$\because \frac{Q}{t}=\frac{(\theta_1-\theta_2)}{R}$ and $\left(\frac{Q}{t}\right)_{AB}=\left(\frac{Q}{t}\right)_{BC}$

$\Rightarrow \frac{(90-\theta)}{R/2}=\frac{(\theta-0)}{R} \Rightarrow 180-2\theta=\theta \Rightarrow \theta=60°C$

6. (a) Heat developed by the heater $H=\frac{V^2}{R}.\frac{t}{J}=\frac{(200)^2\times t}{20\times 4.2}$

Heat conducted by the glass $H=\frac{0.2\times 1\times(20-\theta)t}{0.002}$

Hence $\frac{(200)^2\times t}{20\times 4.2}=\frac{0.2\times(20-\theta)t}{0.002} \Rightarrow \theta=15.24^oC$

7. (a) Since $t = \frac{\rho L}{2k\theta}(x_2^2 - x_1^2)$

$\therefore t = \frac{\rho L}{2k\theta}(x^2 - y^2) = \frac{\rho L(x+y)(x-y)}{2K\theta}$

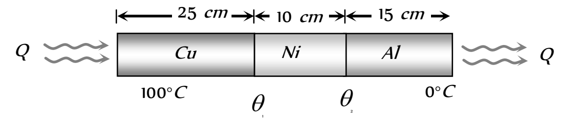
8. (b) If suppose $K_{Ni} = K \Rightarrow K_{Al} = 3K$ and $K_{Cu} = 6K$.

Since all metal bars are connected in series

So $\left(\frac{Q}{t}\right)_{Combination} = \left(\frac{Q}{t}\right)_{Cu} = \left(\frac{Q}{t}\right)_{Al} = \left(\frac{Q}{t}\right)_{Ni}$

and $\frac{3}{K_{eq}} = \frac{1}{K_{Cu}} + \frac{1}{K_{Al}} + \frac{1}{K_{Ni}} = \frac{1}{6K} + \frac{1}{3K} + \frac{1}{K} = \frac{9}{6K}$

$\Rightarrow K_{eq} = 2K$



Hence, if $\left(\frac{Q}{t}\right)_{Combination} = \left(\frac{Q}{t}\right)_{Cu}$

$\Rightarrow \frac{K_{eq}A(100-0)}{l_{Combination}} = \frac{K_{Cu}A(100-\theta_1)}{l_{Cu}}$

$\Rightarrow \frac{2K\,A(100-0)}{(25+10+15)} = \frac{6K\,A(100-\theta_1)}{25} \Rightarrow \theta_1 = 83.33°C$

Similar if $\left(\frac{Q}{t}\right)_{Combination} = \left(\frac{Q}{t}\right)_{Al}$

$\Rightarrow \frac{2K\,A(100-0)}{50} = \frac{3K\,A(\theta_2 - 0)}{15} \Rightarrow \theta_2 = 20^o C$

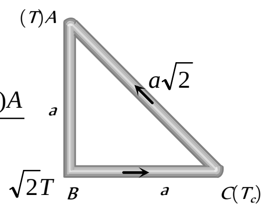
9. (b) $\because T_B > T_A \Rightarrow$ Heat will flow *B* to *A* via two paths (i) *B* to *A* (ii) and along *BCA* as shown.

Rate of flow of heat in path *BCA* will be same

i.e. $\left(\frac{Q}{t}\right)_{BC} = \left(\frac{Q}{t}\right)_{CA}$

$\Rightarrow \frac{k(\sqrt{2}T - T_C)A}{a} = \frac{k(T_C - T)A}{\sqrt{2}a}$

$\Rightarrow \frac{T_C}{T} = \frac{3}{1+\sqrt{2}}$

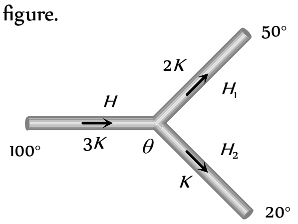


10. (a) $mL = \frac{KA\Delta\theta\ t}{\Delta x} \Rightarrow 500 \times 80 = \frac{0.0075 \times 75 \times (40-0)t}{5}$

$\Rightarrow t = 8.9 \times 10^3$ *sec* = 2.47 *hr.*

11. (a) Rate of cooling $\frac{\Delta\theta}{t} = \frac{A\varepsilon\sigma(T^4 - T_0^4)}{mc} \Rightarrow \frac{\Delta\theta}{t} \propto A$. Since area of plate is largest so it will cool fastest.

12. (b) Let the temperature of junction be θ then according to following figure.

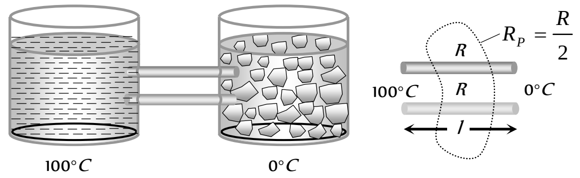


$H = H_1 + H_2$

$\Rightarrow \frac{3K \times A \times (100-\theta)}{l} = \frac{2KA(\theta - 50)}{l} + \frac{KA(\theta - 20)}{l}$

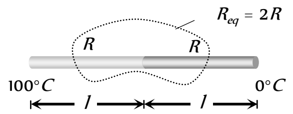
$\Rightarrow 300 - 3\theta = 3\theta - 120 \Rightarrow \theta = 70°C$

13. (c) Initially the rods are placed in vessels as shown below



$\frac{Q}{t} = \frac{(\theta_1 - \theta_2)}{R} \Rightarrow \left(\frac{Q}{t}\right)_1 = \frac{mL}{t} = q_1 L = \frac{(100-0)}{\frac{R}{2}}$ ... (i)

Finally when rods are joined end to end as shown



$\Rightarrow \left(\frac{Q}{t}\right)_2 = \frac{mL}{t} = q_2 L = \frac{(100-0)}{2R}$ ... (ii)

From equation (i) and (ii), $\frac{q_1}{q_2} = \frac{4}{1}$

14. (b) Rate of cooling of a body $R = \frac{\Delta\theta}{t} = \frac{A\varepsilon\sigma(T^4 - T_0^4)}{mc}$

$\Rightarrow R \propto \frac{A}{m} \propto \frac{\text{Area}}{\text{Volume}}$

$\Rightarrow$ For the same surface area. $R \propto \frac{1}{\text{Volume}}$

$\because$ Volume of cube < Volume of sphere

$\Rightarrow R_{Cube} > R_{Sphere}$ *i.e.* cube, cools down with faster rate.

15. (a,b) According to Stefan's law

$E = eA\sigma T^4 \Rightarrow E_1 = e_1 A\sigma T_1^4$ and $E_2 = e_2 A\sigma T_2^4$

$\because E_1 = E_2 \therefore e_1 T_1^4 = e_2 T_2^4$

$\Rightarrow T_2 = \left(\frac{e_1}{e_2}T_1^4\right)^{\frac{1}{4}} = \left(\frac{1}{81} \times (5802)^4\right)^{\frac{1}{4}} \Rightarrow T_B = 1934\ K$

And, from Wein's law $\lambda_A \times T_A = \lambda_B \times T_B$

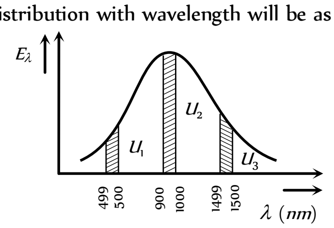
$\Rightarrow \frac{\lambda_A}{\lambda_B} = \frac{T_B}{T_A} \Rightarrow \frac{\lambda_B - \lambda_A}{\lambda_B} = \frac{T_A - T_B}{T_A}$

$\Rightarrow \frac{1}{\lambda_B} = \frac{5802 - 1934}{5802} = \frac{3968}{5802} \Rightarrow \lambda_B = 1.5\ \mu m$

16. (d) Wein's displacement law is $\lambda_m T = b$

$\Rightarrow \lambda_m = \frac{b}{T} = \frac{2.88 \times 10^6}{2880} = 1000\,nm.$

Energy distribution with wavelength will be as follows



From the graph it is clear that $U_2 > U_1$.

17. (b) Energy received per second *i.e.*, power $P \propto (T^4 - T_0^4)$

$\Rightarrow P \propto T^4 \qquad (\because T_0 << T)$

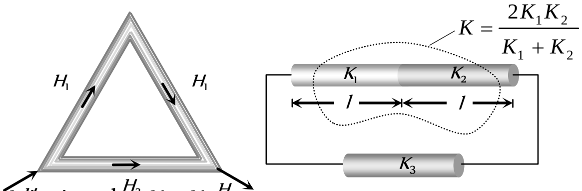
Also energy received per sec $(p) \propto \dfrac{1}{d^2}$

(inverse square law)

$$\Rightarrow P \propto \frac{T^4}{d^2} \Rightarrow \frac{P_1}{P_2} = \left(\frac{T_1}{T_2}\right)^4 \times \left(\frac{d_2}{d_1}\right)^2$$

$$\Rightarrow \frac{P}{P_2} = \left(\frac{T}{2T}\right)^2 \times \left(\frac{2d}{d}\right)^2 = \frac{1}{4} \Rightarrow P_2 = 4P.$$

18. (c) The given arrangement of rods can be redrawn as follows



It is given that $H_1 = H_2$

$$\Rightarrow \frac{KA(\theta_1 - \theta_2)}{2l} = \frac{K_3A(\theta_1 - \theta_2)}{l} \Rightarrow K_3 = \frac{K}{2} = \frac{K_1K_2}{K_1 + K_2}$$

19. (b) Rate of cooling $(R) = \dfrac{\Delta\theta}{t} = \dfrac{A \in \sigma(T^4 - T_0^4)}{mc}$

$$\Rightarrow R \propto \frac{A}{m} \propto \frac{\text{Area}}{\text{volume}} \propto \frac{r^2}{r^3} \propto \frac{1}{r}$$

$$\Rightarrow \text{Rate } (R) \propto \frac{1}{r} \propto \frac{1}{m^{1/3}} \left[\because m = \rho \times \frac{4}{3}\pi r^3 \Rightarrow r \propto m^{1/3}\right]$$

$$\Rightarrow \frac{R_1}{R_2} = \left(\frac{m_2}{m_1}\right)^{1/3} = \left(\frac{1}{3}\right)^{1/3}$$

20. (b) Radiated power $P = A\varepsilon\sigma T^4 \Rightarrow P \propto AT^4$

From Wein's law, $\lambda_m T = \text{constant} \Rightarrow T \propto \dfrac{1}{\lambda_m}$

$$\therefore P \propto \frac{A}{(\lambda_m)^4} \propto \frac{r^2}{(\lambda_m)^4}$$

$$\Rightarrow Q_A : Q_B : Q_C = \frac{2^2}{(300)^4} : \frac{4^2}{(400)^4} : \frac{6^2}{(500)^4}$$

$\therefore Q_B$ will be maximum.

21. (d) The total energy radiated from a black body per minute.

$$Q \propto T^4 \Rightarrow \frac{Q_2}{Q_1} = \left(\frac{2T}{T}\right)^4 = 16 \Rightarrow Q_2 = 16Q_1$$

If m be mass of water taken and S be its specific heat capacity, then $Q_1 = ms(20.5 - 20)$ and $Q_2 = ms(\theta - 20)$

$\theta°C$ = Final temperature of water

$$\Rightarrow \frac{Q_2}{Q_1} = \frac{\theta - 20}{0.5} \Rightarrow \frac{16}{1} = \frac{\theta - 20}{0.5} \Rightarrow \theta = 28°C$$

22. (a) Rate of cooling $\dfrac{\Delta\theta}{t} = \dfrac{A\varepsilon\sigma(T^4 - T_0^4)}{mc}$

As surface area, material and temperature difference are same, so rate of loss of heat is same in both the spheres. Now in this case rate of cooling depends on mass.

$\Rightarrow$ Rate of cooling $\dfrac{\Delta\theta}{t} \propto \dfrac{1}{m}$

$\because m_{solid} > m_{hollow}$. Hence hollow sphere will cool fast.

23. (c) Rate of cooling $\dfrac{\Delta\theta}{t} = \dfrac{A\varepsilon\sigma(T^4 - T_0^4)}{mc}$

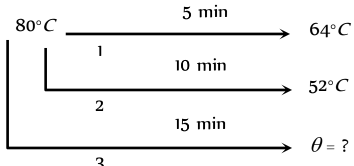
$$\Rightarrow t \propto \frac{m}{A} \qquad [\because \Delta\theta, t, \sigma, (T^4 - T_0^4) \text{ are constant}]$$

$$\Rightarrow t \propto \frac{m}{A} \propto \frac{\text{Volume}}{\text{Area}} \propto \frac{a^3}{a^2} \Rightarrow t \propto a \Rightarrow \frac{t_1}{t_2} = \frac{a_1}{a_2}$$

$$\Rightarrow \frac{100}{t_2} = \frac{1}{2} \Rightarrow t_2 = 200 sec.$$

24. (a) According to Newton law of cooling

$$\frac{\theta_1 - \theta_2}{t} = K\left[\frac{\theta_1 + \theta_2}{2} - \theta_0\right]$$



For first process : $\dfrac{(80 - 64)}{5} = K\left[\dfrac{80 + 64}{2} - \theta_0\right]$ ...(i)

For second process : $\dfrac{(80 - 52)}{10} = K\left[\dfrac{80 + 52}{2} - \theta_0\right]$ ...(ii)

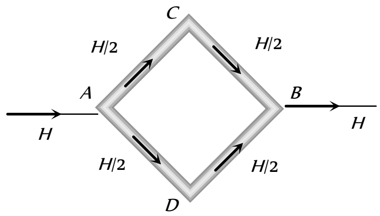
For third process : $\dfrac{(80 - \theta)}{15} = K\left[\dfrac{80 + \theta}{2} - \theta_0\right]$ ...(iii)

On solving equation (i) and (ii) we get $K = \dfrac{1}{15}$ and $\theta_0 = 24°C$. Putting these values in equation (iii) we get $\theta = 42.7°C$

25. (c) $t = \dfrac{Ql}{KA(\theta_1 - \theta_2)} = \dfrac{mLl}{KA(\theta_1 - \theta_2)} = \dfrac{V\rho Ll}{KA(\theta_1 - \theta_2)}$

$$= \frac{5 \times A \times 0.92 \times 80 \times \dfrac{5 + 10}{2}}{0.004 \times A \times 10 \times 3600} = 19.1\, hours.$$

26. (a) Suppose temperature difference between A and B is 100°C and $\theta_A > \theta_B$



Heat current will flow from A to B via path ACB and ADB. Since all the rod are identical so $(\Delta\theta)_{AC} = (\Delta\theta)_{AD}$

(Because heat current $H = \dfrac{\Delta\theta}{R}$; here R = same for all.)

$\Rightarrow \theta_A - \theta_C = \theta_A - \theta_D \Rightarrow \theta_C = \theta_D$

i.e. temperature difference between C and D will be zero.

27. (c) $\frac{Q}{t}=\frac{KA\Delta\theta}{l}\Rightarrow\frac{mL}{t}=\frac{K(\pi r^2)\Delta\theta}{l}$

$\Rightarrow$ Rate of melting of ice $\left(\frac{m}{t}\right)\propto\frac{Kr^2}{l}$

Since for second rod K becomes $\frac{1}{4}th$ r becomes double and length becomes half, so rate of melting will be twice *i.e.* $\left(\frac{m}{t}\right)_2=2\left(\frac{m}{t}\right)_1=2\times0.1=0.2\ gm/sec.$

28. (c) Heat transferred in one minute is utilised in melting the ice so,

$\frac{KA(\theta_1-\theta_2)t}{l}=m\times L$

$\Rightarrow m=\frac{10^{-3}\times92\times(100-0)\times60}{1\times8\times10^4}=6.9\times10^{-3}kg$

29. (d) $\frac{dQ}{dt}=\frac{KA}{l}d\theta=\frac{0.01\times1}{0.05}\times30=6J/sec$

Heat transferred in on day (86400 *sec*)

$\theta=6\times86400=518400\ J$

Now $Q=mL\Rightarrow m=\frac{Q}{L}=\frac{518400}{334\times10^3}$

$=1.552\ kg=1552g.$

30. (b) For no current flow between C and D

$\left(\frac{Q}{t}\right)_{AC}=\left(\frac{Q}{t}\right)_{CB}\Rightarrow\frac{K_1A(\theta_A-\theta_C)}{l}=\frac{K_2A(\theta_C-\theta_B)}{l}$

$\Rightarrow\frac{\theta_A-\theta_C}{\theta_C-\theta_B}=\frac{K_2}{K_1}$ ...(i)

Also $\left(\frac{Q}{t}\right)_{AD}=\left(\frac{Q}{t}\right)_{DB}\Rightarrow\frac{K_3A(\theta_A-\theta_D)}{l}=\frac{K_4A(\theta_D-\theta_B)}{l}$

$\Rightarrow\frac{\theta_A-\theta_D}{\theta_D-\theta_B}=\frac{K_4}{K_3}$ ...(ii)

It is given that $\theta_C=\theta_D$, hence from equation (i) and (ii) we get $\frac{K_2}{K_1}=\frac{K_4}{K_3}\Rightarrow K_1K_4=K_2K_3$

31. (d) Rate of cooling $R_C=\frac{d\theta}{dt}=\frac{A\varepsilon\sigma(T^4-T_0^4)}{mc}$

$\Rightarrow\frac{d\theta}{dt}\propto\frac{A}{V}\propto\frac{r^2}{r^3}\Rightarrow\frac{d\theta}{dt}\propto\frac{1}{r}$

32. (b) $\frac{dT}{dt}=\frac{\sigma A}{mcJ}(T^4-T_0^4)$ [In the given problem fall in temperature of body $dT=(200-100)=100K$, temp. of surrounding $T_0=0K$, Initial temperature of body $T=200K$].

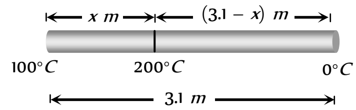
$\frac{100}{dt}=\frac{\sigma4\pi r^2}{\frac{4}{3}\pi r^3\rho c\ J}(200^4-0^4)$

$\Rightarrow dt=\frac{r\rho c\ J}{48\sigma}\times10^{-6}s=\frac{r\rho c}{\sigma}.\frac{4.2}{48}\times10^{-6}$

$=\frac{7}{80}\frac{r\rho c}{\sigma}\mu s\simeq\frac{7}{72}\frac{r\rho c}{\sigma}\mu s$ [As $J=4.2$]

33. (a) Rate of flow of heat is given by $\frac{dQ}{dt}=\frac{\Delta\theta}{l/KA}$ also $\frac{dQ}{dt}=L\frac{dm}{dt}$ (where L = Latent heat)

$\Rightarrow\frac{dm}{dt}=\frac{KA}{l}\left(\frac{\Delta\theta}{L}\right)$. Let the desire point is at a distance x from water at 100°*C*.



$\because$ Rate of ice melting = Rate at which steam is being produced

$\Rightarrow\left(\frac{dm}{dt}\right)_{Steam}=\left(\frac{dm}{dt}\right)_{Ice}\Rightarrow\left(\frac{\Delta\theta}{Ll}\right)_{Steam}=\left(\frac{\Delta\theta}{Ll}\right)_{Ice}$

$\Rightarrow\frac{(200-100)}{540\times x}=\frac{(200-0)}{80(3.1-x)}\Rightarrow x=0.4\ m=40\ cm$

34. (c) $Q=\sigma A\ t\ (T^4-T_0^4)$

If T, T_0, σ and t are same for both bodies then

$\frac{Q_{sphere}}{Q_{cube}}=\frac{A_{sphere}}{A_{cube}}=\frac{4\pi r^2}{6a^2}$ .....(i)

But according to problem, volume of sphere = Volume of cube

$\Rightarrow\frac{4}{3}\pi r^3=a^3\Rightarrow a=\left(\frac{4}{3}\pi\right)^{1/3}r$

Substituting the value of a in equation (i) we get

$\frac{Q_{sphere}}{Q_{cube}}=\frac{4\pi r^2}{6a^2}=\frac{4\pi r^2}{6\left\{\left(\frac{4}{3}\pi\right)^{1/3}r\right\}^2}$

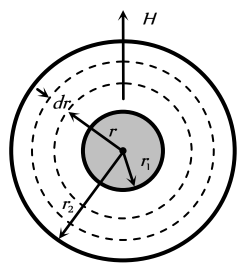
$=\frac{4\pi r^2}{6\left(\frac{4}{3}\pi\right)^{2/3}r^2}=\left(\frac{\pi}{6}\right)^{1/3}:1$

35. (d) Equation of thermal conductivity of the given combination $K_{eq}=\frac{l_1+l_2}{\frac{l_1}{K_1}+\frac{l_2}{K_2}}=\frac{x+4x}{\frac{x}{K}+\frac{4x}{2K}}=\frac{5}{3}K$. Hence rate of flow of heat through the given combination is

$\frac{Q}{t}=\frac{K_{eq}.A(T_2-T_1)}{(x+4x)}=\frac{\frac{5}{3}K\ A(T_2-T_1)}{5x}=\frac{\frac{1}{3}K\ A(T_2-T_1)}{x}$

On comparing it with given equation we get $f=\frac{1}{3}$

36. (a) Consider a concentric spherical shell of radius r and thickness dr as shown in fig.



The radial rate of flow of heat through this shell in steady state will be $H = \frac{dQ}{dt} = -KA\frac{dT}{dr} = -K(4\pi r^2)\frac{dT}{dr}$

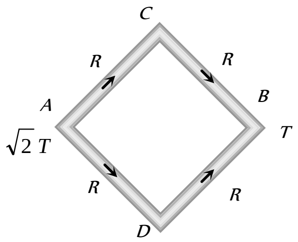
$$\Rightarrow \int_{r_1}^{r_2} \frac{dr}{r^2} = -\frac{4\pi K}{H}\int_{T_1}^{T_1} dT$$

Which on integration and simplification gives

$$H = \frac{dQ}{dt} = \frac{4\pi K r_1 r_2 (T_1 - T_2)}{r_2 - r_1} \Rightarrow \frac{dQ}{dt} \propto \frac{r_1 r_2}{(r_2 - r_1)}$$

37. (c) Similar to Q.No.26

Temperature difference between C and D is zero.



Graphical Questions

1. (c) Rate of cooling $\left(-\frac{dT}{dt}\right) \propto$ emissivity (e)

From graph, $\left(-\frac{dT}{dt}\right)_x > \left(-\frac{dT}{dt}\right)_y \Rightarrow e_x > e_y$

Further emissivity $(e) \propto$ Absorptive power $(a) \Rightarrow a_x > a_y$

($\because$ good absorbers are good emitters).

2. (b) According to Wien's law $\lambda_m \propto \frac{1}{T}$ and from the figure $(\lambda_m)_1 < (\lambda_m)_3 < (\lambda_m)_2$ therefore $T_1 > T_3 > T_2$.

3. (d) $\frac{A_T}{A_{2000}} = \frac{16}{1}$ (given)

Area under $e_\lambda - \lambda$ curve represents the emissive power of body and emissive power $\propto T^4$

(Hence area under $e_\lambda - \lambda$ curve) $\propto T^4$

$$\Rightarrow \frac{AT}{A_{2000}} = \left(\frac{T}{2000}\right)^4 \Rightarrow \frac{16}{1} = \left(\frac{T}{2000}\right)^4 \Rightarrow T = 4000K.$$

4. (c) According to Wein's law $\lambda_m \propto \frac{1}{T} \Rightarrow \nu_m \propto T$. As the temperature of body increases, frequency corresponding to maximum energy in radiation (ν) increases this is shown in graph (c).

5. (c) According to Wein's displacement law.

6. (b) For θ-t plot, rate of cooling $= \frac{d\theta}{dt} =$ slope of the curve.

At P, $\frac{d\theta}{dt} = \tan\phi_2 = k(\theta_2 - \theta_0)$, where k = constant.

At Q $\frac{d\theta}{dt} = \tan\phi_1 = k(\theta_1 - \theta_0) \Rightarrow \frac{\tan\phi_2}{\tan\phi_1} = \frac{\theta_2 - \theta_0}{\theta_1 - \theta_0}$

7. (a) According to Wein's displacement law

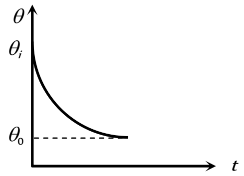
$$\lambda_m \propto \frac{1}{T} \Rightarrow \lambda_{m_2} < \lambda_{m_1} \quad (\because\ T_1 < T_2)$$

There fore I–λ graph for T_2 have lesser wavelength (λ_m) and so curve for T_2 will shift towards left side.

8. (d) Area under given curve represents emissive power and emissive power $\propto T \Rightarrow A \propto T^4$

$$\Rightarrow \frac{A_2}{A_1} = \frac{T_2^4}{T_1^4} = \frac{(273+327)^4}{(273+27)^4} = \left(\frac{600}{300}\right)^4 = \frac{16}{1}$$

9. (b) According to Newton's law of cooling



Rate of cooling ∝ Temperature difference

$\Rightarrow -\frac{d\theta}{dt} \propto (\theta - \theta_0) \Rightarrow -\frac{d\theta}{dt} = \alpha\,(\theta - \theta_0)$ (α= constant)

$\Rightarrow \int_{\theta_i}^{\theta} \frac{d\theta}{(\theta - \theta_0)} = -\alpha \int_0^t dt \Rightarrow \theta = \theta_0 + (\theta_i - \theta_0)e^{-\alpha t}$

This relation tells us that, temperature of the body varies exponentially with time from θ_i to θ_0

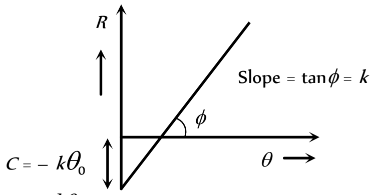
Hence graph (*b*) is correct.

10. (a) According to Wein's displacement law $\lambda_m \propto \frac{1}{T}$. Hence, if temperature increases λ_m decreases *i.e.,* peak of the $E - \lambda$ curve shift towards left.

11. (c) Rate of loss of heat (*R*) ∝ temperature difference

$\Rightarrow R \propto (\theta - \theta_0) \Rightarrow R = k(\theta - \theta_0) = k\theta - k\theta_0$ (*k*= constant)

on comparing it with $y = mx + c$ it is observed that, the graph between *R* and θ will be straight line with slope =*k* and intercept $= -k\theta_0$



12. (c) $\frac{dQ}{dt} = -KA\frac{d\theta}{dx}$

$\because \frac{dQ}{dt}$, *K* and *A* are constants for all points

$\Rightarrow d\theta \propto -dx$; *i.e.* temperature will decrease linearly with *x*.

13. (b) Since the curved surface of the conductor is thermally insulated, therefore, in steady state, the rate of flow of heat at every section will be the same. Hence the curve between *H* and *x* will be straight line parallel to *x*-axis.

14. (d) According to Stefan's law $E = \sigma T^4$

$\Rightarrow \log E = \log\sigma + 4\log T \Rightarrow \log E = 4\log T + \log\sigma$

on comparing this equations with $y = mx + C$

we find that graph between log *E* and log *T* will be a straight line, having positive slope (*m* = 4) and intercept on log *E* axis equal to $\log\sigma$

15. (c) $\frac{d\theta}{dt} = \frac{\varepsilon A\sigma}{mc} 4\theta_0^3 \Delta\theta$

For given sphere and cube $\frac{\varepsilon A\sigma}{mc} 4\theta_0^3 \Delta\theta$ is constant so for both rate of fall of temperature $\frac{d\theta}{dt}$ = constant

16. (b) $\lambda_m T = b$ where $b = 2.89 \times 10^{-3} mK$

$\Rightarrow T = \frac{b}{\lambda_m} = \frac{2.89 \times 10^{-3}}{1.5 \times 10^{-6}} \approx 2000K$

17. (b) Wein's law $\lambda_m \propto \frac{1}{T}$ or $\nu_m \propto T$

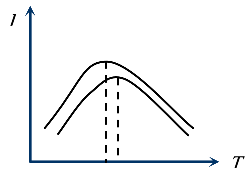
ν increases with temperature. So the graph will be straight line.

Assertion and Reason

1. (a) According to Kirchoff's law $\frac{e_\lambda}{a_\lambda} = E_\lambda$

If for a particular wave length $E_\lambda = 1 \Rightarrow e_\lambda = a_\lambda$ *i.e.,* aborptivity of a body is equal to it's emissivity. This statement also reveals that a good radiator is also a good absorber and vice versa.

2. (c) According to Weins law $\lambda_m T$ = constant *i.e.,* peak emission wavelength $\lambda_m \propto \frac{1}{T}$. Also as T increases λ_m decreases.



Hence assertion is true but reason is false.

3. (b) During the day when water is cooler than the land, the wind blows off the water onto the land (as warm air rises and cooler air fills the place). Also at night, the effect is reversed (since the water is usually warmer than the surrounding air on land). Due to this wind flow the temperature near the sea coast remains moderate.

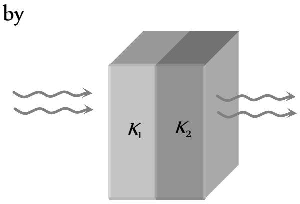
4. (c) Heat is carried away from a fire sideways mainly by radiations. Above the fire, heat is carried by both radiation and by convection of air. The latter process carries much more heat.

5. (e) Assertion is false because at absolute zero (0 *K*), heat is neither radiates nor absorbed. Reason is the statement of Stefan's law, as $E \propto T^4$.

6. (a) Woolen fibres encloses a large amount of air in them. Both wool and air are the bad conductors of heat and the coefficient of thermal conductivity is small. So, they prevent any loss of heat from our body.

7. (d) Equivalent thermal conductivity of two equally thick plates in series combination is given by

$\frac{2}{K} = \frac{1}{K_1} + \frac{1}{K_2}$



If $K_1 < K_2$

then $K_1 < K < K_2$

Hence assertion and reason both are false.

8. (c) Hollow metallic closed container maintained at a uniform temperature can act as source of black body. It is also well-known that all metals cannot act as black body because if we take a highly metallic polished surface. It will not behave as a perfect black body.

9. (b) This is in accordance with the Stefan's law $E \propto T^4$.

10. (c) At a high temperature (6000 *K*), the sun acts like a perfect blackbody emitting complete radiation. That's why the radiation coming from the sun's surface follows Stefan's law $E = \sigma T^4$.

11. (a) From Wein's displacement law, temperature $(T) \propto 1/\lambda_m$ (where λ_m is the maximum wavelength). Thus temperature of a body is inversely proportional to the wavelength. Since blue star has smaller wavelength and red star has maximum wavelength, therefore blue star is at higher temperature then red star.

12. (b) From the definition heat flow, $Q = \dfrac{KA.\Delta\theta t}{l}$

Thermal conductivity $K = \dfrac{\theta \times l}{A \times \Delta\theta \times t}$

$\Rightarrow K = \dfrac{J \times m}{m^2 \times K \times \sec} = \dfrac{watt}{m \times K}$

If thermal conductivity of a substance is high, it will pass more heat.

13. (c) The thermal conductivity of brass is high *i.e.,* brass is a good conductor of heat. So, when a brass tumbler is touched, heat quickly flows from human body to tumbler. Consequently, the tumbler appears colder, on the other hand wood is a bad conductor. So, heat does not flow from the human body to the wooden tray in this case. Thus it appears comparatively hotter.

14. (b) Light radiations and thermal radiations both belongs to electromagnetic spectrum. Light radiations belongs to visible region while thermal radiation belongs to infrared region of *EM* spectrum. Also *EM* radiations requires no medium for propagation.

15. (a) When the temperature of the atmosphere reaches below 0°*C*, then the water vapours present in air, instead of condensing, freeze directly in the form of minute particles of ice. Many particles coalesce and take cotton-like shape which is called snow. Thus snow contains air packets in which convection currents cannot be formed. Hence snow is a good heat insulator. In ice there is no air, so it is a bad insulator.

16. (e) In the process of convection, the liquid at the bottom, becoming lighter, rises up. Thus the basis of convection is the difference in weight and upthrust. In weightlessness, this difference does not exist. So convection is not possible.

17. (b) Both assertion and reason are true but reason is not correctly explaining the assertion.

18. (c) The 98.4°*F* is the standard body temperature of a man. If a man touch a iron or wooden ball at 98.4° *F*, no heat transfer takes place between ball and man, so both the balls would feel equally hot for the man.

19. (c) According to Wien's displacement law the $\lambda_m \propto \dfrac{1}{T}$.

Hence assertion is true but reason is false.

20. (e) It is not necessary that all black coloured object are black bodies. For example, if we take a black surface which is highly polished, it will not behave as a perfect black body.

A perfectly black body absorbs all the radiations incident on it.

21. (b) By definition, $R = \dfrac{(\theta_1 - \theta_2)}{Q/t} = \dfrac{l}{KA} \Rightarrow R \propto \dfrac{1}{K}$.

22. (c) Actually, the process of radiation does not require any material for transmission of heat.

Thermal radiation travels with the velocity of light and hence the fastest mode of the transfer. Thermal radiation is always transmitted in a straight line.

23. (c) Two thin blankets put together are more warm because an insulating layer of air (as air is good insulator of heat) is enclosed between two blankets due to which it gives more warmness.

24. (a) When the animals feel cold, they curl their bodies into a ball so as to decrease the surface area of their bodies. As total energy radiated by body varies directly as the surface area of the body, the loss of heat due to radiation would be reduced.

Transmission of Heat

SET Self Evaluation Test -15

1. A rod of 40 cm in length and temperature difference of 80^oC at its two ends. Another rod B of length 60 cm and of temperature difference 90^oC, having the same area of cross-section. If the rate of flow of heat is the same, then the ratio of their thermal conductivities will be
   (a) 3 : 4 (b) 4 : 3
   (c) 1 : 2 (d) 2 : 1

2. Two vessels of different materials are similar in size in every respect. The same quantity of ice filled in them gets melted in 20 *minutes* and 40 *minutes* respectively. The ratio of thermal conductivities of the materials is [AFMC 1998]
   (a) 5 : 6 (b) 6 : 5
   (c) 3 : 1 (d) 2 : 1

3. In a steady state of thermal conduction, temperature of the ends *A* and *B* of a 20 *cm* long rod are 100^oC and 0^oC respectively. What will be the temperature of the rod at a point at a distance of 6 *cm* from the end *A* of the rod
   (a) -30^oC (b) 70^oC
   (c) 5^oC (d) None of the above

4. Four rods of silver, copper, brass and wood are of same shape. They are heated together after wrapping a paper on it, the paper will burn first on
   (a) Silver (b) Copper
   (c) Brass (d) Wood

5. The two opposite faces of a cubical piece of iron (thermal conductivity = 0.2 CGS units) are at 100^oC and 0^oC in ice. If the area of a surface is $4cm^2$, then the mass of ice melted in 10 minutes will be
   (a) 30 *gm* (b) 300 *gm*
   (c) 5 *gm* (d) 50 *gm*

6. Wein's constant is 2892×10^{-6} MKS unit and the value of λ_m from moon is 14.46 microns. What is the surface temperature of moon
   (a) 100 *K* (b) 300 *K*
   (c) 400 *K* (d) 200 *K*

7. If at temperature $T_1 = 1000K$, the wavelength is $1.4\times10^{-6}m$, then at what temperature the wavelength will be $2.8\times10^{-6}m$
   (a) 2000*K* (b) 500*K*
   (c) 250*K* (d) None of these

8. The wavelength of maximum intensity of radiation emitted by a star is 289.8 *nm*. The radiation intensity for the star is : (Stefan's constant $5.67\times10^{-8}Wm^{-2}K^{-4}$, constant $b = 2898\mu mK$) -
   (a) $5.67\times10^8\ W/m^2$ (b) $5.67\times10^{12} W/m^2$
   (c) $10.67\times10^7 W/m^2$ (d) $10.67\times10^{14} W/m^2$

9. Two friends *A* and *B* are waiting for another friend for tea. *A* took the tea in a cup and mixed the cold milk and then waits. *B* took the tea in the cup and then mixed the cold milk when the friend comes. Then the tea will be hotter in the cup of

   (a) *A*
   (b) *B*
   (c) Tea will be equally hot in both cups
   (d) Friend's cup

10. There are two spherical balls *A* and *B* of the same material with same surface, but the diameter of *A* is half that of *B*. If *A* and *B* are heated to the same temperature and then allowed to cool, then
   (a) Rate of cooling is same in both
   (b) Rate of cooling of *A* is four times that of *B*
   (c) Rate of cooling of *A* is twice that of *B*
   (d) Rate of cooling of *A* is $\frac{1}{4}$ times that of *B*

11. Five identical rods are joined as shown in figure. Point *A* and *C* are maintained at temperature 120°*C* and 20°*C* respectively. The temperature of junction *B* will be

   (a) 100°*C*
   (b) 80°*C*
   (c) 70°*C*
   (d) 0°*C*

12. Can we boil water inside the earth satellite by convection
   (a) Yes
   (b) No
   (c) Nothing can be said
   (d) In complete information is given

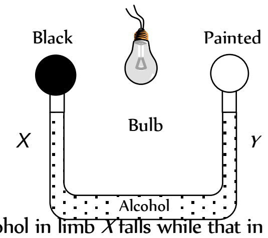
13. In the following figure, two insulating sheets with thermal resistances *R* and 3*R* as shown in figure. The temperature θ is

   (a) 20°*C*
   (b) 60°*C*
   (c) 75°*C*
   (d) 80°*C* [RPMT 2004]

14. The top of insulated cylindrical container is covered by a disc having emissivity 0.6 and thickness 1 *cm*. The temperature is maintained by circulating oil as shown in figure. If temperature of upper surface of disc is 127°*C* and temperature of surrounding is 27°*C*, then the radiation loss to the surroundings will be (Take $\sigma = \frac{17}{3}\times10^{-8} W/m^2K^4$) [EAMCET 2001]

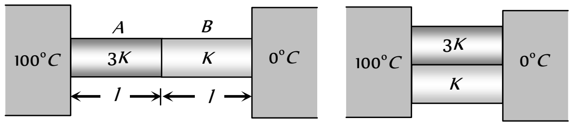
   (a) 595 *J/m × sec* (b) 595 *cal/m × sec*
   (c) 991.0 *J/m × sec* (d) 440 *J/m × sec*

15. The following figure shows two air-filled bulbs connected by a U-tube partly filled with alcohol. What happens to the levels of alcohol in the limbs X and Y when an electric bulb placed midway between the bulbs is lighted



(a) The level of alcohol in limb X falls while that in limb Y rises
(b) The level of alcohol in limb X rises while that in limb Y falls
(c) The level of alcohol falls in both limbs
(d) There is no change in the levels of alcohol in the two limbs

16. Two conducting rods A and B of same length and cross-sectional area are connected (i) In series (ii) In parallel as shown. In both combination a temperature difference of 100°C is maintained. If thermal conductivity of A is $3K$ and that of B is K then the ratio of heat current flowing in parallel combination to that flowing in series combination is



(i) (ii)

(a) $\frac{16}{3}$ (b) $\frac{3}{16}$
(c) $\frac{1}{1}$ (d) $\frac{1}{3}$

17. The area of the glass of a window of a room is $10\ m^2$ and thickness 2mm. The outer and inner temperature are 40^oC and 20^oC respectively. Thermal conductivity of glass in MKS system is 0.2. The heat flowing in the room per second will be

(a) 3×10^4 *joules* (b) 2×10^4 *joules*
(c) 30 *joules* (d) 45 *joules*

18. The spectrum from a black body radiation is a

[MP PMT 1989; RPET 2000]

(a) Line spectrum
(b) Band spectrum
(c) Continuous spectrum
(d) Line and band spectrum both

19. The Wien's displacement law express relation between

[CBSE PMT 2002]

(a) Frequency and temperature
(b) Temperature and amplitude
(c) Wavelength and radiating power of black body
(d) Wavelength corresponding to maximum energy and temperature

20. A black body is heated from 27^oC to 127^oC. The ratio of their energies of radiations emitted will be

[AIIMS 2001]

(a) 3: 4 (b) 9 : 16
(c) 27 : 64 (d) 81: 256

21. A body takes T *minutes* to cool from 62^oC to 61^oC when the surrounding temperature is 30^oC. The time taken by the body to cool from 46^oC to 45.5^oC is

[MP PET 1999]

(a) Greater than T *minutes*
(b) Equal to T *minutes*
(c) Less than T *minutes*
(d) Equal to $T/2$ *minutes*

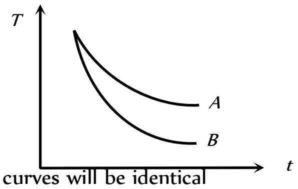
22. A partition wall has two layers A and B in contact, each made of a different material. They have the same thickness but the thermal conductivity of layer A is twice that of layer B. If the steady state temperature difference across the wall is $60K$, then the corresponding difference across the layer A is

[SCRA 1994; JIPMER 2001]

(a) $10\ K$ (b) $20\ K$
(c) $30K$ (d) $40\ K$

23. Water and turpentine oil (specific heat less than that of water) are both heated to same temperature. Equal amounts of these placed in identical calorimeters are then left in air

[MP PMT 1989]



(a) Their cooling curves will be identical
(b) A and B will represent cooling curves of water and oil respectively
(c) B and A will represent cooling curves of water and oil respectively
(d) None of the above

Answers and Solutions

(SET -15)

1. (a) $\frac{dQ}{dt}=\frac{KA(\theta_1-\theta_2)}{d}$

$\Rightarrow \frac{K_1\Delta\theta_1}{l_1}=\frac{K_2\Delta\theta_2}{l_2}$ $\left(\because \frac{dQ}{dt}\text{ and } A \text{ are same}\right)$

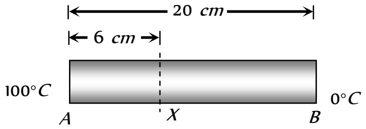
$\Rightarrow \frac{K_1\times80}{40}=\frac{K_2\times90}{60}\Rightarrow\frac{K_1}{K_2}=\frac{3}{4}$

2. (d) $\frac{Q}{t}=\frac{KA(\theta_1-\theta_2)}{l}\Rightarrow\frac{mL}{t}=\frac{KA(\theta_1-\theta_2)}{l}$

$\Rightarrow K\propto\frac{1}{t}$ ($\because$ remaining quantities are same)

$\Rightarrow \frac{K_1}{K_2}=\frac{t_2}{t_1}=\frac{40}{20}=\frac{2}{1}$.

3. (b) In steady state, temperature gradient = constant



$$\Rightarrow \frac{(\theta_A - \theta_x)}{6} = \frac{(\theta_A - \theta_B)}{20} \Rightarrow (100 - \theta) = \frac{6}{20} \times (100 - 0)$$

$$\Rightarrow \theta_x = 70°C$$

4. (d) In conducting rod given heat transmits so burning temperature does not reach soon. In wooden rod heat doesn't conducts.

5. (b) $Q = mL = KA\frac{(\theta_1 - \theta_2)}{l}t \Rightarrow m = \frac{1}{L} \times KA\frac{(\theta_1 - \theta_2)}{l} \times t$

$$= \frac{1}{80} \times 0.2 \times 4 \times \frac{(100-0)}{\sqrt{4}} \times 10 \times 60 \quad (\because l^2 = 4 \Rightarrow l = \sqrt{4})$$

$$= \frac{0.2 \times 4 \times 100 \times 600}{80 \times 2} = 300\ gm$$

6. (d) $\lambda_m T = 2892 \times 10^{-6} \Rightarrow T = \frac{2892 \times 10^{-6}}{14.46 \times 10^{-6}} = 200\ K$

7. (a) $\lambda_m \propto \frac{1}{T} \Rightarrow \lambda m_1 T_1 = \lambda m_2 T_2$

$$\Rightarrow T_2 = \frac{\lambda m_1 T_1}{\lambda m_2} = \frac{1.4 \times 10^{-6} \times 1000}{2.8 \times 10^{-6}} = 2000K$$

8. (a) We know $\lambda_{max} T = b$

$$\Rightarrow T = \frac{b}{\lambda_{max}} = \frac{2898 \times 10^{-6}}{289.8 \times 10^{-9}} = 10^4 K$$

According to Stefan's Law

$$E = \sigma T^4 = (5.67 \times 10^{-8})(10^4)^4 = 5.67 \times 10^8 W/m^2$$

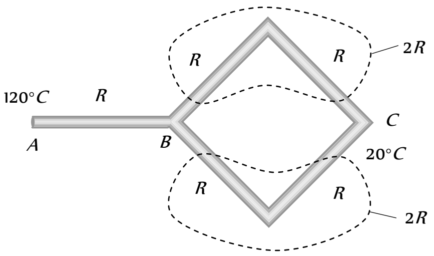
9. (a) The rate of heat loss is proportional to the difference in temperature. The difference of temperature between the tea in cup A and the surrounding is reduced, so it loses less heat. the tea in cup B loses more heat because of large temperature difference. Hence the tea in cup A will be hotter.

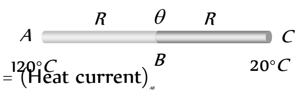
10. (c) Rate of cooling $R_C = \frac{A\varepsilon\sigma(T^4 - T_0^4)}{mc} = \frac{A\varepsilon\sigma(T^4 - T_0^4)}{V\rho C}$

$$\Rightarrow R_C \propto \frac{A}{V} \propto \frac{1}{r} \propto \frac{1}{(\text{Diameter})} \qquad (\because m = \rho V)$$

Since diameter of A is half that of B so it's rate of cooling will be doubled that of B

11. (c) If thermal resistance of each rod is considered R then, the given combination can be redrawn as follows





$(\text{Heat current})_{AC} = (\text{Heat current})_{AB}$

$$\frac{(120-20)}{R} = \frac{(120-\theta)}{R} \Rightarrow \theta = 70°C$$

12. (b) No, In convection the hot liquid at the bottom becomes lighter and hence it rises up. In this way the base of the convection is the difference in weight and upthrust. In the state of weightlessness this difference does not occur, so convection is not possible.

13. (b)

14. (d) For the two sheets $H_1 = H_2$ (H = Rate of heat flow)

$$\Rightarrow \frac{(100-\theta)}{R} = \frac{(\theta - 20)}{3R} \Rightarrow \theta = 80°C$$

15. (a) Rate of heat loss per unit area due to radiation *i.e.* emissive power $e = \varepsilon\sigma(T^4 - T_0^4)$

$$= 0.6 \times \frac{17}{3} \times 10^{-8} \times [(400)^4 - (300)^4]$$

$$= 3.4 \times 10^{-8} \times (175 \times 10^8) = 3.4 \times 175 = 595\ J/m^2 \times \sec$$

16. (a) Black bulb absorbs more heat in comparison with painted bulb. So air in black bulb expands more. Hence the level of alcohol in limb X falls while that in limb Y rises.

17. (a) Heat current $H = \frac{\Delta\theta}{R} \Rightarrow \frac{H_P}{H_S} = \frac{R_S}{R_P}$

In first case : $R_S = R_1 + R_2 = \frac{l}{(3K)A} + \frac{l}{KA} = \frac{4}{3}\frac{l}{KA}$

In second case : $R_P = \frac{R_1 R_2}{R_1 + R_2} = \frac{\frac{l}{(3K)A} \times \frac{l}{KA}}{\left(\frac{l}{(3K)A} + \frac{l}{KA}\right)} = \frac{l}{4KA}$

$$\therefore \frac{H_P}{H_S} = \frac{\frac{4l}{3KA}}{\frac{l}{4KA}} = \frac{16}{3}$$

17. (b) $\frac{Q}{t} = \frac{KA(\theta_1 - \theta_2)}{l} = \frac{0.2 \times 10 \times 20}{2 \times 10^{-3}} = 2 \times 10^4\ J/\sec$

18. (c) All wavelengths are emitted.

19. (d)

20. (d) $\frac{Q_1}{Q_2} = \frac{T_1^4}{T_2^4} = \left(\frac{273+27}{273+127}\right)^4 = \left(\frac{300}{400}\right)^4 = \frac{81}{256}$

21. (b) In first step

$$\frac{62-61}{T} = K\left[\frac{62-61}{2} - 30°\right] \Rightarrow \frac{1}{T} = K[81.5] \qquad \text{...(i)}$$

In second step, suppose process takes T' min then

$$\frac{46-45.5}{T'} = K\left[\frac{46-45.5}{2} - 30\right] \frac{0.5}{T'} = K[15.75] \qquad \text{...(ii)}$$

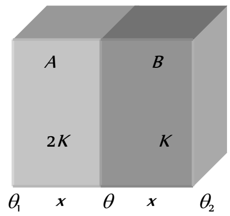
On diving equation (i) and (ii) $\frac{2T'}{T} = 2 \Rightarrow T' = T$

***

22. (b) Suppose conductivity of layer B is K, then it is $2K$ for layer A. Also conductivity of

combination layers A and B is K

$$= \frac{2\times 2K\times K}{(2K+K)} = \frac{4}{3}K$$



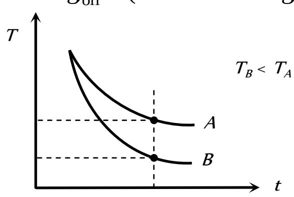
Hence $\left(\frac{Q}{t}\right)_{Combination} = \left(\frac{Q}{t}\right)_A$

$$\Rightarrow \frac{4}{3}\frac{KA\times 60}{2x} = \frac{2K.A\times(\Delta\theta)_A}{x} \Rightarrow (\Delta\theta)_A = 20K$$

23. (b) As we know, Rate of cooling $\propto \frac{1}{\text{specific heat(c)}}$

$\because c_{oil} < c_{Water}$

$\Rightarrow$ (Rate of cooling)$_{oil}$ > (Rate of cooling)$_{Water}$



It is clear that, at a particular time after start cooling, temperature of oil will be less than that of water.

So graph B represents the cooling curve of oil and A represents the cooling curve of water

16
Simple Harmonic Motion

Periodic and Oscillatory (Vibratory) Motion

(1) A motion, which repeat itself over and over again after a regular interval of time is called a periodic motion

Revolution of earth around the sun (period one year), Rotation of earth about its polar axis (period one day), Motion of hour's hand of a clock (period 12-hour) *etc* are common example of periodic motion.

(2) Oscillatory or vibratory motion is that motion in which a body moves to and fro or back and forth repeatedly about a fixed point in a definite interval of time. In such a motion, the body is confined with in well-defined limits on either side of mean position. Oscillatory motion is also called as harmonic motion.

(i) Common examples are

(a) The motion of the pendulum of a wall clock

(b) The motion of a load attached to a spring, when it is pulled and then released.

(c) The motion of liquid contained in U-tube when it is compressed once in one limb and left to itself.

(d) A loaded piece of wood floating over the surface of a liquid when pressed down and then released executes oscillatory motion.

(ii) Harmonic oscillation is that oscillation which can be expressed in terms of single harmonic function (*i.e.* sine or cosine function). *Example* : $y = a\sin\omega t$ or $y = a\cos\omega t$

(iii) Non-harmonic oscillation is that oscillation which can not be expressed in terms of single harmonic function. It is a combination of two or more than two harmonic oscillations. *Example* : $y = a\sin\omega t + b\sin 2\omega t$.

Simple Harmonic Motion

(1) Simple harmonic motion is a special type of periodic motion, in which a particle moves to and fro repeatedly about a mean position.

(2) In linear S.H.M. a restoring force which is always directed towards the mean position and whose magnitude at any instant is directly proportional to the displacement of the particle from the mean position at that instant *i.e.* Restoring force $\propto$ Displacement of the particle from mean position.

$$F \propto -x \Rightarrow F = -kx$$

Where k is known as force constant. Its S.I. unit is Newton/meter and dimension is $[MT^{-2}]$.

(3) In stead of straight line motion, if particle or centre of mass of body is oscillating on a small arc of circular path, then for angular S.H.M.

Restoring torque $(\tau) \propto -$ Angular displacement (θ)

Some Important Definitions

(1) **Time period** (T) **:** It is the least interval of time after which the periodic motion of a body repeats itself.

S.I. unit of time period is second.

(2) **Frequency** (n) **:** It is defined as the number of oscillations executed by body per second. S.I unit of frequency is hertz (Hz).

(3) **Angular Frequency** (ω) **:** Angular frequency of a body executing periodic motion is equal to product of frequency of the body with factor 2π. Angular frequency $\omega = 2\pi n$

Its unit is *rad/sec.*

(4) **Phase** (ϕ) **:** Phase of a vibrating particle at any instant is a physical quantity, which completely express the position and direction of motion, of the particle at that instant with respect to its mean position.

In oscillatory motion the phase of a vibrating particle is the argument of *sine* or *cosine* function involved to represent the generalised equation of motion of the vibrating particle.

$$y = a\sin\theta = a\sin(\omega t + \phi_0)$$

here, $\theta = \omega t + \phi_0$ = phase of vibrating particle.

ϕ = Initial phase or epoch. It is the phase of a vibrating particle at t = 0.

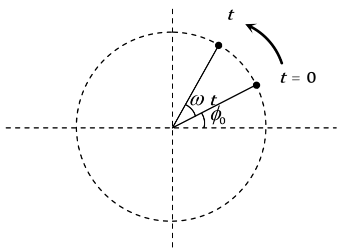


Fig. 16.2

(1) **Same phase :** Two vibrating particle are said to be in same phase, if the phase difference between them is an even multiple of π or path difference is an even multiple of $(\lambda / 2)$ or time interval is an even multiple of $(T/2)$ because 1 time period is equivalent to 2π *rad* or 1 wave length (λ).

(2) **Opposite phase :** When the two vibrating particles cross their respective mean positions at the same time moving in opposite directions, then the phase difference between the two vibrating particles is 180°.

Opposite phase means the phase difference between the particle is an odd multiple of π (say π, 3π, 5π, 7π.....) or the path difference is an odd multiple of λ (say $\frac{\lambda}{2}, \frac{3\lambda}{2}$,.......) or the time interval is an odd multiple of $(T/2)$.

(3) **Phase difference :** If two particles performs S.H.M and their equation are

$$y_1 = a\sin(\omega t + \phi_1) \text{ and } y_2 = a\sin(\omega t + \phi_2)$$

then phase difference $\Delta\phi = (\omega t + \phi_2) - (\omega t + \phi_1) = \phi_2 - \phi_1$

Displacement in S.H.M.

(1) The displacement of a particle executing S.H.M. at an instant is defined as the distance of particle from the mean position at that instant.

(2) Simple harmonic motion is also defined as the projection of uniform circular motion on any diameter of circle of reference.

(3) If the projection is taken on *y*-axis. then from the figure

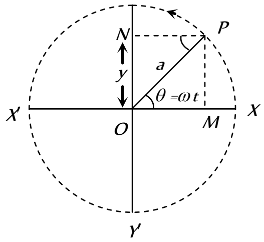

Fig. 16.3

$$y = a\sin\omega t = a\sin\frac{2\pi}{T}t = a\sin 2\pi n t = a\sin(\omega t \pm \phi)$$

(i) $y = a\sin\omega t$ when the time is noted from the instant when the vibrating particle is at mean position.

(ii) $y = a\cos\omega t$ when the time is noted from the instant when the vibrating particle is at extreme position.

(iii) $y = a\sin(\omega t \pm \phi)$ when the vibrating particle is ϕ phase leading or lagging from the mean position.

(4) If the projection of P is taken on *X*-axis then equations of S.H.M. can be given as

$$x = a\cos(\omega t \pm \phi) = a\cos\left(\frac{2\pi}{T}t \pm \phi\right) = a\cos(2\pi n t \pm \phi)$$

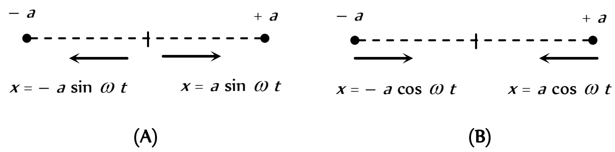

Fig. 16.4

(5) Direction of displacement is always away from the equilibrium position, particle either is moving away from or is coming towards the equilibrium position.

Velocity in S.H.M.

(1) Velocity of the particle executing S.H.M. at any instant, is defined as the time rate of change of its displacement at that instant.

(2) In case of S.H.M. when motion is considered from the equilibrium position, displacement $y = a\sin\omega t$

So $v = \frac{dy}{dt} = a\omega\cos\omega t = a\omega\sqrt{1 - \sin^2\omega t} = \omega\sqrt{a^2 - y^2}$

[As $\sin\omega t = y/a$]

(3) At mean position or equilibrium position (y = 0 and $\theta = \omega t$ = 0), velocity of particle is maximum and it is $v_{max} = a\omega$.

(4) At extreme position ($y = \pm a$ and $\theta = \omega t = \pi/2$), velocity of oscillating particle is zero *i.e.* v = 0.

(5) From $v = \omega\sqrt{a^2 - y^2} \Rightarrow v^2 = \omega^2(a^2 - y^2) \Rightarrow \frac{v^2}{\omega^2} = a^2 - y^2$

$$\Rightarrow \frac{v^2}{a^2\omega^2} + \frac{y^2}{a^2} = 1$$

This is the equation of ellipse. Hence the graph between v and y is an ellipse.

For ω = 1, graph between v and y is a circle.

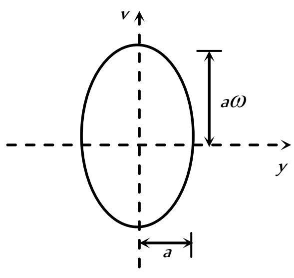

Fig. 16.5

(6) Direction of velocity is either towards or away from mean position depending on the position of particle.

Acceleration in S.H.M.

(1) The acceleration of the particle executing S.H.M. at any instant, is defined as the rate of change of its velocity at that instant. So acceleration

$$A = \frac{dv}{dt} = \frac{d}{dt}(a\omega\cos\omega t) = -\omega^2 a\sin\omega t = -\omega^2 y$$

[As $y = a\sin\omega t$]

(2) In S.H.M. as $|\text{Acceleration}| = \omega^2 y$ is not constant. So equations of translatory motion can not be applied.

(3) In S.H.M. acceleration is maximum at extreme position (at $y = \pm a$).

Hence $|A_{max}| = \omega^2 a$ when $|\sin\omega t| = \text{maximum} = 1$ *i.e.* at $t = \frac{T}{4}$ or $\omega t = \frac{\pi}{2}$. From equation (ii) $|A_{max}| = \omega^2 a$ when $y = a$.

(i) In S.H.M. acceleration is minimum at mean position

From equation (i) $A_{min} = 0$ when $\sin\omega t = 0$ *i.e.* at $t = 0$ or $t = \frac{T}{2}$ or $\omega t = \pi$. From equation (ii) $A_{min} = 0$ when $y = 0$

(ii) Acceleration is always directed towards the mean position and so is always opposite to displacement

i.e., $A \propto -y$

Graph between acceleration (A) and displacement (y) is a straight line as shown

Slope of the line = $-\omega$

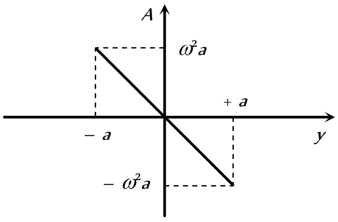

Fig. 16.6

Comparative Study of Displacement Velocity and Acceleration

(1) All the three quantities displacement, velocity and acceleration show harmonic variation with time having same period.

(2) The velocity amplitude is ω times the displacement amplitude

(3) The acceleration amplitude is ω^2 times the displacement amplitude

(4) In S.H.M. the velocity is ahead of displacement by a phase angle $\pi / 2$

(5) In S.H.M. the acceleration is ahead of velocity by a phase angle $\pi / 2$

(6) The acceleration is ahead of displacement by a phase angle of π

Table 16.1 : Various physical quantities in S.H.M. at different position :

Graph	Formula	At mean position	At extreme position
Displacement 	$y = a\sin\omega t$	$y = 0$	$y = \pm a$
Velocity 	$v = a\omega\cos\omega t$ $= a\omega\sin(\omega t + \frac{\pi}{2})$ or $v = \omega\sqrt{a^2 - y^2}$	$v_{max} = a\omega$	$v_{min} = 0$
Acceleration 	$A = -a\omega^2\sin\omega t$ $= a\omega^2\sin(\omega t + \pi)$ or $\lvert A\rvert = \omega^2 y$	$A_{min} = 0$	$\lvert A_{max}\rvert = \omega^2 a$
Force 	$F = -m\omega^2 a\sin\omega t$ or $F = m\omega^2 y$	$F_{min} = 0$	$F_{max} = m\omega^2 a$

Energy in S.H.M.

(1) **Potential energy :** This is an account of the displacement of the particle from its mean position.

(i) The restoring force $F = -ky$ against which work has to be done. Hence potential energy U is given by

$$U = \int dU = -\int dW = -\int_0^x F dx = \int_0^y ky\, dy = \frac{1}{2}ky^2 + U_0$$

where U_0 = Potential energy at equilibrium position.

If $U_0 = 0$ then $U = \frac{1}{2}m\omega^2 y^2$ [As $\omega^2 = k/m$]

(ii) Also $U = \frac{1}{2}m\omega^2 a^2\sin^2\omega t = \frac{1}{4}m\omega^2 a^2(1 - \cos 2\omega t)$

[As $y = a\sin\omega t$]

Hence potential energy varies periodically with double the frequency of S.H.M.

(iii) Potential energy maximum and equal to total energy at extreme positions

$$U_{max} = \frac{1}{2}ka^2 = \frac{1}{2}m\omega^2 a^2 \text{ when } y = \pm a;\ \omega t = \pi/2;\ t = \frac{T}{4}$$

(iv) Potential energy is minimum at mean position

$U_{min} = 0$ when $y = 0$; $\omega t = 0$; $t = 0$

(2) **Kinetic energy :** This is because of the velocity of the particle

Kinetic Energy $K = \frac{1}{2}mv^2 = \frac{1}{2}m\omega^2(a^2 - y^2)$

[As $v = \omega\sqrt{a^2 - y^2}$]

(i) Also $K = \frac{1}{2}m\omega^2 a^2\cos^2\omega t = \frac{1}{4}m\omega^2 a^2(1 + \cos 2\omega t)$

[As $v = a\omega\cos\omega t$]

Hence kinetic energy varies periodically with double the frequency of S.H.M.

(ii) Kinetic energy is maximum at mean position and equal to total energy at mean position.

$$K_{max} = \frac{1}{2} m\omega^2 a^2 \text{ when } y = 0 \; ; \; t = 0 \; ; \; \omega t = 0$$

(iii) Kinetic energy is minimum at extreme position.

$$K_{min} = 0 \qquad \text{when } y = a \; ; \; t = T/4 \; , \; \omega t = \pi/2$$

(3) **Total mechanical energy :** Total mechanical energy always remains constant and it is equal to sum of potential energy and kinetic energy *i.e.* $E = U + K$

$$E = \frac{1}{2} m\omega^2 (a^2 - y^2) + \frac{1}{2} m\omega^2 y^2 = \frac{1}{2} m\omega^2 a^2$$

Total energy is not a position function.

(4) **Energy position graph**

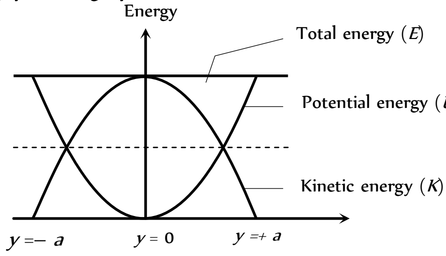

Fig. 16.7

(i) At $y = 0$; $U = 0$ and $K = E$

(ii) At $y = \pm a$; $U = E$ and $K = 0$

(iii) At $y = \pm \frac{a}{2}$; $U = \frac{E}{4}$ and $K = \frac{3E}{4}$

(iv) At $y = \pm \frac{a}{\sqrt{2}}$; $U = K = \frac{E}{2}$

Average Value of P.E. and K.E.

The average value of potential energy for complete cycle is given by

$$U_{average} = \frac{1}{T}\int_0^T U\,dt = \frac{1}{T}\int_0^T \frac{1}{2} m\,\omega^2 a^2 \sin^2(\omega t + \phi) = \frac{1}{4} m\omega^2 a^2$$

The average value of kinetic energy for complete cycle

$$K_{average} = \frac{1}{T}\int_0^T K\,dt = \frac{1}{T}\int_0^T \frac{1}{2} m\,\omega^2 a^2 \cos^2 \omega t\,dt = \frac{1}{4} m\omega^2 a^2$$

Thus average values of kinetic energy and potential energy of harmonic oscillator are equal and each equal to half of the total energy $K_{average} = U_{average} = \frac{1}{2} E = \frac{1}{4} m\omega^2 a^2$.

Differential Equation of S.H.M.

For S.H.M. (linear) Acceleration $\propto$ – (Displacement)

$$A \propto -y \quad \text{or} \quad A = -\omega^2 y \quad \text{or} \quad \frac{d^2 y}{dt^2} = -\omega^2 y$$

or $m\frac{d^2 y}{dt^2} + ky = 0$ [As $\omega = \sqrt{\frac{k}{m}}$]

For angular S.H.M. $\tau = -c\theta$ and $\frac{d^2\theta}{dt^2} + \omega^2\theta = 0$

where $\omega^2 = \frac{c}{I}$ [As c = Restoring torque constant and I = Moment of inertia]

How to Find Frequency and Time Period of S.H.M.

Step 1 : When particle is in its equilibrium position, balance all forces acting on it and locate the equilibrium position mathematically.

Step 2 : From the equilibrium position, displace the particle slightly by a displacement y and find the expression of net restoring force on it.

Step 3 : Try to express the net restoring force acting on particle as a proportional function of its displacement from mean position. The final expression should be obtained in the form.

$$F = -ky$$

Here we put – *ve* sign as direction of F is opposite to the displacement y. If a be the acceleration of particle at this displacement, we have $a = -\left(\frac{k}{m}\right)y$

Step 4 : Comparing this equation with the basic differential equation of S.H.M. we get $\omega^2 = \frac{k}{m} \Rightarrow \omega = \sqrt{\frac{k}{m}}$ or $n = \frac{1}{2\pi}\sqrt{\frac{k}{m}}$

As ω is the angular frequency of the particle in S.H.M., its time period of oscillation can be given as $T = \frac{2\pi}{\omega} = 2\pi\sqrt{\frac{m}{k}}$

(i) In different types of S.H.M. the quantities m and k will go on taking different forms and names. In general m is called inertia factor and k is called spring factor.

Thus $T = 2\pi\sqrt{\frac{\text{Inertia factor}}{\text{Spring factor}}}$ or $n = \frac{1}{2\pi}\sqrt{\frac{\text{Spring factor}}{\text{Inertia factor}}}$

(ii) In linear S.H.M. the spring factor stands for force per unit displacement and inertia factor for mass of the body executing S.H.M. and in Angular S.H.M. k stands for restoring torque per unit angular displacement and inertial factor for moment of inertia of the body executing S.H.M.

For linear S.H.M.

$$T = 2\pi\sqrt{\frac{m}{k}} = \sqrt{\frac{m}{\text{Force/Displacement}}} = 2\pi\sqrt{\frac{\text{Displacement}}{\text{Acceleration}}}$$

Simple Pendulum

(1) An ideal simple pendulum consists of a heavy point mass body (bob) suspended by a weightless, inextensible and perfectly flexible string from a rigid support about which it is free to oscillate.

(2) But in reality neither point mass nor weightless string exist, so we can never construct a simple pendulum strictly according to the definition.

(3) Suppose simple pendulum of length l is displaced through a small angle θ from it's mean (vertical) position. Consider mass of the bob is m and linear displacement from mean position is x

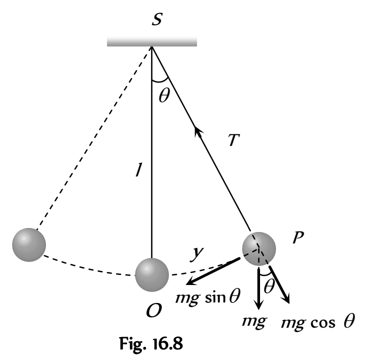

Fig. 16.8

Restoring force acting on the bob

$$F = -mg\sin\theta \quad \text{or} \quad F = -mg\theta = -mg\frac{x}{l}$$

(When θ is small $\sin\theta \simeq \theta = \frac{\text{Arc}}{\text{Length}} = \frac{OP}{l} = \frac{x}{l}$)

$$\therefore \quad \frac{F}{x} = \frac{-mg}{l} = k \quad \text{(Spring factor)}$$

So $T = 2\pi\sqrt{\frac{\text{Inertia factor}}{\text{Spring factor}}} = 2\pi\sqrt{\frac{m}{mg/l}} = 2\pi\sqrt{\frac{l}{g}}$

Factor Affecting Time Period of Simple Pendulum

(1) **Amplitude :** The period of simple pendulum is independent of amplitude as long as its motion is simple harmonic. But if θ is not small, $\sin\theta \neq \theta$ then motion will not remain simple harmonic but will become oscillatory. In this situation if θ is the amplitude of motion. Time period

$$T = 2\pi\sqrt{\frac{l}{g}}\left[1 + \frac{1}{2^2}\sin^2\left(\frac{\theta_0}{2}\right) + ...\right] \approx T_0\left[1 + \frac{{\theta_0}^2}{16}\right]$$

(2) **Mass of the bob :** Time period of simple pendulum is also independent of mass of the bob. This is why

(i) If the solid bob is replaced by a hollow sphere of same radius but different mass, time period remains unchanged.

(ii) If a girl is swinging in a swing and another sits with her, the time period remains unchanged.

(3) **Length of the pendulum :** Time period $T \propto \sqrt{l}$ where l is the distance between point of suspension and center of mass of bob and is called effective length.

(i) When a sitting girl on a swinging swing stands up, her center of mass will go up and so l and hence T will decrease.

(ii) If a hole is made at the bottom of a hollow sphere full of water and water comes out slowly through the hole and time period is recorded till the sphere is empty, initially and finally the center of mass will be at the center of the sphere. However, as water drains off the sphere, the center of mass of the system will first move down and then will come up. Due to this l and hence T first increase, reaches a maximum and then decreases till it becomes equal to its initial value.

(iii) Different graphs

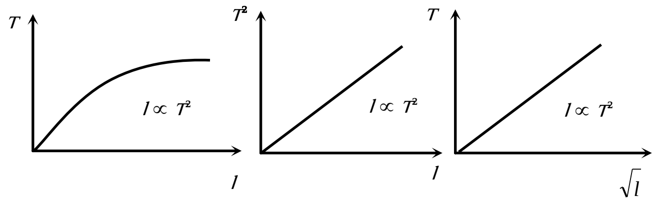

Fig. 16.9

(4) **Effect of g :** $T \propto \frac{1}{\sqrt{g}}$ *i.e.* as g increase T decreases.

(i) As we go high above the earth surface or we go deep inside the mines the value of g decrease, hence time period of pendulum (T) increases.

(ii) If a clock, based on simple pendulum is taken to hill (or on any other planet), g will decrease so T will increases and clock will become slower.

(iii) Different graphs

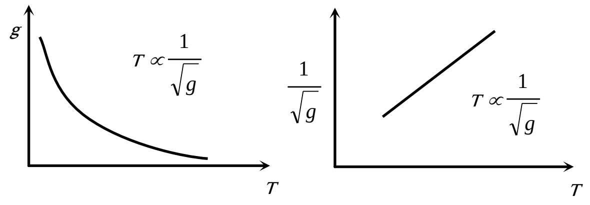

Fig. 16.10

(5) **Effect of temperature on time period :** If the bob of simple pendulum is suspended by a wire then effective length of pendulum will increase with the rise of temperature due to which the time period will increase.

$l = l_0(1 + \alpha\Delta\theta)$ (If $\Delta\theta$ is the rise in temperature, l_0 = initial length of wire, l = final length of wire)

$$\frac{T}{T_0} = \sqrt{\frac{l}{l_0}} = (1 + \alpha\Delta\theta)^{1/2} \approx 1 + \frac{1}{2}\alpha\Delta\theta$$

So $\frac{T}{T_0} - 1 = \frac{1}{2}\alpha\Delta\theta$ *i.e.* $\frac{\Delta T}{T} \approx \frac{1}{2}\alpha\Delta\theta$

Oscillation of Pendulum in Different Situations

(1) **Oscillation in liquid :** If bob a simple pendulum of density ρ is made to oscillate in some fluid of density σ (where $\sigma < \rho$) then time period of simple pendulum gets increased.

As thrust will oppose its weight hence $mg_{eff.} = mg -$ Thrust

or $g_{eff.} = g - \frac{V\sigma g}{V\rho}$ *i.e.* $g_{eff.} = g\left[1 - \frac{\sigma}{\rho}\right]$

$$\Rightarrow \frac{g_{eff.}}{g} = \frac{\rho - \sigma}{\rho}$$

$$\Rightarrow \frac{T'}{T} = \sqrt{\frac{g}{g_{eff.}}} = \sqrt{\frac{\rho}{\rho - \sigma}} > 1$$

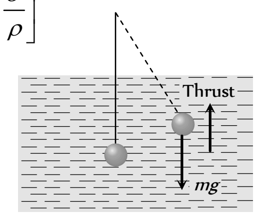

Fig. 16.11

(2) **Oscillation under the influence of electric field :** If a bob of mass m carries a positive charge q and pendulum is placed in a uniform electric field of strength E

(i) If electric field directed vertically upwards.

Effective acceleration

$$g_{eff.} = g - \frac{qE}{m}$$

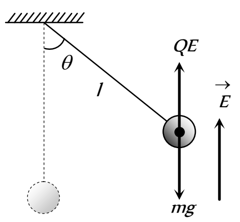

Fig. 16.12

So $T = 2\pi\sqrt{\dfrac{l}{g - \dfrac{qE}{m}}}$

(ii) If electric field is vertically downward then

$$g_{eff.} = g + \frac{qE}{m}$$

$$T = 2\pi\sqrt{\frac{l}{g + \dfrac{qE}{m}}}$$

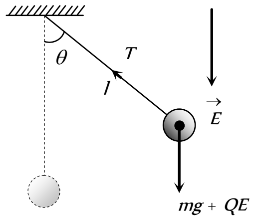

Fig. 16.13

(3) **Pendulum in a lift :** If the pendulum is suspended from the ceiling of the lift.

(i) If the lift is at rest or moving down ward /up ward with constant velocity.

$$T = 2\pi\sqrt{\frac{l}{g}}$$

and $n = \dfrac{1}{2\pi}\sqrt{\dfrac{g}{l}}$

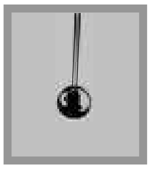

Fig. 16.14

(ii) If the lift is moving up ward with constant acceleration *a*

$$T = 2\pi\sqrt{\frac{l}{g+a}}$$

and $n = \dfrac{1}{2\pi}\sqrt{\dfrac{g+a}{l}}$

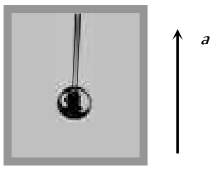

Fig. 16.15

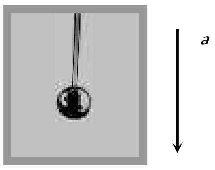
Time period decreases and frequency increases

(iii) If the lift is moving down ward with constant acceleration *a*

$$T = 2\pi\sqrt{\frac{l}{g-a}}$$

and $n = \dfrac{1}{2\pi}\sqrt{\dfrac{g-a}{l}}$



Time period increase and frequency decreases

Fig. 16.16

(iv) If the lift is moving down ward with acceleration $a = g$

$$T = 2\pi\sqrt{\frac{l}{g-g}} = \infty$$

and $n = \dfrac{1}{2\pi}\sqrt{\dfrac{g-g}{l}} = 0$

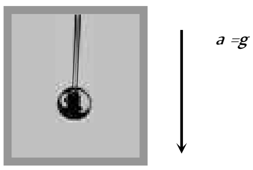


Fig. 16.17

It means there will be no oscillation in a pendulum.

Similar is the case in a satellite and at the centre of earth where effective acceleration becomes zero and pendulum will stop.

(4) **Pendulum in an accelerated vehicle :** The time period of simple pendulum whose point of suspension moving horizontally with acceleration *a*

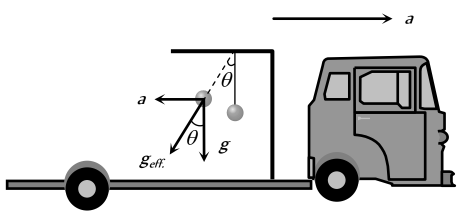

Fig. 16.18

In this case effective acceleration $g_{eff.} = \sqrt{g^2 + a^2}$

$$T = 2\pi\sqrt{\frac{l}{(g^2 + a^2)^{1/2}}} \quad \text{and} \quad \theta = \tan^{-1}(a/g)$$

If simple pendulum suspended in a car that is moving with constant speed *v* around a circle of radius *r*.

$$T = 2\pi\frac{\sqrt{l}}{\sqrt{g^2 + \left(\dfrac{v^2}{r}\right)^2}}$$

Some Other Types of Pendulum

(1) **Infinite length pendulum :** If the length of the pendulum is comparable to the radius of earth then

$$T = 2\pi\sqrt{\frac{1}{g\left[\dfrac{1}{l} + \dfrac{1}{R}\right]}}$$

(i) If $l << R$, then $\dfrac{1}{l} >> \dfrac{1}{R}$ so $T = 2\pi\sqrt{\dfrac{l}{g}}$

(ii) If $l >> R (\to \infty)$ then $\dfrac{1}{l} < \dfrac{1}{R}$

so $T = 2\pi\sqrt{\dfrac{R}{g}} = 2\pi\sqrt{\dfrac{6.4 \times 10^6}{10}} \cong 84.6$ *minutes*

and it is the maximum time period which an oscillating simple pendulum can have

(iii) If $l = R$ so $T = 2\pi\sqrt{\dfrac{R}{2g}} \cong 1 hour$

(2) **Second's Pendulum :** It is that simple pendulum whose time period of vibrations is two seconds.

Putting $T = 2$ *sec* and $g = 9.8 m/\sec^2$ in $T = 2\pi\sqrt{\dfrac{l}{g}}$ we get

$$l = \frac{4 \times 9.8}{4\pi^2} = 0.993\ m = 99.3\ cm$$

Hence length of second's pendulum is 99.3 *cm* or nearly 1 meter on earth surface.

For the moon the length of the second's pendulum will be 1/6 meter

[As $g_{moon} = \dfrac{g_{\text{Earth}}}{6}$]

(3) **Compound pendulum :** Any rigid body suspended from a fixed support constitutes a physical pendulum. Consider the situation when the body is displaced through a small angle θ. Torque on the body about *O* is given by

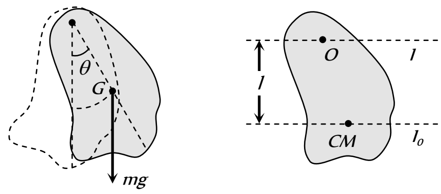

Fig. 16.19

$\tau = mgl\sin\theta$ ...(i)

where l = distance between point of suspension and centre of mass of the body.

If I be the M.I. of the body about O. Then $\tau = I\alpha$ ...(ii)

From (i) and (ii), we get $I\dfrac{d^2\theta}{dt^2} = -mgl\sin\theta$ as θ and $\dfrac{d^2\theta}{dt^2}$ are oppositely directed $\Rightarrow \dfrac{d^2\theta}{dt^2} = -\dfrac{mgl}{I}\theta$ since θ is very small

Comparing with the equation $\dfrac{d^2\theta}{dt^2} = -\omega^2\theta$, we get

$$\omega = \sqrt{\frac{mgl}{I}} \Rightarrow T = 2\pi\sqrt{\frac{I}{mgl}}$$

Also $I = I_{cm} + ml^2$ (Parallel axis theorem)

$= mk^2 + ml^2$ (where k = radius of gyration)

$$\therefore\ T = 2\pi\sqrt{\frac{mK^2 + ml^2}{mgl}} = 2\pi\sqrt{\frac{\frac{K^2}{l} + l}{g}} = 2\pi\sqrt{\frac{l_{eff}}{g}}$$

l_{eff} = Effective length of pendulum = Distance between point of suspension and centre of mass.

Table 16. 2: Some common physical pendulum

Body	Time period
Bar 	$T = 2\pi\sqrt{\dfrac{2l}{3g}}$
Ring 	$T = 2\pi\sqrt{\dfrac{2R}{g}}$
Disc 	$T = 2\pi\sqrt{\dfrac{3R}{2g}}$

Spring System

When a spring is stretched or compressed from its normal position (x = 0) by a small distance x, then a restoring force is produced in the spring because it obeys Hook's law

i.e. $F \propto -x \Rightarrow F = -k\,x$

where k is called spring constant.

(i) It's S.I. unit *Newton/metre*, C.G.S unit *Dyne/cm* and dimension is $[MT^{-2}]$

(ii) Actually k is a measure of the stiffness/softness of the spring.

(iii) For massless spring constant restoring elastic force is same every where

(iv) When a spring compressed or stretched then work done is stored in the form of elastic potential energy in it.

(v) Spring constant depend upon radius and length of the wire used in spring.

(vi) The spring constant k is inversely proportional to the spring length.

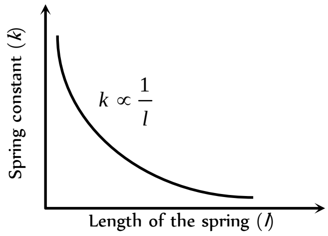

Fig. 16.20

$$k \propto \frac{1}{\text{Extension}} \propto \frac{1}{\text{Length of spring}}$$

That means if the length of spring is halved then its force constant becomes double.

(vii) When a spring of length l is cut in two pieces of length l_1 and l_2 such that $l_1 = nl_2$.

If the constant of a spring is k then spring constant of first part

$$k_1 = \frac{k(n+1)}{n}$$

Spring constant of second part $k_2 = (n+1)k$

and ratio of spring constant $\dfrac{k_1}{k_2} = \dfrac{1}{n}$

Spring Pendulum

A point mass suspended from a mass less spring or placed on a frictionless horizontal plane attached with spring (fig.) constitutes a linear harmonic spring pendulum

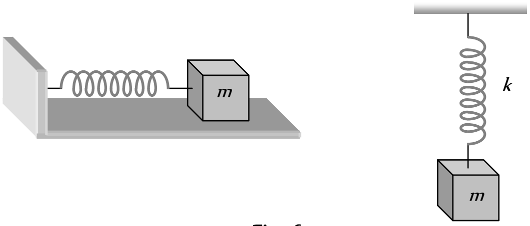

Fig. 16.21

Time period $T = 2\pi\sqrt{\dfrac{\text{Inertia factor}}{\text{Spring factor}}} = 2\pi\sqrt{\dfrac{m}{k}}$

and Frequency $n = \dfrac{1}{2\pi}\sqrt{\dfrac{k}{m}}$

(1) Time period of a spring pendulum depends on the mass suspended

$\Rightarrow T \propto \sqrt{m}$ or $n \propto \dfrac{1}{\sqrt{m}}$ *i.e.* greater the mass greater will be the inertia and so lesser will be the frequency of oscillation and greater will be the time period.

(2) The time period depends on the force constant k of the spring *i.e.* $T \propto \dfrac{1}{\sqrt{k}}$ or $n \propto \sqrt{k}$

(3) Time of a spring pendulum is independent of acceleration due to gravity. That is why a clock based on spring pendulum will keep proper time every where on a hill or moon or in a satellite and time period of a spring pendulum will not change inside a liquid if damping effects are neglected.

(4) **Massive spring :** If the spring has a mass M and mass m is suspended from it, effective mass is given by $m_{eff} = m + \frac{M}{3}$. Hence

$$T = 2\pi\sqrt{\frac{m_{eff}}{k}}$$

(5) **Reduced mass :** If two masses of mass m_1 and m_2 are connected by a spring and made to oscillate on horizontal surface, the reduced mass m_r is given by $\frac{1}{m_r} = \frac{1}{m_1} + \frac{1}{m_2}$ so that

$$T = 2\pi\sqrt{\frac{m_r}{k}}$$

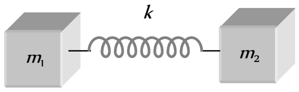

Fig. 16.22

(6) If a spring pendulum, oscillating in a vertical plane is made to oscillate on a horizontal surface, (or on inclined plane) time period will remain unchanged.

(7) Equilibrium position for a spring in a horizontal plain is the position of natural length of spring as weight is balanced by reaction. While in case of vertical motion equilibrium position will be $l + y_0$ with $ky_0 = mg$

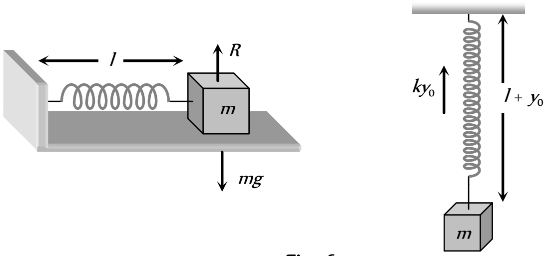

Fig. 16.23

If the stretch in a vertically loaded spring is y_0 then for equilibrium of mass m, $ky_0 = mg$ *i.e.* $\frac{m}{k} = \frac{y_0}{g}$

So that $$T = 2\pi\sqrt{\frac{m}{k}} = 2\pi\sqrt{\frac{y_0}{g}}$$

Time period does not depends on 'g' because along with g, y_0 will also change in such a way that $\frac{y_0}{g} = \frac{m}{k}$ remains constant

Oscillation of Spring Combination

(1) **Series combination :** If two springs of spring constants K_1 and K_2 are joined in series as shown then

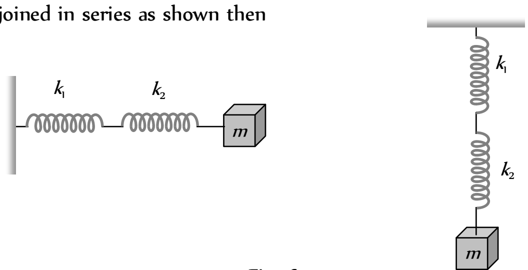

Fig. 16.24

(i) In series combination equal forces acts on spring but extension in springs are different.

(ii) Spring constants of combination

$$\frac{1}{k_s} = \frac{1}{k_1} + \frac{1}{k_2} \Rightarrow k_s = \frac{k_1 k_2}{k_1 + k_2}$$

(iii) If n springs of different force constant are connected in series having force constant k_1, k_2, k_3....... respectively then

$$\frac{1}{k_S} = \frac{1}{k_1} + \frac{1}{k_2} + \frac{1}{k_3} + ...$$

If all spring have same spring constant then $k_S = \frac{k}{n}$

(iv) Time period of combination $T = 2\pi\sqrt{\frac{m}{k_S}} = 2\pi\sqrt{\frac{m(k_1 + k_2)}{k_1 k_2}}$

(2) **Parallel combination :** If the springs are connected in parallel as shown

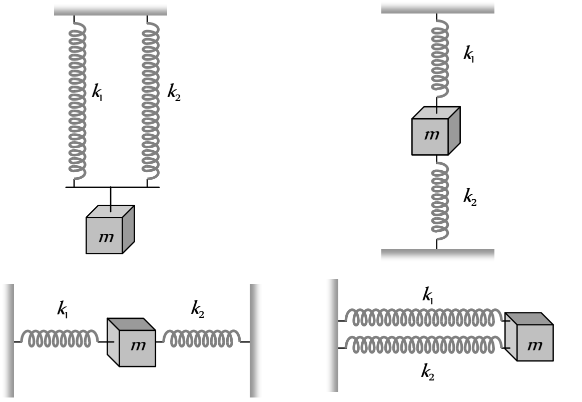

Fig. 16.25

(i) In parallel combination different forces acts on different springs but extension in springs are same

(ii) Spring constants of combination $k_P = k_1 + k_2$

(iii) If n springs of different force constant are connected in parallel having force constant k_1, k_2, k_3....... respectively then $k_P = k_1 + k_2 + k_3 + ...$

If all spring have same spring constant then $k_P = nk$

(iv) Time period of combination $T_P = 2\pi\sqrt{\frac{m}{k_P}} = 2\pi\sqrt{\frac{m}{(k_1 + k_2)}}$

Various Formulae of S.H.M.

(1) **S.H.M. of a liquid in U tube :** If a liquid of density ρ contained in a vertical U tube performs S.H.M. in its two limbs. Then time period

$$T = 2\pi\sqrt{\frac{L}{2g}} = 2\pi\sqrt{\frac{h}{g}}$$

where L = Total length of liquid column,

h = Height of undisturbed liquid in each limb (L=2h)

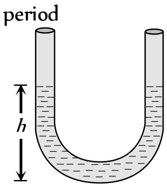

Fig. 16.26

(2) **S.H.M. of a floating cylinder :** If l is the length of cylinder dipping in liquid then

Time period $T = 2\pi\sqrt{\frac{l}{g}}$

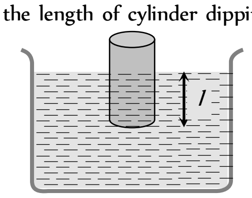

Fig. 16.27

(3) **S.H.M. of a small ball rolling down in hemi-spherical bowl**

$$T = 2\pi\sqrt{\frac{R - r}{g}}$$

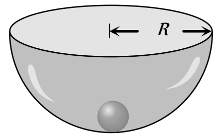

Fig. 16.28

R = Radius of the bowl

r =Radius of the ball

(4) **S.H.M. of a piston in a cylinder**

$$T = 2\pi\sqrt{\frac{Mh}{PA}}$$

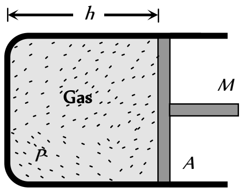

Fig. 16.29

M = mass of the piston

A = area of cross section

h = height of cylinder

P = pressure in a cylinder

(5) **S.H.M. of a body in a tunnel dug along any chord of earth**

$$T = 2\pi\sqrt{\frac{R}{g}} = 84.6 \text{ minutes}$$

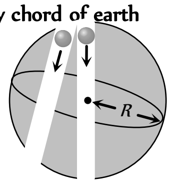

Fig. 16.30

(6) **Torsional pendulum :** In a torsional pendulum an object is suspended from a wire. If such a wire is twisted, due to elasticity it exert a restoring toque $\tau = C\theta$.

In this case time period is given by

$$T = 2\pi\sqrt{\frac{I}{C}}$$

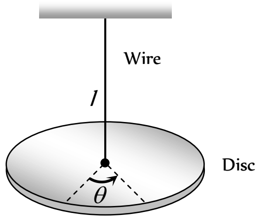

Fig. 16.31

where I = Moment of inertia a disc

C = Torsional constant of wire = $\frac{\pi\eta r^4}{2l}$

η = Modulus of elasticity of wire and r = Radius of wire

(7) **Longitudinal oscillations of an elastic wire :** Wire/string pulled a distance Δl and left. It executes longitudinal oscillations. Restoring force

$$F = -AY\left(\frac{\Delta l}{l}\right)$$

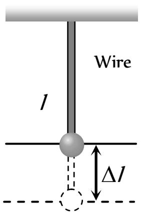

Fig. 16.32

Y = Young's modulus

A = Area of cross-section

Hence $T = 2\pi\sqrt{\frac{m}{k}} = 2\pi\sqrt{\frac{ml}{AY}}$

Free, Damped, Forced and Maintained Oscillations

(1) **Free oscillation**

(i) The oscillation of a particle with fundamental frequency under the influence of restoring force are defined as free oscillations

(ii) The amplitude, frequency and energy of oscillation remains constant

(iii) Frequency of free oscillation is called natural frequency because it depends upon the nature and structure of the body.

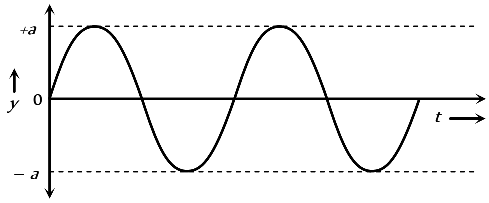

Fig. 16.33

(2) **Damped oscillation**

(i) The oscillation of a body whose amplitude goes on decreasing with time are defined as damped oscillation

(ii) In these oscillation the amplitude of oscillation decreases exponentially due to damping forces like frictional force, viscous force, hystersis *etc*.

(iii) Due to decrease in amplitude the energy of the oscillator also goes on decreasing exponentially

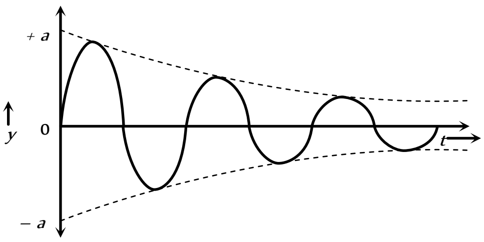

Fig. 16.34

(iv) The force produces a resistance to the oscillation is called damping force.

If the velocity of oscillator is v then

Dumping force $F_d = -bv$, b = damping constant

(v) Resultant force on a damped oscillator is given by

$$F = F_R + F_d = -Kx - Kv \Rightarrow \frac{md^2x}{dt^2} + b\frac{dx}{dt} + Kx = 0$$

(vi) Displacement of damped oscillator is given by

$x = x_m e^{-bt/2m}\sin(\omega' t + \phi)$ where ω' = angular frequency of the damped oscillator = $\sqrt{\omega_0^2 - (b/2m)^2}$

The amplitude decreases continuously with time according to

$$x = x_m e^{-(b/2m)t}$$

(vii) For a damped oscillator if the damping is small then the mechanical energy decreases exponentially with time as

$$E = \frac{1}{2}Kx_m^2 e^{-bt/m}$$

(3) **Forced oscillation**

(i) The oscillation in which a body oscillates under the influence of an external periodic force are known as forced oscillation

(ii) The amplitude of oscillator decrease due to damping forces but on account of the energy gained from the external source it remains constant.

(iii) Resonance : When the frequency of external force is equal to the natural frequency of the oscillator. Then this state is known as the state of resonance. And this frequency is known as resonant frequency.

(iv) While swinging in a swing if you apply a push periodically by pressing your feet against the ground, you find that not only the oscillations can now be maintained but the amplitude can also be increased. Under this condition the swing has forced or driven oscillation.

(v) In forced oscillation, frequency of damped oscillator is equal to the frequency of external force.

(vi) Suppose an external driving force is represented by

$F(t) = F_0 \cos \omega_d t$

The motion of a particle under combined action of

(a) Restoring force $(-Kx)$

(b) Damping force $(-bv)$ and

(c) Driving force $F(t)$ is given by $ma = -Kx - bv + F_0 \cos \omega_d t$

$$\Rightarrow m^2 \frac{d^2x}{d^2} + Kx + b\frac{dx}{dt} = F_0 \cos \omega_d t$$

The solution of this equation gives $x = x_0 \sin(\omega_d t + \phi)$ with amplitude $x_0 = \dfrac{F_0/m}{\sqrt{(\omega^2 - \omega_0^2) + (b\omega/m)^2}}$ and $\tan\theta = \dfrac{(\omega^2 - \omega_0^2)}{b\omega/m}$

where $\omega_0 = \sqrt{\dfrac{K}{m}}$ = Natural frequency of oscillator.

(vii) **Amplitude resonance :** The amplitude of forced oscillator depends upon the frequency ω_d of external force.

When $\omega = \omega_d$, the amplitude is maximum but not infinite because of presence of damping force. The corresponds frequency is called resonant frequency (ω_0).

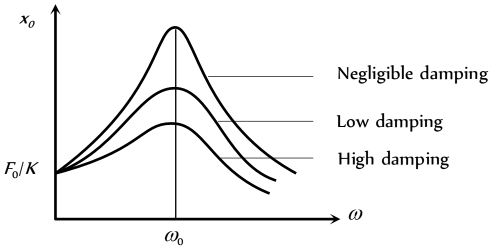

Fig. 16.35

(viii) **Energy resonance :** At $\omega = \omega_0$, oscillator absorbs maximum kinetic energy from the driving force system this state is called energy resonance.

At resonance the velocity of a driven oscillator is in phase with the driving term.

The sharpness of the resonance of a driven oscillator depends on the damping.

In the driven oscillator, the power input of the driving term in maximum at resonance.

(4) **Maintained oscillation :** The oscillation in which the loss of oscillator is compensated by the supplying energy from an external source are known as maintained oscillation.

Super Position of S.H.M's (Lissajous Figures)

If two S.H.M's act in perpendicular directions, then their resultant motion is in the form of a straight line or a circle or a parabola etc. depending on the frequency ratio of the two S.H.M. and initial phase difference. These figures are called Lissajous figures.

Let the equations of two mutually perpendicular S.H.M's of same frequency be

$x = a_1 \sin\omega t$ and $y = a_2 \sin(\omega t + \phi)$

then the general equation of Lissajou's figure can be obtained as

$$\frac{x^2}{a_1^2} + \frac{y^2}{a_2^2} - \frac{2xy}{a_1 a_2}\cos\phi = \sin^2\phi$$

For $\phi = 0°$: $\dfrac{x^2}{a_1^2} + \dfrac{y^2}{a_2^2} - \dfrac{2xy}{a_1 a_2} = 0 \Rightarrow \left(\dfrac{x}{a_1} - \dfrac{y}{a_2}\right)^2 = 0$

$$\Rightarrow \frac{x}{a_1} = \frac{y}{a_2} \Rightarrow y = \frac{a_2}{a_1}x$$

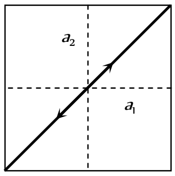

Fig. 16.36

This is a straight line passes through origin and it's slope is $\dfrac{a_2}{a_1}$.

Table 16.3 : Lissajou's figures in other conditions

(with $\dfrac{\omega_1}{\omega_2} = 1$)

Phase diff.(ϕ)	Equation	Figure
$\frac{\pi}{4}$	$\frac{x^2}{a_1^2} + \frac{y^2}{a_2^2} - \frac{\sqrt{2}xy}{a_1 a_2} = \frac{1}{2}$	Oblique ellipse $\frac{\pi}{2}$	$\frac{x^2}{a_1^2} + \frac{y^2}{a_2^2} = 1$	$\frac{3\pi}{4}$	$\frac{x^2}{a_1^2} + \frac{y^2}{a_2^2} - \frac{\sqrt{2}xy}{a_1 a_2} = \frac{1}{2}$	Oblique ellipse π	$\frac{x}{a_1} + \frac{y}{a_2} = 0$ $\Rightarrow y = -\frac{a_2}{a_1}x$	Straight line 
For the frequency ratio $\omega_1 : \omega_2 = 2 : 1$ the two perpendicular S.H.M's are

$x = a_1 \sin(\omega t + \phi)$ and $y = a_2 \sin\omega t$

Tips & Tricks

✍ Suppose a body of mass m vibrate separately with two different springs (of spring constants k and k) with time period T and T respectively. $T_1 = 2\pi\sqrt{\dfrac{m}{k_1}}$ and $T_2 = 2\pi\sqrt{\dfrac{m}{k_2}}$

If the same body vibrates with series combination of these two springs then for the system time period $T = \sqrt{T_1^2 + T_2^2}$

If the same body vibrates with parallel combination of these two springs then time period of the system $T = \dfrac{T_1T_2}{\sqrt{T_1^2 + T_2^2}}$

✍ The pendulum clock runs slow due to increase in its time period whereas it becomes fast due to decrease in time period.

✍ If infinite spring with force constant $k, 2k, 4k, 8k$ .... respectively are connected in series. The effective force constant of the spring will be $k/2$.

✍ Percentage change in time period with l and g.

If g is constant and length varies by $n\%$. Then % change in time period $\dfrac{\Delta T}{T}\times 100 = \dfrac{n}{2}\times 100$

If l is constant and g varies by $n\%$. Then % change in time period $\dfrac{\Delta T}{T}\times 100 = -\dfrac{n}{2}\times 100$

(Valid only for small percentage change say 5%).

✍ Suppose a spring of force constant k oscillates with time period T. If it is divided in to n equal parts then spring constant of each part will become nk and time period of oscillation of each part will become $\dfrac{T}{\sqrt{n}}$.

If these n parts connected in parallel then $k_{eff} = n^2k$. So time period of the system becomes $T' = \dfrac{T}{n}$

✍ If a particle performs S.H.M. whose velocity is v_1 at a x_1 distance from mean position and velocity v_2 at distance x_2

$$\omega = \sqrt{\frac{v_1^2 - v_2^2}{x_2^2 - x_1^2}}\ ;\ T = 2\pi\sqrt{\frac{x_2^2 - x_1^2}{v_1^2 - v_2^2}}$$

$$a = \sqrt{\frac{v_1^2x_2^2 - v_2^2x_1^2}{v_1^2 - v_2^2}}\ ;\ v_{\max} = \sqrt{\frac{v_1^2x_2^2 - v_2^2x_1^2}{x_2^2 - x_1^2}}$$

✍ If $y_1 = a\sin\omega t$ and $y_2 = b\cos\omega t$ are two S.H.M. then by the superimposition of these two S.H.M. we get $\vec{y} = \vec{y_1} + \vec{y_2}$

$\Rightarrow\ y = a\sin\omega t + b\cos\omega t\ \Rightarrow y = A\sin(\omega t + \phi)$ this is also the equation of S.H.M.; where $A = \sqrt{a^2 + b^2}$ and $\phi = \tan^{-1}(b/a)$

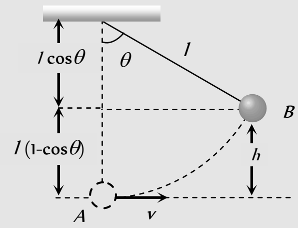
✍ In the absence of resistive force the work done by a simple pendulum in one complete oscillation is zero

✍ If θ is the angular amplitude of pendulum then

Height rises by the bob $h = l(1 - \cos\theta)$

Velocity at mean position

$$v = \sqrt{2gl(1 - \cos\theta)}$$



Work done in displacement

$$W = U = mgl(1 - \cos\theta)$$

K.E. at mean position

$$KE_{mean} = mgl(1 - \cos\theta)$$

Tension in the string of pendulum

At mean position : $T_A(\max) = mg + \dfrac{mv^2}{l} = (3mg - 2mg\cos\theta)$

At extream position : $T = mg\cos\theta$

Ordinary Thinking

Objective Questions

Displacement of S.H.M. and Phase

1. The phase of a particle executing simple harmonic motion is $\dfrac{\pi}{2}$ when it has **[MP PET 1985]**

(a) Maximum velocity (b) Maximum acceleration

(c) Maximum energy (d) Maximum displacement

2. A particle starts S.H.M. from the mean position. Its amplitude is A and time period is T. At the time when its speed is half of the maximum speed, its displacement y is

[Haryana CEE 1996; CBSE PMT 1996; MH CET 2002]

(a) $\dfrac{A}{2}$ (b) $\dfrac{A}{\sqrt{2}}$

(c) $\dfrac{A\sqrt{3}}{2}$ (d) $\dfrac{2A}{\sqrt{3}}$

3. The amplitude and the periodic time of a S.H.M. are $5\,cm$ and $6\,sec$ respectively. At a distance of $2.5\,cm$ away from the mean position, the phase will be

(a) $5\pi/12$ (b) $\pi/4$

(c) $\pi/3$ (d) $\pi/6$

4. Two equations of two S.H.M. are $y = a\sin(\omega t - \alpha)$ and $y = b\cos(\omega t - \alpha)$. The phase difference between the two is

[MP PMT 1985]

(a) 0° (b) $\alpha°$

(c) 90° (d) 180°

5. The amplitude and the time period in a S.H.M. is 0.5 *cm* and 0.4 *sec* respectively. If the initial phase is $\pi/2$ radian, then the equation of S.H.M. will be

(a) $y = 0.5\sin 5\pi t$ (b) $y = 0.5\sin 4\pi t$

(c) $y = 0.5\sin 2.5\pi t$ (d) $y = 0.5\cos 5\pi t$

6. The equation of S.H.M. is $y = a\sin(2\pi nt + \alpha)$, then its phase at time *t* is [DPMT 2001]

(a) $2\pi nt$ (b) α

(c) $2\pi nt + \alpha$ (d) $2\pi t$

7. A particle is oscillating according to the equation $X = 7\cos 0.5\pi t$, where *t* is in second. The point moves from the position of equilibrium to maximum displacement in time [CPMT 1989]

(a) 4.0 *sec* (b) 2.0 *sec*

(c) 1.0 *sec* (d) 0.5 *sec*

8. A simple harmonic oscillator has an amplitude *a* and time period *T*. The time required by it to travel from *x* = *a* to *x* = *a* / 2 is [CBSE PMT 1992; SCRA 1996; BHU 1997]

(a) $T/6$ (b) $T/4$

(c) $T/3$ (d) $T/2$

9. Which of the following expressions represent simple harmonic motion [Roorkee 1999]

(a) $x = A\sin(\omega t + \delta)$ (b) $x = B\cos(\omega t + \phi)$

(c) $x = A\tan(\omega t + \phi)$ (d) $x = A\sin\omega t\cos\omega t$

10. A $1.00 \times 10^{-20} kg$ particle is vibrating with simple harmonic motion with a period of $1.00 \times 10^{-5} sec$ and a maximum speed of $1.00 \times 10^{3} m/s$. The maximum displacement of the particle is [AMU (Med.) 1999]

(a) 1.59 *mm* (b) 1.00 *m*

(c) 10 *m* (d) None of these

11. The phase (at a time *t*) of a particle in simple harmonic motion tells [AMU (Engg.) 1999]

(a) Only the position of the particle at time *t*

(b) Only the direction of motion of the particle at time *t*

(c) Both the position and direction of motion of the particle at time *t*

(d) Neither the position of the particle nor its direction of motion at time *t*

12. A particle is moving with constant angular velocity along the circumference of a circle. Which of the following statements is true [AMU (Engg.) 1999]

(a) The particle so moving executes S.H.M.

(b) The projection of the particle on any one of the diameters executes S.H.M.

(c) The projection of the particle on any of the diameters executes S.H.M.

(d) None of the above

13. A particle is executing simple harmonic motion with a period of *T* *seconds* and amplitude *a* *metre*. The shortest time it takes to reach a point $\frac{a}{\sqrt{2}} m$ from its mean position in *seconds* is [EAMCET (Med.) 2000]

(a) *T* (b) *T*/4

(c) *T*/8 (d) *T*/16

14. A simple harmonic motion is represented by $F(t) = 10\sin(20t + 0.5)$. The amplitude of the S.H.M. is

[DPMT 1998; CBSE PMT 2000; MH CET 2001]

(a) *a* = 30 (b) *a* = 20

(c) *a* = 10 (d) *a* = 5

15. Which of the following equation does not represent a simple harmonic motion [Kerala (Med.) 2002]

(a) $y = a\sin\omega t$ (b) $y = a\cos\omega t$

(c) $y = a\sin\omega t + b\cos\omega t$ (d) $y = a\tan\omega t$

16. A particle in S.H.M. is described by the displacement function $x(t) = a\cos(\omega t + \theta)$. If the initial $(t = 0)$ position of the particle is 1 *cm* and its initial velocity is $\pi\, cm/s$. The angular frequency of the particle is $\pi\, rad/s$, then it's amplitude is

(a) 1 *cm* (b) $\sqrt{2}$ *cm*

(c) 2 *cm* (d) 2.5 *cm*

17. A particle executes a simple harmonic motion of time period *T*. Find the time taken by the particle to go directly from its mean position to half the amplitude [UPSEAT 2002]

(a) $T/2$ (b) $T/4$

(c) $T/8$ (d) $T/12$

18. A particle executing simple harmonic motion along *y*-axis has its motion described by the equation $y = A\sin(\omega t) + B$. The amplitude of the simple harmonic motion is

[Orissa JEE 2003]

(a) *A* (b) *B*

(c) *A* + *B* (d) $\sqrt{A + B}$

19. A particle executing S.H.M. of amplitude 4 *cm* and *T* = 4 *sec*. The time taken by it to move from positive extreme position to half the amplitude is [BHU 1995]

(a) 1 *sec* (b) 1/3 *sec*

(c) 2/3 *sec* (d) $\sqrt{3/2}$ *sec*

20. Which one of the following is a simple harmonic motion

[CBSE PMT 1994]

(a) Wave moving through a string fixed at both ends

(b) Earth spinning about its own axis

(c) Ball bouncing between two rigid vertical walls

(d) Particle moving in a circle with uniform speed

21. A particle is moving in a circle with uniform speed. Its motion is [CPMT 1978; CI

(a) Periodic and simple harmonic

(b) Periodic but not simple harmonic

(c) A periodic

(d) None of the above

22. Two simple harmonic motions are represented by the equations $y_1 = 0.1\sin\left(100\pi t + \frac{\pi}{3}\right)$ and $y_2 = 0.1\cos\pi t$. The phase difference of the velocity of particle 1 with respect to the velocity of particle 2 is [AIEEE 2005]

(a) $\frac{-\pi}{3}$ (b) $\frac{\pi}{6}$

(c) $\frac{-\pi}{6}$ (d) $\frac{\pi}{3}$

23. Two particles are executing S.H.M. The equation of their motion are $y_1 = 10\sin\left(\omega t + \frac{\pi T}{4}\right)$, $y_2 = 25\sin\left(\omega t + \frac{\sqrt{3}\pi T}{4}\right)$. What is the ratio of their amplitude [DCE 1996]

(a) 1 : 1 (b) 2 : 5

(c) 1 : 2 (d) None of these

24. The periodic time of a body executing simple harmonic motion is 3 *sec*. After how much interval from time *t* = 0, its displacement will be half of its amplitude [BHU 1998]

(a) $\frac{1}{8}$ *sec* (b) $\frac{1}{6}$ *sec*

(c) $\frac{1}{4}$ *sec* (d) $\frac{1}{3}$ *sec*

25. A system exhibiting S.H.M. must possess [KCET 1994]

(a) Inertia only

(b) Elasticity as well as inertia

(c) Elasticity, inertia and an external force

(d) Elasticity only

26. If $x = a\sin\left(\omega t + \frac{\pi}{6}\right)$ and $x' = a\cos\omega t$, then what is the phase difference between the two waves [RPET 1996]

(a) $\pi/3$ (b) $\pi/6$

(c) $\pi/2$ (d) π

Velocity of Simple Harmonic Motion

1. A simple pendulum performs simple harmonic motion about *X* = 0 with an amplitude *A* and time period *T*. The speed of the pendulum at $X = \frac{A}{2}$ will be [MP PMT 1987]

(a) $\frac{\pi A\sqrt{3}}{T}$ (b) $\frac{\pi A}{T}$

(c) $\frac{\pi A\sqrt{3}}{2T}$ (d) $\frac{3\pi^2 A}{T}$

2. A body is executing simple harmonic motion with an angular frequency $2 rad/s$. The velocity of the body at 20 *mm* displacement, when the amplitude of motion is 60 *mm*, is

CPMT 1999]

(a) 40 *mm /s* (b) $60 mm/s$

(c) $113 mm/s$ (d) $120 mm/s$

3. A body of mass 5 *gm* is executing S.H.M. about a point with amplitude 10 *cm*. Its maximum velocity is 100 *cm/sec*. Its velocity will be 50 *cm/sec* at a distance [CPMT 1976]

(a) 5 (b) $5\sqrt{2}$

(c) $5\sqrt{3}$ (d) $10\sqrt{2}$

4. A simple harmonic oscillator has a period of 0.01 *sec* and an amplitude of 0.2 *m*. The magnitude of the velocity in $m\,\sec^{-1}$ at the centre of oscillation is [JIPMER 1997]

(a) 20π (b) 100

(c) 40π (d) 100π

5. A particle executes S.H.M. with a period of 6 second and amplitude of 3 *cm*. Its maximum speed in *cm/sec* is

[AIIMS 1982]

(a) $\pi/2$ (b) π

(c) 2π (d) 3π

6. A particle is executing S.H.M. If its amplitude is 2 *m* and periodic time 2 *seconds*, then the maximum velocity of the particle will be

(a) $\pi\, m/s$ (b) $\sqrt{2\pi}\, m/s$

(c) $2\pi\, m/s$ (d) $4\pi\, m/s$

7. A S.H.M. has amplitude '*a*' and time period *T*. The maximum velocity will be

[MP PMT 1985; CPMT 1997; UPSEAT 1999]

(a) $\frac{4a}{T}$ (b) $\frac{2a}{T}$

(c) $2\pi\sqrt{\frac{a}{T}}$ (d) $\frac{2\pi a}{T}$

8. A body is executing S.H.M. When its displacement from the mean position is 4 *cm* and 5 *cm*, the corresponding velocity of the body is 10 *cm/sec* and 8 *cm/sec*. Then the time period of the body is [CPMT 1991; MP PE

(a) $2\pi\, sec$ (b) $\pi/2\, sec$

(c) $\pi\, sec$ (d) $3\pi/2\, sec$

9. A particle has simple harmonic motion. The equation of its motion is $x = 5\sin\left(4t - \frac{\pi}{6}\right)$, where *x* is its displacement. If the displacement of the particle is 3 units, then it velocity is

[MP PMT 1994]

(a) $\frac{2\pi}{3}$ (b) $\frac{5\pi}{6}$

(c) 20 (d) 16

10. [Pb. CET 1998; Pb. PMT 1997; AFMC 1998] If a simple pendulum oscillates with an amplitude of 50 *mm* and time period of 2 *sec*, then its maximum velocity is

[AIIMS 1998; MH CET 2000; DPMT 2000]

(a) 0.10 *m / s* (b) 0.15 *m / s*

(c) 0.8 *m / s* (d) 0.26 *m / s*

11. If the displacement of a particle executing SHM is given by $y = 0.30\sin(220t + 0.64)$ in *metre*, then the frequency and maximum velocity of the particle is [AFMC 1998]

(a) 35 *Hz*, 66 *m / s* (b) 45 *Hz*, 66 *m / s*

(c) 58 *Hz*, 113 *m / s* (d) 35 *Hz*, 132 *m / s*

12. The maximum velocity and the maximum acceleration of a body moving in a simple harmonic oscillator are $2\,m/s$ and $4\,m/s^2$. Then angular velocity will be

[Pb. PMT 1998; MH CET 1999, 2003]

(a) 3 *rad/sec* (b) 0.5 *rad/sec*

(c) 1 *rad/sec* (d) 2 *rad/sec*

13. If a particle under S.H.M. has time period 0.1 *sec* and amplitude $2\times10^{-3}\,m$. It has maximum velocity

[RPET 2000]

(a) $\frac{\pi}{25}\,m/s$ (b) $\frac{\pi}{26}\,m/s$

(c) $\frac{\pi}{30}\,m/s$ (d) None of these

14. A particle executing simple harmonic motion has an amplitude of 6 *cm*. Its acceleration at a distance of 2 *cm* from the mean position is $8\,cm/s^2$. The maximum speed of the particle is [EAMCET (Engg.) 2000]

(a) 8 *cm/s* (b) 12 *cm/s*

(c) 16 *cm/s* (d) 24 *cm/s*

15. A particle executes simple harmonic motion with an amplitude of 4 *cm*. At the mean position the velocity of the particle is 10 *cm/s*. The distance of the particle from the mean position when its speed becomes 5 *cm/s* is

[EAMCET (Med.) 2000]

(a) $\sqrt{3}\,cm$ (b) $\sqrt{5}\,cm$

(c) $2(\sqrt{3})\,cm$ (d) $2(\sqrt{5})\,cm$

16. Two particles *P* and *Q* start from origin and execute Simple Harmonic Motion along *X*-axis with same amplitude but with periods 3 *seconds* and 6 *seconds* respectively. The ratio of the velocities of *P* and *Q* when they meet is

[EAMCET 2001]

(a) 1 : 2 (b) 2 : 1

(c) 2 : 3 (d) 3 : 2

17. A particle is performing simple harmonic motion with amplitude *A* and angular velocity ω. The ratio of maximum velocity to maximum acceleration is [Kerala (Med.) 2002]

(a) ω (b) $1/\omega$

(c) ω (d) $A\omega$

18. The angular velocities of three bodies in simple harmonic motion are $\omega_1, \omega_2, \omega_3$ with their respective amplitudes as A_1, A_2, A_3. If all the three bodies have same mass and velocity, then

(a) $A_1\omega_1 = A_2\omega_2 = A_3\omega_3$ (b) $A_1\omega_1^2 = A_2\omega_2^2 = A_3\omega_3^2$

(c) $A_1^2\omega_1 = A_2^2\omega_2 = A_3^2\omega_3$ (d) $A_1^2\omega_1^2 = A_2^2\omega_2^2 = A^2$

19. The velocity of a particle performing simple harmonic motion, when it passes through its mean position is

[MH CET (Med.) 2002; BCECE 2004]

(a) Infinity (b) Zero

(c) Minimum (d) Maximum

20. The velocity of a particle in simple harmonic motion at displacement *y* from mean position is

[BCECE 2003; RPMT 2003]

(a) $\omega\sqrt{a^2+y^2}$ (b) $\omega\sqrt{a^2-y^2}$

(c) ωy (d) $\omega^2\sqrt{a^2-y^2}$

21. A particle is executing the motion $x = A\cos(\omega t-\theta)$. The maximum velocity of the particle is

[BHU 2003; CPMT 2004]

(a) $A\omega\cos\theta$ (b) $A\omega$

(c) $A\omega\sin\theta$ (d) None of these

22. A particle executing simple harmonic motion with amplitude of 0.1 *m*. At a certain instant when its displacement is 0.02 *m*, its acceleration is 0.5 *m/s*. The maximum velocity of the particle is (in *m/s*)

(a) 0.01 (b) 0.05

(c) 0.5 (d) 0.25

23. The amplitude of a particle executing SHM is 4 *cm*. At the mean position the speed of the particle is 16 *cm/sec*. The distance of the particle from the mean position at which the speed of the particle becomes $8\sqrt{3}\,cm/s$, will be

[Pb. PET 2003]

(a) $2\sqrt{3}\,cm$ (b) $\sqrt{3}\,cm$

(c) 1 *cm* (d) 2 *cm*

24. The maximum velocity of a simple harmonic motion represented by $y = 3\sin\left(100\,t+\frac{\pi}{6}\right)$ is given by

[BCECE 2005]

(a) 300 (b) $\frac{3\pi}{6}$

(c) 100 (d) $\frac{\pi}{6}$

25. The displacement equation of a particle is $x = 3\sin 2t + 4\cos 2t$. The amplitude and maximum velocity will be respectively

(a) 5, 10 (b) 3, 2

(c) 4, 2 (d) 3, 4

26. Velocity at mean position of a particle executing S.H.M. is *v*, they velocity of the particle at a distance equal to half of the amplitude

(a) 4*v* (b) 2*v*

(c) $\frac{\sqrt{3}}{2}v$ (d) $\frac{\sqrt{3}}{4}v$

27. The instantaneous displacement of a simple pendulum oscillator is given by $x = A\cos\left(\omega t+\frac{\pi}{4}\right)$. Its speed will be maximum at time [BHU 2002]

(a) $\frac{\pi}{4\omega}$ (b) $\frac{\pi}{2\omega}$

(c) $\frac{\pi}{\omega}$ (d) $\frac{2\pi}{\omega}$

Acceleration of Simple Harmonic Motion

1. Which of the following is a necessary and sufficient condition for S.H.M. [NCERT 1974]

(a) Constant period

(b) Constant acceleration

(c) Proportionality between acceleration and displacement from equilibrium position

(d) Proportionality between restoring force and displacement from equilibrium position

2. If a hole is bored along the diameter of the earth and a stone is dropped into hole [CPMT 1984]

(a) The stone reaches the centre of the earth and stops there

(b) The stone reaches the other side of the earth and stops there

(c) The stone executes simple harmonic motion about the centre of the earth

(d) The stone reaches the other side of the earth and escapes into space

3. The acceleration of a particle in S.H.M. is [MP PMT 1993]

(a) Always zero

(b) Always constant

(c) Maximum at the extreme position

(d) Maximum at the equilibrium position

4. The displacement of a particle moving in S.H.M. at any instant is given by $y = a\sin\omega t$. The acceleration after time $t = \frac{T}{4}$ is (where *T* is the time period) [MP PET 1984]

(a) $a\omega$ (b) $-a\omega$

(c) $a\omega^2$ (d) $-a\omega^2$

5. The amplitude of a particle executing S.H.M. with frequency of 60 *Hz* is 0.01 *m*. The maximum value of the acceleration of the particle is

[DPMT 1998; CBSE PMT 1999; AFMC 2001; Pb. PMT 2001; Pb. PET 2001, 02; CPMT 1993, 95, 04; RPMT 2005; MP PMT 2005]

(a) $144\pi^2 m/sec^2$ (b) $144 m/sec^2$

(c) $\frac{144}{\pi^2} m/sec^2$ (d) $288\pi^2 m/sec^2$

6. A small body of mass 0.10 *kg* is executing S.H.M. of amplitude 1.0 *m* and period 0.20 *sec*. The maximum force acting on it is

(a) 98.596 *N* (b) 985.96 *N*

(c) 100.2 *N* (d) 76.23 *N*

7. A body executing simple harmonic motion has a maximum acceleration equal to $24 metres/sec^2$ and maximum velocity equal to $16 \; metres/sec$. The amplitude of the simple harmonic motion is

[MP PMT 1995; DPMT 2002; RPET 2003; Pb. PET 2004]

(a) $\frac{32}{3} metres$ (b) $\frac{3}{32} metres$

(c) $\frac{1024}{9} metres$ (d) $\frac{64}{9} metres$

8. For a particle executing simple harmonic motion, which of the following statements is not correct

[MP PMT 1997; AIIMS 1999; Kerala PMT 2005]

(a) The total energy of the particle always remains the same

(b) The restoring force of always directed towards a fixed point

(c) The restoring force is maximum at the extreme positions

(d) The acceleration of the particle is maximum at the equilibrium position

9. A particle of mass 10 *grams* is executing simple harmonic motion with an amplitude of 0.5 *m* and periodic time of $(\pi/5)$ *seconds*. The maximum value of the force acting on the particle is[MP PET 1999; MP PMT

(a) 25 *N* (b) 5 *N*

(c) 2.5 *N* (d) 0.5 *N*

10. The displacement of an oscillating particle varies with time (in *seconds*) according to the equation *y (cm)* = sin $\frac{\pi}{2}\left(\frac{t}{2}+\frac{1}{3}\right)$. The maximum acceleration of the particle is approximately

(a) $5.21 cm/s^2$ (b) $3.62 cm/s^2$

(c) $1.81 cm/s^2$ (d) $0.62 cm/s^2$

11. A particle moving along the *x*-axis executes simple harmonic motion, then the force acting on it is given by

[CBSE PMT 1994]

(a) – *A Kx* (b) *A* cos (*Kx*)

(c) *A exp* (– *Kx*) (d) *A Kx*

Where *A* and *K* are positive constants

12. A body is vibrating in simple harmonic motion with an amplitude of 0.06 *m* and frequency of 15 *Hz*. The velocity and acceleration of body is [AFMC 1999]

(a) $5.65 \, m/s$ and $5.32 \times 10^2 m/s^2$

(b) $6.82 \, m/s$ and $7.62 \times 10^2 m/s^2$

(c) $8.91 \, m/s$ and $8.21 \times 10^2 m/s^2$

(d) $9.82 \, m/s$ and $9.03 \times 10^2 m/s^2$

13. A particle executes harmonic motion with an angular velocity and maximum acceleration of 3.5 *rad/sec* and 7.5 *m/s* respectively. The amplitude of oscillation is

[AIIMS 1999; Pb. PET 1999]

(a) 0.28 *m* (b) 0.36 *m*

(c) 0.53 *m* (d) 0.61 *m*

14. A 0.10 *kg* block oscillates back and forth along a horizontal surface. Its displacement from the origin is given by: $x = (10\,cm)\cos[(10\,rad/s)t + \pi/2\,rad]$. What is the maximum acceleration experienced by the block [AMU (Engg.) 2000]

(a) $10 \; m/s^2$ (b) $10\,\pi \, m/s^2$

(c) $\frac{10\pi}{2} m/s^2$ (d) $\frac{10\pi}{3} m/s^2$

15. In S.H.M. maximum acceleration is at

[RPET 2001; BVP 2003]

(a) Amplitude (b) Equilibrium

(c) Acceleration is constant (d) None of these

16. A particle is executing simple harmonic motion with an amplitude of 0.02 *metre* and frequency 50 *Hz*. The maximum acceleration of the particle is [MP PET 2001]

(a) $100\ m/s^2$ (b) $100\pi^2\ m/s^2$

(c) $100\ m/s^2$ (d) $200\pi^2\ m/s^2$

17. Acceleration of a particle, executing SHM, at it's mean position is[MH CET (Med.) 2002]

(a) Infinity (b) Varies

(c) Maximum (d) Zero

18. Which one of the following statements is true for the speed v and the acceleration a of a particle executing simple harmonic motion

(a) When v is maximum, a is maximum

(b) Value of a is zero, whatever may be the value of v

(c) When v is zero, a is zero

(d) When v is maximum, a is zero

19. What is the maximum acceleration of the particle doing the SHM $y = 2\sin\left[\frac{\pi t}{2} + \phi\right]$ where 2 is in *cm* [DCE 2003]

(a) $\frac{\pi}{2} cm/s^2$ (b) $\frac{\pi^2}{2} cm/s^2$

(c) $\frac{\pi}{4} cm/s^2$ (d) $\frac{\pi}{4} cm/s^2$

20. A particle executes linear simple harmonic motion with an amplitude of 2 *cm*. When the particle is at 1 *cm* from the mean position the magnitude of its velocity is equal to that of its acceleration. Then its time period in seconds is

[Kerala PET 2005]

(a) $\frac{1}{2\pi\sqrt{3}}$ (b) $2\pi\sqrt{3}$

(c) $\frac{2\pi}{\sqrt{3}}$ (d) $\frac{\sqrt{3}}{2\pi}$

21. In simple harmonic motion, the ratio of acceleration of the particle to its displacement at any time is a measure of

[UPSEAT 2001]

(a) Spring constant (b) Angular frequency

(c) (Angular frequency)^2 (d) Restoring force

Energy of Simple Harmonic Motion

1. The total energy of a particle executing S.H.M. is proportional to

[CPMT 1974, 78; EAMCET 1994; RPET 1999; MP PMT 2001; Pb. PMT 2002; MH CET 2002]

(a) Displacement from equilibrium position

(b) Frequency of oscillation

(c) Velocity in equilibrium position

(d) Square of amplitude of motion

2. A particle executes simple harmonic motion along a straight line with an amplitude A. The potential energy is maximum when the displacement is [CPMT 1982]

(a) $\pm A$ (b) Zero

(c) $\pm\frac{A}{2}$ (d) $\pm\frac{A}{\sqrt{2}}$

3. A particle is vibrating in a simple harmonic motion with an amplitude of 4 *cm*. At what displacement from the equilibrium position, is its energy half potential and half kinetic[NCERT 1984; MNR 1995; RPMT 1995; DCE 2000; UPSEAT 2000]

(a) 1 *cm* (b) $\sqrt{2}$ *cm*

(c) 3 *cm* (d) $2\sqrt{2}$ *cm*

4. For a particle executing simple harmonic motion, the kinetic energy K is given by $K = K_o\cos^2\omega t$. The maximum value of potential energy is [CPMT 1981]

[CBSE PMT 2004]

(a) K_0 (b) Zero

(c) $\frac{K_0}{2}$ (d) Not obtainable

5. The potential energy of a particle with displacement X is $U(X)$. The motion is simple harmonic, when (K is a positive constant)

(a) $U = -\frac{KX^2}{2}$ (b) $U = KX^2$

(c) $U = K$ (d) $U = KX$

6. The kinetic energy and potential energy of a particle executing simple harmonic motion will be equal, when displacement (amplitude = a) is

[MP PMT 1987; CPMT 1990; DPMT 1996; MH CET 1997, 99; AFMC 1999; CPMT 2000]

(a) $\frac{a}{2}$ (b) $a\sqrt{2}$

(c) $\frac{a}{\sqrt{2}}$ (d) $\frac{a\sqrt{2}}{3}$

7. The total energy of the body executing S.H.M. is E. Then the kinetic energy when the displacement is half of the amplitude, is

[RPMT 1994, 96; CBSE PMT 1995; JIPMER 2002]

(a) $\frac{E}{2}$ (b) $\frac{E}{4}$

(c) $\frac{3E}{4}$ (d) $\frac{\sqrt{3}}{4}E$

8. The potential energy of a particle executing S.H.M. is 2.5 *J*, when its displacement is half of amplitude. The total energy of the particle be

(a) 18 *J* (b) 10 *J*

(c) 12 *J* (d) 2.5 *J*

9. The angular velocity and the amplitude of a simple pendulum is ω and a respectively. At a displacement X from the mean position if its kinetic energy is T and potential energy is V, then the ratio of T to V is [CBSE PMT 1991]

(a) $X^2\omega^2/(a^2 - X^2\omega^2)$ (b) $X^2/(a^2 - X^2)$

(c) $(a^2 - X^2\omega^2)/X^2\omega^2$ (d) $(a^2 - X^2)/X^2$

10. When the potential energy of a particle executing simple harmonic motion is one-fourth of its maximum value during the oscillation, the displacement of the particle from the equilibrium position in terms of its amplitude a is

[CBSE PMT 1993; EAMCET (Engg.) 1995;

MP PMT 1994, 2000; MP PET 1995, 96, 2002]

(a) $a/4$ (b) $a/3$

(c) $a/2$ (d) $2a/3$

11. A particle of mass 10 *gm* is describing S.H.M. along a straight line with period of 2 *sec* and amplitude of 10 *cm*. Its kinetic energy when it is at 5 *cm* from its equilibrium position is

(a) $37.5\pi^2 ergs$ (b) $3.75\pi^2 ergs$

(c) $375\pi^2 ergs$ (d) $0.375\pi^2 ergs$

12. When the displacement is half the amplitude, the ratio of potential energy to the total energy is

[CPMT 1999; JIPMER 2000; Kerala PET 2002]

(a) $\frac{1}{2}$ (b) $\frac{1}{4}$

(c) 1 (d) $\frac{1}{8}$

13. The P.E. of a particle executing SHM at a distance *x* from its equilibrium position is

[Roorkee 1992; CPMT 1997; RPMT 1999]

(a) $\frac{1}{2}m\omega^2 x^2$ (b) $\frac{1}{2}m\omega^2 a^2$

(c) $\frac{1}{2}m\omega^2(a^2 - x^2)$ (d) Zero

14. A vertical mass-spring system executes simple harmonic oscillations with a period of 2 *s*. A quantity of this system which exhibits simple harmonic variation with a period of 1 *s* is

(a) Velocity

(b) Potential energy

(c) Phase difference between acceleration and displacement

(d) Difference between kinetic energy and potential energy

15. For any S.H.M., amplitude is 6 *cm*. If instantaneous potential energy is half the total energy then distance of particle from its mean position is [RPET 2000]

(a) 3 *cm* (b) 4.2 *cm*

(c) 5.8 *cm* (d) 6 *cm*

16. A body of mass $1 kg$ is executing simple harmonic motion. Its displacement $y(cm)$ at t seconds is given by $y = 6\sin(100t + \pi/4)$. Its maximum kinetic energy is

[EAMCET (Engg.) 2000]

(a) 6 *J* (b) 18 *J*

(c) 24 *J* (d) 36 *J*

17. A particle is executing simple harmonic motion with frequency *f*. The frequency at which its kinetic energy change into potential energy is [MP PET 2000]

(a) *f*/2 (b) *f*

(c) 2 *f* (d) 4 *f*

18. There is a body having mass *m* and performing S.H.M. with amplitude *a*. There is a restoring force $F = -Kx$, where *x* is the displacement. The total energy of body depends upon

[CBSE PMT 2001]

(a) *K, x* (b) *K, a*

(c) *K, a, x* (d) *K, a, v*

[MP PMT 1996]

19. The total energy of a particle executing S.H.M. is 80 *J*. What is the potential energy when the particle is at a distance of 3/4 of amplitude from the mean position

[Kerala (Engg.) 2001]

(a) 60 *J* (b) 10 *J*

(c) 40 *J* (d) 45 *J*

20. In a simple harmonic oscillator, at the mean position

[AIEEE 2002]

(a) Kinetic energy is minimum, potential energy is maximum

(b) Both kinetic and potential energies are maximum

(c) Kinetic energy is maximum, potential energy is minimum

(d) Both kinetic and potential energies are minimum

21. Displacement between maximum potential energy position and maximum kinetic energy position for a particle executing S.H.M. is

(a) $-a$ (b) $+a$

(c) $\pm a$ (d) $\pm\frac{a}{4}$

22. When a mass *M* is attached to the spring of force constant *k*, then the spring stretches by *l*. If the mass oscillates with amplitude *l*, what will be maximum potential energy stored in the spring

(a) $\frac{kl}{2}$ (b) $2kl$

(c) $\frac{1}{2}Mgl$ [SCRA 1998] (d) *Mgl*

23. The potential energy of a simple harmonic oscillator when the particle is half way to its end point is (where *E* is the total energy)

(a) $\frac{1}{8}E$ (b) $\frac{1}{4}E$

(c) $\frac{1}{2}E$ (d) $\frac{2}{3}E$

24. A body executes simple harmonic motion. The potential energy (P.E.), the kinetic energy (K.E.) and total energy (T.E.) are measured as a function of displacement *x*. Which of the following statements is true [AIEEE 2003]

(a) P.E. is maximum when $x = 0$

(b) K.E. is maximum when $x = 0$

(c) T.E. is zero when $x = 0$

(d) K.E. is maximum when *x* is maximum

25. If <*E*> and <*U*> denote the average kinetic and the average potential energies respectively of mass describing a simple harmonic motion, over one period, then the correct relation is

(a) <*E*> = <*U*> (b) <*E*> = 2<*U*>

(c) <*E*> = – 2<*U*> (d) <*E*>= – <*U*>

26. The total energy of a particle, executing simple harmonic motion is

(a) $\propto x$ (b) $\propto x^2$

(c) Independent of x (d) $\propto x^{1/2}$

27. The kinetic energy of a particle executing S.H.M. is 16 *J* when it is at its mean position. If the mass of the particle is 0.32 *kg*, then what is the maximum velocity of the particle

[MH CET 2004]

(a) $5m/s$ (b) $15m/s$

(c) $10m/s$ (d) $20m/s$

28. Consider the following statements. The total energy of a particle executing simple harmonic motion depends on its

(1) Amplitude (2) Period (3) Displacement

Of these statements [RPMT 2001; BCECE 2005]

(a) (1) and (2) are correct

(b) (2) and (3) are correct

(c) (1) and (3) are correct

(d) (1), (2) and (3) are correct

29. A particle starts simple harmonic motion from the mean position. Its amplitude is *a* and total energy *E*. At one instant its kinetic energy is $3E/4$. Its displacement at that instant is

[Kerala PET 2005]

(a) $a/\sqrt{2}$ (b) $a/2$

(c) $\frac{a}{\sqrt{3/2}}$ (d) $a/\sqrt{3}$

30. A particle executes simple harmonic motion with a frequency f. The frequency with which its kinetic energy oscillates is [IIT JEE 1973, 87; Manipal MEE 1995; MP PET 1997; DCE 1997; DCE 1999; UPSEAT 2000; RPET 2002; RPMT 2004; BHU 2005]

(a) $f/2$ (b) f

(c) $2f$ (d) $4f$

31. The amplitude of a particle executing SHM is made three-fourth keeping its time period constant. Its total energy will be

(a) $\frac{E}{2}$ (b) $\frac{3}{4}E$

(c) $\frac{9}{16}E$ (d) None of these

32. A particle of mass *m* is hanging vertically by an ideal spring of force constant *K*. If the mass is made to oscillate vertically, its total energy is [CPMT 1978; RPET 1999]

(a) Maximum at extreme position

(b) Maximum at mean position

(c) Minimum at mean position

(d) Same at all position

33. A body is moving in a room with a velocity of 20 *m* / s perpendicular to the two walls separated by 5 *meters*. There is no friction and the collisions with the walls are elastic. The motion of the body is [MP PMT 1999]

(a) Not periodic

(b) Periodic but not simple harmonic

(c) Periodic and simple harmonic

(d) Periodic with variable time period

34. A body is executing Simple Harmonic Motion. At a displacement x its potential energy is E_1 and at a displacement y its potential energy is E_2. The potential energy E at displacement $(x+y)$ is [EAMCET 20

(a) $\sqrt{E}=\sqrt{E_1}-\sqrt{E_2}$ (b) $\sqrt{E}=\sqrt{E_1}+\sqrt{E_2}$

(c) $E=E_1+E_2$ (d) $E=E_1+E_2$

Time Period and Frequency

1. A particle moves such that its acceleration a is given by $a=-bx$, where x is the displacement from equilibrium position and b is a constant. The period of oscillation is

[NCERT 1984; CPMT 1991; MP PMT 1994; MNR 1995; UPSEAT 2000]

(a) $2\pi\sqrt{b}$ (b) $\frac{2\pi}{\sqrt{b}}$

(c) $\frac{2\pi}{b}$ (d) $2\sqrt{\frac{\pi}{b}}$

2. The equation of motion of a particle is $\frac{d^2y}{dt^2}+Ky=0$, where K is positive constant. The time period of the motion is given by

(a) $\frac{2\pi}{K}$ (b) $2\pi K$

(c) $\frac{2\pi}{\sqrt{K}}$ (d) $2\pi\sqrt{K}$

3. A tunnel has been dug through the centre of the earth and a ball is released in it. It will reach the other end of the tunnel after

(a) 84.6 *minutes*

(b) 42.3 *minutes*

(c) 1 day

(d) Will not reach the other end

[RPMT 2004]

4. The maximum speed of a particle executing S.H.M. is $1m/s$ and its maximum acceleration is $1.57m/sec^2$. The time period of the particle will be [DPMT 2002]

(a) $\frac{1}{1.57}sec$ (b) 1.57 *sec*

(c) 2 *sec* (d) 4 *sec*

5. The motion of a particle executing S.H.M. is given by $x=0.01\sin 100\pi(t+.05)$, where x is in *metres* and time is in seconds. The time period is [CPMT 1990]

(a) 0.01 *sec* (b) 0.02 *sec*

(c) 0.1 *sec* (b) 0.2 *sec*

6. The kinetic energy of a particle executing S.H.M. is 16 *J* when it is in its mean position. If the amplitude of oscillations is 25 *cm* and the mass of the particle is 5.12 *kg*, the time period of its oscillation is

[Haryana CEE 1996; AFMC 1998]

(a) $\frac{\pi}{5}$ *sec* (b) 2π *sec*

(c) 20π *sec* (d) 5π *sec*

7. The acceleration of a particle performing S.H.M. is $12 cm/sec^2$ at a distance of 3 *cm* from the mean position. Its time period is [MP PET 1996; MP PMT 1997]

(a) 0.5 *sec* (b) 1.0 *sec*

(c) 2.0 *sec* (d) 3.14 *sec*

8. To make the frequency double of an oscillator, we have to [CPMT 1999]

(a) Double the mass

(b) Half the mass

(c) Quadruple the mass

(d) Reduce the mass to one-fourth

9. What is constant in S.H.M. [UPSEAT 1999]

(a) Restoring force (b) Kinetic energy

(c) Potential energy (d) Periodic time

10. If a simple harmonic oscillator has got a displacement of 0.02 *m* and acceleration equal to $2.0 ms^{-2}$ at any time, the angular frequency of the oscillator is equal to [CBSE PMT 1992; RPMT 1996]

(a) $10\, rad s^{-1}$ (b) $0.1\, rad s^{-1}$

(c) $100\, rad s^{-1}$ (d) $1\, rad s^{-1}$

11. The equation of a simple harmonic motion is $X = 0.34\cos(3000t + 0.74)$ where *X* and *t* are in *mm* and *sec*. The frequency of motion is [Kerala (Engg.) 2002]

(a) 3000 (b) $3000/2\pi$

(c) $0.74/2\pi$ (d) $3000/\pi$

12. Mark the wrong statement [MP PMT 2003]

(a) All S.H.M.'s have fixed time period

(b) All motion having same time period are S.H.M.

(c) In S.H.M. total energy is proportional to square of amplitude

(d) Phase constant of S.H.M. depends upon initial conditions

13. A particle in SHM is described by the displacement equation $x(t) = A\cos(\omega t + \theta)$. If the initial ($t = 0$) position of the particle is 1 *cm* and its initial velocity is π *cm/s*, what is its amplitude? The angular frequency of the particle is πs^{-1} [DPMT 2004]

(a) 1 *cm* (b) $\sqrt{2}$ *cm*

(c) 2 *cm* (d) 2.5 *cm*

14. A particle executes SHM in a line 4 *cm* long. Its velocity when passing through the centre of line is 12 *cm/s*. The period will be

(a) 2.047 *s* (b) 1.047 *s*

(c) 3.047 *s* (d) 0.047 *s*

15. The displacement *x* (in *metre*) of a particle in, simple harmonic motion is related to time *t* (in seconds) as

$$x = 0.01\cos\left(\pi t + \frac{\pi}{4}\right)$$

The frequency of the motion will be [UPSEAT 2004]

(a) 0.5 *Hz* (b) 1.0 *Hz*

(c) $\frac{\pi}{2} Hz$ (d) $\pi\, Hz$

16. A simple harmonic wave having an amplitude *a* and time period *T* is represented by the equation $y = 5\sin\pi(t+4)m$. Then the value of amplitude (*a*) in (*m*) and time period (*T*) in second are [Pb. PET 2004]

(a) $a = 10, T = 2$ (b) $a = 5, T = 1$

(c) $a = 10, T = 1$ (d) $a = 5, T = 2$

17. A particle executing simple harmonic motion of amplitude 5 *cm* has maximum speed of 31.4 *cm/s*. The frequency of its oscillation is

(a) 3 *Hz* (b) 2 *Hz*

(c) 4 *Hz* (d) 1 *Hz*

18. The displacement *x* (in *metres*) of a particle performing simple harmonic motion is related to time *t* (in *seconds*) as $x = 0.05\cos\left(4\pi t + \frac{\pi}{4}\right)$. The frequency of the motion will be

(a) 0.5 *Hz* (b) 1.0 *Hz*

(c) 1.5 *Hz* (d) 2.0 *Hz*

Simple Pendulum

1. The period of a simple pendulum is doubled, when [CPMT 1974; MNR 1980; AFMC 1995; Pb. PET/PMT 2002]

(a) Its length is doubled

(b) The mass of the bob is doubled

(c) Its length is made four times

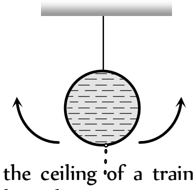
(d) The mass of the bob and the length of the pendulum are doubled

2. The period of oscillation of a simple pendulum of constant length at earth surface is *T*. Its period inside a mine is [CPMT 1973; DPMT 2001]

(a) Greater than *T* (b) Less than *T*

(c) Equal to *T* (d) Cannot be compared

3. A simple pendulum is made of a body which is a hollow sphere containing mercury suspended by means of a wire. If a little mercury is drained off, the period of pendulum will [NCERT 1972; BHU 1979]



(a) Remains unchanged

(b) Increase

(c) Decrease

(d) Become erratic

4. A pendulum suspended from the ceiling of a train has a period *T*, when the train is at rest. When the train is accelerating with a uniform acceleration *a*, the period of oscillation will [NCERT 1980; CPMT 1997] [Pb. PET 2000]

(a) Increase (b) Decrease

(c) Remain unaffected (d) Become infinite

5. The mass and diameter of a planet are twice those of earth. The period of oscillation of pendulum on this planet will be (If it is a second's pendulum on earth) [IIT 1973; DCE 2002]

(a) $\frac{1}{\sqrt{2}}$ *sec* (b) $2\sqrt{2}$ *sec*

(c) 2 *sec* (d) $\frac{1}{2}$ *sec*

6. A simple pendulum is set up in a trolley which moves to the right with an acceleration a on a horizontal plane. Then the thread of the pendulum in the mean position makes an angle θ with the vertical

(a) $\tan^{-1}\frac{a}{g}$ in the forward direction

(b) $\tan^{-1}\frac{a}{g}$ in the backward direction

(c) $\tan^{-1}\frac{g}{a}$ in the backward direction

(d) $\tan^{-1}\frac{g}{a}$ in the forward direction

7. Which of the following statements is not true ? In the case of a simple pendulum for small amplitudes the period of oscillation is

(a) Directly proportional to square root of the length of the pendulum

(b) Inversely proportional to the square root of the acceleration due to gravity

(c) Dependent on the mass, size and material of the bob

(d) Independent of the amplitude

8. The time period of a second's pendulum is 2 *sec*. The spherical bob which is empty from inside has a mass of 50 *gm*. This is now replaced by another solid bob of same radius but having different mass of 100 *gm*. The new time period will be

(a) 4 *sec* (b) 1 *sec*

(c) 2 *sec* (d) 8 *sec*

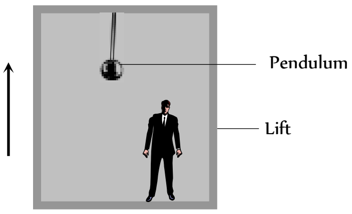
9. A man measures the period of a simple pendulum inside a stationary lift and finds it to be T sec. If the lift accelerates upwards with an acceleration $g/4$, then the period of the pendulum will be

(a) T

(b) $\frac{T}{4}$

(c) $\frac{2T}{\sqrt{5}}$

(d) $2T\sqrt{5}$



10. A simple pendulum is suspended from the roof of a trolley which moves in a horizontal direction with an acceleration a, then the time period is given by $T = 2\pi\sqrt{\frac{l}{g'}}$, where g' is equal to

(a) g (b) $g-a$

(c) $g+a$ (d) $\sqrt{g^2+a^2}$

11. A second's pendulum is placed in a space laboratory orbiting around the earth at a height $3R$, where R is the radius of the earth. The time period of the pendulum is

[CPMT 1989; RPMT 1995]

(a) Zero (b) $2\sqrt{3}$ *sec*

(c) 4 *sec* (d) Infinite

12. The bob of a simple pendulum of mass m and total energy E will have maximum linear momentum equal to

[CPMT 1983] [MP PMT 1986]

(a) $\sqrt{\frac{2E}{m}}$ (b) $\sqrt{2mE}$

(c) $2mE$ (d) mE^2

13. The length of the second pendulum on the surface of earth is 1 *m*. The length of seconds pendulum on the surface of moon, where g is 1/6th value of g on the surface of earth, is

[CPMT 1971]

(a) 1 / 6 *m* (b) 6 *m*

(c) 1 / 36 *m* (d) 36 *m*

[NCERT 1982]

14. If the length of second's pendulum is decreased by 2%, how many seconds it will lose per day [CPMT 1992]

(a) 3927 *sec* (b) 3727 *sec*

(c) 3427 *sec* (d) 864 sec

15. The period of simple pendulum is measured as T in a stationary lift. If the lift moves upwards with an acceleration of 5 g, the period will be [MNR 1979]

(a) The same (b) Increased by 3/5

(c) Decreased by 2/3 times (d) None of the above

[NCERT 1972]

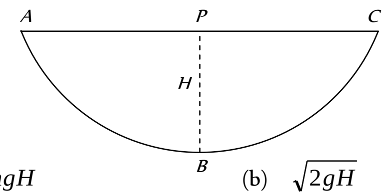
16. The length of a simple pendulum is increased by 1%. Its time period will [MP PET 1994; RPET 2001]

(a) Increase by 1% (b) Increase by 0.5%

(c) Decrease by 0.5% (d) Increase by 2%

17. A simple pendulum with a bob of mass 'm' oscillates from A to C and back to A such that PB is H. If the acceleration due to gravity is 'g', then the velocity of the bob as it passes through B is [NCERT 1990; BHU 2001]

[CBSE PMT 1995; DPMT 1995; Pb. PMT 1996]



(a) mgH (b) $\sqrt{2gH}$

(c) $2gH$ (d) Zero

18. Identify correct statement among the following [BHU 1997]

[Manipal MEE 1995]

(a) The greater the mass of a pendulum bob, the shorter is its frequency of oscillation

(b) A simple pendulum with a bob of mass M swings with an angular amplitude of 40^o. When its angular amplitude is 20^o, the tension in the string is less than $Mg\cos 20^o$.

(c) As the length of a simple pendulum is increased, the maximum velocity of its bob during its oscillation will also decreases

(d) The fractional change in the time period of a pendulum on changing the temperature is independent of the length of the pendulum

19. The bob of a pendulum of length l is pulled aside from its equilibrium position through an angle θ and then released. The bob will then pass through its equilibrium position with a speed v, where v equals [Haryana CEE 1996]

(a) $\sqrt{2gl(1-\sin\theta)}$ (b) $\sqrt{2gl(1+\cos\theta)}$

(c) $\sqrt{2gl(1-\cos\theta)}$ (d) $\sqrt{2gl(1+\sin\theta)}$

20. A simple pendulum executing S.H.M. is falling freely along with the support. Then

(a) Its periodic time decreases

(b) Its periodic time increases

(c) It does not oscillate at all

(d) None of these

21. A pendulum bob has a speed of 3 *m/s* at its lowest position. The pendulum is 0.5 *m* long. The speed of the bob, when the length makes an angle of 60^o to the vertical, will be (If $g = 10 m/s^2$)

(a) $3 m/s$ (b) $\frac{1}{3} m/s$

(c) $\frac{1}{2} m/s$ (d) $2 m/s$

22. The time period of a simple pendulum is 2 *sec*. If its length is increased 4 times, then its period becomes

[CBSE PMT 1999; DPMT 1999]

(a) 16 *sec* (b) 12 *sec*

(c) 8 *sec* (d) 4 *sec*

23. If the metal bob of a simple pendulum is replaced by a wooden bob, then its time period will [AIIMS 1998, 99]

(a) Increase

(b) Decrease

(c) Remain the same

(d) First increase then decrease

24. In a simple pendulum, the period of oscillation T is related to length of the pendulum l as [EAMCET (Med.) 1995]

(a) $\frac{l}{T} =$ constant (b) $\frac{l^2}{T} =$ constant

(c) $\frac{l}{T^2} =$ constant (d) $\frac{l^2}{T^2} =$ constant

25. A pendulum has time period T. If it is taken on to another planet having acceleration due to gravity half and mass 9 times that of the earth then its time period on the other planet will be

(a) $\sqrt{T}$ (b) T

(c) $T^{1/3}$ (d) $\sqrt{2}$ T

26. A simple pendulum is executing simple harmonic motion with a time period T. If the length of the pendulum is increased by 21%, the percentage increase in the time period of the pendulum of increased length is

[BHU 1994, 96; Pb. PMT 1995; AFMC 2001;

AIIMS 2001; AIEEE 2003]

(a) 10% (b) 21%

(c) 30% (d) 50%

27. If the length of simple pendulum is increased by 300%, then the time period will be increased by [RPMT 1999]

(a) 100% (b) 200%

(c) 300% (d) 400%

28. The length of a seconds pendulum is [RPET 2000]

(a) 99.8 *cm* (b) 99 *cm*

(c) 100 *cm* (d) None of these

29. The time period of a simple pendulum in a lift descending with constant acceleration g is [DCE 1998; MP PMT 2001]

(a) $T = 2\pi\sqrt{\frac{l}{g}}$ (b) $T = 2\pi\sqrt{\frac{l}{2g}}$

(c) Zero (d) Infinite

[MP PET 1996]

30. A chimpanzee swinging on a swing in a sitting position, stands up suddenly, the time period will

[KCET (Engg./Med.) 2000; AIEEE 2002; DPMT 2004]

(a) Become infinite (b) Remain same

(c) Increase (d) Decrease

31. The acceleration due to gravity at a place is $\pi^2 m/sec^2$. Then the time period of a simple pendulum of length one *metre* is

(a) $\frac{2}{\pi} sec$ (b) $2\pi\, sec$

(c) $2\, sec$ (d) $\pi\, sec$

32. A plate oscillated with time period '*T*'. Suddenly, another plate put on the first plate, then time period [AIEEE 2002]

(a) Will decrease (b) Will increase

(c) Will be same (d) None of these

33. A simple pendulum of length l has a brass bob attached at its lower end. Its period is T. If a steel bob of same size, having density x times that of brass, replaces the brass bob and its length is changed so that period becomes $2T$, then new length is

(a) 2 l (b) 4 l

(c) $4\, l\, x$ (d) $\frac{4l}{x}$

34. In a seconds pendulum, mass of bob is 30 *gm*. If it is replaced by 90 *gm* mass. Then its time period will

[CMEET Bihar 1995]

[Orissa PMT 2001]

(a) 1 *sec* (b) 2 *sec*

(c) 4 *sec* (d) 3 *sec*

35. The time period of a simple pendulum when it is made to oscillate on the surface of moon [J & K CET 2004]

(a) Increases (b) Decreases

(c) Remains unchanged (d) Becomes infinite

36. A simple pendulum is attached to the roof of a lift. If time period of oscillation, when the lift is stationary is T. Then frequency of oscillation, when the lift falls freely, will be [DCE 2002]

(a) Zero (b) T

(c) $1/T$ (d) None of these

37. A simple pendulum, suspended from the ceiling of a stationary van, has time period T. If the van starts moving with a uniform velocity the period of the pendulum will be [RPMT 2003]

(a) Less than T (b) Equal to $2T$

(c) Greater than T (d) Unchanged

38. If the length of the simple pendulum is increased by 44%, then what is the change in time period of pendulum [MH CET 2004; UPSEAT 2005]

(a) 22% (b) 20%

(c) 33% (d) 44%

39. To show that a simple pendulum executes simple harmonic motion, it is necessary to assume that [CPMT 2001]

(a) Length of the pendulum is small

(b) Mass of the pendulum is small

(c) Amplitude of oscillation is small

(d) Acceleration due to gravity is small

40. The height of a swing changes during its motion from 0.1 m to 2.5 m. The minimum velocity of a boy who swings in this swing is

(a) 5.4 m/s (b) 4.95 m/s

(c) 3.14 m/s (d) Zero

41. The amplitude of an oscillating simple pendulum is 10cm and its period is 4 sec. Its speed after 1 sec after it passes its equilibrium position, is

(a) Zero (b) $0.57 m/s$

(c) $0.212 m/s$ (d) $0.32 m/s$

42. A simple pendulum consisting of a ball of mass m tied to a thread of length l is made to swing on a circular arc of angle θ in a vertical plane. At the end of this arc, another ball of mass m is placed at rest. The momentum transferred to this ball at rest by the swinging ball is [NCERT 1977]

(a) Zero (b) $m\theta\sqrt{\frac{g}{l}}$

(c) $\frac{m\theta}{l}\sqrt{\frac{l}{g}}$ (d) $\frac{m}{l}2\pi\sqrt{\frac{l}{g}}$

43. A simple pendulum hangs from the ceiling of a car. If the car accelerates with a uniform acceleration, the frequency of the simple pendulum will [Pb. PMT 2000]

(a) Increase (b) Decrease

(c) Become infinite (d) Remain constant

44. The periodic time of a simple pendulum of length 1 m and amplitude 2 cm is 5 seconds. If the amplitude is made 4 cm, its periodic time in seconds will be [MP PMT 1985]

(a) 2.5 (b) 5

(c) 10 (d) $5\sqrt{2}$

45. The ratio of frequencies of two pendulums are 2 : 3, then their length are in ratio [DCE 2005]

(a) $\sqrt{2/3}$ (b) $\sqrt{3/2}$

(c) $4/9$ (d) $9/4$

46. Two pendulums begin to swing simultaneously. If the ratio of the frequency of oscillations of the two is 7 : 8, then the ratio of lengths of the two pendulums will be [J & K CET 2005]

(a) 7 : 8 (b) 8 : 7

(c) 49 : 64 (d) 64 : 49

47. A simple pendulum hanging from the ceiling of a stationary lift has a time period T_1. When the lift moves downward with constant velocity, the time period is T_2, then [Orissa JEE 2005]

(a) T_2 is infinity (b) $T_2 > T_1$

(c) $T_2 < T_1$ (d) $T_2 = T_1$

48. If the length of a pendulum is made 9 times and mass of the bob is made 4 times then the value of time period becomes [BHU 2005]

(a) $3T$ (b) $3/2T$

(c) $4T$ (d) $2T$

49. A simple pendulum is taken from the equator to the pole. Its period [CPMT 1997]

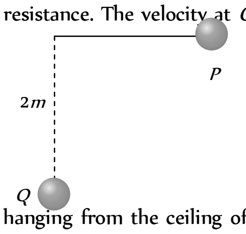
(a) Decreases

(b) Increases

(c) Remains the same

(d) Decreases and then increases

50. A pendulum of length $2m$ lift at P. When it reaches Q, it losses 10% of its total energy due to air resistance. The velocity at Q is



(a) 6 m/sec

(b) 1 m/sec

(c) 2 m/sec

(d) 8 m/sec

51. There is a simple pendulum hanging from the ceiling of a lift. When the lift is stand still, the time period of the pendulum is T. If the resultant acceleration becomes $g/4$, then the new time period of the pendulum is [DCE 2004]

(a) 0.8 T (b) 0.25 T

(c) 2 T (d) 4 T

52. The period of a simple pendulum measured inside a stationary lift is found to be T. If the lift starts accelerating upwards with acceleration of $g/3$, then the time period of the pendulum is [RPMT 2000; DPM

(a) $\frac{T}{\sqrt{3}}$ (b) $\frac{T}{3}$

(c) $\frac{\sqrt{3}}{2}T$ (d) $\sqrt{3}\,T$

53. Time period of a simple pendulum will be double, if we [MH CET 2003]

(a) Decrease the length 2 times
(b) Decrease the length 4 times
(c) Increase the length 2 times
(d) Increase the length 4 times

54. Length of a simple pendulum is l and its maximum angular displacement is θ, then its maximum K.E. is [RPMT 1995; BHU 2003]

(a) $mgl\sin\theta$ (b) $mgl(1+\sin\theta)$
(c) $mgl(1+\cos\theta)$ (d) $mgl(1-\cos\theta)$

55. The velocity of simple pendulum is maximum at [RPMT 2004]

(a) Extremes (b) Half displacement
(c) Mean position (d) Every where

56. A simple pendulum is vibrating in an evacuated chamber, it will oscillate with [Pb. PMT 2004]

(a) Increasing amplitude (b) Constant amplitude
(c) Decreasing amplitude (d) First (c) then (a)

57. The time period of a simple pendulum of length L as measured in an elevator descending with acceleration $\frac{g}{3}$ is [CPMT 2000]

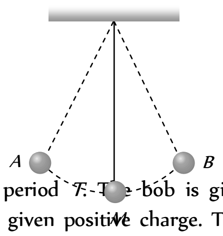
(a) $2\pi\sqrt{\frac{3L}{g}}$ (b) $\pi\sqrt{\left(\frac{3L}{g}\right)}$
(c) $2\pi\sqrt{\left(\frac{3L}{2g}\right)}$ (d) $2\pi\sqrt{\frac{2L}{3g}}$

58. If a body is released into a tunnel dug across the diameter of earth, it executes simple harmonic motion with time period

(a) $T=2\pi\sqrt{\frac{R_e}{g}}$ (b) $T=2\pi\sqrt{\frac{2R_e}{g}}$
(c) $T=2\pi\sqrt{\frac{R_e}{2g}}$ (d) $T=2$ seconds

59. What is the velocity of the bob of a simple pendulum at its mean position, if it is able to rise to vertical height of 10*cm* (g = 9.8 *m/s*)

(a) 2.2 *m/s*
(b) 1.8 *m/s*
(c) 1.4 *m/s*
(d) 0.6 *m/s*



60. A simple pendulum has time period T. The bob is given negative charge and surface below it is given positive charge. The new time period will be [AFMC 2004]

(a) Less than T (b) Greater than T
(c) Equal to T (d) Infinite

61. What effect occurs on the frequency of a pendulum if it is taken from the earth surface to deep into a mine [AFMC 2005]

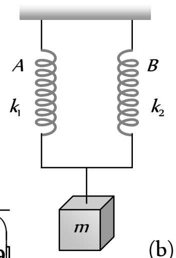
(a) Increases
(b) Decreases
(c) First increases then decrease
(d) None of these

Spring Pendulum

1. Two bodies M and N of equal masses are suspended from two separate massless springs of force constants k_1 and k_2 respectively. If the two bodies oscillate vertically such that their maximum velocities are equal, the ratio of the amplitude M to that of N is [IIT-JEE 1988; MP PET 1997, 2001; MP PMT 1997; BHU 1998; Pb. PMT 1998; MH CET 2000, 03; AIEEE 2003]

(a) $\frac{k_1}{k_2}$ (b) $\sqrt{\frac{k_1}{k_2}}$
(c) $\frac{k_2}{k_1}$ (d) $\sqrt{\frac{k_2}{k_1}}$

2. A mass m is suspended by means of two coiled spring which have the same length in unstretched condition as in figure. Their force constant are k_1 and k_2 respectively. When set into vertical vibrations, the period will be [MP PMT 2001]



(a) $2\pi\sqrt{\left(\frac{m}{k_1k_2}\right)}$ [CPMT 1999] (b) $2\pi\sqrt{m\left(\frac{k_1}{k_2}\right)}$
(c) $2\pi\sqrt{\left(\frac{m}{k_1-k_2}\right)}$ (d) $2\pi\sqrt{\left(\frac{m}{k_1+k_2}\right)}$

3. A spring has a certain mass suspended from it and its period for vertical oscillation is T. The spring is now cut into two equal halves and the same mass is suspended from one of the halves. The period of vertical oscillation is now [BHU 2000] [MP PET 1995]

(a) $\frac{T}{2}$ (b) $\frac{T}{\sqrt{2}}$
(c) $\sqrt{2}T$ (d) $2T$

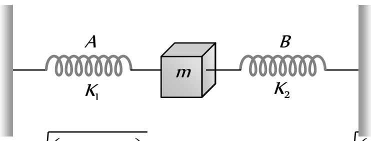
4. Two masses m_1 and m_2 are suspended together by a massless spring of constant k. When the masses are in equilibrium, m_1 is removed without disturbing the system. Then the angular frequency of oscillation of m_2 is

(a) $\sqrt{\frac{k}{m_1}}$ (b) $\sqrt{\frac{k}{m_2}}$

(c) $\sqrt{\frac{k}{m_1+m_2}}$ (d) $\sqrt{\frac{k}{m_1m_2}}$

5. In arrangement given in figure, if the block of mass m is displaced, the frequency is given by

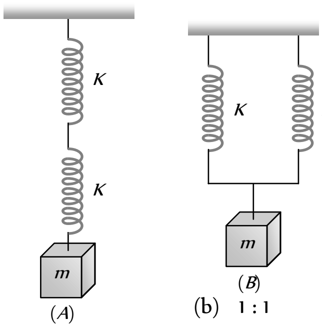
[BHU 1994; Pb. PET 2001]



(a) $n=\frac{1}{2\pi}\sqrt{\left(\frac{k_1-k_2}{m}\right)}$ (b) $n=\frac{1}{2\pi}\sqrt{\left(\frac{k_1+k_2}{m}\right)}$

(c) $n=\frac{1}{2\pi}\sqrt{\left(\frac{m}{k_1+k_2}\right)}$ (d) $n=\frac{1}{2\pi}\sqrt{\left(\frac{m}{k_1-k_2}\right)}$

6. Two identical spring of constant K are connected in series and parallel as shown in figure. A mass m is suspended from them. The ratio of their frequencies of vertical oscillations will be [MP PET 1993; BHU 1997]



(a) 2 : 1 (b) 1 : 1

(c) 1 : 2 (d) 4 : 1

7. A mass m is suspended from the two coupled springs connected in series. The force constant for springs are K_1 and K_2. The time period of the suspended mass will be

[CBSE PMT 1990; Pb. PET 2002]

(a) $T=2\pi\sqrt{\left(\frac{m}{K_1+K_2}\right)}$ (b) $T=2\pi\sqrt{\left(\frac{m}{K_1+K_2}\right)}$

(c) $T=2\pi\sqrt{\left(\frac{m(K_1+K_2)}{K_1K_2}\right)}$ (d) $T=2\pi\sqrt{\left(\frac{mK_1K_2}{K_1+K_2}\right)}$

8. A spring is stretched by 0.20 *m*, when a mass of 0.50 *kg* is suspended. When a mass of 0.25 *kg* is suspended, then its period of oscillation will be $(g=10m/s^2)$

(a) 0.328 *sec* (b) 0.628 *sec*

(c) 0.137 *sec* (d) 1.00 *sec*

9. A mass M is suspended from a spring of negligible mass. The spring is pulled a little and then released so that the mass executes simple harmonic oscillations with a time period T. If the mass is increased by m then the time period becomes $\left(\frac{5}{4}T\right)$. The ratio of $\frac{m}{M}$ is[CPMT 1991]

(a) 9/16 (b) 25/16

(c) 4/5 (d) 5/4

10. A spring having a spring constant 'K' is loaded with a mass 'm'. The spring is cut into two equal parts and one of these is loaded again with the same mass. The new spring constant is [NCERT 1990; KCET 1999; Kerala PMT 2004; BCECE 2004]

(a) $K/2$ (b) K

(c) $2K$ (d) K^2

11. A weightless spring which has a force constant oscillates with frequency n when a mass m is suspended from it. The spring is cut into two equal halves and a mass $2m$ is suspended from it. The frequency of oscillation will now become

[CPMT 1988]

(a) n (b) $2n$

(c) $n/\sqrt{2}$ (d) $n(2)^{1/2}$

12. A mass M is suspended from a light spring. An additional mass m added displaces the spring further by a distance x. Now the combined mass will oscillate on the spring with period[CPMT 1989, 1998 ; UPSEA

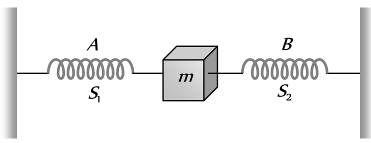
(a) $T=2\pi\sqrt{(mg/x(M+m))}$

(b) $T=2\pi\sqrt{((M+m)x/mg)}$

(c) $T=(\pi/2)\sqrt{(mg/x(M+m))}$

(d) $T=2\pi\sqrt{((M+m)/mgx)}$

13. In the figure, S_1 and S_2 are identical springs. The oscillation frequency of the mass m is f. If one spring is removed, the frequency will become [CPMT 1971]



(a) f (b) $f\times 2$

(c) $f\times\sqrt{2}$ (d) $f/\sqrt{2}$

14. The vertical extension in a light spring by a weight of 1 *kg* suspended from the wire is 9.8 *cm*. The period of oscillation

[CPMT 1981; MP PMT 2003]

(a) 20π sec (b) 2π sec

(c) $2\pi/10$ sec (d) 200π sec

15. A particle of mass 200 *gm* executes S.H.M. The restoring force is provided by a spring of force constant 80 *N / m*. The time period of oscillations is [MP PET 1994]

(a) 0.31 *sec* (b) 0.15 *sec*

(c) 0.05 *sec* (d) 0.02 *sec*

16. The length of a spring is l and its force constant is k. When a weight W is suspended from it, its length increases by x. If the spring is cut into two equal parts and put in parallel and the same weight W is suspended from them, then the extension will be

(a) $2x$ (b) x

(c) $\frac{x}{2}$ (d) $\frac{x}{4}$

17. A block is placed on a frictionless horizontal table. The mass of the block is m and springs are attached on either side with force constants K_1 and K_2. If the block is displaced a little and left to oscillate, then the angular frequency of oscillation will be

(a) $\left(\frac{K_1+K_2}{m}\right)^{1/2}$ (b) $\left[\frac{K_1K_2}{m(K_1+K_2)}\right]^{1/2}$

(c) $\left[\frac{K_1K_2}{(K_1-K_2)m}\right]^{1/2}$ (d) $\left[\frac{K_1^2+K_2^2}{(K_1+K_2)m}\right]^{1/2}$

18. A uniform spring of force constant k is cut into two pieces, the lengths of which are in the ratio 1 : 2. The ratio of the force constants of the shorter and the longer pieces is

[Manipal MEE 1995]

(a) 1 : 3 (b) 1 : 2

(c) 2 : 3 (d) 2 : 1

19. A mass m =100 *gms* is attached at the end of a light spring which oscillates on a frictionless horizontal table with an amplitude equal to 0.16 *metre* and time period equal to 2 *sec*. Initially the mass is released from rest at t = 0 and displacement $x = -0.16$ *metre*. The expression for the displacement of the mass at any time t is [MP PMT 1995]

(a) $x = 0.16\cos(\pi t)$ (b) $x = -0.16\cos(\pi t)$

(c) $x = 0.16\sin(\pi t+\pi)$ (d) $x = -0.16\sin(\pi t+\pi)$

20. A block of mass m, attached to a spring of spring constant k, oscillates on a smooth horizontal table. The other end of the spring is fixed to a wall. The block has a speed v when the spring is at its natural length. Before coming to an instantaneous rest, if the block moves a distance x from the mean position, then

(a) $x = \sqrt{m/k}$ (b) $x = \frac{1}{v}\sqrt{m/k}$

(c) $x = v\sqrt{m/k}$ (d) $x = \sqrt{mv/k}$

21. The force constants of two springs are K_1 and K_2. Both are stretched till their elastic energies are equal. If the stretching forces are F_1 and F_2, then $F_1 : F_2$ is

[MP PET 2002]

(a) $K_1 : K_2$ (b) $K_2 : K_1$

(c) $\sqrt{K_1} : \sqrt{K_2}$ (d) $K_1^2 : K_2^2$

22. A mass m is vertically suspended from a spring of negligible mass; the system oscillates with a frequency n. What will be the frequency of the system if a mass 4 m is suspended from the same spring

(a) $n/4$ (b) $4n$

(c) $n/2$ (d) $2n$

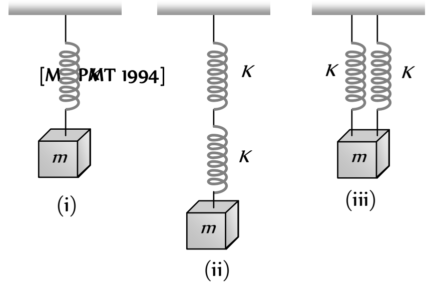
23. If the period of oscillation of mass m suspended from a spring is 2 *sec*, then the period of mass $4m$ will be

[AIIMS 1998]

(a) 1 *sec* (b) 2 *sec*

(c) 3 *sec* (d) 4 *sec*

24. Five identical springs are used in the following three configurations. The time periods of vertical oscillations in configurations (i), (ii) and (iii) are in the ratio [AMU 1995]



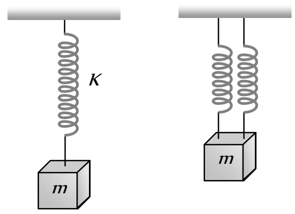
[M P PMT 1994]

(a) $1 : \sqrt{2} : \frac{1}{\sqrt{2}}$ (b) $2 : \sqrt{2} : \frac{1}{\sqrt{2}}$

(c) $\frac{1}{\sqrt{2}} : 2 : 1$ (d) $2 : \frac{1}{\sqrt{2}} : 1$

25. A mass m performs oscillations of period T when hanged by spring of force constant K. If spring is cut in two parts and arranged in parallel and same mass is oscillated by them, then the new time period will be

[CPMT 1995; RPET 1997; RPMT 2003]



(a) $2T$

(b) T

(c) $\frac{T}{\sqrt{2}}$

(d) $\frac{T}{2}$ [MP PET 1996]

26. If a watch with a wound spring is taken on to the moon, it

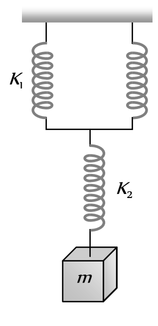
[AFMC 1993]

(a) Runs faster (b) Runs slower

(c) Does not work (d) Shows no change

27. What will be the force constant of the spring system shown in the figure

[RPET 1996; Kerala (Med./ Engg.) 2005]



(a) $\frac{K_1}{2} + K_2$

(b) $\left[\frac{1}{2K_1}+\frac{1}{K_2}\right]^{-1}$ [CBSE PMT 1998]

(c) $\frac{1}{2K_1}+\frac{1}{K_2}$

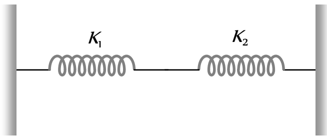
(d) $\left[\frac{2}{K_1}+\frac{1}{K_1}\right]^{-1}$

28. Two springs have spring constants K_A and K_B and $K_A > K_B$. The work required to stretch them by same extension will be

(a) More in spring A (b) More in spring B

(c) Equal in both (d) Noting can be said

29. The effective spring constant of two spring system as shown in figure will be [RPMT 1999]



(a) $K_1 + K_2$ (b) $K_1K_2 / K_1 + K_2$

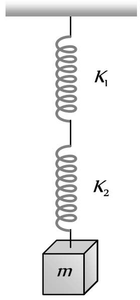
(c) $K_1 - K_2$ (d) $K_1K_2 / K_1 - K_2$

30. A mass m attached to a spring oscillates every 2 *sec*. If the mass is increased by 2 *kg*, then time-period increases by 1 *sec*. The initial mass is [CBSE PMT 2000; AIIMS 2000; MP PET 2000; DPMT 2001; Pb. PMT 2003]

(a) 1.6 *kg* (b) 3.9 *kg*

(c) 9.6 *kg* (d) 12.6 *kg*

31. A mass M is suspended by two springs of force constants K_1 and K_2 respectively as shown in the diagram. The total elongation (stretch) of the two springs is [MP PMT 2000; RPET 2001]



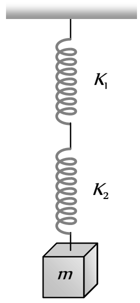
(a) $\dfrac{Mg}{K_1 + K_2}$

(b) $\dfrac{Mg(K_1 + K_2)}{K_1K_2}$

(c) $\dfrac{Mg\,K_1K_2}{K_1 + K_2}$

(d) $\dfrac{K_1 + K_2}{K_1K_2Mg}$

32. The frequency of oscillation of the springs shown in the figure will be [AIIMS 2001; Pb. PET 2002]



(a) $\dfrac{1}{2\pi}\sqrt{\dfrac{K}{m}}$

(b) $\dfrac{1}{2\pi}\sqrt{\dfrac{(K_1 + K_2)m}{K_1K_2}}$

(c) $2\pi\sqrt{\dfrac{K}{m}}$

(d) $\dfrac{1}{2\pi}\sqrt{\dfrac{K_1K_2}{m(K_1 + K_2)}}$

33. The scale of a spring balance reading from 0 to 10 *kg* is 0.25 m long. A body suspended from the balance oscillates vertically with a period of $\pi/10$ second. The mass suspended is (neglect the mass of the spring) [Kerala (Engg.) 2001]

(a) 10 *kg* (b) 0.98 *kg*

(c) 5 *kg* (d) 20 *kg*

34. If a spring has time period T, and is cut into n equal parts, then the time period of each part will be [AIEEE 2002]

(a) $T\sqrt{n}$ (b) $T/\sqrt{n}$

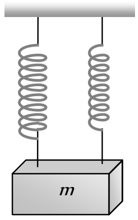
(c) nT (d) T

35. One-forth length of a spring of force constant K is cut away. The force constant of the remaining spring will be [MP PET 2002]

(a) $\dfrac{3}{4}K$ (b) $\dfrac{4}{3}K$

(c) K (d) 4 K

36. A mass m is suspended separately by two different springs of spring constant K_1 and K_2 gives the time-period t_1 and t_2 respectively. If same mass m is connected by both springs as shown in figure then time-period t is given by the relation [CBSE PMT 2002]



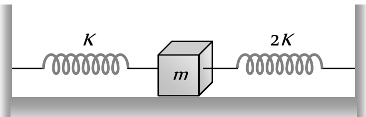
(a) $t = t_1 + t_2$

(b) $t = \dfrac{t_1.t_2}{t_1 + t_2}$

(c) $t^2 = t_1{}^2 + t_2{}^2$

(d) $t^{-2} = t_1{}^{-2} + t_2{}^{-2}$

37. Two springs of force constants K and $2K$ are connected to a mass as shown below. The frequency of oscillation of the mass is [RPMT 1996; DCE 200



(a) (1 / 2 ... /m)

(c) $(1/2\pi)\sqrt{(3K/m)}$ (d) $(1/2\pi)\sqrt{(m/K)}$

38. Two springs of constant k_1 and k_2 are joined in series. The effective spring constant of the combination is given by [CBSE PMT 2004]

(a) $\sqrt{k_1k_2}$ (b) $(k_1 + k_2)/2$

(c) $k_1 + k_2$ (d) $k_1k_2/(k_1 + k_2)$

39. A particle at the end of a spring executes simple harmonic motion with a period t_1, while the corresponding period for another spring is t_2. If the period of oscillation with the two springs in series is T, then [AIEEE 2004]

(a) $T = t_1 + t_2$ (b) $T^2 = t_1^2 + t_2^2$

(c) $T^{-1} = t_1^{-1} + t_2^{-1}$ (d) $T^{-2} = t_1^{-2} + t_2^{-2}$

40. Infinite springs with force constant k, $2k$, $4k$ and $8k$.... respectively are connected in series. The effective force constant of the spring will be [J & K CET 2004]

(a) 2K (b) k

(c) $k/2$ (d) 2048

41. To make the frequency double of a spring oscillator, we have to

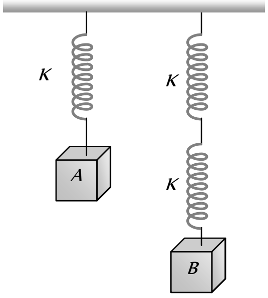
(a) Reduce the mass to one fourth

(b) Quardruple the mass

(c) Double of mass

(d) Half of the mass

42. The springs shown are identical. When $A = 4kg$, the elongation of spring is 1 *cm*. If $B = 6kg$, the elongation produced by it is



(a) 4 *cm* (b) 3 *cm*
(c) 2 *cm* (d) 1 *cm*

43. When a body of mass 1.0 *kg* is suspended from a certain light spring hanging vertically, its length increases by 5 *cm*. By suspending 2.0 *kg* block to the spring and if the block is pulled through 10 *cm* and released the maximum velocity in it in *m/s* is : (Acceleration due to gravity $= 10 m/s^2$) [EAMCET 2003]

(a) 0.5 (b) 1
(c) 2 (d) 4

44. Two springs with spring constants $K_1 = 1500\, N/m$ and $K_2 = 3000\, N/m$ are stretched by the same force. The ratio of potential energy stored in spring will be [RPET 2001]

(a) 2 : 1 (b) 1 : 2
(c) 4 : 1 (d) 1 : 4

45. If a spring extends by *x* on loading, then energy stored by the spring is (if *T* is the tension in the spring and *K* is the spring constant)

(a) $\frac{T^2}{2x}$ (b) $\frac{T^2}{2K}$
(c) $\frac{2K}{T^2}$ (d) $\frac{2T^2}{K}$

46. A weightless spring of length 60 *cm* and force constant 200 *N/m* is kept straight and unstretched on a smooth horizontal table and its ends are rigidly fixed. A mass of 0.25 *kg* is attached at the middle of the spring and is slightly displaced along the length. The time period of the oscillation of the mass is [MP PET 2003]

(a) $\frac{\pi}{20} s$ (b) $\frac{\pi}{10} s$
(c) $\frac{\pi}{5} s$ (d) $\frac{\pi}{\sqrt{200}} s$

47. The time period of a mass suspended from a spring is *T*. If the spring is cut into four equal parts and the same mass is suspended from one of the parts, then the new time period will be [MP PMT 2002; CBSE PMT 2003]

(a) *T* (b) $\frac{T}{2}$
(c) 2 *T* (d) $\frac{T}{4}$

48. A mass *M* is suspended from a spring of negligible mass. The spring is pulled a little and then released so that the mass executes S.H.M. of time period *T*. If the mass is increased by m, the time period becomes 5*T*/3. Then the ratio of *m*/*M* is [Pb. PET 2002]

(a) $\frac{5}{3}$ (b) $\frac{3}{5}$
(c) $\frac{25}{9}$ (d) $\frac{16}{9}$

49. An object is attached to the bottom of a light vertical spring and set vibrating. The maximum speed of the object is 15 *cm/sec* and the period is 628 *milli-seconds*. The amplitude of the motion in centimeters is [EAMCET 2003]

(a) 3.0 (b) 2.0
(c) 1.5 (d) 1.0

50. When a mass *m* is attached to a spring, it normally extends by 0.2 *m*. The mass *m* is given a slight addition extension and released, then its time period will be [MH CET 2001]

(a) $\frac{1}{7}$ *sec* (b) 1 *sec*
(c) $\frac{2\pi}{7}$ *sec* (d) $\frac{2}{3\pi}$ *sec*

51. If a body of mass 0.98 *kg* is made to oscillate on a spring of force constant 4.84 *N/m*, the angular frequency of the body is

(a) 1.22 *rad/s* (b) 2.22 *rad/s*
(c) 3.22 *rad/s* (d) 4.22 *rad/s*

52. A mass *m* is suspended from a spring of length *l* and force constant *K*. The frequency of vibration of the mass is f_1. The spring is cut into two equal parts and the same mass is suspended from one of the parts. The new frequency of vibration of mass is f_2. Which of the following relations between the frequencies is correct [AFMC 2000]

[NCERT 1983; CPMT 1986; MP PMT 1991; DCE 2002]

(a) $f_1 = \sqrt{2} f_2$ (b) $f_1 = f_2$
(c) $f_1 = 2f_2$ (d) $f_2 = \sqrt{2} f_1$

53. A mass *m* oscillates with simple harmonic motion with frequency $f = \frac{\omega}{2\pi}$ and amplitude *A* on a spring with constant K, therefore

(a) The total energy of the system is $\frac{1}{2}KA^2$

(b) The frequency is $\frac{1}{2\pi}\sqrt{\frac{K}{M}}$

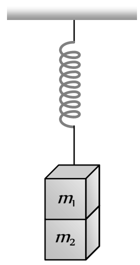
(c) The maximum velocity occurs, when $x = 0$

(d) All the above are correct

54. Two masses m_1 and m_2 are suspended together by a massless spring of constant *K*. When the masses are in equilibrium, m_2 is removed without disturbing the system. The amplitude of oscillations is

(a) $\frac{m_1 g}{K}$

(b) $\frac{m_2 g}{K}$



(c) $\frac{(m_1+m_2)g}{K}$

(d) $\frac{(m_1-m_2)g}{K}$

55. A spring executes SHM with mass of 10*kg* attached to it. The force constant of spring is 10*N/m*.If at any instant its velocity is 40*cm/sec*, the displacement will be (where amplitude is 0.5*m*)

(a) 0.09 *m* (b) 0.3 *m*

(c) 0.03 *m* (d) 0.9 *m*

Superposition of S.H.M's and Resonance

1. The S.H.M. of a particle is given by the equation $y = 3\sin\omega t + 4\cos\omega t$. The amplitude is [MP PET 1993]

(a) 7 (b) 1

(c) 5 (d) 12

2. If the displacement equation of a particle be represented by $y = A\sin PT + B\cos PT$, the particle executes [MP PET 1986]

(a) A uniform circular motion

(b) A uniform elliptical motion

(c) A S.H.M.

(d) A rectilinear motion

3. The motion of a particle varies with time according to the relation $y = a(\sin\omega t + \cos\omega t)$, then

(a) The motion is oscillatory but not S.H.M.

(b) The motion is S.H.M. with amplitude a

(c) The motion is S.H.M. with amplitude $a\sqrt{2}$

(d) The motion is S.H.M. with amplitude $2a$

4. The resultant of two rectangular simple harmonic motions of the same frequency and unequal amplitudes but differing in phase by $\frac{\pi}{2}$ is [BHU 2003; CPMT 2004; MP PMT 1989, 2005; BCECE 2005]

(a) Simple harmonic (b) Circular

(c) Elliptical (d) Parabolic

5. The composition of two simple harmonic motions of equal periods at right angle to each other and with a phase difference of π results in the displacement of the particle along

(a) Straight line (b) Circle

(c) Ellipse (d) Figure of eight

6. Two mutually perpendicular simple harmonic vibrations have same amplitude, frequency and phase. When they superimpose, the resultant form of vibration will be [MP PMT 1992]

(a) A circle (b) An ellipse

(c) A straight line (d) A parabola

7. The displacement of a particle varies according to the relation $x = 4(\cos\pi t + \sin\pi t)$. The amplitude of the particle is [AIEEE 2003]

(a) 8 (b) – 4

(c) 4 (d) $4\sqrt{2}$

8. A S.H.M. is represented by $x = 5\sqrt{2}(\sin 2\pi t + \cos 2\pi t)$. The amplitude of the S.H.M. is [MH CET 2004] [RPMT 2004]

(a) 10 *cm* (b) 20 *cm*

(c) $5\sqrt{2}$ *cm* (d) 50 *cm*

9. Resonance is an example of [CBSE PMT 1999; BHU 1999; 2005]

(a) Tuning fork (b) Forced vibration

(c) Free vibration (d) Damped vibration

10. In case of a forced vibration, the resonance wave becomes very sharp when the [CBSE PMT 2003]

(a) Restoring force is small

(b) Applied periodic force is small

(c) Quality factor is small

(d) Damping force is small

11. Amplitude of a wave is represented by

$$A = \frac{c}{a+b-c}$$

Then resonance will occur when [CPMT 1984]

(a) $b = -c/2$ (b) $b = 0$ and $a = -c$

(c) $b = -a/2$ (d) None of these

12. A particle with restoring force proportional to displacement and resisting force proportional to velocity is subjected to a force $F\sin\omega t$. If the amplitude of the particle is maximum for $\omega = \omega_1$ and the energy of the particle is maximum for $\omega = \omega_2$, then (where ω_0 natural frequency of oscillation of particle) [CBSE PMT 1990]

(a) $\omega_1 = \omega_0$ and $\omega_2 \neq \omega_o$ (b) $\omega_1 = \omega_0$ and $\omega_2 = \omega_o$

(c) $\omega_1 \neq \omega_0$ and $\omega_2 = \omega_o$ (d) $\omega_1 \neq \omega_0$ and $\omega_2 \neq \omega_o$

13. A simple pendulum is set into vibrations. The bob of the pendulum comes to rest after some time due to [AFMC 2003; JIPMER 1999]

(a) Air friction

(b) Moment of inertia

(c) Weight of the bob

(d) Combination of all the above

14. A simple pendulum oscillates in air with time period T and amplitude A. As the time passes [CPMT 2005]

(a) T and A both decrease

(b) T increases and A is constant

(c) T increases and A decreases

(d) T decreases and A is constant

Critical Thinking

Objective Questions

1. Two particles executes S.H.M. of same amplitude and frequency along the same straight line. They pass one another when going in opposite directions, and each time their displacement is half of their amplitude. The phase difference between them is

(a) 30° (b) 60°

(c) 90° (d) 120°

2. The displacement of a particle varies with time as $x = 12\sin\omega t - 16\sin^3 \omega t$ (in *cm*). If its motion is S.H.M., then its maximum acceleration is

(a) $12\,\omega^2$ (b) $36\,\omega^2$

(c) $144\,\omega^2$ (d) $\sqrt{192}\,\omega^2$

3. A linear harmonic oscillator of force constant $2\times10^6 N/m$ times and amplitude 0.01 *m* has a total mechanical energy of 160 *joules*. Its [IIT JEE 1989; CPMT 1995; CBSE PMT 1996; KECT (Med.) 1999; AMU (Engg.) 2000; UPSEAT 2001]

(a) Maximum potential energy is 100 *J*

(b) Maximum K.E. is 100 *J*

(c) Maximum P.E. is 160 *J*

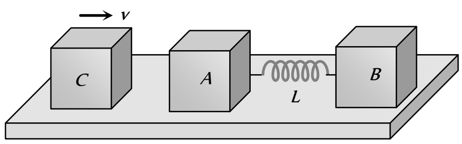
(d) Minimum P.E. is zero

4. A particle of mass *m* is executing oscillations about the origin on the *x*-axis. Its potential energy is $U(x) = k[x]^3$, where k is a positive constant. If the amplitude of oscillation is *a*, then its time period *T* is

(a) Proportional to $\frac{1}{\sqrt{a}}$ (b) Independent of *a*

(c) Proportional to $\sqrt{a}$ (d) Proportional to $a^{3/2}$

5. Two blocks *A* and *B* each of mass *m* are connected by a massless spring of natural length *L* and spring constant *K*. The blocks are initially resting on a smooth horizontal floor with the spring at its natural length as shown in figure. A third identical block *C* also of mass *m* moves on the floor with a speed *v* along the line joining *A* and *B* and collides with *A*. Then [IIT-JEE 1993]



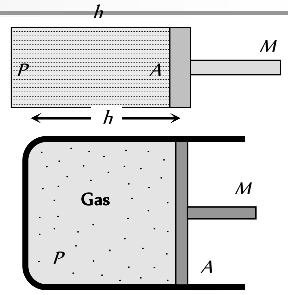
(a) The kinetic energy of the *A*-*B* system at maximum compression of the spring is zero

(b) The kinetic energy of the *A*-*B* system at maximum compression of the spring is $mv^2/4$

(c) The maximum compression of the spring is $v\sqrt{m/K}$

(d) The maximum compression of the spring is $v\sqrt{m/2K}$

6. A cylindrical piston of mass *M* slides smoothly inside a long cylinder closed at one end, enclosing a certain mass of gas. The cylinder is kept with its axis horizontal. If the piston is disturbed from its equilibrium position, it oscillates simple harmonically. The period of oscillation will be [IIT-JEE 1981]



(a) $T = 2\pi\sqrt{\left(\frac{Mh}{PA}\right)}$

(b) $T = 2\pi\sqrt{\left(\frac{MA}{Ph}\right)}$

(c) $T = 2\pi\sqrt{\left(\frac{M}{PAh}\right)}$ [MP PMT 1999]

(d) $T = 2\pi\sqrt{MPhA}$

7. A sphere of radius *r* is kept on a concave mirror of radius of curvature *R*. The arrangement is kept on a horizontal table (the surface of concave mirror is frictionless and sliding not rolling). If the sphere is displaced from its equilibrium position and left, then it executes S.H.M. The period of oscillation will be

(a) $2\pi\sqrt{\left(\frac{(R-r)1.4}{g}\right)}$ (b) $2\pi\sqrt{\left(\frac{R-r}{g}\right)}$

(c) $2\pi\sqrt{\left(\frac{rR}{a}\right)}$ (d) $2\pi\sqrt{\left(\frac{R}{gr}\right)}$

8. The amplitude of vibration of a particle is given by $a_m = (a_0)/(a\omega^2 - b\omega + c)$; where a_0, a, b and *c* are positive. The condition for a single resonant frequency is [CPMT 1982]

(a) $b^2 = 4ac$ [IIT-JEE 1998] (b) $b^2 > 4ac$

(c) $b^2 = 5ac$ (d) $b^2 = 7ac$

9. A *U* tube of uniform bore of cross-sectional area *A* has been set up vertically with open ends facing up. Now *m* gm of a liquid of density *d* is poured into it. The column of liquid in this tube will oscillate with a period *T* such that

(a) $T = 2\pi\sqrt{\frac{M}{g}}$ (b) $T = 2\pi\sqrt{\frac{MA}{gd}}$

(c) $T = 2\pi\sqrt{\frac{M}{gdA}}$ (d) $T = 2\pi\sqrt{\frac{M}{2Adg}}$

10. A particle is performing simple harmonic motion along *x*-axis with amplitude 4 *cm* and time period 1.2 *sec*. The minimum time taken by the particle to move from *x* =2 *cm* to *x* = + 4 *cm* and back again is given by [AIIMS 1995]

(a) 0.6 *sec* (b) 0.4 *sec*

(c) 0.3 *sec* (d) 0.2 *sec*

11. A large horizontal surface moves up and down in SHM with an amplitude of 1 *cm*. If a mass of 10 *kg* (which is placed on the surface) is to remain continually in contact with it, the maximum frequency of S.H.M. will be [SCRA 1994; AIIMS 1995]

(a) 0.5 *Hz* (b) 1.5 *Hz*

(c) 5 *Hz* (d) 10 *Hz*

12. Due to some force F_1 a body oscillates with period 4/5 *sec* and due to other force F_2 oscillates with period 3/5 *sec*. If both forces act simultaneously, the new period will be

[RPET 1997]

(a) 0.72 *sec* (b) 0.64 *sec*

(c) 0.48 *sec* (d) 0.36 *sec*

13. A horizontal platform with an object placed on it is executing S.H.M. in the vertical direction. The amplitude of oscillation is $3.92\times10^{-3}m$. What must be the least period of these oscillations, so that the object is not detached from the platform

(a) 0.1256 *sec* (b) 0.1356 *sec*

(c) 0.1456 *sec* (d) 0.1556 *sec*

14. A particle executes simple harmonic motion (amplitude = *A*) between $x=-A$ and $x=+A$. The time taken for it to go from 0 to *A*/2 is T_1 and to go from *A*/2 to *A* is T_2. Then

[IIT-JEE (Screening) 2001]

(a) $T_1 < T_2$ (b) $T_1 > T_2$

(c) $T_1 = T_2$ (d) $T_1 = 2T_2$

15. A simple pendulum of length *L* and mass (bob) *M* is oscillating in a plane about a vertical line between angular limits $-\phi$ and $+\phi$. For an angular displacement $\theta(|\theta|<\phi)$, the tension in the string and the velocity of the bob are T and v respectively. The following relations hold good under the above conditions

(a) $T\cos\theta = Mg$

(b) $T - Mg\cos\theta = \frac{Mv^2}{L}$

(c) The magnitude of the tangential acceleration of the bob $|a_T| = g\sin\theta$

(d) $T = Mg\cos\theta$

16. Two simple pendulums of length 5 *m* and 20 *m* respectively are given small linear displacement in one direction at the same time. They will again be in the phase when the pendulum of shorter length has completed .... oscillations.

[CBSE PMT 1998; JIPMER 2001, 02]

(a) 5 (b) 1

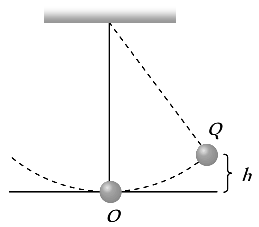
(c) 2 (d) 3

17. The bob of a simple pendulum is displaced from its equilibrium position *O* to a position *Q* which is at height *h* above *O* and the bob is then released. Assuming the mass of the bob to be *m* and time period of oscillations to be 2.0 *sec*, the tension in the string when the bob passes through *O* is

(a) $m(g+\pi\sqrt{2gh})$

(b) $m(g+\sqrt{\pi^2 gh})$

(c) $m\left(g+\sqrt{\frac{\pi^2}{2}gh}\right)$



(d) $m\left(g+\sqrt{\frac{\pi^2}{3}gh}\right)$

18. The metallic bob of a simple pendulum has the relative density ρ. The time period of this pendulum is *T*. If the metallic bob is immersed in water, then the new time period is given by

(a) $T\frac{\rho-1}{\rho}$ (b) $T\frac{\rho}{\rho-1}$

(c) $T\sqrt{\frac{\rho-1}{\rho}}$ [AIIMS 1999] (d) $T\sqrt{\frac{\rho}{\rho-1}}$

19. A clock which keeps correct time at 20^oC, is subjected to 40^oC. If coefficient of linear expansion of the pendulum is $12\times10^{-6}/°C$. How much will it gain or loose in time

[BHU 1998]

(a) 10.3 *seconds / day* (b) 20.6 *seconds / day*

(c) 5 *seconds / day* (d) 20 *minutes / day*

20. The period of oscillation of a simple pendulum of length *L* suspended from the roof of a vehicle which moves without friction down an inclined plane of inclination α, is given by

[IIT-JEE (Screening) 2000]

(a) $2\pi\sqrt{\frac{L}{g\cos\alpha}}$ (b) $2\pi\sqrt{\frac{L}{g\sin\alpha}}$

(c) $2\pi\sqrt{\frac{L}{g}}$ (d) $2\pi\sqrt{\frac{L}{g\tan\alpha}}$

[IIT 1986; UPSEAT 1998]

21. The bob of a simple pendulum executes simple harmonic motion in water with a period *t*, while the period of oscillation of the bob is t_0 in air. Neglecting frictional force of water and given that the density of the bob is (4/3) ×1000 *kg/m*. What relationship between t and t_0 is true [AIEEE 2004]

(a) $t = t_0$ (b) $t = t_0/2$

(c) $t = 2t_0$ (d) $t = 4t_0$

22. A spring of force constant *k* is cut into two pieces such that one piece is double the length of the other. Then the long piece will have a force constant of

[IIT-JEE (Screening) 1999]

(a) $(2/3)k$ (b) $(3/2)k$

(c) $3k$ (d) $6k$

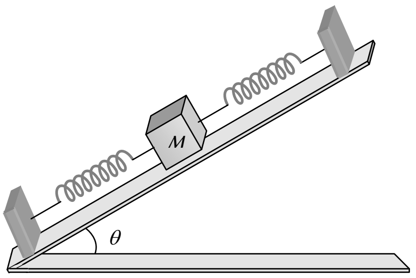
23. One end of a long metallic wire of length *L* is tied to the ceiling. The other end is tied to massless spring of spring constant *K*. *A* mass *m* hangs freely from the free end of the spring. The area of cross-section and Young's modulus of the wire are *A* and *Y* respectively. If the mass is slightly pulled down and released, it will oscillate with a time period *T* equal to [IIT 1993]

[AMU 1995]

(a) $2\pi\left(\frac{m}{K}\right)$ (b) $2\pi\left\{\frac{(YA+KL)m}{YAK}\right\}^{1/2}$

(c) $2\pi\frac{mYA}{KL}$ (d) $2\pi\frac{mL}{YA}$

24. On a smooth inclined plane, a body of mass *M* is attached between two springs. The other ends of the springs are fixed to firm supports. If each spring has force constant *K*, the period of oscillation of the body (assuming the springs as massless) is



(a) $2\pi\left(\frac{m}{2K}\right)^{1/2}$

(b) $2\pi\left(\frac{2M}{K}\right)^{1/2}$

(c) $2\pi\frac{Mg\sin\theta}{2K}$

(d) $2\pi\left(\frac{2Mg}{K}\right)^{1/2}$

25. A particle of mass m is attached to a spring (of spring constant k) and has a natural angular frequency ω_0 -An external force $F(t)$ proportional to $\cos\omega t((\omega \neq \omega_0)$ is applied to the oscillator. The time displacement of the oscillator will be proportional to

(a) $\frac{m}{\omega_0^2-\omega^2}$ (b) $\frac{1}{m(\omega_0^2-\omega^2)}$

(c) $\frac{1}{m(\omega_1^2+\omega^2)}$ (d) $\frac{m}{\omega_1^2+\omega^2}$

26. A 15 g ball is shot from a spring gun whose spring has a force constant of 600 N/m. The spring is compressed by 5 cm. The greatest possible horizontal range of the ball for this compression is (g = 10 m/s) [DPMT 2004]

(a) 6.0 m (b) 10.0 m

(c) 12.0 m (d) 8.0 m

27. An ideal spring with spring-constant K is hung from the ceiling and a block of mass M is attached to its lower end. The mass is released with the spring initially unstretched. Then the maximum extension in the spring is

[IIT-JEE (Screening) 2002]

(a) 4 Mg/K (b) 2 Mg/K

(c) Mg/K (d) $Mg/2K$

28. The displacement y of a particle executing periodic motion is given by $y = 4\cos^2(t/2)\sin(1000t)$. This expression may be considered to be a result of the superposition of .... independent harmonic motions [IIT 1992]

(a) Two (b) Three

(c) Four (d) Five

29. Three simple harmonic motions in the same direction having the same amplitude a and same period are superposed. If each differs in phase from the next by 45^o, then

(a) The resultant amplitude is $(1+\sqrt{2})a$

(b) The phase of the resultant motion relative to the first is 90°

(c) The energy associated with the resulting motion is $(3+2\sqrt{2})$ times the energy associated with any single motion

(d) The resulting motion is not simple harmonic

30. The function $\sin^2(\omega t)$ represents [AIEEE 2005]

(a) A simple harmonic motion with a period $2\pi/\omega$

(b) A simple harmonic motion with a period π/ω

(c) A periodic but not simple harmonic motion with a period $2\pi/\omega$

(d) A periodic but not simple harmonic, motion with a period π/ω

31. A simple pendulum has time period T_1. The point of suspension is now moved upward according to equation $y = kt^2$ where $k = 1\,m/sec^2$. If new time period is T_2 then ratio $\frac{T_1^2}{T_2^2}$ will be

(a) 2/3 (b) 5/6

(c) 6/5 (d) 3/2

32. A simple pendulum is hanging from a peg inserted in a vertical wall. Its bob is stretched in horizontal position from the wall and is left free to move. The bob hits on the wall the coefficient of restitution $\frac{2}{\sqrt{5}}$ [AIEEE 2004] After how many collisions the amplitude of vibration will become less than 60°

[UPSEAT 1999]

(a) 6 (b) 3

(c) 5 (d) 4

33. A brass cube of side a and density σ is floating in mercury of density ρ. If the cube is displaced a bit vertically, it executes S.H.M. Its time period will be

(a) $2\pi\sqrt{\frac{\sigma a}{\rho g}}$ (b) $2\pi\sqrt{\frac{\rho a}{\sigma g}}$

(c) $2\pi\sqrt{\frac{\rho g}{\sigma a}}$ (d) $2\pi\sqrt{\frac{\sigma g}{\rho a}}$

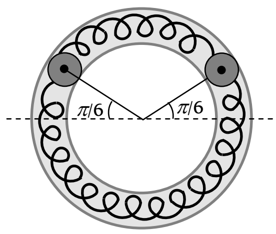
34. Two identical balls A and B each of mass 0.1 kg are attached to two identical massless springs. The spring mass system is constrained to move inside a rigid smooth pipe bent in the form of a circle as shown in the figure. The pipe is fixed in a horizontal plane. The centres of the balls can move in a circle of radius 0.06 m. Each spring has a natural length of 0.06π m and force constant 0.1N/m. Initially both the balls are displaced by an angle $\theta = \pi/6$ radian with respect to the diameter PQ of the circle and released from rest. The frequency of oscillation of the ball B is

(a) $\pi\,Hz$

(b) $\frac{1}{\pi}Hz$

(c) $2\pi\,Hz$ [IIT JEE 1999]

(d) $\frac{1}{2\pi}Hz$



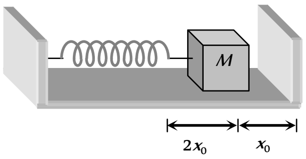
35. A disc of radius R and mass M is pivoted at the rim and is set for small oscillations. If simple pendulum has to have the same period as that of the disc, the length of the simple pendulum should be

(a) $\frac{5}{4}R$ (b) $\frac{2}{3}R$

(c) $\frac{3}{4}R$ (d) $\frac{3}{2}R$

36. One end of a spring of force constant k is fixed to a vertical wall and the other to a block of mass m resting on a smooth horizontal surface. There is another wall at a distance x_0 from the black. The

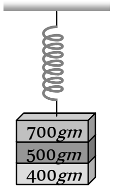
spring is then compressed by $2x_0$ and released. The time taken to strike the wall is



(a) $\frac{1}{6}\pi\sqrt{\frac{k}{m}}$ (b) $\sqrt{\frac{k}{m}}$

(c) $\frac{2\pi}{3}\sqrt{\frac{m}{k}}$ (d) $\frac{\pi}{4}\sqrt{\frac{k}{m}}$

37. Three masses $700g$, $500g$, and $400g$ are suspended at the end of a spring a shown and are in equilibrium. When the $700g$ mass is removed, the system oscillates with a period of 3 seconds, when the 500 *gm* mass is also removed, it will oscillate with a period of



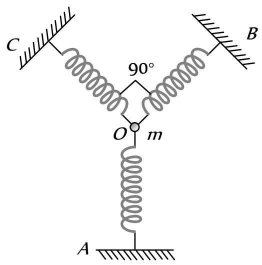
(a) 1 *s*

(b) 2 *s*

(c) 3 *s*

(d) $\sqrt{\frac{12}{5}}\,s$

38. A particle of mass *m* is attached to three identical springs *A, B* and *C* each of force constant *k* a shown in figure. If the particle of mass *m* is pushed slightly against the spring *A* and released then the time period of oscillations is



(a) $2\pi\sqrt{\frac{2m}{k}}$

(b) $2\pi\sqrt{\frac{m}{2k}}$

(c) $2\pi\sqrt{\frac{m}{k}}$

(d) $2\pi\sqrt{\frac{m}{3k}}$

39. A hollow sphere is filled with water through a small hole in it. It is then hung by a long thread and made to oscillate. As the water slowly flows out of the hole at the bottom, the period of oscillation will

[MP PMT 1994; KCET 1994; RPET 1996; AFMC 2000; CBSE PMT 2000; CPMT 2001; AIEEE 2005]

(a) Continuously decrease

(b) Continuously increase

(c) First decrease and then increase to original value

(d) First increase and then decrease to original value

40. Two simple pendulums whose lengths are 100 *cm* and 121 *cm* are suspended side by side. Their bobs are pulled together and then released. After how many minimum oscillations of the longer pendulum, will the two be in phase again

(a) 11 (b) 10

(c) 21 (d) 20

41. The amplitude of a damped oscillator becomes half in one minute. The amplitude after 3 *minute* will be $\frac{1}{X}$ times the original, where *X* is [CPMT 1989; DPMT 2002]

(a) 2×3 (b) 2^3

(c) 3^2 (d) 3×2^2

42. Which of the following function represents a simple harmonic oscillation [AIIMS 2005]

(a) $\sin\omega t - \cos\omega t$ (b) $\sin^2\omega t$

(c) $\sin\omega t + \sin 2\omega t$ (d) $\sin\omega t - \sin 2\omega t$

43. A uniform rod of length 2.0 *m* is suspended through an end and is set into oscillation with small amplitude under gravity. The time period of oscillation is approximately

[AMU (Med.) 2000]

(a) 1.60 *sec* (b) 1.80 *sec*

(c) 2.0 *sec* (d) 2.40 *sec*

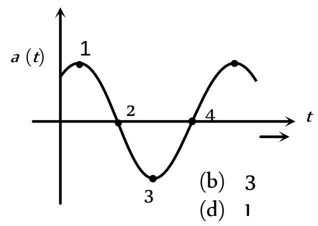
Graphical Questions

1. A particle is executing S.H.M. Then the graph of acceleration as a function of displacement is

(a) A straight line (b) A circle

(c) An ellipse (d) A hyperbola

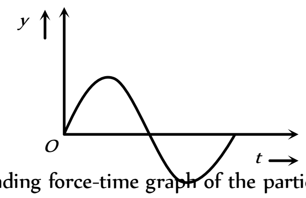
2. The acceleration *a* of a particle undergoing S.H.M. is shown in the figure. Which of the labelled points corresponds to the particle being at $-x_0$ [AMU (Med.) 2000]



(a) 4 (b) 3

(c) 2 (d) 1

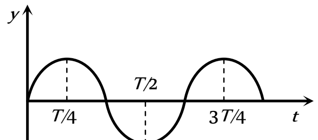
3. The displacement time graph of a particle executing S.H.M. is as shown in the figure [KCET 2003]



The corresponding force-time graph of the particle is

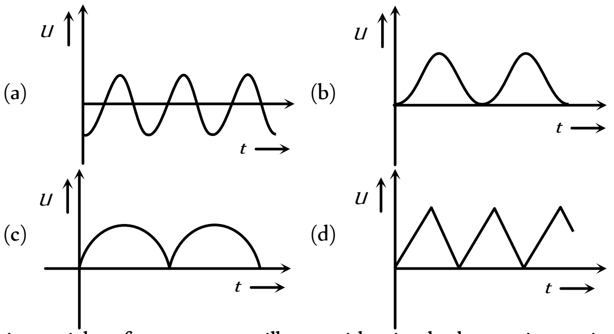
(a) 
(b) 
[DPMT 2005]

(c) 
(d) 
4. The graph shows the variation of displacement of a particle executing S.H.M. with time. We infer from this graph that

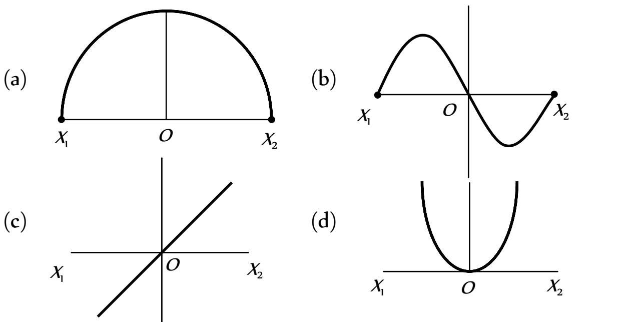


(a) The force is zero at time $3T/4$
(b) The velocity is maximum at time $T/2$
(c) The acceleration is maximum at time T
(d) The P.E. is equal to total energy at time $T/2$

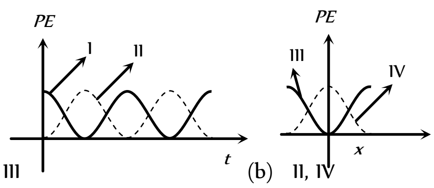
5. As a body performs S.H.M., its potential energy U. varies with time as indicated in [AMU (Med.) 2001]



6. A particle of mass m oscillates with simple harmonic motion between points x_1 and x_2, the equilibrium position being O. Its potential energy is plotted. It will be as given below in the graph



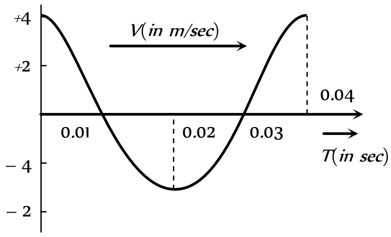
7. For a particle executing S.H.M. the displacement x is given by $x = A\cos\omega t$. Identify the graph which represents the variation of potential energy (P.E.) as a function of time t and displacement x



(a) I, III
(b) II, IV
(c) II, III
(d) I, IV

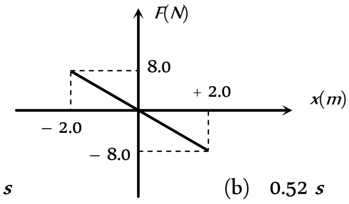
8. The velocity-time diagram of a harmonic oscillator is shown in the adjoining figure. The frequency of oscillation is

[CPMT 1989]



(a) 25 Hz
(b) 50 Hz
(c) 12.25 Hz
(d) 33.3 Hz

9. A body of mass 0.01 kg executes simple harmonic motion (S.H.M.) about $x = 0$ under the influence of a force shown below : The period of the S.H.M. is [AMU (Med.) 2002]



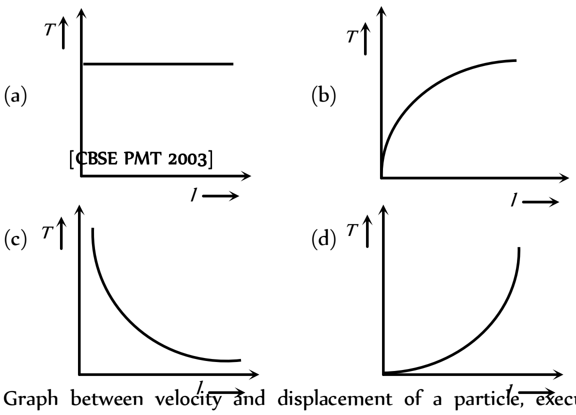
(a) 1.05 s
(b) 0.52 s
(c) 0.25 s
(d) 0.30 s

10. For a simple pendulum the graph between L and T will be.

[CPMT 1992]

(a) Hyperbola
(b) Parabola
(c) A curved line
(d) A straight line

11. In case of a simple pendulum, time period versus length is depicted by [DCE 1999, 2001]

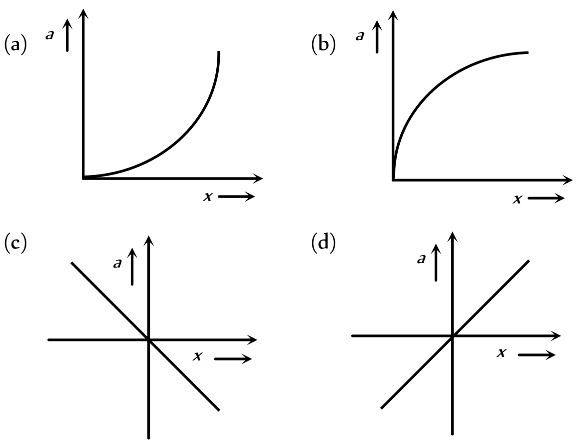


[CBSE PMT 2003]

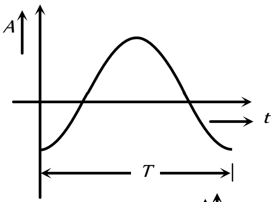
12. Graph between velocity and displacement of a particle, executing S.H.M. is [DPMT 2005]

(a) A straight line
(b) A parabola
(c) A hyperbola
(d) An ellipse

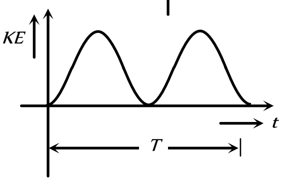
13. The variation of the acceleration a of the particle executing S.H.M. with displacement x is as shown in the figure [IIT JEE (Screening) 2003]



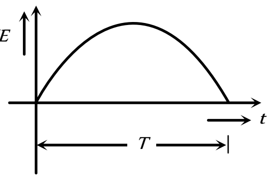
14. Acceleration A and time period T of a body in S.H.M. is given by a curve shown below. Then corresponding graph, between kinetic energy (K.E.) and time t is correctly represented by



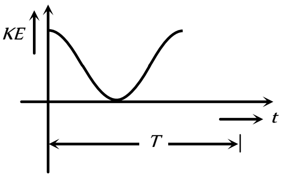
(a)



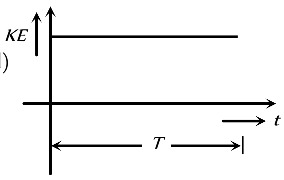
(b)



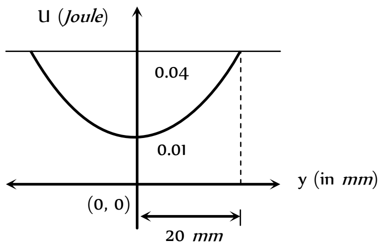
(c)



(d)



15. The variation of potential energy of harmonic oscillator is as shown in figure. The spring constant is

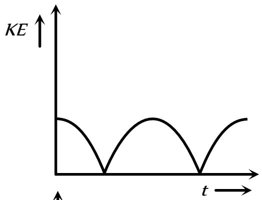


(a) 1×10^2 N/m (b) 150 N/m

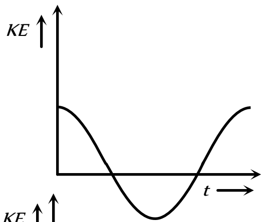
(c) 0.667×10^2 N/m (d) 3×10^2 N/m

16. A body performs S.H.M. Its kinetic energy K varies with time t as indicated by graph

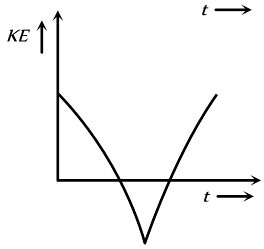
(a)



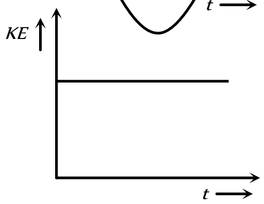
(b)



(c)



(d)



AR Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : All oscillatory motions are necessarily periodic motion but all periodic motion are not oscillatory.

Reason : Simple pendulum is an example of oscillatory motion.

2. Assertion : Simple harmonic motion is a uniform motion.

Reason : Simple harmonic motion is the projection of uniform circular motion.

3. Assertion : Acceleration is proportional to the displacement. This condition is not sufficient for motion in simple harmonic.

Reason : In simple harmonic motion direction of displacement is also considered.

4. Assertion : Sine and cosine functions are periodic functions.

Reason : Sinusoidal functions repeats it values after a definite interval of time.

5. Assertion : The graph between velocity and displacement for a harmonic oscillator is a parabola.

Reason : Velocity does not change uniformly with displacement in harmonic motion.

6. Assertion : When a simple pendulum is made to oscillate on the surface of moon, its time period increases.

Reason : Moon is much smaller as compared to earth.

7. Assertion : Resonance is special case of forced vibration in which the natural frequency of vibration of the body is the same as the impressed frequency of external periodic force and the amplitude of forced vibration is maximum.

Reason : The amplitude of forced vibrations of a body increases with an increase in the frequency of the externally impressed periodic force.

[AIIMS 1994]

8. Assertion : The graph of total energy of a particle in SHM *w.r.t.,* position is a straight line with zero slope.

Reason : Total energy of particle in SHM remains constant throughout its motion.

9. Assertion : The percentage change in time period is 1.5%, if the length of simple pendulum increases by 3%.

Reason : Time period is directly proportional to length of pendulum.

10. Assertion : The frequency of a second pendulum in an elevator moving up with an acceleration half the acceleration due to gravity is 0.612 s^{-}.

Reason : The frequency of a second pendulum does not depend upon acceleration due to gravity.

11. Assertion : Damped oscillation indicates loss of energy.

Reason : The energy loss in damped oscillation may be due to friction, air resistance etc.

12. Assertion : In a S.H.M., kinetic and potential energies become equal when the displacement is $1/\sqrt{2}$ times the amplitude.

Reason : In SHM, kinetic energy is zero when potential energy is maximum.

13. Assertion : If the amplitude of a simple harmonic oscillator is doubled, its total energy becomes four times.

Reason : The total energy is directly proportional to the square of amplitude of vibration of the harmonic oscillator.

14. Assertion : For an oscillating simple pendulum, the tension in the string is maximum at the mean position and minimum at the extreme position.

Reason : The velocity of oscillating bob in simple harmonic motion is maximum at the mean position.

15. Assertion : The spring constant of a spring is k. When it is divided into n equal parts, then spring constant of one piece is k/n.

Reason : The spring constant is independent of material used for the spring.

16. Assertion : The periodic time of a hard spring is less as compared to that of a soft spring.

Reason : The periodic time depends upon the spring constant, and spring constant is large for hard spring.

17. Assertion : In extreme position of a particle executing S.H.M., both velocity and acceleration are zero.

Reason : In S.H.M., acceleration always acts towards mean position.

18. Assertion : Soldiers are asked to break steps while crossing the bridge.

Reason : The frequency of marching may be equal to the natural frequency of bridge and may lead to resonance which can break the bridge.

[AIIMS 2001]

19. Assertion : The amplitude of oscillation can never be infinite.

Reason : The energy of oscillator is continuously dissipated.

20. Assertion : In S.H.M., the motion is 'to and fro' and periodic.

Reason : Velocity of the particle $(v) = \omega\sqrt{k^2 - x^2}$ (where x is the displacement and k is amplitude)

[AIIMS 2002]

21. Assertion : The amplitude of an oscillating pendulum decreases gradually with time

Reason : The frequency of the pendulum decreases with time [AIIMS 2003]

22. Assertion : In simple harmonic motion, the velocity is maximum when acceleration is minimum

Reason : Displacement and velocity of S.H.M. differ is phase by $\pi/2$ [AIIMS 1999]

23. Assertion : Consider motion for a mass spring system under gravity, motion of M is not a simple harmonic motion unless Mg is negligibly small.

Reason : For simple harmonic motion acceleration must be proportional to displacement and is directed towards the mean position

[SCRA 1994]

Answers and Solutions

Displacement of S.H.M. and Phase

1. (b,d) For S.H.M. displacement $y = a\sin\omega t$ and acceleration

$A = -\omega^2 y\sin\omega t$ these are maximum at $\omega t = \frac{\pi}{2}$.

2. (c) $v_{max} = \omega A \Rightarrow v = \frac{\omega A}{2} = \omega\sqrt{A^2 - y^2}$

$\Rightarrow A^2 - y^2 = \frac{A^2}{4} \Rightarrow y^2 = \frac{3A^2}{4} \Rightarrow y = \frac{\sqrt{3}A}{2}$

3. (d) Equation of motion is $y = 5\sin\frac{2\pi t}{6}$. For $y = 2.5\,cm$

$2.5 = 5\sin\frac{2\pi t}{6} \Rightarrow \frac{2\pi t}{6} = \frac{\pi}{6} \Rightarrow t = \frac{1}{2}sec$

and phase $= \frac{2\pi t}{6} = \frac{\pi}{6}$.

4. (c) $y = a\sin(\omega t - \alpha) = a\cos\left(\omega t - \alpha - \frac{\pi}{2}\right)$

Another equation is given $y = \cos(\omega t - \alpha)$

So, there exists a phase difference of $\frac{\pi}{2} = 90°$

5. (d) $y = a\sin(\omega t + \phi)$

$= a\sin\left(\frac{2\pi}{T}t + \phi\right) \Rightarrow y = 0.5\sin\left(\frac{2\pi}{0.4}t + \frac{\pi}{2}\right)$

$y = 0.5\sin\left(5\pi t + \frac{\pi}{2}\right) = 0.5\cos 5\pi t$

6. (c) $y = a\sin(2\pi nt + \alpha)$. Its phase at time $t = 2\pi nt + \alpha$

7. (c) From given equation $\omega = \frac{2\pi}{T} = 0.5\pi \Rightarrow T = 4\ sec$

Time taken from mean position to the maximum displacement $= \frac{1}{4}T = 1\ sec.$

8. (a) It is required to calculate the time from extreme position. Hence, in this case equation for displacement of particle can be written as $x = a\sin(\omega t + \frac{\pi}{2}) = a\cos\omega t$

$\Rightarrow \frac{a}{2} = a\cos\omega t \Rightarrow \omega t = \frac{\pi}{3} \Rightarrow \frac{2\pi}{T}.t = \frac{\pi}{3} \Rightarrow t = \frac{T}{6}$

9. (a,b,d) $x = a\sin\omega t\cos\omega t = \frac{a}{2}\sin 2\omega t$

10. (a) $v_{\max} = a\omega = a \times \frac{2\pi}{T} \Rightarrow a = \frac{v_{\max} \times T}{2\pi}$

$a = \frac{1.00\times 10^3 \times (1\times 10^{-5})}{2\pi} = 1.59\ mm$

11. (c)

12. (c)

13. (c) $y = a\sin\frac{2\pi}{T}t \Rightarrow \frac{a}{\sqrt{2}} = a\sin\frac{2\pi}{T}\cdot t$

$\Rightarrow \sin\frac{2\pi}{T}t = \frac{1}{\sqrt{2}} = \sin\frac{\pi}{4} \Rightarrow \frac{2\pi}{T}t = \frac{\pi}{4} \Rightarrow t = \frac{T}{8}$

14. (c)

15. (d) Standard equation of S.H.M. $\frac{d^2y}{dt^2} = -\omega^2 y$, is not satisfied by $y = a\tan\omega t$.

16. (b) $x = a\cos(\omega t + \theta)$ ....(i)

and $v = \frac{dx}{dt} = -a\omega\sin(\omega t + \theta)$ ....(ii)

Given at $t = 0$, $x = 1\,cm$ and $v = \pi$ and $\omega = \pi$

Putting these values in equation (i) and (ii) we will get $\sin\theta = \frac{-1}{a}$ and $\cos\theta = \frac{1}{a}$

$\Rightarrow \sin^2\theta + \cos^2\theta = \left(-\frac{1}{a}\right)^2 + \left(\frac{1}{a}\right)^2 \Rightarrow a = \sqrt{2}\,cm$

17. (d) $y = A\sin\omega t = \frac{A\sin 2\pi}{T}t \Rightarrow \frac{A}{2} = A\sin\frac{2\pi t}{T} \Rightarrow t = \frac{T}{12}$.

18. (a) The amplitude is a maximum displacement from the mean position.

19. (c) Equation of motion $y = a\cos\omega t$

$\Rightarrow \frac{a}{2} = a\cos\omega t \Rightarrow \cos\omega t = \frac{1}{2} \Rightarrow \omega t = \frac{\pi}{3}$

$\Rightarrow \frac{2\pi t}{T} = \frac{\pi}{3} \Rightarrow t = \frac{\frac{\pi}{3}\times T}{2\pi} = \frac{4}{3\times 2} = \frac{2}{3}\sec$

20. (a) Simple harmonic waves are set up in a string fixed at the, two ends.

21. (b)

22. (c) $v_1 = \frac{dy_1}{dt} = 0.1\times 100\pi\cos\left(100\pi t + \frac{\pi}{3}\right)$

$v_2 = \frac{dy_2}{dt} = -0.1\pi\sin\pi t = 0.1\pi\cos\left(\pi t + \frac{\pi}{2}\right)$

Phase difference of velocity of first particle with respect to the velocity of 2nd particle at $t = 0$ is

$\Delta\phi = \phi_1 - \phi_2 = \frac{\pi}{3} - \frac{\pi}{2} = -\frac{\pi}{6}$.

23. (b) $\frac{a_1}{a_2} = \frac{10}{25} = \frac{2}{5}$

24. (c) $y = a\sin\frac{2\pi}{T}t \Rightarrow \frac{a}{2} = a\sin\frac{2\pi t}{3} \Rightarrow \frac{1}{2} = \sin\frac{2\pi t}{3}$

$\Rightarrow \sin\frac{2\pi t}{3} = \sin\frac{\pi}{6} \Rightarrow \frac{2\pi t}{3} = \frac{\pi}{6} \Rightarrow t = \frac{1}{4}\sec$

25. (b)

26. (a) $x = a\sin\left(\omega t + \frac{\pi}{6}\right)$ and $x' = a\cos\omega t = a\sin\left(\omega t + \frac{\pi}{2}\right)$

$\therefore \Delta\phi = \left(\omega t + \frac{\pi}{2}\right) - \left(\omega t + \frac{\pi}{6}\right) = \frac{\pi}{3}$

Velocity of Simple Harmonic Motion

1. (a) Velocity of a particle executing S.H.M. is given by

$v = \omega\sqrt{a^2 - x^2} = \frac{2\pi}{T}\sqrt{A^2 - \frac{A^2}{4}} = \frac{2\pi}{T}\sqrt{\frac{3A^2}{4}} = \frac{\pi A\sqrt{3}}{T}$.

2. (c) $v = \omega\sqrt{(a^2 - y^2)} = 2\sqrt{60^2 - 20^2} = 113\,mm/s$.

3. (c) It is given $v_{max} = 100\,cm/sec$, $a = 10\,cm$.

$\Rightarrow v_{max} = a\omega \Rightarrow \omega = \frac{100}{10} = 10\,rad/sec$

Hence $v = \omega\sqrt{a^2 - y^2} \Rightarrow 50 = 10\sqrt{(10)^2 - y^2}$

$\Rightarrow y = 5\sqrt{3}\,cm$

4. (c) At centre $v_{max} = a\omega = a.\frac{2\pi}{T} = \frac{0.2\times 2\pi}{0.01} = 40\pi$

5. (b) $v_{max} = a\omega = a\frac{2\pi}{T} = 3\times\frac{2\pi}{6} = \pi\,cm/s$

6. (c) $v_{max} = \omega a = \frac{2\pi}{T}\times a \Rightarrow v_{max} = \frac{2\times\pi\times 2}{2} = 2\pi\,m/s$

7. (d) $v_{max} = a\omega = \frac{a.2\pi}{T} = \frac{2\pi a}{T}$

8. (c) $v = \omega\sqrt{a^2 - y^2} \Rightarrow 10 = \omega\sqrt{a^2 - (4)^2}$ and $8 = \omega\sqrt{a^2 - (5)^2}$

On solving $\omega = 2 \Rightarrow \omega = \frac{2\pi}{T} = 2 \Rightarrow T = \pi\,sec$

9. (d) From the given equation, $a = 5$ and $\omega = 4$

$\therefore v = \omega\sqrt{a^2 - y^2} = 4\sqrt{(5)^2 - (3)^2} = 16$

10. (b) $v_{max} = a\omega = a\times\frac{2\pi}{T} = (50\times 10^{-3})\times\frac{2\pi}{2} = 0.15\,m/s$

11. (a) $n = \frac{\omega}{2\pi} = \frac{220}{2\pi} = 35\,Hz$

$v_{max} = \omega a = 220\times 0.30\,m/s = 66\,m/s$

12. (d) $v_{max} = a\omega$ and $A_{max} = a\omega^2 \Rightarrow \omega = \frac{A_{max}}{v_{max}} = \frac{4}{2} = 2\,rad/sec$

13. (a) $v_{max} = a\omega = \frac{a\times 2\pi}{T} = \frac{2\times 10^{-3}\times 2\pi}{0.1} = \frac{\pi}{25}\,m/s$

14. (b) $A = \omega^2 y \Rightarrow \omega = \sqrt{A/y} = \sqrt{\frac{8}{2}} = 2\,rad/sec$

Now $v_{max} = a\omega = 6\times 2 = 12\,cm/sec$

15. (c) $v_{max} = a\omega \Rightarrow \omega = \frac{v_{max}}{a} = \frac{10}{4}$

Now, $v = \omega\sqrt{a^2 - y^2} \Rightarrow v^2 = \omega^2(a^2 - y^2) \Rightarrow y^2 = a^2 - \frac{v^2}{\omega^2}$

$\Rightarrow y = \sqrt{a^2 - \frac{v^2}{\omega^2}} = \sqrt{4^2 - \frac{5^2}{(10/4)^2}} = 2\sqrt{3}\,cm$

16. (b) The particles will meet at the mean position when P completes one oscillation and Q completes half an oscillation

So $\frac{v_P}{v_Q} = \frac{a\omega_P}{a\omega_Q} = \frac{T_Q}{T_P} = \frac{6}{3} = \frac{2}{1}$

17. (b) $\frac{v_{max}}{A_{max}} = \frac{a\omega}{a\omega^2} = \frac{1}{\omega}$

18. (a) Velocity is same. So by using $v = a\omega$

$\Rightarrow A_1\omega_1 = A_2\omega_2 = A_3\omega_3$

19. (d) In S.H.M. at mean position velocity is maximum

So $v = a\omega$ (maximum)

20. (b)

21. (b)

22. (c) Acceleration $A = \omega^2 y \Rightarrow \omega = \sqrt{\frac{A}{y}} = \sqrt{\frac{0.5}{0.02}} = 5$

Maximum velocity $v_{max} = a\omega = 0.1 \times 5 = 0.5$

23. (d) At mean position velocity is maximum

i.e., $v_{max} = \omega a \Rightarrow \omega = \frac{v_{max}}{a} = \frac{16}{4} = 4$

$\therefore v = \omega\sqrt{a^2 - y^2} \Rightarrow 8\sqrt{3} = 4\sqrt{4^2 - y^2}$

$\Rightarrow 192 = 16(16 - y^2) \Rightarrow 12 = 16 - y^2 \Rightarrow y = 2\,cm.$.

24. (a) $v_{max} = a\omega = 3 \times 100 = 300$

25. (a) $x = 3\sin 2t + 4\cos 2t$. From given equation

$a_1 = 3, a_2 = 4$, and $\phi = \frac{\pi}{2}$

$\therefore a = \sqrt{a_1^2 + a_2^2} = \sqrt{3^2 + 4^2} = 5 \Rightarrow v_{max} = a\omega = 5 \times 2 = 10$

26. (c) Velocity in mean position $v = a\omega$, velocity at a distance of half amplitude.

$v' = \omega\sqrt{a^2 - y^2} = \omega\sqrt{a^2 - \frac{a^2}{4}} = \sqrt{\frac{3}{2}}\,a\omega = \sqrt{\frac{3}{2}}\,v$

27. (a) $x = A\cos\left(\omega t + \frac{\pi}{4}\right)$ and $v = \frac{dx}{dt} = -A\omega\sin\left(\omega t + \frac{\pi}{4}\right)$

For maximum speed,

$\sin\left(\omega t + \frac{\pi}{4}\right) = 1 \Rightarrow \omega t + \frac{\pi}{4} = \frac{\pi}{2}$ or $\omega t = \frac{\pi}{2} - \frac{\pi}{4} \Rightarrow t = \frac{\pi}{4\omega}$

Acceleration of Simple Harmonic Motion

1. (d) $F = -kx$

2. (c) The stone execute S.H.M. about centre of earth with time period $T = 2\pi\sqrt{\frac{R}{g}}$; where R = Radius of earth.

3. (c) Acceleration $= \omega^2 a$ at extreme position is maximum.

4. (d) $-a\omega^2$ when it is at one extreme point.

5. (a) Maximum acceleration $= a\omega^2 = a \times 4\pi^2 n^2$

$= 0.01 \times 4 \times (\pi)^2 \times (60)^2 = 144\pi^2 m/\sec$

6. (a) Maximum acceleration

$A_{max} = a\omega^2 = \frac{a \times 4\pi^2}{T^2} = \frac{1 \times 4 \times (3.14)^2}{0.2 \times 0.2}$

$F_{max} = m \times A_{max} = \frac{0.1 \times 4 \times (3.14)^2}{0.2 \times 0.2} = 98.596\ N$

7. (a) Maximum velocity $= a\omega = 16$

Maximum acceleration $= \omega^2 a = 24$

$\Rightarrow a = \frac{(a\omega)^2}{\omega^2 a} = \frac{16 \times 16}{24} = \frac{32}{3} m$

8. (d) Acceleration $\propto$ – displacement, and direction of acceleration is always directed towards the equilibrium position.

9. (d) Maximum force $= m(a\omega^2) = ma\left(\frac{4\pi^2}{T^2}\right)$

$= 0.5\left(\frac{4\pi^2}{\pi^2/25}\right) \times 0.01 = 0.5N$

10. (d) $a_{max} = \omega^2 a = \left(\frac{\pi}{4}\right)^2 a = 0.62\ cm/sec^2$ $[\because a = 1]$

11. (a) For S.H.M. $F = -kx$.

$\therefore$ Force = Mass × Acceleration $\propto -x$

$\Rightarrow F = -Akx$; where A and k are positive constants.

12. (a) Velocity $v = a\omega = a \times 2\pi n$

$= 0.06 \times 2\pi \times 15 = 5.65\ m/s$

Acceleration $A = \omega^2 a = 4\pi^2 n^2 a = 5.32 \times 10^2 m/s^2$

13. (d) $A_{max} = a\omega^2 \Rightarrow a = \frac{A_{max}}{\omega^2} = \frac{7.5}{(3.5)^2} = 0.61\ m$

14. (a) $a = 10 \times 10^{-2} m$ and $\omega = 10\ rad/sec$

$A_{max} = \omega^2 a = 10 \times 10^{-2} \times 10^2 = 10\ m/\sec^2$

15. (a) $A_{max} = \omega^2 a$

16. (d) $A_{max} = 4\pi^2 n^2 a = 4\pi^2 \times (50)^2 \times 0.02 = 200\pi^2 m/s$

17. (d) $A = -\omega^2 y$ at mean position $y = 0$

So acceleration is minimum (zero).

18. (d) In S.H.M. $v = \sqrt{a^2 - y^2}$ and $a = -\omega^2 y$ when $y = a$

$\Rightarrow v_{min} = 0$ and $a_{max} = -\omega^2 a$

19. (b) Comparing given equation with standard equation,

$y = a\sin(\omega t + \phi)$, we get, $a = 2\,cm$, $\omega = \frac{\pi}{2}$

$\therefore A_{max} = \omega^2 A = \left(\frac{\pi}{2}\right)^2 \times 2 = \frac{\pi^2}{2} cm/s^2$.

20. (c) Velocity $v = \omega\sqrt{A^2 - x^2}$ and acceleration $= \omega^2 x$

Now given, $\omega^2 x = \omega\sqrt{A^2 - x^2} \Rightarrow \omega^2.1 = \omega\sqrt{2^2 - 1^2}$

$\Rightarrow \omega = \sqrt{3}\ \therefore\ T = \frac{2\pi}{\omega} = \frac{2\pi}{\sqrt{3}}$

21. (c) $a = -\omega^2 x \Rightarrow \left|\frac{a}{x}\right| = \omega^2$

Energy of Simple Harmonic Motion

1. (d) $E = \frac{1}{2}m\omega^2 a^2 \Rightarrow E \propto a^2$

2. (a) P.E. $=\frac{1}{2}m\omega^2x^2$

It is clear P.E. will be maximum when x will be maximum *i.e.*, at $x=\pm A$

3. (d) Let x be the point where K.E. = P.E.

Hence $\frac{1}{2}m\omega^2(a^2-x^2)=\frac{1}{2}m\omega^2x^2$

$\Rightarrow 2x^2=a^2 \Rightarrow x=\frac{a}{\sqrt{2}}=\frac{4}{\sqrt{2}}=2\sqrt{2}\ cm$

4. (a) Since maximum value of $\cos^2\omega t$ is 1.

$\therefore K_{\max}=K_o\cos^2\omega t=K_o$

Also $K_{\max}=PE_{\max}=K_o$

5. (a) $F=-kx \Rightarrow dW=Fdx=-kxdx$

So $\int_0^W dW=\int_0^x -kx\,dx \Rightarrow W=U=-\frac{1}{2}kx^2$

6. (c) Suppose at displacement y from mean position potential energy = kinetic energy

$\Rightarrow \frac{1}{2}m(a^2-y^2)\omega^2=\frac{1}{2}m\omega^2y^2$

$\Rightarrow a^2=2y^2 \Rightarrow y=\frac{a}{\sqrt{2}}$

7. (c) Total energy in SHM $E=\frac{1}{2}m\omega^2a^2$; (where a = amplitude)

Potential energy $U=\frac{1}{2}m\omega^2(a^2-y^2)=E-\frac{1}{2}m\omega^2y^2$

When $y=\frac{a}{2}\Rightarrow U=E-\frac{1}{2}m\omega^2\left(\frac{a^2}{4}\right)=E-\frac{E}{4}=\frac{3E}{4}$

8. (b) $\frac{\text{Potential energy }(U)}{\text{Total energy }(E)}=\frac{\frac{1}{2}m\omega^2y^2}{\frac{1}{2}m\omega^2a^2}=\frac{y^2}{a^2}$

So $\frac{2.5}{E}=\frac{\left(\frac{a}{2}\right)^2}{a^2} \Rightarrow E=10J$

9. (d) Kinetic energy $T=\frac{1}{2}m\omega^2(a^2-x^2)$

and potential energy, $V=\frac{1}{2}m\omega^2x^2 \quad \therefore \frac{T}{V}=\frac{a^2-x^2}{x^2}$

10. (c) $\frac{U}{U_{\max}}=\frac{\frac{1}{2}m\omega^2y^2}{\frac{1}{2}m\omega^2a^2}\Rightarrow \frac{1}{4}=\frac{y^2}{a^2}\Rightarrow y=\frac{a}{2}$

11. (c) Kinetic energy $K=\frac{1}{2}m\omega^2(a^2-y^2)$

$=\frac{1}{2}\times 10\times\left(\frac{2\pi}{2}\right)^2[10^2-5^2]=375\,\pi^2 ergs$

12. (b) $\frac{U}{E}=\frac{\frac{1}{2}m\omega^2y^2}{\frac{1}{2}m\omega^2a^2}=\frac{y^2}{a^2}=\frac{\left(\frac{a}{2}\right)^2}{a}=\frac{1}{4}$

13. (a)

14. (a) The time period of potential energy and kinetic energy is half that of SHM.

15. (b) If at any instant displacement is y then it is given that $U=\frac{1}{2}\times E \Rightarrow \frac{1}{2}m\omega^2y^2=\frac{1}{2}\times\left(\frac{1}{2}m\omega^2a^2\right)$

$\Rightarrow y=\frac{a}{\sqrt{2}}=\frac{6}{\sqrt{2}}=4.2\,cm$

16. (b) So $a=6cm,\ \omega=100 rad/\sec$

$K_{\max}=\frac{1}{2}m\omega^2a^2=\frac{1}{2}\times 1\times(100)^2\times(6\times10^{-2})^2=18\ J$

17. (c) In S.H.M., frequency of K.E. and P.E.

= 2 × (Frequency of oscillating particle)

18. (b) Total energy $U=\frac{1}{2}Ka^2$

19. (d) $\frac{U}{E}=\frac{\frac{1}{2}m\omega^2y^2}{\frac{1}{2}m\omega^2a^2}=\frac{y^2}{a^2}\Rightarrow\frac{U}{80}=\frac{\left(\frac{3}{4}a\right)^2}{a^2}=\frac{9}{16}\Rightarrow U=45\ J$

20. (c)

21. (c) Maximum potential energy position is $y=\pm a$

and maximum kinetic energy position is $y=0$

22. (c) $Mg=Kl \Rightarrow U_{\max}=\frac{1}{2}Kl^2=\frac{1}{2}mgl$

23. (b) $\frac{U}{E}=\frac{\frac{1}{2}m\omega^2y^2}{\frac{1}{2}m\omega^2a^2}=\frac{y^2}{a^2}=\frac{\left(\frac{a}{2}\right)^2}{a^2}=\frac{1}{4}\Rightarrow U=\frac{E}{4}$

24. (b) In S.H.M., at mean position *i.e.* at $x=0$ kinetic energy will be maximum and pE will be minimum. Total energy is always constant.

25. (a) In SHM for a complete cycle average value of kinetic energy and potential energy are equal *i.e.* $\langle E\rangle=\langle U\rangle$ $=\frac{1}{4}m\omega^2a^2$

26. (c) Total energy $=\frac{1}{2}m\omega^2a^2$ = constant

27. (c) Kinetic energy at mean position,

$K_{\max}=\frac{1}{2}mv_{\max}^2.\Rightarrow v_{\max}=\sqrt{\frac{2K_{\max}}{m}}$

$=\sqrt{\frac{2\times16}{0.32}}=\sqrt{100}=10\,m/s.$

28. (a) $E=\frac{1}{2}ma^2\omega^2=\frac{1}{2}ma^2\left(\frac{4\pi^2}{T^2}\right)\Rightarrow E\propto\frac{a^2}{T^2}$

29. (b) $\frac{K}{E}=\frac{\frac{1}{2}m\omega^2(a^2-y^2)}{\frac{1}{2}m\omega^2a^2}=\frac{a^2-y^2}{a^2}=1-\frac{y^2}{a^2}$

So, $\frac{\left(\frac{3E}{4}\right)}{E} = 1 - \frac{y^2}{a^2} \Rightarrow \frac{y^2}{a^2} = 1 - \frac{3}{4} = \frac{1}{4} \Rightarrow y = \frac{a}{2}$.

30. (c) Kinetic energy $K = \frac{1}{2}mv^2 = \frac{1}{2}ma^2\omega^2\cos^2\omega t$

$= \frac{1}{2}m\omega^2 a^2(1+\cos 2\omega t)$ hence kinetic energy varies periodically with double the frequency of S.H.M. *i.e.* 2ω.

31. (c) $E = \frac{1}{2}m\omega^2 a^2 \Rightarrow \frac{E'}{E} = \frac{a'^2}{a^2} \Rightarrow \frac{E'}{E} = \frac{\left(\frac{3}{4}a\right)^2}{a^2}$ $\left(\because a' = \frac{3}{4}a\right)$

$\Rightarrow E' = \frac{9}{16}E$

32. (d) In simple harmonic motion, energy changes from kinetic to potential and potential to kinetic but the sum of two always remains constant.

33. (b) Body collides elastically with walls of room. So, there will be no loss in its energy and it will remain colliding with walls of room, so it's motion will be periodic.

There is no change in energy of the body, hence there is no acceleration, so it's motion is not SHM.

34. (b) $E_1 = \frac{1}{2}Kx^2 \Rightarrow x = \sqrt{\frac{2E_1}{K}}$, $E_2 = \frac{1}{2}Ky^2 \Rightarrow y = \sqrt{\frac{2E_2}{K}}$

and $E = \frac{1}{2}K(x+y)^2 \Rightarrow x + y = \sqrt{\frac{2E}{K}}$

$\Rightarrow \sqrt{\frac{2E_1}{K}} + \sqrt{\frac{2E_2}{K}} = \sqrt{\frac{2E}{K}} \Rightarrow \sqrt{E_1} + \sqrt{E_2} = \sqrt{E}$

Time Period and Frequency

1. (b) In the given case, $\frac{\text{Displacement}}{\text{Acceleration}} = \frac{1}{b}$

$\therefore$ Time period $T = 2\pi\sqrt{\frac{\text{Displacement}}{\text{Acceleration}}} = \frac{2\pi}{\sqrt{b}}$

2. (c) On comparing with standard equation $\frac{d^2y}{dt^2} + \omega^2 y = 0$ we get $\omega^2 = K \Rightarrow \omega = \frac{2\pi}{T} = \sqrt{K} \Rightarrow T = \frac{2\pi}{\sqrt{K}}$.

3. (b) Ball execute S.H.M. inside the tunnel with time period $T = 2\pi\sqrt{\frac{R}{g}} = 84.63$ min

Hence time to reach the ball from one end to the other end of the tunnel $t = \frac{84.63}{2} = 42.3$ min.

4. (d) Given max velocity $\omega a = 1$ and maximum acceleration $\omega^2 a = 1.57$

$\therefore \frac{\omega^2 a}{\omega a} = 1.57 \Rightarrow \omega = 1.57 \Rightarrow \frac{2\pi}{T} = 1.57 \Rightarrow T = 4$

5. (b) $\omega = \frac{2\pi}{T} = 100\pi \Rightarrow T = 0.02$ sec

6. (a) At mean position, the kinetic energy is maximum.

Hence $\frac{1}{2}ma^2\omega^2 = 16$

On putting the values we get $\omega = 10 \Rightarrow T = \frac{2\pi}{\omega} = \frac{\pi}{5}$ sec

7. (d) $T = 2\pi\sqrt{\frac{\text{Displacement}}{\text{Acceleration}}} = 2\pi\sqrt{\frac{3}{12}} = \pi = 3.14$ sec

8. (d) $\omega = \sqrt{\frac{k}{m}} \Rightarrow \frac{\omega_2}{\omega_1} = \sqrt{\frac{m_1}{m_2}} \Rightarrow 2 = \sqrt{\frac{m_1}{m_2}} \Rightarrow m_2 = \frac{m_1}{4}$

9. (d)

10. (a) $\omega = \sqrt{\frac{\text{Acceleration}}{\text{Displacement}}} = \sqrt{\frac{2.0}{0.02}} = 10\, rad\, s^{-1}$

11. (b) From given equation $\omega = 3000$, $\Rightarrow n = \frac{\omega}{2\pi} = \frac{3000}{2\pi}$

12. (b)

13. (b) Given, $v = \pi\, cm/\sec$, $x = 1\, cm$ and $\omega = \pi s^{-1}$

using $v = \omega\sqrt{a^2 - x^2} \Rightarrow \pi = \pi\sqrt{a^2 - 1}$

$\Rightarrow 1 = a^2 - 1 \Rightarrow a = \sqrt{2}\, cm$.

14. (b) Length of the line = Distance between extreme positions of oscillation = 4 cm

So, Amplitude $a = 2\, cm$.

also $v_{\max} = 12\, cm/s$.

$\because v_{\max} = \omega a = \frac{2\pi}{T}a$

$\Rightarrow T = \frac{2\pi a}{v_{\max}} = \frac{2 \times 3.14 \times 2}{12} = 1.047$ sec

15. (a) Comparing given equation with standard equation,

$x = a\cos(\omega t + \phi)$ we get, $a = 0.01$ and $\omega = \pi$

$\Rightarrow 2\pi n = \pi \Rightarrow n = 0.5\, Hz$

16. (d) $y = 5\sin(\pi t + 4\pi)$, comparing it with standard equation

$y = a\sin(\omega t + \phi) = a\sin\left(\frac{2\pi t}{T} + \phi\right)$

$a = 5\, m$ and $\frac{2\pi t}{T} = \pi t \Rightarrow T = 2$ *sec.*

17. (d) $v_{\max} = a\omega = a \times 2\pi n \Rightarrow n = \frac{v_{\max}}{2\pi a} = \frac{31.4}{2 \times 3.14 \times 5} = 1\, Hz$

18. (d) From the given equitation $\omega = 2\pi n = 4\pi \Rightarrow n = 2Hz$

Simple Pendulum

1. (c) $T = 2\pi\sqrt{\frac{l}{g}} \Rightarrow T \propto \sqrt{l}$

2. (a) Inside the mine g decreases

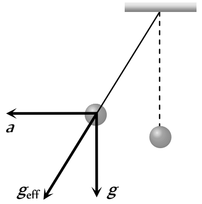
hence from $T = 2\pi\sqrt{\frac{l}{g}}$; T increase

3. (b) When a little mercury is drained off, the position of *c.g.* of ball falls (*w.r.t.* fixed and) so that effective length of pendulum increases hence *T* increase.

4. (b) Initially time period was $T = 2\pi\sqrt{\frac{l}{g}}$.

When train accelerates, the effective value of *g* becomes $\sqrt{(g^2 + a^2)}$ which is greater than *g*

Hence, new time period, becomes less than the initial time period.



5. (b) As we know $g = \frac{GM}{R^2}$

$$\Rightarrow \frac{g_{\text{earth}}}{g_{\text{planet}}} = \frac{M_e}{M_p} \times \frac{R_\rho^2}{R_e^2} \Rightarrow \frac{g_e}{g_p} = \frac{2}{1}$$

Also $T \propto \frac{1}{\sqrt{g}} \Rightarrow \frac{T_e}{T_p} = \sqrt{\frac{g_p}{g_e}} \Rightarrow \frac{2}{T_p} = \sqrt{\frac{1}{2}}$

$$\Rightarrow T_p = 2\sqrt{2}\ \text{sec}.$$

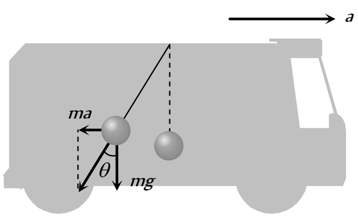
6. (b) In accelerated frame of reference, a fictitious force (pseudo force) *ma* acts on the bob of pendulum as shown in figure.

Hence,

$\tan\theta = \frac{ma}{mg} = \frac{a}{g}$

$\Rightarrow$

$\theta = \tan^{-1}\left(\frac{a}{g}\right)$ in the backward direction.



7. (c)

8. (c) $T = 2\pi\sqrt{\frac{l}{g}}$ (Independent of mass)

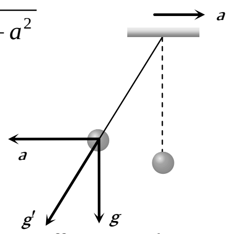
9. (c) In stationary lift $T = 2\pi\sqrt{\frac{l}{g}}$

In upward moving lift $T' = 2\pi\sqrt{\frac{l}{(g+a)}}$

(a = Acceleration of lift)

$$\Rightarrow \frac{T'}{T} = \sqrt{\frac{g}{g+a}} = \sqrt{\frac{g}{\left(g + \frac{g}{4}\right)}} = \sqrt{\frac{4}{5}} \Rightarrow T' = \frac{2T}{\sqrt{5}}$$

10. (d) $g' = \sqrt{g^2 + a^2}$



11. (d) In the given case effective acceleration $g_{eff} = 0 \Rightarrow T = \infty$

12. (b) $p_{\max} = \sqrt{2m\,E_{\max}}$

13. (a) $T = 2\pi\sqrt{\frac{l}{g}} \Rightarrow \sqrt{\frac{l}{g}}$ = constant

$$\Rightarrow l \propto g; \Rightarrow \frac{l_m}{1} = \frac{1}{6}\frac{g}{g} \Rightarrow l_m = \frac{1}{6}m$$

14. (d) $T \propto \sqrt{l} \Rightarrow \frac{\Delta T}{T} = \frac{1}{2}\frac{\Delta l}{l} = \frac{0.02}{2} = 0.01 \Rightarrow \Delta T = 0.01T$

Loss of time per day $= 0.01 \times 24 \times 60 \times 60 = 864\ \text{sec}$

15. (d) $\frac{T'}{T} = \sqrt{\frac{g}{g'+a}} = \sqrt{\frac{g}{g+5g}} = \sqrt{\frac{1}{6}} \Rightarrow T' = \frac{T}{\sqrt{6}}$

16. (b) $T \propto \sqrt{l} \Rightarrow \frac{\Delta T}{T} = \frac{1}{2}\frac{\Delta l}{l} = \frac{1}{2} \times 1\% = 0.5\%$

17. (b) At *B*, the velocity is maximum using conservation of mechanical energy

$$\Delta PE = \Delta KE \Rightarrow mgH = \frac{1}{2}mv^2 \Rightarrow v = \sqrt{2gH}$$

18. (c)

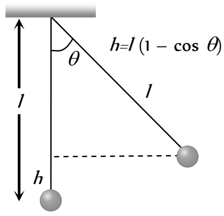
19. (c) If suppose bob rises up to a height *h* as shown then after releasing potential energy at extreme position becomes kinetic energy of mean position

$$\Rightarrow mgh = \frac{1}{2}mv_{\max}^2 \Rightarrow v_{\max} = \sqrt{2gh}$$

Also, from figure $\cos\theta = \frac{l-h}{l}$

$\Rightarrow h = l(1 - \cos\theta)$

So, $v_{\max} = \sqrt{2gl(1-\cos\theta)}$

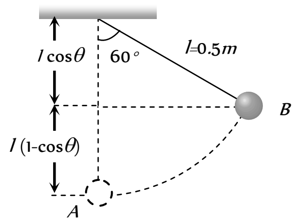


20. (c) $T = 2\pi\sqrt{\frac{l}{g}}$; for freely falling system effective $g = 0$

so $T = \infty$ or $n = 0$

It means that pendulum does not oscillate at all.

21. (d) Let bob velocity be *v* at point *B* where it makes an angle of 60° with the vertical, then using conservation of mechanical energy



$$KE_A + PE_A = KE_B + PE_B$$

$$\Rightarrow \frac{1}{2}m \times 3^2 = \frac{1}{2}mv^2 + mgl(1-\cos\theta)$$

$$\Rightarrow 9 = v^2 + 2 \times 10 \times 0.5 \times \frac{1}{2} \Rightarrow v = 2\ m/s$$

22. (d) $T \propto \sqrt{l} \Rightarrow \frac{T_1}{T_2} = \sqrt{\frac{l_1}{l_2}} \Rightarrow \frac{2}{T_2} = \sqrt{\frac{l}{4l}} \Rightarrow T_2 = 4sec$

23. (c) Remains the same because time period of simple pendulum *T* is independent of mass of the bob

24. (c) $T = 2\pi\sqrt{\frac{l}{g}} \Rightarrow \frac{l}{T^2} = \frac{g}{4\pi^2}$ = constant

25. (d) $T = 2\pi\sqrt{\frac{l}{g}} \Rightarrow T \propto \frac{1}{\sqrt{g}} \Rightarrow \frac{T_P}{T_e} = \sqrt{\frac{g_e}{g_P}} = \sqrt{\frac{2}{1}} \Rightarrow T' = \sqrt{2}T$

26. (a) If initial length $l_1 = 100$ then $l_2 = 121$

By using $T = 2\pi\sqrt{\frac{l}{g}} \Rightarrow \frac{T_1}{T_2} = \sqrt{\frac{l_1}{l_2}}$

Hence, $\frac{T_1}{T_2} = \sqrt{\frac{100}{121}} \Rightarrow T_2 = 1.1\,T_1$

% increase = $\frac{T_2 - T_1}{T_1} \times 100 = 10\%$

27. (a) $\frac{T_1}{T_2} = \sqrt{\frac{l_1}{l_2}} \Rightarrow \frac{T_1}{T_2} = \sqrt{\frac{100}{400}}$ (If $l_1 = 100$ then $l_2 = 400$)

$\Rightarrow T_2 = 2T_1$

Hence % increase $= \frac{T_2 - T_1}{T_1} \times 100 = 100\%$

28. (b) $T = 2\pi\sqrt{l/g} \Rightarrow l = \frac{gT^2}{4\pi^2} = \frac{9.8 \times 4}{4 \times \pi^2} = 99\ cm$

29. (d) This is the case of freely falling lift and in free fall of lift effective g for pendulum will be zero. So $T = 2\pi\sqrt{\frac{l}{0}} = \infty$

30. (d) After standing centre of mass of the oscillating body will shift upward therefore effective length will decrease and by $T \propto \sqrt{l}$, time period will decrease.

31. (c) $T = 2\pi\sqrt{l/g} = 2\pi\sqrt{\frac{1}{\pi^2}} = 2\ sec$

32. (c) Time period is independent of mass of pendulum.

33. (b) $T \propto \sqrt{l}$ Time period depends only on effective length. Density has no effect on time period. If length made 4 times then time period becomes 2 times.

34. (b) Time period is independent of mass of bob of pendulum.

35. (a) At the surface of moon, g decreases hence time period increases $\left(\text{as } T \propto \frac{1}{\sqrt{g}}\right)$

36. (a) When lift falls freely effective acceleration and frequency of oscillations be zero

$g_{eff} = 0 \Rightarrow T' = \infty$, hence a frequency = 0.

37. (d) Effective value of 'g' remains unchanged.

38. (b) $T = 2\pi\sqrt{\frac{l}{g}} \Rightarrow \frac{T_2}{T_1} = \sqrt{\frac{l_2}{l_1}} = \sqrt{\frac{144}{100}} = \frac{12}{10}$

$\Rightarrow T_2 = 1.2\ T_1$

Hence % increase $= \frac{T_2 - T_1}{T_1} \times 100 = 20\%$

39. (c) If amplitude is large motion will not remain simple harmonic.

40. (d) Minimum velocity is zero at the extreme positions.

41. (a) At the time $t = \frac{T}{4} = \frac{4}{4} = 1\,\text{sec}$ after passing from mean position, the body reaches at it's extreme position. At extreme, position velocity of body becomes zero.

42. (a) No momentum will be transferred because, at extreme position the velocity of bob is zero.

43. (a) In this case frequency of oscillation is given by $n = \frac{1}{2\pi}\sqrt{\frac{\sqrt{g^2 + a^2}}{l}}$ where a is the acceleration of car. If a increases then n also increases.

44. (b) As periodic time is independent of amplitude.

45. (d) Frequency $n \propto \frac{1}{\sqrt{l}} \Rightarrow \frac{n_1}{n_2} = \sqrt{\frac{l_2}{l_1}} \Rightarrow \frac{l_1}{l_2} = \frac{n_2^2}{n_1^2} = \frac{3^2}{2^2} = \frac{9}{4}$

46. (d) Suppose at $t = 0$, pendulums begins to swing simultaneously. Hence, they will again swing simultaneously if $n_1T_1 = n_2T_2$

$\Rightarrow \frac{n_1}{n_2} = \frac{T_2}{T_1} = \sqrt{\frac{l_2}{l_1}} \Rightarrow \frac{l_1}{l_2} = \left(\frac{n_2}{n_1}\right)^2 = \left(\frac{8}{7}\right)^2 = \frac{64}{49}$

47. (b) $T \propto \frac{1}{\sqrt{g}}$ and g is same in both cases so time period remain same.

48. (a) $T = 2\pi\sqrt{\frac{l}{g}} \Rightarrow T \propto \sqrt{l}$, hence if l made 9 times T becomes 3 times.

Also time period of simple pendulum does not depends on the mass of the bob.

49. (a) As we go from equator to pole the value of g increases. Therefore time period of simple pendulum $\left(T \propto \frac{1}{\sqrt{g}}\right)$ decreases. $\left(\because T \propto \frac{1}{\sqrt{g}}\right)$

50. (a) If v is velocity of pendulum at Q and 10% energy is lost while moving from P to Q

Hence, by applying conservation of between P and Q

$\frac{1}{2}mv^2 = 0.9\,(mgh) \Rightarrow v^2 = 2 \times 0.9 \times 10 \times 2 \Rightarrow v = 6\,m/sec$

51. (c) $T \propto \frac{1}{\sqrt{g}} \Rightarrow \frac{T_2}{T_1} = \sqrt{\frac{g_1}{g_2}} = \sqrt{\left(\frac{g}{g/4}\right)} \Rightarrow T_2 = 2T_1 = 2T$

52. (c) For stationary lift $T_1 = 2\pi\sqrt{\frac{l}{g}}$

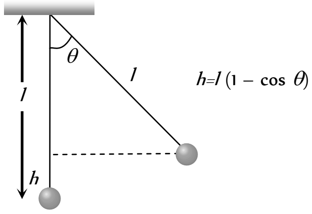
For ascending lift with acceleration a, $T_2 = 2\pi\sqrt{\frac{l}{g + a}}$

$\Rightarrow \frac{T_1}{T_2} = \sqrt{\frac{g + a}{g}} \Rightarrow \frac{T}{T_2} = \sqrt{\frac{g + \frac{g}{3}}{g}} = \sqrt{\frac{4}{3}} \Rightarrow T_2 = \frac{\sqrt{3}}{2}T$

53. (c) $T \propto \sqrt{l}$

54. (d) Kinetic energy will be maximum at mean position.

From law of conservation of energy maximum kinetic energy at mean position = Potential energy at displaced position



$\Rightarrow K_{\max} = mgh = mgl(1-\cos\theta)$

55. (c)

56. (b) As it is clear that in vacuum, the bob will not experience any frictional force. Hence, there shall be no dissipation therefore, it will oscillate with constant amplitude.

57. (c) The effective acceleration in a lift descending with acceleration $\frac{g}{3}$ is $g_{eff} = g - \frac{g}{3} = \frac{2g}{3}$

$\therefore T = 2\pi\sqrt{\left(\frac{L}{g_{eff}}\right)} = 2\pi\sqrt{\left(\frac{L}{2g/3}\right)} = 2\pi\sqrt{\left(\frac{3L}{2g}\right)}$

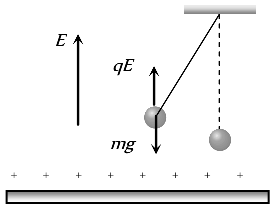
58. (a)

59. (c) According to the principle of conservation of energy, $\frac{1}{2}mv^2 = mgh$ or $v = \sqrt{2gh} = \sqrt{2\times 9.8\times 0.1} = 1.4\, m/s.$

60. (a) In this case time period of pendulum becomes

$T' = 2\pi\sqrt{\frac{l}{\left(g+\frac{qE}{m}\right)}}$

$\Rightarrow T' < T$



61. (b) In deep mine $g' = g\left(1-\frac{d}{R}\right)$; *i.e.*, g decreases so according to $n \propto \sqrt{g}$, frequency also decreases.

Spring Pendulum

1. (d) Maximum velocity $= a\omega = a\sqrt{\frac{k}{m}}$

Given that $a_1\sqrt{\frac{K_1}{m}} = a_2\sqrt{\frac{K_2}{m}} \Rightarrow \frac{a_1}{a_2} = \sqrt{\frac{K_2}{K_1}}$

2. (d) Given spring system has parallel combination, so

$k_{eq} = k_1 + k_2$ and time period $T = 2\pi\sqrt{\frac{m}{(k_1+k_2)}}$

3. (b) $T = 2\pi\sqrt{\frac{m}{k}}$. Also spring constant $(k) \propto \frac{1}{\text{Length}(l)}$, when the spring is half in length, then k becomes twice.

$\therefore T' = 2\pi\sqrt{\frac{m}{2k}} \Rightarrow \frac{T'}{T} = \frac{1}{\sqrt{2}} \Rightarrow T' = \frac{T}{\sqrt{2}}$

4. (b) $\omega = \sqrt{\frac{k}{m}}$

5. (b) With respect to the block the springs are connected in parallel combination.

$\therefore$ Combined stiffness $k = k_1 + k_2$ and $n = \frac{1}{2\pi}\sqrt{\frac{k_1+k_2}{m}}$

6. (c) $n = \frac{1}{2\pi}\sqrt{\frac{k}{m}} \Rightarrow \frac{n_S}{n_P} = \sqrt{\frac{k_S}{k_P}} \Rightarrow \frac{n_s}{n_p} = \sqrt{\frac{\left(\frac{k}{2}\right)}{2k}} = \frac{1}{2}$

7. (c) In series $k_{eq} = \frac{k_1k_2}{k_1+k_2}$ so time period $T = 2\pi\sqrt{\frac{m(k_1+k_2)}{k_1k_2}}$

8. (b) Force constant $k = \frac{F}{x} = \frac{0.5\times 10}{0.2} = 25\ N/m$

Now $T = 2\pi\sqrt{\frac{m}{k}} = 2\pi\sqrt{\frac{0.25}{25}} = 0.628\ sec$

9. (a) $T = 2\pi\sqrt{\frac{m}{k}} \Rightarrow m \propto T^2 \Rightarrow \frac{m_2}{m_1} = \frac{T_2^2}{T_1^2}$

$\Rightarrow \frac{M+m}{M} = \left(\frac{\frac{5}{4}T}{T}\right)^2 \Rightarrow \frac{m}{M} = \frac{9}{16}$

10. (c) Spring constant $(k) \propto \frac{1}{\text{Length of the spirng}(l)}$

as length becomes half, k becomes twice is $2k$.

11. (a) $n = \frac{1}{2\pi}\sqrt{\frac{k}{m}} \Rightarrow \frac{n}{n'} = \sqrt{\frac{k}{m}\times\frac{m'}{K'}} = \sqrt{\frac{k}{m}\times\frac{2m}{2K}} = 1 \Rightarrow n' = n$

12. (b) As mg produces extension x, hence $k = \frac{mg}{x}$

$\therefore T = 2\pi\sqrt{\frac{(M+m)}{k}} = 2\pi\sqrt{\frac{(M+m)x}{mg}}$

13. (d) For the given figure $f = \frac{1}{2\pi}\sqrt{\frac{k_{eq}}{m}} = \frac{1}{2\pi}\sqrt{\frac{2k}{m}}$ .....(i)

If one spring is removed, then $k_{eq} = k$ and

$f' = \frac{1}{2\pi}\sqrt{\frac{k}{m}}$ ....(ii)

From equation (i) and (ii), $\frac{f}{f'} = \sqrt{2} \Rightarrow f' = \frac{f}{\sqrt{2}}$

14. (c) $\because mg = kx \Rightarrow \frac{m}{k} = \frac{x}{g} \Rightarrow T = 2\pi\sqrt{\frac{m}{k}} = 2\pi\sqrt{\frac{x}{g}}$

$= 2\pi\sqrt{\frac{9.8\times 10^{-2}}{9.8}} = \frac{2\pi}{10}\ sec$

15. (a) $T = 2\pi\sqrt{\frac{m}{k}} = 2\pi\sqrt{\frac{0.2}{80}} = 0.31\ sec$

16. (d) Spring is cut into two equal halves so spring constant of each part = $2k$

These parts are in parallel so $K_{eq} = 2K + 2K = 4K$

Extension force (*i.e.* *W*) is same hence by using $F = kx \Rightarrow 4k \times x' = kx \Rightarrow x' = \frac{x}{4}$.

17. (a) In this case springs are in parallel, so $k_{eq} = k_1 + k_2$

and $\omega = \sqrt{\frac{k_{eq}}{m}} = \sqrt{\frac{k_1 + k_2}{m}}$

18. (d) Force constant $(k) \propto \frac{1}{\text{Length of the spring}(l)}$

$\Rightarrow \frac{k_1}{k_2} = \frac{l_2}{l_1} = \frac{2}{1}$

19. (b) Standard equation for given condition

$x = a\cos\frac{2\pi}{T}t \Rightarrow x = -0.16\cos(\pi t)$

[As $a = -0.16$ *meter*, $T = 2$ *sec*]

20. (c) By using conservation of mechanical energy

$\frac{1}{2}kx^2 = \frac{1}{2}mv^2 \Rightarrow x = v\sqrt{m/k}$

21. (c) Given elastic energies are equal *i.e.*, $\frac{1}{2}k_1x_1^2 = \frac{1}{2}k_2x_2^2$

$\Rightarrow \frac{k_1}{k_2} = \left(\frac{x_2}{x_1}\right)^2$ and using $F = kx$

$\Rightarrow \frac{F_1}{F_2} = \frac{k_1x_1}{k_2x_2} = \frac{k_1}{k_2} \times \sqrt{\frac{k_2}{k_1}} = \sqrt{\frac{k_1}{k_2}}$

22. (c) $n = \frac{1}{2\pi}\sqrt{\frac{k}{m}} \Rightarrow n \propto \frac{1}{\sqrt{m}} \Rightarrow \frac{n_1}{n_2} = \sqrt{\frac{m_2}{m_1}}$

$\Rightarrow \frac{n}{n_2} = \sqrt{\frac{4m}{m}} \Rightarrow n_2 = \frac{n}{2}$

23. (d) $T = 2\pi\sqrt{\frac{m}{k}} \Rightarrow \frac{T_2}{T_1} = \sqrt{\frac{m_2}{m_1}} = \sqrt{\frac{4m}{m}} = 2 \Rightarrow T_2 = 2 \times 2 = 4s$

24. (a) $T \propto \frac{1}{\sqrt{k}} \Rightarrow T_1 : T_2 : T_3 = \frac{1}{\sqrt{k}} : \frac{1}{\sqrt{k/2}} : \frac{1}{\sqrt{2k}} = 1 : \sqrt{2} : \frac{1}{\sqrt{2}}$

25. (d) $T \propto \frac{1}{\sqrt{k}} \Rightarrow \frac{T_2}{T_1} = \sqrt{\frac{k_1}{k_2}} = \sqrt{\frac{k}{4k}} = \frac{1}{2} \Rightarrow T_2 = \frac{T_1}{2}$

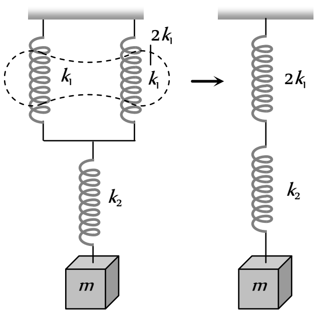
26. (d) The time period of oscillation of a spring does not depend on gravity.

27. (b) In series combination

$\frac{1}{k_S} = \frac{1}{2k_1} + \frac{1}{k_2}$

$\Rightarrow$

$k_S = \left[\frac{1}{2k_1} + \frac{1}{k_2}\right]^{-1}$



28. (a) Work done in stretching $(W) \propto$ Stiffness of spring (*i.e.* *k*)

$\because k_A > k_B \Rightarrow W_A > W_B$

29. (a) When external force is applied, one spring gets extended and another one gets contracted by the same distance hence force due to two springs act in same direction.

i.e. $F = F_1 + F_2 \Rightarrow -kx = -k_1x - k_2x \Rightarrow k = k_1 + k_2$

30. (a) $T = 2\pi\sqrt{\frac{m}{k}} \Rightarrow \frac{T_2}{T_1} = \sqrt{\frac{m_2}{m_1}} \Rightarrow \frac{3}{2} = \sqrt{\frac{m+2}{m}} \Rightarrow \frac{9}{4} = \frac{m+2}{m}$

$\Rightarrow m = \frac{8}{5}kg = 1.6\ kg$

31. (b) For series combination $k_{eq} = \frac{k_1k_2}{k_1 + k_2}$

$F = k_{eq}x \Rightarrow mg = \left(\frac{k_1k_2}{k_1 + k_2}\right)x \Rightarrow x = \frac{mg(k_1 + k_2)}{k_1k_2}$

32. (d) $n = \frac{1}{2\pi}\sqrt{\frac{k_{eq}}{m}} = \frac{1}{2\pi}\sqrt{\frac{k_1k_2}{(k_1 + k_2)m}}$

33. (b) Using $F = kx \Rightarrow 10g = k \times 0.25 \Rightarrow k = \frac{10g}{0.25} = 98 \times 4$

Now $T = 2\pi\sqrt{\frac{m}{k}} \Rightarrow m = \frac{T^2}{4\pi^2}k$

$\Rightarrow m = \frac{\pi^2}{100} \times \frac{1}{4\pi^2} \times 98 \times 4 = 0.98\ kg$

34. (b) When spring is cut into *n* equal parts then spring constant of each part will be *nk* and so using $T \propto \frac{1}{\sqrt{k}}$, time period will be $T/\sqrt{n}$.

35. (b) By using $K \propto \frac{1}{l}$

Since one fourth length is cut away so remaining length is $\frac{3}{4}th$, hence *k* becomes $\frac{4}{3}$ times *i.e.*, $k' = \frac{4}{3}x$.

36. (d) $t_1 = 2\pi\sqrt{\frac{m}{K_1}}$ and $t_2 = 2\pi\sqrt{\frac{m}{K_2}}$

Equivalent spring constant for shown combination is $K_1 + K_2$. So time period *t* is given by $t = 2\pi\sqrt{\frac{m}{K_1 + K_2}}$

By solving these equations we get $t^{-2} = t_1^{-2} + t_2^{-2}$

37. (c) $n = \frac{1}{2\pi}\sqrt{\frac{K_{effective}}{m}} = \frac{1}{2\pi}\sqrt{\frac{(K + 2K)}{m}} = \frac{1}{2\pi}\sqrt{\frac{3K}{m}}$

38. (d) In series combination

$\frac{1}{k_S} = \frac{1}{k_1} + \frac{1}{k_2} = \frac{k_2 + k_1}{k_1k_2} \Rightarrow k_S = \frac{k_1k_2}{k_1 + k_2}$.

39. (b) $t_1 = 2\pi\sqrt{\frac{m}{k_1}}$ and $t_2 = 2\pi\sqrt{\frac{m}{k_2}}$

In series, effective spring constant, $k = \dfrac{k_1k_2}{k_1 + k_2}$

$\therefore$ Time period, $T = 2\pi\sqrt{\dfrac{m(k_1+k_2)}{k_1k_2}}$ .....(ii)

Now, $t_1^2 + t_2^2 = 4\pi^2 m\left(\dfrac{1}{k_1} + \dfrac{1}{k_2}\right) = \dfrac{4\pi^2 m(k_1+k_2)}{k_1k_2}$

$t_1^2 + t_2^2 = T^2$. [Using equation (ii)]

40. (c) $\dfrac{1}{k_{eff}} = \dfrac{1}{k} + \dfrac{1}{2k} + \dfrac{1}{4k} + \dfrac{1}{8k} + ...$

$= \dfrac{1}{k}\left[1 + \dfrac{1}{2} + \dfrac{1}{4} + \dfrac{1}{8} + ...\right] = \dfrac{1}{k}\left(\dfrac{1}{1-1/2}\right) = \dfrac{2}{k}$

(By using sum of infinite geometrical progression $a + \dfrac{a}{r} + \dfrac{a}{r^2} + ...\infty$ sum $(S) = \dfrac{a}{1-r}$)

$\therefore k_{eff} = \dfrac{k}{2}$.

41. (a) $n \propto \sqrt{\dfrac{k}{m}}$

42. (b) $F = kx \Rightarrow mg = kx \Rightarrow m \propto kx$

Hence $\dfrac{m_1}{m_2} = \dfrac{k_1}{k_2} \times \dfrac{x_1}{x_2} \Rightarrow \dfrac{4}{6} = \dfrac{k}{k/2} \times \dfrac{1}{x_2}$

$\Rightarrow x_2 = 3\,cm$.

43. (b) Initially when 1 *kg* mass is suspended then by using $F = kx$

$\Rightarrow mg = kx \Rightarrow k = \dfrac{mg}{x} = \dfrac{1\times 10}{5\times 10^{-2}} = 200\,\dfrac{N}{m}$

Further, the angular frequency of oscillation of 2 *kg* mass is

$\omega = \sqrt{\dfrac{k}{M}} = \sqrt{\dfrac{200}{2}} = 10\,rad/sec$

Hence, $v_{max} = a\omega = (10\times 10^{-2})\times 10 = 1\,m/s$

44. (a) $U = \dfrac{F^2}{2K} \Rightarrow U \propto \dfrac{1}{K} \Rightarrow \dfrac{U_1}{U_2} = \dfrac{K_2}{K_1} = 2$

45. (b) $U = \dfrac{1}{2}Kx^2$ but $T = Kx$

So energy stored $= \dfrac{1}{2}\dfrac{(Kx)^2}{K} = \dfrac{1}{2}\dfrac{T^2}{K}$

46. (a) System is equivalent to parallel combination of springs $\therefore K_{eq} = K_1 + K_2 = 400$ and

$T = 2\pi\sqrt{\dfrac{m}{K_{eq}}} = 2\pi\sqrt{\dfrac{0.25}{400}} = \dfrac{\pi}{20}$

47. (b) By cutting spring in four equal parts force constant (*K*) of each parts becomes four times $\left(\because k \propto \dfrac{1}{l}\right)$ so by using

$T = 2\pi\sqrt{\dfrac{m}{K}}$; time period will be half *i.e.* $T' = T/2$

48. (d) $T \propto \sqrt{m} \Rightarrow \dfrac{T_2}{T_1} = \sqrt{\dfrac{m_2}{m_1}} \Rightarrow \dfrac{5}{3} = \sqrt{\dfrac{M+m}{M}}$

$\Rightarrow \dfrac{25}{9} = \dfrac{M+m}{M} \Rightarrow \dfrac{m}{M} = \dfrac{16}{9}$

49. (c) $v_{max} = a\omega = a\dfrac{2\pi}{T}$

$\Rightarrow a = \dfrac{v_{max}T}{2\pi} = \dfrac{15\times 628\times 10^{-3}}{2\times 3.14} = 1.5\,cm$

50. (c) $Kx = mg \Rightarrow \dfrac{m}{K} = \dfrac{x}{g}$

So $T = 2\pi\sqrt{\dfrac{m}{K}} = 2\pi\sqrt{\dfrac{x}{g}} = 2\pi\sqrt{\dfrac{0.2}{9.8}} = \dfrac{2\pi}{7}\sec$

51. (b) $\omega = \sqrt{k/m} = \sqrt{\dfrac{4.84}{0.98}} = 2.22\,rad/\sec$

52. (d) When spring is cut into two equal parts then spring constant of each part will be $2K$ and so using $n \propto \sqrt{K}$, new frequency will be $\sqrt{2}$ times *i.e.* $f_2 = \sqrt{2}\,f_1$.

53. (d)

54. (a) With mass m_2 alone, the extension of the spring l is given as

$m_2 g = kl$ ...(i)

With mass $(m_1 + m_2)$, the extension l' is given by

$(m_1 + m_2)g = k(l + \Delta l)$ ....(ii)

The increase in extension is Δl which is the amplitude of vibration. Subtracting (i) from (ii), we get

$m_1 g = k\Delta l$ or $\Delta l = \dfrac{m_1 g}{k}$

55. (b) Angular velocity $\omega = \sqrt{\left(\dfrac{k}{m}\right)} = \sqrt{\left(\dfrac{10}{10}\right)} = 1$

Now $v = \omega\sqrt{a^2 - y^2} \Rightarrow y^2 = a^2 - \dfrac{v^2}{\omega^2} = (0.5)^2 - \dfrac{(0.4)^2}{1^2}$

$\Rightarrow y^2 = 0.9 = y = 0.3\,m$

Superposition of S.H.M.'s and Resonance

1. (c) Resultant amplitude $= \sqrt{3^2 + 4^2} = 5$

2. (c) $y = A\sin PT + B\cos PT$

Let $A = r\cos\theta$, $B = r\sin\theta$

$\Rightarrow y = r\sin(PT + \theta)$ which is the equation of SHM.

3. (c) $y = a(\cos\omega t + \sin\omega t) = a\sqrt{2}\left[\dfrac{1}{\sqrt{2}}\cos\omega t + \dfrac{1}{\sqrt{2}}\sin\omega t\right]$

$= a\sqrt{2}[\sin 45°\cos\omega t + \cos 45°\sin\omega t]$

$= a\sqrt{2}\sin(\omega t + 45°) \Rightarrow$ Amplitude $= a\sqrt{2}$

4. (c) If first equation is $y_1 = a_1\sin\omega t \Rightarrow \sin\omega t = \dfrac{y_1}{a_1}$ ... (i)

then second equation will be $y_2 = a_2\sin\left(\omega t + \dfrac{\pi}{2}\right)$

$= a_2\left[\sin\omega t\cos\frac{\pi}{2} + \cos\omega t\sin\frac{\pi}{2}\right] = a_2\cos\omega t$

$\Rightarrow \cos\omega t = \frac{y_2}{a_2}$ ... (ii)

By squaring and adding equation (i) and (ii)

$$\sin^2\omega t + \cos^2\omega t = \frac{y_1^2}{a_1^2} + \frac{y_2^2}{a_2^2}$$

$\Rightarrow \frac{y_1^2}{a_1^2} + \frac{y_2^2}{a_2^2} = 1$; This is the equation of ellipse.

5. (a) If $y_1 = a_1\sin\omega t$ and $y_2 = a_2\sin(\omega t + \pi)$

$\Rightarrow \frac{y_1}{a_1} + \frac{y_2}{a_2} = 0 \Rightarrow y_2 = -\frac{a_2}{a_1}y_1$

This is the equation of straight line.

6. (c) If $y_1 = a_1\sin\omega t$ and $y_2 = a_2\sin(\omega t + 0) = a_2\sin\omega t$

$\Rightarrow \frac{y_1^2}{a_1^2} + \frac{y_2^2}{a_2^2} - \frac{2y_1y_2}{a_1a_2} = 0 \Rightarrow y_2 = \frac{a_2}{a_1}y_1$

This is the equation of straight line.

7. (d) For given relation

Resultant amplitude $= \sqrt{4^2 + 4^2} = 4\sqrt{2}$

8. (a) $x = 5\sqrt{2}(\sin 2\pi t + \cos 2\pi t)$

$= 5\sqrt{2}\sin 2\pi t + 5\sqrt{2}\cos 2\pi t$

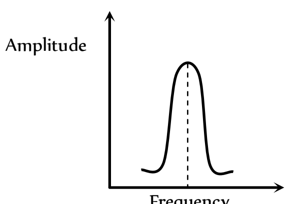
$x = 5\sqrt{2}\sin 2\pi t + 5\sqrt{2}\sin\left(2\pi t + \frac{\pi}{2}\right)$

Phase difference between constituent waves $\phi = \frac{\pi}{2}$

$\therefore$ Resultant amplitude $A = \sqrt{(5\sqrt{2})^2 + (5\sqrt{2})^2}$ =10 *cm*.

9. (b)

10. (d) Less damping force gives a taller and narrower resonance peak



11. (b) $A = \frac{c}{a + b - c}$; when $b = 0$, $a = c$ amplitude

$A \to \infty$. This corresponds to resonance.

12. (c) Energy of particle is maximum at resonant frequency *i.e.,* $\omega_2 = \omega_o$. For amplitude resonance (amplitude maximum) frequency of driver force $\omega = \sqrt{\omega_o^2 - b^2 2m^2} \Rightarrow \omega_1 \neq \omega_o$

13. (a)

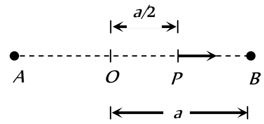
14. (c)

Critical Thinking Questions

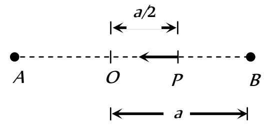
1. (d) $y = a\sin(\omega t + \phi_0)$. According to the question

$y = \frac{a}{2} \Rightarrow \frac{a}{2} = a\sin(\omega t + \phi_0) \Rightarrow (\omega t + \phi_0) = \phi = \frac{\pi}{6}$ or $\frac{5\pi}{6}$

Physical meaning of $\phi = \frac{\pi}{6}$: Particle is at point P and it is going towards B



Physical meaning of $\phi = \frac{5\pi}{6}$: Particle is at point P and it is going towards O



So phase difference $\Delta\phi = \frac{5\pi}{6} - \frac{\pi}{6} = \frac{2\pi}{3} = 120°$

2. (b) $x = 12\sin\omega t - 16\sin^3\omega t = 4[3\sin\omega t - 4\sin^3\omega t]$

$= 4[\sin 3\omega t]$ (By using $\sin 3\theta = 3\sin\theta - 4\sin^3\theta$)

$\therefore$ maximum acceleration $A_{max} = (3\omega)^2 \times 4 = 36\omega^2$

3. (b,c) Harmonic oscillator has some initial elastic potential energy and amplitude of harmonic variation of energy is $\frac{1}{2}Ka^2 = \frac{1}{2}\times 2\times 10^6 \times (0.01)^2 = 100J$

This is the maximum kinetic energy of the oscillator. Thus $K_{max} = 100J$

This energy is added to initial elastic potential energy may give maximum mechanical energy to have value $160J$.

4. (a) $U = k|x|^3 \Rightarrow F == -\frac{dU}{dx} = -3k|x|^2$ ...(i)

Also, for SHM $x = a\sin\omega t$ and $\frac{d^2x}{dt^2} + \omega^2 x = 0$

$\Rightarrow$ acceleration $a = \frac{d^2x}{dt^2} = -\omega^2 x \Rightarrow F = ma$

$= m\frac{d^2x}{dt^2} = -m\omega^2 x$ ...(ii)

From equation (i) & (ii) we get $\omega = \sqrt{\frac{3kx}{m}}$

$\Rightarrow T = \frac{2\pi}{\omega} = 2\pi\sqrt{\frac{m}{3kx}} = 2\pi\sqrt{\frac{m}{3k(a\sin\omega t)}} \Rightarrow T \propto \frac{1}{\sqrt{a}}$.

5. (b, d) Let the velocity acquired by *A* and *B* be *V*, then

$mv = mV + mV \Rightarrow V = \frac{v}{2}$

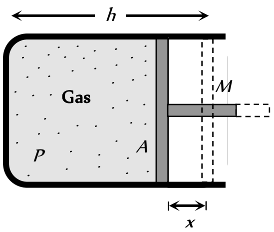
Also $\frac{1}{2}mv^2 = \frac{1}{2}mV^2 + \frac{1}{2}mV^2 + \frac{1}{2}kx^2$

Where x is the maximum compression of the spring. On solving the above equations, we get $x = v\left(\frac{m}{2k}\right)^{1/2}$

At maximum compression, kinetic energy of the

$A - B$ system $= \frac{1}{2}mV^2 + \frac{1}{2}mV^2 = mV^2 = \frac{mv^2}{4}$

6. (a) Let the piston be displaced through distance x towards left, then volume decreases, pressure increases. If ΔP is increase in pressure and ΔV is decrease in volume, then considering the process to take place gradually (i.e. isothermal)



$P_1V_1 = P_2V_2$

$\Rightarrow PV = (P + \Delta P)(V - \Delta V)$

$\Rightarrow PV = PV + \Delta PV - P\Delta V - \Delta P\Delta V$

$\Rightarrow \Delta P.V - P.\Delta V = 0$ (neglecting $\Delta P.\Delta V$)

$\Delta P(Ah) = P(Ax) \Rightarrow \Delta P = \frac{P.x}{h}$

This excess pressure is responsible for providing the restoring force (*F*) to the piston of mass *M*.

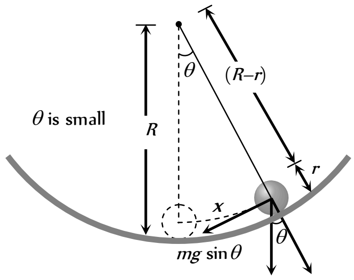
Hence $F = \Delta P.A = \frac{PAx}{h}$

Comparing it with $|F| = kx \Rightarrow k = M\omega^2 = \frac{PA}{h}$

$\Rightarrow \omega = \sqrt{\frac{PA}{Mh}} \Rightarrow T = 2\pi\sqrt{\frac{Mh}{PA}}$

Short trick : by checking the options dimensionally. Option (a) is correct.

7. (b) Tangential acceleration, $a_t = -g\sin\theta = -g\theta$



$a_t = -g\frac{x}{(R-r)}$

Motion is S.H.M., with time period

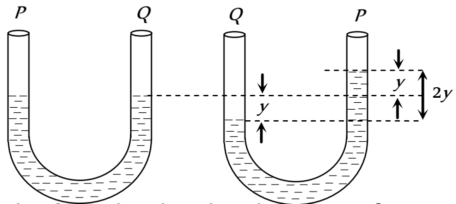
$T = 2\pi\sqrt{\frac{\text{displacement}}{\text{acceleration}}} = 2\pi\sqrt{\frac{x}{\frac{gx}{(R-r)}}} = 2\pi\sqrt{\frac{R-r}{g}}$

8. (a) For resonance amplitude must be maximum which is possible only when the denominator of expression is zero *i.e.*

$a\omega^2 - b\omega + c = 0 \Rightarrow \omega = \frac{+b \pm \sqrt{b^2 - 4ac}}{2a}$

For a single resonant frequency, $b = 4ac$.

9. (d) If the level of liquid is depressed by *y cm* on one side, then the level of liquid in column *P* is *2y cm* higher than *B* as shown.



The weight of extra liquid on the side $P = 2Aydg$.

This becomes the restoring force on mass *M*.

$\therefore$ Restoring acceleration $= \frac{-2Aydg}{M}$

This relation satisfies the condition of SHM i.e. $a \propto -y$.

Hence time period $T = 2\pi\sqrt{\frac{\text{Displacement}}{|\text{Acceleration}|}}$

$= 2\pi\sqrt{\frac{y}{\frac{2Aydg}{M}}} \Rightarrow T = 2\pi\sqrt{\frac{M}{2Adg}}$

10. (b) Time taken by particle to move from *x*=0 (mean position) to *x* = 4 (extreme position) $= \frac{T}{4} = \frac{1.2}{4} = 0.3\ s$

Let *t* be the time taken by the particle to move from *x*=0 to *x*=2 *cm*

$y = a\sin\omega t \Rightarrow 2 = 4\sin\frac{2\pi}{T}t \Rightarrow \frac{1}{2} = \sin\frac{2\pi}{1.2}t$

$\Rightarrow \frac{\pi}{6} = \frac{2\pi}{1.2}t \Rightarrow t = 0.1\ s$. Hence time to move from *x* = 2 to *x* = 4 will be equal to 0.3 – 0.1 = 0.2 s

Hence total time to move from *x* = 2 to *x* = 4 and back again $= 2 \times 0.2 = 0.4\,\text{sec}$

11. (c) For body to remain in contact $a_{\max} = g$

$\therefore \omega^2 A = g \Rightarrow 4\pi^2 n^2 A = g$

$\Rightarrow n^2 = \frac{g}{4\pi^2 A} = \frac{10}{4(3.14)^2 0.01} = 25 \Rightarrow n = 5\ Hz$

12. (c) Under the influence of one force $F_1 = m\omega_1^2 y$ and under the action of another force, $F_2 = m\omega_2^2 y$.

Under the action of both the forces $F = F_1 + F_2$

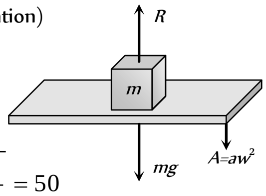
$\Rightarrow m\omega^2 y = m\omega_1^2 y + m\omega^2 y$

$\Rightarrow \omega^2 = \omega_1^2 + \omega_2^2 \Rightarrow \left(\frac{2\pi}{T}\right)^2 = \left(\frac{2\pi}{T_1}\right)^2 + \left(\frac{2\pi}{T_2}\right)^2$

$\Rightarrow T = \sqrt{\frac{T_1^2 T_2^2}{T_1^2 + T_2^2}} = \sqrt{\frac{\left(\frac{4}{5}\right)^2\left(\frac{3}{5}\right)^2}{\left(\frac{4}{5}\right)^2 + \left(\frac{3}{5}\right)^2}} = 0.48 \text{ sec}$

13. (a) By drawing free body diagram of object during the downward motion at extreme position, for equilibrium of mass

$mg - R = mA$ (A = Acceleration)



For critical condition $R = 0$

so $mg = mA \Rightarrow mg = ma\omega^2$

$\Rightarrow \omega = \sqrt{g/a} = \sqrt{\frac{9.8}{3.92 \times 10^{-3}}} = 50$

$\Rightarrow T = \frac{2\pi}{\omega} = \frac{2\pi}{50} = 0.1256 sec$

14. (a) Using $x = A\sin\omega t$

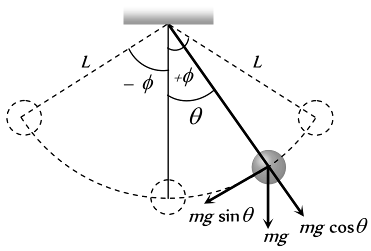
For $x = A/2,\ \sin\omega T_1 = 1/2 \Rightarrow T_1 = \frac{\pi}{6\omega}$

For $x = A, \sin\omega(T_1 + T_2) = 1 \Rightarrow T_1 + T_2 = \frac{\pi}{2\omega}$

$\Rightarrow T_2 = \frac{\pi}{2\omega} - T_1 = \frac{\pi}{2\omega} - \frac{\pi}{6\omega} = \frac{\pi}{3\omega}$ i.e. $T_1 < T_2$

Alternate method : In S.H.M., velocity of particle also oscillates simple harmonically. Speed is more near the mean position and less near the extreme position. Therefore the time taken for the particle to go from 0 to $\frac{A}{2}$ will be less than the time taken to go from $\frac{A}{2}$ to A. Hence $T_1 < T_2$.

15. (b, c) From following figure it is clear that



$T - Mg\cos\theta =$ Centripetal force

$\Rightarrow T - Mg\cos\theta = \frac{Mv^2}{L}$

Also tangential acceleration $|a_T| = g\sin\theta$.

16. (c) If t is the time taken by pendulums to come in same phase again first time after $t = 0$.

and $N_S =$ Number of oscillations made by shorter length pendulum with time period T_S.

$N_L =$ Number of oscillations made by longer length pendulum with time period T_L.

Then $t = N_S T_S = N_L T_L$

$\Rightarrow N_S 2\pi\sqrt{\frac{5}{g}} = N_L \times 2\pi\sqrt{\frac{20}{g}}$ $\left(\because T = 2\pi\sqrt{\frac{l}{g}}\right)$

$\Rightarrow N_S = 2N_L$ i.e. if $N_L = 1 \Rightarrow N_S = 2$

17. (a) Tension in the string when bob passes through lowest point

$T = mg + \frac{mv^2}{r} = mg + mv\omega$ $(\because v = r\omega)$

putting $v = \sqrt{2gh}$ and $\omega = \frac{2\pi}{T} = \frac{2\pi}{2} = \pi$

we get $T = m(g + \pi\sqrt{2gh})$

18. (d) When the bob is immersed in water its effective weight =

$\left(mg - \frac{m}{\rho}g\right) = mg\left(\frac{\rho - 1}{\rho}\right)$ $\therefore g_{eff} = g\left(\frac{\rho-1}{\rho}\right)$

$\frac{T'}{T} = \sqrt{\frac{g}{g_{eff}}} \Rightarrow T' = T\sqrt{\frac{\rho}{(\rho - 1)}}$

19. (a) Time period $T \propto \sqrt{l} \Rightarrow \frac{\Delta T}{T} = \frac{1}{2}\frac{\Delta l}{l} = \frac{1}{2}\alpha\Delta\theta$

Also according to thermal expansion $l' = (1 + \alpha\Delta\theta)$

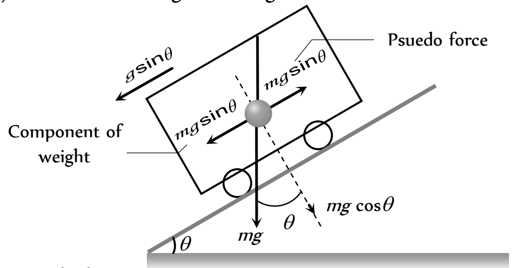
$\frac{\Delta l}{l} = \alpha + \theta$. Hence $\frac{\Delta T}{T} = \frac{1}{2}\frac{\Delta l}{l} = \frac{1}{2}\alpha\Delta\theta$

$= \frac{1}{2} \times 12 \times 10^{-6} \times (40 - 20) = 12 \times 10^{-5}$

$\Rightarrow \Delta T = 12 \times 10^{-5} \times 86400$ *seconds / day*

$\therefore \Delta T \approx 10.3$ *seconds / day*

20. (a) See the following force diagram.



Vehicle is moving down the frictionless inclined surface so, it's acceleration is $g\sin\theta$. Since vehicle is accelerating, a pseudo force $m(g\sin\theta)$ will act on bob of pendulum which cancel the $\sin\theta$ component of weight of the bob.

Hence net force on the bob is $F_{\_} = mg\cos\theta$ or net acceleration of the bob is $g_{eff} = g\cos\theta$

$\therefore$ Time period $T = 2\pi\sqrt{\frac{l}{g_{eff}}} = 2\pi\sqrt{\frac{l}{g\cos\theta}}$

21. (c) $\because t_o = 2\pi\sqrt{\frac{l}{g}}$

Effective weight of bob inside water,

$W' = mg - \text{thrust} = V\rho g - V\rho' g$

$\Rightarrow V\rho g_{eff} = V(\rho - \rho')g$, where, ρ = Density of bob

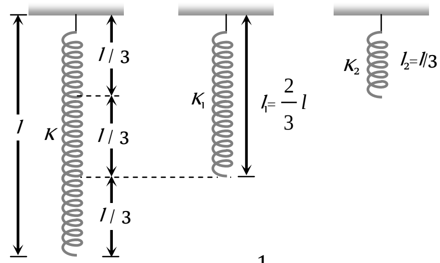
$\Rightarrow g_{eff} = \left(1 - \frac{\rho'}{\rho}\right)g$ and ρ' = Density of water

$$\therefore t = 2\pi\sqrt{\frac{l}{g_{eff}}} = 2\pi\sqrt{\frac{l}{(1-\rho'/\rho)g}}$$

$$\therefore \frac{t}{t_0} = \sqrt{\frac{1}{1-\rho'/\rho}} = \sqrt{\frac{1}{1-\frac{3}{4}}} \quad \left(\because \rho' = 10^3 kg/m^3, \ \rho = \frac{4}{3}\times 10^3 kg/m^3\right)$$

$\Rightarrow t = 2t_0$.

22. (b)



Force constant $(k) \propto \frac{1}{\text{Length of spring}}$

$$\Rightarrow \frac{K}{K_1} = \frac{l_1}{l} = \frac{\frac{2}{3}l}{l} \Rightarrow K_1 = \frac{3}{2}K.$$

23. (b) The wire may be treated as a string for which force constant

$$k_1 = \frac{\text{Force}}{\text{Extension}} = \frac{YA}{L} \quad \left(\because Y = \frac{F}{A}\times\frac{L}{\Delta L}\right)$$

Spring constant of the spring $k_2 = K$

Hence spring constant of the combination (series)

$$k_{eq} = \frac{k_1 k_2}{k_1 + k_2} = \frac{(YA/L)K}{(YA/L)+K} = \frac{YAK}{YA+KL}$$

$\because$ Time period $T = 2\pi\sqrt{\frac{m}{k}} = 2\pi\left[\frac{(YA+KL)m}{YAK}\right]^{1/2}$

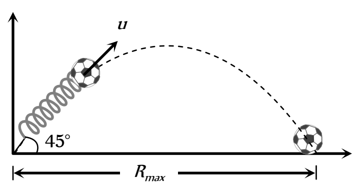
24. (a) Slope is irrelevant hence $T = 2\pi\left(\frac{M}{2K}\right)^{1/2}$

25. (b) For forced oscillation,

$x = x_0 \sin(\omega t + \phi)$ and $F = F_0 \cos\omega t$

where, $x_0 = \frac{F_o}{m(\omega_o^2 - \omega^2)} \propto \frac{1}{m(\omega_o^2 - \omega^2)}$.

26. (b) For getting horizontal range, there must be some inclination of spring with ground to project ball.



$\Rightarrow R_{\max} = \frac{u^2}{g}$ .....(i)

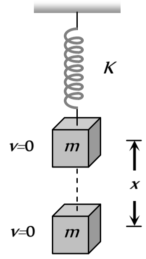
But K.E. acquired by ball = P.E. of spring gun

$\Rightarrow \frac{1}{2}mu^2 = \frac{1}{2}kx^2 \Rightarrow u^2 = \frac{kx^2}{m}$ .....(ii)

From equation (i) and (ii)

$$R_{\max} = \frac{kx^2}{mg} = \frac{600\times(5\times10^{-2})^2}{15\times10^{-3}\times10} = 10\,m.$$

27. (b) Let x be the maximum extension of the spring. From energy conservation



Loss in gravitational potential energy

= Gain in potential energy of spring

$Mgx = \frac{1}{2}Kx^2$

$\Rightarrow x = \frac{2Mg}{K}$

28. (b) $y = 4\cos^2\left(\frac{t}{2}\right)\sin 1000\,t$

$\Rightarrow y = 2(1+\cos t)\sin 1000\,t$

$\Rightarrow y = 2\sin 1000\,t + 2\cos t \sin 1000t$

$\Rightarrow y = 2\sin 1000\,t + \sin 999\,t + \sin 1001\,t$

It is a sum of three S.H.M.

29. (a, c) Let simple harmonic motions be represented by

$y_1 = a\sin\left(\omega t - \frac{\pi}{4}\right)$; $y_2 = a\sin\omega t$ and

$y_3 = a\sin\left(\omega t + \frac{\pi}{4}\right)$. On superimposing, resultant SHM will be $y = a\left[\sin\left(\omega t - \frac{\pi}{4}\right) + \sin\omega t + \sin\left(\omega t + \frac{\pi}{4}\right)\right]$

$= a\left[2\sin\omega t\cos\frac{\pi}{4} + \sin\omega t\right]$

$= a[\sqrt{2}\sin\omega t + \sin\omega t] = a(1+\sqrt{2})\sin\omega t$

Resultant amplitude $= (1+\sqrt{2})a$

Energy is S.H.M. $\propto$ (Amplitude)^2

$$\therefore \frac{E_{\text{Resultant}}}{E_{\text{Single}}} = \left(\frac{A}{a}\right)^2 = (\sqrt{2}+1)^2 = (3+2\sqrt{2})$$

$\Rightarrow E_{\text{Resultant}} = (3+2\sqrt{2})E_{\text{Single}}$

30. (d) $y = \sin^2\omega t = \frac{1-\cos 2\omega t}{2} \Rightarrow$ Period, $T = \frac{2\pi}{2\omega} = \frac{\pi}{\omega}$

The given function is not satisfying the standard differential equation of S.H.M. $\frac{d^2y}{dx^2} = -\omega^2 y$. Hence it represents periodic motion but not S.H.M.

31. (c) $y = Kt^2 \Rightarrow \frac{d^2y}{dt^2} = a_y = 2K = 2\times 1 = 2\,m/s$ ($\because K = 1\,m/s$)

Now, $T_1 = 2\pi\sqrt{\frac{l}{g}}$ and $T_2 = 2\pi\sqrt{\frac{l}{(g+a_y)}}$

Dividing, $\frac{T_1}{T_2} = \sqrt{\frac{g + a_y}{g}} \Rightarrow \sqrt{\frac{6}{5}} \Rightarrow \frac{T_1^2}{T_2^2} = \frac{6}{5}$

32. (b) From the relation of restitution $\frac{h_n}{h_0} = e^{2n}$ and

$$h_n = h_0(1 - \cos 60°) \Rightarrow \frac{h_n}{h_0} = 1 - \cos 60° = \left(\frac{2}{\sqrt{5}}\right)^{2n}$$

$$\Rightarrow 1 - \frac{1}{2} = \left(\frac{4}{5}\right)^n \Rightarrow \frac{1}{2} = \left(\frac{4}{5}\right)^n$$

Taking log of both sides we get

$$\log 1 - \log 2 = n(\log 4 - \log 5)$$

$$0 - 0.3010 = n(0.6020 - 0.6990)$$

$$-0.3010 = -n \times 0.097 \Rightarrow n = \frac{0.3010}{0.097} = 3.1 \approx 3$$

33. (a) As a is the side of cube σ is its density.

Mass of cube is $a^2\sigma$, its weight $= a^3\sigma g$

Let h be the height of cube immersed in liquid of density ρ in equilibrium then, $F = a^2 h \rho g = Mg = a^3 \sigma g$

If it is pushed down by y then the buoyant force $F' = a^2(h + y)\rho g$

Restoring force is $\Delta F = F' - F = a^2(h + y)\sigma g - a^2 h \sigma g$

$$= a^2 y \rho g$$

Restoring acceleration $= \frac{\Delta F}{M} = -\frac{a^2 y \rho g}{M} = -\frac{a^2 \rho g}{a^2 \sigma} y$

Motion is S.H.M.

$$\Rightarrow T = 2\pi\sqrt{\frac{a^3\sigma}{a^2 \rho g}} = 2\pi\sqrt{\frac{a\sigma}{\rho g}}$$

34. (b) As here two masses are connected by two springs, this problem is equivalent to the oscillation of a reduced mass m_r of a spring of effective spring constant.

$$T = 2\pi\sqrt{\frac{m_r}{K_{eff.}}}$$

Here $m_r = \frac{m_1 m_2}{m_1 + m_2} = \frac{m}{2} \Rightarrow K_{eff.} = K_1 + K_2 = 2K$

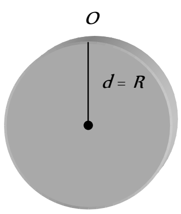
$$\therefore n = \frac{1}{2\pi}\sqrt{\frac{K_{eff.}}{m_r}} = \frac{1}{2\pi}\sqrt{\frac{2K}{m} \times 2} = \frac{1}{\pi}\sqrt{\frac{K}{m}} = \frac{1}{\pi}\sqrt{\frac{0.1}{0.1}} = \frac{1}{\pi} Hz$$

35. (d) Time period of a physical pendulum

$$T = 2\pi\sqrt{\frac{I_0}{mgd}} = 2\pi\sqrt{\frac{\left(\frac{1}{2}mR^2 + mR^2\right)}{mgR}}$$

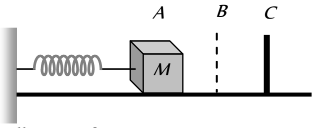
$$= 2\pi\sqrt{\frac{3R}{2g}} \quad .....(i)$$

$$T_{simple\ pendulum} = 2\pi\sqrt{\frac{l}{g}} \quad .....(ii)$$



Equating (i) and (ii), $l = \frac{3}{2}R$.

36. (c) The total time from A to C



$$t_{Ac} = t_{AB} + t_{BC}$$

$$= (T/4) + t_{BC}$$

where T = time period of oscillation of spring mass system

t_{BC} can be obtained from, $BC = AB\sin(2\pi/T)t_{BC}$

Putting $\frac{BC}{AB} = \frac{1}{2}$ we obtain $t_{BC} = \frac{T}{12}$

$$\Rightarrow t_{AC} = \frac{T}{4} + \frac{T}{12} = \frac{2\pi}{3}\sqrt{\frac{m}{k}}.$$

37. (b) When mass 700 gm is removed, the left out mass (500 + 400) gm oscillates with a period of 3 sec

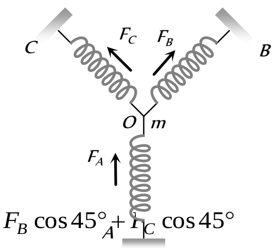
$$\therefore 3 = t = 2\pi\sqrt{\frac{(500 + 400)}{k}} \quad ......(i)$$

When 500 gm mass is also removed, the left out mass is 400 gm.

$$\therefore t' = 2\pi\sqrt{\frac{400}{k}} \quad .....(ii)$$

$$\Rightarrow \frac{3}{t'} = \sqrt{\frac{900}{400}} \Rightarrow t' = 2\,\text{sec}$$

38. (b) When the particle of mass m at O is pushed by y in the direction of A The spring A will be compressed by y while spring B and C will be stretched by $y' = y\cos 45°$. So that the total restoring force on the mass m along OA.



$$F_{net} = F_A + F_B\cos 45° + F_C\cos 45°$$

$$= ky + 2ky'\cos 45° = ky + 2k(y\cos 45°)\cos 45° = 2ky$$

Also $F_{net} = k'y \Rightarrow k'y = 2ky \Rightarrow k' = 2k$

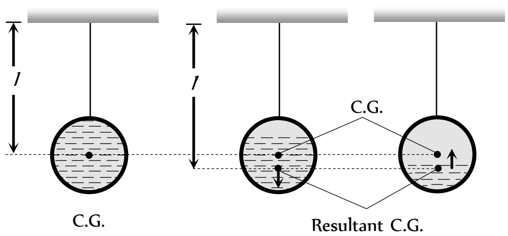
$$T = 2\pi\sqrt{\frac{m}{k'}} = 2\pi\sqrt{\frac{m}{2k}}$$

39. (d) The given system is like a simple pendulum, whose effective length (l) is equal to the distance between point of suspension and C.G. (Centre of Gravity) of the hanging body.

When water slowly flows out the sphere, the C.G. of the system is lowered, and hence l increases, which in turn increases time period (as $T \propto \sqrt{l}$).

After some time weight of water left in sphere become less than the weight of sphere itself, so the resultant C.G. gets clear the C.G. of sphere itself i.e. l decreases and hence T increases.

Finally when the sphere becomes empty, the resulting C.G. is the C.G. of sphere i.e. length becomes equal to the original length and hence the time period becomes equal to the same value as when it was full of water.



40. (b) Let T_1 and T_2 are the time period of the two pendulums

$T_1 = 2\pi\sqrt{\frac{100}{g}}$ and $T_2 = 2\pi\sqrt{\frac{121}{g}}$

$(T_1 < T_2$ because $l_1 < l_2)$.

Let at $t = 0$, they start swinging together. Since their time periods are different, the swinging will not be in unision always. Only when number of completed oscillation differs by an integer, the two pendulum will again begin to swing together.

Let longer length pendulum complete n oscillation and shorter length pendulum complete $(n+1)$ oscillation, for the unision swinging, then $(n+1)T_1 = nT_2$

$$(n+1)\times 2\pi\sqrt{\frac{100}{g}} = n\times 2\pi\sqrt{\frac{121}{g}} \Rightarrow n = 10$$

41. (b) Amplitude of damped oscillator

$A = A_0 e^{-\lambda t}$; $\lambda =$ constant, t = time

For t =1 min. $\frac{A_0}{2} = A_0 e^{-\lambda t} \Rightarrow e^{\lambda} = 2$

For t = 3 min. $A = A_0 e^{-\lambda\times 3} = \frac{A_0}{(e^{\lambda})^3} = \frac{A_0}{2^3}$

$\Rightarrow X = 2^3$

42. (a) The standard differential equation is satisfied by only the function $\sin\omega t - \cos\omega t$. Hence it represents S.H.M.

43. (d) This is the special case of physical pendulum and in this case $T = 2\pi\sqrt{\frac{2l}{3g}}$

$$\Rightarrow\ T = 2\times 3.14\sqrt{\frac{2\times 2}{3\times 9.8}} = 2.31\,\text{sec} \approx 2.4\,\text{sec}$$

Graphical Questions

1. (a) Because acceleration $\propto$ displacement.

2. (d) Using acceleration $A = -\omega^2 x$

$At - x_{\max}$ A will be maximum and positive.

3. (d) Acceleration $= -\omega^2 y$. So $F = -m\omega^2 y$

y is sinusoidal function.

So F will be also sinusoidal function with phase difference π

4. (d) At time $\frac{T}{2}$; $v = 0$ $\therefore$ Total energy = Potential energy.

5. (b) PE varies from zero to maximum. It is always positive sinusoidal function.

6. (d) Potential energy of particle performing SHM is given by: $PE = \frac{1}{2}m\omega^2 y^2$ *i.e.* it varies parabolically such that at mean position it becomes zero and maximum at extreme position.

7. (a) Potential energy is minimum (in this case zero) at mean position $(x = 0)$ and maximum at extreme position $(x = \pm A)$.

At time $t = 0$, $x = A$, hence potential should be maximum. Therefore graph I is correct. Further in graph III. Potential energy is minimum at $x = 0$, hence this is also correct.

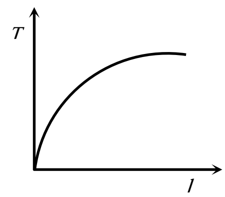
8. (a) $f = \frac{1}{T} = \frac{1}{0.04} = 25\ Hz$

9. (d) From graph, slope $K = \frac{F}{x} = \frac{8}{2} = 4$

$$T = 2\pi\sqrt{\frac{m}{K}} \Rightarrow T = 2\pi\sqrt{\frac{0.01}{4}} = 0.3\,\text{sec}$$

10. (b) $T = 2\pi\sqrt{\frac{l}{g}} \Rightarrow l \propto T^2$ (Equation of parabola)

11. (b) $T \propto \sqrt{l} \Rightarrow T^2 \propto l$



12. (d) In simple harmonic motion

$y = a\sin\omega t$ and $v = a\omega\cos\omega t$ from this we have

$\frac{y^2}{a^2} + \frac{v^2}{a^2\omega^2} = 1$, which is a equation of ellipse.

13. (c)

14. (a) In S.H.M. when acceleration is negative maximum or positive maximum, the velocity is zero so kinetic energy is also zero. Similarly for zero acceleration, velocity is maximum so kinetic energy is also maximum.

15. (b) Total potential energy = 0.04 J

Resting potential energy =0.01 J

Maximum kinetic energy =(0.04–0.01)

$$= 0.03J = \frac{1}{2}m\,\omega^2 a^2 = \frac{1}{2}ka^2$$

$$0.03 = \frac{1}{2}\times k\times\left(\frac{20}{1000}\right)^2$$

$k = 0.06\times 2500\ N/m = 150\ N/m$.

16. (a) Kinetic energy varies with time but is never negative.

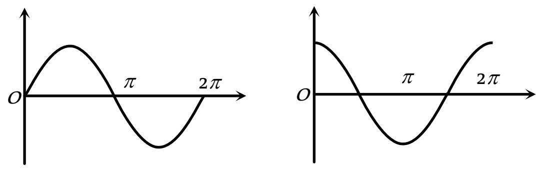
Assertion and Reason

1. (b) Both assertion and reason are correct but reason is not the correct explanation of assertion.

2. (e) In simple harmonic motion, $v = \omega\sqrt{a^2 - y^2}$ as y changes, velocity v will also change. So simple harmonic motion is not uniform motion. But simple harmonic motion may be defined as the projection of uniform circular motion along one of the diameter of the circle.

3. (a) In SHM, the acceleration is always in a direction opposite to that of the displacement *i.e.,* proportional to $(-y)$.

4. (a) A periodic function is one whose value repeats after a definite interval of time. $\sin\theta$ and $\cos\theta$ are periodic functions because they repeat itself after 2π interval of time.



sin curve cos curve

It is also true that moon is smaller than the earth, but this statement is not explaining the assertion.

5. (e) In SHM, $v = \omega\sqrt{a^2 - y^2}$ or $v^2 = \omega^2 a^2 - \omega^2 y^2$.

Dividing both sides by $\omega^2 a^2$, $\frac{v^2}{\omega^2 a^2} + \frac{y^2}{a^2} = 1$. This is the equation of an ellipse. Hence the graph between v and y is an ellipse not a parabola.

6. (b) $T = 2\pi\sqrt{\frac{l}{g}}$. On moon, g is much smaller compared to g on earth. Therefore, T increases.

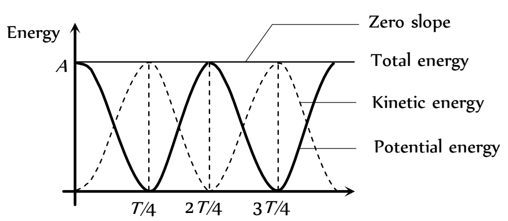
7. (c) Amplitude of oscillation for a forced, damped oscillator is $A = \frac{F_0/m}{\sqrt{(\omega^2 - \omega_0^2) + (b\omega/m)^2}}$, where b is constant related to the strength of the resistive force, $\omega_0 = \sqrt{k/m}$ is natural frequency of undamped oscillator ($b = 0$).

When the frequency of driving force $(\omega) \approx \omega_0$, then amplitude A is very larger.

For $\omega < \omega_0$ or $\omega > \omega_0$, the amplitude decrease.

8. (a) The total energy of S.H.M. = Kinetic energy of particle + potential energy of particle.

The variation of total energy of the particle in SHM with time is shown in a graph.



9. (c) Time period of simple pendulum of length l is,

$$T = 2\pi\sqrt{\frac{l}{g}} \Rightarrow T \propto \sqrt{l} \Rightarrow \sqrt{\frac{\Delta T}{T}} = \frac{1}{2}\frac{\Delta l}{l}$$

$$\therefore \frac{\Delta T}{T} = \frac{1}{2} \times 3 = 1.5\%$$

10. (c) Frequency of second pendulum $n = (1/2)s^{-1}$. When elevator is moving upwards with acceleration *g/2*, the effective acceleration due to gravity is

$$g = g + a = g + g/2 = 3g/2.$$

As $n = \frac{1}{2\pi}\sqrt{\frac{g}{l}}$ so $n^2 \propto g$.

$$\therefore \frac{n_1^2}{n_2^2} = \frac{g_1}{g} = \frac{3g/2}{g} = \frac{3}{2} \text{ or, } \frac{n_1}{n} = \sqrt{\frac{3}{2}} = 1.225$$

or, $n_1 = 1.225n = 1.225 \times (1/2) = 0.612\ s^{-1}$.

11. (b) Energy of damped oscillator at an any instant t is given by

$$E = E_0 e^{-bt/m} \quad [\text{where } E_0 = \frac{1}{2}kx^2 = \text{maximum energy}]$$

Due to damping forces the amplitude of oscillator will go on decreasing with time whose energy is expressed by above equation.

12. (b) In SHM. $K.E. = \frac{1}{2}m\omega^2(a^2 - y^2)$ and $P.E. = \frac{1}{2}m\omega^2 y^2$.

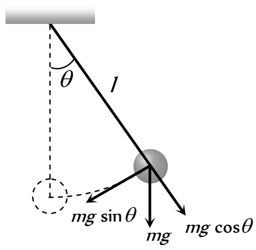
For *K.E.* = *P.E.* $\Rightarrow 2y^2 = a^2 \Rightarrow y = a/\sqrt{2}$. Since total energy remains constant through out the motion, which is $E = K.E. + P.E.$ So, when *P.E.* is maximum then *K.E.* is zero and viceversa.

13. (a) Total energy of the harmonic oscillator,

$$E = \frac{1}{2}m\omega^2 a^2 \quad i.e., \ E \propto a^2.$$

Therefore $\frac{E'}{E} = \left(\frac{2a}{a}\right)^2$ or, $E' = 4E$.

14. (b) In simple pendulum, when bob is in deflection position, the tension in the string is $T = mg\cos\theta + \frac{mv^2}{l}$. Since the value of θ is different at different positions, hence tension in the string is not constant throughout the oscillation. At end points θ is maximum; the value of $\cos\theta$ is least, hence the value of tension in the string is least. At the mean position, the value of $\theta = 0°$ and $\cos 0° = 1$, so the value of tension is largest.



Also velocity is given by $v = \omega\sqrt{a^2 - y^2}$ which is maximum when $y = 0$, at mean position.

15. (e) Spring constant $\propto \frac{1}{\text{Length of spring}}$

$\Rightarrow k' = \frac{k}{n}$

Also, spring constant depends on material properties of the spring.

Hence assertion is false, but reason is true.

16. (a) The time period of a oscillating spring is given by,

$T = 2\pi\sqrt{\frac{m}{k}} \Rightarrow T \propto \frac{1}{\sqrt{k}}$. Since the spring constant is large for hard spring, therefore hard spring has a less periodic time as compared to soft spring.

17. (e) In simple harmonic motion the velocity is given by,

$v = \omega\sqrt{a^2 - y^2}$ at extreme position, $y = a$.

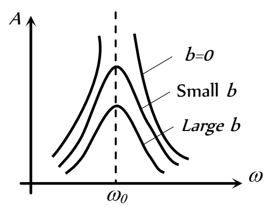
$\therefore v = 0$. But acceleration $A = -\omega^2 a$, which is maximum at extreme position.

18. (a) If the soldiers while crossing a suspended bridge march in steps, the frequency of marching steps of soldiers may match with the natural frequency of oscillations of the suspended bridge. In that situation resonance will take place, then the amplitude of oscillation of the suspended bridge will increase enormously, which may cause the collapsing of the bridge. To avoid situations the soldiers are advised to go out steps on suspended bridge.

19. (a) From equation, amplitude of oscillation

$$A = \frac{F_0 / m}{\sqrt{(\omega^2 - \omega_0^2)^2 + (b\omega / m)^2}}$$

In absence of damping force (b = 0), that the steady state amplitude approaches infinity as $\omega \to \omega_0$. That is, if there is no resistive force in the system and then it is possible to drive an oscillator with sinusoidal force at the resonance frequency, the amplitude of motion will build up without limit. This does not occur in practice because some damping is always present in real oscillation.



20. (b)

21. (c) The amplitude of an oscillating pendulum decreases with time because of friction due to air. Frequency of pendulum is independent $\left(T = \frac{1}{2\pi}\sqrt{\frac{g}{l}}\right)$ of amplitude.

22. (b) $x = a\sin\omega t$ and $v = \frac{dx}{dt} = a\omega\cos\omega t$

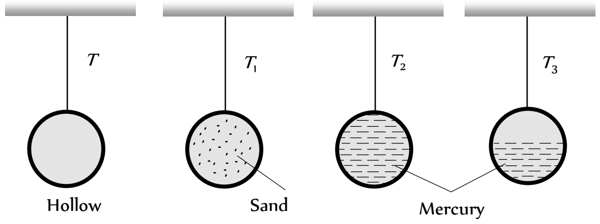
It is clear phase difference between 'x' and 'a' is $\pi / 2$.

23. (e)

Simple Harmonic Motion

SET Self Evaluation Test -16

1. The period of a simple pendulum, whose bob is a hollow metallic sphere, is T. The period is T_1 when the bob is filled with sand, T_2 when it is filled with mercury and T_3 when it is half filled with mercury. Which of the following is true



(a) $T = T_1 = T_2 > T_3$ (b) $T_1 = T_1 = T_3 > T$

(c) $T > T_3 > T_1 = T_2$ (d) $T = T_1 = T_2 < T_3$

2. A pendulum clock that keeps correct time on the earth is taken to the moon it will run (it is given that $g_{Moon} = g_{Earth}/6$)

(a) At correct rate (b) 6 time faster

(c) $\sqrt{6}$ times faster (d) $\sqrt{6}$ times slowly

3. A pendulum has time period T in air. When it is made to oscillate in water, it acquired a time period $T' = \sqrt{2}T$. The density of the pendulum bob is equal to (density of water = 1)

(a) $\sqrt{2}$ (b) 2

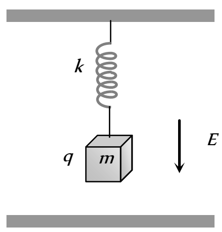
(c) $2\sqrt{2}$ (d) None of these

4. An object of mass 0.2 kg executes simple harmonic along X-axis with frequency of $\frac{25}{\pi} Hz$. At the position $x = 0.04m$, the object has kinetic energy of 0.5 J and potential energy of 0.4 J amplitude of oscillation in meter is equal to

(a) 0.05 (b) 0.06

(c) 0.01 (d) None of these

5. Time period of a block suspended from the upper plate of a parallel plate capacitor by a spring of stiffness k is T. When block is uncharged. If a charge q is given to the block them, the new time period of oscillation will be



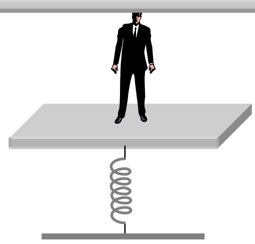
(a) T

(b) $> T$

(c) $< T$

(d) $\geq T$

6. A man weighing 60 kg stands on the horizontal platform of a spring balance. The platform starts executing simple harmonic motion of amplitude 0.1 m and frequency $\frac{2}{\pi} Hz$. Which of the following statement is correct



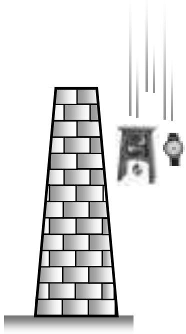
(a) The spring balance reads the weight of man as 60 kg

(b) The spring balance reading fluctuates between 60 kg. and 70 kg

(c) The spring balance reading fluctuates between 50 kg and 60 kg

(d) The spring balance reading fluctuates between 50 kg and 70 kg

7. A man having a wrist watch and a pendulum clock rises on a TV tower. The wrist watch and pendulum clock per chance fall from the top of the tower. Then



(a) Both will keep correct time during the fall.

(b) Both will keep incorrect time during the fall.

(c) Wrist watch will keep correct time and clock will become fast.

(d) Clock will stop but wrist watch will function normally.

8. A force of 6.4 N stretches a vertical spring by 0.1 m. The mass that must be suspended from the spring so that it oscillates with a period of $\left(\frac{\pi}{4}\right)$ sec. is **[Roorkee 1990]**

(a) $\left(\frac{\pi}{4}\right) kg$ (b) $1\, kg$

(c) $\left(\frac{1}{\pi}\right) kg$ (d) $10\, kg$

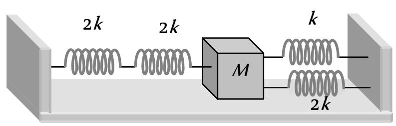
9. A spring with 10 coils has spring constant k. It is exactly cut into two halves, then each of these new springs will have a spring constant **[Kerala PMT 2004]**

(a) $k/2$ (b) $3k/2$

(c) $2k$ (d) $3k$

(e) $4k$

10. Four massless springs whose force constants are $2k$, $2k$, k and $2k$ respectively are attached to a mass M kept on a frictionless plane (as shown in figure). If the mass M is displaced in the horizontal direction, then the frequency of oscillation of the system is



(a) $\frac{1}{2\pi}\sqrt{\frac{k}{4M}}$ (b) $\frac{1}{2\pi}\sqrt{\frac{4k}{M}}$

(c) $\frac{1}{2\pi}\sqrt{\frac{k}{7M}}$ (d) $\frac{1}{2\pi}\sqrt{\frac{7k}{M}}$

11. Values of the acceleration A of a particle moving in simple harmonic motion as a function of its displacement x are given in the table below.

A $(mm\ s^{-2})$	16	8	0	– 8	– 16
x (mm)	– 4	– 2	0	2	4

The period of the motion is

(a) $\frac{1}{\pi}s$ (b) $\frac{2}{\pi}s$

(c) $\frac{\pi}{2}s$ (d) $\pi\, s$

12. Two pendulums have time periods T and $\frac{5T}{4}$. They start S.H.M. at the same time from the mean position. What will be the phase difference between them after the bigger pendulum has complete one oscillation

(a) 45° (b) 90°

(c) 60° (d) 30°

13. The periodic time of a particle doing simple harmonic motion is 4 *second*. The time taken by it to go from its mean position to half the maximum displacement (amplitude) is

(a) 2*s* (b) 1*s*

(c) $\frac{2}{3}s$ (d) $\frac{1}{3}s$

14. The displacement of a particle from its mean position (in metre) is given by $y = 0.2\sin(10\pi t + 1.5\pi)\cos(10\pi t + 1.5\pi)$. The motion of particle is **[CPMT 1998]**

(a) Periodic but not S.H.M.

(b) Non-periodic

(c) Simple harmonic motion with period 0.1 *s*

(d) Simple harmonic motion with period 0.2 *s*

15. The kinetic energy and the potential energy of a particle executing S.H.M. are equal. The ratio of its displacement and amplitude will be **[RPMT 2003; CPMT 2001]**

(a) $\frac{1}{\sqrt{2}}$ (b) $\frac{\sqrt{3}}{2}$

(c) $\frac{1}{2}$ (d) $\sqrt{2}$

16. Two simple pendulums of lengths 1.44 *m* and 1 *m* start swinging together. After how many vibrations will they again start swinging together **[J & K CET 2005]**

(a) 5 oscillations of smaller pendulum

(b) 6 oscillations of smaller pendulum

(c) 4 oscillations of bigger pendulum

(d) 6 oscillations of bigger pendulum

17. Equations $y_1 = A\sin\omega t$ and $y_2 = \frac{A}{2}\sin\omega t + \frac{A}{2}\cos\omega t$ represent S.H.M. The ratio of the amplitudes of the two motions is

(a) 1 (b) 2

(c) 0.5 (d) $\sqrt{2}$

18. A particle doing simple harmonic motion, amplitude = 4 *cm*, time period = 12 *sec*. The ratio between time taken by it in going from its mean position to 2 *cm* and from 2 *cm* to extreme position is

(a) 1 (b) 1/3

(c) 1/4 (d) 1/2

19. On a planet a freely falling body takes 2 *sec* when it is dropped from a height of 8 *m*, the time period of simple pendulum of length 1 *m* on that planet is **[Pb. PMT 2004]**

(a) 3.14 *sec* (b) 16.28 *sec*

(c) 1.57 *sec* (d) None of these

20. If a simple pendulum is taken to place where g decreases by 2%, then the time period **[Pb. PET 2002]**

(a) Decreases by 1% (b) Increases by 2%

(c) Increases by 2% (d) Increases by 1%

21. Two simple pendulum first of bob mass M_A and length L_A second of bob mass M_B and length L_B. $M_A = M_B$ and $L_A = 2L_B$. If these vibrational energy of both is same. Then which is correct

(a) Amplitude of B greater than A

(b) Amplitude of B smaller than A

(c) Amplitudes will be same

(d) None of these

Answers and Solutions

(SET -16)

1. (d) Time period of pendulum doesn't depends upon mass but it depends upon length (distance between point of suspension and centre of mass).

In first three cases length are same so $T = T_1 = T_2$ but in last case centre of mass lowers which in turn increases the length. So in this case time period will be more than the other cases.

2. (d) $T = 2\pi\sqrt{\frac{l}{g}} \Rightarrow \frac{T_e}{T_m} = \sqrt{\frac{g_m}{g_e}} = \sqrt{\frac{g_e/6}{g_e}} = \frac{1}{\sqrt{6}}$

$\Rightarrow T_m = \sqrt{6}T_e$ *i.e.* clock becomes slower.

3. (b) The effective acceleration of a bob in water

$= g' = g\left(1 - \frac{\sigma}{\rho}\right)$ where σ and ρ are the density of water and the bob respectively. Since the period of oscillation of the bob in air and water are given as $T = 2\pi\sqrt{\frac{l}{g}}$ and

$T' = 2\pi\sqrt{\frac{l}{g'}}$

$\therefore \frac{T}{T'} = \sqrt{\frac{g'}{g}} = \sqrt{\frac{g(1-\sigma/\rho)}{g}} = \sqrt{1 - \frac{\sigma}{\rho}} = \sqrt{1 - \frac{1}{\rho}}$

Putting $\frac{T}{T'} = \frac{1}{\sqrt{2}}$. We obtain, $\frac{1}{2} = 1 - \frac{1}{\rho} \Rightarrow \rho = 2$

4. (b) $E = \frac{1}{2}m\omega^2 A^2 \Rightarrow E = \frac{1}{2}m(2\pi f)^2 A^2 \Rightarrow A = \frac{1}{2\pi f}\sqrt{\frac{2E}{m}}$

Putting $E = K + U$ we obtain,

$A = \frac{1}{2\pi\left(\frac{25}{\pi}\right)}\sqrt{\frac{2\times(0.5+0.4)}{0.2}} \Rightarrow A = 0.06\,m$

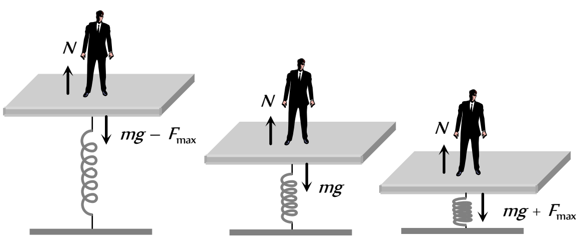
5. (a) The forces that act on the block are qE and mg. Since qE and mg are constant forces, the only variable elastic force changes by kx. Where x is the elongation in the spring $\Rightarrow$ unbalanced (restoring) force $= F = -kx$

$\Rightarrow -m\omega^2 X = -KX \Rightarrow \omega = \sqrt{\frac{k}{M}} = T$.

6. (d) The maximum force acting on the body executing simple harmonic motion is

$m\omega^2 a = m\times(2\pi f)^2 a = 60\times\left(2\pi\times\frac{2}{\pi}\right)^2\times 0.1\ N$

$= 60\times 16\times 0.1 = 96N = \frac{96}{9.8} \approx 10kgf$ and this force is towards mean position.



Upper extreme   Equilibrium position   Lower extreme

The reaction of the force on the platform away from the mean position. It reduces the weight of man on upper extreme *i.e.* net weight = (60 – 10) *kgf.*

This force adds to the weight at lower extreme position *i.e.* net weight becomes = (60 + 10) *kgf.*

Therefore, the reading the weight recorded by spring balance fluctuates between 50 *kgf* and 70 *kgf.*

7. (d) Function of wrist watch depends upon spring action so it is not effected by gravity but pendulum clock has time period, $T = 2\pi\sqrt{\frac{l}{g}}$. During free fall effective acceleration becomes zero, so time period comes out to be infinity i.e. the clock stops.

8. (b) Force constant of a spring is given by $F = kx$

$6.4 = k(0.1)$ or $k = 64\,N/m$

$\because T = 2\pi\sqrt{\frac{m}{k}} \Rightarrow \frac{\pi}{4} = 2\pi\sqrt{\frac{m}{64}}$; $\frac{m}{64} = \left(\frac{1}{8}\right)^2$; $m = 1kg$

9. (b) $K \propto \frac{1}{l} \Rightarrow Kl = K'\times\frac{l}{2} \Rightarrow K' = 2K$

10. (b) The two springs on left side having spring constant of $2k$ each are in series, equivalent constant is $\frac{1}{\left(\frac{1}{2k}+\frac{1}{2k}\right)} = k$. The two springs on right hand side of mass M are in parallel. Their effective spring constant is $(k + 2k) = 3k$.

Equivalent spring constants of value k and $3k$ are in parallel and their net value of spring constant of all the four springs is $k + 3k = 4k$

$\therefore$ Frequency of mass is $n = \frac{1}{2\pi}\sqrt{\frac{4k}{M}}$

11. (d) $|A| = \omega x \Rightarrow \frac{|A|}{x} = \omega^2$

From the given value $\frac{|A|}{x} = \omega^2 = 4 \Rightarrow \omega = 2$.

Also $\omega = \frac{2\pi}{T} \Rightarrow 2 = \frac{2\pi}{T} \Rightarrow T = \pi\ sec$

12. (b) $\frac{5T}{4} = T + \frac{T}{4}$

Bigger pendulum ($5T/4$)   Smaller pendulum (T)

By the time, the bigger pendulum makes one full oscillation, the smaller pendulum will make $\left(1+\frac{1}{4}\right)$ oscillation. The bigger pendulum will be in the mean position and the smaller one will be in the positive extreme position. Thus, phase difference = 90°

13. (d) $y = A\sin\left(\frac{2\pi}{T}\right)\cdot t$

$\Rightarrow \frac{A}{2} = A\sin\left(\frac{2\pi}{4}\right)t \Rightarrow \frac{\pi t}{2} = \frac{\pi}{6} \Rightarrow t = \frac{1}{3}\ sec$

14. (c) $y = 0.2\sin(10\pi t + 1.5\pi)\cos(10\pi t + 1.5\pi)$

$= 0.1\sin 2(10\pi t + 1.5\pi)$ $[\because \sin 2A = 2\sin A\cos A]$

$= 0.1\sin(20\pi t + 3.0\pi)$

$\therefore$ Time period, $T = \frac{2\pi}{\omega} = \frac{2\pi}{20\pi} = \frac{1}{10} = 0.1\ sec$

15. (a) Given $K.E. = P.E. \Rightarrow \frac{1}{2}mv^2 = \frac{1}{2}kx^2$

$\Rightarrow \frac{1}{2}m\omega^2(a^2 - x^2) = \frac{1}{2}m\omega^2 x^2$

$\Rightarrow a^2 - x^2 = x^2 \Rightarrow x^2 = \frac{a^2}{2} \Rightarrow \frac{x}{a} = \frac{1}{\sqrt{2}}.$

16. (b) $n \propto \frac{1}{\sqrt{l}} \Rightarrow \frac{n_2}{n_1} = \sqrt{\frac{1.44}{1}} = \frac{1.2}{1} \Rightarrow n_2 = 1.2 n_1$

For n be integer minimum value of n should be 5 and then n = 6 *i.e.,* after 6 oscillations of smaller pendulum both will be in phase.

***

17. (d) $y_2 = \frac{A}{2}\sin\omega t + \frac{A}{2}\cos\omega t$

$y_2 = \frac{A}{2}(\sin\omega t + \cos\omega t) = \frac{A}{2} \times \sqrt{2}\ [\sin(\omega t + 45^o)]$

$y_2 = \frac{A}{\sqrt{2}}\sin(\omega t + 45^o) \Rightarrow \frac{A_1}{A_2} = \frac{A}{A/\sqrt{2}} = \sqrt{2}$

18. (d) $\omega = \frac{2\pi}{T} = \frac{2\pi}{12} = \frac{\pi}{6}\frac{rad}{sec}$ (For y = 2 *cm*) $2 = 4\left(\sin\frac{\pi}{6}t_1\right)$

By solving $t_1 = 1\ sec$ (For y = 4 *cm*) $t_2 = 3\ sec$

So time taken by particle in going from 2 *cm* to extreme position is

$t_2 - t_1 = 2\ sec$. Hence required ratio will be $\frac{1}{2}$.

19. (a) On a planet, if a body dropped initial velocity (u = 0) from a height h and takes time t to reach the ground then

$h = \frac{1}{2}g_P t^2 \Rightarrow g_P = \frac{2h}{t^2} = \frac{2\times 8}{4} = 4\ m/s^2$

Using $T = 2\pi\sqrt{\frac{l}{g}} \Rightarrow T = 2\pi\sqrt{\frac{1}{4}} = \pi = 3.14\ sec.$

20. (d) $T = 2\pi\sqrt{\frac{l}{g}} \Rightarrow T \propto \frac{l}{\sqrt{g}}$

$\Rightarrow \frac{\Delta T}{T}\times 100 = -\frac{1}{2}\left(\frac{\Delta g}{g}\right)\times 100 = -\frac{1}{2}(-2\%) = 1\%.$

21. (b) $n = \frac{1}{2\pi}\sqrt{\frac{g}{l}} \Rightarrow n \propto \frac{1}{\sqrt{l}} \Rightarrow \frac{n_1}{n_2} = \sqrt{\frac{l_2}{l_1}} = \sqrt{\frac{L_2}{2L_2}}$

$\Rightarrow \frac{n_1}{n_2} = \frac{1}{\sqrt{2}} \Rightarrow n_2 = \sqrt{2}\,n_1 \Rightarrow n_2 > n_1$

Energy $E = \frac{1}{2}m\omega^2 a^2 = 2\pi^2 mn^2 a^2$

$\Rightarrow \frac{a_1^2}{a_2^2} = \frac{m_2 n_2^2}{m_1 n_1^2}$ ($\because$ E is same)

Given $n_2 > n_1$ and $m_1 = m_2 \Rightarrow a_1 > a_2$

Chapter 17

Waves and Sound

Waves

Ripple on a pond

Musical sound

Seismic waves

(Earth quake)

Tsunami

on.

stem is disturbed from equilibrium and wh r propagate from one region of the system to another. Wave can carry energy and momentum. The energy in light waves from the sun warms the surface of our planet; the energy in seismic waves can crack our planet's crust.

Characteristics of Wave Motion

(1) When a wave motion passes through a medium, particles of the medium only vibrate simple harmonically about their mean position. They do leave their position and move with the disturbance.

(2) In wave motion, the phase of particles of medium keeps on changing.

(3) The velocity of the particle during their vibration is different at different position.

(4) The velocity of wave motion through a particular medium is constant. It depends only on the nature of medium not on the frequency, wavelength or intensity.

(5) Energy is propagated along with the wave motion without any net transport of the medium.

(6) For the propagation of wave, a medium should have following characteristics.

(i) Elasticity : So that particles can return to their mean position, after having been.

(ii) Inertia : So that particles can store energy and overshoot their mean position.

(iii) Minimum friction amongst the particles of the medium.

(iv) Uniform density of the medium.

Types of Waves

Waves can be classified in a number of ways based on the following characteristics

(1) **On the basis necessity of medium**

(i) **Mechanical waves :** Require medium for their propagation *e.g.* Waves on string and spring, waves on water surface, sound waves, seismic waves.

(ii) **Non-mechanical waves :** Do not require medium for their propagation are called *e.g,* Light, heat (Infrared), radio waves, γ- rays, X-rays *etc.*

(2) **On the basis of vibration of particle :** On the basis of vibration of particle of medium waves can be classified as transverse waves and longitudinal waves.

Table 17.1 : Transverse and longitudinal waves

Transverse waves	Longitudinal waves
Particles of the medium vibrates in a direction perpendicular to the direction of propagation of wave.  Transverse wave on a string	Particles of a medium vibrate in the direction of wave motion.  Longitudinal wave in a fluid
It travels in the form of crests (C) and troughs (T). 	It travels in the form of compression (C) and rarefaction (R). Transverse waves can be transmitted through solids, they can be setup on the surface of liquids. But they can not be transmitted into liquids and gases.  Transverse wave in a rod	These waves can be transmitted through solids, liquids and gases because for these waves propagation, volume elasticity is necessary.  Longitudinal wave in a rod
Medium should posses the property of rigidity	Medium should posses the property of elasticity
Transverse waves can be polarised.	Longitudinal waves can not be polarised.
Movement of string of a sitar or violin, movement of the membrane of a Tabla or Dholak, movement of kink on a rope, waves set-up on the surface of water.	Sound waves travel through air, Vibration of air column in organ pipes Vibration of air column above the surface of water in the tube of resonance apparatus

(3) **On the basis of energy propagation**

(i) **Progressive wave :** These waves advances in a medium with definite velocity. These waves propagate energy in the medium *e.g.* Sound wave and light waves.

(ii) **Stationary wave :** These waves remains stationary between two boundaries in medium. Energy is not propagated by these waves but it is confined in segments (or loops) *e.g.*. Wave in a string, waves in organ pipes.

(4) **On the basis of dimension**

(i) **One dimensional wave :** Energy is transferred in a single direction only *e.g.* Wave propagating in a stretched string.

(ii) **Two dimensional wave :** Energy is transferred in a plane in two mutually perpendicular directions *e.g.* Wave propagating on the surface of water.

(iii) **Three dimensional wave :** Energy in transferred in space in all direction *e.g.* Light and sound waves propagating in space.

(5) **Some other waves**

(i) **Matter waves :** The waves associated with the moving particles are called matter waves.

(ii) **Audible or sound waves :** Range 20 *Hz* to 20 *KHz.* These are generated by vibrating bodies such as vocal cords, stretched strings or membrane.

(iii) **Infrasonic waves :** Frequency lie below 20 *Hz* and wavelengths are greater than 16.6 *cm. Example* : waves produced during earth quake, ocean waves *etc.*

(iv) **Ultrasonic waves :** Frequency greater than 20 *KHz.* Human ear cannot detect these waves, certain creatures such as mosquito, dog and bat show response to these. As velocity of sound in air is 332 *m/sec* so the wavelength λ < 1.66 *cm.*

These waves are used for navigation under water (SONAR).

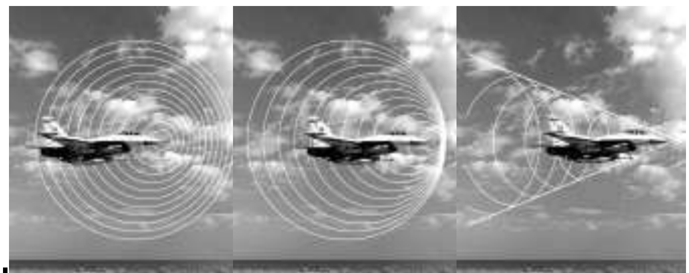
They are used in ultrasonography (in photography or scanning soft tissue of body).

Their used to repel mosquitoes or attract fishes

(v) **Shock waves :** When an object moves with a velocity greater than that of sound, it is termed as **Supersonic**. When such a supersonic body or plane travels in air, it produces energetic disturbance which moves in backward direction and diverges in the form of a cone. Such disturbance are called the shock waves.

The speed of supersonic is measured in Mach number. One mach number is the speed of sound.

Mach Number $= \dfrac{\text{Velocity of source}}{\text{Velocity of sound}}$.



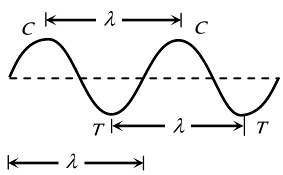
Important Terms Regarding Wave Motion

(1) **Amplitude** (a) **:** Maximum displacement of a vibrating particle of medium from it's mean position is called amplitude.

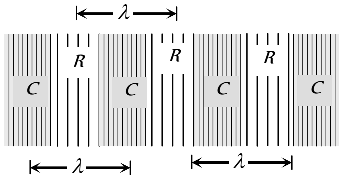
(2) **Wavelength** (λ) **:** It is equal to the distance travelled by the wave during the time in which any one particle of the medium completes one vibration about its mean position.

(i) Or distance travelled by the wave in one time period is known as wavelength.

(ii) Or is the distance between the two successive points with the same phase.



(A) Transverse wave



(B) Longitudinal wave

Fig. 17.1

(3) **Frequency** (n) **:** Frequency of vibration of a particle is defined as the number of vibrations completed by particle in one second.

It is the number of complete wavelengths traversed by the wave in one second.

Units of frequency are hertz (Hz) and per second.

(4) **Time period** (T) **:** Time period of vibration of particle is defined as the time taken by the particle to complete one vibration about its mean position.

It is the time taken by the wave to travel a distance equal to one wavelength

Time period = 1/Frequency $\Rightarrow T = 1/n$

(5) **Wave pulse :** It is a short wave produced in a medium when the disturbance created for a short time.

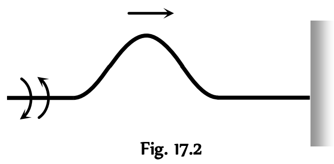


Fig. 17.2

(6) **Wave train :** A series of wave pulse is called wave train.

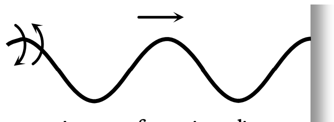

Fig. 17.3

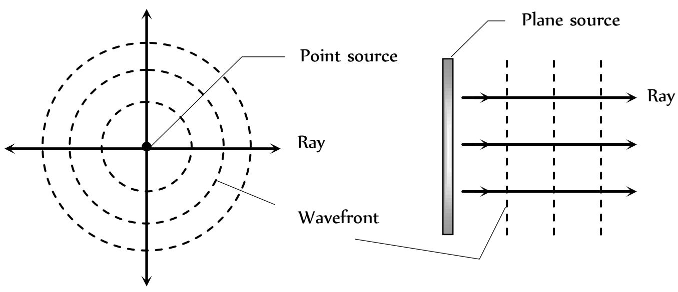
(7) **Wave front :** A wave front is a line or surface on which the disturbance has **the** same phase at all points. If the source is periodic, it produces a succession of wave front, all of the same shape. Ripples on a pond are the example of wave fronts.



(A) Spherical wavefront (B) Plane wavefront

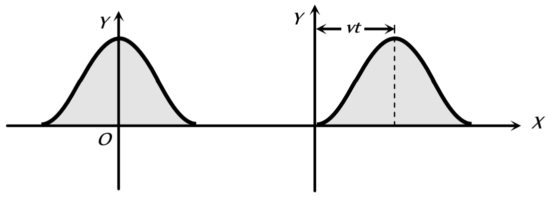
Fig. 17.4

(8) **Wave function ;** It is a mathematical description of the disturbance created by a wave. For a string, the wave function is a displacement for sound waves. It is a pressure or density fluctuation where as for light waves it is electric or magnetic field.

Now let us consider a one dimensional wave travelling along x-axis. During wave motion, a particle with equilibrium position x is displaced some distance y in the direction perpendicular to the x-axis. In this case y is a function of position (x) and time (t).

i.e. $y = f(x, t)$. This is called wave function .

Let the wave pulse is travelling with a speed v, after a time t, the pulse reaches a distance vt along the $+x$-axis as shown. The wave function now can be represented as $y = f(x - vt)$



(A) Pulse at time $t = 0$ (B) Pulse after time t

Fig. 17.5

If the wave pulse is travelling along $-x$-axis then $y = f(x + vt)$

If order of a wave function to represent a wave, the three quantities x, v, t must appear in combinations $(x + vt)$ or $(x - vt)$

Thus $y = (x - vt)$, $\sqrt{(x - vt)}$, $Ae^{-B(x-vt)^2}$ *etc.* represents travelling waves while $y = (x^2 - v^2t^2), (\sqrt{x} - \sqrt{vt})$, $A \sin(4x - 9t)$ *etc.* doesn't represents a wave.

(9) **Harmonic wave :** If a travelling wave is a sin or cos function of $(x \pm vt)$ the wave is said to be harmonic or plane progressive wave.

(10) **The wave equation :** All the travelling waves satisfy a differential equation which is called the wave equation. It is given by $\frac{\partial^2 y}{\partial t^2} = v^2 \frac{\partial^2 y}{\partial x^2}$; where $v = \frac{\omega}{k}$

It is satisfied by any equation of the form $y = f(x \pm vt)$

(11) **Angular wave number or propagation constant (k) :** Number of wavelengths in the distance 2π is called the wave number or propagation constant *i.e.* $k = \frac{2\pi}{\lambda}$.

It is unit is *rad/m.*

(12) **Wave velocity** (v) **:** It is the distance travelled by the disturbance in one time period. It only depends on the properties of the medium and it independent of time and position.

$$v = n\lambda = \frac{\lambda}{T} = \frac{\omega}{2\pi} = \frac{\omega}{k}$$

(13) **Group velocity** (v) **:** The velocity with which the group of waves travels is known as group velocity

or the velocity with which a wave packet travels is known as group velocity $v_g = \frac{d\omega}{dk}$.

(14) **Phase** (ϕ) **:** The quantity which express at any instant, the displacement of the particle and it's direction of motion is called the phase of the particle.

If two particles of the medium, at any instant are at the same distance in the same direction from their equilibrium positions and are moving in the same direction then they are said to be in same phase *e.g.* In the following figure particles 1, 3 and 5 are in same phase and point 6, 7 are also in same phase.

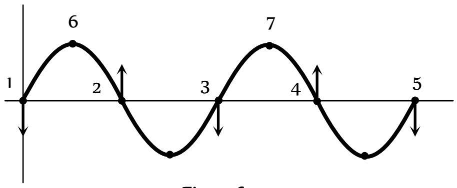


Fig. 17.6

(15) **Intensity of wave :** The wave intensity is defined as the average amount of energy flow in medium per unit time and per unit of it's cross-sectional area. It's unit is W/m^2

Hence intensity (I) $= \dfrac{\text{Energy}}{\text{Area} \times \text{Time}} = \dfrac{\text{Power}}{\text{Area}} = 2\pi n a \rho v$

$\Rightarrow I \propto a^2$ (when v, ρ = constant)

where a = Amplitude, n =Frequency, v = Wave velocity,

ρ = Density of medium.

At a distance r from a point source of power P the intensity is given by $I = \dfrac{P}{4\pi r^2} \Rightarrow I \propto \dfrac{1}{r^2}$

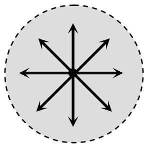

Fig. 17.7

The human ear can hear sound of intensity up to 10^{-12} W/m^2. This is called **threshold of intensity**. The upper limit of intensity of sound which can be tolerated by human ear is 1 W/m^2. This is called **threshold of pain**.

(16) **Energy density :** The energy associated with unit volume of the medium is defined as energy density

Energy density $= \dfrac{\text{Energy}}{\text{Volume}} = \dfrac{\text{Intensity}}{\text{Velocity}} = \dfrac{2\pi^2 n^2 a^2 \rho v}{v} = 2\pi^2 n^2 a^2 \rho$

Velocity of Transverse Wave

The velocity of a transverse wave in a stretched string is given by $v = \sqrt{\dfrac{T}{m}}$; where T = Tension in the string; m = Linear density of string (mass per unit length).

(1) If A is the area of cross-section of the wire then $m = \rho A$

$\Rightarrow v = \sqrt{\dfrac{T}{\rho A}} = \sqrt{\dfrac{S}{\rho}}$; where S = Stress $= \dfrac{T}{A}$

(2) If string is stretched by some weight then

$T = Mg$

$\Rightarrow v = \sqrt{\dfrac{Mg}{m}}$

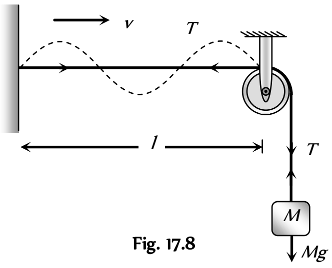

Fig. 17.8

(3) If suspended weight is immersed in a liquid of density σ and ρ = density of material of the suspended load then

$T = Mg\left(1 - \dfrac{\sigma}{\rho}\right)$

$\Rightarrow v = \sqrt{\dfrac{Mg(1 - \sigma/\rho)}{m}}$

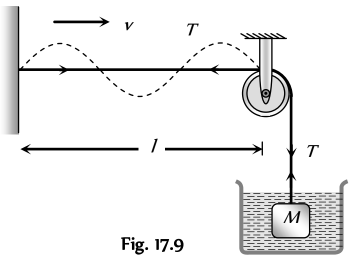

Fig. 17.9

(4) If two rigid supports of stretched string are maintained at temperature difference of $\Delta\theta$ then due to elasticity of string.

$T = YA\,\alpha\,\Delta\theta$

$\Rightarrow v = \sqrt{\dfrac{YA\,\alpha\Delta\theta}{m}}$

$= \sqrt{\dfrac{Y\alpha\Delta\theta}{d}}$

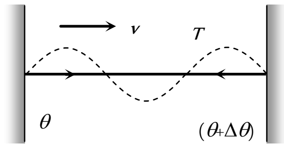

Fig. 17.10

where Y = Young's modulus of elasticity of string, A = Area of cross section of string, α = Temperature coefficient of thermal expansion, d = Density of wire $= \dfrac{m}{A}$

(5) In a solid body : $v = \sqrt{\dfrac{\eta}{\rho}}$

where η = Modulus of rigidity; ρ = Density of the material.

Velocity of Longitudinal Wave (Sound Wave)

(1) **Velocity of sound in any elastic medium :** It is given by $v = \sqrt{\dfrac{E}{\rho}} = \sqrt{\dfrac{\text{Elasticity of the medium}}{\text{Density of the medium}}}$

(i) In solids $v = \sqrt{\dfrac{Y}{\rho}}$; where Y = Young's modulus of elasticity

(ii) In a liquid and gaseous medium $v = \sqrt{\dfrac{B}{\rho}}$; where B = Bulk modulus of elasticity of liquid or gaseous medium.

(iii) As solids are most elastic while gases least *i.e.* $E_S > E_L > E_G$. So the velocity of sound is maximum in solids and minimum in gases, hence $v_{steel} > v_{water} > v_{air}$

5000 m/s > 1500 m/s > 330 m/s

(iv) The velocity of sound in case of extended solid (crust of the earth) $v = \sqrt{\dfrac{B + \frac{4}{3}\eta}{\rho}}$; B = Bulk modulus; η = Modulus of rigidity; ρ = Density

(2) **Newton's formula :** He assumed that when sound propagates through air temperature remains constant. *i.e.* the process is isothermal. For isothermal process

B = Isothermal elasticity (E_θ) = Pressure (P) $\Rightarrow v = \sqrt{\dfrac{B}{\rho}} = \sqrt{\dfrac{P}{\rho}}$

For air at NTP : $P = 1.01 \times 10^5$ N/m^2 and $\rho = 1.29$ kg/m^3.

$\Rightarrow v_{air} = \sqrt{\dfrac{1.01 \times 10^5}{1.29}} \approx 280\, m/s$

However the experimental value of sound in air is 332 m/sec which is greater than that given by Newton's formula.

(3) **Laplace correction :** He modified Newton's formula assuming that propagation of sound in gaseous medium is adiabatic process. For adiabatic process

B = Adiabatic elasticity (E_ϕ) $= \gamma P$

$\Rightarrow v = \sqrt{\frac{B}{\rho}} = \sqrt{\frac{E_\phi}{\rho}} = \sqrt{\frac{\gamma P}{\rho}} = \sqrt{\frac{\gamma RT}{M}}$

For air : $\gamma = 1.41 \Rightarrow v_{air} = \sqrt{1.41} \times 280 \approx 332$ *m/sec*

(4) **Relation between velocity of sound and root mean square velocity :**

If sound travel in a gaseous medium then $v_{sound} = \sqrt{\frac{\gamma RT}{M}}$ and *r.m.s.* velocity of gas $v_{rms} = \sqrt{\frac{3RT}{M}}$

So $\frac{v_{rms}}{v_{sound}} = \sqrt{\frac{3}{\gamma}}$ or $v_{sound} = [\gamma/3]^{1/2} v_{rms}$.

Factors Affecting Velocity of Sound in Gaseous Medium

(1) **Effect of pressure at constant temperature :** Velocity of sound is independent of the pressure of gas, because as pressure increases, density also increases hence $\frac{P}{\rho}$ ratio remains constant. So from $v = \sqrt{\frac{\gamma P}{\rho}}$,

(2) **Effect of temperature :** With rise in temperature velocity of sound increases.

$$v = \sqrt{\frac{\gamma RT}{M}} \Rightarrow v \propto \sqrt{T} \Rightarrow \frac{v_1}{v_2} = \sqrt{\frac{T_1}{T_2}} = \sqrt{\frac{(273 + t_1°C)}{(273 + t_2°C)}}$$

When the temperature change is small then $v_t = v_0 + 0.61\,t$

where v_t = Velocity of sound at $t°C$

v_0 = Velocity of sound at $0°C$ = 332 *m/sec*

t = Small temperature change

If $t = 1°C$ then $v_t = (v_0 + 0.61)$ *m/sec*. Hence for $1°C$ rise, speed of sound in air increases by 0.61 *m/sec*.

(3) **Effect of density :** $v = \sqrt{\frac{\gamma P}{\rho}} \Rightarrow v \propto \frac{1}{\sqrt{\rho}}$

(4) **Effect of humidity :** With increase in humidity, density of air decreases. So with rise in humidity velocity of sound increases.

Sound travels faster in humid air (rainy season) than in dry air (summer) at the same temperature because

$$\rho_{moist\ air} < \rho_{dry\ air} \Rightarrow v_{moist\ air} > v_{dry\ air}$$

(5) **Effect of wind velocity :** Because wind drifts the medium (air) along its direction of motion therefore the velocity of sound in a particular direction is the algebraic sum of the velocity of sound and the component of wind velocity in that direction. Resultant velocity of sound towards observer $v' = v + w\cos\theta$.

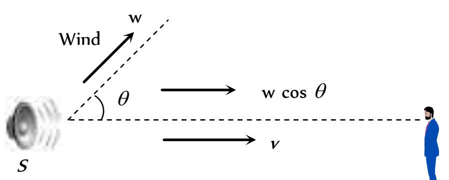

Fig. 17.11

(6) Sound of any frequency or wavelength travels through a given medium with the same velocity.

For a given medium velocity remains constant. All other factors like phase, loudness pitch, quality *etc.* have practically no effect on sound velocity.

Equation of a Plane Progressive Waves

(1) If during the propagation of a progressive wave, the particles of the medium perform SHM about their mean position, then the waves is known as a harmonic progressive wave.

(2) Suppose a plane simple harmonic wave travels from the origin along the positive direction of *x-axis* from left to right as shown in the figure.

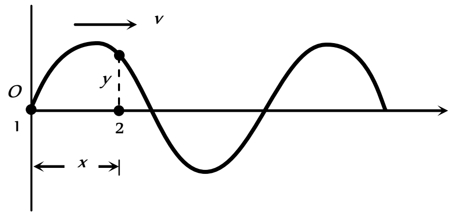

Fig. 17.12

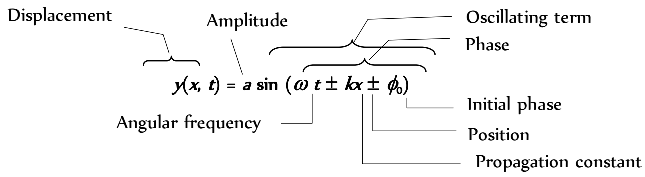
The displacement y of a particle 1 at O from its mean position at any time t is given by $y = a\sin\omega t$.

The wave reaches the particle 2 after time $t = \frac{x}{v}$. Hence displacement y of a particle 2 is given by

$$y = a\sin\omega\left(t - \frac{x}{v}\right) = a\sin(\omega t - kx) \qquad \left(\because k = \frac{\omega}{v}\right)$$

The general equation of a plane progressive wave with initial phase is



(3) Various forms of progressive wave function.

(i) $y = a\sin(\omega t - kx)$

(ii) $y = a\sin\left(\omega t - \frac{2\pi}{\lambda}x\right)$

(iii) $y = a\sin 2\pi\left[\frac{t}{T} - \frac{x}{\lambda}\right]$

(iv) $y = a\sin\frac{2\pi}{T}\left(t - x\frac{T}{\lambda}\right)$

(v) $y = a\sin\frac{2\pi}{\lambda}(vt - x)$

(vi) $y = a\sin\omega\left(t - \frac{x}{v}\right)$

(4) **Particle velocity :** The rate of change of displacement y *w.r.t.* time t is known as particle velocity

Hence from $y = a\sin(\omega t - kx)$

Particle velocity $v_p = \frac{\partial y}{\partial t} = a\omega \cos(\omega t - kx)$

Maximum particle velocity $(v_p)_{max} = a\omega$

Also $\frac{\partial y}{\partial t} = -\frac{\omega}{k} \times \frac{\partial y}{\partial x}$ $\Rightarrow v_p = -v \times$ Slope of wave at that point

(5) **Important relations for numerical solving**

(i) Angular frequency ω = co-efficient of t

(ii) Propagation constant k = co-efficient of x

Wave speed $v = \frac{\text{co-efficient of } t}{\text{co-efficient of } x} = \frac{\omega}{k}$

(iii) Wave length $\lambda = \frac{\text{co-efficient of } x}{2\pi}$

(iv) Time period $T = \frac{2\pi}{\text{co-efficient of } t}$

(v) Frequency $n = \frac{\text{co-efficient of } t}{2\pi}$

(vi) $(v_p)_{max} = a\omega = a(2\pi n) = \frac{a2\pi}{T}$

(vii) If the sign between t and x terms is negative the wave is propagating along positive X-axis and if the sign is positive then the wave moves in negative X-axis direction.

(viii) Co-efficient of sin or cos functions *i.e.* Argument of sin or cos function is represented by phase *i.e.* $(\omega t - kx)$ = Phase.

(ix) **Phase difference and path difference :** At any instant t, if ϕ_1 and ϕ_2 are the phases of two particles whose distances from the origin are x_1 and x_2 respectively then $\phi_1 = (\omega t - kx_1)$ and $\phi_2 = (\omega t - kx_2)$ $\Rightarrow$ $\phi_1 - \phi_2 = k(x_2 - x_1)$

$\Rightarrow$ Phase difference $(\Delta\phi) = \frac{2\pi}{\lambda}$. Path difference (Δx)

(x) **Phase difference and time difference :** If the phases of a particle distance x from the origin is ϕ_1 at time t_1 and ϕ_2 at time t_2, then $\phi_1 = (\omega t_1 - kx)$ and $\phi_1 = (\omega t_2 - kx)$ $\Rightarrow \phi_1 - \phi_2 = \omega(t_1 - t_2)$

$\Rightarrow$ Phase difference $(\Delta\phi) = \frac{2\pi}{T}$. Time difference (Δt)

Pressure Waves

A longitudinal sound wave can be expressed either in terms of the longitudinal displacement of the particles of the medium or in terms of excess pressure produced due to compression or rarefaction. (at compression, the pressure is more than the normal pressure of the medium and at rarefaction the pressure is lesser than the normal). The first type is called the displacement wave and the second type the pressure wave.

If the displacement wave is represented by $y = a\sin(\omega t - kx)$ then the corresponding pressure wave will be represented by $\Delta P = -B\frac{dy}{dx}$ (B = Bulk modulus of elasticity of medium)

$\Rightarrow \Delta P = \Delta P_0 \cos(\omega t - kx)$

where ΔP_0 = pressure amplitude $= akB$

Pressure wave is $\left(\frac{\pi}{2}\right)$ out of phase with displacement wave. *i.e.* pressure is maximum when displacement is minimum and vice-versa.

Reflection and Refraction of Waves

When waves are incident on a boundary between two media, a part of incident waves returns back into the initial medium (reflection) while the remaining is partly absorbed and partly transmitted into the second medium (refraction)

(1) **Rarer and denser medium :** A medium is said to be denser (relative to the other) if the speed of wave in this medium is less than the speed of the wave in other medium.

In comparison to air speed of sound is maximum in water, hence water is rarer medium for sound waves *w.r.t.* air. But it is not true for light (EM-waves). For light waves water is denser medium *w.r.t.* air.

(2) In reflection or refraction frequency remains same

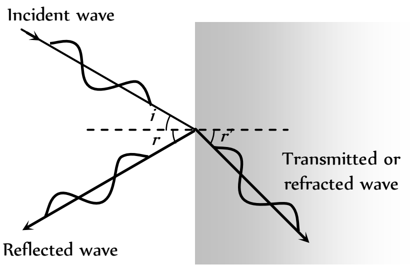


Fig. 17.13

(3) For reflection angle of incidence (i) = Angle of reflection (r)

(4) In case of refraction or transmission $\frac{\sin i}{\sin r'} = \frac{v_i}{v_t}$

(5) **Boundary conditions :** Reflection of a wave pulse from some boundary depends on the nature of the boundary.

(i) **Rigid end :** When the incident wave reaches a fixed end, it exerts an upward pull on the end, according to Newton's law the fixed end exerts an equal and opposite down ward force on the string. It result an inverted pulse or phase change of π.

Crest (C) reflects as trough (T) and vice-versa, Time changes by $\frac{T}{2}$ and Path changes by $\frac{\lambda}{2}$

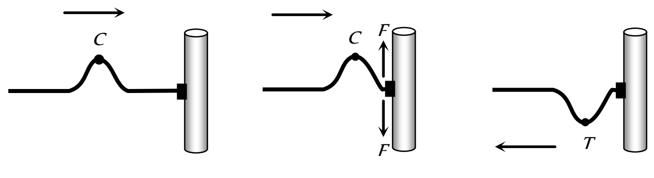

Fig. 17.14

(ii) **Free end :** When a wave or pulse is reflected from a free end, then there is no change of phase (as there is no reaction force).

Crest (C) reflects as crest (C) and trough (T) reflects as trough (T), Time changes by zero and Path changes by zero.

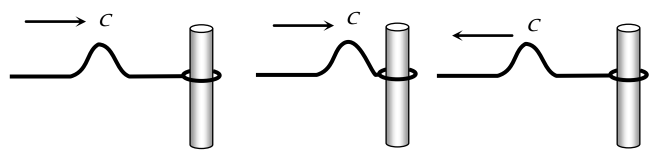

Fig. 17.15

(iii) **Exception :** Longitudinal pressure waves suffer no change in phase from rigid end *i.e.* compression pulse reflects as compression pulse. On the other hand if longitudinal pressure wave reflects from free end, it suffer a phase change of π *i.e.* compression reflects as rarefaction and vice-versa.

(iv) **Effect on different variables :** In case of reflection, because medium is same and hence, speed, frequency (ω) and wavelength λ (or k) do not changes. On the other hand in case of transmitted wave since medium changes and hence speed, wavelength (or k) changes but frequency (ω) remains the same.

(6) **Wave in a combination of string**

(i) **Wave goes from rarer to denser medium**

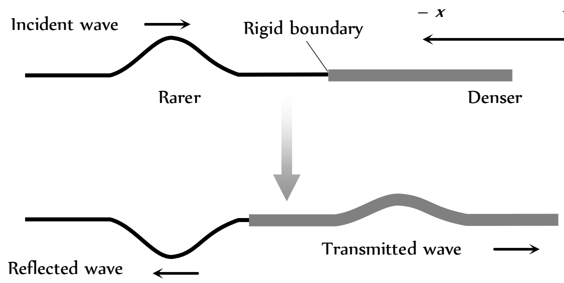

Fig. 17.16

Incident wave $y_i = a_i \sin(\omega t - k_1 x)$

Reflected wave $y_r = a_r \sin[\omega t - k_1(-x) + \pi] = -a \sin(\omega t + k_1 x)$

Transmitted wave $y_t = a_t \sin(\omega t - k_2 x)$

(ii) **Wave goes from denser to rarer medium**

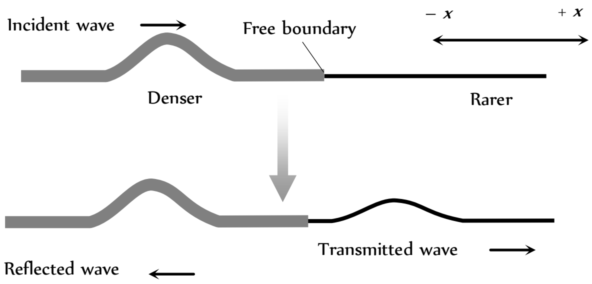

Fig. 17.17

Incident wave $y_i = a_i \sin(\omega t - k_1 x)$

Reflected wave $y_r = a_r \sin[\omega t - k_1(-x) + 0] = a \sin(\omega t + k_1 x)$

Transmitted wave $y_t = a_t \sin(\omega t - k_2 x)$

(iii) **Ratio of amplitudes :** It is given as follows

$$\frac{a_r}{a_i} = \frac{k_1 - k_2}{k_1 + k_2} = \frac{v_2 - v_1}{v_2 + v_1} \text{ and } \frac{a_t}{a_i} = \frac{2k_1}{k_1 + k_2} = \frac{2v_2}{v_1 + v_2}$$

Echo

An echo is simply the repetition of speaker's own voice caused by reflection at a distance surface *e.g.* a cliff. a row of building or any other extended surface.

If there is a sound reflector at a distance d from source, then the time interval between original source and it's echo at the site of source will be

$$t = \frac{d}{v} + \frac{d}{v} = \frac{2d}{v}$$

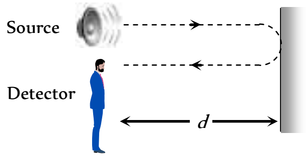

Fig. 17.18

As the persistence of hearing for human ear is 0.1 *sec*, therefore in order that an echo of short sound (*e.g.* clap or gun fire) will be heard if $t > 0.1 \Rightarrow \frac{2d}{v} > 0.1 \Rightarrow d > \frac{v}{20}$

If v = Speed of sound = 340 *m/s* then $d > 17$ *m*.

Principle of Superposition

(1) The displacement at any time due to any number of waves meeting simultaneously at a point in a medium is the vector sum of the individual displacements due each one of the waves at that point at the same time.

(2) If $\vec{y}_1, \vec{y}_2, \vec{y}_3$ .... are the displacements at a particular time at a particular position, due to individual waves, then the resultant displacement.

$$\vec{y} = \vec{y}_1 + \vec{y}_2 + \vec{y}_3 + ...$$

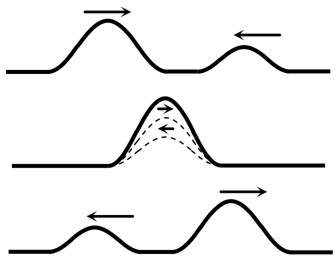

Fig. 17.19

(3) Important applications of superposition principle

(i) **Interference of waves :** Adding waves that differs in phase

(ii) **Formation of stationary waves :** Adding wave that differs in direction.

(iii) **Formation of beats :** Adding waves that differs in frequency.

(iv) **Formation of Lissaju's figure :** Adding two perpendicular simple harmonic motions. (See S.H.M. for more detail)

Interference of Sound Waves

(1) When two waves of same frequency, same wavelength, same velocity (nearly equal amplitude) moves in the same direction, Their superimposition results in the interference.

(2) Due to interference the resultant intensity of sound at that point is different from the sum of intensities due to each wave separately.

(3) Interference is of two type (i) Constructive interference (ii) Destructive interference.

(4) In interference energy is neither created nor destroyed but is redistributed.

(5) For observable interference, the sources (producing interfering waves) must be coherent.

(6) Let at a given point two waves arrives with phase difference ϕ and the equation of these waves is given by

$y_1 = a_1 \sin \omega t$, $y_2 = a_2 \sin(\omega t + \phi)$ then by the principle of superposition $\vec{y} = \vec{y}_1 + \vec{y}_2$

$\Rightarrow y = a_1 \sin \omega t + a_2 \sin(\omega t + \phi) = A \sin(\omega t + \theta)$

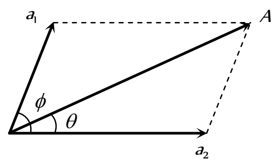

Fig. 17.20

where $A = \sqrt{a_1^2 + a_2^2 + 2a_1 a_2 \cos\phi}$

and $\tan\theta = \dfrac{a_2 \sin\phi}{a_1 + a_2 \cos\phi}$

since Intensity (I) $\propto$ (Amplitude A)^2 $\Rightarrow \dfrac{I_1}{I_2} = \left(\dfrac{a_1}{a_2}\right)^2$

Therefore, the resultant intensity is given by

$$I = I_1 + I_2 + 2\sqrt{I_1 I_2}\cos\phi$$

Table 17.2 : Constructive and destructive interference

Constructive interference	Destructive interference
When the waves meets a point with same phase, constructive interference is obtained at that point (*i.e.* maximum sound).	When the wave meets a point with opposite phase, destructive interference is obtained at that point (*i.e.* minimum sound)
Phase difference between the waves at the point of observation $\phi = 0^o$ or $2n\pi$	Phase difference $\phi = 180^o$ or $(2n-1)\pi$; n = 1, 2, ...
Path difference between the waves at the point of observation $\Delta = n\lambda$ (*i.e.* even multiple of $\lambda/2$)	Path difference $\Delta = (2n-1)\dfrac{\lambda}{2}$ (*i.e.* odd multiple of $\lambda/2$)
Resultant amplitude at the point of observation will be maximum $A_{max} = a_1 + a_2$ If $a_1 = a_2 = a_0 \Rightarrow A_{max} = 2a_0$	Resultant amplitude at the point of observation will be minimum $A_{min} = a_1 - a_2$ If $a_1 = a_2 \Rightarrow A_{min} = 0$
Resultant intensity at the point of observation will be maximum $I_{max} = I_1 + I_2 + 2\sqrt{I_1 I_2}$ $= \left(\sqrt{I_1} + \sqrt{I_2}\right)^2$ If $I_1 = I_2 = I_0 \Rightarrow I_{max} = 4I_0$	Resultant intensity at the point of observation will be minimum $I_{min} = I_1 + I_2 - 2\sqrt{I_1 I_2}$ $= \left(\sqrt{I_1} - \sqrt{I_2}\right)^2$ If $I_1 = I_2 = I_0 \Rightarrow I_{min} = 0$

(7) $\dfrac{I_{max}}{I_{min}} = \left(\dfrac{\sqrt{I_1} + \sqrt{I_2}}{\sqrt{I_1} - \sqrt{I_2}}\right)^2 = \left(\dfrac{\sqrt{\dfrac{I_1}{I_2}} + 1}{\sqrt{\dfrac{I_1}{I_2}} - 1}\right)^2 = \left(\dfrac{a_1 + a_2}{a_1 - a_2}\right)^2 = \left(\dfrac{\dfrac{a_1}{a_2} + 1}{\dfrac{a_1}{a_2} - 1}\right)^2$

Quink's Tube

This is an apparatus used to demonstrate the phenomenon of interference and also used to measure velocity of sound in air. This is made up of two U-tube A and B as shown in figure. Here the tube B can slide in and out from the tube A. There are two openings P and Q in the tube A. At opening P, a tuning fork or a sound source of known frequency n_0 is placed and at the other opening a detector is placed to detect the resultant sound of interference occurred due to superposition of two sound waves coming from the tubes A and B.

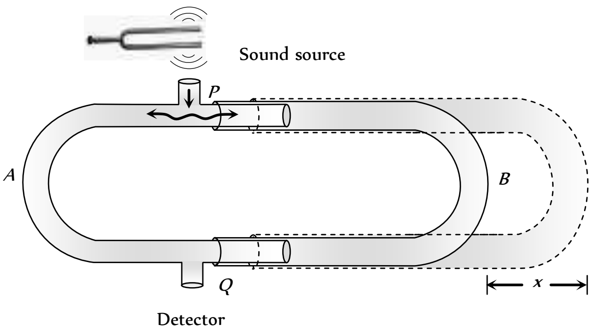

Fig. 17.21

Initially tube B is adjusted so that detector detects a maximum. At this instant if length of paths covered by the two waves from P and Q from the side of A and side of B are l_1 and l_2 respectively then for constructive interference we must have

$$l_2 - l_1 = N\lambda \quad .... \text{(i)}$$

If now tube B is further pulled out by a distance x so that next maximum is obtained and the length of path from the side of B is l'_2 then we have

$$l'_2 = l_2 + 2x \quad .... \text{(ii)}$$

where x is the displacement of the tube. For next constructive interference of sound at point Q, we have

$$l'_2 - l_1 = (N+1)\lambda \quad .... \text{(iii)}$$

From equation (i), (ii) and (iii), we get

$$l'_2 - l_2 = 2 \times x = \lambda \Rightarrow x = \frac{\lambda}{2}$$

Thus by experiment we get the wavelength of sound as for two successive points of constructive interference, the path difference must be λ. As the tube B is pulled out by x, this introduces a path difference $2x$ in the path of sound wave through tube B. If the frequency of the source is known, n_0, the velocity of sound in the air filled in tube can be gives as $v = n_0.\lambda = 2n_0 x$

Standing Waves or Stationary Waves

When two sets of progressive wave trains of same type (both longitudinal or both transverse) having the same amplitude and same time period/frequency/wavelength travelling with same speed along the same straight line in opposite directions superimpose, a new set of waves are formed. These are called stationary waves or standing waves.

In practice, a stationary wave is formed when a wave train is reflected at a boundary. The incident and reflected waves then interfere to produce a stationary wave.

(1) Suppose that the two super imposing waves are incident wave $y_1 = a\sin(\omega t - kx)$ and reflected wave $y_2 = a\sin(\omega t + kx)$

(As y_2 is the displacement due to a reflected wave from a free boundary)

Then by principle of superposition

$$y = y_1 + y_2 = a[\sin(\omega t - kx) + \sin(\omega t + kx)]$$

(By using $\sin C + \sin D = 2\sin\dfrac{C+D}{2}\cos\dfrac{C-D}{2}$)

$$\Rightarrow \quad y = 2a\cos kx \sin\omega t$$

(If reflection takes place from rigid end, then equation of stationary wave will be $y = 2a\sin kx \cos\omega t$)

(2) As this equation satisfies the wave equation

$\frac{\partial^2 y}{\partial t^2} = v^2 \frac{\partial^2 y}{\partial x^2}$. It represents a wave.

(3) As it is not of the form $f(ax \pm bt)$, the wave is not progressive.

(4) Amplitude of the wave $A_{SW} = 2a\cos kx$.

Table 17.3 : Amplitude in two different cases

Reflection at open end	Reflection at closed end
$A_{SW} = 2a\cos kx$	$A_{SW} = 2a\sin kx$
Amplitude is maximum when cos kx = ± 1 $\Rightarrow kx = 0, \pi, 2\pi, ... n\pi.$ $\Rightarrow x = 0, \frac{\lambda}{2}, \lambda .... \frac{n\lambda}{2}$ where $k = \frac{2\pi}{\lambda}$ and $n = 0, 1, 2, 3, ...$	Amplitude is maximum when sin kx = ± 1 $\Rightarrow kx = \frac{\pi}{2}, \frac{3\pi}{2} ..... \frac{(2n-1)\pi}{2}$ $\Rightarrow x = \frac{\lambda}{4}, \frac{3\lambda}{4} ....$ where $k = \frac{2\pi}{\lambda}$ and $n = 1, 2, 3, ...$
Amplitude is minimum when $\cos kx = 0$ $\Rightarrow kx = \frac{\pi}{2}, \frac{3\pi}{2} ..... \frac{(2n-1)\pi}{2}$ $\Rightarrow x = \frac{\lambda}{4}, \frac{3\lambda}{4} ....$	Amplitude is minimum when $\sin kx = 0$ $\Rightarrow kx = \frac{\pi}{2}, \frac{3\pi}{2} ..... \frac{(2n-1)\pi}{2}$ $\Rightarrow x = 0, \frac{\lambda}{2}, \lambda ...... \frac{n\lambda}{2}$

(5) **Nodes** (*N*) **:** The points where amplitude is minimum are called nodes.

(i) Distance between two successive nodes is $\frac{\lambda}{2}$.

(ii) Nodes are at permanents rest.

(iii) At nodes air pressure and density both are high.

(6) **Antinodes** (*A*) **:** The points of maximum amplitudes are called antinodes.

(i) The distance between two successive antinodes is $\frac{\lambda}{2}$

(ii) At nodes air pressure and density both are low.

(iii) The distance between a node (*N*) and adjoining antinode (*A*) is $\frac{\lambda}{4}$.

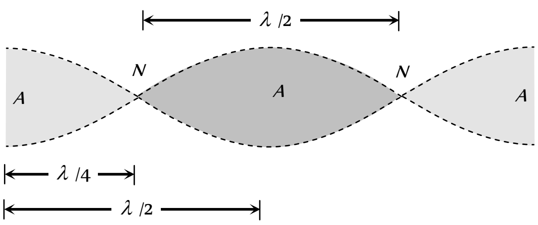

Fig. 17.22

Characteristics of Standing Waves

(1) Standing waves can be transverse or longitudinal.

(2) The disturbance confined to a particular region between the starting point and reflecting point of the wave.

(3) There is no forward motion of the disturbance from one particle to the adjoining particle and so on, beyond this particular region.

(4) The total energy associated with a stationary wave is twice the energy of each of incident and reflected wave. As in stationary waves nodes are permanently at rest. So no energy can be transmitted across then *i.e.* energy of one region (segment) is confined in that region. However this energy oscillates between elastic potential energy and kinetic energy of particles of the medium.

(5) The medium splits up into a number of segments. Each segment is vibrating up and down as a whole.

(6) All the particles in one particular segment vibrate in the same phase. Particles in two consecutive segments differ in phase by 180°.

(7) All the particles except those at nodes, execute simple harmonic motion about their mean position with the same time period.

(8) The amplitude of vibration of particles varies from zero at nodes to maximum at antinodes (2*a*).

(9) All points (except nodes) pass their mean position twice in one time period.

(10) Velocity of particles while crossing mean position varies from maximum $(\omega A_{SW} = \omega .2a)$ at antinodes to zero at nodes.

(11) In standing waves, if amplitude of component waves are not equal. Resultant amplitude at nodes will be minimum (but not zero). Therefore, some energy will pass across nodes and waves will be partially standing.

(12) Application of stationary waves

(i) Vibration in stretched string

(ii) Vibration in organ pipes (closed and open)

(iii) Kundt's tube

Table 17.4 : Progressive v/s stationary wave

Progressive wave	Stationary wave
These waves transfers energy	These wave does not transfers energy
All particles have the same amplitude	Between a node and an antinode all particles have different amplitudes
Over one wavelength span all particles have difference phase	Between a node and an antnodes all particles have same phase.
No point is at rest	Nodes are always at rest
All particles do not cross the mean position simultaneously.	All particles cross the mean position simultaneously.

Terms Related to the Application of Stationary Wave

(1) **Note :** Any musical sound produced by the simple harmonic oscillations of the source is called note.

(2) **Tone :** Every musical sound consists of a number of components of different frequencies every component is known as a Tone.

(3) **Fundamental note and fundamental frequency :** The note of lowest frequency produced by an instrument is called fundamental note. The frequency of this note is called fundamental frequency.

(4) **Harmonics :** The frequency which are the integral multiple of the fundamental frequency are known as harmonics *e.g.* if *n* be the fundamental frequency, then the frequencies *n*, 2*n*, 3*n* .... are termed as first, second, third .... harmonics.

(5) **Overtone :** The harmonics other than the first (fundamental note) which are actually produced by the instrument are called overtones. *e.g.* the tone with frequency immediately higher than the fundamental is defined as first overtone.

(6) **Octave :** The tone whose frequency is doubled the fundamental frequency is defined as Octave.

(i) If $n_2 = 2n_1$ it means n_2 is an octave higher than n_1 or n_1 is an octave lower than n_2.

(ii) If $n_2 = 2^3 n_1$, it means n_2 is 3-octave higher or n_1 is 3-octave lower.

(iii) Similarly if $n_2 = 2^n n_1$ it means n_2 is n-octave higher n_1 is n octave lower.

(7) **Unison :** If the interval is one *i.e.* two frequencies are equal then vibrating bodies are said to be in unison.

(8) **Resonance :** The phenomenon of making a body vibrate with its natural frequency under the influence of another vibrating body with the same frequency is called resonance.

Standing Waves on a String

(1) Consider a string of length l, stretched under tension T between two fixed points.

(2) If the string is plucked and then released, a transverse harmonic wave propagate along it's length and is reflected at the end.

(3) The incident and reflected waves will superimpose to produce transverse stationary waves in a string.

(4) Nodes (N) are formed at rigid end and antinodes (A) are formed in between them.

(5) Number of antinodes = Number of nodes – 1

(6) Velocity of wave (incident or reflected wave) is given by $v = \sqrt{\frac{T}{m}}$; m = Mass per unit length of the wire

(7) Frequency of vibration (n) = Frequency of wave

$$= \frac{v}{\lambda} = \frac{1}{\lambda}\sqrt{\frac{T}{m}}$$

(8) For obtaining p loops (p-segments) in string, it has to be plucked at a distance $\frac{l}{2p}$ from one fixed end.

(9) **Fundamental mode of vibration**

(i) Number of loops $p = 1$

(ii) Plucking at $\frac{l}{2}$

(from one fixed end)

(iii) $l = \frac{\lambda_1}{2} \Rightarrow \lambda_1 = 2l$

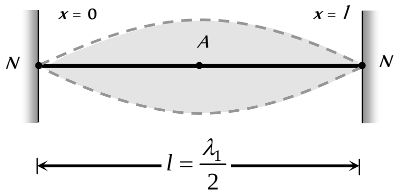

Fig. 17.23

(iv) Fundamental frequency or first harmonic

$$n_1 = \frac{1}{\lambda_1}\sqrt{\frac{T}{m}} = \frac{1}{2l}\sqrt{\frac{T}{m}}$$

(10) **Second mode of vibration** (First over tone or second harmonic)

(i) Number of loops $p = 2$

(ii) Plucking at $\frac{l}{2 \times 2} = \frac{l}{4}$

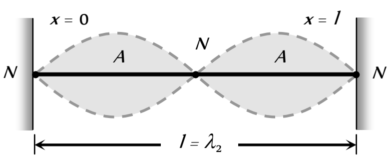

Fig. 17.24

(from one fixed end)

(iii) $l = \lambda_2$

(iv) Second harmonic or first over tone

$$n_2 = \frac{1}{\lambda_2}\sqrt{\frac{T}{m}} = \frac{1}{l}\sqrt{\frac{T}{m}} = 2n_1$$

(11) **Third normal mode of vibration** (Second over tone or third harmonic)

(i) Number of loops $p = 3$

(ii) Plucking at $\frac{l}{2 \times 3} = \frac{l}{6}$

(from one fixed end)

(iii) $l = \frac{3\lambda_3}{2} \Rightarrow \lambda_3 = \frac{2l}{3}$

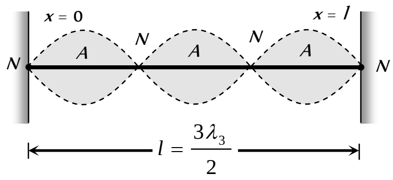

Fig. 17.25

(iv) Third harmonic or second over tone

$$n_3 = \frac{1}{\lambda_3}\sqrt{\frac{T}{m}} = \frac{3}{2l}\sqrt{\frac{T}{m}} = 3n_1$$

(12) **More about string vibration**

(i) In general, if the string is plucked at length $\frac{l}{2p}$, then it vibrates in p segments (loops) and we have the p harmonic is give $f_p = \frac{p}{2l}\sqrt{\frac{T}{m}}$

(ii) All even and odd harmonics are present. Ratio of harmonic = 1 : 2 : 3 .....

(iii) Ratio of over tones = 2 : 3 : 4 ....

(iv) General formula for wavelength $\lambda = \frac{2l}{N}$; where N = 1,2,3, ... correspond to 1st, 2nd, 3rd modes of vibration of the string.

(v) General formula for frequency $n = N \times \frac{v}{2l}$

(vi) **Position of nodes :** $x = 0, \frac{l}{N}, \frac{2l}{N}, \frac{3l}{N} ..... l$

(vii) **Position of antinodes :** $x = \frac{l}{2N}, \frac{3l}{2N}, \frac{5l}{2N} .... \frac{(2N-1)l}{2N}$

Melde's Experiment

(1) It is an experimental representation of transverse stationary wave.

(2) In Melde's experiment, one end of a flexible piece of string is tied to the end of a tuning fork. The other end passes over a smooth pulley carries a suitable load.

(3) If p is the number of loop's formed in stretched string and T is the tension in the string then Melde's law is $p\sqrt{T}$ = constant

$$\Rightarrow \frac{p_1}{p_2} = \sqrt{\frac{T_2}{T_1}}$$ (For comparing two cases)

Table 17.5 ; Two arrangements of connecting a string to turning fork

Transversely	Example
	Prongs of tuning fork vibrates at right angles to the thread.	Prongs vibrated along the length of the thread.
Frequency of vibration of turning fork : frequency of vibration of the thread.	Frequency of turning fork =2 × (Frequency of vibration of thread)
If number of loops in string is P then $l = \frac{p\lambda}{2} \Rightarrow \lambda = \frac{2l}{p}$	It number of loop so in string is p then $l = \frac{p\lambda}{2} \Rightarrow \lambda = \frac{2l}{p}$
$\Rightarrow$ Frequency of string $= \frac{v}{\lambda} = \frac{p}{2l}\sqrt{\frac{T}{m}}$ $\left(\because v = \sqrt{\frac{T}{m}}\right)$	$\Rightarrow$ Frequency of string $= \frac{v}{\lambda} = \frac{p}{2l}\sqrt{\frac{T}{m}}$
$\Rightarrow$ Frequency of tuning fork $= \frac{p}{2l}\sqrt{\frac{T}{m}}$	$\Rightarrow$ Frequency of turning fork $I = \frac{P}{l}\sqrt{\frac{T}{m}}$
$\Rightarrow$ If $l, m, n \rightarrow$ constant then $p\sqrt{T}$ = constant	$\Rightarrow$ If $l, m, n \rightarrow$ constant then $p\sqrt{T}$ = constant

Sonometer

(1) It is an apparatus, used to produce resonance (matching frequency) of tuning fork (or any source of sound) with stretched vibrating string.

(2) It consists of a hollow rectangular box of light wood. The experimental fitted on the box as shown.

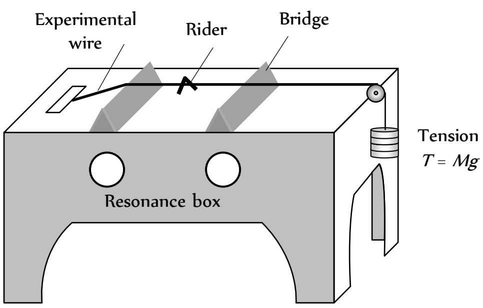

Fig. 17.26

(3) The box serves the purpose of increasing the loudness of the sound produced by the vibrating wire.

(4) If the length of the wire between the two bridges is l, then the frequency of vibration is $n = \frac{1}{2l}\sqrt{\frac{T}{m}} = \sqrt{\frac{T}{\pi r^2 d}}$

(r = Radius of the wire, d = Density of material of wire) m = mass per unit length of the wire)

(5) **Resonance :** When a vibrating tuning fork is placed on the box, and if the length between the bridges is properly adjusted then if $(n)_{Fork} = (n)_{String} \rightarrow$ rider is thrown off the wire.

(6) **Laws of string**

(i) **Law of length :** If T and m are constant then $n \propto \frac{1}{l}$

$\Rightarrow nl$ = constant $\Rightarrow n_1 l_1 = n_2 l_2$

(ii) **Law of mass :** If T and l are constant then $n \propto \frac{1}{\sqrt{m}}$

$\Rightarrow n\sqrt{m}$ = constant $\Rightarrow \frac{n_1}{n_2} = \sqrt{\frac{m_2}{m_1}}$

(iii) **Law of density :** If T, l and r are constant then $n \propto \frac{1}{\sqrt{d}}$

$\Rightarrow n\sqrt{d}$ = constant $\Rightarrow \frac{n_1}{n_2} = \sqrt{\frac{d_2}{d_1}}$

(iv) **Law of tension :** If l and m are constant then $n \propto \sqrt{T}$

$\Rightarrow \frac{n}{\sqrt{T}}$ = constant $\Rightarrow \frac{n_1}{n_2} = \sqrt{\frac{T_2}{T_1}}$

Vibration of Composite Strings

Suppose two strings of different material and lengths are joined end to end and tied between clamps as shown. Now after plucking, stationary waves are established only at those frequencies which matches with any one harmonic of both the independent string S_1 and S_2

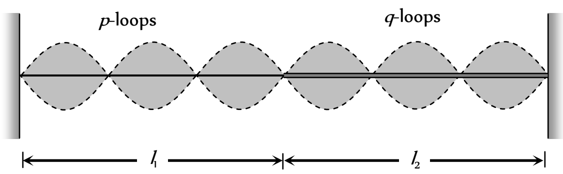

Fig. 17.27

As the frequency of the wave in both strings must be same so

$$\frac{p}{2l_1}\sqrt{\frac{T}{m_1}} = \frac{q}{2l_2}\sqrt{\frac{T}{m_2}} \Rightarrow \frac{p}{q} = \frac{l_1}{l_2}\sqrt{\frac{m_1}{m_2}} = \frac{l_1}{l_2}\sqrt{\frac{\rho_1}{\rho_2}}$$

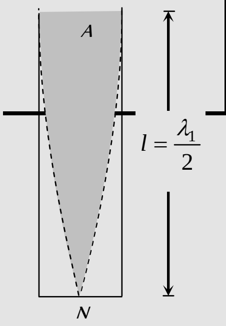
Standing Wave in a Organ Pipe

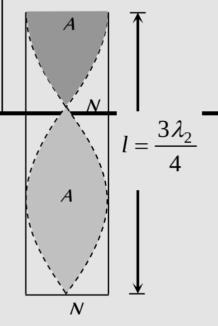
Organ pipes are the musical instrument which are used for producing musical sound by blowing air into the pipe. Longitudinal stationary waves are formed on account of superimposition of incident and reflected longitudinal waves.

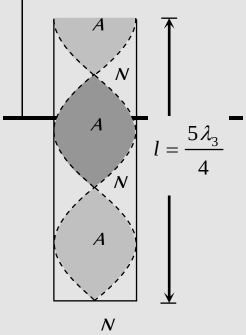
Equation of standing wave y = $2a \cos\frac{2\pi vt}{\lambda}\sin\frac{2\pi x}{\lambda}$

Frequency of vibration $n = \frac{v}{\lambda}$

Table 17.6 : Different mode of vibration in organ pipe

Closed organ pipe		
Fundamental mode	Third harmonic First over tone	Fifth harmonic Second over tone
		






$n_1 = \frac{v}{4l}$	$n_2 = \frac{v}{\lambda_2} = \frac{3v}{4l} = 3n_1$	$n_3 = \frac{5v}{4l} = 5n_1$
Open organ pipe		
Fundamental mode	**Second harmonic**	**Third harmonic**
 $l = \frac{\lambda_1}{2}$	 $l = \lambda_2$	 $l = \frac{3\lambda_3}{2}$
$n_1 = \frac{v}{\lambda_1} = \frac{v}{2l}$	$n_2 = \frac{v}{\lambda_2} = \frac{v}{L} = 2n_1$	$n_3 = \frac{v}{\lambda_3} = \frac{3v}{2l} = 3n_1$

(1) **Closed organ pipe**

(i) In closed organ pipe only odd harmonic are present. Ratio of harmonic is $n_1 : n_2 : n_3$ ....= 1 : 3 : 5 ....

(ii) p^{th} overtone = $(2p + 1)^{th}$ harmonics

(iii) Ratio of overtones = 3 : 5 : 7 ....

(iv) The maximum possible wavelength is $4l$

(v) General formula for wavelength is $\lambda = \frac{4l}{(2N-1)}$; where N = 1, 2, 3, ... corresponds to order of mode of vibration.

(vi) General formula for frequency $n = \frac{(2N-1)v}{4l}$

(vii) Position of nodes from closed end $x = 0, \frac{\lambda}{2}, \lambda, \frac{3\lambda}{2}$.....

(viii) Position of antinodes from closed end $x = \frac{\lambda}{4}, \frac{3\lambda}{4}, \frac{5\lambda}{4}$...

(2) **Open organ pipe**

(i) In open organ pipe all (even and odd) harmonic are present. Ratio of harmonic is $n_1 : n_2 : n_3$ ....= 1 : 2 : 3 ....

(ii) p^{th} overtone = $(p + 1)^{th}$ harmonics

(iii) Ratio of overtones = 2 : 3 : 5 ....

(iv) The maximum possible wavelength is $2l$

(v) General formula for wavelength is $\lambda = \frac{2l}{N}$; where N = 1, 2, 3, ... corresponds to order of mode of vibration.

(vi) General formula for frequency $n = \frac{Nv}{2l}$

(vii) Position of nodes from one end $x = \frac{\lambda}{4}, \frac{3\lambda}{4}, \frac{5\lambda}{4}$.....

(viii) Position of antinodes from one end $x = 0, \frac{\lambda}{2}, \lambda, \frac{3\lambda}{2}$.....

Tuning Fork

(1) The tuning fork is a metallic device that produces sound of a single frequency.

(2) A tuning fork is really a transversely vibrating rod of rectangular cross-section bent into the shape of U as shown.

(3) The prongs execute transverse vibrations and the stem executes the longitudinal vibration. Both vibrate with the same frequency.

(4) The phase difference between the vibrations produced by both prongs of tuning fork is zero.

Fig. 17.28

(5) Tuning forks are generally taken as the standards of frequency of pure notes.

The frequency of the tuning fork is given by $n \propto \frac{t}{l^2}.\sqrt{\frac{Y}{\rho}}$

where t = Thickness of the prongs, l = Length of the prongs, Y = Young's modulus of elasticity and ρ = Density of the material of tuning fork.

(6) If one prong is broken tuning fork does not vibrate.

Effect on frequency of tuning fork

(i) A fork of shorter prongs gives high frequency tone

(ii) The frequency of a tuning fork decreases when it's prongs are loaded (say with wax) near the end.

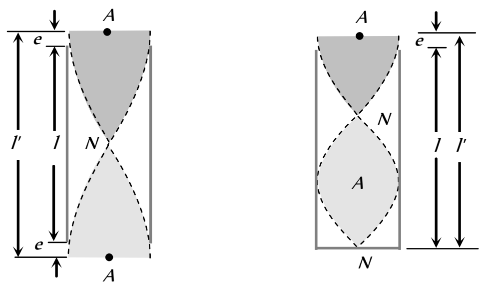
(iii) The frequency of tuning fork increases when prongs are filed near the ends.

(iv) The frequency of a tuning fork decreases if temperature of the fork is increases.

End Correction

Due to finite momentum of air molecules in organ pipe reflection takes place not exactly at open end but some what above it. Hence antinode is not formed exactly at the open end rater it is formed at a little distance away from open end outside it.

The distance of antinode from the open end is known as end correction (e). It is given by e = 0.6 r where r = radius of pipe.



(A) Open pipe (B) Closed pipe

Fig. 17.29

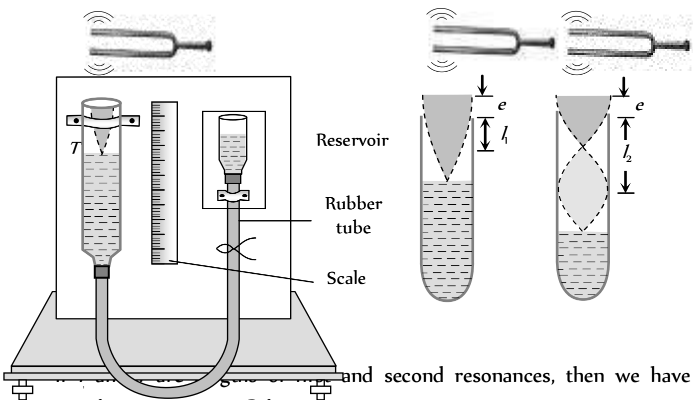
Effect length in open organ pipe $l' = (l + 2e)$

Effect length in closed organ pipe l = (l + e)

Resonance Tube

It is used to determine velocity of sound in air by the help of a tuning fork of known frequency.

It is a closed organ pipe having an air column of variable length. When a tuning fork is brought over it's mouth. It's air column vibrates with the frequency of the fork. If the length of the air column is varied until it's natural frequency equals the frequency of the fork, then the column resonants and emits a loud note.



...and second resonances, then we have

$l_1 + e = \frac{\lambda}{4}$ and $l_2 + e = \frac{3\lambda}{4}$

Fig. 17.30

$$\Rightarrow l_2 - l_1 = \frac{\lambda}{2} \Rightarrow \lambda = 2(l_2 - l_1)$$

Speed of sound in air at room (temperature) $v = n\lambda = 2n(l_2 - l_1)$

Also $\frac{l_2 + e}{l_1 + e} = 3 \Rightarrow l_2 = 3l_1 + 2e$ *i.e.* second resonance is obtained at length more than thrice the length of first resonance.

Kundt's Tube

The apparatus consists of a long glass tube about 5 *cm* in diameter, fixed horizontally. A metal rod *R* clamped firmly at the centre is mounted so that its one end carrying a light disc P_1 (of cork or card board) projects some distance into the glass tube. The other end of the glass tube is closed with a moveable piston P_2. Any desired length of the air or gas can be enclosed in between the two discs P_1 and P_2. A small amount of dry lycopodium powder or cork dust is spread along base of the entire length of the tube.

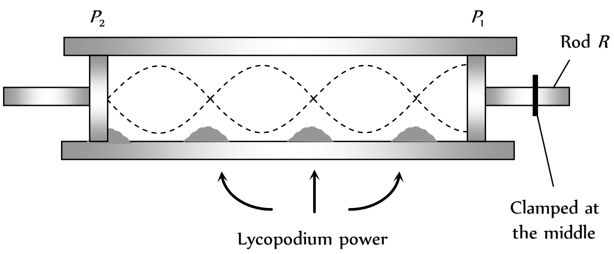


Fig. 17.31

The free end of the metal rod *R* is rubbed (stroked) along the length with resined cloth. The rod begins to vibrate longitudinally and emits a very high pitched shrill note. These vibrations are impressed upon the air column in the tube through disc P_1. Let disc P_2 is so adjusted, that the stationary waves are formed in the air (gas) column in the tube. At antinodes powder is set into oscillations vigorously while it remains uneffected at nodes. Heaps of power are formed at nodes.

Let n is the frequency of vibration of the rod then, this is also the frequency of sound wave in the air column in the tube.

For rod : $\frac{\lambda_{rod}}{2} = l_{rod}$, For air : $\frac{\lambda_{air}}{2} = l_{air}$

where l is the distance between two heaps of power in the tube (*i.e.* distance between two nodes). If v_{air} and v_{rod} are velocity of sound waves in the air and rod respectively, then

$$n = \frac{v_{air}}{\lambda_{air}} = \frac{v_{rod}}{\lambda_{rod}} . \text{ Therefore } \frac{v_{air}}{v_{rod}} = \frac{\lambda_{air}}{\lambda_{rod}} = \frac{\lambda_{air}}{\lambda_{rod}}$$

Thus knowledge of v_{rod}, determiens v_{air}

Kundt's tube may be used for

(i) Comparison of velocities of sound in different gases.

(ii) Comparison of velocities of sound in different solids

(iii) Comparison of velocities of sound in a solid and in a gas.

(iv) Comparison of density of two gases.

(v) Determination of γ of a gas.

(vi) Determination of velocity of sound in a liquid.

Beats

When two sound waves of slightly different frequencies, travelling in a medium along the same direction, superimpose on each other, the intensity of the resultant sound at a particular position rises and falls regularly with time. This phenomenon of regular variation in intensity of sound with time at a particular position is called beats.

(1) **Persistence of hearing :** The impression of sound heard by our ears persist in our mind for $1/10^{th}$ of a second. If another sound is heard before 1/10 second is over, the impression of the two sound mix up and our mind cannot distinguish between the two.

So for the formation of distinct beats, frequencies of two sources of sound should be nearly equal (difference of frequencies less than 10)

(2) **Equation of beats :** If two waves of equal amplitudes '*a*' and slightly different frequencies n_1 and n_2 travelling in a medium in the same direction are.

$y_1 = a \sin \omega_1 t = a \sin 2\pi n_1 t$; $y_2 = a \sin \omega_2 t = a \sin 2\pi n_2 t$

By the principle of super position : $\vec{y} = \vec{y_1} + \vec{y_2}$

$y = A \sin \pi(n_1 + n_2)t$ where $A = 2a \cos \pi (n_1 - n_2)t$ = Amplitude of resultant wave.

(3) **One beat :** If the intensity of sound is maximum at time $t = 0$, one beat is said to be formed when intensity becomes maximum again after becoming minimum once in between.

(4) **Beat period :** The time interval between two successive beats (*i.e.* two successive maxima of sound) is called beat period.

$$n = n_1 \sim n_2$$

(5) **Beat frequency :** The number of beats produced per second is called beat frequency.

$$T = \frac{1}{\text{Beat frequency}} = \frac{1}{n_1 \sim n_2}$$

Determination of Unknown Frequency

Suppose a tuning fork of known frequency (n) is sounded together with another tuning fork of unknown frequency (n) and x beats heard per second.

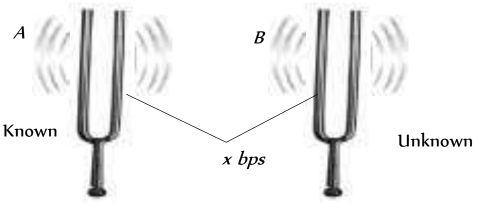

Fig. 17.32

There are two possibilities for known frequency of unknown tuning fork.

$$n_A - n_B = x \quad \text{... (i)}$$

or $$n_B - n_A = x \quad \text{... (ii)}$$

To find the frequency of unknown tuning fork (n) following steps are taken.

(1) Loading or filing of one prong of known or unknown (by wax) tuning fork, so frequency changes (decreases after loading, increases after filing).

(2) Sound them together again, and count the number of heard beats per sec again, let it be x'. These are following four condition arises.

(i) $x' > x$ (ii) $x' < x$ (iii) $x' = 0$ (iv) $x' = x$

(3) With the above information, the exact frequency of the unknown tuning fork can be determined as illustrated below.

Suppose two tuning forks A (frequency n_A is known) and B (frequency n_B is unknown) are sounded together and gives x *beats/sec*. If one prong of unknown tuning fork B is loaded with a little wax (so n_B decreases) and it is sounded again together with known tuning fork A, then in the following four given condition n_B can be determined.

(4) If $x' > x$ than x, then this would happen only when the new frequency of B is more away from n_A. This would happen if originally (before loading), n_B was less than n_A.

Thus initially $n_B = n_A - x$.

(5) If $x' < x$ than x, then this would happen only when the new frequency of B is more nearer to n_A. This would happen if originally (before loading), n_B was more than n_A.

Thus initially $n_B = n_A + x$.

(6) If $x' = x$ then this would means that the new frequency (after loading) differs from n_A by the same amount as was the old frequency (before loading). This means initially $n_B = n_A + x$

(and now it has decreased to $n'_B = n_A - x$)

(7) If $x' = 0$, then this would happen only when the new frequency of B becomes equal to n_A. This would happen if originally n_B was more than n_A.

Thus initially $n_B = n_A + x$.

Table 17.7 ; Frequency of unknown tuning fork for various cases

By loading	
If B is loaded with wax so its frequency decreases	If A is loaded with wax its frequency decreases
If x increases $n_B = n_A - x$	If x increases $n_B = n_A + x$
If x decrease $n_B = n_A + x$	If x decrease $n_B = n_A - x$
If remains same $n_B = n_A + x$	If remains same $n_B = n_A - x$
If x becomes zero $n_B = n_A + x$	If x becomes zero $n_B = n_A - x$
By filing	
If B is filed, its frequency increases	**If A is filed, its frequency increases**
If x increases $n_B = n_A + x$	If x increases $n_B = n_A - x$
If x decrease $n_B = n_A - x$	If x decrease $n_B = n_A + x$
If remains same $n_B = n_A - x$	If remains same $n_B = n_A + x$
If x becomes zero $n_B = n_A - x$	If x becomes zero $n_B = n_A + x$

Doppler's Effect

Whenever there is a relative motion between a source of sound and the observer (listener), the frequency of sound heard by the observer is different from the actual frequency of sound emitted by the source.

The frequency observed by the observer is called the apparent frequency. It may be less than or greater than the actual frequency emitted by the sound source. The difference depends on the relative motion between the source and observer.

(1) **When observer and source are stationary**

(i) Sound waves propagate in the form of spherical wavefronts (shown as circles)

(ii) The distance between two successive circles is equal to wavelength λ.

(iii) Number of waves crossing the observer = Number of waves emitted by the source

(iv) Thus apparent frequency (n') = actual frequency (n).

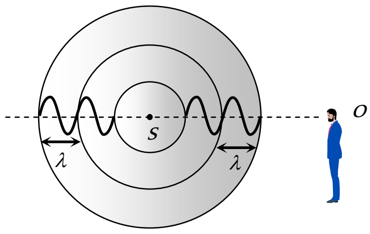

Fig. 17.33

(2) **When source is moving but observer is at rest**

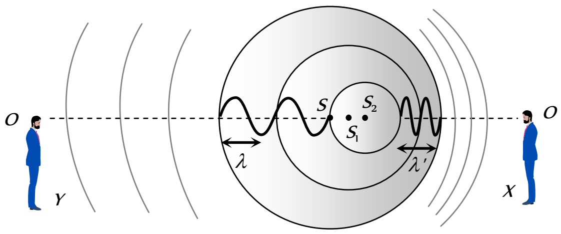

Fig. 17.34

(i) S_1, S_2, S_3 are the positions of the source at three different positions.

(ii) Waves are represented by non-concentric circles, they appear compressed in the forward direction and spread out in backward direction.

(iii) For observer (X)

Apparent wavelength $\lambda' <$ Actual wavelength λ

$\Rightarrow$ Apparent frequency n' > Actual frequency n

For observer (Y) : $\lambda' > \lambda \Rightarrow n' < n$

(3) **When source is stationary but observer is moving**

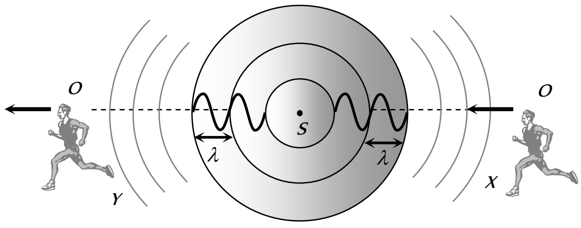

Fig. 17.35

(i) Waves are again represented by concentric circles.

(ii) No change in wavelength received by either observer X or Y.

(iii) Observer X (moving towards) receives wave fronts at shorter interval thus $n' > n$.

(iv) Observer Y receives wavelengths at longer interval thus $n' < n$.

(4) **General expression for apparent frequency** : Suppose observed (O) and source (S) are moving in the same direction along a line with velocities v_o and v_s respectively. Velocity of sound is v and velocity of medium is v_m then apparent frequency observed by observer is given by $n' = \left[\frac{(v + v_m) - v_0}{(v + v_m) - v_S}\right] n$

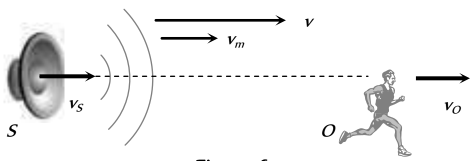

Fig. 17.36

If medium is stationary *i.e.* $v_m = 0$ then $n' = n\left(\frac{v - v_O}{v - v_S}\right)$

Sign convection for different situation

(i) The direction of v is always taken from source to observer.

(ii) All the velocities in the direction of v are taken positive.

(iii) All the velocities in the opposite direction of v are taken negative.

Common Cases in Doppler's Effect

Case 1 : **Source is moving but observer at rest.**

(1) Source is moving towards the observer

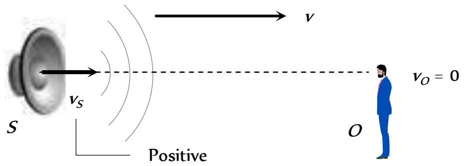

Fig. 17.37

Apparent frequency $n' = n\left[\frac{v - 0}{v - (+v_S)}\right] = n\left(\frac{v}{v - v_S}\right)$

Apparent wavelength $\lambda' = \lambda\left(\frac{v - v_S}{v}\right)$

(2) Source is moving away from the observer.

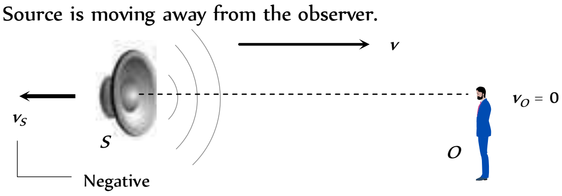

Fig. 17.38

Apparent frequency $n' = n\left[\frac{v - 0}{v - (-v_S)}\right] = n\left(\frac{v}{v + v_S}\right)$

Apparent wavelength $\lambda' = \lambda\left(\frac{v + v_S}{v}\right)$

Case **2: Source is at rest but observer is moving.**

(1) Observer is moving towards the source.

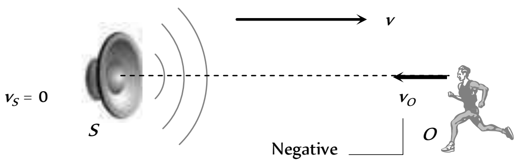

Fig. 17.39

Apparent frequency $n' = n\left[\frac{v - (-v_O)}{v - 0}\right] = n\left[\frac{v + v_O}{v}\right]$

Apparent wavelength $\lambda' = \frac{(v + v_O)}{n'} = \frac{(v + v_O)}{n\frac{(v + v_O)}{v}} = \frac{v}{n} = \lambda$

(2) Observer is moving away from the source

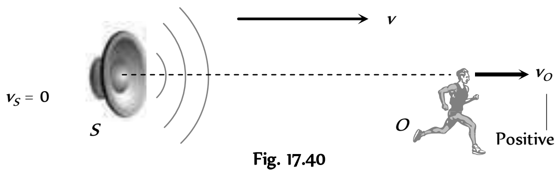

Fig. 17.40

Apparent frequency $n' = n\left[\frac{v - (+v_O)}{v - 0}\right] = n\left[\frac{v - v_O}{v}\right]$

Apparent wavelength $\lambda' = \lambda$

Case **3: When source and observer both are moving**

(1) When both are moving towards each other

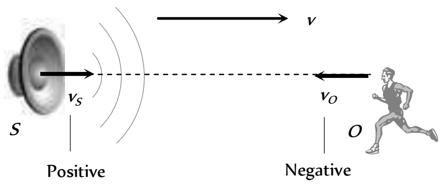

Fig. 17.41

(i) Apparent frequency $n' = n\left[\frac{v - (-v_O)}{v - (+v_S)}\right] = n\left[\frac{v + v_O}{v - v_S}\right]$

(ii) Apparent wavelength $\lambda' = \lambda\left(\frac{v - v_S}{v}\right)$

(iii) Velocity of wave with respect to observer $= (v + v_O)$

(2) When both are moving away from each other.

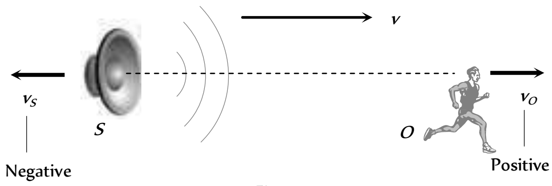

Fig. 17.42

(i) Apparent frequency $n' = n\left[\dfrac{v-(+v_O)}{v-(-v_S)}\right] = n\left[\dfrac{v-v_O}{v+v_S}\right]$

$(n' < n)$

(ii) Apparent wavelength $\lambda' = \lambda\left(\dfrac{v+v_S}{v}\right)$

$(\lambda' > \lambda)$

Velocity of waves with respect to observer = $(v - v)$

(3) When source is moving behind observer

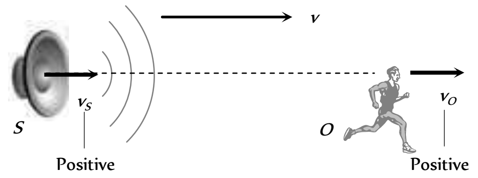

Fig. 17.43

(i) Apparent frequency $n' = n\left(\dfrac{v-v_O}{v-v_S}\right)$

(a) If $v_O < v_S$, then $n' > n$

(b) If $v_O > v_S$ then $n' < n$

(c) If $v_O = v_S$ then $n' = n$

(ii) Apparent wavelength $\lambda' = \lambda\left(\dfrac{v-v_S}{v}\right)$

(iii) Velocity of waves with respect to observer = $(v - v_O)$

(4) When observer is moving behind the source

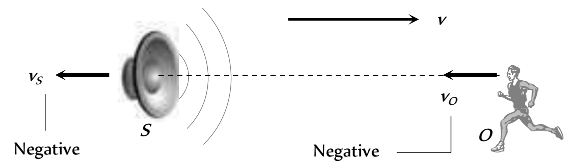

Fig. 17.44

(i) Apparent frequency $n' = n\left(\dfrac{v-(-v_O)}{v-(-v_S)}\right)$

(a) If $v_O > v_S$, then $n' > n$

(b) If $v_O < v_S$ then $n' < n$

(c) If $v_O = v_S$ then $n' = n$

(ii) Apparent wavelength $\lambda' = \lambda\left(\dfrac{v+v_S}{v}\right)$

(iii) The velocity of waves with respect to observer = $(v + v_O)$

***Case* 4: Crossing**

(1) Moving sound source crosses a stationary observer

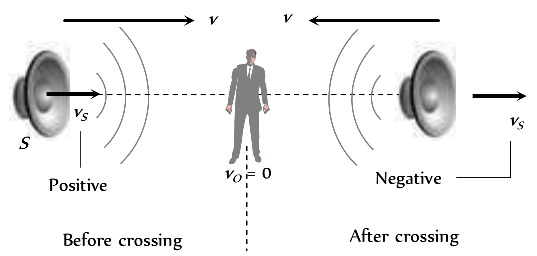

Fig. 17.45

Apparent frequency before crossing

$$n'_{Before} = n\left[\frac{v-0}{v-(+v_S)}\right] = n\left[\frac{v}{v-v_S}\right]$$

Apparent frequency

$$n'_{After} = n\left[\frac{v-0}{v-(-v_S)}\right] = n\left[\frac{v}{v+v_S}\right]$$

Ratio of two frequency $\dfrac{n'_{Before}}{n'_{After}} = \left[\dfrac{v+v_S}{v-v_S}\right] > 1$

Change in apparent frequency $n'_{Before} - n'_{After} = \dfrac{2nv_S v}{(v^2 - v_S^2)}$

If $v_S << v$ then $n'_{Before} - n'_{After} = \dfrac{2nv_S}{v}$

(2) **Moving observer crosses a stationary source**

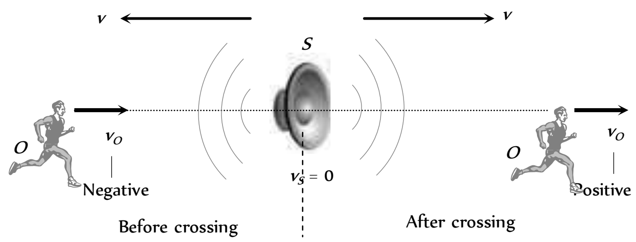

Fig. 17.46

Apparent frequency before crossing

$$n'_{Before} = n\left[\frac{v-(-v_O)}{v-0}\right] = n\left[\frac{v+v_O}{v}\right]$$

Apparent frequency

$$n'_{After} = n\left[\frac{v-(+v_O)}{v-0}\right] = n\left[\frac{v-v_O}{v}\right]$$

Ratio of two frequency $\dfrac{n'_{Before}}{n'_{After}} = \left[\dfrac{v+v_S}{v-v_S}\right]$

Change in apparent frequency $n'_{Before} - n'_{After} = \dfrac{2nv_O}{v}$

***Case* 5:** Both moves in the same direction with same velocity $n' = n$, *i.e.* there will be no Doppler effect because relative motion between source and listener is zero.

***Case* 6:** Source and listener moves at right angle to the direction of wave propagation. $n' = n$

It means there is no change in frequency of sound heard if there is a small displacement of source and listener at right angle to the direction of wave propagation but for a large displacement the frequency decreases because the distance between source of sound and listener increases.

Some Typical Cases of Doppler's Effect

(1) **Moving car towards wall :** When a car is moving towards a stationary wall as shown in figure. If the car sounds a horn, wave travels toward the wall and is reflected from the wall. When the reflected wave is

heard by the driver, it appears to be of relatively high pitch. If we wish to measure the frequency of reflected sound then the problem.

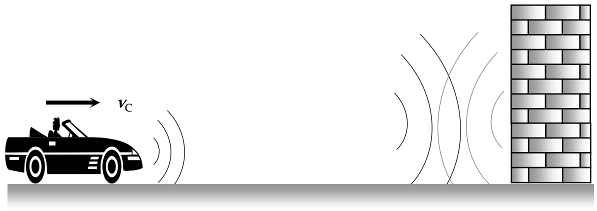

Fig. 17.47

Can be solved in a different manner by using method of sound images. In this procedure we assume the image of the sound source behind the reflector.

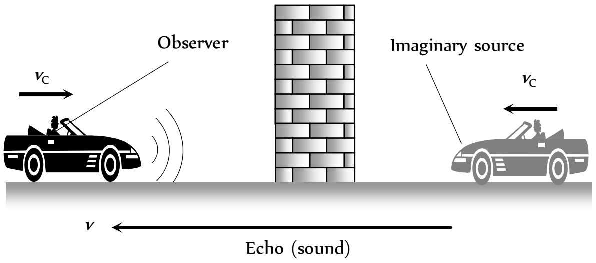

Fig. 17.48

Here we assume that the sound which is reflected by the stationary wall is coming from the image of car which is at the back of it and coming toward it with velocity v_c. Now the frequency of sound heard by car driver can directly be given as

$$n' = n\left[\frac{v-(-v_C)}{v-(+v_C)}\right] = n\left[\frac{v+v_C}{v-v_C}\right]$$

This method of images for solving problems of Doppler effect is very convenient but is used only for velocities of source and observer which are very small compared to the speed of sound and it should not be used frequently when the reflector of sound is moving.

(2) **Moving target :** Let a sound source S and observer O are at rest (stationary). The frequency of sound emitted by the source is n and velocity of waves is v.

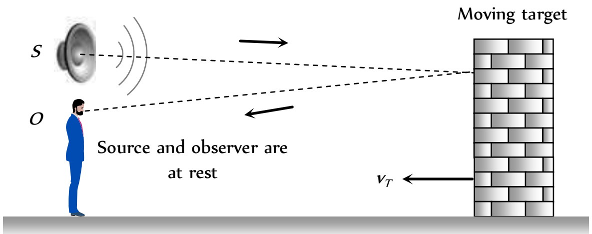

Fig. 17.49

A target is moving towards the source and observer, with a velocity v_t. Our aim is to find out the frequency observed by the observer, for the waves reaching it after reflection from the moving target. The formula is derived by applying Doppler equations twice, first with the target as observer and then with the target as source.

The frequency n' of the waves reaching surface of the moving target (treating it as observer) will be $n' = \left(\frac{v+v_T}{v}\right)n$

Now these waves are reflected by the moving target (which now acts as a source). Therefore the apparent frequency, for the real observer O will be $n'' = \frac{v}{v-v_T}n' \Rightarrow n'' = \frac{v+v_T}{v-v_T}n$

(i) If the target is moving away from the observer, then

$$n' = \frac{v-v_T}{v+v_T}n$$

(ii) If target velocity is much less than the speed of sound, $(v_T << v)$, then $n' = \left(1+\frac{2v_T}{v}\right)n$, for approaching target

and $n' = \left(1-\frac{2v_T}{v}\right)n$, for receding target

(3) **Transverse Doppler's effect**

(i) If a source is moving in a direction making an angle θ *w.r.t.* the observer

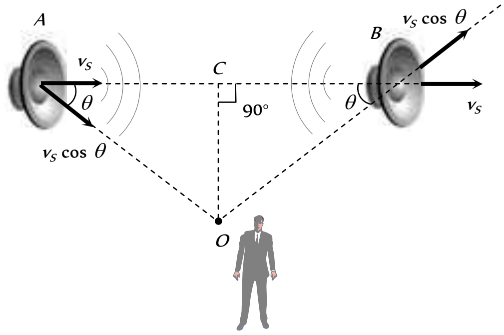

Fig. 17.50

The apparent frequency heard by observer O at rest

At point A : $n' = \dfrac{nv}{v-v_S\cos\theta}$

As source moves along AB, value of θ increases, $\cos\theta$ decreases, n' goes on decreasing.

At point C : $\theta = 90^o$, $\cos\theta = \cos 90^o = 0$, $n' = n$.

At point B : the apparent frequency of sound becomes

$$n'' = \frac{nv}{v+v_s\cos\theta}$$

(ii) When two cars are moving on perpendicular roads : When car-1 sounds a horn of frequency n, the apparent frequency of sound heard by car-2 can be given as $n' = n\left[\frac{v+v_2\cos\theta_2}{v-v_1\cos\theta_1}\right]$

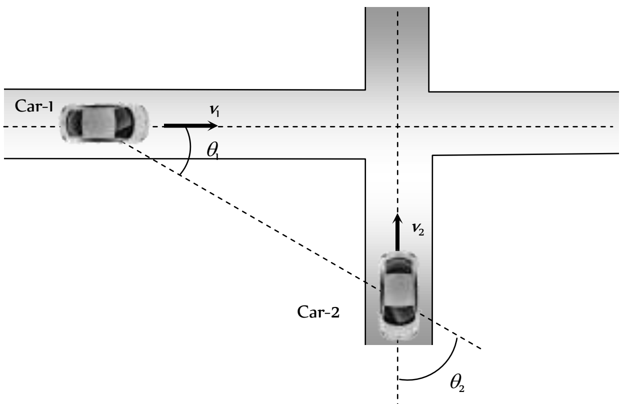

Fig. 17.51

(4) **Rotating source/observer :** Suppose that a source of sound/observer is rotating in a circle of radius r with angular velocity ω (Linear velocity $v_s = r\omega$)

(i) **When source is rotating**

(a) Towards the observer heard frequency will be maximum

i.e. $n_{max} = \frac{nv}{v - v_S}$

(b) Away from the observer heard frequency will be minimum

and $n_{min} = \frac{nv}{v + v_S}$

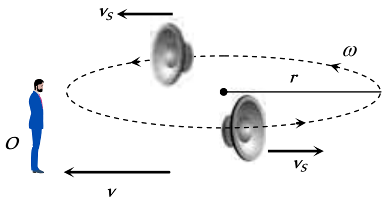

Fig. 17.52

(c) Ratio of maximum and minimum frequency

$$\frac{n_{max}}{n_{min}} = \frac{v + v_S}{v - v_S}$$

(ii) **When observer is rotating**

(a) Towards the source heard frequency will be maximum

i.e. $n_{max} = \frac{nv}{v - v_S}$

(b) Away from the source heard frequency will be minimum

and $n_{min} = \frac{nv}{v + v_S}$

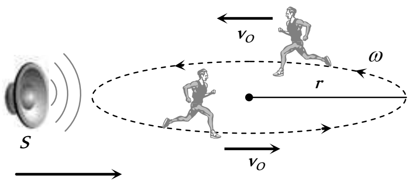

Fig. 17.53

(c) Ratio of maximum and minimum frequency

$$\frac{n_{max}}{n_{min}} = \frac{v + v_S}{v - v_S}$$

(iii) **Observer is situated at the centre of circle :** There will be no change in frequency of sound heard, if the source is situated at the centre of the circle along which listener is moving..

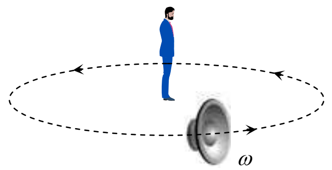

Fig. 17.54

(5) **SONAR :** Sonar means Sound Navigation and Ranging.

(i) Ultrasonic waves are used to detect the presence of big rocks, submarines *etc* in the sea.

(ii) The waves emitted by a source are reflected by the target and received back at the SONAR station.

(iii) If v is velocity of sound waves in water and v_{sub} is velocity of target (submarine), the apparent frequency of reflected waves will be $n' = \left(1 \pm \frac{2v_{sub}}{v}\right)n$

+ sign is for target approaching the receiver and – sign for target moving away.

Conditions for No Doppler's Effect

(1) When source (S) and listener (L) both are at rest.

(2) When medium alone is moving.

(3) When S and L move in such a way that distance between S and L remains constant.

(4) When source S and listener L, are moving in mutually perpendicular directions.

(5) If the velocity of source and listener is equal to or greater than the sound velocity then Doppler effect is not seen.

Musical Sound

other rapidly at regular interval of time without a sudden change in amplitude.

(1) **Noise :** A noise consists of a series of waves following each other at irregular intervals of time with sudden changes in amplitude.

(2) **Pitch :** The pitch of a sound is the characteristic which distinguishes between a shrill (or sharp) sound and a grave (or flat) sound.

(i) A sound of high pitch is said to be shrill and it's frequency is high.

(ii) A sound of low pitch is said to be grave and it's frequency is low.

(iii) The pitch of female voice is higher than the pitch of male voice.

(iv) The pitch of sound produced by roaring of lion is lower where as the pitch of sound produced by mosquito whisper is high.

(3) **Quality (or timbre) :** A musical instrument vibrates with many frequencies at the same time. The quality of any musical sound is determined by the number of overtones and their relative intensities.

(i) The quality of sound enables us to distinguish between two sounds having same intensity and pitch.

(ii) The sounds of different instruments (such as Tabla and Mridang) are said to differ in quality.

(iii) Due to quality of sound one can recognise the voice of his friend without seeing him.

(4) **Loudness :** Characteristic of sound, on account of which the sound appears to be intense or slow.

(i) The loudness that we sense is related to the intensity of sound though it is not directly proportional

(ii) The loudness depends on intensity as well as upon the sensitiveness of ear.

(iii) Our perception of loudness is better co–related with the sound level measured in decible (dB) and defined as follows $\beta = 10\log_{10}\left(\frac{I}{I_0}\right)$;

where I_0 = The minimum intensity that can be heard called threshold of hearing = 10^{-12} W/m^2 at 1 KHz.

(iv) At the threshold of hearing β = 0. At the threshold of pain $\beta = 10\log_{10}\frac{1}{10^{-2}} = 120\, dB.$

(v) When the intensity doubles, the intensity level changes by 3 dB.

(vi) When the intensity increases 10 times the level increases by 10 dB.

Table 17.8 ; Different sound intensity level

Source of sound	*dB*

Rustling leaves	10
Whisper	20
Quiet room	30
Normal level of speech (inside)	30
Street traffic (inside car)	65
Riveting tool	80
Thunder	100
Indoor rock concert	120

Interval : The ratio of the frequencies of the two notes is called the interval between them *e.g.* interval between two notes of frequencies 256 *Hz* and 512 *Hz* is 1 : 2.

Table 17.9 ; Different interval

Name of interval	Frequency ratio
Unison	1 : 1
Octave	2 : 1
Major tone	9 : 8
Minor tone	10 : 9
Semi tone	16 : 15

Musical scale : It consists of a series of notes of successively increasing frequency, having constant intervals. The note of the lowest frequency is called the key note.

These are many kinds of musical scales. The most commonly used scale is called major diatonic scale. It is formed by introducing six more notes between a given note and it's octave, so that these are eight notes in all.

Table 17.10 : Major diatonic scale

Symbol	Indian name	Western name	Frequency in the base of 256 *Hz*	Interval between successive notes
C	*SA*	*DO*	256	9/8
D	*RE*	*RE*	288	10/9
E	*GA*	*MI*	320	16/15
F	MA	*FA*	341	9/8
G	PA	SOL	384	10/9
A	*DHA*	*LA*	427	9/8
B	Ni	*SI*	480	16/15
C_1	*SA*	*DO*	512	

Accoustics of Buildings

Accounstics is the branch of physics that deals with the generation, propagation and reception of sound.

W.C. Sabine was the first to carry out the scientific study of architectural acoustics by laying down following rules.

The sound must be loud enough.

The quality of sound must be unaltered.

The successive sounds of speech or music must remain distinct.

These should not be unnecessary interference or resonance of sound in the auditorium.

These should be no echoes in the auditorium.

(1) **Reverberation :** Phenomenon of persistence or prolongation of sound in the auditorium is called reverberation.

(2) **Reverberation time :** The time gap between the initial direct note and the reflected note upto the minimum audibility level is called reverberation time.

(3) **Sabine law :** Sabine derived an expression of the reverberation time which is $t = K.\frac{V}{\alpha S}$; where *K* is constant, *V* = Volume of the hall, *S* = Surface area exposed to the sound α =Co-efficient of absorption.

(4) **Controlling the reverberation time :** It may be controlled as follows :

By hanging heavy curtains on the doors.

By having few open windows in the hall.

By having large audience.

By using absorbing materials in the walls and roofs of the hall.

Tips & Tricks

✍ In an open pipe all harmonics are present whereas in a closed organ pipe, only alternate harmonics of frequencies $n_1, 3n_1, 5n_1, ...$ *etc.* are present.

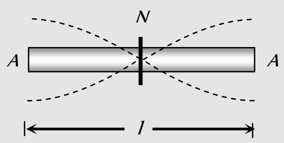
The harmonics of frequencies $2n_1, 4n_1, 6n_1....$ are missing. Hence musical sound produces by an open organ pipe is sweeter than that produced by a closed organ pipe.

✍ If an open pipe is half submerged in water, it will become a closed organ pipe of length half that of a open pipe. It's fundamental frequency will become $n' = \frac{v}{4\left(\frac{l}{2}\right)} = \frac{v}{2l} = n_1$ *i.e.,* equal to that of open pipe.

i.e., frequency remains unchanged.

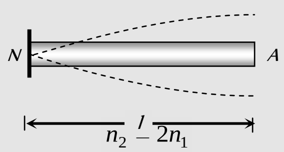
✍ **Vibrating clamped rod :** Frequency of vibration of clamped rod are same as that of organ pipes

Middle clamping : Similar to open organ pipe



$n_1 = \frac{v}{2l}$ $n_2 = 2n_1$ $n_3 = 3n_1$

End clamping : Similar to closed organ pipe



$n_1 = \frac{v}{4l}$ $n_2 = 2n_1$ $n_3 = 3n_1$

✍ Sound produced in air is not heard by the diver deep inside the water because most of the sound is reflected from the surface of water in comparison to the refraction.

✍ If the difference between the apparent frequency of a source of sound as perceived by an observer during it's approach and recession is x% of the natural frequency of source then speed of $v_s = \frac{v_{\text{sound}}}{200}x$ $(v^2 >> v_s^2)$

✍ In a Tabla, the membrane is loaded about the centre why? a note is musical when it is rich in harmonics and not partial overtones. Ordinarily a stretched membrane vibrates with such overtones. But when the stretched membrane is loaded at the centre, its overtones become nearly harmonics, so it's sound becomes fairly musical.

✍ All harmonics are overtones but all overtones are not harmonics.

✍ Stethoscope work on the principle of reflection of sound.

✍ Ultrasonic waves can be produced by utilizing piezoelectric effect.

✍ There is no atmosphere on moon, therefore propagation of sound is not possible there. To do conversation on moon, the astronaut uses an instrument which can transmit and detect electromagnetic waves.

✍ Doppler effect gives information regarding the change in frequency only. It does not says about intensity of sound.

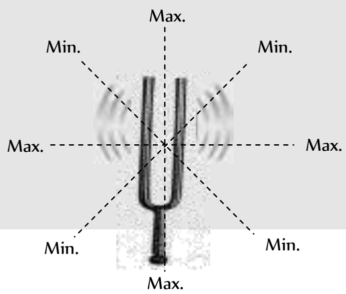
✍ Doppler effect in sound is asymmetric but in light it is symmetric.

✍ If three tuning forks of frequencies n, $n + x$ and $n + 2x$ are sounded together to produce waves of equal amplitude these three wave produces beats with beat frequency = x *beats/sec*

✍ If N tuning forks are so arranged that every fork gives x *beats per sec* with the next then the frequency of last fork will be

$$n_{\text{Last}} = n_{\text{First}} + (N - 1)\,x$$

✍ If a vibrating tuning fork is rotated about it's stem, maximum and minimum number of beats heard by an observer in one revolution of tuning fork are 4.



✍ The tuning of radio receiving set to a particular station is based on forced vibration.

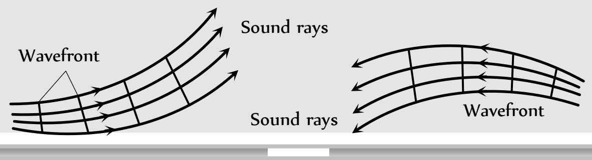
✍ Two avoid resonant vibration of the bridge, soldiers are orderd to break steps while crossing a bridge.

✍ **Confusion :** So many students often confuse whether the equation of a plan progressive wave should be

$$y = a\sin(\omega t - kx) \text{ or } y = a\sin(kx - \omega t)$$

Both the equations represent a travelling wave but these two are not same. These waves are differ by a phae difference of π.

✍ **Audibility of sound in day/night :** During the day temperature of air is maximum and it dimnished upwards. Therefore velocity of sound is also decreases upwards ($v \propto \sqrt{T}$). The plane wavefronts, initially vertical are turned, upwards so sound rays curl up during the day. At night the conditions are reversed hence audibility of sound is better in night as compare to day.



Ordinary Thinking

Objective Questions

Basics of Mechanical Waves

1. Which of the following statements is wrong [NCERT 1976, 79]
   (a) Sound travels in straight line
   (b) Sound is a form of energy
   (c) Sound travels in the form of waves
   (d) Sound travels faster in vacuum than in air

2. The relation between frequency 'n' wavelength 'λ' and velocity of propagation 'v' of wave is [EAMCET 1979; CPMT 1976, 85]
   (a) $n = v\lambda$ (b) $n = \lambda / v$
   (c) $n = v / \lambda$ (d) $n = 1 / v$

3. Ultrasonic, Infrasonic and audible waves travel through a medium with speeds V_u, V_i and V_a respectively, then

[CPMT 1989]

(a) V_u, V_i and V_a are nearly equal

(b) $V_u \geq V_a \geq V_i$

(c) $V_u \leq V_a \leq V_i$

(d) $V_a \leq V_u$ and $V_u \approx V_i$

4. The distance between two consecutive crests in a wave train produced in a string is 5 *cm*. If 2 complete waves pass through any point per second, the velocity of the wave is

[CPMT 1990]

(a) 10 *cm/sec* (b) 2.5 *cm/sec*

(c) 5 *cm/sec* (d) 15 *cm/sec*

5. A tuning fork makes 256 vibrations per second in air. When the velocity of sound is 330 *m/s*, then wavelength of the tone emitted is

MH CET 1999; CBSE PMT 1999]

(a) 0.56 *m* (b) 0.89 *m*

(c) 1.11 *m* (d) 1.29 *m*

6. A man sets his watch by a whistle that is 2 *km* away. How much will his watch be in error. (speed of sound in air 330 *m/sec*)

(a) 3 seconds fast (b) 3 seconds slow

(c) 6 seconds fast (d) 6 seconds slow

7. When a sound wave of frequency 300 *Hz* passes through a medium the maximum displacement of a particle of the medium is 0.1 *cm*. The maximum velocity of the particle is equal to [MNR 1992; UPSEAT 1998, 2000;

RPMT 2002; Pb. PET 2004]

(a) 60 π *cm/sec* (b) 30 π *cm/sec*

(c) 30 *cm/sec* (d) 60 *cm/sec*

8. Sound waves have the following frequencies that are audible to human beings [CPMT 1975]

(a) 5 *c/s* (b) 27000 *c/s*

(c) 5000 *c/s* (d) 50,000 *c/s*

9. Velocity of sound waves in air is 330 *m/sec*. For a particular sound in air, a path difference of 40 *cm* is equivalent to a phase difference of 1.6 π. The frequency of this wave is

[CBSE PMT 1990]

(a) 165 *Hz* (b) 150 *Hz*

(c) 660 *Hz* (d) 330 *Hz*

10. The wavelength of ultrasonic waves in air is of the order of

[EAMCET 1989]

(a) 5×10^{-5} *cm* (b) 5×10^{-8} *cm*

(c) 5×10^{5} *cm* (d) 5×10^{8} *cm*

11. The relation between phase difference ($\Delta\phi$) and path difference (Δx) is [MNR 1995; UPSEAT 1999, 2000]

(a) $\Delta\phi = \frac{2\pi}{\lambda}\Delta x$ (b) $\Delta\phi = 2\pi\lambda\Delta x$

(c) $\Delta\phi = \frac{2\pi\lambda}{\Delta x}$ (d) $\Delta\phi = \frac{2\Delta x}{\lambda}$

12. A hospital uses an ultrasonic scanner to locate tumours in a tissue. The operating frequency of the scanner is 4.2 *MHz*. The speed of sound in a tissue is 1.7 *km-s*. The wavelength of sound in the tissue is close to

[CBSE PMT 1995]

(a) $4 \times 10^{-4}\, m$ (b) $8 \times 10^{-3}\, m$

(c) $4 \times 10^{-3}\, m$ (d) $8 \times 10^{-4}\, m$

13. The minimum audible wavelength at room temperature is about

(a) 0.2 $\mathring{A}$ (b) 5 $\mathring{A}$

(c) 5 *cm* to 2 *metre* (d) 20 *mm*

14. The ratio of the speed of sound in nitrogen gas to that in helium gas, at 300 *K* is [IIT 1999]

(a) $\sqrt{2/7}$ (b) $\sqrt{1/7}$

(c) $\sqrt{3}/5$ (d) $\sqrt{6}/5$

15. In a sinusoidal wave, the time required for a particular point to move from maximum displacement to zero displacement is 0.170 second. The frequency of the wave is [KCET 1994; AFMC 1998;

[CBSE PMT 1998; AIIMS 2001;

AFMC 2002; CPMT 2004]

(a) 1.47 *Hz* (b) 0.36 *Hz*

(c) 0.73 *Hz* (d) 2.94 *Hz*

[MP PET 1991]

16. The number of waves contained in unit length of the medium is called [AIIMS 1998]

(a) Elastic wave (b) Wave number

(c) Wave pulse (d) Electromagnetic wave

17. The frequency of a rod is 200 *Hz*. If the velocity of sound in air is $340\, ms^{-1}$, the wavelength of the sound produced is

[EAMCET (Med.) 1995;

Pb. PMT 1999; CPMT 2000]

(a) 1.7 *cm* (b) 6.8 *cm*

(c) 1.7 *m* (d) 6.8 *m*

18. Frequency range of the audible sounds is

[EAMCET (Med.) 1995; RPMT 1997]

(a) 0 *Hz* – 30 *Hz* (b) 20 *Hz* – 20 *kHz*

(c) 20 *kHz* – 20,000 *kHz* (d) 20 *kHz* – 20 *MHz*

19. In a medium sound travels 2 *km* in 3 *sec* and in air, it travels 3 *km* in 10 *sec*. The ratio of the wavelengths of sound in the two media is

(a) 1 : 8 (b) 1 : 18

(c) 8 : 1 (d) 20 : 9

20. A stone is dropped into a lake from a tower 500 *metre* high. The sound of the splash will be heard by the man approximately after[CPMT 1992; JI

Kerala PMT 2005]

(a) 11.5 seconds (b) 21 seconds

(c) 10 seconds (d) 14 seconds

21. When sound waves travel from air to water, which of the following remains constant

[AFMC 1993; DCE 1999; CPMT 2004]

(a) Velocity (b) Frequency

(c) Wavelength (d) All the above

22. A stone is dropped in a well which is 19.6*m* deep. Echo sound is heard after 2.06 *sec* (after dropping) then the velocity of sound is

(a) 332.6 m/sec (b) 326.7 m/sec

(c) 300.4 m/sec (d) 290.5 m/sec

23. At what temperature velocity of sound is double than that of at $0°C$

(a) 819 K (b) $819°C$

(c) $600°C$ (d) 600 K

24. Velocity of sound is maximum in [AFMC 1998; BCECE 2001; RPMT 1999, 02]

(a) Air (b) Water

(c) Vacuum (d) Steel

25. If velocity of sound in a gas is 360 m/s and the distance between a compression and the nearest rarefaction is 1m, then the frequency of sound is [KCET 1999]

(a) 90 Hz (b) 180 Hz

(c) 360 Hz (d) 720 Hz

26. If the density of oxygen is 16 times that of hydrogen, what will be the ratio of their corresponding velocities of sound waves [KCET 1999]

(a) 1 : 4 (b) 4 : 1

(c) 16 : 1 (d) 1 : 16

27. At which temperature the speed of sound in hydrogen will be same as that of speed of sound in oxygen at $100°C$ [UPSEAT 1999]

(a) $-148°C$ (b) $-212.5°C$

(c) $-317.5°C$ (d) $-249.7°C$

28. A tuning fork produces waves in a medium. If the temperature of the medium changes, then which of the following will change [EAMCET (Med.) 1998; Pb. PMT 1999; MH CET 2001]

(a) Amplitude (b) Frequency

(c) Wavelength (d) Time-period

29. The wave length of light in visible part (λ_V) and for sound (λ_S) are related as [RPMT 1999]

(a) $\lambda_V > \lambda_S$ (b) $\lambda_S > \lambda_V$

(c) $\lambda_S = \lambda_V$ (d) None of these

30. Which of the following is different from others [AFMC 1994; CPMT 1999; Pb. PMT 2004]

(a) Velocity (b) Wavelength

(c) Frequency (d) Amplitude

31. The phase difference between two points separated by 1m in a wave of frequency 120 Hz is $90°$. The wave velocity is [KCET 1999]

(a) 180 m/s (b) 240 m/s

(c) 480 m/s (d) 720 m/s

32. The echo of a gun shot is heard 8 sec. after the gun is fired. How far from him is the surface that reflects the sound (velocity of sound in air = 350 m/s) [JIPMER 1999]

(a) 1400 m (b) 2800 m

(c) 700 m (d) 350 m

33. A man sets his watch by the sound of a siren placed at a distance 1 km away. If the velocity of sound is 330 m/s [JIPMER 1999]

(a) His watch is set 3 sec. faster

(b) His watch is set 3 sec. slower

(c) His watch is set correctly

(d) None of the above [RPMT 1999]

34. Velocity of sound in air is [Pb. PMT 1999; UPSEAT 2000]

(a) Faster in dry air than in moist air

(b) Directly proportional to pressure

(c) Directly proportional to temperature

(d) Independent of pressure of air

35. Two monoatomic ideal gases 1 and 2 of molecular masses m_1 and m_2 respectively are enclosed in separate containers kept at the same temperature. The ratio of the speed of sound in gas 1 to that in gas 2 is given by [IIT-JEE Screening 2000]

(a) $\sqrt{\frac{m_1}{m_2}}$ (b) $\sqrt{\frac{m_2}{m_1}}$

(c) $\frac{m_1}{m_2}$ (d) $\frac{m_2}{m_1}$

36. A man is standing between two parallel cliffs and fires a gun. If he hears first and second echoes after 1.5 s and 3.5s respectively, the distance between the cliffs is (Velocity of sound in air = 340 ms^{-1}) [EAMCET (Med.) 2000]

(a) 1190 m (b) 850 m

(c) 595 m (d) 510 m

37. When the temperature of an ideal gas is increased by 600 K, the velocity of sound in the gas becomes $\sqrt{3}$ times the initial velocity in it. The initial temperature of the gas is [EAMCET (Med.) 2000]

(a) $-73°C$ (b) $27°C$

(c) $127°C$ (d) $327°C$

38. The frequency of a sound wave is n and its velocity is v. If the frequency is increased to $4n$, the velocity of the wave will be

(a) v (b) $2v$

(c) $4v$ (d) $v/4$

39. The temperature at which the speed of sound in air becomes double of its value at $27°C$ is [CPMT 1997; UPSEAT 2000; DPMT 2003]

(a) $54°C$ (b) $327°C$

(c) $927°C$ (d) $-123°C$

40. The speed of a wave in a certain medium is 960 m/s. If 3600 waves pass over a certain point of the medium in 1 minute, the wavelength is [MP PMT 2000]

(a) 2 *metres* (b) 4 *metres*

(c) 8 *metres* (d) 16 *metres*

41. Speed of sound at constant temperature depends on [RPET 2000; AIIMS 1998]

(a) Pressure (b) Density of gas

(c) Above both (d) None of the above

42. A man standing on a cliff claps his hand hears its echo after 1 *sec*. If sound is reflected from another mountain and velocity of sound in air is 340 *m/sec*. Then the distance between the man and reflection point is **[RPET 2000]**

(a) 680 *m* (b) 340 *m*

(c) 85 *m* (d) 170 *m*

43. What will be the wave velocity, if the radar gives 54 waves per min and wavelength of the given wave is 10 *m* **[RPET 2000]**

(a) 4 *m/sec* (b) 6 *m/sec*

(c) 9 *m/sec* (d) 5 *m/sec*

44. Sound velocity is maximum in **[Pb. CET 2000; RPMT 2000]**

(a) H_2 (b) N_2

(c) He (d) O_2

45. The minimum distance of reflector surface from the source for listening the echo of sound is **[CPMT 1997; RPMT 1999; KCET 2000]**

(a) 28 *m* (b) 18 *m*

(c) 19 *m* (d) 16.5 *m*

46. The type of waves that can be propagated through solid is **[CPMT 2000]**

(a) Transverse (b) Longitudinal

(c) Both (a) and (b) (d) None of these

47. A man stands in front of a hillock and fires a gun. He hears an echo after 1.5 *sec*. The distance of the hillock from the man is (velocity of sound in air is 330 *m/s*) **[EAMCET (Eng.) 1998; CPMT 2000]**

(a) 220 *m* (b) 247.5 *m*

(c) 268.5 *m* (d) 292.5 *m*

48. Velocity of sound in air

I. Increases with temperature

II. Decreases with temperature

III. Increase with pressure

IV. Is independent of pressure

V. Is independent of temperature

Choose the correct answer. **[Kerala (Engg.) 2001]**

(a) Only I and II are true (b) Only I and III are true

(c) Only II and III are true (d) Only I and IV are true

49. The speed of a wave in a medium is 760 m/s. If 3600 waves are passing through a point, in the medium in 2 minutes, then its wavelength is **[AFMC 1998; CPMT 2001]**

(a) 13.8 *m* (b) 25.3 *m*

(c) 41.5 *m* (d) 57.2 *m*

50. If at same temperature and pressure, the densities for two diatomic gases are respectively d_1 and d_2, then the ratio of velocities of sound in these gases will be **[CPMT 2001]**

(a) $\sqrt{\dfrac{d_2}{d_1}}$ (b) $\sqrt{\dfrac{d_1}{d_2}}$

(c) $d_1 d_2$ (d) $\sqrt{d_1 d_2}$

51. The frequency of a tunning fork is 384 per second and velocity of sound in air is 352 *m/s*. How far the sound has traversed while fork completes 36 vibration **[KCET 2001]**

(a) 3 *m* (b) 13 *m*

(c) 23 *m* (d) 33 *m*

52. v_1 and v_2 are the velocities of sound at the same temperature in two monoatomic gases of densities ρ_1 and ρ_2 respectively. If $\rho_1 / \rho_2 = \dfrac{1}{4}$ then the ratio of velocities v_1 and v_2 will be **[KCET 2000; AIIMS**

(a) 1 : 2 (b) 4 : 1

(c) 2 : 1 (d) 1 : 4

53. The temperature at which the speed of sound in air becomes double of its value at $0^o C$ is **[AIEEE 2002]**

(a) $273K$ (b) $546K$

(c) $1092K$ (d) $0K$

54. If wavelength of a wave is $\lambda = 6000Å$. Then wave number will be **[MH CET 2002]**

(a) $166 \times 10^3\ m^{-1}$ (b) $16.6 \times 10^{-1}\ m^{-1}$

(c) $1.66 \times 10^6\ m^{-1}$ (d) $1.66 \times 10^7\ m^{-1}$

55. Velocity of sound measured in hydrogen and oxygen gas at a given temperature will be in the ratio **[RPET 2001; UPSEAT 2001; KCET 2002, 05]**

(a) 1 : 4 (b) 4 : 1

(c) 2 : 1 (d) 1 : 1

56. Find the frequency of minimum distance between compression & rarefaction of a wire. If the length of the wire is 1*m* & velocity of sound in air is 360 *m/s* **[CPMT 2003]**

(a) 90 sec^{-1} (b) 180 s^{-1}

(c) 120 sec^{-1} (d) 360 sec^{-1}

57. The velocity of sound is v_s in air. If the density of air is increased to 4 times, then the new velocity of sound will be **[BHU 2003]**

(a) $\dfrac{v_s}{2}$ (b) $\dfrac{v_s}{12}$

(c) $12v_s$ (d) $\dfrac{3}{2}v_s^2$

58. It takes 2.0 seconds for a sound wave to travel between two fixed points when the day temperature is $10^o C$. If the temperature rise to $30^o C$ the sound wave travels between the same fixed parts in **[Orissa JEE 2**

(a) 1.9 *sec* (b) 2.0 *sec*

(c) 2.1 *sec* (d) 2.2 *sec*

59. If v_m is the velocity of sound in moist air, v_d is the velocity of sound in dry air, under identical conditions of pressure and temperature **[KCET 2002,**

(a) $v_m > v_d$ (b) $v_m < v_d$

(c) $v_m = v_d$ (d) $v_m v_d = 1$

60. A man, standing between two cliffs, claps his hands and starts hearing a series of echoes at intervals of one second. If the speed of sound in air is 340 *ms*, the distance between the cliffs is

(a) 340 *m* (b) 1620 *m*

(c) 680 *m* (d) 1700 *m*

61. A source of sound of frequency 600 *Hz* is placed inside water. The speed of sound in water is 1500 *m/s* and in air is 300 *m/s*. The frequency of sound recorded by an observer who is standing in air is

(a) 200 *Hz* (b) 3000 *Hz*

(c) 120 *Hz* (d) 600 *Hz*

62. If the temperature of the atmosphere is increased the following character of the sound wave is effected

[AFMC 2004]

(a) Amplitude (b) Frequency

(c) Velocity (d) Wavelength

63. An underwater sonar source operating at a frequency of 60 *KHz* directs its beam towards the surface. If the velocity of sound in air is 330 *m/s*, the wavelength and frequency of waves in air are:

(a) 5.5 *mm*, 60 *KHz* (b) 330 *m*, 60 *KHz*

(c) 5.5 *mm*, 20 *KHz* (d) 5.5 *mm*, 80 *KHz*

64. Two sound waves having a phase difference of 60° have path difference of [CBSE PMT 1996; AIIMS 2001]

(a) 2λ (b) $\lambda/2$

(c) $\lambda/6$ (d) $\lambda/3$

65. It is possible to distinguish between the transverse and longitudinal waves by studying the property of

[CPMT 1976; EAMCET 1994]

(a) Interference (b) Diffraction

(c) Reflection (d) Polarisation

66. Water waves are [EAMCET 1979; AIIMS 2004]

(a) Longitudinal

(b) Transverse

(c) Both longitudinal and transverse

(d) Neither longitudinal nor transverse

67. Sound travels in rocks in the form of

[NCERT 1968]

(a) Longitudinal elastic waves only

(b) Transverse elastic waves only

(c) Both longitudinal and transverse elastic waves

(d) Non-elastic waves

68. The waves in which the particles of the medium vibrate in a direction perpendicular to the direction of wave motion is known as

[EAMCT 1981; AIIMS 1998; DPMT 2000]

(a) Transverse wave (b) Longitudinal waves

(c) Propagated waves (d) None of these

69. A medium can carry a longitudinal wave because it has the property of [KCET 1994]

(a) Mass (b) Density

(c) Compressibility (d) Elasticity

70. Which of the following is the longitudinal wave

[AFMC 1997]

(a) Sound waves (b) Waves on plucked string

[KCET 2004]

(c) Water waves (d) Light waves

71. The nature of sound waves in gases is

[RPMT 1999; RPET 2000; J & K CET 2004]

(a) Transverse (b) Longitudinal

(c) Stationary (d) Electromagnetic

[IIT-JEE Screening 2004]

72. Transverse waves can propagate in

[CPMT 1984; KCET 2000; RPET 2001]

(a) Liquids (b) Solids

(c) Gases (d) None of these

73. Sound waves in air are [RPET 2000; AFMC 2001]

(a) Transverse (b) Longitudinal

(c) De-Broglie waves (d) All the above

74. Which of the following is not the transverse wave

[AFMC 1999; BHU 2001]

(a) X-rays (b) γ -rays

[DPMT 2004]

(c) Visible light wave (d) Sound wave in a gas

75. What is the phase difference between two successive crests in the wave [RPMT 2001, 02; MH CET 2004]

(a) π (b) $\pi/2$

(c) 2π (d) 4π

76. A wave of frequency 500 *Hz* has velocity 360 *m/sec*. The distance between two nearest points 60° out of phase, is

[NCERT 1979; MP PET 1989; JIPMER 1997; RPMT 2002, 03; CPMT 1979, 90, 2003; BCECE 2005]

(a) 0.6 *cm* (b) 12 *cm*

(c) 60 *cm* (d) 120 *cm*

77. The following phenomenon cannot be observed for sound waves [NCERT 1982; C

AFMC 2002; RPMT 2003]

(a) Refraction (b) Interference

(c) Diffraction (d) Polarisation

78. When an aeroplane attains a speed higher than the velocity of sound in air, a loud bang is heard. This is because

[NCERT 1972; J & K CET 2002]

(a) It explodes

(b) It produces a shock wave which is received as the bang

(c) Its wings vibrate so violently that the bang is heard

(d) The normal engine noises undergo a Doppler shift to generate the bang

79. Ultrasonic waves are those waves [CPMT 1979]

(a) To which man can hear (b) Man can't hear

(c) Are of high velocity (d) Of high amplitude

80. A big explosion on the moon cannot be heard on the earth because

(a) The explosion produces high frequency sound waves which are inaudible

(b) Sound waves required a material medium for propagation

(c) Sound waves are absorbed in the moon's atmosphere

(d) Sound waves are absorbed in the earth's atmosphere

81. Sound waves of wavelength greater than that of audible sound are called [KCET 1999]

(a) Seismic waves (b) Sonic waves

(c) Ultrasonic waves (d) Infrasonic waves

82. 'SONAR' emits which of the following waves [AIIMS 1999]

(a) Radio waves (b) Ultrasonic waves

(c) Light waves (d) Magnetic waves

83. Which of the following do not require medium for transmission

(a) Cathode ray (b) Electromagnetic wave

(c) Sound wave (d) None of the above

84. Consider the following

I. Waves created on the surfaces of a water pond by a vibrating sources.

II. Wave created by an oscillating electric field in air.

III. Sound waves travelling under water.

Which of these can be polarized [AMU 2001]

(a) I and II (b) II only

(c) II and III (d) I, II and III

85. Mechanical waves on the surface of a liquid are [SCRA 1996]

(a) Transverse

(b) Longitudinal

(c) Torsional

(d) Both transverse and longitudinal

86. The ratio of densities of nitrogen and oxygen is 14:16. The temperature at which the speed of sound in nitrogen will be same at that in oxygen at $55^\circ C$ is [EAMCET (Engg.) 1999]

(a) $35^\circ C$ (b) $48^\circ C$

(c) $65^\circ C$ (d) $14^\circ C$

87. The intensity of sound increases at night due to [CPMT 2000]

(a) Increase in density of air (b) Decreases in density of air

(c) Low temperature (d) None of these

88. A wavelength 0.60 *cm* is produced in air and it travels at a speed of 300 ms^{-1}. It will be an [UPSEAT 2000]

(a) Audible wave (b) Infrasonic wave

(c) Ultrasonic wave (d) None of the above

89. Speed of sound in mercury at a certain temperature is 1450 *m/s*. Given the density of mercury as $13.6 \times 10^3\ kg/m^3$, the bulk modulus for mercury is [JIPMER 2000]

(a) $2.86 \times 10^{10}\ N/m^2$ (b) $3.86 \times 10^{10}\ N/m^2$

(c) $4.86 \times 10^{10}\ N/m^2$ (d) $5.86 \times 10^{10}\ N/m^2$

90. A micro-wave and an ultrasonic sound wave have the same wavelength. Their frequencies are in the ratio (approximately)

(a) $10^6 : 1$ (b) $10^4 : 1$

(c) $10^2 : 1$ (d) $10 : 1$

91. A point source emits sound equally in all directions in a non-absorbing medium, Two points P and Q are at distance of $2m$ and $3m$ respectively from the source. The ratio of the intensities of the waves at P and Q is [CBSE PMT 2005]

(a) 9 : 4 (b) 2 : 3

(c) 3 : 2 (d) 4 : 9

92. A wave has velocity u in medium P and velocity $2u$ in medium Q. If the wave is incident in medium P at an angle of 30° then the angle of refraction will be [J & K CET 2005]

(a) 30° (b) 45°

(c) 60° (d) 90°

[RPMT 2000]

93. An observer standing near the sea shore observes 54 waves per minute. If the wavelength of the water wave is $10m$ then the velocity of water wave is [Kerala (Engg.) 2005]

(a) 540 ms^{-1} (b) 5.4 ms^{-1}

(c) 0.184 ms^{-1} (d) 9 ms^{-1}

94. Ultrasonic signal sent from SONAR returns to it after reflection from a rock after a lapse of 1 *sec*. If the velocity of ultrasound in water is 1600 ms^{-1}, the depth of the rock in water is

(a) 300 *m* (b) 400 *m*

(c) 500 *m* (d) 800 *m*

Progressive Waves

1. The equation of a wave is $y = 2\sin\pi(0.5x - 200t)$, where x and y are expressed in cm and t in sec. The wave velocity is [MP PMT 1986]

(a) 100 *cm/sec* (b) 200 *cm/sec*

(c) 300 *cm/sec* (d) 400 *cm/sec*

2. Equation of a progressive wave is given by

$$y = 0.2\cos\pi\left(0.04t + .02x - \frac{\pi}{6}\right)$$

The distance is expressed in *cm* and time in second. What will be the minimum distance between two particles having the phase difference of $\pi/2$

(a) 4 *cm* (b) 8 *cm*

(c) 25 *cm* (d) 12.5 *cm*

3. A travelling wave passes a point of observation. At this point, the time interval between successive crests is 0.2 seconds and

(a) The wavelength is 5 *m*

(b) The frequency is 5 *Hz*

(c) The velocity of propagation is 5 *m/s*

(d) The wavelength is 0.2 *m*

4. The equation of a transverse wave is given by

$$y = 10\sin\pi(0.01x - 2t)$$

where x and y are in *cm* and t is in second. Its frequency is [MP PET 1990; MNR 1986; RPET 2003]

(a) $10\ sec^{-1}$ (b) $2\ sec^{-1}$

(c) $1\ sec^{-1}$ (d) $0.01\ sec^{-1}$

5. At a moment in a progressive wave, the phase of a particle executing S.H.M. is $\frac{\pi}{3}$. Then the phase of the particle 15 *cm* ahead and at the time $\frac{T}{2}$ will be, if the wavelength is 60 *cm* [Kerala (Engg.) 2002]

(a) $\frac{\pi}{2}$ (b) $\frac{2\pi}{3}$

(c) Zero (d) $\frac{5\pi}{6}$

6. The equation of a wave travelling on a string is $y = 4\sin\frac{\pi}{2}\left(8t - \frac{x}{8}\right)$. If x and y are in *cm*, then velocity of wave is [MP PET 1990]

(a) 64 *cm/sec* in $-x$ direction
(b) 32 *cm/sec* in $-x$ direction
(c) 32 *cm/sec* in $+x$ direction
(d) 64 *cm/sec* in $+x$ direction

7. The equation of a progressive wave is given by

$$y = a\sin(628t - 31.4x)$$

If the distances are expressed in *cms* and time in seconds, then the wave velocity will be [DPMT 1999]

(a) 314 *cm/sec* (b) 628 *cm/sec*
(c) 20 *cm/sec* (d) 400 *cm/sec*

8. Two waves are given by $y_1 = a\sin(\omega t - kx)$ and $y_2 = a\cos(\omega t - kx)$ The phase difference between the two waves is [MP PMT 1993; SCRA 1996; CET 1998; EAMCET 1991; Orissa JEE 2002]

(a) $\frac{\pi}{4}$ (b) π
(c) $\frac{\pi}{8}$ (d) $\frac{\pi}{2}$

9. If amplitude of waves at distance r from a point source is A, the amplitude at a distance $2r$ will be [MP PMT 1985]

(a) $2A$ (b) A
(c) $A/2$ (d) $A/4$

10. The relation between time and displacement for two particles is given by

$$y_1 = 0.06\sin 2\pi(0.04t + \phi_1),\ y_2 = 0.03\sin 2\pi(1.04t + \phi_2)$$

The ratio of the intensity of the waves produced by the vibrations of the two particles will be [MP PMT 1991]

(a) 2 : 1 (b) 1 : 2
(c) 4 : 1 (d) 1 : 4

11. A wave is reflected from a rigid support. The change in phase on reflection will be [MP PMT 1990; RPMT 2002]

(a) $\pi / 4$ (b) $\pi / 2$
(c) π (d) 2π

12. A plane wave is represented by

$$x = 1.2\sin(314\,t + 12.56y)$$

Where x and y are distances measured along in x and y direction in meters and t is time in seconds. This wave has [MP PET 1991]

(a) A wavelength of 0.25 *m* and travels in + *ve x* direction
(b) A wavelength of 0.25 *m* and travels in + *ve y* direction
(c) A wavelength of 0.5 *m* and travels in – *ve y* direction
(d) A wavelength of 0.5 *m* and travels in – *ve x* direction

13. The displacement y (in *cm*) produced by a simple harmonic wave is $y = \frac{10}{\pi}\sin\left(2000\pi t - \frac{\pi x}{17}\right)$. The periodic time and maximum velocity of the particles in the medium will respectively be

(a) 10^{-3} *sec* and 330 *m/sec* (b) 10^{-4} sec and 20 *m/sec*
(c) 10^{-3} *sec* and 200 *m/sec* (d) 10^{-2} *sec* and 2000 *m/sec*

14. The equation of a wave travelling in a string can be written as $y = 3\cos\pi(100\,t - x)$. Its wavelength is [MNR 1985; CPMT 1991; MP PMT 1994, 97; Pb. PET 2004]

(a) 100 *cm* (b) 2 *cm*
(c) 5 *cm* (d) None of the above

15. A transverse wave is described by the equation $Y = Y_0\sin 2\pi\left(ft - \frac{x}{\lambda}\right)$. The maximum particle velocity is four times the wave velocity if [IIT 1984; MP PMT 1997; EAMCET; 1998; CBSE PMT 2000; AFMC 2000; MP PMT/PET 1998; 01; KCET 1999, 04; Pb. PET 2001; DPMT 2005]

(a) $\lambda = \frac{\pi Y_0}{4}$ (b) $\lambda = \frac{\pi Y_0}{2}$
(c) $\lambda = \pi Y_0$ (d) $\lambda = 2\pi Y_0$

16. A wave equation which gives the displacement along the Y direction is given by the equation $y = 10^4\sin(60t + 2x)$, where x and y are in *metres* and t is time in seconds. This represents a wave [MNR 1983; IIT 1982; RPMT 1998; MP PET 2001]

(a) Travelling with a velocity of 30 *m/sec* in the negative X direction
(b) Of wavelength π *metre*
(c) Of frequency $30/\pi$ *Hz*
(d) Of amplitude 10^4 *metre* travelling along the negative X direction

17. A transverse wave of amplitude 0.5 *m* and wavelength 1 *m* and frequency 2 *Hz* is propagating in a string in the negative *x*-direction. The expression for this wave is [AIIMS 1980]

(a) $y(x,t) = 0.5\sin(2\pi x - 4\pi t)$
(b) $y(x,t) = 0.5\cos(2\pi x + 4\pi t)$
(c) $y(x,t) = 0.5\sin(\pi x - 2\pi t)$
(d) $y(x,t) = 0.5\cos(2\pi x + 2\pi t)$

18. The displacement of a particle is given by $y = 5\times 10^{-4}\sin(100t - 50x)$, where x is in meter and t in sec, find out the velocity of the wave [CPMT 1982]

(a) 5000 *m/sec* (b) 2 *m/sec*
(c) 0.5 *m/sec* (d) 300 *m/sec*

19. Which one of the following does not represent a travelling wave

(a) $y = \sin(x - v\,t)$ (b) $y = y_m\sin k(x + v\,t)$
(c) $y = y_m\log(x - v\,t)$ (d) $y = f(x^2 - v\,t^2)$

20. A wave represented by the given equation $Y = A\sin\left(10\,\pi\,x + 15\,\pi\,t + \frac{\pi}{3}\right)$, where x is in meter and t is in second. The expression represents [IIT 1990]

(a) A wave travelling in the positive X direction with a velocity of 1.5 *m/sec*
(b) A [CPMT 1986] wave travelling in the negative X direction with a velocity of 1.5 *m/sec*

(c) A wave travelling in the negative X direction with a wavelength of 0.2 m

(d) A wave travelling in the positive X direction with a wavelength of 0.2 m

21. A plane wave is described by the equation $y = 3\cos\left(\frac{x}{4} - 10t - \frac{\pi}{2}\right)$. The maximum velocity of the particles of the medium due to this wave is [MP PMT 1994]

(a) 30 (b) $\frac{3\pi}{2}$

(c) 3/4 (d) 40

22. The path difference between the two waves $y_1 = a_1 \sin\left(\omega t - \frac{2\pi x}{\lambda}\right)$ and $y_2 = a_2 \cos\left(\omega t - \frac{2\pi x}{\lambda} + \phi\right)$ is [MP PMT 1994]

(a) $\frac{\lambda}{2\pi}\phi$ (b) $\frac{\lambda}{2\pi}\left(\phi + \frac{\pi}{2}\right)$

(c) $\frac{2\pi}{\lambda}\left(\phi - \frac{\pi}{2}\right)$ (d) $\frac{2\pi}{\lambda}\phi$

23. Wave equations of two particles are given by $y_1 = a\sin(\omega t - kx)$, $y_2 = a\sin(kx + \omega t)$, then [BHU 1995]

(a) They are moving in opposite direction

(b) Phase between them is 90°

(c) Phase between them is 180°

(d) Phase between them is 0°

24. A wave is represented by the equation $y = 0.5\sin(10t - x)m$. It is a travelling wave propagating along the + x direction with velocity [Roorkee 1995]

(a) 10 m/s (b) 20 m/s

(c) 5 m/s (d) None of these

25. A wave is represented by the equation

$$y = 7\sin\left(7\pi t - 0.04\, x\pi + \frac{\pi}{3}\right)$$

x is in *metres* and t is in seconds. The speed of the wave is [MP PET 1996; AMU (Engg.) 1999]

(a) 175 m/sec (b) 49 $\pi m/sec$

(c) 49 $/\pi m/sec$ (d) 0.28 $\pi m/sec$

26. The equation of a transverse wave travelling on a rope is given by $y = 10\sin\pi(0.01x - 2.00t)$ where y and x are in cm and t in seconds. The maximum transverse speed of a particle in the rope is about [MP PET 1999; AIIMS 2000]

(a) 63 cm/s (b) 75 cm/s

(c) 100 cm/s (d) 121 cm/s

27. As a wave propagates [IIT-JEE 1999]

(a) The wave intensity remains constant for a plane wave

(b) The wave intensity decreases as the inverse of the distance from the source for a spherical wave

(c) The wave intensity decreases as the inverse square of the distance from the source for a spherical wave

(d) Total intensity of the spherical wave over the spherical surface centered at the source remains constant at all times

28. A transverse wave is represented by the equation

$$y = y_0 \sin\frac{2\pi}{\lambda}(vt - x)$$

For what value of λ, the maximum particle velocity equal to two times the wave velocity [CBSE PMT 1998; JIPMER 2001, 02; AFMC 2002]

(a) $\lambda = 2\pi y_0$ (b) $\lambda = \pi y_0 / 3$

(c) $\lambda = \pi y_0 / 2$ (d) $\lambda = \pi y_0$

29. A travelling wave in a stretched string is described by the equation $y = A\sin(kx - \omega t)$. The maximum particle velocity is [IIT 1997 Re-Exam; UPSEAT 2004]

(a) $A\omega$ (b) ω/k

(c) $d\omega/dk$ (d) x/t

30. A wave travels in a medium according to the equation of displacement given by

$$y(x, t) = 0.03\sin\pi(2t - 0.01x)$$

where y and x are in *metres* and t in seconds. The wavelength of the wave is [EAMCET 1994; CPMT 2004]

(a) 200 m (b) 100 m

(c) 20 m (d) 10 m

31. The particles of a medium vibrate about their mean positions whenever a wave travels through that medium. The phase difference between the vibrations of two such particles

(a) Varies with time

(b) Varies with distance separating them

(c) Varies with time as well as distance

(d) Is always zero

32. A wave is given by $y = 3\sin 2\pi\left(\frac{t}{0.04} - \frac{x}{0.01}\right)$, where y is in cm. Frequency of wave and maximum acceleration of particle will be

(a) $100\,Hz,\ 4.7\times10^3\ cm/s^2$ (b) $50\,Hz,\ 7.5\times10^3\ cm/s^2$

(c) $25\,Hz,\ 4.7\times10^4\ cm/s^2$ (d) $25\,Hz,\ 7.4\times10^4\ cm/s^2$

33. Equation of a progressive wave is given by

$$y = 4\sin\left\{\pi\left(\frac{t}{5} - \frac{x}{9}\right) + \frac{\pi}{6}\right\}$$

Then which of the following is correct [CBSE PMT 1993]

(a) $v = 5\,m/\sec$ (b) $\lambda = 18\,m$

(c) $a = 0.04\,m$ (d) $n = 50\,Hz$

34. With the propagation of a longitudinal wave through a material medium, the quantities transmitted in the propagation direction are [CBSE PMT

(a) Energy, momentum and mass

(b) Energy

(c) Energy and mass

(d) Energy and linear momentum

35. The frequency of the sinusoidal wave $y = 0.40\cos[2000\,t + 0.80\,x]$ would be [CBSE PMT 1992]

(a) 1000 π Hz (b) 2000 Hz

(c) 20 Hz (d) $\frac{1000}{\pi}Hz$

36. Which of the following equations represents a wave [CBSE PMT 1994; JIPMER 2000]

(a) $Y = A(\omega t - kx)$ (b) $Y = A\sin\omega t$

(c) $Y = A\cos kx$ (d) $Y = A\sin(at - bx + c)$

37. The equation of a transverse wave is given by

$y = 100\sin\pi(0.04z - 2t)$

where y and z are in *cm* ant t is in seconds. The frequency of the wave in *Hz* is [SCRA 1998]

(a) 1 (b) 2

(c) 25 (d) 100

38. The equation of a plane progressive wave is given by $y = 0.025\sin(100t + 0.25x)$. The frequency of this wave would be [CPMT 1993; JIPMER 2001, 02]

(a) $\frac{50}{\pi}Hz$ (b) $\frac{100}{\pi}Hz$

(c) 100 *Hz* (d) 50 *Hz*

39. The equation of a sound wave is

$y = 0.0015\sin(62.4x + 316t)$

The wavelength of this wave is [CBSE PMT 1996; AFMC 2002; AIIMS 2002]

(a) 0.2 unit (b) 0.1 unit

(c) 0.3 unit (d) Cannot be calculated

40. In the given progressive wave equation, what is the maximum velocity of particle $Y = 0.5\sin(10\pi t - 5x)$ *cm* [BHU 1997]

(a) 5 *cm/s* (b) 5π *cm/s*

(c) 10 *cm/s* (d) 10.5 *cm/s*

41. A pulse or a wave train travels along a stretched string and reaches the fixed end of the string. It will be reflected back with

(a) The same phase as the incident pulse but with velocity reversed

(b) A phase change of 180° with no reversal of velocity

(c) The same phase as the incident pulse with no reversal of velocity

(d) A phase change of 180° with velocity reversed

42. The equation of a travelling wave is

$y = 60\cos(1800t - 6x)$

where y is in microns, t in seconds and x in metres. The ratio of maximum particle velocity to velocity of wave propagation is [CBSE PMT 1997; JIPMER 2001, 02]

(a) 3.6×10^{-11} (b) 3.6×10^{-6}

(c) 3.6×10^{-4} (d) 3.6

43. The wave equation is $y = 0.30\sin(314t - 1.57x)$ where *t*, *x* and *y* are in second, meter and centimeter respectively. The speed of the wave is [CPMT 1997; AFMC 1999; CPMT 2001]

(a) 100 *m/s* (b) 200 *m/s*

(c) 300 *m/s* (d) 400 *m/s*

44. Equation of the progressive wave is given by : $y = a\sin\pi(40t - x)$ where a and x are in *metre* and t in second. The velocity of the wave is [KCET 1999]

(a) 80 *m/s* (b) 10 *m/s*

(c) 40 *m/s* (d) 20 *m/s*

45. Progressive wave of sound is represented by $y = a\sin[400\pi t - \pi x / 6.85]$ where x is in m and t is in sec. Frequency of the wave will be [RPMT 1999]

(a) 200 *Hz* (b) 400 *Hz*

(c) 500 *Hz* (d) 600 *Hz*

46. Two waves of frequencies 20 *Hz* and 30 *Hz*. Travels out from a common point. The phase difference between them after 0.6 *sec* is

(a) Zero (b) $\frac{\pi}{2}$

(c) π (d) $\frac{3\pi}{4}$

47. The phase difference between two points separated by 0.8 *m* in a wave of frequency 120 *Hz* is 90^o. Then the velocity of wave will be

(a) 192 *m/s* (b) 360 *m/s*

(c) 710 *m/s* (d) 384 *m/s*

48. The equation of progressive wave is $y = 0.2\sin 2\pi\left[\frac{t}{0.01} - \frac{x}{0.3}\right]$, where x and y are in metre and t is in second. The velocity of propagation of the wave is

(a) 30 *m/s* (b) 40 *m/s*

(c) 300 *m/s* (d) 400 *m/s*

49. If the equation of transverse wave is $y = 5\sin 2\pi\left[\frac{t}{0.04} - \frac{x}{40}\right]$, where distance is in *cm* and time in second, then the wavelength of the wave is [MH CET 2000; DPMT 2003]

(a) 60 *cm* (b) 40 *cm*

(c) 35 *cm* (d) 25 *cm*

50. A wave is represented by the equation : $y = a\sin(0.01x - 2t)$ where *a* and *x* are in *cm*. velocity of propagation of wave is [CBSE PMT 1997] [EAMCET 1994; AIIMS 2000; Pb. PMT 2003]

(a) 10 *cm/s* (b) 50 *cm/s*

(c) 100 *cm/s* (d) 200 *cm/s*

51. A simple harmonic progressive wave is represented by the equation : $y = 8\sin 2\pi(0.1x - 2t)$ where x and y are in *cm* and t is in seconds. At any instant the phase difference between two particles separated by 2.0 *cm* in the *x*-direction is [MP PMT 2000]

(a) 18° (b) 36°

(c) 54° (d) 72°

52. The intensity of a progressing plane wave in loss-free medium is

(a) Directly proportional to the square of amplitude of the wave

(b) Directly proportional to the velocity of the wave

(c) Directly proportional to the square of frequency of the wave

(d) Inversely proportional to the density of the medium

53. The equation of progressive wave is $y = a\sin(200t - x)$. where x is in meter and t is in second. The velocity of wave is

(a) 200 *m/sec* (b) 100 *m/sec*

(c) 50 *m/sec* (d) None of these

54. A wave is represented by the equation $y = 7\sin\{\pi(2t - 2x)\}$ where x is in *metres* and t in seconds. The velocity of the wave is [CPMT 2000; CBSE PMT 2000; Pb. PET 2000]

(a) 1 *m/s* (b) 2 *m/s*

(c) 5 *m/s* (d) 10 *m/s*

55. The equation of a longitudinal wave is represented as $y = 20\cos\pi(50t - x)$. Its wavelength is

[UPSEAT 2001; Orissa PMT 2004]

(a) 5 *cm* (b) 2 *cm*

(c) 50 *cm* (d) 20 *cm*

56. A wave equation which gives the displacement along *y*-direction is given by $y = 0.001\sin(100t + x)$ where *x* and *y* are in meterand *t* is time in second. This represented a wave

[UPSEAT 2001]

(a) Of frequency $\frac{100}{\pi}$ *Hz*

(b) Of wavelength one metre

(c) Travelling with a velocity of $\frac{50}{\pi}$ *ms* in the positive *X*-direction

(d) Travelling with a velocity of 100 *ms* in the negative *X*-direction

57. A transverse wave is given by $y = A\sin 2\pi\left(\frac{t}{T} - \frac{x}{\lambda}\right)$. The maximum particle velocity is equal to 4 times the wave velocity when [MP PMT 2001]

(a) $\lambda = 2\pi A$ (b) $\lambda = \frac{1}{2}\pi A$

(c) $\lambda = \pi A$ (d) $\lambda = \frac{1}{4}\pi A$

58. The equation of a wave is represented by $y = 10^{-4}\sin\left[100\,t - \frac{x}{10}\right]$. The velocity of the wave will be

[CBSE PMT 2001]

(a) 100 *m/s* (b) 250 *m/s*

(c) 750 *m/s* (d) 1000 *m/s*

59. A wave travelling in positive X-direction with $A = 0.2m$ has a velocity of 360 *m/sec*. if $\lambda = 60m$, then correct expression for the wave is [CBSE PMT 2002; KCET 2003]

(a) $y = 0.2\sin\left[2\pi\left(6t + \frac{x}{60}\right)\right]$ (b) $y = 0.2\sin\left[\pi\left(6t + \frac{x}{60}\right)\right]$

(c) $y = 0.2\sin\left[2\pi\left(6t - \frac{x}{60}\right)\right]$ (d) $y = 0.2\sin\left[\pi\left(6t - \frac{x}{60}\right)\right]$

60. The equation of a wave motion (with t in seconds and x in *metres*) is given by $y = 7\sin\left[7\pi t - 0.4\pi x + \frac{\pi}{3}\right]$. The velocity of the wave will be

[BHU 2002]

(a) 17.5 *m/s* (b) 49π *m/s*

(c) $\frac{49}{2\pi} m/s$ (d) $\frac{2\pi}{49} m/s$

61. Two waves represented by the following equations are travelling in the same medium $y_1 = 5\sin 2\pi(75t - 0.25x)$, $y_2 = 10\sin 2\pi(150t - 0.50x)$

The intensity ratio I_1 / I_2 of the two waves is

[UPSEAT 2002]

(a) 1 : 2 (b) 1 : 4

(c) 1 : 8 (d) 1 : 16

62. The equation of a progressive wave is $y = 8\sin\left[\pi\left(\frac{t}{10} - \frac{x}{4}\right) + \frac{\pi}{3}\right]$. The wavelength of the wave is

[MH CET 2002]

(a) 8 *m* (b) 4 *m*

(c) 2 *m* (d) 10 *m*

63. Which of the following is not true for this progressive wave $y = 4\sin 2\pi\left(\frac{t}{0.02} - \frac{x}{100}\right)$ where y and x are in cm & t in *sec* [CPMT 2003]

(a) Its amplitude is 4 *cm*

(b) Its wavelength is 100 *cm*

(c) Its frequency is 50 *cycles/sec*

(d) Its propagation velocity is 50×10^3 *cm/sec*

64. The equation of a wave is given as $y = 0.07\sin(12\pi x - 3000\pi t)$. Where x is in *metre* and t in sec, then the correct statement is

(a) $\lambda = 1/6m, v = 250m/s$ (b) $a = 0.07m, v = 300m/s$

(c) $n = 1500, v = 200m/s$ (d) None

65. The equation of the propagating wave is $y = 25\sin(20t + 5x)$, where y is displacement. Which of the following statement is not true [MP PET 2003]

(a) The amplitude of the wave is 25 units

(b) The wave is propagating in positive X-direction

(c) The velocity of the wave is 4 units

(d) The maximum velocity of the particles is 500 units

66. In a plane progressive wave given by $y = 25\cos(2\pi t - \pi x)$, the amplitude and frequency are respectively

[BCECE 2003]

(a) 25,100 (b) 25, 1

(c) 25, 2 (d) 50π, 2

67. The displacement y of a wave travelling in the *x*-direction is given by $y = 10^{-4}\sin\left(600t - 2x + \frac{\pi}{3}\right)$ metres, where x is expressed in metres and t in seconds. The speed of the wave-motion, in *ms*, is

(a) 200 (b) 300

(c) 600 (d) 1200

68. The displacement *y* of a particle in a medium can be expressed as: $y = 10^{-6}\sin(100t + 20x + \pi/4)m$, where *t* is in second and *x* in *meter*. The speed of wave is

[AIEEE 2004]

(a) 2000 *m/s* (b) 5 *m/s*

(c) 20 *m/s* (d) $5\pi\, m/s$

69. If the wave equation $y = 0.08\sin\frac{2\pi}{\lambda}(200t - x)$ then the velocity of the wave will be [BCECE 2004]

(a) $400\sqrt{2}$ (b) $200\sqrt{2}$

(c) 400 (d) 200

70. The phase difference between two points separated by 0.8 m in a wave of frequency is 120 Hz is $\frac{\pi}{2}$. The velocity of wave is

(a) 720 m/s (b) 384 m/s

(c) 250 m/s (d) 1 m/s

71. A plane progressive wave is represented by the equation

$y = 0.1\sin\left(200\pi t - \frac{20\pi x}{17}\right)$ where y is displacement in m, t in second and x is distance from a fixed origin in *meter*. The frequency, wavelength and speed of the wave respectively are

(a) 100 Hz, 1.7 m, 170 m/s (b) 150 Hz, 2.4 m, 200 m/s

(c) 80 Hz, 1.1 m, 90 m/s (d) 120 Hz, 1.25 m, 207 m/s

72. The equation of a travelling wave is given by

$y = 0.5\sin(20x - 400t)$ where x and y are in *meter* and t is in *second*. The velocity of the wave is [UPSEAT 2004]

(a) 10 m/s (b) 20 m/s

(c) 200 m/s (d) 400 m/s

73. A transverse progressive wave on a stretched string has a velocity of $10\,ms^{-1}$ and a frequency of 100 Hz. The phase difference between two particles of the string which are 2.5 cm apart will be

(a) $\frac{\pi}{8}$ (b) $\frac{\pi}{4}$

(c) $\frac{3\pi}{8}$ (d) $\frac{\pi}{2}$

74. A transverse sinusoidal wave of amplitude a, wavelength λ and frequency n is travelling on a stretched string. The maximum speed of any point on the string is $v/10$, where v is the speed of propagation of the wave. If $a = 10^{-3}\,m$ and $v = 10\,ms^{-1}$, then λ and n are given by [IIT 1998]

(a) $\lambda = 2\pi \times 10^{-2}\,m$ (b) $\lambda = 10^{-3}\,m$

(c) $n = \frac{10^3}{2\pi} Hz$ (d) $n = 10^4\,Hz$

75. When a longitudinal wave propagates through a medium, the particles of the medium execute simple harmonic oscillations about their mean positions. These oscillations of a particle are characterised by an invariant

[SCRA 1998]

(a) Kinetic energy

(b) Potential energy

(c) Sum of kinetic energy and potential energy

(d) Difference between kinetic energy and potential energy

76. Equation of a progressive wave is given by $y = a\sin\pi\left[\frac{t}{2} - \frac{x}{4}\right]$, where t is in seconds and x is in meters. The distance through which the wave moves in 8 *sec* is (in meter)

(a) 8 (b) 16

(c) 2 (d) 4

77. The phase difference between two waves represented by $y_1 = 10^{-6}\sin[100t + (x/50) + 0.5]m$

$y_2 = 10^{-6}\cos[100\,t + (x/50)]m$

where x is expressed in metres and t is expressed in seconds, is approximately [CBSE PMT 2004]

(a) 1.5 *rad* (b) 1.07 *rad*

(c) 2.07 *rad* [Pb. PET 2000] (d) 0.5 *rad*

78. Equation of motion in the same direction are given by

$y_1 = 2a\sin(\omega t - kx)$ and $y_2 = 2a\sin(\omega t - kx - \theta)$

The amplitude of the medium particle will be [CPMT 2004]

(a) $2a\cos\theta$ (b) $\sqrt{2}a\cos\theta$

(c) $4a\cos\theta/2$ (d) $\sqrt{2}a\cos\theta/2$

79. A particle on the trough of a wave at any instant will come to the mean position after a time (T = time period) [Pb. PET 2001]

[KCET 2005]

(a) $T/2$ (b) $T/4$

(c) T (d) $2T$

80. If the equation of transverse wave is $Y = 2\sin(kx - 2t)$, then the maximum particle velocity is [Orissa JEE 2005]

(a) 4 units (b) 2 units

(c) 0 (d) 6 units

Interference and Superposition of Waves

1. There is a destructive [MP PMT 1994] interference between the two waves of wavelength λ coming from two different paths at a point. To get maximum sound or constructive interference at that point, the path of one wave is to be increased by

[MP PET 1985]

(a) $\frac{\lambda}{4}$ (b) $\frac{\lambda}{2}$

(c) $\frac{3\lambda}{4}$ (d) λ

2. When two sound waves with a phase difference of $\pi/2$, and each having amplitude A and frequency ω, are superimposed on each other, then the maximum amplitude and frequency of resultant wave is [MP PMT 1989]

(a) $\frac{A}{\sqrt{2}} : \frac{\omega}{2}$ (b) $\frac{A}{\sqrt{2}} : \omega$

(c) $\sqrt{2}\,A : \frac{\omega}{2}$ (d) $\sqrt{2}\,A : \omega$

3. If the phase difference between the two wave is 2π during superposition, then the resultant amplitude is

[DPMT 2001]

(a) Maximum (b) Minimum

(c) Maximum or minimum (d) None of the above

4. The superposition takes place between two waves of frequency f and amplitude a. The total intensity is directly proportional to

(a) a (b) $2a$

[KCET 1998] (c) $2a^2$ (d) $4a^2$

5. If two waves of same frequency and same amplitude respectively, on superimposition produced a resultant disturbance of the same amplitude, the waves differ in phase by

(a) π (b) $2\pi/3$

(c) $\pi / 2$ (d) Zero

6. Two sources of sound *A* and *B* produces the wave of 350 *Hz*, they vibrate in the same phase. The particle P is vibrating under the influence of these two waves, if the amplitudes at the point *P* produced by the two waves is 0.3 *mm* and 0.4 *mm*, then the resultant amplitude of the point *P* will be when *AP* – *BP* = 25 *cm* and the velocity of sound is 350 *m/sec*

(a) 0.7 *mm* (b) 0.1 *mm*

(c) 0.2 *mm* (d) 0.5 *mm*

7. Two waves are propagating to the point *P* along a straight line produced by two sources *A* and *B* of simple harmonic and of equal frequency. The amplitude of every wave at *P* is '*a*' and the phase of *A* is ahead by $\frac{\pi}{3}$ than that of *B* and the distance *AP* is greater than *BP* by 50 *cm*. Then the resultant amplitude at the point *P* will be, if the wavelength is 1 *meter* [BVP 2003]

(a) $2a$ (b) $a\sqrt{3}$

(c) $a\sqrt{2}$ (d) a

8. Coherent sources are characterized by the same [KCET 1993]

(a) Phase and phase velocity

(b) Wavelength, amplitude and phase velocity

(c) Wavelength, amplitude and frequency

(d) Wavelength and phase

9. The minimum intensity of sound is zero at a point due to two sources of nearly equal frequencies, when

(a) Two sources are vibrating in opposite phase

(b) The amplitude of two sources are equal

(c) At the point of observation, the amplitudes of two S.H.M. produced by two sources are equal and both the S.H.M. are along the same straight line

(d) Both the sources are in the same phase

10. Two sound waves (expressed in CGS units) given by $y_1 = 0.3\sin\frac{2\pi}{\lambda}(vt - x)$ and $y_2 = 0.4\sin\frac{2\pi}{\lambda}(vt - x + \theta)$ interfere. The resultant amplitude at a place where phase difference is $\pi / 2$ will be [MP PET 1991]

(a) 0.7 *cm* (b) 0.1 *cm*

(c) 0.5 *cm* (d) $\frac{1}{10}\sqrt{7}\ cm$

11. If two waves having amplitudes 2*A* and *A* and same frequency and velocity, propagate in the same direction in the same phase, the resulting amplitude will be [MP PET 1991; DPMT 1999]

(a) $3A$ (b) $\sqrt{5}A$

(c) $\sqrt{2}A$ (d) A

12. The intensity ratio of two waves is 1 : 16. The ratio of their amplitudes is [EAMCET 1983]

(a) 1 : 16 (b) 1 : 4

(c) 4 : 1 (d) 2 : 1

13. Out of the given four waves (1), (2), (3) and (4)

$y = a\sin(kx + \omega t)$ ......(1)

$y = a\sin(\omega t - kx)$ ......(2)

$y = a\cos(kx + \omega t)$ ......(3)

$y = a\cos(\omega t - kx)$ ......(4)

emitted by four different sources S_1, S_2, S_3 and S_4 respectively, interference phenomena would be observed in space under appropriate conditions when [CPMT 1988]

(a) Source S_1 emits wave (1) and S_2 emits wave (2)

(b) Source S_3 emits wave (3) and S_4 emits wave (4)

(c) Source S_2 emits wave (2) and S_4 emits wave (4)

(d) S_4 emits waves (4) and S_3 emits waves (3)

14. Two waves of same frequency and intensity superimpose with each other in opposite phases, then after superposition the

(a) Intensity increases by 4 times

(b) Intensity increases by two times

(c) Frequency increases by 4 times

(d) None of these

15. The superposing waves are represented by the following equations :

$y_1 = 5\sin 2\pi(10\,t - 0.1x)$, $y_2 = 10\sin 2\pi(20\,t - 0.2x)$

Ratio of intensities $\frac{I_{max}}{I_{min}}$ will be [AIIMS 1995; KCET 2001]

(a) 1 (b) 9

(c) 4 (d) 16

16. The displacement of a particle is given by

$x = 3\sin(5\pi\,t) + 4\cos(5\pi\,t)$

The amplitude of the particle is [MP PMT 1999]

(a) 3 (b) 4

(c) 5 (d) 7

17. Two waves

$y_1 = A_1\sin(\omega t - \beta_1)$, $y_2 = A_2\sin(\omega t - \beta_2)$

Superimpose to form a resultant wave whose amplitude is [CPMT 1999]

(a) $\sqrt{A_1^2 + A_2^2 + 2A_1A_2\cos(\beta_1 - \beta_2)}$

(b) $\sqrt{A_1^2 + A_2^2 + 2A_1A_2\sin(\beta_1 - \beta_2)}$

(c) $A_1 + A_2$

(d) $|\ A_1 + A_2\ |$

18. If the ratio of amplitude of wave is 2 : 1, then the ratio of maximum and minimum intensity is [MH CET 1999]

(a) 9 : 1 (b) 1 : 9

(c) 4 : 1 (d) 1 : 4

19. The two interfering waves have intensities in the ratio 9 : 4. The ratio of intensities of maxima and minima in the interference pattern will be [AMU 2000]

(a) 1 : 25 (b) 25 : 1

(c) 9 : 4 (d) 4 : 9

20. If the ratio of amplitude of two waves is 4 : 3. Then the ratio of maximum and minimum intensity will be [MHCET 2000]

(a) 16 : 18 (b) 18 : 16
(c) 49 : 1 (d) 1 : 49

21. Equation of motion in the same direction is given by $y_1 = A\sin(\omega t - kx)$, $y_2 = A\sin(\omega t - kx - \theta)$. The amplitude of the medium particle will be [BHU 2003]

(a) $2A\cos\frac{\theta}{2}$ (b) $2A\cos\theta$
(c) $\sqrt{2}A\cos\frac{\theta}{2}$ (d) $1.2f, 1.2\lambda$

22. Two waves having the intensities in the ratio of 9 : 1 produce interference. The ratio of maximum to the minimum intensity, is equal to

[CPMT 2001; Pb. PET 2004]

(a) 2 : 1 (b) 4 : 1
(c) 9 : 1 (d) 10 : 8

23. The displacement of the interfering light waves are $y_1 = 4\sin\omega t$ and $y_2 = 3\sin\left(\omega t + \frac{\pi}{2}\right)$. What is the amplitude of the resultant wave

[RPMT 1996; Orissa JEE 2005]

(a) 5 (b) 7
(c) 1 (d) 0

24. Two waves are represented by $y_1 = a\sin\left(\omega t + \frac{\pi}{6}\right)$ and $y_2 = a\cos\omega t$. What will be their resultant amplitude

[RPMT 1996]

(a) a (b) $\sqrt{2}\,a$
(c) $\sqrt{3}\,a$ (d) $2a$

25. The amplitude of a wave represented by displacement equation $y = \frac{1}{\sqrt{a}}\sin\omega t \pm \frac{1}{\sqrt{b}}\cos\omega t$ will be

[BVP 2003]

(a) $\frac{a+b}{ab}$ (b) $\frac{\sqrt{a}+\sqrt{b}}{ab}$
(c) $\frac{\sqrt{a}\pm\sqrt{b}}{ab}$ (d) $\sqrt{\frac{a+b}{ab}}$

26. Two waves having equations

$$x_1 = a\sin(\omega t + \phi_1),\ x_2 = a\sin(\omega t + \phi_2)$$

If in the resultant wave the frequency and amplitude remain equal to those of superimposing waves. Then phase difference between them is [CBSE PMT 2001]

(a) $\frac{\pi}{6}$ (b) $\frac{2\pi}{3}$
(c) $\frac{\pi}{4}$ (d) $\frac{\pi}{3}$

Beats

1. Two tuning forks when sounded together produced 4 *beats/sec*. The frequency of one fork is 256. The number of beats heard increases when the fork of frequency 256 is loaded with wax. The frequency of the other fork is

[CPMT 1976; MP PMT 1993]

(a) 504 (b) 520
(c) 260 (d) 252

2. Beats are the result of

[CPMT 1971; J & K CET 2002]

(a) Diffraction
(b) Destructive interference
(c) Constructive and destructive interference
(d) Superposition of two waves of nearly equal frequency

3. Two adjacent piano keys are struck simultaneously. The notes emitted by them have frequencies n_1 and n_2. The number of beats heard per second is

[CPMT 1974, 78; CBSE PMT 1993]

(a) $\frac{1}{2}(n_1 - n_2)$ (b) $\frac{1}{2}(n_1 + n_2)$
(c) $n_1 \sim n_2$ (d) $2(n_1 - n_2)$

4. A tuning fork of frequency 100 when sounded together with another tuning fork of unknown frequency produces 2 beats per second. On loading the tuning fork whose frequency is not known and sounded together with a tuning fork of frequency 100 produces one beat, then the frequency of the other tuning fork is

(a) 102 (b) 98
(c) 99 (d) 101

5. A tuning fork sounded together with a tuning fork of frequency 256 emits two beats. On loading the tuning fork of frequency 256, the number of beats heard are 1 per second. The frequency of tuning fork is

[NCERT 1975, 81; MP PET 1985]

(a) 257 (b) 258
(c) 256 (d) 254

6. If two tuning forks *A* and *B* are sounded together, they produce 4 beats per second. *A* is then slightly loaded with wax, they produce 2 beats when sounded again. The frequency of *A* is 256. The frequency of *B* will be

[CPMT 1976; RPET 1998]

(a) 250 (b) 252
(c) 260 (d) 262

7. The frequencies of two sound sources are 256 *Hz* and 260 *Hz*. At $t = 0$, the intensity of sound is maximum. Then the phase difference at the time $t = 1/16$ *sec* will be

(a) Zero (b) π
(c) $\pi/2$ (d) $\pi/4$

8. Two tuning forks have frequencies 450 *Hz* and 454 *Hz* respectively. On sounding these forks together, the time interval between successive maximum intensities will be

[MP PET 1989; MP PMT 2003]

(a) 1/4 *sec* (b) 1/2 *sec*
(c) 1 *sec* (d) 2 *sec*

9. When a tuning fork of frequency 341 is sounded with another tuning fork, six beats per second are heard. When the second tuning fork is loaded with wax and sounded with the first tuning fork, the number of beats is two per second. The natural frequency of the second tuning fork is

[MP PET 1989]

(a) 334 (b) 339

(c) 343 (d) 347

10. Two tuning forks of frequencies 256 and 258 vibrations/sec are sounded together, then time interval between consecutive maxima heard by the observer is

[MP PET/PMT 1988]

(a) 2 *sec* (b) 0.5 *sec*

(c) 250 *sec* (d) 252 *sec*

11. A tuning fork gives 5 beats with another tuning fork of frequency 100 *Hz*. When the first tuning fork is loaded with wax, then the number of beats remains unchanged, then what will be the frequency of the first tuning fork

[MP PMT 1985]

(a) 95 *Hz* (b) 100 *Hz*

(c) 105 *Hz* (d) 110 *Hz*

12. Tuning fork F_1 has a frequency of 256 *Hz* and it is observed to produce 6 beats/second with another tuning fork F_2. When F_2 is loaded with wax, it still produces 6 beats/second with F_1. The frequency of F_2 before loading was

[MP PET 1990]

(a) 253 *Hz* (b) 262 *Hz*

(c) 250 *Hz* (d) 259 *Hz*

13. A tuning fork and a sonometer wire were sounded together and produce 4 beats per second. When the length of sonometer wire is 95 *cm* or 100 *cm*, the frequency of the tuning fork is

(a) 156 *Hz* (b) 152 *Hz*

(c) 148 *Hz* (d) 160 *Hz*

14. Two tuning forks *A* and *B* vibrating simultaneously produce 5 beats. Frequency of *B* is 512. It is seen that if one arm of *A* is filed, then the number of beats increases. Frequency of A will be

(a) 502 (b) 507

(c) 517 (d) 522

15. The beats are produced by two sound sources of same amplitude and of nearly equal frequencies. The maximum intensity of beats will be ...... that of one source

[CPMT 1999]

(a) Same (b) Double

(c) Four times (d) Eight times

16. Beats are produced by two waves given by $y_1 = a\sin 2000\,\pi t$ and $y_2 = a\sin 2008\,\pi t$. The number of beats heard per second is

(a) Zero (b) One

(c) Four (d) Eight

17. A tuning fork whose frequency as given by manufacturer is 512 *Hz* is being tested with an accurate oscillator. It is found that the fork produces a beat of 2 *Hz* when oscillator reads 514 *Hz* but produces a beat of 6 *Hz* when oscillator reads 510 *Hz*. The actual frequency of fork is

[MNR 1979; RPMT 1999]

(a) 508 *Hz* (b) 512 *Hz*

(c) 516 *Hz* (d) 518 *Hz*

18. A tuning fork of frequency 480 *Hz* produces 10 beats per second when sounded with a vibrating sonometer string. What must have been the frequency of the string if a slight increase in tension produces lesser beats per second than before

(a) 460 *Hz* (b) 470 *Hz*

(c) 480 *Hz* (d) 490 *Hz*

19. When a tuning fork *A* of unknown frequency is sounded with another tuning fork *B* of frequency 256 *Hz*, then 3 beats per second are observed. After that *A* is loaded with wax and sounded, the again 3 beats per second are observed. The frequency of the tuning fork *A* is

[MP PMT 1994]

(a) 250 *Hz* (b) 253 *Hz*

(c) 259 *Hz* (d) 262 *Hz*

20. A source of sound gives five beats per second when sounded with another source of frequency $100\,s^{-1}$. The second harmonic of the source together with a source of frequency $205\,s^{-1}$ gives five beats per second. What is the frequency of the source

(a) $105\,s^{-1}$ (b) $205\,s^{-1}$

(c) $95\,s^{-1}$ (d) $100\,s^{-1}$

21. When two sound waves are superimposed, beats are produced when they have [MP PET 1995; CBSE PMT 1992, 99; DCE 2000; DPMT 2000, 01]

(a) Different amplitudes and phases

(b) Different velocities

(c) Different phases

(d) Different frequencies

22. Two tuning forks *A* and *B* give 4 beats per second. The frequency of *A* is 256 *Hz*. On loading *B* slightly, we get 5 beats in 2 seconds. The frequency of *B* after loading is [MP PMT 1990]

[Haryana CEE 1996]

(a) 253.5 *Hz* (b) 258.5 *Hz*

(c) 260 *Hz* [MP PMT 1991] (d) 252 *Hz*

23. A tuning fork *A* of frequency 200 *Hz* is sounded with fork *B*, the number of beats per second is 5. By putting some wax on *A*, the number of beats increases to 8. The frequency of fork *B* is

(a) 200 *Hz* (b) 195 *Hz*

(c) 192 *Hz* (d) 205 *Hz*

24. Two tuning forks, *A* and *B*, give 4 *beats per second* when sounded together. The frequency of *A* is 320 *Hz*. When some wax is added to *B* and it is sounded with *A*, 4 *beats per second* are again heard. The frequency of *B* is

[MP PMT 1997]

[CPMT 1990; DCE 1999]

(a) 312 *Hz* (b) 316 *Hz*

(c) 324 *Hz* (d) 328 *Hz*

25. Two tuning forks have frequencies 380 and 384 *Hz* respectively. When they are sounded together, they produce 4 beats. After hearing the maximum sound, how long will it take to hear the minimum sound

[MP PMT/PET 1998]

(a) $\frac{1}{2}$ *sec* (b) $\frac{1}{4}$ *sec*

(c) $\frac{1}{8}$ *sec* (d) $\frac{1}{16}$ *sec*

26. Beats are produced with the help of two sound waves of amplitudes 3 and 5 *units*. The ratio of maximum to minimum intensity in the beats is [MP PMT 1999]

(a) 2 : 1 (b) 5 : 3

(c) 4 : 1 (d) 16 : 1

27. Two waves of lengths 50 *cm* and 51 *cm* produced 12 beats per second. The velocity of sound is

[CBSE PMT 1999; Pb. PET 2001; AFMC 2003]

(a) 306 *m/s* (b) 331 *m/s*

(c) 340 *m/s* (d) 360 *m/s*

28. Two waves $y = 0.25 \sin 316\,t$ and $y = 0.25 \sin 310\,t$ are travelling in same direction. The number of beats produced per second will be

[CPMT 1993; JIPMER 2000]

(a) 6 (b) 3

(c) $3/\pi$ (d) 3π

29. The couple of tuning forks produces 2 beats in the time interval of 0.4 seconds. So the beat frequency is

[CPMT 1996]

(a) 8 *Hz* (b) 5 *Hz*

(c) 2 *Hz* (d) 10 *Hz*

30. An unknown frequency *x* produces 8 beats per seconds with a frequency of 250 *Hz* and 12 beats with 270 *Hz* source, then *x* is

(a) 258 *Hz* (b) 242 *Hz*

(c) 262 *Hz* (d) 282 *Hz*

31. Beats are produced by two waves

$$y_1 = a \sin 1000\pi t,\ \ y_2 = a \sin 998\pi t$$

The number of beats heard/sec is [KCET 1998]

(a) 0 (b) 2

(c) 1 (d) 4

32. The wavelengths of two waves are 50 and 51 *cm* respectively. If the temperature of the room is 20°*C*, then what will be the number of beats produced per second by these waves, when the speed of sound at 0°*C* is 332 *m/sec*

[UPSEAT 1999]

(a) 14 (b) 10

(c) 24 (d) None of these

33. Maximum number of beats frequency heard by a human being is

(a) 10 (b) 4

(c) 20 (d) 6

34. Two sound waves of slightly different frequencies propagating in the same direction produce beats due to

[MP PET 2000]

(a) Interference (b) Diffraction

(c) Polarization (d) Refraction

35. On sounding tuning fork *A* with another tuning fork *B* of frequency 384 *Hz*, 6 *beats* are produced per second. After loading the prongs of *A* with some wax and then sounding it again with *B*, 4 beats are produced per second. What is the frequency of the tuning fork *A*

[MP PMT 2000]

(a) 388 *Hz* (b) 380 *Hz*

(c) 378 *Hz* (d) 390 *Hz*

36. It is possible to hear beats from the two vibrating sources of frequency [UPSEAT 2001]

(a) 100 *Hz* and 150 *Hz* (b) 20 *Hz* and 25 *Hz*

(c) 400 *Hz* and 500 *Hz* (d) 1000 *Hz* and 1500 *Hz*

37. A tuning fork gives 4 beats with 50 cm length of a sonometer wire. If the length of the wire is shortened by 1 cm, the number of beats is still the same. The frequency of the fork is

(a) 396 (b) 400

(c) 404 (d) 384

38. Two sound waves of wavelengths 5*m* and 6*m* formed 30 beats in 3 seconds. The velocity of sound is

[EAMCET 2001]

(a) 300 ms^{-1} (b) 310 ms^{-1}

(c) 320 ms^{-1} (d) 330 ms^{-1}

39. The wavelength of a particle is 99 cm and that of other is 100 cm. Speed of sound is 396 m/s. The number of beats heard is

(a) 4 (b) 5

(c) 1 (d) 8

40. A tuning fork arrangement (pair) produces 4 *beats/sec* with one fork of frequency 288 *cps*. A little wax is placed on the unknown fork and it then produces 2 *beats/sec*. The frequency of the unknown fork is

[CPMT 1997; KCET 2000] [KCET 1998; AIEEE 2002]

(a) 286 *cps* (b) 292 *cps*

(c) 294 *cps* (d) 288 *cps*

41. A tuning fork vibrates with 2 beats in 0.04 second. The frequency of the fork is [AFMC 2003]

(a) 50 *Hz* (b) 100 *Hz*

(c) 80 *Hz* (d) None of these

42. Two sound sources when sounded simultaneously produce four beats in 0.25 second. the difference in their frequencies must be

(a) 4 (b) 8

(c) 16 (d) 1

43. A tuning fork of known frequency 256 *Hz* makes 5 beats per second with the vibrating string of a piano. The beat frequency decreases to 2 beats per second when the tension in the piano string is slightly increased. The frequency of the piano string before increasing the tension was

[RPMT 2000] [AIEEE 2003]

(a) 256 + 5 *Hz* (b) 256 + 2*Hz*

(c) 256 – 2 *Hz* (d) 256 – 5*Hz*

44. When temperature increases, the frequency of a tuning fork

[AIEEE 2002]

(a) Increases

(b) Decreases

(c) Remains same

(d) Increases or decreases depending on the material

45. Two strings *X* and *Y* of a sitar produce a beat frequency 4 *Hz*. When the tension of the string *Y* is slightly increased the beat frequency is found to be 2 *Hz*. If the frequency of *X* is 300 *Hz*, then the original frequency of *Y* was

[UPSEAT 2000]

(a) 296 *Hz* (b) 298 *Hz*

(c) 302 *Hz* (d) 304 *Hz*

46. The frequency of tuning forks *A* and *B* are respectively 3% more and 2% less than the frequency of tuning fork *C*. When *A* and *B* are simultaneously excited, 5 beats per second are produced. Then the frequency of the tuning fork '*A*' (in *Hz*) is

(a) 98 (b) 100

(c) 103 (d) 105

47. When a tuning fork vibrates, the waves produced in the fork are

(a) Longitudinal (b) Transverse

(c) Progressive (d) Stationary

48. Two vibrating tuning forks produce progressive waves given by $Y_1 = 4\sin 500\pi t$ and $Y_2 = 2\sin 506\pi t$. Number of beats produced per minute is [CBSE PMT 2005]

(a) 360 (b) 180

(c) 3 (d) 60

49. When a tuning fork produces sound waves in air, which one of the following is same in the material of tuning fork as well as in air

(a) Wavelength (b) Frequency

(c) Velocity (d) Amplitude

50. The disc of a siren containing 60 holes rotates at a constant speed of 360 *rpm*. The emitted sound is in unison with a tuning fork of frequency [KCET 2005]

(a) 10 *Hz* (b) 360 *Hz*

(c) 216 *Hz* (d) 6 *Hz*

51. A sound source of frequency 170 *Hz* is placed near a wall. A man walking from a source towards the wall finds that there is a periodic rise and fall of sound intensity. If the speed of sound in air is 340 *m/s* the distance (in *metres*) separating the two adjacent positions of minimum intensity is

[MNR 1992; UPSEAT 2000; CPMT 2002]

(a) 1/2 (b) 1

(c) 3/2 (d) 2

Stationary Waves

1. The distance between the nearest node and antinode in a stationary wave is

[MP PET 1984; CBSE PMT 1993; AFMC 1996; RPET 2002]

(a) λ (b) $\frac{\lambda}{2}$

(c) $\frac{\lambda}{4}$ (d) 2λ

2. In stationary wave [MP PET 1987; BHU 1995]

(a) Strain is maximum at nodes

(b) Strain is maximum at antinodes

(c) Strain is minimum at nodes

(d) Amplitude is zero at all the points

3. The phase difference between the two particles situated on both the sides of a node is [MP PET 2002]

(a) 0° (b) 90°

(c) 180° (d) 360°

4. Which of the property makes difference between progressive and stationary waves [MP PMT 1987]

(a) Amplitude (b) Frequency

(c) Propagation of energy (d) Phase of the wave

5. Stationary waves are formed when

[NCERT 1983]

(a) Two waves of equal amplitude and equal frequency travel along the same path in opposite directions

(b) Two waves of equal wavelength and equal amplitude travel along the same path with equal speeds in opposite directions [EAMCET 2001]

(c) Two waves of equal wavelength and equal phase travel along the same path with equal speed

(d) Two waves of equal amplitude and equal speed travel along the same path in opposite direction [AFMC 2001]

6. For the stationary wave $y = 4\sin\left(\frac{\pi x}{15}\right)\cos(96\pi t)$, the distance between a node and the next antinode is

[MP PMT 1987]

(a) 7.5 (b) 15

(c) 22.5 (d) 30

7. The equation of stationary wave along a stretched string is given by $y = 5\sin\frac{\pi x}{3}\cos 40\pi t$, where *x* and *y* are in cm and *t* in second. [AFMC 2005]

The separation between two adjacent nodes is [CPMT 1990; MP PET 1999; AMU 19

DPMT 2004; BHU 2005]

(a) 1.5 *cm* (b) 3 *cm*

(c) 6 *cm* (d) 4 *cm*

8. The equation $\vec{\phi}(x,t) = \vec{j}\sin\left(\frac{2\pi}{\lambda}vt\right)\cos\left(\frac{2\pi}{\lambda}x\right)$ represents

[MNR 1994]

(a) Transverse progressive wave

(b) Longitudinal progressive wave

(c) Longitudinal stationary wave

(d) Transverse stationary wave

9. The equation of a stationary wave is $y = 0.8\cos\left(\frac{\pi x}{20}\right)\sin 200\pi t$, where *x* is in *cm* and *t* is in *sec*. The separation between consecutive nodes will be

[MP PET 1994]

(a) 20 *cm* (b) 10 *cm*

(c) 40 *cm* (d) 30 *cm*

10. In a stationary wave, all particles are

[MP PMT 1994]

(a) At rest at the same time twice in every period of oscillation

(b) At rest at the same time only once in every period of oscillation

(c) Never at rest at the same time

(d) Never at rest at all

11. A wave represented by the given equation $y = a\cos(kx - \omega t)$ is superposed with another wave to form a stationary wave such that the point $x = 0$ is a node. The equation for the other wave is

AIIMS 1998; SCRA 1998; MP PET 2001; KCET 2001;

AIEEE 2002; UPSEAT 2004]

(a) $y = a\sin(kx + \omega t)$ (b) $y = -a\cos(kx + \omega t)$

(c) $y = -a\cos(kx - \omega t)$ (d) $y = -a\sin(kx - \omega t)$

12. At a certain instant a stationary transverse wave is found to have maximum kinetic energy. The appearance of string at that instant is

(a) Sinusoidal shape with amplitude $A/3$
(b) Sinusoidal shape with amplitude $A/2$
(c) Sinusoidal shape with amplitude A
(d) Straight line

13. The equation $y = 0.15\sin 5x \cos 300t$, describes a stationary wave. The wavelength of the stationary wave is [MP PMT 1995]

(a) Zero (b) 1.256 *metres*
(c) 2.512 *metres* (d) 0.628 *metre*

14. In stationary waves, antinodes are the points where there is [MP PMT 1996]

(a) Minimum displacement and minimum pressure change
(b) Minimum displacement and maximum pressure change
(c) Maximum displacement and maximum pressure change
(d) Maximum displacement and minimum pressure change

15. In stationary waves all particles between two nodes pass through the mean position [MP PMT 1999; KCET 2001]

(a) At different times with different velocities
(b) At different times with the same velocity
(c) At the same time with equal velocity
(d) At the same time with different velocities

16. Standing waves can be produced [IIT-JEE 1999]

(a) On a string clamped at both the ends
(b) On a string clamped at one end and free at the other
(c) When incident wave gets reflected from a wall
(d) When two identical waves with a phase difference of π are moving in the same direction

17. A standing wave having 3 nodes and 2 antinodes is formed between two atoms having a distance 1.21 Å between them. The wavelength of the standing wave is [CBSE PMT 1998; MH CET 2002; AIIMS 2000; BHU 2001]

(a) 1.21 Å (b) 2.42 Å
(c) 6.05 Å (d) 3.63 Å

18. In stationary waves, distance between a node and its nearest antinode is 20 *cm*. The phase difference between two particles having a separation of 60 *cm* will be [CMEET Bihar 1995]

(a) Zero (b) $\pi/2$
(c) π (d) $3\pi/2$

19. Stationary waves of frequency 300 *Hz* are formed in a medium in which the velocity of sound is 1200 *metre/sec*. The distance between a node and the neighbouring antinode is

(a) 1 *m* (b) 2 *m*
(c) 3 *m* (d) 4 *m*

20. Which two of the given transverse waves will give stationary waves when get superimposed [RPET 1997; MP PET 1993]

$z_1 = a\cos(kx - \omega t)$ .....(A)

[AIIMS 1995]

$z_2 = a\cos(kx + \omega t)$ .....(B)

$z_3 = a\cos(ky - \omega t)$ .....(C)

(a) A and B (b) A and C
(c) B and C (d) Any two

21. A standing wave is represented by

$$Y = A\sin(100t)\cos(0.01x)$$

where Y and A are in *millimetre*, t is in seconds and x is in *metre*. The velocity of wave is [CBSE PMT 1994; AFMC 2002]

(a) $10^4\ m/s$
(b) $1\ m/s$
(c) $10^{-4}\ m/s$
(d) Not derivable from above data

22. A wave of frequency 100 *Hz* is sent along a string towards a fixed end. When this wave travels back after reflection, a node is formed at a distance of 10 *cm* from the fixed end of the string. The speed of incident (and reflected) wave are [CBSE PMT 1994]

(a) 40 *m/s* (b) 20 *m/s*
(c) 10 *m/s* (d) 5 *m/s*

23. $y = a\cos(kx + \omega t)$ superimposes on another wave giving a stationary wave having node at $x = 0$. What is the equation of the other wave [BHU 1998; DPMT 2000]

(a) $-a\cos(kx + \omega t)$ (b) $a\cos(kx - \omega t)$
(c) $-a\cos(kx - \omega t)$ (d) $-a\sin(kx + \omega t)$

24. Two waves are approaching each other with a velocity of 20 *m/s* and frequency n. The distance between two consecutive nodes is

(a) $\frac{20}{n}$ (b) $\frac{10}{n}$
(c) $\frac{5}{n}$ (d) $\frac{n}{10}$

25. Energy is not carried by which of the following waves [RPMT 1998; AIIMS 1998, 99]

(a) Stationary (b) Progressive
(c) Transverse (d) Electromagnetic

26. The stationary wave produced on a string is represented by the equation $y = 5\cos(\pi x/3)\sin 40\pi t$. Where x and y are in *cm* and t is in seconds. The distance between consecutive nodes is

(a) 5 *cm* (b) π cm

[SCRA 1994]

(c) 3 *cm* (d) 40 *cm*

27. Two sinusoidal waves with same wavelengths and amplitudes travel in opposite directions along a string with a speed 10 *ms*. If the minimum time interval between two instants when the string is flat is 0.5 *s*, the wavelength of the waves is

(a) 25 *m* (b) 20 *m*
(c) 15 *m* (d) 10 *m*

28. "Stationary waves" are so called because in them [MP PMT 2001]

(a) The particles of the medium are not disturbed at all

(b) The particles of the medium do not execute SHM

(c) There occurs no flow of energy along the wave

(d) The interference effect can't be observed

29. Two waves are approaching each other with a velocity of 16 *m/s* and frequency *n*. The distance between two consecutive nodes is

(a) $\frac{16}{n}$ (b) $\frac{8}{n}$

(c) $\frac{n}{16}$ (d) $\frac{n}{8}$

30. Stationary waves [Kerala (Med.) 2002]

(a) Transport energy

(b) Does not transport energy

(c) Have nodes and antinodes

(d) Both (b) and (c)

31. In a stationary wave all the particles [KCET 2002]

(a) On either side of a node vibrate in same phase

(b) In the region between two nodes vibrate in same phase

(c) In the region between two antinodes vibrate in same phase

(d) Of the medium vibrate in same phase

32. When a stationary wave is formed then its frequency is [Kerala (Engg.) 2002]

(a) Same as that of the individual waves

(b) Twice that of the individual waves

(c) Half that of the individual waves

(d) None of the above

33. In stationary waves [RPMT 1998; JIPMER 2002]

(a) Energy is uniformly distributed

(b) Energy is minimum at nodes and maximum at antinodes

(c) Energy is maximum at nodes and minimum at antinodes

(d) Alternating maximum and minimum energy producing at nodes and antinodes

34. Equation of a stationary wave is $y = 10\sin\frac{\pi x}{4}\cos 20\pi t$. Distance between two consecutive nodes is [MP PMT 2002]

(a) 4 (b) 2

(c) 1 (d) 8

35. At nodes in stationary waves [SCRA 1994; UPSEAT 2000; MP PET 2003; RPET 2003]

(a) Change in pressure and density are maximum

(b) Change in pressure and density are minimum

(c) Strain is zero

(d) Energy is minimum

36. Consider the three waves z_1, z_2 and z_3 as

$z_1 = A\sin(kx - \omega t)$, $z_2 = A\sin(kx + \omega t)$

and $z_3 = A\sin(ky - \omega t)$. Which of the following represents a standing wave [DCE 2004]

(a) $z_1 + z_2$ (b) $z_2 + z_3$

(c) $z_3 + z_1$ (d) $z_1 + z_2 + z_3$

37. The following equations represent progressive transverse waves $Z_1 = A\cos(\omega t - kx)$, $Z_2 = A\cos(\omega t + kx)$, $Z_3 = A\cos(\omega t + ky)$ and $Z_4 = A\cos(2\omega t - 2ky)$. A stationary wave will be formed by superposing [MP PET 1993]

(a) Z_1 and Z_2 (b) Z_1 and Z_4

(c) Z_2 and Z_3 (d) Z_3 and Z_4

38. Two travelling waves $y_1 = A\sin[k(x - ct)]$ and $y_2 = A\sin[k(x + ct)]$ are superimposed on string. The distance between adjacent nodes is [CPMT 2001; Pb. PMT 1999] [IIT 1992]

(a) ct/π (b) $ct/2\pi$

(c) $\pi/2k$ (d) π/k

39. A string vibrates according to the equation $y = 5\sin\left(\frac{2\pi x}{3}\right)\cos 20\pi t$, where *x* and *y* are in *cm* and *t* in *sec*. The distance between two adjacent nodes is [UPSEAT 2005]

(a) 3 *cm* (b) 4.5 *cm*

(c) 6 *cm* (d) 1.5 *cm*

Vibration of String

1. A string fixed at both the ends is vibrating in two segments. The wavelength of the corresponding wave is [SCRA 1994]

(a) $\frac{l}{4}$ (b) $\frac{l}{2}$

(c) l (d) $2l$

2. A 1 *cm* long string vibrates with fundamental frequency of 256 *Hz*. If the length is reduced to $\frac{1}{4}cm$ keeping the tension unaltered, the new fundamental frequency will be [BHU 1997]

(a) 64 (b) 256

(c) 512 (d) 1024

3. Standing waves are produced in a 10 *m* long stretched string. If the string vibrates in 5 segments and the wave velocity is 20 *m/s*, the frequency is [CBSE PMT 1997; AIIMS 1998; JIPMER 2000]

(a) 2 *Hz* (b) 4 *Hz*

(c) 5 *Hz* (d) 10 *Hz*

4. The velocity of waves in a string fixed at both ends is 2 *m/s*. The string forms standing waves with nodes 5.0 *cm* apart. The frequency of vibration of the string in *Hz* is [SCRA 1998]

(a) 40 (b) 30

(c) 20 (d) 10

5. Which of the following is the example of transverse wave [CPMT 1999]

(a) Sound waves

(b) Compressional waves in a spring

(c) Vibration of string

(d) All of these

6. A stretched string of 1*m* length and mass $5 \times 10^{-4} kg$ is having tension of 20*N*. If it is plucked at 25*cm* from one end then it will vibrate with frequency

[RPET 1999; RPMT 2002]

(a) 100 *Hz* (b) 200 *Hz*

(c) 256 *Hz* (d) 400 *Hz*

7. Two similar sonometer wires given fundamental frequencies of 500*Hz*. These have same tensions. By what amount the tension be increased in one wire so that the two wires produce 5 *beats/sec* [RPET 1999]

(a) 1% (b) 2%

(c) 3% (d) 4%

8. A string is producing transverse vibration whose equation is $y = 0.021\sin(x + 30t)$, Where *x* and *y* are in meters and t is in seconds. If the linear density of the string is 1.3×10^{-4} *kg/m*, then the tension in the string in N will be

[RPET 1999; RPMT 2002]

(a) 10 (b) 0.5

(c) 1 (d) 0.117

9. If the tension of sonometer's wire increases four times then the fundamental frequency of the wire will increase by

[RPMT 1999]

(a) 2 times (b) 4 times

(c) 1/2 times (d) None of the above

10. If vibrations of a string are to be increased by a factor of two, then tension in the string must be made

[AIIMS 1999; Pb. PET 2000]

(a) Half (b) Twice

(c) Four times (d) Eight times

11. Four wires of identical length, diameters and of the same material are stretched on a sonometre wire. If the ratio of their tensions is 1 : 4 : 9 : 16 then the ratio of their fundamental frequencies are [KCET 2000]

(a) 16 : 9 : 4 : 1 (b) 4 : 3 : 2 : 1

(c) 1 : 4 : 2 : 16 (d) 1 : 2 : 3 : 4

12. A tuning fork vibrating with a sonometer having 20 *cm* wire produces 5 beats per second. The beat frequency does not change if the length of the wire is changed to 21 *cm*. the frequency of the tuning fork (in Hertz) must be

[UPSEAT 2000; Pb. PET 2004]

(a) 200 (b) 210

(c) 205 (d) 215

13. A stretched string of length l, fixed at both ends can sustain stationary waves of wavelength λ, given by

[UPSEAT 2000; Pb. PET 2004; CPMT 2005]

(a) $\lambda = \frac{n^2}{2l}$ (b) $\lambda = \frac{l^2}{2n}$

(c) $\lambda = \frac{2l}{n}$ (d) $\lambda = 2l\,n$

14. If you set up the seventh harmonic on a string fixed at both ends, how many nodes and antinodes are set up in it

[AMU 2000]

(a) 8, 7 (b) 7, 7

(c) 8, 9 (d) 9, 8

15. If you set up the ninth harmonic on a string fixed at both ends, its frequency compared to the seventh harmonic

[AMU (Engg.) 2000]

(a) Higher (b) Lower

(c) Equal (d) None of the above

16. Frequency of a sonometer wire is *n*. Now its tension is increased 4 times and its length is doubled then new frequency will be

(a) *n*/2 (b) 4*n*

(c) 2*n* (d) *n*

17. A device used for investigating the vibration of a fixed string or wire is [BHU 2000]

(a) Sonometer (b) barometer

(c) Hydrometer (d) None of these

18. A string on a musical instrument is 50 *cm* long and its fundamental frequency is 270 *Hz*. If the desired frequency of 1000 *Hz* is to be produced, the required length of the string is

[EAMCET (Engg.) 1998; CPMT 2000; Pb. PET 2001]

(a) 13.5 *cm* (b) 2.7 *cm*

(c) 5.4 *cm* (d) 10.3 *cm*

19. The tension in a piano wire is 10N. What should be the tension in the wire to produce a note of double the frequency

(a) 5 *N* (b) 20 *N*

(c) 40 *N* (d) 80 *N*

20. To increase the frequency from 100 *Hz* to 400 *Hz* the tension in the string has to be changed by [RPET 2001]

(a) 4 times (b) 16 times

(c) 20 times (d) None of these

21. In order to double the frequency of the fundamental note emitted by a stretched string, the length is reduced to $\frac{3}{4}$ *th* of the original length and the tension is changed. The factor by which the tension is to be changed, is [EAMCET 2001]

(a) $\frac{3}{8}$ (b) $\frac{2}{3}$

(c) $\frac{8}{9}$ (d) $\frac{9}{4}$

22. A string of 7 *m* length has a mass of 0.035 *kg*. If tension in the string is 60.5 *N*, then speed of a wave on the string is

[CBSE PMT 2001]

(a) 77 *m/s* (b) 102 *m/s*

(c) 110 *m/s* (d) 165 *m/s*

23. A second harmonic has to be generated in a string of length l stretched between two rigid supports. The point where the string has to be plucked and touched are

[KCET 2001]

(a) Plucked at $\frac{l}{4}$ and touch at $\frac{l}{2}$

(b) Plucked at $\frac{l}{4}$ and touch at $\frac{3l}{4}$

(c) Plucked at $\frac{l}{2}$ and touched at $\frac{l}{4}$

(d) Plucked at $\frac{l}{2}$ and touched at $\frac{3l}{4}$

24. Transverse waves of same frequency are generated in two steel wires *A* and *B*. The diameter of *A* is twice of *B* and the tension in *A* is half that in *B*. The ratio of velocities of wave in *A* and *B* is

(a) $1 : 3\sqrt{2}$ (b) $1 : 2\sqrt{2}$

(c) $1:2$ (d) $\sqrt{2}:1$

25. A sonometer wire resonates with a given tuning fork forming standing waves with five antinodes between the two bridges when a mass of 9 *kg* is suspended from the wire. When this mass is replaced by a mass *M*, the wire resonates with the same tuning fork forming three antinodes for the same positions of the bridges. The value of *M* is

[IIT-JEE (Screening) 2002]

(a) 25 *kg* (b) 5 *kg*

(c) 12.5 *kg* (d) 1/25 *kg*

26. The tension of a stretched string is increased by 69%. In order to keep its frequency of vibration constant, its length must be increased by [KCET 2002]

(a) 20% (b) 30%

(c) $\sqrt{69}\%$ (d) 69%

27. The length of a sonometer wire tuned to a frequency of 250 *Hz* is 0.60 *metre*. The frequency of tuning fork with which the vibrating wire will be in tune when the length is made 0.40 *metre* is

(a) 250 *Hz* (b) 375 *Hz*

(c) 256 *Hz* (d) 384 *Hz*

28. Length of a string tied to two rigid supports is 40 *cm*. Maximum length (wavelength in *cm*) of a stationary wave produced on it is

(a) 20 (b) 80

(c) 40 (d) 120

29. A string in musical instrument is 50 *cm* long and its fundamental frequency is 800 *Hz*. If a frequency of 1000 *Hz* is to be produced, then required length of string is

[AIIMS 2002]

(a) 62.5 *cm* (b) 50 *cm*

(c) 40 *cm* (d) 37.5 *cm*

30. Two wires are in unison. If the tension in one of the wires is increased by 2%, 5 beats are produced per second. The initial frequency of each wire is [MP PET 2002]

(a) 200 *Hz* (b) 400 *Hz*

(c) 500 *Hz* (d) 1000 *Hz*

31. Two uniform strings *A* and *B* made of steel are made to vibrate under the same tension. if the first overtone of *A* is equal to the second overtone of *B* and if the radius of *A* is twice that of *B*, the ratio of the lengths of the strings is

[EAMCET 2003]

(a) 1: 2 (b) 1 : 3

(c) 1 : 4 (d) 1 : 6

32. If the length of a stretched string is shortened by 40% and the tension is increased by 44%, then the ratio of the final and initial fundamental frequencies is

[EAMCET 2003]

(a) 2 : 1 (b) 3 : 2

(c) 3 : 4 (d) 1 : 3

33. Two wires are fixed in a sonometer. Their tensions are in the ratio 8 : 1. The lengths are in the ratio $36:35$. The diameters are in the ratio 4 : 1. Densities of the materials are in the ratio 1 : 2. If the lower frequency in the setting is 360 *Hz*. the beat frequency when the two wires are sounded together is

(a) 5 (b) 8

(c) 6 (d) 10

34. The first overtone of a stretched wire of given length is 320 *Hz*. The first harmonic is : [DPMT 2004]

(a) 320 *Hz* (b) 160 *Hz*

(c) 480 *Hz* (d) 640 *Hz*

35. Two perfectly identical wires are in unison. When the tension in one wire is increased by 1%, then on sounding them together 3 beats are heard in 2 *sec*. The initial frequency of each wire is :

(a) $220s^{-1}$ (b) $320s^{-1}$

(c) $150s^{-1}$ (d) $300s^{-1}$

36. A tuning fork of frequency 392 *Hz*, resonates with 50 *cm* length of a string under tension (T). If length of the string is decreased by 2%, keeping the tension constant, the number of beats heard when the string and the tuning fork made to vibrate simultaneously is

(a) 4 (b) 6

(c) 8 (d) 12

37. The sound carried by air from a sitar to a listener is a wave of the following type [JIPMER 2002] [MP PMT 1987; RPET 2001]

(a) Longitudinal stationary (b) Transverse progressive

(c) Transverse stationary (d) Longitudinal progressive

38. In Melde's experiment in the transverse mode, the frequency of the tuning fork and the frequency of the waves in the strings are in the ratio [AIEEE 2002] [KCET 2004]

(a) 1 : 1 (b) 1 : 2

(c) 2 : 1 (d) 4 : 1

39. The frequency of transverse vibrations in a stretched string is 200 *Hz*. If the tension is increased four times and the length is reduced to one-fourth the original value, the frequency of vibration will be

(a) 25 *Hz* (b) 200 *Hz*

(c) 400 *Hz* (d) 1600 *Hz*

40. Three similar wires of frequency n, n and n are joined to make one wire. Its frequency will be

[CBSE PMT 2000]

(a) $n = n_1 + n_2 + n_3$ (b) $\frac{1}{n} = \frac{1}{n_1} + \frac{1}{n_2} + \frac{1}{n_3}$

(c) $\frac{1}{\sqrt{n}} = \frac{1}{\sqrt{n_1}} + \frac{1}{\sqrt{n_2}} + \frac{1}{\sqrt{n_3}}$ (d) $\frac{1}{n^1} = \frac{1}{n_1^2} + \frac{1}{n_2^2} + \frac{1}{n_3^2}$

41. A steel rod 100 *cm* long is clamped at its mid-point. The fundamental frequency of longitudinal vibrations of the rod is given to be 2.53 *kHz*. What is the speed of sound in steel

[AFMC 2000]

(a) 5.06 *km/s* (b) 6.06 *km/s*

(c) 7.06 *km/s* (d) 8.06 *km/s*

42. Two wires are producing fundamental notes of the same frequency. Change in which of the following factors of one wire will not produce beats between them

[BHU (Med.) 1999]

(a) Amplitude of the vibrations

(b) Material of the wire

[KCET 2003]

(c) Stretching force

(d) Diameter of the wires

43. Calculate the frequency of the second harmonic formed on a string of length 0.5 *m* and mass 2×10^{-4} *kg* when stretched with a tension of 20 *N* **[BHU (Med.) 2000]**

(a) 274.4 *Hz* (b) 744.2 *Hz*

(c) 44.72 *Hz* (d) 447.2 *Hz*

44. The fundamental frequency of a string stretched with a weight of 4 *kg* is 256 *Hz*. The weight required to produce its octave is

(a) 4 *kg wt* (b) 8 *kg wt*

(c) 12 *kg wt* (d) 16 *kg wt*

45. Two vibrating strings of the same material but lengths L and $2L$ have radii $2r$ and r respectively. They are stretched under the same tension. Both the strings vibrate in their fundamental modes, the one of length L with frequency n_1 and the other with frequency n_2. The ratio n_1/n_2 is given by

[IIT-JEE (Screening) 2000]

(a) 2 (b) 4

(c) 8 (d) 1

46. If the tension and diameter of a sonometer wire of fundamental frequency *n* are doubled and density is halved then its fundamental frequency will become

[CBSE PMT 2001]

(a) $\frac{n}{4}$ (b) $\sqrt{2}\, n$

(c) n (d) $\frac{n}{\sqrt{2}}$

47. In a sonometer wire, the tension is maintained by suspending a 50.7 *kg* mass from the free end of the wire. The suspended mass has a volume of 0.0075 m^3. The fundamental frequency of the wire is 260 *Hz*. If the suspended mass is completely submerged in water, the fundamental frequency will become (take g = 10 ms^{-2})

[KCET 2001]

(a) 240 *Hz* (b) 230 *Hz*

(c) 220 *Hz* (d) 200 *Hz*

48. A string is rigidly tied at two ends and its equation of vibration is given by $y = \cos 2\pi t \sin \sin \pi x$. Then minimum length of string is **[RPMT 2001]**

(a) 1 *m* (b) $\frac{1}{2} m$

(c) 5 *m* (d) $2\pi m$

49. Fundamental frequency of sonometer wire is *n*. If the length, tension and diameter of wire are tripled, the new fundamental frequency is

(a) $\frac{n}{\sqrt{3}}$ (b) $\frac{n}{3}$

(c) $n\sqrt{3}$ (d) $\frac{n}{3\sqrt{3}}$

[DPMT 2002]

50. A string of length 2 *m* is fixed at both ends. If this string vibrates in its fourth normal mode with a frequency of 500 *Hz* then the waves would travel on its with a velocity of

[BCECE 2005]

(a) 125 *m/s* (b) 250 *m/s*

(c) 500 *m/s* (d) 1000 *m/s*

51. The fundamental frequency of a sonometre wire is *n*. If its radius is doubled and its tension becomes half, the material of the wire remains same, the new fundamental frequency will be **[BCECE 2005]**

(a) n (b) $\frac{n}{\sqrt{2}}$

(c) $\frac{n}{2}$ (d) $\frac{n}{2\sqrt{2}}$

52. In an experiment with sonometer a tuning fork of frequency 256 *Hz* resonates with a length of 25 *cm* and another tuning fork resonates with a length of 20 *cm*. Tension of the string remaining constant the frequency of the second tuning fork is **[J & K CET 2000]**

(a) 163.84 *Hz* (b) 400 *Hz*

(c) 320 *Hz* (d) 204.8 *Hz*

Organ Pipe (Vibration of Air Column)

1. The length of two open organ pipes are l and $(l + \Delta l)$ respectively. Neglecting end correction, the frequency of beats between them will be approximately

[MP PET 1994; BHU 1995]

(a) $\frac{v}{2l}$ (b) $\frac{v}{4l}$

(c) $\frac{v\Delta l}{2l^2}$ (d) $\frac{v\Delta l}{l}$

(Here v is the speed of sound)

2. A tube closed at one end and containing air is excited. It produces the fundamental note of frequency 512 *Hz*. If the same tube is open at both the ends the fundamental frequency that can be produced is

(a) 1024 *Hz* (b) 512 *Hz*

(c) 256 *Hz* (d) 128 *Hz*

3. A closed pipe and an open pipe have their first overtones identical in frequency. Their lengths are in the ratio

[Roorkee 1999]

(a) 1 : 2 (b) 2 : 3

(c) 3 : 4 (d) 4 : 5

4. The first overtone in a closed pipe has a frequency

[JIPMER 1999]

(a) Same as the fundamental frequency of an open tube of same length

(b) Twice the fundamental frequency of an open tube of same length

(c) Same as that of the first overtone of an open tube of same length

(d) None of the above

5. An empty vessel is partially filled with water, then the frequency of vibration of air column in the vessel

[KCET 2000]

(a) Remains same

(b) Decreases

(c) Increases

(d) First increases then decreases

6. It is desired to increase the fundamental resonance frequency in a tube which is closed at one end. This can be achieved by

(a) Replacing the air in the tube by hydrogen gas

(b) Increasing the length of the tube

(c) Decreasing the length of the tube

(d) Opening the closed end of the tube

7. An air column in a pipe, which is closed at one end, will be in resonance with a vibrating body of frequency 166 *Hz*, if the length of the air column is **[UPSEAT 2001]**

(a) 2.00 *m* (b) 1.50 *m*

(c) 1.00 *m* (d) 0.50 *m*

8. If the velocity of sound in air is 350 *m/s*. Then the fundamental frequency of an open organ pipe of length 50 *cm*, will be [CPMT 1997; MH CET 2001; Pb. PMT 2001]

(a) 350 *Hz* (b) 175 *Hz*

(c) 900 *Hz* (d) 750 *Hz*

9. If the length of a closed organ pipe is 1m and velocity of sound is 330 *m/s*, then the frequency for the second note is [AFMC 2001]

(a) $4 \times \frac{330}{4} Hz$ (b) $3 \times \frac{330}{4} Hz$

(c) $2 \times \frac{330}{4} Hz$ (d) $2 \times \frac{4}{330} Hz$

10. The fundamental note produced by a closed organ pipe is of frequency f. The fundamental note produced by an open organ pipe of same length will be of frequency [BHU 2001]

(a) $\frac{f}{2}$ (b) f

(c) $2f$ (d) $4f$

11. If the velocity of sound in air is 336 m/s. The *maximum* length of a closed pipe that would produce a just audible sound will be [KCET 2001]

(a) 3.2 *cm* (b) 4.2 *m*

(c) 4.2 *cm* (d) 3.2 *m*

12. An organ pipe P_1 closed at one end vibrating in its first overtone and another pipe P_2 open at both ends vibrating in its third overtone are in resonance with a given tuning fork. The ratio of lengths of P_1 and P_2 is [EAMCET 1997; MH CET 1999; AFMC 2001]

(a) 1 : 2 (b) 1 : 3

(c) 3 : 8 (d) 3 : 4

13. A resonance air column of length 20 *cm* resonates with a tuning fork of frequency 250 *Hz*. The speed of sound in air is [AFMC 1999; BHU 2000; CPMT 2001]

(a) 300 *m/s* (b) 200 *m/s*

(c) 150 *m/s* (d) 75 *m/s*

14. A cylindrical tube, open at both ends, has a fundamental frequency f_0 in air. The tube is dipped vertically into water such that half of its length is inside water. The fundamental frequency of the air column now is [RPET 1999; RPMT 1998, 2000; J & K CET 2000; KCET 2002; BHU 2002; BCECE 2003]

(a) $3f_0/4$ (b) f_0

(c) $f_0/2$ (d) $2f_0$

15. If the length of a closed organ pipe is 1.5 *m* and velocity of sound is 330 *m/s*, then the frequency for the second note is [CBSE PMT 2002]

(a) 220 *Hz* (b) 165 *Hz*

(c) 110 *Hz* (d) 55 *Hz*

16. A pipe 30 *cm* long is open at both ends. Which harmonic mode of the pipe is resonantly excited by a 1.1 *kHz* source ? (Take speed of sound in air = 330 *ms*) [AMU 2002]

(a) First (b) Second

(c) Third (d) Fourth

17. Two closed organ pipes, when sounded simultaneously gave 4 beats per sec. If longer pipe has a length of 1*m*. Then length of shorter pipe will be, (v = 300 *m/s*) [Pb. PMT 2002]

(a) 185.5 *cm* (b) 94.9 *cm*

(c) 90 *cm* (d) 80 *cm*

18. A source of sound placed at the open end of a resonance column sends an acoustic wave of pressure amplitude ρ_0 inside the tube. If the atmospheric pressure is ρ_A, then the ratio of maximum and minimum pressure at the closed end of the tube will be

(a) $\frac{(\rho_A + \rho_0)}{(\rho_A - \rho_0)}$ (b) $\frac{(\rho_A + 2\rho_0)}{(\rho_A - 2\rho_0)}$

(c) $\frac{\rho_A}{\rho_A}$ (d) $\frac{\left(\rho_A + \frac{1}{2}\rho_0\right)}{\left(\rho_A - \frac{1}{2}\rho_0\right)}$

19. Two closed pipe produce 10 beats per second when emitting their fundamental nodes. If their length are in ratio of 25 : 26. Then their fundamental frequency in *Hz*, are [MH CET 2002]

(a) 270, 280 (b) 260, 270

(c) 260, 250 (d) 260, 280

20. A closed organ pipe and an open organ pipe are tuned to the same fundamental frequency. What is the ratio of lengths

(a) 1 : 2 (b) 2 : 1

(c) 2 : 3 (d) 4 : 3

21. An open pipe resonates with a tuning fork of frequency 500 *Hz*. it is observed that two successive nodes are formed at distances 16 and 46 *cm* from the open end. The speed of sound in air in the pipe is

(a) 230 *m/s* (b) 300 *m/s*

(c) 320 *m/s* (d) 360 *m/s*

22. Find the fundamental frequency of a closed pipe, if the length of the air column is 42 *m*. (speed of sound in air = 332 *m/sec*)

(a) 2 *Hz* (b) 4 *Hz*

(c) 7 *Hz* (d) 9 *Hz*

23. If v is the speed of sound in air then the shortest length of the closed pipe which resonates to a frequency n [KCET 2003]

(a) $\frac{v}{4n}$ (b) $\frac{v}{2n}$

(c) $\frac{2n}{v}$ (d) $\frac{4n}{v}$

24. The frequency of fundamental tone in an open organ pipe of length 0.48 *m is* 320 *Hz*. Speed of sound is 320 *m/sec*. Frequency of fundamental tone in closed organ pipe will be [MP PMT 2003]

(a) 153.8 *Hz* (b) 160.0 *Hz*

(c) 320.0 *Hz* (d) 143.2 *Hz*

25. If fundamental frequency of closed pipe is 50 *Hz* then frequency of 2nd overtone is [AFMC 2004]

(a) 100 *Hz* (b) 50 *Hz*

(c) 250 *Hz* (d) 150 *Hz*

26. Two open organ pipes of length 25 *cm* and 25.5 *cm* produce 10 *beat/sec*. The velocity of sound will be

[Pb. PMT 2004]

(a) 255 *m/s* (b) 250 *m/s*

(c) 350 *m/s* (d) None of these

27. What is minimum length of a tube, open at both ends, that resonates with tuning fork of frequency 350 *Hz* ? [velocity of sound in air = 350 *m/s*] [DPMT 2004]

(a) 50 *cm* (b) 100 *cm*

(c) 75 *cm* (d) 25 *cm*

28. Two open organ pipes give 4 *beats/sec* when sounded together in their fundamental nodes. If the length of the pipe are 100 *cm* and 102.5 *cm* respectively, then the velocity of sound is : [Pb. PET 2000; CPMT 2001]

(a) 496 *m/s* (b) 328 *m/s*

(c) 240 *m/s* (d) 160 *m/s*

29. The harmonics which are present in a pipe open at one end are [UPSEAT 2000; MHCET 2004]

(a) Odd harmonics

(b) Even harmonics

(c) Even as well as odd harmonics

(c) None of these

30. An open pipe is suddenly closed at one end with the result that the frequency of third harmonic of the closed pipe is found to be higher by 100 *Hz*, then the fundamental frequency of open pipe is: [UPSEAT 2001; Pb. PET 2004]

(a) 480 *Hz* (b) 300 *Hz*

(c) 240 *Hz* (d) 200 *Hz*

31. Tube *A* has both ends open while tube *B* has one end closed, otherwise they are identical. The ratio of fundamental frequency of tube *A* and *B* is

[AIEEE 2002; CPMT 2004]

(a) 1 : 2 (b) 1 : 4

(c) 2 : 1 (d) 4 : 1

32. If the temperature increases, then what happens to the frequency of the sound produced by the organ pipe

[RPET 1996; DPMT 2000; RPMT 2001]

(a) Increases (b) Decreases

(c) Unchanged (d) Not definite

33. Apparatus used to find out the velocity of sound in gas is

[AFMC 2004]

(a) Melde's apparatus (b) Kundt's tube

(c) Quincke's tube (d) None of these

34. Standing stationary waves can be obtained in an air column even if the interfering waves are [CPMT 1972]

(a) Of different pitches

(b) Of different amplitudes

(c) Of different qualities

(d) Moving with different velocities

35. The stationary wave $y = 2a \sin kx \cos \omega t$ in a closed organ pipe is the result of the superposition of $y = a\sin(\omega t - kx)$ and

(a) $y = -a\cos(\omega t + kx)$ (b) $y = -a\sin(\omega t + kx)$

(c) $y = a\sin(\omega t + kx)$ (d) $y = a\cos(\omega t + kx)$

36. Stationary waves are set up in air column. Velocity of sound in air is 330 *m/s* and frequency is 165 *Hz*. Then distance between the nodes is

[EAMCET (Engg.) 1995; CPMT 1999]

(a) 2 *m* (b) 1 *m*

(c) 0.5 *m* (d) 4 *m*

37. An open pipe of length *l* vibrates in fundamental mode. The pressure variation is maximum at

[EAMCET (Med.) 1999]

(a) 1/4 from ends

(b) The middle of pipe

(c) The ends of pipe

(d) At 1/8 from ends of pipe middle of the pipe

38. Fundamental frequency of pipe is 100 *Hz* and other two frequencies are 300 *Hz* and 500 *Hz* then

[RPMT 1998, 2003; CPMT 2001]

(a) Pipe is open at both the ends

(b) Pipe is closed at both the ends

(c) One end open and another end is closed

(d) None of the above

39. Fundamental frequency of an open pipe of length 0.5 *m* is equal to the frequency of the first overtone of a closed pipe of length *l*. The value of *l* is (*m*) [KCET 1999]

(a) 1.5 (b) 0.75

(c) 2 (d) 1

40. In a closed organ pipe the frequency of fundamental note is 50 *Hz*. The note of which of the following frequencies will not be emitted by it [J & K CET 2000]

(a) 50 *Hz* (b) 100 *Hz*

(c) 150 *Hz* (d) None of the above

41. On producing the waves of frequency 1000 *Hz* in a Kundt's tube, the total distance between 6 successive nodes is 85 *cm*. Speed of sound in the gas filled in the tube is

[AFMC 1999]

(a) 330 *m/s* (b) 340 *m/s*

(c) 350 *m/s* (d) 300 *m/s*

42. What is the base frequency if a pipe gives notes of frequencies 425, 255 and 595 and decide whether it is closed at one end or open at both ends [UPSEAT 2001]

(a) 17, closed (b) 85, closed

(c) 17, open (d) 85, open

43. A student determines the velocity of sound with the help of a closed organ pipe. If the observed length for fundamental frequency is 24.7 *m*, the length for third harmonic will be

[RPET 2002]

(a) 74 [Roorkee 1994] (b) 72.7 *cm*

(c) 75.4 *cm* (d) 73.1 *cm*

44. An open pipe of length 33 *cm* resonates with frequency of 100 *Hz*. If the speed of sound is 330 *m/s*, then this frequency is

(a) Fundamental frequency of the pipe

(b) Third harmonic of the pipe

(c) Second harmonic of the pipe

(d) Fourth harmonic of the pipe

45. In a resonance tube the first resonance with a tuning fork occurs at 16 *cm* and second at 49 *cm*. If the velocity of sound is 330 *m/s*, the frequency of tuning fork is

[DPMT 2002]

(a) 500 (b) 300

(c) 330 (d) 165

46. Two closed organ pipes of length 100 *cm* and 101 *cm* 16 beats in 20 *sec*. When each pipe is sounded in its fundamental mode calculate the velocity of sound

[AFMC 2003]

(a) 303 ms^{-1} (b) 332 ms^{-1}

(c) 323.2 ms^{-1} (d) 300 ms^{-1}

47. In open organ pipe, if fundamental frequency is n then the other frequencies are [BCECE 2005]

(a) $n, 2n, 3n, 4n$ (b) $n, 3n, 5n$

(c) $n, 2n, 4n, 8n$ (d) None of these

48. If in an experiment for determination of velocity of sound by resonance tube method using a tuning fork of 512 *Hz*, first resonance was observed at 30.7 *cm* and second was obtained at 63.2 *cm*, then maximum possible error in velocity of sound is (consider actual speed of sound in air is 332 *m/s*)

(a) 204 *cm/sec* (b) 110 *cm/sec*

(c) 58 *cm/sec* (d) 80 *cm/sec*

49. An organ pipe, open from both end produces 5 beats per second when vibrated with a source of frequency 200 *Hz*. The second harmonic of the same pipes produces 10 beats per second with a source of frequency 420 *Hz*. The frequency of source is

(a) 195 *Hz* (b) 205 *Hz*

(c) 190 *Hz* (d) 210 *Hz*

50. In one metre long open pipe what is the harmonic of resonance obtained with a tuning fork of frequency 480 *Hz*

[J & K CET 2005]

(a) First (b) Second

(c) Third (d) Fourth

51. An organ pipe open at one end is vibrating in first overtone and is in resonance with another pipe open at both ends and vibrating in third harmonic. The ratio of length of two pipes is

(a) 1 : 2 (b) 4 : 1

(c) 8 : 3 (d) 3 : 8

52. In a resonance pipe the first and second resonances are obtained at depths 22.7 *cm* and 70.2 *cm* respectively. What will be the end correction [J & K CET 2005]

(a) 1.05 *cm* (b) 115.5 *cm*

(c) 92.5 *cm* (d) 113.5 *cm*

53. An open tube is in resonance with string (frequency of vibration of tube is n). If tube is dipped in water so that 75% of length of tube is inside water, then the ratio of the frequency of tube to string now will be [J & K CET 2005]

(a) 1 (b) 2

(c) $\frac{2}{3}$ (d) $\frac{3}{2}$

Doppler's Effect

1. Doppler shift in frequency does not depend upon

[MP PMT 1993; DPMT 2000]

(a) The frequency of the wave produced

(b) The velocity of the source

(c) The velocity of the observer

(d) Distance from the source to the listener

2. A source of sound of frequency 450 *cycles/sec* is moving towards a stationary observer with 34 *m/sec* speed. If the speed of sound is 340 *m/sec*, then the apparent frequency will be

(a) 410 *cycles/sec* (b) 500 *cycles/sec*

(c) 550 *cycles/sec* (d) 450 *cycles/sec*

3. The wavelength is 120 *cm* when the source is stationary. If the source is moving with relative velocity of 60 *m/sec* towards the observer, then the wavelength of the sound wave reaching to the observer will be (velocity of sound = 330 *m/s*)

(a) 98 *cm* (b) 140 *cm*

(c) 120 *cm* (d) 144 *cm*

4. [IIT-JEE (Screening) 2005 The frequency of a whistle of an engine is 600 *cycles/sec* is moving with the speed of 30 *m/sec* towards an observer. The apparent frequency will be (velocity of sound = 330 *m/s*)

(a) 600 *cps* (b) 660 *cps*

(c) 990 *cps* (d) 330 *cps*

5. A source of sound emits waves with frequency f *Hz* and speed V *m/sec*. Two observers move away from this source in opposite directions [DCE 2005] each with a speed 0.2 V relative to the source. The ratio of frequencies heard by the two observers will be

(a) 3 : 2 (b) 2 : 3

(c) 1 : 1 (d) 4 : 10

6. The source producing sound and an observer both are moving along the direction of propagation of sound waves. If the respective velocities of sound, source and an observer are v, v_s and v_o, then the apparent frequency heard by the observer will be (n = frequency of sound)

[MP PMT 1989]

(a) $\frac{n(v+v_o)}{v-v_o}$ [DCE 2005] (b) $\frac{n(v-v_o)}{v-v_s}$

(c) $\frac{n(v-v_o)}{v+v_s}$ (d) $\frac{n(v+v_o)}{v+v_s}$

7. An observer moves towards a stationary source of sound of frequency n. The apparent frequency heard by him is $2n$. If the velocity of sound in air is 332 m/sec, then the velocity of the observer is [MP PET 1990]

(a) 166 *m/sec* (b) 664 *m/sec*

(c) 332 *m/sec* (d) 1328 *m/sec*

8. An observer is moving towards the stationary source of sound, then

(a) Apparent frequency will be less than the real frequency

(b) Apparent frequency will be greater than the real frequency

(c) Apparent frequency will be equal to real frequency

(d) Only the quality of sound will change

9. A whistle sends out 256 waves in a second. If the whistle approaches the observer with velocity 1/3 of the velocity of sound in air, the number of waves per second the observer will receive [MP PET 1990; DPMT 2002]

(a) 384 (b) 192

(c) 300 (d) 200

10. A person feels 2.5% difference of frequency of a motor-car horn. If the motor-car is moving to the person and the velocity of sound is 320 *m/sec*, then the velocity of car will be

(a) 8 *m/s* (approx.) (b) 800 *m/s*

(c) 7 *m/s* (d) 6 *m/s* (approx.)

11. Two passenger trains moving with a speed of 108 *km/hour* cross each other. One of them blows a whistle whose frequency is 750 *Hz*. If sound speed is 330 *m/s*, then passengers sitting in the other train, after trains cross each other will hear sound whose frequency will be

[MP PMT 1991]

(a) 900 *Hz* (b) 625 *Hz*

(c) 750 *Hz* (d) 800 *Hz*

12. With what velocity an observer should move relative to a stationary source so that he hears a sound of double the frequency of source

(a) Velocity of sound towards the source

(b) Velocity of sound away from the source

(c) Half the velocity of sound towards the source

(d) Double the velocity of sound towards the source

13. A source of sound emitting a note of frequency 200 *Hz* moves towards an observer with a velocity v equal to the velocity of sound. If the observer also moves away from the source with the same velocity v, the apparent frequency heard by the observer is

(a) 50 *Hz* (b) 100 *Hz*

(c) 150 *Hz* (d) 200 *Hz*

14. Doppler's effect will not be applicable when the velocity of sound source is

(a) Equal to that of the sound velocity

(b) Less than the velocity of sound

(c) Greater than the velocity of sound

(d) Zero

15. An observer while going on scooter hears sound of two sirens of same frequencies from two opposite directions. If he travels along the direction of one of the siren, then he

(a) Listens resonance

(b) Listens beats

(c) Will not listen sound due to destructive interference

(d) Will listen intensive sound due to constructive interference

16. A source of sound is travelling towards a stationary observer. The frequency of sound heard by the observer is of three times the original frequency. The velocity of sound is v *m/sec*. The speed of source will be

[MP PET 1991]

(a) $\frac{2}{3}v$ (b) v

(c) $\frac{3}{2}v$ (d) $3v$

17. A sound source is moving towards a stationary observer with 1/10 of the speed of sound. The ratio of apparent to real frequency is

[CPMT 1977; NCERT 1977; KCET 2001, 03]

(a) 10/9 (b) 11/10

(c) $(11/10)^2$ (d) $(9/10)^2$

18. The speed of sound in air at a given temperature is 350 *m/s*. An engine blows whistle at a frequency of 1200 *cps*. It is approaching the observer with velocity 50 *m/s*. The apparent frequency in *cps* heard by the observer will be

[CPMT 1981; MP PET 1989]

[CPMT 1976; RPET 1999; BHU 1997, 2001]

(a) 600 (b) 1050

(c) 1400 (d) 2400

19. Suppose that the speed of sound in air at a given temperature is 400 *m/sec*. An engine blows a whistle at 1200 *Hz* frequency. It is approaching an observer at the speed of 100 *m/sec*. What is the apparent frequency as heard by the observer

(a) 600 *Hz* (b) 1200 *Hz*

(c) 1500 *Hz* (d) 1600 *Hz*

[MP PMT 1991]

20. A source of frequency 150 *Hz* is moving in the direction of a person with a velocity of 110 *m/s*. The frequency heard by the person will be (speed of sound in medium = 330 *m/s*)

(a) 225 *Hz* (b) 200 *Hz*

(c) 150 *Hz* (d) 100 *Hz*

21. The Doppler's effect is applicable for

[AFMC 1998]

(a) Light waves (b) Sound waves

[MP PMT 1990]

(c) Space waves (d) Both (a) and (b)

22. A source of sound is moving with constant velocity of 20 *m/s* emitting a note of frequency 1000 *Hz*. The ratio of frequencies observed by a stationary observer while the source is approaching him and after it crosses him will be

[MP PET 1994]

(a) 9 : 8 (b) 8 : 9

(c) 1 : 1 (d) 9 : 10

(Speed of sound v = 340 *m/s*)

23. A source of sound S is moving with a velocity 50*m/s* towards a stationary observer. The observer measures the frequency of the source as 1000 *Hz*. What will be the apparent frequency of the source when it is moving away from the observer after crossing him ? The velocity of sound in the medium is 350 *m/s*

(a) 750 *Hz* (b) 857 *Hz*

(c) 1143 *Hz* (d) 1333 *Hz*

24. A source and listener are both moving towards each other with speed $v/10$, where v is the speed of sound. If the frequency of the note emitted by the source is f, the frequency heard by the listener would be nearly

[MP PMT 1994; MP PET 2001]

(a) 1.11 f (b) 1.22 f

(c) f (d) 1.27 f

25. A table is revolving on its axis at 5 revolutions per second. A sound source of frequency 1000 *Hz* is fixed on the table at 70 *cm* from the axis. The minimum frequency heard by a listener standing at a distance from the table will be (speed of sound = 352 *m/s*)

(a) 1000 *Hz* (b) 1066 *Hz*

(c) 941 *Hz* (d) 352 *Hz*

26. A source of sound *S* of frequency 500 *Hz* situated between a stationary observer *O* and a wall *W*, moves towards the wall with a speed of 2 *m/s*. If the velocity of sound is 332 *m/s*, then the number of beats per second heard by the observer is (approximately)

(a) 8 (b) 6

(c) 4 (d) 2

27. A motor car blowing a horn of frequency 124 *vib/sec* moves with a velocity 72 *km/hr* towards a tall wall. The frequency of the reflected sound heard by the driver will be (velocity of sound in air is 330 *m/s*) [MP PET 1997]

(a) 109 *vib/sec* (b) 132 *vib/sec*

(c) 140 *vib/sec* (d) 248 *vib/sec*

28. A source of sound of frequency *n* is moving towards a stationary observer with a speed *S*. If the speed of sound in air is *V* and the frequency heard by the observer is n_1, the value of n_1/n is

(a) $(V+S)/V$ (b) $V/(V+S)$

(c) $(V-S)/V$ (d) $V/(V-S)$

29. A vehicle with a horn of frequency *n* is moving with a velocity of 30 *m/s* in a direction perpendicular to the straight line joining the observer and the vehicle. The observer perceives the sound to have a frequency $n+n_1$. Then (if the sound velocity in air is 300 *m/s*)

[CBSE PMT 1998; AIIMS 2000]

(a) $n_1 = 10n$ (b) $n_1 = 0$

(c) $n_1 = 0.1n$ (d) $n_1 = -0.1n$

30. A whistle giving out 450 *Hz* approaches a stationary observer at a speed of 33 *m/s*. The frequency heard by the observer in *Hz* is

(a) 409 (b) 429

(c) 517 (d) 500

31. An observer is moving away from source of sound of frequency 100 *Hz*. His speed is 33 *m/s*. If speed of sound is 330 *m/s*, then the observed frequency is

[EAMCET (Engg.) 1995; CPMT 1999]

(a) 90 *Hz* (b) 100 *Hz*

(c) 91 *Hz* (d) 110 *Hz*

32. An observer standing at station observes frequency 219 *Hz* when a train approaches and 184 *Hz* when train goes away from him. If velocity of sound in air is 340 *m*/s, then velocity of train and actual frequency of whistle will be

[RPET 1997]

(a) $15.5\,ms^{-1}$, $200\,Hz$ (b) $19.5\,ms^{-1}$, $205\,Hz$

(c) $29.5\,ms^{-1}$, $200\,Hz$ (d) $32.5\,ms^{-1}$, $205\,Hz$

33. At what speed should a source of sound move so that stationary observer finds the apparent frequency equal to half of the original frequency [RPMT 1996]

(a) $\frac{v}{2}$ (b) $2v$

(c) $\frac{v}{4}$ (d) v

34. A boy is walking away from a wall towards an observer at a speed of 1 *metre/sec* and blows a whistle whose frequency is 680 *Hz*. The number of beats heard by the observer per second is (Velocity of sound in air = 340 *metres/sec*

[MP PMT 1995]

(a) Zero (b) 2

(c) 8 (d) 4

35. The driver of a car travelling with speed 30 *metres per second* towards a hill sounds a horn of frequency 600 *Hz*. If the velocity of sound in air is 330 *metres per second*, the frequency of the reflected sound as heard by the driver is

[MP PMT 1996]

(a) 720 *Hz* (b) 555.5 *Hz*

(c) 550 *Hz* (d) 500 *Hz*

36. Two sirens situated one kilometer apart are producing sound of frequency 330 *Hz*. [MP PMT 1997] An observer starts moving from one siren to the other with a speed of 2 *m/s*. If the speed of sound be 330 *m/s*, what will be the beat frequency heard by the observer [RPMT 1996; CPMT 2002]

(a) 8 (b) 4

(c) 6 (d) 1

37. A source of sound is travelling with a velocity 40 *km/hour* towards observer and emits sound of frequency 2000 *Hz*. If velocity of sound is 1220 *km/hour*, then what is the apparent frequency heard by an observer [AFMC 1997]

(a) 2210 *Hz* (b) 1920 *Hz*

(c) 2068 *Hz* (d) 2086 *Hz*

38. A source of sound and listener are approaching each other with a speed of 40 *m/s*. [IIT 1997 Cancelled] The apparent frequency of note produced by the source is 400 *cps*. Then, its true frequency (in *cps*) is (velocity of sound in air = 360 *m/s*)

[KCET 1999]

(a) 420 (b) 360

(c) 400 (d) 320

39. A siren emitting sound of frequency 500 *Hz* is going away from a static listener with a speed of 50 *m/sec*. The frequency of sound to be heard, directly from the siren, is

[AIIMS 1999; Pb. PMT 2003]

(a) 434.2 *Hz* (b) 589.3 *Hz*

(c) 481.2 *Hz* (d) 286.5 *Hz*

40. A man sitting in a moving train hears the whistle of the engine. The frequency of the whistle is 600 *Hz*

[JIPMER 1999]

(a) The apparent frequency as heard by him is smaller than 600 *Hz*

(b) The apparent frequency is larger than 600 *Hz*

(c) The frequency as heard by him is 600 *Hz*

(d) None of the above

41. A source of sound of frequency 500 *Hz* is moving towards an observer with velocity 30 *m/s*. The speed of sound is 330 *m/s*. the frequency heard by the observer will be

[MP PET 2000; Kerala PMT 2005; UPSEAT 2005]

(a) 550 *Hz* (b) 458.3 *Hz*

(c) 530 *Hz* (d) 545.5 *Hz*

42. A source of sound of frequency 90 vibrations/ *sec* is approaching a stationary observer with a speed equal to 1/10 the speed of sound. What will be the frequency heard by the observer

(a) 80 vibrations/*sec* (b) 90 vibrations/*sec*

(c) 100 vibrations/*sec* (d) 120 vibrations/*sec*

43. A whistle of frequency 500 *Hz* tied to the end of a string of length 1.2 *m* revolves at 400 *rev/min*. A listener standing some distance away in the plane of rotation of whistle hears frequencies in the range (speed of sound = 340 *m/s*)

[KCET 2000; AMU 1999; Pb. PET 2003]

(a) 436 to 586 (b) 426 to 574

(c) 426 to 584 (d) 436 to 674

44. A train moves towards a stationary observer with speed 34 *m/s*. The train sounds a whistle and its frequency registered by the observer is f_1. If the train's speed is reduced to 17 *m/s*, the frequency registered is f_2. If the speed of sound is 340 *m/s* then the ratio f_1 / f_2 is

[IIT-JEE (Screening) 2000]

(a) 18/19 (b) 1/2

(c) 2 (d) 19/18

45. If source and observer both are relatively at rest and if speed of sound is increased then frequency heard by observer will

[RPET 2000; J & K CET 2004]

(a) Increases (b) Decreases

(c) Can not be predicted (d) Will not change

46. A source and an observer move away from each other with a velocity of 10 *m/s* with respect to ground. If the observer finds the frequency of sound coming from the source as 1950 *Hz*, then actual frequency of the source is (velocity of sound in air = 340 *m/s*)

MH CET 2000; AFMC 2000; CBSE PMT 2001]

(a) 1950 *Hz* (b) 2068 *Hz*

(c) 2132 *Hz* (d) 2486 *Hz*

47. A source is moving towards an observer with a speed of 20 *m/s* and having frequency of 240 *Hz*. The observer is now moving towards the source with a speed of 20 *m/s*. Apparent frequency heard by observer, if velocity of sound is 340 *m/s*, is [CPMT 2000; KCET 2001; MH CET 2004]

(a) 240 *Hz* (b) 270 *Hz*

(c) 280 *Hz* (d) 360 *Hz*

48. A siren placed at a railway platform is emitting sound of frequency 5 *kHz*. A passenger sitting in a moving train *A* records a frequency of 5.5 *kHz* while the train approaches the siren. During his return journey in a different train *B* he records a frequency of 6.0 *kHz* while approaching the same siren. The ratio of the velocity of train *B* to that of train *A* is

[IIT-JEE (Screening) 2002]

(a) 242/252 (b) 2

(c) 5/6 (d) 11/6

49. A whistle revolves in a circle with an angular speed of 20 *rad/sec* using a string of length 50 *cm*. If the frequency of sound from the whistle is 385 *Hz*, then what is the minimum frequency heard by an observer, which is far away from the centre in the same plane ? (v = 340 *m/s*) [MP PMT 2000]

[CBSE PMT 2002]

(a) 333 *Hz* (b) 374 *Hz*

(c) 385 *Hz* (d) 394 *Hz*

50. A Siren emitting sound of frequency 800 *Hz* is going away from a static listener with a speed of 30 *m/s*, frequency of the sound to be heard by the listener is (take velocity of sound as 330 *m/s*)

[CPMT 1996; AIIMS 2002; Pb. PMT 2001]

(a) 733.3 *Hz* (b) 644.8 *Hz*

(c) 481.2 *Hz* (d) 286.5 *Hz*

51. A car sounding a horn of frequency 1000 *Hz* passes an observer. The ratio of frequencies of the horn noted by the observer before and after passing of the car is 11 : 9. If the speed of sound is v, the speed of the car is

[MP PET 2002]

(a) $\frac{1}{10}v$ (b) $\frac{1}{2}v$

(c) $\frac{1}{5}v$ (d) v

52. What should be the velocity of a sound source moving towards a stationary observer so that apparent frequency is double the actual frequency (Velocity of sound is v)

[MP PMT 2002]

(a) v (b) $2v$

(c) $\frac{v}{2}$ (d) $\frac{v}{4}$

[EAMCET 1997;

53. Two trains are moving towards each other at speeds of 20 *m/s* and 15 *m/s* relative to the ground. The first train sounds a whistle of frequency 600 *Hz*. the frequency of the whistle heard by a passenger in the second train before the train meets is (the speed of sound in air is 340 *m/s*)

[UPSEAT 2002]

(a) 600 *Hz* (b) 585 *Hz*

(c) 645 *Hz* (d) 666 *Hz*

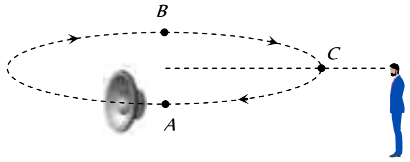
54. A small source of sound moves on a circle as shown in the figure and an observer is standing on O. Let n_1, n_2 and n_3 be the frequencies heard when the source is at A, B and C respectively. Then [UPSEAT 2002]

(a) $n_1 > n_2 > n_3$

(b) $n_2 > n_3 > n_1$

(c) $n_1 = n_2 > n_3$

(d) $n_2 > n_1 > n_3$



55. A source and an observer approach each other with same velocity 50 *m/s*. If the apparent frequency is 435 *sec*, then the real frequency is [CPMT 2003]

(a) 320 *s* (b) 360 *sec*

(c) 390 *sec* (d) 420 *sec*

56. A source emits a sound of frequency of 400 *Hz*, but the listener hears it to be 390 *Hz*. Then [Orissa JEE 2003]

(a) The listener is moving towards the source

(b) The source is moving towards the listener

(c) The listener is moving away from the source

(d) The listener has a defective ear

57. Doppler effect is applicable for [AFMC 2003]

(a) Moving bodies

(b) One is moving and other are stationary

(c) For relative motion

(d) None of these

58. A source and an observer are moving towards each other with a speed equal to $\frac{v}{2}$ where v is the speed of sound. The source is emitting sound of frequency *n*. The frequency heard by the observer will be [MP PET 2003]

(a) Zero (b) n

(c) $\frac{n}{3}$ (d) $3n$

59. When an engine passes near to a stationary observer then its apparent frequencies occurs in the ratio 5/3. If the velocity of engine is [MP PMT 2003]

(a) 540 *m/s* (b) 270 *m/s*

(c) 85 *m/s* (d) 52.5 *m/s*

60. A police car horn emits a sound at a frequency 240 *Hz* when the car is at rest. If the speed of the sound is 330 *m/s*, the frequency heard by an observer who is approaching the car at a speed of 11 *m/s*, is :

(a) 248 *Hz* (b) 244 *Hz*

(c) 240 *Hz* (d) 230 *Hz*

61. A person carrying a whistle emitting continuously a note of 272 *Hz* is running towards a reflecting surface with a speed of 18 *km/hour*. The speed of sound in air is $345ms^{-1}$. The number of beats heard by him is [Kerala (Engg.) 2002]

(a) 4 (b) 6

(c) 8 (d) 3

62. A bus is moving with a velocity of 5 *m/s* towards a huge wall. the driver sounds a horn of frequency 165 *Hz*. If the speed of sound in air is 355 *m/s*, the number of beats heard per second by a passenger on the bus will be [KCET 2001; BHU 2002]

(a) 6 (b) 5

(c) 3 (d) 4

63. A source of sound of frequency 256 *Hz* is moving rapidly towards a wall with a velocity of 5*m/s*. The speed of sound is 330 *m/s*. If the observer is between the wall and the source, then beats per second heard will be [UPSEAT 2002]

(a) 7.8 *Hz* (b) 7.7 *Hz*

(c) 3.9 *Hz* (d) Zero

64. The apparent frequency of a note, when a listener moves towards a stationary source, with velocity of 40 *m/s* is 200 *Hz*. When he moves away from the same source with the same speed, the apparent frequency of the same note is 160 *Hz*. The velocity of sound in air is (in *m/s*) [KCET 1998]

(a) 360 (b) 330

(c) 320 (d) 340

65. An observer moves towards a stationary source of sound, with a velocity one-fifth of the velocity of sound. What is the percentage increase in the apparent frequency [AIEEE 2005]

(a) 5% (b) 20%

(c) Zero (d) 0.5%

Musical Sound

1. The walls of the halls built for music concerts should [NCERT 1979]

(a) Amplify sound (b) Transmit sound

(c) Reflect sound (d) Absorb sound

2. A spherical source of power 4 *W* and frequency 800 *Hz* is emitting sound waves. The intensity of waves at a distance 200 *m* is[CPMT 1999; JIPMER

(a) $8\times10^{-6}\ W/m^2$ (b) $2\times10^{-4}\ W/m^2$

(c) $1\times10^{-4}\ W/m^2$ (d) $4\ W/m^2$

3. If the pressure amplitude in a sound wave is tripled, then the intensity of sound is increased by a factor of [CPMT 1992; JIPMER 2000]

(a) 9 (b) 3

(c) 6 (d) $\sqrt{3}$

4. If the amplitude of sound is doubled and the frequency reduced to one-fourth, the intensity of sound at the same point will be [UPSEAT 2004]

(a) Increased by a factor of 2

(b) Decreased by a factor of 2

(c) Decreased by a factor of 4

(d) Unchanged

5. Intensity level of a sound of intensity *I* is 30 *dB*. The ratio $\frac{I}{I_0}$ is (Where I_0 is the threshold of hearing) [KCET 1999; J & K CET 2005]

(a) 3000 (b) 1000

(c) 300 (d) 30

6. Decibel is unit of [RPMT 2000]

(a) Intensity of light (b) X-rays radiation capacity

(c) Sound loudness (d) Energy of radiation

7. Quality of a musical note depends on [MP PMT 1998; KCET 1999; RPET 2000]

(a) Harmonics present

(b) Amplitude of the wave

(c) Fundamental frequency

(d) Velocity of sound in the medium

8. When we hear a sound, we can identify its source from

[KCET (Med.) 2001]

(a) Amplitude of sound

(b) Intensity of sound

(c) Wavelength of sound

(d) Overtones present in the sound

9. A man X can hear only upto 10 *kHz* and another man y upto 20 *kHz*. A note of frequency 500 *Hz* is produced before them from a stretched string. Then [KCET 2002]

(a) Both will hear sounds of same pitch but different quality

(b) Both will hear sounds of different pitch but same quality

(c) Both will hear sounds of different pitch and different quality

(d) Both will hear sounds of same pitch and same quality

10. The amplitude of two waves are in ratio 5 : 2. If all other conditions for the two waves are same, then what is the ratio of their energy densities [MH CET 2004]

(a) 5 : 2 (b) 10: 4

(c) 2.5 : 1 (d) 25 : 4

11. *A* is singing a note and at the same time *B* is singing a note with exactly one-eighth the frequency of the note of *A*. The energies of two sounds are equal, the amplitude of the note of *B* is [NCERT 1981; AIIMS 2001]

(a) Same that of *A* (b) Twice as that of *A*

(c) Four times as that of *A* (d) Eight times as that of *A*

12. The loudness and pitch of a sound depends on [KCET 2004; Pb. PET 2003]

(a) Intensity and velocity

(b) Frequency and velocity

(c) Intensity and frequency

(d) Frequency and number of harmonics

13. If *T* is the reverberation time of an auditorium of volume *V* then

(a) $T \propto \frac{1}{V}$ (b) $T \propto \frac{1}{V^2}$

(c) $T \propto V^2$ (d) $T \propto V$

14. The intensity of sound from a radio at a distance of 2 *metres* from its speaker is $1 \times 0^{-2}\,\mu\, W/m^2$. The intensity at a distance of 10 meters would be [CPMT 2005]

(a) $0.2 \times 10^{-2}\,\mu\, W/m^2$ (b) $1 \times 10^{-2}\,\mu\, W/m^2$

(c) $4 \times 10^{-4}\,\mu\, W/m^2$ (d) $5 \times 10^{-2}\,\mu\, W/m^2$

15. The intensity of sound wave while passing through an elastic medium falls down by 10% as it covers one metre distance through the medium. If the initial intensity of the sound wave was 100 *decibels*, its value after it has passed through 3 *metre* thickness of the medium will be [CPMT 1988]

(a) 70 *decibel* (b) 72.9 *decibel*

(c) 81 *decibel* (d) 60 *decibel*

16. A musical scale is constructed by providing intermediate frequencies between a note and its octave which [CPMT 1972; NCERT 1980]

(a) Form an arithmetic progression

(b) Form a geometric progression

(c) Bear a simple ratio with their neighbours

(d) Form a harmonic progression

17. In a harmonium the intermediate notes between a note and its octave form [CPMT 1973]

(a) An arithmetic progression

(b) A geometric progression

(c) A harmonic progression

(d) An exponential progression

18. The power of a sound from the speaker of a radio is 20 *mW*. By turning the knob of the volume control, the power of the sound is increased to 400 *mW*. The power increase in decibels as compared to the original power is

(a) 13 *dB* (b) 10 *dB*

(c) 20 *dB* (d) 800 *dB*

19. If separation between screen and source is increased by 2% what would be the effect on the intensity [CPMT 2003]

(a) Increases by 4% (b) Increases by 2%

(c) Decreases by 2% (d) Decreases by 4%

20. The musical interval between two tones of frequencies 320 *Hz* and 240 *Hz* is [MP PMT 1992; AFMC 1992]

(a) 80 (b) $\left(\frac{4}{3}\right)$

(c) 560 (d) 320×240

21. In an orchestra, the musical sounds of different instruments are distinguished from one another by which of the following characteristics [CBSE PMT 1993]

(a) Pitch (b) Loudness

(c) Quality (d) Overtones

22. The intensity level due to two waves of the same frequency in a given medium are 1 *bel* and 5 *bel*. Then the ratio of amplitudes is [KCET 2003]

(a) 1 : 4 (b) 1 : 2

(c) $1 : 10^4$ (d) $1 : 10^2$

23. It is possible to recognise a person by hearing his voice even if he is hidden behind a wall. This is due to the fact that his voice

(a) Has a definite pitch (b) Has a definite quality

(c) Has a definite loudness (d) Can penetrate the wall

24. Of the following the one which emits sound of higher pitch is

(a) Mosquito (b) Lion

(c) Man (d) Woman

25. In the musical octave 'Sa', 'Re', 'Ga'

(a) The frequency of the note 'Sa' is greater than that of 'Re', 'Ga'

(b) The frequency of the note 'Sa' is smaller than that of 'Re', 'Ga'

(c) The frequency of all the notes 'Sa', 'Re', 'Ga' is the same

(d) The frequency decreases in the sequence 'Sa', 'Re', 'Ga'

26. Tone *A* has frequency of 240 *Hz*. Of the following tones, the one which will sound least harmonious with *A* is

(a) 240 (b) 480

(c) 360 (d) 450

27. Learned Indian classical vocalists do not like the accompaniment of a harmonium because [MP PMT 1992]

(a) Intensity of the notes of the harmonium is too large

(b) Notes of the harmonium are too shrill

(c) Diatonic scale is used in the harmonium

(d) Tempered scale is used in the harmonium

28. Each of the properties of sound listed in column A primarily depends on one of the quantities in column B. Choose the matching pairs from two columns

Column A	Column B
Pitch	Waveform
Quality	Frequency
Loudness	Intensity

[IIT 1980]

(a) Pitch-waveform, Quality-frequency; Loudness-intensity

(b) Pitch-frequency, Quality-waveform; Loudness-intensity

(c) Pitch-intensity, Quality-waveform; Loudness- frequency

(d) Pitch-waveform, Quality- intensity; Loudness-frequency

29. Intensity level 200 *cm* from a source of sound is 80 *dB*. If there is no loss of acoustic power in air and intensity of threshold hearing is $10^{-12}\,Wm^{-2}$ then, what is the intensity level at a distance of 400 *cm* from source

(a) Zero (b) 54 *dB*

(c) 64 *dB* (d) 44 *dB*

30. A point source emits sound equally in all directions in a non-absorbing medium. Two points P and Q are at distances of $2m$ and $3m$ respectively from the source. The ratio of the intensities of the waves at P and Q is [CBSE PMT 2005]

(a) 9 : 4 (b) 2 : 3

(c) 3 : 2 (d) 4 : 9

31. Quality depends on [AFMC 2003]

(a) Intensity (b) Loudness

(c) Timbre (d) Frequency

32. Two waves having sinusoidal waveforms have different wavelengths and different amplitude. They will be having

[BHU 2005]

(a) Same pitch and different intensity

(b) Same quality and different intensity

(c) Different quality and different intensity

(d) Same quality and different pitch

Critical Thinking

Objective Questions

1. A wave disturbance in a medium is described by $y(x,t) = 0.02\cos\left(50\pi t + \frac{\pi}{2}\right)\cos(10\pi x)$, where x and y are in *metres* and t in seconds [IIT 1995]

(a) A displacement node occurs at $x = 0.15\ m$

(b) An antinode occurs at $x = 0.3\ m$

(c) The wavelength of the wave is 0.2 *m*

(d) The speed of the wave is 5.0 *m/s*

2. The (x, y) coordinates of the corners of a square plate are (0, 0), (*L*, 0), (*L*, *L*) and (0, *L*). The edges of the plate are clamped and transverse standing waves are set up in it. If $u(x, y)$ denotes the displacement of the plate at the point (x, y) at some instant of time, the possible expression(s) for u is(are) (a = positive constant)

[IIT 1998; Orissa PMT 2004]

(a) $a\cos\frac{\pi x}{2L}\cos\frac{\pi y}{2L}$ (b) $a\sin\frac{\pi x}{L}\sin\frac{\pi y}{L}$

(c) $a\sin\frac{\pi x}{L}\sin\frac{2\pi y}{L}$ (d) $a\cos\frac{2\pi x}{L}\cos\frac{\pi y}{L}$

3. The ends of a stretched wire of length L are fixed at $x = 0$ and $x = L$. In one experiment, the displacement of the wire is $y_1 = A\sin(\pi x/L)\sin\omega t$ and energy is E_1, and in another experiment its displacement is $y_2 = A\sin(2\pi x/L)\sin 2\omega t$ and energy is E_2. Then

[IIT-JEE (Screening) 2001]

(a) $E_2 = E_1$ (b) $E_2 = 2E_1$

(c) $E_2 = 4E_1$ (d) $E_2 = 16E_1$

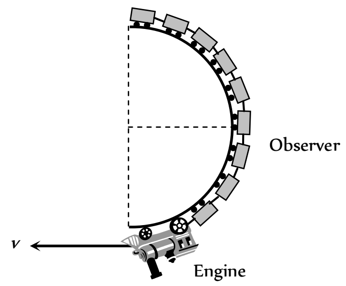
4. In a large room, a person receives direct sound waves from a source 120 *metres* away from him. He also receives waves from the same source which reach him, being reflected from the 25 *metre* high ceiling at a point halfway between them. The two waves interfere constructively for wavelength of

[Roorkee 1982]

(a) 20, 20/3, 20/5 *etc* (b) 10, 5, 2.5 *etc*

(c) 10, 20, 30 *etc* (d) 15, 25, 35 *etc*

5. A train has just complicated a *U*-curve in a track which is a semicircle. The engine is at the forward end of the semi circular part of the track while the last carriage is at the rear end of the semicircular track. The driver blows a whistle of frequency 200 *Hz*. Velocity of sound is 340 *m/sec*. Then the apparent frequency as observed by a passenger in the middle of a train when the speed of the train is 30 *m/sec* is



(a) 209 *Hz* (b) 288 *Hz*

(c) 200 *Hz* (d) 181 *Hz*

6. Two identical flutes produce fundamental notes of frequency 300 *Hz* at 27^o *C*. If the temperature of air in one flute is increased to 31^o *C*, the number of the beats heard per second will be

(a) 1 (b) 2

(c) 3 (d) 4

7. In the experiment for the determination of the speed of sound in air using the resonance column method, the length of the air column that resonates in the fundamental mode, with a tuning fork is 0.1 *m*. when this length is changed to 0.35 *m*, the same tuning fork resonates with the first overtone. Calculate the end correction

[IIT-JEE (Screening) 2003]

(a) 0.012*m* (b) 0.025*m*

(c) 0.05*m* (d) 0.024*m*

8. A closed organ pipe of length L and an open organ pipe contain gases of densities ρ_1 and ρ_2 respectively. The compressibility of gases are equal in both the pipes. Both the pipes are vibrating in their first overtone with same frequency. The length of the open organ pipe is

[IIT-JEE (Screening) 2004]

(a) $\frac{L}{3}$ (b) $\frac{4L}{3}$

(c) $\frac{4L}{3}\sqrt{\frac{\rho_1}{\rho_2}}$ (d) $\frac{4L}{3}\sqrt{\frac{\rho_2}{\rho_1}}$

9. A string of length 0.4 m and mass $10^{-2}\ kg$ is tightly clamped at its ends. The tension in the string is 1.6 N. Identical wave pulses are produced at one end at equal intervals of time Δt. The minimum value of Δt which allows constructive interference between successive pulses is [IIT 1998]

(a) 0.05 s (b) 0.10 s
(c) 0.20 s (d) 0.40 s

10. Two identical stringed instruments have frequency 100 Hz. If tension in one of them is increased by 4% and they are sounded together then the number of beats in one second is

[EAMCET (Engg.) 1995]

(a) 1 (b) 8
(c) 4 (d) 2

11. The difference between the apparent frequency of a source of sound as perceived by an observer during its approach and recession is 2% of the natural frequency of the source. If the velocity of sound in air is 300 m/sec, the velocity of the source is (It is given that velocity of source << velocity of sound) [CPMT 1982; RPET 1998]

(a) 6 m/sec (b) 3 m/sec
(c) 1.5 m/sec (d) 12 m/sec

12. A sound wave of frequency ν travels horizontally to the right. It is reflected from a large vertical plane surface moving to the left with a speed v. The speed of sound in the medium is c, then

(a) The frequency of the reflected wave is $\frac{\nu(c+v)}{c-v}$

(b) The wavelength of the reflected wave is $\frac{c(c-v)}{\nu(c+v)}$

(c) The number of waves striking the surface per second is $\frac{\nu(c+v)}{c}$

(d) The number of beats heard by a stationary listener to the left of the reflecting surface is $\frac{v\nu}{c-v}$

13. Two cars are moving on two perpendicular roads towards a crossing with uniform speeds of 72 km/hr and 36 km/hr. If first car blows horn of frequency 280 Hz, then the frequency of horn heard by the driver of second car when line joining the cars make 45° angle with the roads; will be

[RPET 1997]

(a) 321 Hz (b) 298 Hz
(c) 289 Hz (d) 280 Hz

14. Two whistles A and B produces notes of frequencies 660 Hz and 596 Hz respectively. There is a listener at the mid-point of the line joining them. Now the whistle B and the listener start moving with speed 30 m/s away from the whistle A. If speed of sound be 330 m/s, how many beats will be heard by the listener

(a) 2 (b) 4
(c) 6 (d) 8

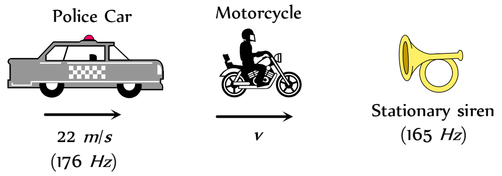
15. A source producing sound of frequency 170 Hz is approaching a stationary observer with a velocity 17 ms^{-1}. The apparent change in the wavelength of sound heard by the observer is (speed of sound in air = 340 ms^{-1})

[EAMCET (Engg.) 2000]

(a) 0.1m (b) 0.2m
(c) 0.4m (d) 0.5m

16. A police car moving at 22 m/s, chases a motorcyclist. The police man sounds his horn at 176 Hz, while both of them move towards a stationary siren of frequency 165 Hz. Calculate the speed of the motorcycle, if it is given that he does not observes any beats

[IIT-JEE (Screening) 2003]



(a) 33 m/s (b) 22 m/s
(c) Zero (d) 11 m/s

17. An observer moves towards a stationary source of sound with a speed 1/5th of the speed of sound. The wavelength and frequency of the source emitted are λ and f respectively. The apparent frequency and wavelength recorded by the observer are respectively[CBSE PMT

(a) $1.2\,f, \lambda$ (b) $f, 1.2\lambda$
(c) $0.8f, 0.8\lambda$ (d) $1.2f, 1.2\lambda$

18. A light pointer fixed to one prong of a tuning fork touches a vertical plate. The fork is set vibrating and the plate is allowed to fall freely. If eight oscillations are counted when the plate falls through 10 cm, the frequency of the tuning fork is [IIT 1977; KCET 2002]
[IIT 1995; BCECE 2005]

(a) 360 Hz (b) 280 Hz
(c) 560 Hz (d) 56 Hz

19. Oxygen is 16 times heavier than hydrogen. Equal volumes of hydrogen and oxygen are mixed. The ratio of speed of sound in the mixture to that in hydrogen is [KCET 2004]

(a) $\sqrt{\frac{1}{8}}$ (2) $\sqrt{\frac{32}{17}}$
(c) $\sqrt{8}$ (d) $\sqrt{\frac{2}{17}}$

20. The equation of displacement of two waves are given as $y_1 = 10\sin\left(3\pi t + \frac{\pi}{3}\right)$; $y_2 = 5(\sin 3\pi t + \sqrt{3}\cos 3\pi t)$. Then what is the ratio of their amplitudes

[AIIMS 1997; Haryana PMT 2000]

(a) 1 : 2 (b) 2 : 1
(c) 1 : 1 (d) None of these

21. The equation $y = A\cos^2\left(2\pi\, nt - 2\pi\frac{x}{\lambda}\right)$ represents a wave with

(a) Amplitude $A/2$, frequency $2n$ and wavelength $\lambda/2$

(b) Amplitude $A/2$, frequency $2n$ and wavelength λ [RPET 1996]

(c) Amplitude A, frequency $2n$ and wavelength 2λ

(d) Amplitude A, frequency n and wavelength λ

22. In a wave motion $y = a\sin(kx - \omega t)$, y can represent

[IIT-JEE 1999]

(a) Electric field (b) Magnetic field
(c) Displacement (d) Pressure

23. Consider ten identical sources of sound all giving the same frequency but having phase angles which are random. If the average intensity of each source is I_0, the average of resultant intensity I due to all these ten sources will be

[MP PMT 1990]

(a) $I = 100\, I_0$ (b) $I = 10\, I_0$

(c) $I = I_0$ (d) $I = \sqrt{10}\, I_0$

24. Ten tuning forks are arranged in increasing order of frequency in such a way that any two nearest tuning forks produce 4 *beats/sec*. The highest frequency is twice of the lowest. Possible highest and the lowest frequencies are

[MP PMT 1990; MHCET 2002]

(a) 80 and 40 (b) 100 and 50

(c) 44 and 22 (d) 72 and 36

25. 41 forks are so arranged that each produces 5 *beats per sec* when sounded with its near fork. If the frequency of last fork is double the frequency of first fork, then the frequencies of the first and last fork are respectively

[MP PET 1997; KCET 2002]

(a) 200, 400 (b) 205, 410

(c) 195, 390 (d) 100, 200

26. Two identical wires have the same fundamental frequency of 400 *Hz*. when kept under the same tension. If the tension in one wire is increased by 2% the number of beats produced will be

(a) 4 (b) 2

(c) 8 (d) 1

27. 25 tunning forks are arranged in series in the order of decreasing frequency. Any two successive forks produce 3 beats/sec. If the frequency of the first turning fork is the octave of the last fork, then the frequency of the 21st fork is

[Kerala (Engg.) 2001]

(a) 72 *Hz* (b) 288 *Hz*

(c) 84 *Hz* (d) 87 *Hz*

28. 16 tunning forks are arranged in the order of increasing frequencies. Any two successive forks give 8 beats per sec when sounded together. If the frequency of the last fork is twice the first, then the frequency of the first fork is

[CBSE PMT 2000; MP PET 2001]

(a) 120 (b) 160

(c) 180 (d) 220

29. Two identical straight wires are stretched so as to produce 6 beats per second when vibrating simultaneously. On changing the tension in one of them, the beat frequency remains unchanged. Denoting by T_1, T_2, the higher and the lower initial tensions in the strings, then it could be said that while making the above change in tension[IIT 1991]

(a) T_2 was decreased (b) T_2 was increased

(c) T_1 was increased (d) T_1 was kept constant

30. The frequency of a stretched uniform wire under tension is in resonance with the fundamental frequency of a closed tube. If the tension in the wire is increased by 8 *N*, it is in resonance with the first overtone of the closed tube. The initial tension in the wire is

(a) 1 *N* (b) 4 *N*

(c) 8 *N* (d) 16 *N*

31. A metal wire of linear mass density of 9.8 *g/m* is stretched with a tension of 10 *kg* weight between two rigid supports 1 *metre* apart. The wire passes at its middle point between the poles of a permanent magnet, and it vibrates in resonance when carrying an alternating current of frequency *n*. The frequency *n* of the alternating source is

[AIEEE 2003]

(a) 25 *Hz* (b) 50 *Hz*

(c) 100 *Hz* (d) 200 *Hz*

32. A wire of density 9×10^{3} kg /m^3 is stretched between two clamps 1 m apart and is subjected to an extension of 4.9×10^{-4} m. The lowest frequency of transverse vibration in the wire is ($Y = 9 \times 10^{10}$ N / m^2)[UPSEAT 200

(a) 40 *Hz* (b) 35 *Hz*

(c) 30 *Hz* (d) 25 *Hz*

33. A man is watching two trains, one leaving and the other coming in with equal speeds of 4 *m*/sec. If they sound their whistles, each of frequency 240 *Hz*, the number of beats heard by the man (velocity of sound in air = 320 *m/sec*) will be equal to

MP PET 1999; RPMT 2000; BHU 2004, 05]

(a) 6 (b) 3

(c) 0 [JIPMER 1999] (d) 12

34. An open pipe is in resonance in its 2nd harmonic with tuning fork of frequency f_1. Now it is closed at one end. If the frequency of the tuning fork is increased slowly from f_1 then again a resonance is obtained with a frequency f_2. If in this case the pipe vibrates n^{th} harmonics then

[IIT-JEE (Screening) 2005]

(a) $n = 3,\ f_2 = \frac{3}{4} f_1$ (b) $n = 3,\ f_2 = \frac{5}{4} f_1$

(c) $n = 5,\ f_2 = \frac{5}{4} f_1$ (d) $n = 5,\ f_2 = \frac{3}{4} f_1$

35. Two speakers connected to the same source of fixed frequency are placed 2.0 *m* apart in a box. A sensitive microphone placed at a distance of 4.0*m* from their midpoint along the perpendicular bisector shows maximum response. The box is slowly rotated until the speakers are in line with the microphone. The distance between the midpoint of the speakers and the microphone remains unchanged. Exactly five maximum responses are observed in the microphone in doing this. The wavelength of the sound wave is

(a) 0.2 *m* (b) 0.4 *m*

(c) 0.6 *m* (d) 0.8 *m*

36. A wire of $9.8 \times 10^{-3}\, kgm^{-1}$ passes over a frictionless light pulley fixed on the top of a frictionless inclined plane which makes an angle of 30° with the horizontal. Masses *m* and *M* are tied at the two ends of wire such that *m* rests on the plane and *M* hangs freely vertically downwards. The entire system is in equilibrium and a transverse wave propagates along the wire with a velocity of 100 ms^{-1}.

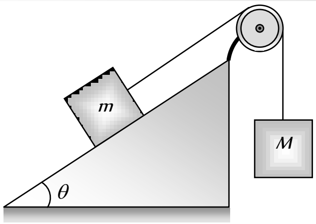
Chose the correct option [EAMCET (Engg.) 2000]

(a) $m = 20\,kg$

(b) $m = 5\,kg$

(c) $m = 2\,kg$

(d) $m = 7\,kg$

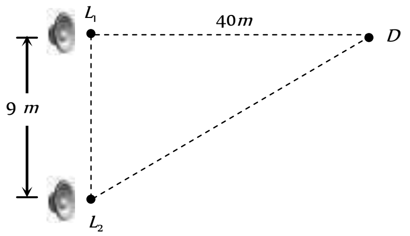


37. A man standing in front of a mountain beats a drum at regular intervals. The rate of drumming is generally increased and he finds that the echo is not heard distinctly when the rate becomes 40 per minute. He then moves nearer to the mountain by 90 *m* and finds that echo is again not heard when the drumming rate becomes 60 per minute. The distance between the mountain and the initial position of the man is

(a) 205 *m* (b) 300 *m*

(c) 180 *m* (d) 270 *m*

38. Two loudspeakers L_1 and L_2 driven by a common oscillator and amplifier, are arranged as shown. The frequency of the oscillator is gradually increased from zero and the detector at *D* records a series of maxima and minima. If the speed of sound is 330 *ms* then the frequency at which the first maximum is observed is



(a) 165 *Hz* (b) 330 *Hz*

(c) 496 *Hz* (d) 660 *Hz*

39. The displacement due to a wave moving in the positive *x*-direction is given by $y = \frac{1}{(1 + x^2)}$ at time $t = 0$ and by $y = \frac{1}{[1 + (x-1)^2]}$ at $t = 2$ seconds, where *x* and *y* are in *metres*. The velocity of the wave in *m/s* is

(a) 0.5 (b) 1

(c) 2 (d) 4

40. A person speaking normally produces a sound intensity of 40 *dB* at a distance of 1 *m*. If the threshold intensity for reasonable audibility is 20 *dB*, the maximum distance at which he can be heard clearly is

(a) 4 *m* (b) 5 *m*

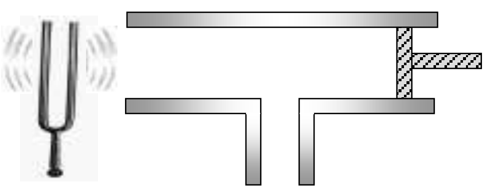
(c) 10 *m* (d) 20 *m*

41. A string of length *L* and mass *M* hangs freely from a fixed point. Then the velocity of transverse waves along the string at a distance *x* from the free end is

(a) $\sqrt{gL}$ (b) $\sqrt{gx}$

(c) gL (d) gx

42. Vibrating tuning fork of frequency *n* is placed near the open end of a long cylindrical tube. The tube has a side opening and is fitted with a movable reflecting piston. As the piston is moved through 8.75 *cm*, the intensity of sound changes from a maximum to minimum. If the speed of sound is 350 *m/s*. Then *n* is



(a) 500 *Hz* (b) 1000 *Hz*

(c) 2000 *Hz* (d) 4000 *Hz*

43. A stone is hung in air from a wire which is stretched over a sonometer. The bridges of the sonometer are *L cm* apart when the wire is in unison with a tuning fork of frequency *N*. When the stone is completely immersed in water, the length between the bridges is *l cm* for re-establishing unison, the specific gravity of the material of the stone is

(a) $\frac{L^2}{L^2 + l^2}$ (b) $\frac{L^2 - l^2}{L^2}$

(c) $\frac{L^2}{L^2 - l^2}$ (d) $\frac{L^2 - l^2}{L^2}$

44. The displacement of a particle in string stretched in *X* direction is represented by *y*. Among the following expressions for *y*, those describing wave motions are

[IIT 1987]

(a) $\cos kx \sin \omega t$ (b) $k^2x^2 - \omega^2t^2$

(c) $\cos(kx + \omega t)$ (d) $\cos(k^2x^2 - \omega^2t^2)$

45. Three waves of equal frequency having amplitudes 10 μm, 4 μm and 7 μm arrive at a given point with successive phase difference of $\frac{\pi}{2}$. The amplitude of the resulting wave in μm is given by

(a) 7 (b) 6

(c) 5 (d) 4

46. There are three sources of sound of equal intensity with frequencies 400, 401 and 402 *vib/sec*. The number of beats heard per second is

[MNR 1980; J & K CET 2005]

(a) 0 (b) 1

(c) 2 (d) 3

47. A tuning fork of frequency 340*Hz* is vibrated just above the tube of 120 *cm* height. Water is poured slowly in the tube. What is the minimum height of water necessary for the resonance (speed of sound in the air = 340 *m/sec*)

[CBSE PMT 1999; UPSEAT 1999]

(a) 15 *cm* (b) 25 *cm*

(c) 30 *cm* (d) 45 *cm*

48. An organ pipe is closed at one end has fundamental frequency of 1500 *Hz*. The maximum number of overtones generated by this pipe which a normal person can hear is :

[AIIMS 2004]

(a) 14 (b) 13

(c) 6 (d) 9

49. In Melde's experiment, the string vibrates in 4 loops when a 50 *gram* weight is placed in the pan of weight 15 *gram*. To make the string to vibrates in 6 loops the weight that has to be removed from the pan is [MH CET 2004]

(a) 0.0007 *kg wt* (b) 0.0021 *kg wt*

(c) 0.036 *kg wt* (d) 0.0029 *kg wt*

50. A racing car moving towards a cliff, sounds its horn. The driver observes that the sound reflected from the cliff has a pitch one octave higher than the actual sound of the horn. If v is the velocity of sound, then the velocity of the car is

[KCET 2002; CBSE PMT 2004]

(a) $v/\sqrt{2}$ (b) $v/2$

(c) $v/3$ (d) $v/4$

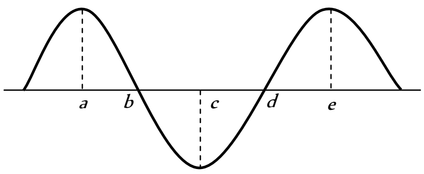
51. An earthquake generates both transverse (*S*) and longitudinal (*P*) sound waves in the earth. The speed of *S* waves is about 4.5 *km*/s and that of *P* waves is about 8.0 *km/s*. A seismograph records *P* and *S* waves from an earthquake. The first *P* wave arrives 4.0 *min* before the first *S* wave. The epicenter of the earthquake is located at a distance about **[AIIMS 2003]**

(a) 25 *km* (b) 250 *km*

(c) 2500 *km* (d) 5000 *km*

GQ Graphical Questions

1. The rope shown at an instant is carrying a wave travelling towards right, created by a source vibrating at a frequency n. Consider the following statements



I. The speed of the wave is $4n\times ab$

II. The medium at a will be in the same phase as d after $\frac{4}{3n}$ s

III. The phase difference between b and e is $\frac{3\pi}{2}$

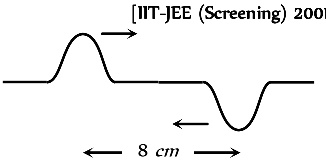
Which of these statements are correct **[AMU 2001]**

(a) I, II and III (b) II only

(c) I and III (d) III only

2. Two pulses in a stretched string whose centres are initially 8 *cm* apart are moving towards each other as shown in the figure. The speed of each pulse is 2 *cm/s*. After 2 seconds, the total energy of the pulses will be

[IIT-JEE (Screening) 2001]



(a) Zero

(b) Purely kinetic

(c) Purely potential

(d) Partly kinetic and partly potential

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) *If both assertion and reason are true and the reason is the correct explanation of the assertion.*
(b) *If both assertion and reason are true but reason is not the correct explanation of the assertion.*
(c) *If assertion is true but reason is false.*
(d) *If the assertion and reason both are false.*
(e) *If assertion is false but reason is true.*

1. Assertion : Two persons on the surface of moon cannot talk to each other.
Reason : There is no atmosphere on moon.

2. Assertion : Transverse waves are not produced in liquids and gases.
Reason : Light waves are transverse waves.

3. Assertion : Sound waves cannot propagate through vacuum but light waves can.
Reason : Sound waves cannot be polarised but light waves can be polarised. [AIIMS 1998]

4. Assertion : The velocity of sound increases with increase in humidity.
Reason : Velocity of sound does not depend upon the medium.

5. Assertion : Ocean waves hitting a beach are always found to be nearly normal to the shore.
Reason : Ocean waves are longitudinal waves.

6. Assertion : Compression and rarefaction involve changes in density and pressure.
Reason : When particles are compressed, density of medium increases and when they are rarefied, density of medium decreases.

7. Assertion : Transverse waves travel through air in an organ pipe.
Reason : Air possesses only volume elasticity.

8. Assertion : Sound would travel faster on a hot summer day than on a cold winter day.
Reason : Velocity of sound is directly proportional to the square of its absolute temperature.

9. Assertion : The basic of Laplace correction was that, exchange of heat between the region of compression and rarefaction in air is not possible.
Reason : Air is a bad conductor of heat and velocity of sound in air is large.

10. Assertion : Particle velocity and wave velocity both are independent of time.
Reason : For the propagation of wave motion, the medium must have the properties of elasticity and inertia.

11. Assertion : When we start filling an empty bucket with water, the pitch of sound produced goes on decreasing.
Reason : The frequency of man voice is usually higher than that of woman.

12. Assertion : A tuning fork is made of an alloy of steel, nickel and chromium.
Reason : The alloy of steel, nickel and chromium is called elinvar.

13. Assertion : The change in air pressure effect the speed of sound.
Reason : The speed of sound in a gas is proportional to square root of pressure.

14. Assertion : Solids can support both longitudinal and transverse waves but only longitudinal waves can propagate in gases.
Reason : For the propagation of transverse waves, medium must also neccessarly have the property of rigidity.

15. Assertion : Under given conditions of pressure and temperature, sound travels faster in a monoatomic gas than in diatomic gas.
Reason : Opposition for wave to travel is more in diatomic gas than monoatomic gas.

16. Assertion : The speed of sound in solids is maximum though their density is large.
Reason : The coefficient of elasticity of solid is large.

17. Assertion : On a rainy day sound travel slower than on a dry day.
Reason : When moisture is present in air the density of air increases.

18. Assertion : To hear distinct beats, difference in frequencies of two sources should be less than 10.
Reason : More the number of beats per sec more difficult to hear them.

19. Assertion : Sound produced by an open organ pipe is richer than the sound produced by a closed organ pipe.
Reason : Outside air can enter the pipe from both ends, in case of open organ pipe.

20. Assertion : It is not possible to have interference between the waves produced by two violins.
Reason : For interference of two waves the phase difference between the waves must remain constant.

21. Assertion : Beats can also be observed by two light sources as in sound.
Reason : Light sources have constant phase deference.

22. Assertion : In the case of a stationary wave, a person hear a loud sound at the nodes as compared to the antinodes.
Reason : In a stationary wave all the particles of the medium vibrate in phase.

23. Assertion : Velocity of particles, while crossing mean position (in stationary waves) varies from maximum at antinodes to zero at nodes.
Reason : Amplitude of vibration at antinodes is maximum and at nodes, the amplitude is zero, And all particles between two successive nodes cross the mean position together.

24. Assertion : Where two vibrating tuning forks having frequencies 256 *Hz* and 512 *Hz* are held near each other, beats cannot be heard.
Reason : The principle of superposition is valid only if the frequencies of the oscillators are nearly equal.

25. Assertion : The fundamental frequency of an open organ pipe increases as the temperature is increased.
Reason : As the temperature increases, the velocity of sound increases more rapidly than length of the pipe.

26. Assertion : Sound travel faster in solids than gases.

Reason : Solid possess greater density than gases. [AIIMS 2000]

27. Assertion : Like sound, light can not propagate in vacuum.

Reason : Sound is a square wave. It propagates in a medium by a virtue of damping oscillation. [AIIMS 2000]

28. Assertion : Speed of wave $= \dfrac{\text{Wave length}}{\text{Time period}}$

Reason : Wavelength is the distance between two nearest particles in phase. [AIIMS 2002]

29. Assertion : The flash of lightening is seen before the sound of thunder is heard.

Reason : Speed of sound is greater than speed of light [AIIMS 2002]

30. Assertion : When a beetle moves along the sand with in a few tens of centimeters of a sand scorpion the scorpion immediately turn towards the beetle and dashes to it

Reason : When a beetle disturbs the sand, it sends pulses along the sands surface one set of pulses is longitudinal while other set is transverse. [AIIMS 2003]

31. Assertion : The reverberation time dependent on the the shape of enclosure, position of source and observer.

Reason : The unit of absorption coefficient in *mks* system is metric sabine. [EAMCET 2004]

Answers and Solutions

Basics of Mechanical Waves

1. (d) Air is more rarer for sound to travel as compared to vacuum.

2. (c)

3. (a)

4. (a) $v = n\lambda = 2 \times 5 = 10$ *cm/sec*

5. (d) $v = n\lambda \Rightarrow \lambda = \frac{v}{n} = \frac{330}{256} = 1.29m$

6. (d) Time lost in covering the distance of 2 km by the sound waves $t = \frac{d}{v} = \frac{2000}{330} = 6.06\ sec \approx 6\ sec$

7. (a) $v_{max} = a\omega = a \times 2\pi n = 0.1 \times 2\pi \times 300 = 60\pi\ cm/\sec$

8. (c) Audiable range of frequency is 20Hz to 20kHz

9. (c) Phase difference $= \frac{2\pi}{\lambda} \times$ path difference

$\Rightarrow 1.6\pi = \frac{2\pi}{\lambda} \times 40 \Rightarrow \lambda = 50\ cm = 0.5m$

$\Rightarrow v = n\lambda \Rightarrow 330 = 0.5 \times n \Rightarrow n = 660\ Hz$

10. (a) $\lambda = \frac{v}{n}; n \approx 50{,}000\ Hz$, $v = 330$ *m/sec* $\Rightarrow \lambda = \frac{330}{50000} m$

$= 6.6 \times 10^{-5} cm \approx 5 \times 10^{-5} cm$

11. (a)

12. (a) $\lambda = \frac{v}{n} = \frac{1.7 \times 1000}{4.2 \times 10^6} = 4 \times 10^{-4}\ m$

13. (d) Since maximum audible frequency is 20,000 Hz, hence $\lambda_{min} = \frac{v}{n_{max}} = \frac{340}{20{,}000} \approx 20\ mm$

14. (c) Velocity of sound in gas $v = \sqrt{\frac{\gamma RT}{M}} \Rightarrow v \propto \sqrt{\frac{\gamma T}{M}}$

$\Rightarrow \frac{v_{N_2}}{v_{He}} = \sqrt{\frac{\gamma_{N_2}}{\gamma_{He}} \times \frac{M_{He}}{M_{H_2}}} = \sqrt{\frac{\frac{7}{5} R \times 4}{\frac{5}{3} R \times 28}} = \frac{\sqrt{3}}{5}$

15. (a) Time required for a point to move from maximum displacement to zero displacement is $t = \frac{T}{4} = \frac{1}{4n}$

$\Rightarrow n = \frac{1}{4t} = \frac{1}{4 \times 0.170} = 1.47\ Hz$

16. (b) Wave number is the reciprocal of wavelength and is written as $\bar{n} = \frac{1}{\lambda}$.

17. (c) $\lambda = \frac{v}{n} = \frac{340}{200} = 1.7\ m$

18. (b)

19. (d) $v \propto \lambda \Rightarrow \frac{\lambda_1}{\lambda_2} = \frac{v_1}{v_2} = \frac{2/3}{3/10} = \frac{20}{9}$

20. (a) The time taken by the stone to reach the lake

$t_1 = \sqrt{\left(\frac{2h}{g}\right)} = \sqrt{\left(\frac{2 \times 500}{10}\right)} = 10\ sec$ (Using $h = ut + \frac{1}{2}gt^2$)

Now time taken by sound from lake to the man

$t_2 = \frac{h}{v} = \frac{500}{340} \approx 1.5 \sec$

$\Rightarrow$ Total time $= t_1 + t_2 = 10 + 1.5 = 11.5 \sec$.

21. (b) When medium changes, velocity and wavelength changes but frequency remains constant.

22. (b) $t = \sqrt{\frac{2h}{g}} + \frac{h}{v} = \sqrt{\frac{2 \times 19.6}{9.8}} + \frac{19.6}{v} = 2.06$

$\Rightarrow v = 326.7\ m/s$

23. (b) $v \propto \sqrt{T} \Rightarrow \frac{v_2}{v_1} = \sqrt{\frac{T_2}{T_1}} \Rightarrow 2 = \sqrt{\frac{T_2}{(273+0)}}$

$\Rightarrow T_2 = 273 \times 4 = 1092\ K = 819^o C$

24. (d) Velocity of sound in steel is maximum out of the given materials water and air. In vacuum sound cannot travel, it's speed is zero.

25. b) Distance between a compression and the nearest rarefaction is $\frac{\lambda}{2} = 1m$. Hence $n = \frac{v}{\lambda} = \frac{360}{2} = 180\ Hz$.

26. (a) $v = \sqrt{\frac{\gamma P}{\rho}} \Rightarrow \frac{v_{O_2}}{v_{H_2}} = \sqrt{\frac{\rho_{H_2}}{\rho_{o_2}}} = \sqrt{\frac{1}{16}} = \frac{1}{4}$

27. (d) Speed of sound in gases is $v = \sqrt{\frac{\gamma RT}{M}} \Rightarrow T \propto M$

(Because v, γ-constant). Hence $\frac{T_{H_2}}{T_{O_2}} = \frac{M_{H_2}}{M_{O_2}}$

$\Rightarrow \frac{T_{H_2}}{(273+100)} = \frac{2}{32} \Rightarrow T_{H_2} = 23.2K = -249.7°C$

28. (c) If the temperature changes then velocity of wave and its wavelength changes. Frequency amplitude and time period remains constant.

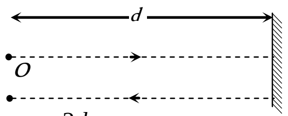
29. (b)

30. (d)

31. (c) Path difference $\Delta = \frac{\lambda}{2\pi} \times \phi \Rightarrow 1 = \frac{\lambda}{2\pi} \times \frac{\pi}{2} \Rightarrow \lambda = 4m$

Hence $v = n\lambda = 120 \times 4 = 480\ m/s$

32. (a) Suppose the distance between shooter and reflecting surface is d. Hence time interval for hearing echo is



$t = \frac{2d}{v} \Rightarrow 8 = \frac{2d}{350} \Rightarrow d = 1400\,m$.

33. (b) $\text{Time} = \frac{\text{Distance}}{\text{Velocity}} = \frac{1000}{330} = 3.03\ \text{sec}$.

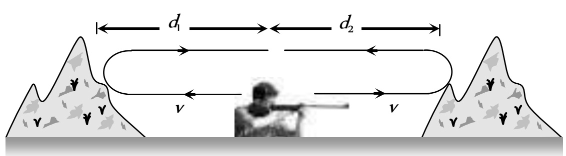
Sound will be heard after 3.03 sec. So his watch is set 3*sec*, slower.

34. (d) $v = \sqrt{\frac{\gamma P}{\rho}}$; as P changes, ρ also changes. Hence $\frac{P}{\rho}$ remains constant so speed remains constant.

35. (b) Speed of sound in gases is given by

$v = \sqrt{\frac{\gamma RT}{M}} \Rightarrow v \propto \frac{1}{\sqrt{M}} \Rightarrow \frac{v_1}{v_2} = \sqrt{\frac{m_2}{m_1}}$

36. (b)



$2d_1 + 2d_2 = v \times t_1 + v \times t_2 \Rightarrow 2(d_1 + d_2) = v(t_1 + t_2)$

$d_1 + d_2 = \frac{v(t_1+t_2)}{2} = \frac{340 \times (1.5+3.5)}{2} = 850\ m$.

37. (b) By using $v = \sqrt{\frac{\gamma RT}{M}} \Rightarrow v \propto \sqrt{T}$

$\frac{v_2}{v_1} = \sqrt{\frac{T_2}{T_1}} = \sqrt{\frac{T+600}{T}} = \sqrt{3} \Rightarrow T = 300\,K = 27^o\,C$

38. (a) Velocity of sound is independent of frequency. Therefore it is same (v) for frequency n and $4n$.

39. (c) $v = \sqrt{\frac{\gamma RT}{M}} \Rightarrow v \propto \sqrt{T}$

i.e. if v is doubled then T becomes four times,

hence $T_2 = 4T_1 = 4(273+27) = 1200K = 927°C$

40. (d) $n = \frac{3600}{60} = 60\ Hz \Rightarrow \lambda = \frac{v}{n} = \frac{960}{60} = 16\,m$

41. (d) Speed do sound, doesn't depend up on pressure and density medium.

42. (d) If d is the distance between man and reflecting surface of sound then for hearing echo

$2d = v \times t \Rightarrow d = \frac{340 \times 1}{2} = 170\,m$

43. (c) $n = \frac{54}{60} Hz, \lambda = 10\,m \Rightarrow v = n\lambda = 9\,m/s$.

44. (a) $v = \sqrt{\frac{\gamma RT}{M}} \Rightarrow v \propto \frac{1}{\sqrt{M}}$. Since M is minimum for H_2 so sound velocity is maximum in H_2.

45. (d) $2d = v \times t$, where v = velocity of sound = 332 m/s

t = Persistence of hearing = $\frac{1}{10}$ sec.

$\Rightarrow d = \frac{v \times t}{2} = \frac{332 \times \frac{1}{10}}{2} = 16.5\ m$

46. (c) Since solid has both the properties (rigidity and elasticity)

47. (b) If d is the distance between man and reflecting surface of sound then for hearing echo

$2d = v \times t \Rightarrow d = \frac{330 \times 1.5}{2} = 247.5\ m$

48. (d) Speed of sound $v \propto \sqrt{T}$ and it is independent of pressure.

49. (b) Frequency of wave is

$n = \frac{3600}{2 \times 60} Hz \Rightarrow \lambda = \frac{v}{n} = \frac{760}{30} = 25.3\ m.$

50. (a) Speed of sound $v = \sqrt{\frac{\gamma P}{d}} \Rightarrow \frac{v_1}{v_2} = \sqrt{\frac{d_2}{d_1}}$ ($\because P$ - constant)

51. (d) $\lambda = \frac{v}{n} = \frac{352}{384}$; during 1 vibration of fork sound will travel $\frac{352}{384}\,m$ during 36 vibration of fork sound will travel $\frac{352}{384} \times 36 = 33\ m$

52. (c) At given temperature and pressure

$v \propto \frac{1}{\sqrt{\rho}} \Rightarrow \frac{v_1}{v_2} = \sqrt{\frac{\rho_2}{\rho_1}} = \sqrt{\frac{4}{1}} = 2:1$

53. (c) $v \propto \sqrt{T} \Rightarrow \sqrt{\frac{T_2}{T_1}} = \frac{v_2}{v_1} \Rightarrow T_2 = T_1\left(\frac{v_2}{v_1}\right)^2$

$\Rightarrow T_2 = 273 \times 4 = 1092K$

54. (c) $\bar{n} = \frac{1}{\lambda} = \frac{1}{6000\times10^{-10}} = 1.66\times10^{6} m^{-1}$

55. (b) $v \propto \frac{1}{\sqrt{M}} \Rightarrow \frac{v_{H_2}}{v_{O_2}} = \sqrt{\frac{M_{O_2}}{M_{H_2}}} = \sqrt{\frac{32}{2}} \Rightarrow \frac{v_{H_2}}{v_{O_2}} = \frac{4}{1}$

56. (a) The minimum distance between compression and rarefaction of the wire $l = \frac{\lambda}{4}$ $\therefore$ Wave length $\lambda = 4l$

Now by $v = n\lambda \Rightarrow n = \frac{360}{4\times1} = 90\ \sec^{-1}$.

57. (a) $v_{sound} \propto \frac{1}{\sqrt{\rho}} \Rightarrow \frac{v_1}{v_2} = \sqrt{\frac{\rho_2}{\rho_1}} = \sqrt{\frac{4}{1}} = 2 \Rightarrow v_2 = \frac{v_1}{2} = \frac{v_s}{2}$

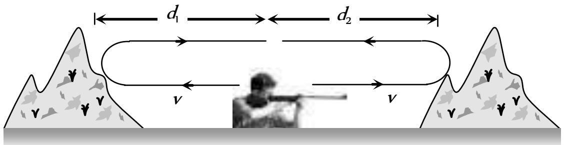
58. (a) Suppose the distance between two fixed points is d then $t = \frac{d}{v}$ also $v \propto \sqrt{T} \Rightarrow \frac{t_1}{t_2} = \frac{v_2}{v_1} = \sqrt{\frac{T_2}{T_1}}$

$\Rightarrow \frac{2}{t_2} = \sqrt{\frac{303}{283}} \Rightarrow t_2 = 1.9\ sec.$

59. (a) The density of moist air (*i.e.* air mixed with water vapours) is less than the density of dry air

Hence from $v = \sqrt{\frac{\gamma P}{\rho}} \Rightarrow v_{moist\ air} > v_{dry\ air}$

60. (a) Total time taken for both the echoes $t = t_1 + t_2 = 2\ sec$



but $t = \frac{2d_1}{v} + \frac{2d_2}{v} \Rightarrow t = \frac{2}{v}(d_1 + d_2)$

$\Rightarrow (d_1 + d_2) = \frac{v\times t}{2} = \frac{340\times2}{2} = 340m.$

61. (d) Frequency of sound does not change with medium, because it is characteristics of source.

62. (c) Since $v = \sqrt{\frac{\gamma RT}{M}}$ *i.e.,* $v \propto \sqrt{T}$

63. (a) Frequency of waves remains same, *i.e.* 60 *Hz*

and wavelength $\lambda = \frac{v}{n} = \frac{330}{60\times10^3} = 5.5\ mm.$

64. (c) Path difference $\Delta = \frac{\lambda}{2\pi}\times\phi = \frac{\lambda}{2\pi}\times\frac{\pi}{3} = \frac{\lambda}{6}$

65. (d) Interference, diffraction and reflection occurs in both transverse and longitudinal waves. Polarisation occurs only in transverse waves.

66. (c) Water waves are transverse as well as longitudinal in nature.

67. (c)

68. (a) In transverse waves medium particles vibrate perpendicular to the direction of propagation of wave.

69. (d)

70. (a) Wave on a plucked string is stationary wave. Light waves are EM waves. Water waves are transverse as well as longitudinal.

71. (b)

72. (b) Transverse wave can propagate in solids but not in liquids and gases.

73. (b) Because sound waves in gases are longitudinal.

74. (d)

75. (c) Since distance between two consecutive crests is λ, so

$\phi = \frac{2\pi}{\lambda}\times\lambda = 2\pi.$

76. (b) The distance between two points *i.e.* path difference between them $\Delta = \frac{\lambda}{2\pi}\times\phi = \frac{\lambda}{2\pi}\times\frac{\pi}{3} = \frac{\lambda}{6} = \frac{v}{6n}$ $(\because v = n\lambda) \Rightarrow$

$\Delta = \frac{360}{6\times500} = 0.12\,m = 12\,cm$

77. (d) Sound waves are longitudinal in nature so they can not be polarised

78. (b)

79. (b) Ultrasonic waves are those of higher frequencies than maximum audible range frequencies (audible range of frequencies is 20 *Hz* to 20000 *Hz*)

80. (b)

81. (d) Infrasonic waves have frequency less than (20 *Hz*) audible sound and wavelength more than audible sound.

82. (b) SONAR emits ultrasonic waves.

83. (b) EM waves do not requires medium for their propagation.

84. (b)

85. (d)

86. (d) $v = \sqrt{\frac{\gamma RT}{M}} \Rightarrow \frac{T_N}{T_0} = \frac{M_N}{M_0} \Rightarrow \frac{T_N}{273+55} = \frac{14}{16} = \frac{7}{8}$

$\Rightarrow T_N = 287K = 14°C$

87. (a) We know that at night amount of carbon dioxide in atmosphere increases which raises the density of atmosphere. Since intensity is directly proportional to density, intensity of sound is more at night.

88. (c) $n = \frac{v}{\lambda} = \frac{300}{0.6\times10^{-2}} Hz = \frac{3}{6}\times10^4 Hz = 50{,}000 Hz$

$\Rightarrow$ Wave is ultrasonic.

89. (a) $v = \sqrt{\frac{K}{\rho}}$ $\therefore$ $K = v^2\rho = 2.86\times10^{10} N/m^3$

90. (a) $n = \frac{v}{\lambda} \propto v \Rightarrow \frac{n_{MW}}{n_{US}} \approx \frac{3\times10^8}{3\times10^2} \approx 10^6 : 1$

91. (a) Intensity $\propto \frac{1}{(\text{Distance})^2} \Rightarrow \frac{I_1}{I_2} = \left(\frac{d_2}{d_1}\right)^2 = \left(\frac{3}{2}\right)^2 = \frac{9}{4}$

92. (d) $v = \frac{\sin i}{\sin r} = \frac{v_1}{v_2}$

$\Rightarrow \sin r = \sin 30°\times\frac{2u}{u} \Rightarrow \sin r = \frac{1}{2}\times2\times1 \Rightarrow r = 90°$

93. (d) Number of waves per minute = 54

$\therefore$ Number of waves per second = 54/60

Now $v = n\lambda \Rightarrow n = \frac{54}{60}\times10 = 9\,m/s.$

94. (d) If d is the distance of rock from SONAR then

$$2d = vt \Rightarrow d = \frac{v \times t}{2} = \frac{1600 \times 1}{2} = 800m$$

Progressive Waves

1. (d) Comparing given equation with standard equation of progressive wave. The velocity of wave

$$v = \frac{\omega (\text{Co-efficient of } t)}{k (\text{Co-efficient of } x)} = \frac{200\pi}{0.5\pi} = 400\ cm/s$$

2. (c) Comparing with $y = a\cos(\omega t + kx - \phi)$,

We get $k = \frac{2\pi}{\lambda} = 0.02 \Rightarrow \lambda = 100\ cm$

Also, it is given that phase difference between particles $\Delta\phi = \frac{\pi}{2}$. Hence path difference between them

$$\Delta = \frac{\lambda}{2\pi} \times \Delta\phi = \frac{\lambda}{2\pi} \times \frac{\pi}{2} = \frac{\lambda}{4} = \frac{100}{4} = 25\ cm$$

3. (b) Phase difference between two successive crest is 2π. Also, phase difference $(\Delta\phi) = \frac{2\pi}{T}$ time interval (Δt)

$$\Rightarrow 2\pi = \frac{2\pi}{T} \times 0.2 \Rightarrow \frac{1}{T} = 5\sec^{-1} \Rightarrow n = 5\ Hz$$

4. (c) Comparing with the standard equation,

$y = A\sin\frac{2\pi}{\lambda}(vt - x)$, we have

$v = 200\ cm/\sec$, $\lambda = 200\ cm$; $\therefore n = \frac{v}{\lambda} = 1\ \sec^{-1}$

5. (d) Let the phase of second particle be ϕ. Hence phase difference between two particles is $\Delta\phi = \frac{2\pi}{\lambda}\Delta x$

$$\Rightarrow \left(\phi - \frac{\pi}{3}\right) = \frac{2\pi}{60} \times 15 \Rightarrow \phi - \frac{\pi}{3} = \frac{\pi}{2} \Rightarrow \phi = \frac{5\pi}{6}$$

6. (d) The given equation can be written as $y = 4\sin\left(4\pi t - \frac{\pi x}{16}\right)$

$$\Rightarrow (v) = \frac{\text{Co-efficient of } t(\omega)}{\text{Co-efficient of } x(K)}$$

$\Rightarrow v = \frac{4\pi}{\pi/16} = 64\ cm/sec$ along $+x$ direction.

7. (c) $v = \frac{\text{Co-efficient of } t}{\text{Co-efficient of } x} = \frac{628}{31.4} = 20\ cm/sec$

8. (d) $y_1 = a\sin(\omega t - kx)$

and $y_2 = a\cos(\omega t - kx) = a\sin\left(\omega t - kx + \frac{\pi}{2}\right)$

Hence phase difference between these two is $\frac{\pi}{2}$.

9. (c) $I \propto a^2 \propto \frac{1}{d^2} \Rightarrow a \propto \frac{1}{d}$

10. (c) $\frac{I_1}{I_2} = \frac{a_1^2}{a_2^2} = \left(\frac{0.06}{0.03}\right)^2 = \frac{4}{1}$

11. (c) After reflection from rigid support, a wave suffers a phase change of π.

12. (c) The given equation representing a wave travelling along $-y$ direction (because '+' sign is given between t term and x term). On comparing it with $x = A\sin(\omega t + ky)$

We get $k = \frac{2\pi}{\lambda} = 12.56 \Rightarrow \lambda = \frac{2 \times 3.14}{12.56} = 0.5\ m$

13. (c) Comparing with $y = a\sin(\omega t - kx) \Rightarrow a = \frac{10}{\pi}, \omega = 200\pi$

$\therefore v_{max} = a\omega = \frac{10}{\pi} \times 2000\pi = 200 m/\sec$

and $\omega = \frac{2\pi}{T} \Rightarrow 200\pi = \frac{2\pi}{T} \Rightarrow T = 10^{-3}$ *sec*

14. (b) Comparing the given equation with $y = a\cos(\omega t - kx)$

We get $k = \frac{2\pi}{\lambda} = \pi \Rightarrow \lambda = 2cm$

15. (b) Comparing the given equation with $y = a\sin(\omega t - kx)$, We get $a = Y$, $\omega = 2\pi f$, $k = \frac{2\pi}{\lambda}$. Hence maximum particle velocity $(v_{max})_{particle} = a\omega = Y_0 \times 2\pi f$ and wave velocity $(v)_{wave} = \frac{\omega}{k} = \frac{2\pi f}{2\pi/\lambda} = f\lambda$

$\because (v_{max})_{Particle} = 4v_{Wave} \Rightarrow Y_0 \times 2\pi f = 4f\lambda \Rightarrow \lambda = \frac{\pi Y_0}{2}$.

16. (a,b,c,d) On comparing the given equation with $y = a\sin(\omega t + kx)$, it is clear that wave is travelling in negative x-direction.

It's amplitude $a = 10$ m and $\omega = 60$, $k = 2$. Hence frequency $n = \frac{\omega}{2\pi} = \frac{60}{2\pi} = \frac{30}{\pi} Hz$

$k = \frac{2\pi}{\lambda} = 2 \Rightarrow \lambda = \pi\ m$ and $v = \frac{\omega}{k} = \frac{60}{2} = 30\ m/s$

17. (b) $\because y = a\cos\left(\frac{2\pi}{\lambda}vt + \frac{2\pi x}{\lambda}\right) = 0.5\cos(4\pi t + 2\pi x)$

18. (b) $v = \frac{\text{Co-efficient of } t}{\text{Co-efficient of } x} = \frac{100}{50} = 2\ m/\sec$.

19. (d) $y = f(x^2 - vt^2)$ doesn't follows the standard wave equation.

20. (b,c) Standard wave equation which travel in negative x-direction is $y = A\sin(\omega t + kx + \phi_0)$

For the given wave $\omega = 2\pi n = 15\pi$, $k = \frac{2\pi}{\lambda} = 10\pi$

Now $v = \frac{\text{Co-efficient of } t}{\text{Co-efficient of } x} = \frac{\omega}{k} = \frac{15\pi}{10\pi} = 1.5$ *m/sec*

and $\lambda = \frac{2\pi}{k} = \frac{2\pi}{10\pi} = 0.2$ *m.*

21. (a) $v_{max} = a\omega = 3 \times 10 = 30$

22. (b) $y_1 = a_1\sin\left(\omega t - \frac{2\pi x}{\lambda}\right)$ and

$y_2 = a_2 \cos\left(\omega t - \frac{2\pi x}{\lambda} + \phi\right) = a_2 \sin\left(\omega t - \frac{2\pi x}{\lambda} + \phi + \frac{\pi}{2}\right)$

So phase difference $= \phi + \frac{\pi}{2}$ and $\Delta = \frac{\lambda}{2\pi}\left(\phi + \frac{\pi}{2}\right)$

23. (a) Both waves are moving opposite to each other .

24. (a) The velocity of wave

$v = \frac{\omega\,(\text{Co - efficient of } t)}{k\,(\text{Co - efficient of } x)} = \frac{10}{1} = 10\ m/s$

25. (a) $v = \frac{\text{Co - efficient of } t}{\text{Co - efficient of } x} = \frac{7\pi}{0.04} = 175\ m/s$.

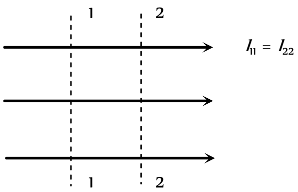
26. (a) The given equation is $y = 10\sin(0.01\pi x - 2\pi t)$

Hence $\omega =$ coefficient of $t = 2\pi$

$\Rightarrow$ Maximum speed of the particle $v_{\max} = a\omega = 10 \times 2\pi$

$= 10 \times 2 \times 3.14 = 62.8 \approx 63$ *cm/s*

27. (a,c,d) For a travelling wave, the intensity of wave remains constant if it is a plane wave.



Intensity of wave is inversely proportional to the square of the distance from the source if the wave is spherical

$\left(I = \frac{P}{4\pi r^2}\right)$

Intensity of spherical wave on the spherical surface centred at source always remains same. Here total intensity means power P.

28. (d) On comparing the given equation with standard equation $y = a\sin\frac{2\pi}{\lambda}(vt - x)$. It is clear that wave speed $(v)_{wave} = v$ and maximum particle velocity $(v_{\max})_{particle} = a\omega = y_0 \times$ co-efficient of $t = y_0 \times \frac{2\pi v}{\lambda}$

$\because\ (v_{\max})_{particle} = 2(\omega)_{wave} \Rightarrow \frac{a \times 2\pi v}{\lambda} = 2v \Rightarrow \lambda = \pi y_0$

29. (a) Given $y = A\sin(kx - \omega t)$

$\Rightarrow v = \frac{dy}{dt} = -A\omega\cos(kx - \omega t)$; $\Rightarrow v_{\max} = A\omega$

30. (a) Comparing with $y = (x, t) = a\sin(\omega t - kx)$

$k = \frac{2\pi}{\lambda} = 0.01\pi \Rightarrow \lambda = 200\ m.$

31. (b)

32. (d) Comparing the given equation with standard equation $y = a\sin 2\pi\left(\frac{t}{T} - \frac{x}{\lambda}\right) \Rightarrow T = 0.04\ sec \Rightarrow v = \frac{1}{T} = 25 Hz$

Also $(A)_{\max} = \omega^2 a = \left(\frac{2\pi}{T}\right)^2 \times a = \left(\frac{2\pi}{0.04}\right)^2 \times 3$

$= 7.4 \times 10^{4}$ *cm/sec*.

33. (b) From the given equation amplitude $a = 0.04 m$

Frequency $= \frac{\text{Co–efficient of t}}{2\pi} = \frac{\pi/5}{2\pi} = \frac{1}{10} Hz$

Wave length $\lambda = \frac{2\pi}{\text{Co–efficient } of\ x} = \frac{2\pi}{\pi/9} = 18 m.$

Wave speed $v = \frac{\text{Co - efficient of } t}{\text{Co - efficient of } x} = \frac{\pi/5}{\pi/9} = 1.8 m/s.$

34. (d)

35. (d) Compare the given equation with $y = a\cos(\omega t + k\phi)$

$\Rightarrow \omega = 2\pi n = 2000 \Rightarrow n = \frac{1000}{\pi} Hz$

36. (d) $y = A\sin(at - bx + c)$ represents equation of simple harmonic progressive wave as it describes displacement of any particle (x) at any time (t). or It represents a wave because it satisfies wave equation $\frac{\partial^2 y}{\partial t^2} = v^2\frac{\partial^2 y}{\partial x^2}$.

37. (a) Here $\omega = 2\pi n = 2\pi \Rightarrow n = 1$

38. (a) Compare the given equation with $y = a\sin(\omega t + kx)$. We get

$\omega = 2\pi n = 100 \Rightarrow n = \frac{50}{\pi} Hz$

39. (b) Compare with $y = a\sin(\omega t - kx)$

We have $k = \frac{2\pi}{\lambda} = 62.4 \Rightarrow \lambda = \frac{2\pi}{62.4} = 0.1$

40. (b) Maximum velocity of the particle

$v_{\max} = a\omega = 0.5 \times 10\pi = 5\pi\ cm/sec$

41. (d) On reflection from fixed end (denser medium) a phase difference of π is introduced.

42. (c) Maximum particle velocity $v_{\max} = \omega a$ and wave velocity

$v = \frac{\omega}{k} \Rightarrow \frac{v_{\max}}{v} = \frac{\omega a}{\omega/k} = ka$. From the given equation $k = \text{Co - efficient of } x = 6 micron = 6 \times 10^{-6} m$

$\Rightarrow \frac{v_{\max}}{v} = ka = 6 \times 10^{-6} \times 60 = 3.6 \times 10^{-4}$

43. (b) $\omega = 314$, $k = 1.57$ and $v = \frac{\omega}{k} = \frac{314}{1.57} = 200$ *m/s.*

44. (c) $v = \frac{\text{Co - efficient of } t}{\text{Co - efficient of } x} = \frac{40}{1} = 40\ m/s$

45. (a) $n = \frac{\omega}{2\pi} = \frac{400\pi}{2\pi} = 200\ Hz$ (As $\omega = 400\pi$)

46. (a) Beats period $= \frac{1}{30 - 20} = 0.1\ sec$

$\Delta\phi = \frac{2\pi}{T}\Delta t = \frac{2\pi}{0.1} \times 0.6 = 2\pi \times 6 = 12\ \pi$ or Zero.

47. (d) Path difference $\Delta = \frac{\lambda}{2\pi} \times \phi = \frac{\lambda}{2\pi} \times \frac{\pi}{2} = \frac{\lambda}{4}$

$\because \Delta = 0.8\ m \Rightarrow \frac{\lambda}{4} = 0.8 \Rightarrow \lambda = 3.2\ m.$

$\therefore\ v = n\lambda = 120 \times 3.2 = 384$ *m/s*

48. (a) $v = \frac{\text{co-efficient of } t}{\text{co-efficient of } x} = \frac{2\pi/0.01}{2\pi/0.3} = 30\, m/s$

49. (b) Comparing with $y = a\sin 2\pi\left[\frac{t}{T} - \frac{x}{\lambda}\right] \Rightarrow \lambda = 40\ cm$

50. (d) $v = \frac{\omega}{k} = \frac{\text{Co - efficient of } t}{\text{Co - efficient of } x} = \frac{2}{0.01} = 200\ cm/\sec$.

51. (d) From the given equation $k = 0.2\pi$

$\Rightarrow \frac{2\pi}{\lambda} = 0.2\pi \Rightarrow \lambda = 10\ cm$

$\Delta\phi = \frac{2\pi}{\lambda}\Delta x = \frac{2\pi}{10} \times 2 = \frac{2\pi}{5} = 72^o$

52. (a,b,c) $I = 2\pi n^2 a^2 \rho v \Rightarrow I \propto n^2 a^2 v$

53. (a) comparing the given equation with $y = a\sin(\omega t - kx)$

$\omega = 200,\ k = 1$ so $v = \frac{\omega}{k} = 200\ m/s$

54. (a) $v = \frac{\omega}{k} = \frac{2\pi}{2\pi} = 1\ m/s$

55. (b) By comparing it with standard equation

$y = a\cos(\omega t - kx) \Rightarrow k = \frac{2\pi}{\lambda} = \pi \Rightarrow \lambda = 2cm$

56. (d) Compare the given equation with

$y = a\sin(\omega t + kx) \Rightarrow \omega = 2\pi n = 100 \Rightarrow n = \frac{50}{\pi} Hz$

$k = \frac{2\pi}{\lambda} = 1 \Rightarrow \lambda = 2\pi$ and $v = \omega/k = 100\ m/s$

Since '+' is given between t terms and x term, so wave is travelling in negative x-direction.

57. (b) Given $A\omega = 4v \Rightarrow A2\pi n = 4n\lambda \Rightarrow \lambda = \frac{\pi A}{2}$

58. (d) $v = \frac{\omega}{k} = \frac{100}{1/10} = 1000\ m/s$

59. (c) A wave travelling in positive x-direction may be represented as $y = A\sin\frac{2\pi}{\lambda}(vt - x)$. On putting values

$y = 0.2\sin\frac{2\pi}{60}(360t - x) \Rightarrow y = 0.2\sin 2\pi\left(6t - \frac{x}{60}\right)$

60. (a) $v = \frac{\omega}{k} = \frac{7\pi}{0.4\pi} = 17.5\ m/s$

61. (b) $\frac{I_1}{I_2} = \frac{a_1^2}{a_2^2} \Rightarrow \frac{I_1}{I_2} = \frac{25}{100} = \frac{1}{4}$

62. (a) From the given equation $k = \frac{2\pi}{\lambda}$ = Co-efficient of x

$= \frac{\pi}{4} \Rightarrow \lambda = 8m$

63. (d) $y = 4\sin 2\pi\left(\frac{t}{0.02} - \frac{x}{100}\right)$.

Comparing this equation with $y = a\sin 2\pi\left(\frac{t}{T} - \frac{x}{\lambda}\right)$

$v = \frac{\text{Co-efficient of } t}{\text{Co-efficient of } x} = \frac{1/0.02}{1/100}$

64. (a) Comparing the given equation with $y = a\sin(\omega t - kx)$

We get $\omega = 3000\pi \Rightarrow n = \frac{\omega}{2\pi} = 1500\,Hz$

and $k = \frac{2\pi}{\lambda} = 12\pi \Rightarrow \lambda = \frac{1}{6}m$

So, $v = n\lambda \Rightarrow v = 1500 \times \frac{1}{6} = 250\ m/s$

65. (b) Positive sign in the argument of sin indicating that wave is travelling in negative x-direction.

66. (b) Comparing the given equation with $y = a\cos(\omega t - kx)$

$a = 25,\ \omega = 2\pi n = 2\pi \Rightarrow n = 1Hz$

67. (b) $v = \frac{\omega}{k} = \frac{600}{2} = 300 m/\sec$.

68. (b) $v = \frac{\text{Co–efficent of } t}{\text{Co–efficent of } x} = \frac{\omega}{k} = \frac{100}{20} = 5\, m/s.$

69. (d) Comparing with standard wave equation

$y = a\sin\frac{2\pi}{\lambda}(vt - x)$, we get, $v = 200\, m/s.$

70. (b) Phase difference $= \frac{2\pi}{\lambda} \times$ path difference

$\Rightarrow \frac{\pi}{2} = \frac{2\pi}{\lambda} \times 0.8 \Rightarrow \lambda = 4 \times 0.8 = 3.2\,m$

Velocity $v = n\lambda = 120 \times 3.2 = 384\, m/s.$

71. (a) Comparing the given equation with standard equation

We get $\omega = 2\pi n = 200\pi \Rightarrow n = 100\ Hz$

$k = \frac{20\pi}{17} \Rightarrow \lambda = \frac{2\pi}{k} = \frac{2\pi}{20\pi/17} = 1.7\,m$

and $v = \frac{\omega}{k} = \frac{200\pi}{20\pi/17} = 170\, m/s.$

72. (b) Given, $y = 0.5\sin(20x - 400t)$

Comparing with $y = a\sin(\omega t - kx)$

Gives velocity of wave $v = \frac{\omega}{k} = \frac{400}{20} = 20\, m/s.$

73. (d) $v = n\lambda \Rightarrow \lambda = 10\ cm$

Phase difference $\frac{2\pi}{\lambda} \times$ Path difference $\frac{2\pi}{10} \times 2.5 = \frac{\pi}{2}$

74. (a, c) $v_{max} = a\omega = \frac{v}{10} = \frac{10}{10} =$ m/sec

$\Rightarrow a\omega = a \times 2\pi n = 1 \Rightarrow n = \frac{10^3}{2\pi}$ $(\because a = 10^{-3}\,m)$

Since $v = n\lambda \Rightarrow \lambda = \frac{v}{n} = \frac{10}{10^3/2\pi} = 2\pi \times 10^{-2}\ m$

75. (c) Total energy is conserved.

76. (b) $v = \frac{\text{Co–efficent of } t}{\text{Co–efficent of } x} = \frac{1/2}{1/4} = 2\, m/s$

Hence $d = vt = 2 \times 8 = 16m$

77. (b) $y_1 = 10^{-6}\sin[100t + (x/50) + 0.5]$

$y_2 = 10^{-6}\sin\left[100\,t + \left(\frac{x}{50}\right) + \left(\frac{\pi}{2}\right)\right]$

Phase difference ϕ

$= [100t + (x/50) + 1.57] - [100t + (x/50) + 0.5]$

$= 1.07$ *radians.*

78. (c) Resultant amplitude

$A_R = 2A\cos\left(\frac{\theta}{2}\right) = 2\times(2a)\cos\left(\frac{\theta}{2}\right) = 4a\cos\left(\frac{\theta}{2}\right)$

79. (b) The particle will come after a time $\frac{T}{4}$ to its mean position.

80. (a) Maximum particle velocity $= a\omega = 2\times 2 = 4$ units.

Interference and Superposition of Waves

1. (b) With path difference $\frac{\lambda}{2}$, waves are out of phase at the point of observation.

2. (d) $A_{max} = \sqrt{A^2 + A^2} = A\sqrt{2}$, frequency will remain same *i.e.* ω.

3. (a) Phase difference is 2π means constrictive interference so resultant amplitude will be maximum.

4. (d) Resultant amplitude

$A = \sqrt{a^2 + a^2 + 2aa\cos\phi} = \sqrt{4a^2\cos^2\left(\frac{\phi}{2}\right)}$

$\because\ I \propto A^2 \Rightarrow I \propto 4a^2$

5. (b) $A^2 = a^2 = a^2 + a^2 + 2a^2\cos\theta \Rightarrow \cos\theta = -\frac{1}{2} \Rightarrow \theta = \frac{2\pi}{3}$

6. (d) $\lambda = \frac{v}{n} = \frac{350}{350} = 1\,m = 100\ cm$

Also path difference (Δx) between the waves at the point of observation is $AP - BP = 25cm$. Hence

$\Rightarrow \Delta\phi = \frac{2\pi}{\lambda}(\Delta x) = \frac{2\pi}{1}\times\left(\frac{25}{100}\right) = \frac{\pi}{2}$

$\Rightarrow A = \sqrt{(a_1)^2 + (a_2)^2} = \sqrt{(0.3)^2 + (0.4)^2} = 0.5\ mm$

7. (d) Path difference $(\Delta x) = 50\,cm = \frac{1}{2}m$

$\therefore$ Phase difference $\Delta\phi = \frac{2\pi}{\lambda}\times\Delta x \Rightarrow \phi = \frac{2\pi}{1}\times\frac{1}{2} = \pi$

Total phase difference $= \pi - \frac{\pi}{3} = \frac{2\pi}{3}$

$\Rightarrow A = \sqrt{a^2 + a^2 + 2a^2\cos(2\pi/3)} = a$

8. (b,c) Because in general phase velocity = wave velocity. But in case of complex waves (many waves together) phase velocity $\neq$ wave velocity.

$\therefore$ If two waves have same λ, v; then they have same frequency too

9. (c) If two waves of nearly equal frequency superpose, they give beats if they both travel in straight line and $I_{min} = 0$ if they have equal amplitudes.

10. (c) Resultant amplitude = $\sqrt{a_1^2 + a_2^2 + 2a_1a_2\cos\phi}$

$= \sqrt{0.3^2 + 0.4^2 + 2\times 0.3\times 0.4\times\cos\frac{\pi}{2}} = 0.5\ cm$

11. (a) In the same phase $\phi = 0$ so resultant amplitude $= a_1 + a_2 = 2A + A = 3A$

12. (b) $\frac{I_1}{I_2} = \left(\frac{a_1}{a_2}\right)^2 = \frac{1}{16} \Rightarrow \frac{a_1}{a_2} = \frac{1}{4}$

13. (c) For interference, two waves must have a constant phase relation ship. Equation '1' and '3' and '2' and '4' have a constant phase relationship of $\frac{\pi}{2}$ out of two choices. Only one S_1 emitting '2' and S_2 emitting '4' is given so only (c) option is correct.

14. (d) This is a case of destructive interference.

15. (b) $a_1 = 5,\ a_2 = 10 \Rightarrow \frac{I_{max}}{I_{min}} = \frac{(a_1 + a_2)^2}{(a_1 - a_2)^2} = \left(\frac{5+10}{5-10}\right)^2 = \frac{9}{1}$

16. (c) For the given super imposing waves

$a_1 = 3,\ a_2 = 4$ and phase difference $\phi = \frac{\pi}{2}$

$\Rightarrow A = \sqrt{a_1^2 + a_2^2 + 2a_1a_2\cos\pi/2} = \sqrt{(3)^2 + (4)^2} = 5$

17. (a) Phase difference between the two waves is

$\phi = (\omega t - \beta_2) = (\omega t - \beta_1) = (\beta_1 - \beta_2)$

$\therefore$ Resultant amplitude $A = \sqrt{A_1^2 + A_2^2 + 2A_1A_2\cos(\beta_1 - \beta_2)}$

18. (a) $\frac{I_{max}}{I_{min}} = \left(\frac{\frac{a_1}{a_2}+1}{\frac{a_1}{a_2}-1}\right)^2 = \left(\frac{2+1}{2-1}\right)^2 = 9/1$

19. (b) $\frac{I_{max}}{I_{min}} = \left(\frac{\sqrt{\frac{I_1}{I_2}}+1}{\frac{\sqrt{I_1}}{\sqrt{I_2}}-1}\right)^2 = \left(\frac{\sqrt{\frac{9}{4}}+1}{\sqrt{\frac{9}{4}}-2}\right)^2 = \frac{25}{1}$

20. (c) $\frac{I_{max}}{I_{min}} = \left(\frac{\frac{a_1}{a_2}+1}{\frac{a_1}{a_2}-1}\right)^2 = \left(\frac{\frac{4}{3}+1}{\frac{4}{3}-1}\right)^2 = \frac{49}{1}$

21. (a) The resultant amplitude is given by

$A_R = \sqrt{A^2 + A^2 + 2AA\cos\theta} = \sqrt{2A^2(1+\cos\theta)}$

$= 2A\cos\theta/2 \qquad (\because H\cos\theta = 2\cos^2\theta/2)$

22. (b) $\frac{I_{max}}{I_{min}} = \frac{\left(\frac{\sqrt{I_1}}{\sqrt{I_2}}+1\right)^2}{\left(\frac{\sqrt{I_1}}{\sqrt{I_2}}-1\right)^2} = \frac{\left(\sqrt{\frac{9}{1}}+1\right)^2}{\left(\sqrt{\frac{9}{1}}-1\right)^2} = \frac{4}{1}$

23. (a) Since $\phi = \frac{\pi}{2} \Rightarrow A = \sqrt{a_1^2 + a_2^2} = \sqrt{(4)^2 + (3)^2} = 5$

24. (c) $A = \sqrt{(a_1^2 + a_2^2 + 2a_1 a_2 \cos\phi)}$

Putting $a_1 = a_2 = a$ and $\phi = \frac{\pi}{3}$, we get $A = \sqrt{3}a$

25. (d) $y = \frac{1}{\sqrt{a}}\sin\omega t \pm \frac{1}{\sqrt{b}}\sin\left(\omega t + \frac{\pi}{2}\right)$

Here phase difference = $\frac{\pi}{2}$ $\therefore$ The resultant amplitude

$$= \sqrt{\left(\frac{1}{\sqrt{a}}\right)^2 + \left(\frac{1}{\sqrt{b}}\right)^2} = \sqrt{\frac{1}{a} + \frac{1}{b}} = \sqrt{\frac{a+b}{ab}}$$

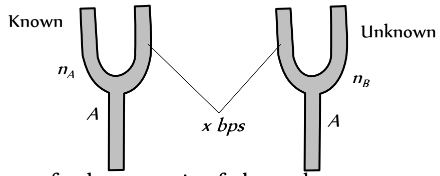
26. (b) Superposition of waves does not alter the frequency of resultant wave and resultant amplitude

$\Rightarrow a^2 = a^2 + a^2 + 2a^2\cos\phi = 2a^2(1 + \cos\phi)$

$\Rightarrow \cos\phi = -1/2 = \cos 2\pi/3 \therefore \phi = 2\pi/3$

Beats

1. (c) Suppose two tuning forks are named *A* and *B* with frequencies $n_A = 256\, Hz$ (known), n_B = ? (unknown), and beat frequency x = 4 *bps*.



Frequency of unknown tuning fork may be

$n_B = 256 + 4 = 260\, Hz$

or $= 256 - 4 = 252\, Hz$

It is given that on sounding waxed fork *A* (fork of frequency 256 *Hz*) and fork *B*, number of beats (beat frequency) increases. It means that with decrease in frequency of *A*, the difference in new frequency of *A* and the frequency of *B* has increased. This is possible only when the frequency of *A* while decreasing is moving away from the frequency of *B*.

This is possible only if n_B = 260 *Hz*.

Alternate method : It is given $n_A = 256\, Hz, n_B = ?$ and x = 4 *bps*

Also after loading *A* (*i.e.* $n_A \downarrow$), beat frequency (*i.e.* x) increases ($\uparrow$).

Apply these informations in two possibilities to known the frequency of unknown tuning fork.

$n_A \downarrow - n_B = x\uparrow$ ... (i)

$n_B - n_A \downarrow = x\uparrow$ ... (ii)

It is obvious that equation (i) is wrong (ii) is correct so

$n_B = n_A + x = 256 + 4 = 260\ Hz$.

2. (d)

3. (c)

4. (a) Suppose n_A = known frequency = 100 *Hz*, n_B = ?

x = 2 = Beat frequency, which is decreasing after loading (*i.e.* $x\downarrow$)

Unknown tuning fork is loaded so $n_B\downarrow$

Hence $n_A - n_B \downarrow = x\downarrow$ ... (i) ⟶ Wrong

$n_B \downarrow - n_A = x\downarrow$ ... (ii) ⟶ Correct

$\Rightarrow n_B = n_A + x = 100 + 2 = 102\ Hz$.

5. (d) n_A = Known frequency = 256, n_B = ?

x = 2 *bps*, which is decreasing after loading (*i.e.* $x\downarrow$) known tuning fork is loaded so $n_A\downarrow$

Hence $n_A\downarrow - n_B = x\downarrow$ ... (i) ⟶ Correct

$n_B - n_A\downarrow = x\downarrow$ ... (ii) ⟶ Wrong

$\Rightarrow n_B = n_A - x = 256 - 2 = 254\ Hz$.

6. (b) n_A = Known frequency = 256 *Hz*, n_B = ?

x = 4 *bps*, which is decreasing after loading (*i.e.* $x\downarrow$) also known tuning fork is loaded so $n_A\downarrow$

Hence $n_A\downarrow - n_B = x\downarrow$ ... (i) ⟶ Correct

$n_B - n_A\downarrow = x\downarrow$ ... (ii) ⟶ Wrong

$\Rightarrow n_B = n_A - x = 256 - 4 = 252\ Hz$.

7. (c) Time interval between two consecutive beats

$T = \frac{1}{n_1 - n_2} = \frac{1}{260 - 256} = \frac{1}{4}$ sec so, $t = \frac{1}{16} = \frac{T}{4}$ sec

By using time difference = $\frac{T}{2\pi} \times$ Phase difference

$\Rightarrow \frac{T}{4} = \frac{T}{2\pi} \times \phi \Rightarrow \phi = \frac{\pi}{2}$

8. (a) The time interval between successive maximum intensities will be $\frac{1}{n_1 \sim n_2} = \frac{1}{454 - 450} = \frac{1}{4}$ sec.

9. (d) n_A = Known frequency = 341 *Hz*, n_B = ?

x = 6 *bps*, which is decreasing (*i.e.* $x\downarrow$) after loading (from 6 to 1 *bps*)

Unknown tuning fork is loaded so $n_B\downarrow$

Hence $n_A - n_B\downarrow = x\downarrow$ ... (i) ⟶ Wrong

$n_B\downarrow - n_A = x\downarrow$ ... (ii) ⟶ Correct

$\Rightarrow n_B = n_A + x = 341 + 6 = 347\ Hz$.

10. (b) $T = \frac{1}{258 - 256} = 0.5$ sec

11. (c) Suppose n_A = known frequency = 100 *Hz*, n_B = ?

x = 5 *bps*, which remains unchanged after loading

Unknown tuning fork is loaded so $n_B\downarrow$

Hence $n_A - n_B \downarrow = x$ ... (i)

$n_B \downarrow - n_A = x$ ... (ii)

From equation (i), it is clear that as n_B decreases, beat frequency. (*i.e.* $n_A - (n_B)_{new}$) can never be x again.

From equation (ii), as $n_B\downarrow$, beat frequency (*i.e.* $(n_B)_{new} - n_A$) decreases as long as $(n_B)_{new}$ remains greater than n_A, If $(n_B)_{new}$ become lesser than n_A the beat frequency will increase again and will be x. Hence this is correct.

So, $n_B = n_A + x = 100 + 5 = 105\ Hz$.

12. (b) n_A = Known frequency = 256 *Hz*, n_B = ?

x = 6 *bps*, which remains the same after loading.

Unknown tuning fork *F* is loaded so $n_B\downarrow$

Hence $n_A - n_B\downarrow = x$ ... (i) ⟶ Wrong

$n_B\downarrow - n_A = x$ ... (ii) ⟶ Correct

$\Rightarrow n_B = n_A + x = 256 + 6 = 262\ Hz.$

13. (a) Probable frequencies of tuning fork be $n+4$ or $n-4$

Frequency of sonometer wire $n \propto \frac{1}{l}$

$\therefore \frac{n+4}{n-4} = \frac{100}{95}$ or $95(n+4) = 100(n-4)$

or $95n + 380 = 100n - 400$ or $5n = 780$ or $n = 156$

14. (c) After filling frequency increases, so n_A decreases ($\downarrow$). Also it is given that beat frequency increases (*i.e.*, $x\uparrow$)

Hence $n_A\downarrow - n_B = x\uparrow$ ... (i) ⟶ Correct

$n_B - n_A\uparrow = x\uparrow$ ... (ii) ⟶ Wrong

$\Rightarrow n_A = n_B + x = 512 + 5 = 517\ Hz.$

15. (c) Intensity $\propto$ (amplitude)^2

as $A_{\max} = 2a_o$ (a_o = amplitude of one source) so $I_{\max} = 4I_o$.

16. (c) Number of beats per second $= n_1 \sim n_2$

$\omega_1 = 2000\pi = 2\pi n_1 \Rightarrow n_1 = 1000$

and $\omega_2 = 2008\pi = 2\pi n_2 \Rightarrow n_2 = 1004$

Number of beats heard per sec $= 1004 - 1000 = 4$

17. (c) The tuning fork whose frequency is being tested produces 2 beats with oscillator at 514 *Hz*, therefore, frequency of tuning fork may either be 512 or 516. With oscillator frequency 510 it gives 6 *beats/sec*, therefore frequency of tuning fork may be either 516 or 504.

Therefore, the actual frequency is 516 *Hz* which gives 2 *beats/sec* with 514 *Hz* and 6 *beats/sec* with 510 *Hz*.

18. (b) If suppose n_s = frequency of string $= \frac{1}{2l}\sqrt{\frac{T}{m}}$

n_f = Frequency of tuning fork = 480 *Hz*

x = Beats heard per second = 10

as tension T increases, so n_s increases ($\uparrow$)

Also it is given that number of beats per sec decreases (*i.e.* $x\downarrow$)

Hence $n_s\uparrow - n_f = x\downarrow$ ... (i) ⟶ Wrong

$n_f - n_s\uparrow = x\downarrow$ ... (ii) ⟶ Correct

$\Rightarrow n_s = n_f - x = 480 - 10 = 470\ Hz.$

19. (c) It is given that

n_A = Unknown frequency = ?

n_B = Known frequency = 256 *Hz*

x = 3 *bps*, which remains same after loading

Unknown tuning fork *A* is loaded so $n_A\downarrow$

Hence $n_A\downarrow - n_B = x$ ... (i) ⟶ Correct

$n_B - n_A\downarrow = x$ ... (ii) ⟶ Wrong

$\Rightarrow n_A = n_B + x = 256 + 3 = 259\ Hz.$

20. (a) Frequency of the source = 100 $\pm$ 5 = 105 *Hz* or 95 *Hz*.

Second harmonic of the source = 210 *Hz* or 190 *Hz*.

As the second harmonic gives 5 *beats/sec* with sound of frequency 205 *Hz*, the second harmonic should be 210 *Hz*.

$\Rightarrow$ Frequency of the source = 105 *Hz*.

21. (d) For producing beats, their must be small difference in frequency.

22. (c) n_A = Known frequency = 256 *Hz*, n_B = ?

x = 4 *beats per sec* which is decreasing (4 *bps* to $\frac{5}{2}bps$) after loading (*i.e.* $x\downarrow$)

Unknown tuning fork *B*, is loaded so $n_B\downarrow$

Hence $n_A - n_B\downarrow = x\downarrow$ ... (i) ⟶ Wrong

$n_B\downarrow - n_A = x\downarrow$ ... (ii) ⟶ Correct

$\Rightarrow n_B = n_A + x = 256 + 4 = 260\ Hz.$

23. (d) $n_A\downarrow - n_B = x\uparrow$ ... (i) ⟶ Wrong

$n_B - n_A\downarrow = x\uparrow$ ... (ii) ⟶ Correct

$\Rightarrow n_B = n_A + x = 200 + 5 = 205\ Hz.$

24. (c) $n_A - n_B\downarrow = x$ (same) ... (i) ⟶ Wrong

$n_B\downarrow - n_A = x$ (same) ... (ii) ⟶ Correct

$\Rightarrow n_B = n_A + x = 320 + 4 = 324\ Hz.$

25. (c) Beat period $T = \frac{1}{n_1 \sim n_2} = \frac{1}{384 - 380} = \frac{1}{4}\sec$. Hence minimum time interval between maxima and minima $t = \frac{T}{2} = \frac{1}{8}\sec$.

26. (d) $\frac{I_{\max}}{I_{\min}} = \left(\frac{a_1 + a_2}{a_1 - a_2}\right)^2 = \frac{(5+3)^2}{(5-3)^2} = \frac{16}{1}$

27. (a) $n_1 = \frac{v}{\lambda_1} = \frac{v}{0.50}$ and $n_2 = \frac{v}{\lambda_2} = \frac{v}{0.51}$

$\Delta n = n_1 - n_2 = v\left[\frac{1}{0.05} - \frac{1}{0.51}\right] = 12$

$\Rightarrow v = \frac{12 \times 0.51 \times 0.50}{0.01} = 306\ m/s$

28. (c) $n_1 = \frac{316}{2\pi}$ and $n_2 = \frac{310}{2\pi}$ Number of beats heard per second $= n_1 - n_2 = \frac{316}{2\pi} - \frac{310}{2\pi} = \frac{3}{\pi}$

29. (b) Beat frequency $= \frac{2}{0.4} = 5Hz$

30. (a) Since source of frequency x gives 8 beats per second with frequency 250 *Hz*, it's possible frequency are 258 or 242. As source of frequency x gives 12 beats per second with a frequency 270 *Hz*, it's possible frequencies 282 or 258 *Hz*. The only possible frequency of x which gives 8 beats with frequency 250 *Hz* also 12 beats per second with 258 *Hz*.

31. (c) $n_1 = \frac{1000\pi}{2\pi} = 500Hz$ and $n_2 = \frac{998\pi}{2\pi} = 499\ Hz$

Hence beat frequency $= n_1 - n_2 = 1$

32. (a) $v_0 = 332$ *m/s*. Velocity sound at $t°C$ is $v_t = (v_0 + 0.61\,t)$

$\Rightarrow v_{20} = v_0 + 0.61 \times 20 = 344.2\ m/s$

$\Rightarrow \Delta n = v_{20}\left(\frac{1}{\lambda_1} - \frac{1}{\lambda_2}\right) = 344.2\left(\frac{100}{50} - \frac{100}{51}\right) = 14$

33. (a) Persistence of hearing is 10 *sec*.

34. (a)

35. (d) n_A = ?, n_B = 384 *Hz*

x = 6 *bps*, which is decreasing (from 6 to 4) *i.e.* $x\downarrow$

Tuning fork *A* is loaded so $n_A\downarrow$

Hence $n_A\downarrow - n_B = x\downarrow$ ⟶ Correct

$n_B - n_A\downarrow = x\downarrow$ ⟶ Wrong

$\Rightarrow n_A = n_B + x = 384 + 6 = 390$ *Hz*.

36. (b) For hearing beats, difference of frequencies should be approximately 10 *Hz*.

37. (a) $n \propto \frac{1}{l} \Rightarrow n_1 l_1 = n_2 l_2 \Rightarrow (n+4)49 = (n-4)50 \Rightarrow n = 396$

38. (a) No of beats, $x = \Delta n = \frac{30}{3} = 10\ Hz$

$\Rightarrow$ Also $\Delta n = v\left[\frac{1}{\lambda_1} - \frac{1}{\lambda_2}\right] = v\left[\frac{1}{5} - \frac{1}{6}\right]$=10$\Rightarrow v = 300$ *m/s*

39. (a) $\Delta n = v\left[\frac{1}{\lambda_1} - \frac{1}{\lambda_2}\right] = 396\left[\frac{1}{0.99} - \frac{1}{1}\right] = 3.96 \approx 4.$

40. (b) n_A = Known frequency = 288 *cps*, n_B = ?

x = 4 *bps*, which is decreasing (from 4 to 2) after loading *i.e.* $x\downarrow$

Unknown fork is loaded so $n_B\downarrow$

Hence $n_A - n_B\downarrow = x\downarrow$ ⟶ Wrong

$n_B\downarrow - n_A\downarrow = x\downarrow$ ⟶ Correct

$\Rightarrow n_B = n_A + x = 288 + 4 = 292$ *Hz*.

41. (a) Frequency = $\frac{\text{Number of beats}}{\text{Time}} = \frac{2}{0.04} = 50\ Hz$

42. (c) No. of beats = frequency difference = $\frac{4}{0.25} = 16$

43. (d) Suppose n_P = frequency of piano = ? $(n_P \propto \sqrt{T})$

n_f = Frequency of tuning fork $= 256 Hz$

x = Beat frequency = 5 *bps*, which is decreasing (5⟶2) after clanging the tension of piano wire

Also, tension of piano wire is increasing so $n_P\downarrow$

Hence $n_P\uparrow - n_f = x\downarrow$ ⟶ Wrong

$n_f - n_P\uparrow = x\downarrow$ ⟶ Correct

$\Rightarrow n_P = n_f - x = 256 - 5$ *Hz*.

44. (b) With temperature rise frequency of tuning fork decreases. Because, the elastic properties are modified when temperature is changed

also, $n_t = n_0(1 - 0.00011t)$

where n_t = frequency at $t°C$, n_0 = frequency at $0°C$

45. (a) $n_x = 300 Hz$, $n_y = ?$

x = beat frequency = 4 *Hz*, which is decreasing (4⟶2) after increasing the tension of the string *y*.

Also tension of wire *y* increasing so $n_y\uparrow$ $(\because n \propto \sqrt{T})$

Hence $n_x - n_y\uparrow = x\downarrow$ ⟶ Correct

$n_y\uparrow - n_x = x\downarrow$ ⟶ Wrong

$\Rightarrow n_y = n_x - x = 300 - 4 = 296 Hz$

46. (c) Let n be the frequency of fork *C* then

$n_A = n + \frac{3n}{100} = \frac{103n}{100}$ and $n_B = n - \frac{2n}{100} = \frac{98}{100}$

but $n_A - n_B = 5 \Rightarrow \frac{5n}{100} = 5 \Rightarrow n = 100\,Hz$

$\therefore n_A = \frac{(103)(100)}{100} = 103\,Hz$

47. (a)

48. (b) From the given equations of progressive waves $\omega_1 = 500\pi$ and $\omega_2 = 506\pi$ $\therefore n_1 = 250$ and $n_2 = 253$

So beat frequency $= n_2 - n_1 = 253 - 250 = 3$ *beats per sec*

$\therefore$ Number of beats per min = 180.

49. (b)

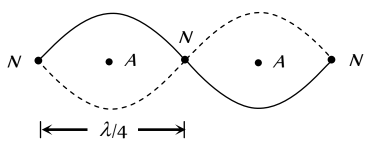
50. (b) Frequency $= \frac{360}{60} \times 60 = 360 Hz.$

51. (b) $v = n\lambda \Rightarrow \lambda = \frac{v}{n} = \frac{340}{170} \Rightarrow \lambda = 2$

Distance separating the position of minimum intensity = $\frac{\lambda}{2} = \frac{2}{2} = 1\ m$

Stationary Waves

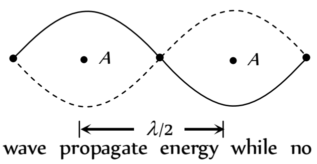
1. (c) The distance between the nearest node and antinode in a stationary wave is $\frac{\lambda}{4}$



2. (c) At nodes pressure change (strain) is maximum

3. (c) Both the sides of a node, two antinodes are present with separation $\frac{\lambda}{2}$

So phase difference between then $\phi = \frac{2\pi}{\lambda} \times \frac{\lambda}{2} = \pi$



4. (c) Progressive wave propagate energy while no propagation of energy takes place in stationary waves.

5. (b)

6. (a) Comparing given equation with standard equation

$y = 2a\sin\frac{2\pi x}{\lambda}\cos\frac{2\pi vt}{\lambda}$ gives us $\frac{2\pi}{\lambda} = \frac{\pi}{15} \Rightarrow \lambda = 30$

Distance between nearest node and antinodes = $\frac{\lambda}{4} = \frac{30}{4} = 7.5$

7. (b) On comparing the given equation with standard equation $y = 2a\sin\frac{2\pi x}{\lambda}\cos\frac{2\pi vt}{\lambda} \Rightarrow \frac{2\pi x}{\lambda} = \frac{\pi x}{3} \Rightarrow \lambda = 6$

Separation between two adjacent nodes = $\frac{\lambda}{2} = 3\ cm$

8. (d)

9. (a) On comparing the given equation with standard equation $y = 2a\sin\frac{2\pi x}{\lambda}\cos\frac{2\pi vt}{\lambda}$]

We get $\frac{2\pi}{\lambda} = \frac{\pi}{20} \Rightarrow \lambda = 40$

Separation between two consecutive nodes = $\frac{\lambda}{2} = \frac{40}{2} = 20\ cm$

10. (a)

11. (b) Since the point $x = 0$ is a node and reflection is taking place from point $x = 0$. This means that reflection must be taking place from the fixed end and hence the reflected ray must suffer an additional phase change of π or a path change of $\frac{\lambda}{2}$.

So, if $y_{\text{incident}} = a\cos(kx - \omega t)$

$\Rightarrow y_{\text{reflected}} = a\cos(-kx - \omega t + \pi) = -a\cos(\omega t + kx)$

12. (d) Particles have kinetic energy maximum at mean position.

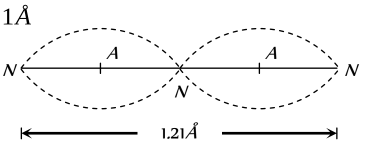
13. (b) On comparing the given equation with standard equation $\frac{2\pi}{\lambda} = 5 \Rightarrow \lambda = \frac{6.28}{5} = 1.256m$

14. (d)

15. (d)

16. (a,b,c) Standing waves can be produced only when two similar type of waves (same frequency and speed, but amplitude may be different) travel in opposite directions.

17. (a) $\lambda = 1.21 Å$



18. (d) $\frac{\lambda}{4} = 20 \Rightarrow \lambda = 80\ cm$, also $\Delta\phi = \frac{\lambda}{2\pi}.\Delta x$

$\Rightarrow \Delta\phi = \frac{60}{80}\times 2\pi = \frac{3\pi}{2}$

19. (a) Required distance $= \frac{\lambda}{4} = \frac{v/n}{4} = \frac{1200}{4\times 300} = 1\ m$

20. (a) Waves *A* and *B* satisfied the conditions required for a standing wave.

21. (a) By comparing given equation with $y = a\sin(\omega t)\cos kx$

$\Rightarrow v = \frac{\omega}{k} = \frac{100}{0.01} = 10^4\ m/s$

22. (b) At fixed end node is formed and distance between two consecutive nodes $\frac{\lambda}{2} = 10\ cm \Rightarrow \lambda = 20\ cm$

$\Rightarrow v = n\lambda = 20\ m/sec$

23. (c) $a\cos(kx + \omega t)$

hence $y_{\text{reflected}} = a\cos(-kx + \omega t + \pi) = -a\cos(kx - \omega t)$

24. (b) Distance between the consecutive node $= \frac{\lambda}{2}$,

but $\lambda = \frac{v}{n} = \frac{20}{n}$ so $\frac{\lambda}{2} = \frac{10}{n}$

25. (a) Energy is not carried by stationary waves

26. (c) On comparing the given equation with standard equation $\Rightarrow \frac{2\pi}{\lambda} = \frac{\pi}{3} \Rightarrow \lambda = 6\ cm$. Hence, distance between two consecutive nodes $\Rightarrow \lambda = 3\ cm$

27. (d) Minimum time interval between two instants when the string is flat = $\frac{T}{2} = 0.5\text{ sec} \Rightarrow T = 1\text{ sec}$

Hence $\lambda = v\times T = 10\times 1 = 10\,m$.

28. (c)

29. (b) Distance between two nodes = $\frac{\lambda}{2} = \frac{v}{2n} = \frac{16}{2n} = \frac{8}{n}$

30. (d)

31. (b) In stationary wave all the particles in one particular segment (*i.e.,* between two nodes) vibrates in the same phase.

32. (a) If $y_{incident} = a\sin(\omega t - kx)$ and $y_{stationary} = a\sin(\omega t)\cos kx$ then it is clear that frequency of both is same (ω)

33. (b)

34. (a) On comparing the given equation with standard equation $\frac{2\pi}{\lambda} = \frac{\pi}{4} \Rightarrow \lambda = 8$

Hence distance between two consecutive nodes $\frac{\lambda}{2} = 4$

35. (a)

36. (a) Waves $Z_1 = A\sin(kx - \omega t)$ is travelling towards positive *x*-direction.

Wave $Z_2 = A\sin(kx + \omega t)$, is travelling towards negative *x*-direction.

Wave $Z_3 = A\sin(ky - \omega t)$ is travelling towards positive *y* direction.

Since waves Z_1 and Z_2 are travelling along the same line so they will produce stationary wave.

37. (a) When two waves of equal frequency and travelling in opposite direction superimpose, then the stationary wave is produced. Hence Z_1 and Z_2 produces stationary wave.

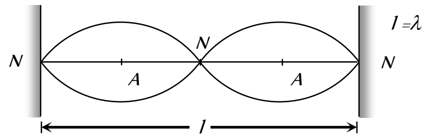
38. (d) The distance between adjacent nodes $x = \frac{\lambda}{2}$

Also $k = \frac{2\pi}{\lambda}$. Hence $x = \frac{\pi}{k}$.

39. (d) $y = 5\sin\left(\frac{2\pi x}{3}\right)\cos 20\pi t$, comparing with equation $y = 2a\sin\frac{2\pi x}{\lambda}\cos\frac{2\pi vt}{\lambda} \Rightarrow \lambda = 3$, distance between two adjacent nodes $= \lambda/2 = 1.5cm$.

Vibration of String

1. (c)



2. (d) $n \propto \frac{1}{l} \Rightarrow \frac{n_2}{n_1} = \frac{l_1}{l_2} \Rightarrow n_2 = \frac{l_1}{l_2} n_1 = \frac{1 \times 256}{1/4} = 1024 Hz$

3. (c) String vibrates in five segment so $\frac{5}{2}\lambda = l \Rightarrow \lambda = \frac{2l}{5}$

Hence $n = \frac{v}{\lambda} = 5 \times \frac{v}{2l} = 5 \times \frac{20}{2 \times 10} = 5\ Hz$

4. (c) Here $\frac{\lambda}{2} = 5.0\, cm \quad \Rightarrow \lambda = 10\ cm$

Hence $n = \frac{v}{\lambda} = \frac{200}{10} = 20\ Hz.$

5. (c)

6. (b) As we know plucking distance from one end $= \frac{l}{2p}$

$\Rightarrow\ 25 = \frac{100}{2p}\ \Rightarrow\ p = 2$. Hence frequency of vibration

$n = \frac{p}{2l}\sqrt{\frac{T}{m}} = \frac{2}{2 \times 1}\sqrt{\frac{20}{5 \times 10^{-4}}} = 200 Hz.$

7. (b) To produce 5 *beats/sec.* Frequency of one wire should be increase up to 505 Hz. *i.e.* increment of 1% in basic frequency.

$n \propto \sqrt{T}$ or $T \propto n^2 \Rightarrow \frac{\Delta T}{T} = 2\frac{\Delta n}{n}$

$\Rightarrow$ percentage change in Tension = 2 (1%) = 2%

8. (d) $y = 0.021 \sin(x + 30t) \Rightarrow v = \frac{\omega}{k} = \frac{30}{1} = 30\, m/s$.

Using, $v = \sqrt{\frac{T}{m}} \Rightarrow 30 = \sqrt{\frac{T}{1.3 \times 10^{-4}}} \Rightarrow T = 0.117\ N$

9. (a) $n \propto \sqrt{T}$

10. (c) $n \propto \sqrt{T}$

11. (d) $n \propto \sqrt{T}$

$\Rightarrow n_1 : n_2 : n_3 : n_4 = \sqrt{1} : \sqrt{4} : \sqrt{9} : \sqrt{16} = 1 : 2 : 3 : 4$

12. (c) Let the frequency of tunning fork be N

As the frequency of vibration string $\propto \frac{1}{\text{length of string}}$

For sonometer wire of length 20 *cm*, frequency must be (N + 5) and that for the sonometer wire of length 21*cm*, the frequency must be (N – 5) as in each case the tunning fork produces 5 beats/sec with sonometer wire

Hence $n_1 l_1 = n_2 l_2 \Rightarrow (N + 5) \times 20 = (N - 5) \times 21$

$\Rightarrow N = 205 Hz.$

13. (c) $\lambda = \frac{2l}{p}$ (p = Number of loops)

14. (a) String will vibrate in 7 loops so it will have 8 nodes 7 antinodes.

Number of harmonics = Number of loops = Number of antinodes $\Rightarrow$ Number of antinodes = 7

Hence number of nodes = Number of antinodes + 1

$= 7 + 1 = 8$

15. (a)

16. (d) $n \propto \frac{1}{l}\sqrt{T} \Rightarrow \frac{n'}{n} = \sqrt{\frac{T'}{T}} \times \frac{l}{l'} = \sqrt{4} \times \frac{1}{2} = 1 \Rightarrow n' = n$

17. (a) Sonometer is used to produce resonance of sound source with stretched vibrating string.

18. (a) $n \propto \frac{1}{l} \Rightarrow \frac{l_2}{l_1} = \frac{n_1}{n_2} \Rightarrow l_2 = l_1\left(\frac{n_1}{n_2}\right) = 50 \times \frac{270}{1000} = 13.5 cm$

19. (c) $n \propto \sqrt{T} \Rightarrow \frac{n_1}{n_2} = \sqrt{\frac{T_1}{T_2}} \Rightarrow \frac{n}{2n} = \sqrt{\frac{10}{T_2}} \Rightarrow T_2 = 40 N$

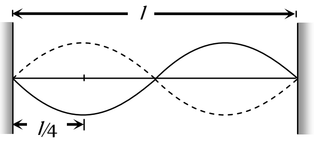
20. (b) $n \propto \sqrt{T}$

21. (d) $n = \frac{1}{2l}\sqrt{\frac{T}{m}} \Rightarrow n \propto \frac{\sqrt{T}}{l}$

$\Rightarrow \frac{T_2}{T_1} = \left(\frac{n_2}{n_1}\right)^2 \left(\frac{l_2}{l_1}\right)^2 = (2)^2 \left(\frac{3}{4}\right)^2 = \frac{9}{4}$

22. (c) $v = \sqrt{\frac{T}{m}} \Rightarrow v = \sqrt{\frac{60.5}{(0.035/7)}} = 110\ m/s$

23. (a) Second harmonic means 2 loops in a total length



Hence plucking distance from one end $= \frac{l}{2p} = \frac{l}{2 \times 2} = \frac{l}{4}$.

24. (b) $v = \sqrt{\frac{T}{m}} = \sqrt{\frac{T}{\pi r^2 \rho}}$

$v \propto \frac{\sqrt{T}}{r} \Rightarrow \frac{v_A}{v_B} = \sqrt{\frac{T_A}{T_B}} \cdot \frac{r_B}{r_A} = \sqrt{\frac{1}{2}} \cdot \frac{1}{2} = \frac{1}{2\sqrt{2}}$

25. (a) The frequency of vibration of a string $n = \frac{p}{2l}\sqrt{\frac{T}{m}}$

Also number of loops = Number of antinodes.

Hence, with 5 antinodes and hanging mass of 9 *kg*.

We have p = 5 and T = 9g $\Rightarrow n_1 = \frac{5}{2l}\sqrt{\frac{9g}{m}}$

With 3 antinodes and hanging mass M

We have p = 3 and T = Mg $\Rightarrow n_2 = \frac{3}{2l}\sqrt{\frac{Mg}{m}}$

$\because\ n_1 = n_2 \Rightarrow \frac{5}{2l}\sqrt{\frac{9g}{m}} = \frac{3}{2l}\sqrt{\frac{Mg}{m}} \Rightarrow M = 25\ kg.$

26. (b) $n \propto \frac{\sqrt{T}}{l} \Rightarrow l \propto \sqrt{T}$ (As n = constant)

$\Rightarrow \frac{l_2}{l_1} = \sqrt{\frac{T_2}{T_1}} = l_1\sqrt{\frac{169}{100}} \Rightarrow l_2 = 1.3 l_1 = l_1 + 30\%$ of l_1

27. (b) $n_1 l_1 = n_2 l_2 \Rightarrow 250 \times 0.6 = n_2 \times 0.4 \Rightarrow n_2 = 375 Hz$

28. (b) In fundamental mode of vibration wavelength is maximum $\Rightarrow$ $l = \frac{\lambda}{2} = 40\, cm \Rightarrow \lambda = 80\, cm$

29. (c) $n_1 l_1 = n_2 l_2 \Rightarrow 800 \times 50 = 1000 \times l_2 \Rightarrow l_2 = 40\ cm$

30. (c) $n \propto \sqrt{T} \Rightarrow \frac{\Delta n}{n} = \frac{\Delta T}{2T}$

If tension increases by 2%, then frequency must increases by 1%.

If initial frequency $n_1 = n$ then final frequency $n_2 - n_1 = 5$

$\Rightarrow \frac{101}{100} n - n = 5 \Rightarrow n = 500 Hz.$

Short trick : If you can remember then apply following formula to solve such type of problems.

Initial frequency of each wire (n)

$= \frac{\text{(Number of beats heard per sec)} \times 200}{\text{(per centage change in tension of the wire)}}$

Here $n = \frac{5 \times 200}{2} = 500 Hz$

31. (b) First overtone of string A = Second overtone of string B.

$\Rightarrow$ Second harmonic of A = Third harmonic of B

$\Rightarrow n_2 = n_3 \Rightarrow [2(n_1)]_A = [3(n_1)]_B$ ($\because n_1 = \frac{1}{2l}\sqrt{\frac{T}{\pi r^2 \rho}}$)

$\Rightarrow 2\left[\frac{1}{2 l_A r_A}\sqrt{\frac{T}{\pi \rho}}\right] = 3\left[\frac{1}{2 l_B r_B}\sqrt{\frac{T}{\pi \rho}}\right]$

$\frac{l_A}{l_B} = \frac{2}{3}\frac{r_B}{r_A} \Rightarrow \frac{l_A}{l_B} = \frac{2}{3} \times \frac{r_B}{(2r_B)} = \frac{1}{3}$

32. (a) Fundamental frequency in case of string is

$n = \frac{1}{2l}\sqrt{\frac{T}{m}} \Rightarrow n \propto \frac{\sqrt{T}}{l} \Rightarrow \frac{n'}{n} = \sqrt{\frac{T'}{T}} \times \frac{l}{l'}$

putting $T' = T + 0.44T = \frac{144}{100}T$ and $l' = l - 0.4l = \frac{3}{5}l$

We get $\frac{n'}{n} = \frac{2}{1}$.

33. (d) Frequency in a stretched string is given by

$n = \frac{1}{2l}\sqrt{\frac{T}{\pi r^2 \rho}} = \frac{1}{l}\sqrt{\frac{T}{\pi d^2 \rho}}$ (d = Diameter of string)

$\Rightarrow \frac{n_1}{n_2} = \frac{l_2}{l_1}\sqrt{\frac{T_1}{T_2} \times \left(\frac{d_2}{d_1}\right)^2 \times \left(\frac{\rho_2}{\rho_1}\right)}$

$= \frac{35}{36}\sqrt{\frac{8}{1} \times \left(\frac{1}{4}\right)^2 \times \frac{2}{1}} = \frac{35}{36} \Rightarrow n_2 = \frac{36}{35} \times 360 = 370$

Hence beat frequency = $n_2 - n_1 = 10$

34. (b) Frequency of first overtone or second harmonic (n_2) $= 320\ Hz$. So, frequency of first harmonic

$n_1 = \frac{n_2}{2} = \frac{320}{2} = 160 Hz$

35. (d) Similar to Q. 30

Initial frequency of each wire (n)

$= \frac{\text{(Number of beats heared per sec)} \times 200}{\text{(per centage change in tension of the wire)}}$

$= \frac{(3/2) \times 200}{1} = 300 \sec^{-1}$

36. (c) $n \propto \frac{1}{l} \Rightarrow \frac{\Delta n}{n} = -\frac{\Delta l}{l}$

If length is decreased by 2% then frequency increases by 2% *i.e.,* $\frac{n_2 - n_1}{n_1} = \frac{2}{100}$

$\Rightarrow n_2 - n_1 = \frac{2}{100} \times n_1 = \frac{2}{100} \times 392 = 7.8 \approx 8.$

37. (d) Observer receives sound waves (music) which are longitudinal progressive waves.

38. (a) Because both tuning fork and string are in resonance condition.

39. (d) $n = \frac{1}{2l}\sqrt{\frac{T}{m}} \Rightarrow \frac{n_1}{n_2} = \frac{l_2}{l_1}\sqrt{\frac{T_1}{T_2}} = \frac{1}{4}\sqrt{\frac{1}{4}} = \frac{1}{8}$

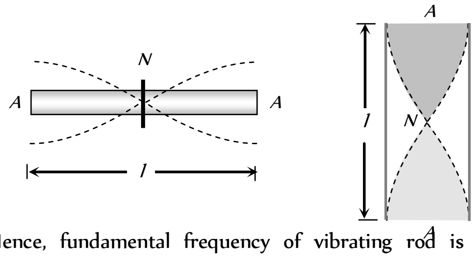
$\Rightarrow n_2 = 8 n_1 = 8 \times 200 = 1600 Hz$

40. (b) $n = \frac{1}{2l}\sqrt{\frac{T}{m}} \Rightarrow n_1 l_1 = n_2 l_2 = n_3 l_3 = k$

$l_1 + l_2 + l_3 = l \Rightarrow \frac{k}{n_1} + \frac{k}{n_2} + \frac{k}{n_3} = \frac{k}{n}$

$\Rightarrow \frac{1}{n} = \frac{1}{n_1} + \frac{1}{n_2} + \frac{1}{n_3} + ...$

41. (a) If a rod clamped at middle, then it vibrates with similar fashion as open organ pipe vibrates as shown.



Hence, fundamental frequency of vibrating rod is given by $n_1 = \frac{v}{2l} \Rightarrow 2.53 = \frac{v}{4 \times 1} \Rightarrow v = 5.06\ km/sec.$

42. (a) Change in amplitude does not produce change in frequency, $\left(n = \frac{1}{2l}\sqrt{\frac{T}{\pi r^2 \rho}}\right)$.

43. (d) Mass per unit length $m = \frac{2 \times 10^{-4}}{0.5} kg/m = 4 \times 10^{-4} kg/m$

Frequency of 2nd harmonic $n_2 = 2n_1$

$= 2 \times \frac{1}{2l}\sqrt{\frac{T}{m}} = \frac{1}{0.5}\sqrt{\frac{20}{4 \times 10^{-4}}} = 447.2 Hz$

44. (d) $n = \frac{1}{2l}\sqrt{\frac{T}{m}} \Rightarrow n \propto \sqrt{T}$ For octave, $n' = 2n$

$\Rightarrow \frac{n'}{n} = \sqrt{\frac{T'}{T}} = 2 \Rightarrow T' = 4T = 16 kg\text{-}wt$

45. (d) Fundamental frequency $n = \frac{1}{2l}\sqrt{\frac{T}{\pi r^2 \rho}}$

where m = Mass per unit length of wire

$\Rightarrow n \propto = \frac{1}{lr} \Rightarrow \frac{n_1}{n_2} = \frac{r_2}{r_1} \times \frac{l_2}{l_1} = \frac{r}{2r} \times \frac{2L}{L} = \frac{1}{1}$

46. (c) $n = \frac{1}{2l}\sqrt{\frac{T}{\pi r^2 \rho}} \propto \sqrt{\frac{T}{r^2 \rho}}$

$\Rightarrow \frac{n_1}{n_2} = \sqrt{\left(\frac{T_1}{T_2}\right)\left(\frac{r_2}{r_1}\right)^2\left(\frac{\rho_2}{\rho_1}\right)} = \sqrt{\left(\frac{1}{2}\right)\left(\frac{2}{1}\right)^2\left(\frac{1}{2}\right)} = 1$

$\therefore\ n_1 = n_2$

47. (a) $n = \frac{p}{2l}\sqrt{\frac{T}{m}} \propto \sqrt{T} \Rightarrow \frac{n_1}{n_2} = \sqrt{\frac{T_1}{T_2}}$

$\Rightarrow \frac{260}{n_2} = \sqrt{\frac{50.7g}{(50.7 - 0.0075 \times 10^3)g}} \Rightarrow n_2 \approx 240$

48. (b) Given equation of stationary wave is

$y = \sin 2\pi x \cos 2\pi t$, comparing it with standard equation $y = 2A \sin\frac{2\pi x}{\lambda}\cos\frac{2\pi x}{\lambda}$

We have $\frac{2\pi x}{\lambda} = 2\pi x \Rightarrow \lambda = 1m$

Minimum distance of string (first mode) $L_{\min} = \frac{\lambda}{2} = \frac{1}{2}m$

49. (d) $n = \frac{1}{2l}\sqrt{\frac{T}{\pi r^2 \rho}} \Rightarrow n \propto \frac{\sqrt{T}}{lr} \Rightarrow \frac{n_1}{n_2} = \sqrt{\frac{T_1}{T_2}} \times \frac{l_2}{l_1} \times \frac{r_2}{r_1}$

$= \sqrt{\frac{T}{3T}} \times \frac{3l}{l} \times \frac{2r}{r} = 3\sqrt{3} \Rightarrow n_2 = \frac{n}{3\sqrt{3}}$

50. (c) For string $\lambda = \frac{2l}{p}$

where p = No. of loops = Order of vibration

Hence for forth mode $p = 4 \Rightarrow \lambda = \frac{l}{2}$

Hence $v = n\lambda = 500 \times \frac{2}{2} = 500\ Hz$

51. (d) $n = \frac{1}{2l}\sqrt{\frac{T}{\pi r^2 \rho}} \Rightarrow n \propto \frac{\sqrt{T}}{r}$

$\Rightarrow \frac{n_2}{n_1} = \frac{r_1}{r_2}\sqrt{\frac{T_2}{T_1}} = \frac{1}{2} \times \sqrt{\frac{1}{2}} = \frac{1}{2\sqrt{2}}$

52. (b) In case of sonometer frequency is given by

$n = \frac{p}{2l}\sqrt{\frac{T}{m}} \Rightarrow \frac{n_2}{n_1} = \frac{l_1}{l_2} \Rightarrow n_2 = \frac{25}{16} \times 256 = 400\ Hz$

Organ Pipe (Vibration of Air Column)

1. (c) $\lambda_1 = 2l, \lambda_2 = 2l + 2\Delta l \Rightarrow n_1 = \frac{v}{2l}$ and $n_2 = \frac{v}{2l + 2\Delta l}$

$\Rightarrow$ No. of beats $= n_1 - n_2 = \frac{v}{2}\left(\frac{1}{l} - \frac{1}{l + \Delta l}\right) = \frac{v\Delta l}{2l^2}$

2. (a) Fundamental frequency of open pipe is double that of the closed pipe.

3. (c) If is given that

First over tone of closed pipe = First over tone of open pipe $\Rightarrow$ $3\left(\frac{v}{4l_1}\right) = 2\left(\frac{v}{2l_2}\right)$; where l_1 and l_2 are the lengths of closed and open organ pipes hence $\frac{l_1}{l_2} = \frac{3}{4}$

4. (d) First overtone for closed pipe = $\frac{3v}{4l}$

Fundamental frequency for open pipe = $\frac{v}{2l}$

First overtone for open pipe = $\frac{2v}{2l}$.

5. (c) For closed pipe in general $n = \frac{v}{4l}(2N - 1) \Rightarrow n \propto \frac{1}{l}$

i.e. if length of air column decreases frequency increases.

6. (a,c,d) Fundamental frequency of closed pipe $n = \frac{v}{4l}$

where $v = \sqrt{\frac{\gamma RT}{M}} \Rightarrow v \propto \frac{1}{\sqrt{M}}$

$\because\ M_{H_2} < M_{air} \Rightarrow v_{H_2} > v_{air}$

Hence fundamental frequency with H_2 will be more as compared to air. So option (a) is correct.

Also $n \propto \frac{1}{l}$, hence if l decreases n increases so option (c) is correct.

It is well known that $(n)_{Open} = 2(n)_{Closed}$ hence option (d) is correct.

7. (d) For closed pipe $n_1 = \frac{v}{4l} \Rightarrow l = \frac{v}{4n} = \frac{332}{4 \times 166} = 0.5m$

8. (a) Fundamental frequency of open pipe

$n_1 = \frac{v}{2l} = \frac{350}{2 \times 0.5} = 350\ Hz$.

9. (b) For closed pipe $n_1 = \frac{v}{4l} = \frac{330}{4}\ Hz$

Second note = $3n_1 = \frac{3 \times 300}{4}\ Hz$.

10. (c) $n_{\text{closed}} = \frac{v}{4l}, n_{\text{open}} = \frac{v}{2l} \Rightarrow n_{\text{open}} = 2n_{\text{closed}} = 2f$

11. (b) Minimum audible frequency = 20 Hz.

$\Rightarrow \frac{v}{4l} = 20 \Rightarrow l = \frac{336}{4 \times 20} = 4.2\ m$

12. (c) First overtone of closed organ pipe $n_1 = \frac{3v}{4l_1}$

Third overtone of open organ pipe $n_2 = \frac{4v}{2l_2}$

$n_1 = n_2$ (Given) $\Rightarrow \frac{3v}{4l_1} = \frac{4v}{2l_2} \Rightarrow \frac{l_1}{l_2} = \frac{3}{8}$

13. (b) For closed pipe $n_1 = \frac{v}{4l} \Rightarrow 250 = \frac{v}{4\times 0.2} \Rightarrow v = 200 m/s$

14. (b) $n_{\text{open}} = \frac{v}{2l_{\text{open}}}$

$n_{\text{closed}} = \frac{v}{4l_{\text{closed}}} = \frac{v}{4l_{\text{open}}/2} = \frac{v}{2l_{\text{open}}}$

$\left(\text{As } l_{closed} = \frac{l_{open}}{2}\right)$, *i.e.* frequency remains unchanged.

15. (b) For closed pipe second note = $\frac{3v}{4l} = \frac{3\times 330}{4\times 1.5} = 165\ Hz$.

16. (a) Fundamental frequency of open pipe

$n_1 = \frac{v}{2l} = \frac{330}{2\times 0.3} = 550\ Hz$

First harmonic = $2\times n_1 = 1100\ Hz$. = 1.1 *kHz*

17. (b) For first pipe $n_1 = \frac{v}{4l_1}$ and for second pipe $n_2 = \frac{v}{4l_2}$

So, number of beats = $n_2 - n_1 = 4$

$\Rightarrow 4 = \frac{v}{4}\left(\frac{1}{l_2} - \frac{1}{l_1}\right) \Rightarrow 16 = 300\left(\frac{1}{l_2} - \frac{1}{1}\right) \Rightarrow l_2 = 94.9\ cm$

18. (a) Maximum pressure at closed end will be atmospheric pressure adding with acoustic wave pressure

So $\rho_{\max} = \rho_A + \rho_0$ and $\rho_{\min} = \rho_A - \rho_0$

Thus $\frac{\rho_{\max}}{\rho_{\min}} = \frac{\rho_A + \rho_0}{\rho_A - \rho_0}$

19. (c) $n_1 - n_2 = 10$ .....(i)

Using $n_1, = \frac{v}{4l_1}$ and $n_2 = \frac{v}{4l_2}$

$\Rightarrow \frac{n_1}{n_2} = \frac{l_2}{l_1} = \frac{26}{25}$ .....(ii)

After solving these equation $n_1 = 260 Hz$, $n_2 = 250\ Hz$

20. (a) Let l_1 and l_2 be the length's of closed and open pipes respectively. (Neglecting end correction)

$l_1 = \frac{\lambda_1}{4} \Rightarrow \lambda_1 = 4l_1$ and $l_2 = \frac{\lambda_2}{2} \Rightarrow \lambda_2 = 2l_2$

Given $n_1 = n_2$ so $\frac{v}{\lambda_1} = \frac{v}{\lambda_2} \Rightarrow \frac{v}{4l_1} = \frac{v}{2l_2} = \frac{l_1}{l_2} = \frac{1}{2}$

21. (b) Distance between two consecutive nodes

$= \frac{\lambda}{2} = 46 - 16 = 30 \Rightarrow \lambda = 60\ cm = 0.6m$

$\therefore\ v = n\lambda = 500\times 0.6 = 300\ m/s$.

22. (a) For closed pipe $n = \frac{v}{4l} \Rightarrow n = \frac{332}{4\times 42} = 2Hz$.

23. (a) For shortest length of pipe mode of vibration must be fundamental *i.e.,* $n = \frac{v}{4l} \Rightarrow l = \frac{v}{4n}$.

24. (b) $n_{\text{Closed}} = \frac{1}{2}(n_{\text{Open}}) = \frac{1}{2}\times 320 = 160\ Hz$

25. (c) Frequency of 2^{nd} overtone $n_3 = 5n_1 = 5\times 50 = 250\ Hz$.

26. (a) $\Delta n = n_1 - n_2 \Rightarrow 10 = \frac{v}{2l_1} - \frac{v}{2l_2} = \frac{v}{2}\left[\frac{1}{l_1} - \frac{1}{l_2}\right]$

$\Rightarrow 10 = \frac{v}{2}\left[\frac{1}{0.25} - \frac{1}{0.255}\right] \Rightarrow v = 255 m/s.$

27. (a) Fundamental frequency $n = \frac{v}{2l}$

$\Rightarrow 350 = \frac{350}{2l} \Rightarrow l = \frac{1}{2}m = 50 cm.$

28. (b) $\Delta n = n_1 - n_2 \Rightarrow 4 = \frac{v}{2l_1} - \frac{v}{2l_2} = \frac{v}{2}\left[\frac{1}{1.00} - \frac{1}{1.025}\right]$

$\Rightarrow 8 = [1 - 0.975] \Rightarrow v = \frac{8}{0.025} \approx 328 m/s.$

29. (a) In closed pipe only odd harmonics are present

30. (d) Fundamental frequency of open organ pipe $= \frac{v}{2l}$

Frequency of third harmonic of closed pipe $= \frac{3v}{4l}$

$\therefore \frac{3v}{4l} = 100 + \frac{v}{2l} \Rightarrow \frac{3v}{4l} - \frac{2v}{4l} = \frac{v}{4l} = 100 \Rightarrow \frac{v}{2l} = 200 Hz.$

31. (c) $n_A = \frac{v}{2l}; n_B = \frac{v}{4l} \Rightarrow n_A/n_B = 2:1$

32. (a) Due to rise in temperature, the speed of sound increases. Since $n = \frac{v}{\lambda}$ and λ remains unchanged, hence n increases.

33. (b)

34. (b)

35. (b) In closed organ pipe. If $y_{incident} = a\sin(\omega t - kx)$

then $y_{reflected} = a\sin(\omega t + kx + \pi) = -a\sin(\omega t + kx)$

Superimposition of these two waves give the required stationary wave.

36. (b) $v = 330\ m/s$; $n = 165\ Hz$. Distance between two successive nodes = $\frac{\lambda}{2} = \frac{v}{2n} = \frac{330}{2\times 165} = 1m$

37. (b) At the middle of pipe, node is formed.

38. (c) For closed organ pipe $n_1 : n_2 : n_3 .... = 1:3:5:.....$

39. (b) First tone of open pipe = first overtone of closed pipe $\Rightarrow \frac{v}{2l_0} = \frac{3v}{4l_c} \Rightarrow l_c = \frac{3\times 2\times 0.5}{4} = 0.75m$

40. (b) Only odd harmonics are present.

41. (b) Distance between six successive node

$= \frac{5\lambda}{2} = 85cm \Rightarrow \lambda = \frac{2\times 85}{5} = 34\ cm = 0.34\ m$

Therefore speed of sound in gas

$= n\lambda = 1000\times 0.34 = 340\ m/s$

42. (b) Let the base frequency be n for closed pipe then notes are $n, 3n, 5n.....$

$\therefore$ note $3n = 255 \Rightarrow n = 85$, note $5n = 85\times 5 = 425$

note $7n = 7\times 85 = 595$

43. (a) $l_2 = 3l_1 = 3\times 24.7 = 74.1 cm$

44. (c) Frequency of p *th* harmonic

$n = \frac{pv}{2l} \Rightarrow p = \frac{2ln}{v} = \frac{2 \times 0.33 \times 1000}{330} = 2$

45. (a) For closed pipe $l_1 = \frac{v}{4n}; l_2 = \frac{3v}{4n} \Rightarrow v = 2n(l_2 - l_1)$

$\Rightarrow n = \frac{v}{2(l_2 - l_1)} = \frac{330}{2 \times (0.49 - 0.16)} = 500\,Hz$

46. (c) Number of beats per second,

$n = \frac{16}{20} = \frac{4}{5} \Rightarrow n = n_1 - n_2 = \frac{v}{4}\left(\frac{1}{l_1} - \frac{1}{l_2}\right)$

$\Rightarrow \frac{4}{5} = \frac{v}{4}\left(\frac{1}{1} - \frac{1}{1.01}\right) = \frac{0.01v}{4 \times 1.01}$

$v = \frac{16 \times 101}{5} = 323.2\,ms^{-1}$

47. (a) In open organ pipe both even and odd harmonics are produced.

48. (d) Using $\lambda = 2(l_2 - l_1) \Rightarrow v = 2n(l_2 - l_1)$

$\Rightarrow 2 \times 512(63.2 - 30.7) = 33280 cm/s$

Actual speed of sound $v_0 = 332 m/s = 33200 cm/s$

Hence error $= 33280 - 33200 = 80 cm/s$

49. (b) Initially number of beats per second = 5

$\therefore$ Frequency of pipe = 200 $\pm$ 5 = 195 Hz or 205 Hz ...(i)

Frequency of second harmonics of the pipe = $2n$ and number of beats in this case = 10

$\therefore$ $2n$ = 420 $\pm$ 10 $\Rightarrow$ 410 Hz or 430 Hz

$\Rightarrow n$ = 205 Hz or 215 Hz ... (ii)

From equation (i) and (ii) it is clear that n = 205 Hz

50. (c) In case of open pipe, $n = \frac{N}{2l}$ where N = order of harmonics = order of mode of vibration $\Rightarrow N = \frac{n \times 2l}{v}$

$= \frac{480}{330} \times 2 \times 1 = 3$ (Here v = 330 m/s)

51. (a) In first overtone of organ pipe open at one end,

end, $n_c = \frac{3v}{4l_c}$ .....(i)

Third harmonic or second overtone of organ pipe open at both

end, $n_0 = \frac{3v}{2l_0}$ .....(ii)

given $n_c = n_o \Rightarrow \frac{3v}{4l_c} = \frac{3v_0}{2l_0} \Rightarrow \frac{l_c}{l_o} = \frac{1}{2}$.

52. (a) For end correction x, $\frac{l_2 + x}{l_1 + x} = \frac{3\lambda/4}{\lambda/4} = 3$

$x = \frac{l_2 - 3l_1}{2} = \frac{70.2 - 3 \times 22.7}{2} = 1.05\,cm$

53. (b) For open tube, $n_0 = \frac{v}{2l}$

For closed tube length available for resonance is

$l' = l \times \frac{25}{100} = \frac{l}{4}$ $\therefore$ Fundamental frequency of water filled tube $n = \frac{v}{4l'} = \frac{v}{4 \times (l/4)} = \frac{v}{l} = 2n_0 \Rightarrow \frac{n}{n_0} = 2$

Doppler's Effect

1. (d)

2. (b) $n' = n\left(\frac{v}{v - v_O}\right) = 450\left(\frac{340}{340 - 34}\right) = 500\ cycles/\sec$

3. (a) $n' = n\left(\frac{v}{v - v_s}\right) \Rightarrow \lambda' = \lambda\left(\frac{v - v_S}{v}\right)$

$\Rightarrow \lambda' = 120\left(\frac{330 - 60}{330}\right) = 98\,cm.$

4. (b) $n' = n\left(\frac{v}{v - v_S}\right) = 600\left(\frac{330}{300}\right) = 660\ cps$

5. (c) Both listeners, hears the same frequencies.

6. (b)

7. (c) $n' = n\left(\frac{v + v_O}{v}\right) \Rightarrow 2n = n\left(\frac{v + v_0}{v}\right) \Rightarrow \frac{v + v_0}{v} = 2$

$\Rightarrow v_O = v = 332\ m/sec$

8. (b) Apparent frequency in this case $n' = \frac{n(v + v_O)}{v}$

$\because \frac{v + v_0}{v} > 1 \Rightarrow \frac{n'}{n} > 1$ *i.e.* $n' > n$.

9. (a) Wave number = $\frac{1}{\lambda}$ but $\frac{1}{\lambda'} = \frac{1}{\lambda}\left(\frac{v}{v - v_s}\right)$ and $v_S = \frac{v}{3}$

$\therefore$ (W.N.)' = (W.N.) $\left(\frac{v}{v - v/3}\right) = 256 \times \frac{v}{2v/3}$

$= \frac{3}{2} \times 256 = 384$

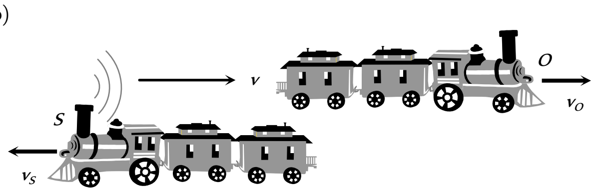
10. (a) By Doppler's formula $n' = \frac{nv}{(v - v_S)}$

Since, source is moving towards the listener so $n' > n$.

If n = 100 then n' = 102.5

$\Rightarrow 102.5 = \frac{100 \times 320}{(320 - v_S)} \Rightarrow v_s = 8\ m/\sec$

11. (b)

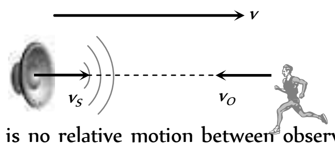


$n' = n\left(\frac{v - v_O}{v + v_S}\right) = 750\left(\frac{330 - 180\times\frac{5}{18}}{330 + 108\times\frac{5}{18}}\right) = 625\ Hz$

12. (a) By using $n' = n\left(\frac{v}{v - v_S}\right)$

$2n = n\left(\frac{v - v_O}{v - 0}\right) \Rightarrow v_O = -v = -$ (Speed of sound)

Negative sign indicates that observer is moving opposite to the direction of velocity of sound, as shown



13. (d) Since there is no relative motion between observer and source, therefore there is no apparent change in frequency.

14. (c)

15. (b)

16. (a) $n' = n\left(\frac{v}{v - v_S}\right) \Rightarrow \frac{n'}{n} = \frac{v}{v - v_S} \Rightarrow \frac{v}{v - v_S} = 3 \Rightarrow v_s = \frac{2v}{3}$

17. (a) $n' = n\left(\frac{v}{v - v_S}\right) = n\left(\frac{v}{v - v/10}\right) \Rightarrow \frac{n'}{n} = \frac{10}{9}$

18. (c) $n' = n\left(\frac{v}{v - v_S}\right) = 1200\times\left(\frac{350}{350 - 50}\right) = 1400$ *cps*

19. (d) $n' = n\left(\frac{v}{v - v_S}\right) = 1200\left(\frac{400}{400 - 100}\right) = 1600\ Hz$

20. (a) $n' = \frac{v}{v - v_S}\times n = \left(\frac{330}{330 - 110}\right)\times 150 = 225\ Hz$

21. (d) Doppler's effect is applicable for both light and sound waves.

22. (a) When source is approaching the observer, the frequency heard

$n_a = \left(\frac{v}{v - v_S}\right)\times n = \left(\frac{340}{340 - 20}\right)\times 1000 = 1063 Hz$

When source is receding, the frequency heard

$n_r = \left(\frac{v}{v + v_S}\right)\times n = \frac{340}{340 + 20}\times 1000 = 944$

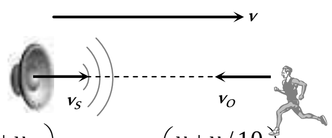
$\Rightarrow n_a : n_r = 9 : 8$

Short tricks : $\frac{n_a}{n_r} = \frac{v + v_S}{v - v_S} = \frac{340 + 20}{340 - 20} = \frac{9}{8}$.

23. (a) By using $\frac{n_{\text{approaching}}}{n_{\text{receding}}} = \frac{v + v_s}{v - v_s}$

$\Rightarrow \frac{1000}{n_r} = \frac{350 + 50}{350 - 50} \Rightarrow n_r = 750 Hz.$

24. (b) When source and listener both are moving towards each other then, the frequency heard



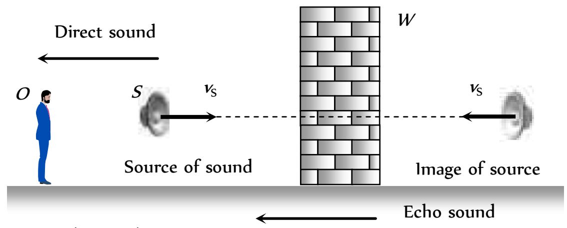
$n' = n\left(\frac{v + v_O}{v - v_S}\right) \Rightarrow n' = f\left(\frac{v + v/10}{v - v/10}\right) = 1.22\,f.$

25. (c) For source $v_s = r\omega = 0.70\times 2\pi\times 5 = 22$ *m/sec*

Minimum frequency is heard when the source is receding the man. It is given by $n_{\min} = n\frac{v}{v + v_S}$

$= 1000\times\frac{352}{352 + 22} = 941\ Hz$

26. (b) For direct sound source is moving away from the observes so frequency heard in this case



$n_1 = n\left(\frac{v}{v + v_s}\right) = 500\left(\frac{332}{332 + 2}\right) = 500\left(\frac{332}{334}\right) Hz$

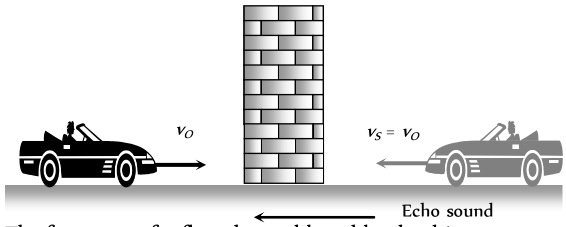
The other sound is echo, reaching the observer from the wall and can be regarded as coming from the image of source formed by reflection at the wall. This image is approaching the observer in the direction of sound.

Hence for reflected sound, frequency heard by the observer is

$n_2 = n\left(\frac{v}{v - v_S}\right) = 500\left(\frac{332}{332 - 2}\right) = 500\left(\frac{332}{330}\right) Hz$

Beats frequency $= n_2 - n_1 = 500\times 332\left(\frac{1}{330} - \frac{1}{334}\right) = 6.$

27. (c) Similar to previous question



The frequency of reflected sound heard by the driver

$n' = n\left(\frac{v - (-v_O)}{v - v_S}\right) = n\left(\frac{v + v_O}{v - v_S}\right)$

$= 124\left[\frac{330 + (72\times 5/18)}{330 - (72\times 5/18)}\right] = 140$ *vibration/sec.*

28. (d) By using $n' = n\frac{v}{v - v_S} \Rightarrow \frac{n_1}{n} = \left(\frac{V}{V - S}\right)$

29. (b) In this case Doppler's effect is not applicable.

30. (d) The apparent frequency heard by the observer is given by

$n' = \frac{v}{v - v_S} n = \frac{330}{330 - 33}\times 450 = \frac{330}{297}\times 450 = 500\ \ Hz$

31. (a) $n' = n\left(\frac{v - v_O}{v}\right) = \left(\frac{330 - 33}{330}\right)\times 100 = 90\ \ Hz$

32. (c) When train is approaching frequency heard by the observer is

$n_a = n\left(\frac{v}{v - v_S}\right) \Rightarrow 219 = n\left(\frac{340}{340 - v_S}\right)$ ....(i) when train is receding (goes away), frequency heard by the observer is

$$n_r = n\left(\frac{v}{v+v_S}\right) \Rightarrow 184 = n\left(\frac{340}{340+v_S}\right) \quad ...(ii)$$

On solving equation (i) and (ii) we get $n = 200Hz$

and $v_S = 29.5 m/s$.

33. (d) Frequency is decreasing (becomes half), it means source is going away from the observes. In this case frequency observed by the observer is

$$n' = n\left(\frac{v}{v+v_S}\right) \Rightarrow \frac{n}{2} = n\left(\frac{v}{v+v_S}\right) \Rightarrow v_S = v$$

34. (d) Observer hears two frequencies

(i) n_1 which is coming from the source directly

(ii) n_2 which is coming from the reflection image of source

so, $n_1 = 680\left(\frac{340}{340-1}\right)$ and $n_2 = 680\left(\frac{340}{340+1}\right)$

$\Rightarrow n_1 - n_2 = 4$ *beats*

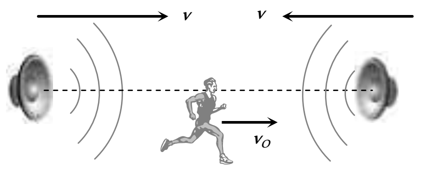
35. (a) From the figure, it is clear that

Frequency of reflected sound heard by the driver.

$$n' = n\left[\frac{v-(-v_o)}{v-v_s}\right] = n\left[\frac{v+v_o}{v-v_s}\right] = n\left[\frac{v+v_{car}}{v-v_{car}}\right]$$

$$= 600\left[\frac{330+30}{330-30}\right] = 720\ Hz.$$

36. (b) Observer is moving away from siren 1 and towards the siren 2.



Hearing frequency of sound emitted by siren 1

$$n_1 = n\left(\frac{v-v_0}{v}\right) = 330\left(\frac{330-2}{330}\right) = 328Hz$$

Hearing frequency of sound emitted by siren 2

$$n_2 = n\left(\frac{v+v_O}{v}\right) = 330\left(\frac{330+2}{330}\right) = 332Hz$$

Hence, beat frequency $= n_2 - n_1 = 332 - 328 = 4$.

37. (c) $n' = n\left(\frac{v}{v-v_S}\right) = \frac{2000 \times 1220}{(1220-40)} = 2068\ Hz$

38. (d) $n' = n\left(\frac{v+v_O}{v-v_S}\right)n \Rightarrow 400 = n\left(\frac{360+40}{360-40}\right) \Rightarrow n = 320\ cps$

39. (a) $n' = n\left(\frac{v}{v+v_S}\right) = 500 \times \left(\frac{330}{300+50}\right) = 434.2Hz$

40. (c) Since there is no relative motion between the listener and source, hence actual frequency will be heard by listener.

41. (a) $n' = n\left(\frac{v}{v-v_S}\right) \Rightarrow n' = 500\left(\frac{330}{330-30}\right) = 550\ Hz$.

42. (c) $n' = n\left(\frac{v}{v-v_S}\right) = 90\left(\frac{v}{v-\frac{v}{10}}\right) = 100\ \frac{Vibration}{sec}$

43. (a) The linear velocity of Whistle

$$v_S = r\omega = 1.2 \times 2\pi \frac{400}{60} = 50\ m/s$$

When Whistle approaches the listener, heard frequency will be maximum and when listener recedes away, heard frequency will be minimum

So, $n_{max} = n\left(\frac{v}{v-v_S}\right) = 500\left(\frac{340}{290}\right) = 586Hz$

$$n_{min} = n\left(\frac{v}{v+v_S}\right) = 500\left(\frac{340}{390}\right) = 436Hz$$

44. (d) By using $n' = n\left(\frac{v}{v-v_S}\right)$

$$\Rightarrow f_1 = n\left(\frac{v}{v-v_S}\right) = n\left(\frac{340}{340-34}\right) = \frac{340}{306}n$$

and $f_2 = n\left(\frac{340}{340-17}\right) = n\left(\frac{340}{323}\right) \Rightarrow \frac{f_1}{f_2} = \frac{323}{306} = \frac{19}{18}$

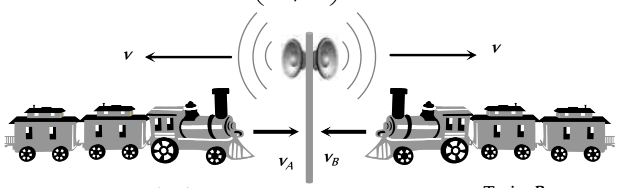
45. (d) No change in frequency.

46. (b) $n' = n\left(\frac{v-v_O}{v+v_S}\right) = n\left(\frac{340-10}{340+10}\right) = 1950 \Rightarrow n = 2068\ Hz$

47. (b) $n' = n\left(\frac{v+v_O}{v-v_S}\right) = 240\left(\frac{340+20}{340-20}\right) = 270\ Hz$.

48. (b) In both the cases observer is moving towards, the source.

Hence by using $n' = n\left(\frac{v+v_0}{v}\right)$



When passenger is sitting in train *A*, then

$$5.5 = 5\left(\frac{v+v_A}{v}\right) \quad ...(i)$$

when passenger is sitting in train *B*, then

$$6 = 5\left(\frac{v+v_B}{v}\right) \quad ...(ii)$$

On solving equation (i) and (ii) we get $\frac{v_B}{v_A} = 2$

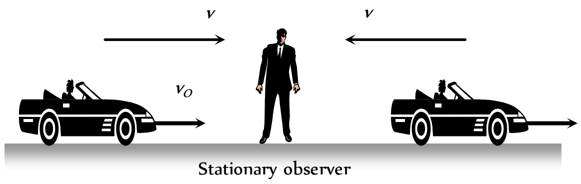
49. (b) Minimum frequency will be heard, when whistle moves away from the listener.

$n_{min} = n\left(\frac{v}{v+v_s}\right)$ where $v = r\omega = 0.5 \times 10 = 1\ m/s$

$$\Rightarrow n_{min} = 385\left(\frac{340}{340+10}\right) = 374Hz.$$

50. (a) $n' = n\left(\frac{v}{v+v_S}\right) = 800\left(\frac{330}{330+30}\right) = 733.33\ Hz$.

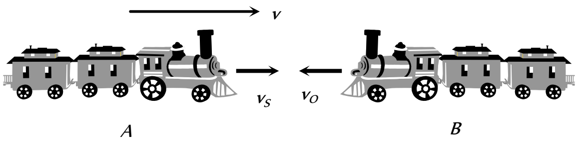
51. (a) $n_{Before} = \frac{v}{v-v_c}n$ and $n_{After} = \frac{v}{v+v_c}.n$



$\frac{n_{Before}}{n_{After}} = \frac{11}{9} = \left(\frac{v+v_c}{v-v_c}\right) \Rightarrow v_c \Rightarrow \frac{v}{10}$

52. (c) By using $n' = \left(\frac{v}{v-v_S}\right) \Rightarrow 2n = n\left(\frac{v}{v-v_S}\right) \Rightarrow v_S = \frac{v}{2}$

53. (d) The frequency of whistle heard by passenger in the train *B*, is



$n' = n\left(\frac{v+v_0}{v-v_s}\right) = 600\left(\frac{340+15}{340-20}\right) \approx 666\ Hz$

54. (b) At point *A*, source is moving away from observer so apparent frequency $n_1 < n$ (actual frequency) At point *B* source is coming towards observer so apparent frequency $n_2 > n$ and point *C* source is moving perpendicular to observer so $n_3 = n$

Hence $n_2 > n_3 > n_1$

55. (a) $n' = n\left[\frac{v+v_O}{v-v_S}\right]$; Here $v = 332\ m/s$ and $v_0 = v_s = 50\ m/s$

$\Rightarrow 435 = n\left[\frac{332+50}{332-50}\right] \Rightarrow n = 321.12\ sec^{-1} \approx 320\ sec^{1}$

56. (c) Since apparent frequency is lesser than the actual frequency, hence the relative separation between source and listener should be increasing.

57. (c)

58. (d) $n' = n\left(\frac{v+v_0}{v-v_s}\right) = n\left(\frac{v+v/2}{v-v/2}\right) = 3n$

59. (c) When engine approaches towards observer $n' = n\left(\frac{v}{v-v_S}\right)$

when engine going away from observer $n'' = \left(\frac{v}{v+v_S}\right)n$

$\therefore \frac{n'}{n''} = \frac{v+v_S}{v-v_S} \Rightarrow \frac{5}{3} = \frac{340+v_S}{340-v_S} \Rightarrow v_S = 85\ m/s$.

60. (a) Frequency heard by the observer

$n' = n\left(\frac{v+v_0}{v}\right) = 240\left(\frac{330+11}{330}\right) = 248 Hz.$

61. (c) According the concept of sound image

$n' = \frac{v+v_{person}}{v-v_{person}}.272 = \frac{345+5}{345-5}\times 272 = 280\ Hz$

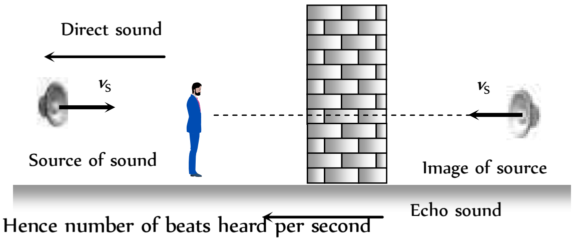
Δn = Number of beats = 280 − 272 = 8 Hz

62. (b) According the concept of sound image

$n' = \frac{v+v_B}{v-v_B}\times n = \frac{355+5}{355-5}\times 165 = 170\ Hz$

Number of beats $= n' - n = 170 - 165 = 5$

63. (a) The observer will hear two sound, one directly from source and other from reflected image of sound



Hence number of beats heard per second

$= \left(\frac{v}{v-v_S}\right)n - \left(\frac{v}{v+v_S}\right)n$

$= \frac{2nvv_S}{v^2 - v_S^2} = \frac{2\times 256\times 330\times 5}{335\times 325} = 7.8\ Hz$

64. (a) When a listener moves towards a stationary source apparent frequency

$n' = \left(\frac{v+v_O}{v}\right) n = 200$ .....(i)

When listener moves away from the same source

$n'' = \frac{(v-v_O)}{v}n = 160$ .....(ii)

From (i) and (ii)

$\frac{v+v_O}{v-v_O} = \frac{200}{160} \Rightarrow \frac{v+v_O}{v-v_O} = \frac{5}{4} \Rightarrow v = 360 m/\sec$

65. (b) When observer moves towards stationary source then apparent frequency

$n' = \left[\frac{v+v_O}{v}\right]n = \left[\frac{v+v/5}{v}\right]n = \frac{6}{5}n = 1.2n$

Increment in frequency = 0.2 n so percentage change in frequency $= \frac{0.2n}{n}\times 100$ = 20%.

Musical Sound

1. (d)

2. (a) Intensity $= \frac{\text{Power}}{\text{Area}} = \frac{4}{4\pi\times(200)^2} = 7.9\times 10^{-6}\ W/m^2$

3. (a) Intensity $\propto$ (Amplitude)

4. (c) $I = 2\pi^2 a^2 n^2\ v\rho \Rightarrow I \propto a^2 n^2 \Rightarrow \frac{I_1}{I_2} = \left(\frac{a_1}{a_2}\right)^2 \times \left(\frac{n_1}{n_2}\right)^2$

$= \left(\frac{1}{2}\right)^2 \times \left(\frac{1}{1/4}\right)^2 \Rightarrow I_2 = \frac{I_1}{4}$

5. (b) $L = 10\log_{10}\left(\frac{I}{I_0}\right) = 30 \Rightarrow \frac{I}{I_0} = 10^3$

6. (c)

7. (a) The quality of sound depends upon the number of harmonics present. Due to different number of harmonics present in two sounds, the shape of the resultant wave is also different.

8. (d) The sounds of different source are said to differ in quality. The number of overtones and their relative intensities determines the quality of any musical sound.

9. (d)

10. (d) $\text{Energy density} \propto (\text{amplitude})^2$

11. (d) Energy $\propto a^2n^2 \Rightarrow \frac{a_B}{a_A} = \frac{n_A}{n_B}$ ($\because$ energy is same)

$\Rightarrow \frac{a_B}{a_A} = \frac{8}{1}$

12. (c) Loudness depends upon intensity while pitch depends upon frequency.

13. (d) Reverberation time $T = \frac{kV}{\alpha S} \Rightarrow T \propto V$.

14. (c) $I \propto \frac{1}{r^2} \Rightarrow \frac{I_2}{I_1} = \frac{r_1^2}{r_2^2} \Rightarrow \frac{I_2}{1\times 10^{-2}} = \frac{2^2}{10^2} = \frac{4}{100}$

$\Rightarrow I_2 = \frac{4\times 10^{-2}}{100} = 4\times 10^{-4}\ \mu W/m^2$

15. (b) After passing the 3 meter intensity is given by

$I_3 = \frac{90}{100}\times\frac{90}{100}\times\frac{90}{100}\times I = 72.9\%\text{ of } I$

So, the intensity is 72.9 decibel.

16. (c)

17. (b)

18. (a) $P \propto I$

$L_1 = 10\log_{10}\left(\frac{I_1}{I_0}\right)$ and $L_2 = 10\log_{10}\left(\frac{I_2}{I_0}\right)$

So $L_2 - L_1 = 10\log_{10}\left(\frac{I_2}{I_1}\right)$

$= 10\log_{10}\left(\frac{P_2}{P_1}\right) = 10\log_{10}\left(\frac{400}{20}\right) = 10\log_{10} 20$

$= 10\log(2\times 10) = 10(0.301+1) = 13dB$

19. (d) $I \propto \frac{1}{r^2} \Rightarrow \frac{\Delta I}{I} = -2\frac{\Delta r}{r} = -2\times 2 = -4\%$

Hence intensity is decreased by 4%.

20. (b) Musical interval is the ratio of frequencies $= \frac{320}{240} = \frac{4}{3}$

21. (c)

22. (d) By using $L = \log_{10}\frac{I}{I_0}$

$L_2 - L_1 = \log_{10}\frac{I_2}{I_0} - \log_{10}\frac{I_1}{I_0}$

$5 - 1 = \log_{10}\frac{I_2}{I_1} \Rightarrow 4 = \log_{10}\frac{I_2}{I_1} \Rightarrow \frac{I_2}{I_1} = 10^4$

$\Rightarrow \frac{a_2^2}{a_1^2} = 10^4 \Rightarrow \frac{a_2}{a_1} = \frac{10^2}{1} \Rightarrow \frac{a_1}{a_2} = \frac{1}{10^2}$

23. (b)

24. (a) Pitch of mosquito is higher among all given options.

25. (b) The frequency of note 'Sa' is 256 Hz while that of note 'Re' and 'Ga' respectively are 288 Hz and 320 Hz.

26. (d)

27. (d) Indian classical vocalists don't like harmoniuim because it uses tempered scale.

28. (b)

29. (b) $I \propto \frac{1}{r^2} \Rightarrow \frac{I_2}{I_1} = \frac{r_1^2}{r_2^2} = \frac{2^2}{(40)^2} = \frac{1}{400} \Rightarrow I_1 = 400 I_2$

Intensity level at point 1, $L_1 = 10\log_{10}\left(\frac{I_1}{I_0}\right)$

and intensity at point 2, $L_2 = 10\log_{10}\left(\frac{I_2}{I_0}\right)$

$\therefore L_1 - L_2 = 10\log\frac{I_1}{I_2} = 10\log_{10}(400)$

$\Rightarrow L_1 - L_2 = 10\times 2.602 = 26$

$L_2 = L_1 - 26 = 80 - 26 = 54\ dB$

30. (a) Intensity $\propto \frac{1}{(\text{Distance})^2} \Rightarrow \frac{I_1}{I_2} = \left(\frac{d_2}{d_1}\right)^2 = \left(\frac{3}{2}\right)^2 = \frac{9}{4}$.

31. (d)

32. (a) The pitch depends upon the frequency of the source. As the two waves have different amplitude therefore they having different intensity. While quality depends on number of harmonics/overtone produced and their relative intensity. Assuming that their frequencies are the same.

Critical Thinking Questions

1. (a,b,c,d) $y = 0.02\cos(10\pi x)\cos\left(50\pi t + \frac{\pi}{2}\right)$

At node, amplitude = 0

$\Rightarrow \cos(10\pi x) = 0 \Rightarrow 10\pi x = \frac{\pi}{2}, \frac{3\pi}{2}$

$\Rightarrow x = \frac{1}{20} = 0.05\ m,\ 0.15m$ .....

At antinode, amplitude is maximum

$\Rightarrow \cos(10\pi x) = \pm 1 \Rightarrow x = 0, \pi, 2\pi ...$

$\Rightarrow x = 0,\ 0.1m,\ 0.2m$ ...

Now $\lambda = 2\times$ Distance between two nodes or antinodes

$= 2\times 0.1 = 0.2\ m$ and $\frac{2\pi v t}{\lambda} = 50\pi t$

$v = 25\lambda = 25\times 0.2 = 5m/\sec$.

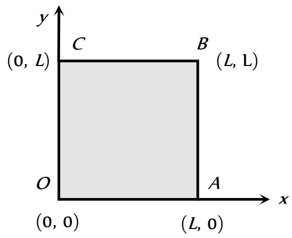
2. (b,c) Since the edges are clamped, displacement of the edges $u(x, y) = 0$ for line –

OA i.e. $y = 0$, $0 \le x \le L$

AB i.e. $x = L$, $0 \le y \le L$

BC i.e. $y = L$, $0 \le x \le L$

OC i.e. $x = 0$, $0 \le y \le L$



The above conditions are satisfied only in alternatives (b) and (c).

Note that $u(x,y)=0$, for all four values e.g. in alternative (d), $u(x,y)=0$ for $y=0, y=L$ but it is not zero for $x=0$ or $x=L$. Similarly in option (a). $u(x,y)=0$ at $x=L, y=L$ but it is not zero for $x=0$ or $y=0$, while in options (b) and (c), $u(x,y)=0$ for $x=0, y=0, x=L$ and $y=L$

3. (c) Energy $(E) \propto$ (Amplitude)^2 (Frequency)^2

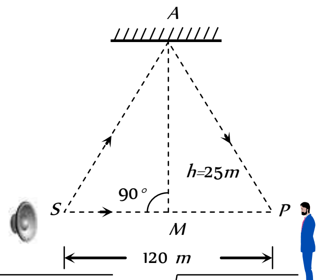
Amplitude is same in both the cases, but frequency 2ω in the second case is two times the frequency (ω) in the first case. Hence $E_2 = 4E_1$.

4. (a) Let S be source of sound and P the person or listner.

The waves from S reach point P directly following the path SMP and being reflected from the ceiling at point A following the path SAP. M is mid-point of SP (*i.e.* $SM = MP$) and $\angle SMA = 90^o$

Path difference between waves $\Delta x = SAP - SMP$

We have $SAP = SA + AP = 2(SA)$



$= 2\sqrt{[(SM)^2 + (MA)^2]} = 2\sqrt{(60^2 + 25^2)} = 130\ m$

$\therefore$ Path difference = SAP – SMP $= 130 - 120 = 10\ m$

Path difference due to reflection from ceiling = $\frac{\lambda}{2}$

$\therefore$ Effective path difference $\Delta x = 10 + \frac{\lambda}{2}$

For constructive interference

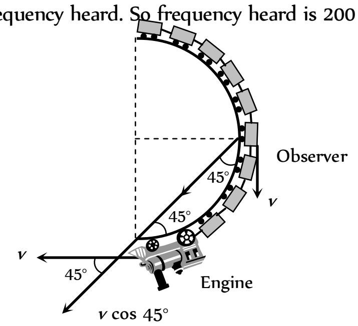
$$\Delta x = 10 + \frac{\lambda}{2} = n\lambda \Rightarrow (2n-1)\frac{\lambda}{2} = 10 (n = 1,\ 2,\ 3....)$$

$\therefore$ Wavelength $\lambda = \frac{2\times 10}{(2n-1)} = \frac{20}{2n-1}$. The possible wavelength are $\lambda = 20,\ \frac{20}{3},\ \frac{20}{5},\ \frac{20}{7},\ \frac{20}{9}, ...$

$= 20\ m,\ 6.67\ m,\ 4m,\ 2.85\,m,\ \ 2.22\ m, ...$

5. (c) The situation is shown in the fig.

Both the source (engine) and the observer (Person in the middle of the train) have the same speed, but their direction of motion is right angles to each other. The component of velocity of observer towards source is $v\cos 45°$ and that of source along the time joining the observer and source is also $v\cos 45°$. There is number relative motion between them, so there is no change in frequency heard. So frequency heard is 200 *Hz*.



6. (b) Velocity of sound increases if the temperature increases. So with $v = n\lambda$, if v increases n will increase

at $27^o C, v_1 = n\lambda$, at $31^o C$, $v_2 = (n+x)\lambda$

Now using $v \propto \sqrt{T}$ $\left(\because v = \sqrt{\frac{\gamma RT}{M}}\right)$

$$\frac{v_2}{v_1} = \sqrt{\frac{T_2}{T_1}} = \frac{n+x}{n}$$

$$\Rightarrow \frac{300+x}{300} = \sqrt{\frac{(273+31)}{(273+27)}} = \sqrt{\frac{304}{300}} = \sqrt{\frac{300+4}{300}}$$

$$\Rightarrow 1 + \frac{x}{300} = \left(1+\frac{4}{300}\right)^{1/2} = \left(1 + \frac{1}{2}\times\frac{4}{300}\right) \Rightarrow x = 2.$$

$[\because (1+x)^n = 1 + nx]$

7. (b) Let *x* be the end correction then according to question.

$$\frac{v}{4(l_1+x)} = \frac{3v}{4(l_2+x)} \Rightarrow x = 2.5\ cm = 0.025\ m.$$

8. (c) Frequency of first over tone of closed pipe = Frequency of first over tone of open pipe

$$\Rightarrow \frac{3v}{4L_1} = \frac{v}{L_2} \Rightarrow \frac{3}{4L_1}\sqrt{\frac{\gamma P}{\rho_1}} = \frac{1}{L_2}\sqrt{\frac{\gamma P}{\rho_2}} \quad \left[\because v = \sqrt{\frac{\gamma P}{\rho}}\right]$$

$$\Rightarrow L_2 = \frac{4L_1}{3}\sqrt{\frac{\rho_1}{\rho_2}} = \frac{4L}{3}\sqrt{\frac{\rho_1}{\rho_2}}$$

9. (b) For string, $\frac{\text{Mass}}{\text{Length}} = m = \frac{10^{-2}}{0.4} = 2.5\times 10^{-2} kg/m$

$\therefore$ Velocity $v = \sqrt{\frac{T}{m}} = \sqrt{\frac{16}{2.5\times 10^{-2}}} = 8m/s$

For constructive interference between successive pulses.

$$\Delta t_{\min} = \frac{2l}{v} = \frac{2(0.4)}{8} = 0.1\sec$$

(After two reflections, the wave pulse is in same phase as it was produced since in one reflection it's phase changes by π, and If at this moment next identical pulse is produced, then constructive interference will be obtained.

10. (d) Frequency of vibration in tight string

$$n = \frac{p}{2l}\sqrt{\frac{T}{m}} \Rightarrow n \propto \sqrt{T} \Rightarrow \frac{\Delta n}{n} = \frac{\Delta T}{2T} = \frac{1}{2}\times(4\%) = 2\%$$

$\Rightarrow$ Number of beats = $\Delta n = \frac{2}{100}\times n = \frac{2}{100}\times 100 = 2$

11. (b) When the source approaches the observer

Apparent frequency $n' = \frac{v}{v - v_s}.n = n\left[\frac{1}{1-\frac{v_s}{v}}\right]$

$= n\left[1 - \frac{v_s}{v}\right]^{-1} = n\left[1 + \frac{v_s}{v}\right]$

(Neglecting higher powers because $v_s << v$)

When the source recedes the observed apparent frequency $n'' = n\left[1 - \frac{v_s}{v}\right]$

Given $n' - n'' = \frac{2}{100}n,\ v = 300\ m/\sec$

$$\therefore \frac{2}{100}n = n\left[1+\frac{v_s}{v}\right] - n\left[1 - \frac{v_s}{v}\right] = n\left[2\frac{v_s}{v}\right]$$

$$\Rightarrow \frac{2}{100} = 2\frac{v_s}{v} \Rightarrow v_s = \frac{v}{100} = \frac{300}{100} = 3\ m/\sec.$$

12. (a,b,c) Number of waves striking the surface per second (or the frequency of the waves reaching surface of the moving target) $n' = \frac{(c+v)}{\lambda} = \frac{\nu(c+v)}{c}$

Now these waves are reflected by the moving target

(Which now act as a source). Therefore apparent frequency of reflected second $n'' = \left(\frac{c}{c-v}\right)n' = \nu\left(\frac{c+v}{c-v}\right)$

The wavelength of reflected wave $= \frac{c}{n''} = \frac{c(c-v)}{\nu(c+v)}$

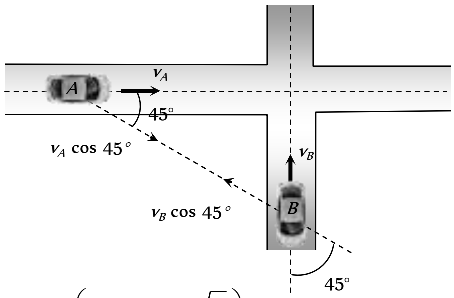
The number of beats heard by stationary listener $= n'' - \nu = \nu\left(\frac{c+v}{c-v}\right) - \nu = \frac{2\nu v}{(c-v)}$

Hence option (a) (b) and (c) are correct.

13. (b) Here $v_A = 72km/hr = 20m/\sec$

$v_B = 36km/hr = 10m/\sec$

$$n' = n\left(\frac{v + v_B \cos 45^o}{v - v_A \cos 45^o}\right)$$



$$\Rightarrow \; n' = 280\left(\frac{340 + 10/\sqrt{2}}{340 - 20/\sqrt{2}}\right) = 298\ Hz$$

14. (b) For observer note of B will not change due to zero relative motion.

Observed frequency of sound produced by A

$= 660\,\frac{(330-30)}{330} = 600\ Hz$

$\therefore$ No. of beats = 600 – 596 = 4

15. (a) $\lambda = \frac{v}{n} = \frac{340}{170} = 2m,\; n' = \frac{340}{340-17}\times 170 \Rightarrow n' = 178.9 Hz$

Now $\lambda' = \frac{v}{n'} = \frac{340}{178.9} = 1.9$

$\Rightarrow \lambda - \lambda' = 2 - 1.9 = 0.1$

16. (b) n_1 = Frequency of the police car horn observer heard by motorcyclist

n_2 = Frequency of the siren heard by motorcyclist.

v = Speed of motor cyclist

$n_1 = \frac{330 - v}{330 - 22}\times 176$; $n_2 = \frac{330 + v}{330}\times 165$

$\because\; n_1 - n_2 = 0 \Rightarrow v = 22\ m/s$.

17. (a) $n' = \frac{v + v_0}{v}.n = \frac{v + \frac{v}{5}}{v}.f = \frac{6}{5}f = 1.2f$ and since the source is stationary, so wave length remains unchanged for observer.

18. (d) Time of fall = $\sqrt{\frac{2h}{g}} = \sqrt{\frac{2\times 10}{1000}} = \frac{1}{\sqrt{50}}$

In this time number of oscillations are eight.

So time for 1 oscillation = $\frac{1}{8\sqrt{50}}$

Frequency = $8\sqrt{50}\ Hz$ = 56 Hz

19. (a) Density of mixture $= \rho_{\text{mix}} = \frac{V_{O_2}\rho_{O_2} + V_{H_2}\rho_{H_2}}{V_{O_2} + V_{H_2}}$

$= \frac{V(\rho_{O_2} + \rho_{H_2})}{2V} = \frac{\rho_{O_2} + \rho_{H_2}}{2}$ (since $V_{O_2} = V_{H_2} = V$)

$= \frac{\rho_{H_2} + 16\rho_{H_2}}{2} = 8.5\rho_{H_2} \Rightarrow v \propto \frac{1}{\sqrt{\rho}}$

$\Rightarrow \frac{V_{\text{mix}}}{V_{H_2}} = \sqrt{\frac{\rho_{H_2}}{\rho_{\text{mxn}}}} = \sqrt{\frac{\rho_{H_2}}{8.5\rho_{H_2}}} \approx \sqrt{\frac{1}{8}}$

20. (c) $y_1 = 10\sin\left(3\pi t + \frac{\pi}{3}\right)$ ...(i)

and $y_2 = 5[\sin 3\pi t + \sqrt{3}\cos 3\pi t]$

$= 5\times 2\left[\frac{1}{2}\times \sin 3\pi t + \frac{\sqrt{3}}{2}\times \cos 3\pi t\right]$

$= 10\left[\cos\frac{\pi}{3}\sin 3\pi t + \sin\frac{\pi}{3}\cos \pi t\right]$

$= 10\left[\sin\left(3\pi t + \frac{\pi}{t}\right)\right]$ ... (ii)

($\because$ sin(A + B) = sin$A$ cos$B$ + cos$A$ sin$B$)

Comparing equation (i) and (ii) we get ratio of amplitude 1 : 1.

21. (a) The given equation can be x written as

$y = \frac{A}{2}\cos\left(4\pi n t - \frac{4\pi x}{\lambda}\right) + \frac{A}{2}\quad \left(\because \cos^2\theta = \frac{1 + \cos 2\theta}{2}\right)$

Hence amplitude $= \frac{A}{2}$ and frequency $= \frac{\omega}{2\pi} = \frac{4\pi n}{2\pi} = 2n$

and wave length $= \frac{2\pi}{k} = \frac{2\pi}{4\pi/\lambda} = \frac{\lambda}{2}$.

22. (a,b,c,d) In case of sound wave, y can represent pressure and displacement, while in case of an electromagnetic wave it represents electric and magnetic fields.

(In general y is any general physical quantity which is made to oscillate at one place and these oscillations are propagated to other places also).

23. (b) In case of interference of two waves resultant intensity

$I = I_1 + I_2 + 2\sqrt{I_1 I_2}\cos\phi$

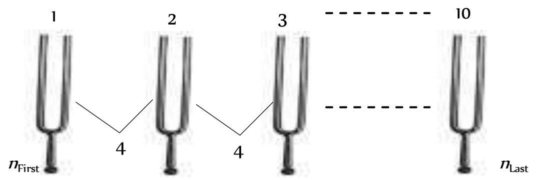
If ϕ varies randomly with time, so $(\cos\phi)_{av} = 0$

$\Rightarrow I = I_1 + I_2$

For n identical waves, $I = I_0 + I_0 + ... = nI_0$

here $I = 10I_0$.

24. (d)



Using $n_{Last} = n_{First} + (N - 1)x$

where N = Number of tuning fork in series

x = beat frequency between two successive forks

$\Rightarrow 2n = n + (10 - 1)\times 4 \Rightarrow n = 36\ Hz$

$\therefore\; n_{First} = 36\ Hz$ and $n_{Last} = 2\times n_{First} = 72\ Hz$

25. (a) Similar to previous question

$n_{last} = n_{first} + (N - 1)x$

$2n = n + (41 - 1)\times 5$

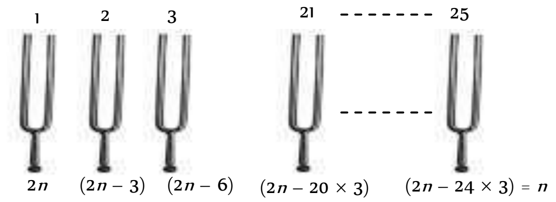
$\Rightarrow n_{first} = 200\ Hz$ and $n_{last} = 400\ Hz$

26. (a) $n \propto \sqrt{T} \Rightarrow \frac{\Delta n}{n} = \frac{1}{2}\frac{\Delta T}{T}$

Beat frequency $= \Delta n = \left(\frac{1}{2}\frac{\Delta T}{T}\right)n = \frac{1}{2} \times \frac{2}{100} \times 400 = 4$

27. (c) According to the question frequencies of first and last tuning forks are $2n$ and n respectively.

Hence frequency in given arrangement are as follows



$\Rightarrow 2n - 24 \times 3 = n \Rightarrow n = 72\ Hz$

So, frequency of 21st tuning fork

$n_{21} = (2 \times 72 - 20 \times 3) = 84 Hz$

28. (a) Using $n_{last} = n_{first} + (N-1)x$

$\Rightarrow 2n = n + (16 - 1) \times 8 \Rightarrow n = 120\ Hz$

29. (b) Using $n = \frac{1}{2l}\sqrt{\frac{T}{m}}$;

As $T_1 > T_2 \Rightarrow n_1 > n_2$ giving $n_1 - n_2 = 6$

The beat frequency of 6 will remain fixed when

(i) n_1 remains same but n_2 is increased to a new value $(n_2' - n_2 = 12)$ by increasing tension T_2.

(ii) n_2 remains same but n_1 is decreased to a new value $(n_1 - n_1' = 12)$ by decreasing tension T_1.

30. (a) According to problem

$\frac{1}{2L}\sqrt{\frac{T}{m}} = \frac{v}{4L}$ .....(i)

and $\frac{1}{2L}\sqrt{\frac{T+8}{m}} = \frac{3v}{4L}$ .....(ii)

Dividing equation (i) and (ii), $\sqrt{\frac{T}{T+8}} = \frac{1}{3} \Rightarrow T = 1N$

31. (b) In condition of resonance, frequency of a.c. will be equal to natural frequency of wire

$n = \frac{1}{2l}\sqrt{\frac{T}{m}} = \frac{1}{2 \times 1}\sqrt{\frac{10 \times 9.8}{9.8 \times 10^{-3}}} = \frac{100}{2} = 50\ Hz$

32. (b) For wire if

M = mass, ρ = density, A = Area of cross section

V = volume, l = length, Δl = change in length

Then mass per unit length $m = \frac{M}{l} = \frac{Al\rho}{l} = A\rho$

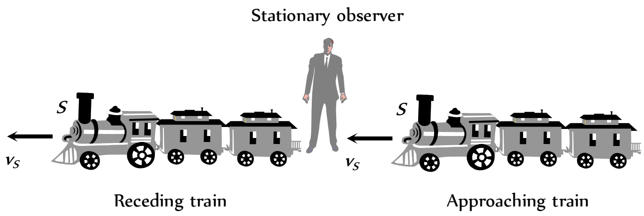
And Young's modules of elasticity $y = \frac{T/A}{\Delta l/l}$

$\Rightarrow T = \frac{Y\Delta lA}{l}$. Hence lowest frequency of vibration

$n = \frac{1}{2l}\sqrt{\frac{T}{m}} = \frac{1}{2l}\sqrt{\frac{y\left(\frac{\Delta l}{l}\right)A}{A\rho}} = \frac{1}{2l}\sqrt{\frac{y\Delta l}{l\rho}}$

$\Rightarrow n = \frac{1}{2 \times 1}\sqrt{\frac{9 \times 10^{10} \times 4.9 \times 10^{-4}}{1 \times 9 \times 10^{3}}} = 35 Hz$

33. (a)



Frequency of sound heard by the man from approaching train

$n_a = n\left(\frac{v}{v - v_s}\right) = 240\left(\frac{320}{320 - 4}\right) = 243\ Hz$

Frequency of sound heard by the man from receding train

$n_r = n\left(\frac{v}{v + v_s}\right) = 240\left(\frac{320}{320 + 4}\right) = 237 Hz$

Hence, number of beats heard by man per sec

$= n_a - n_r = 243 - 237 = 6$

Short trick : Number of beats heard per sec

$= \frac{2nvv_S}{v^2 - v_S^2} = \frac{2nvv_S}{(v - v_S)(v + v_S)} = \frac{2 \times 240 \times 320 \times 4}{(320-4)(320+4)} = 6$

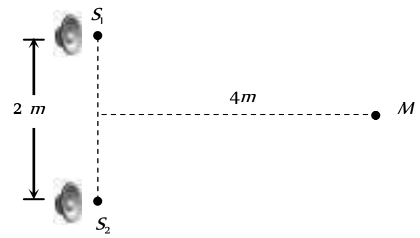
34. (c) Open pipe resonance frequency $f_1 = \frac{2v}{2L}$

Closed pipe resonance frequency $f_2 = \frac{nv}{4L}$

$f_2 = \frac{n}{4} f_1$ (where n is odd and $f_2 > f_1$) $\therefore n = 5$

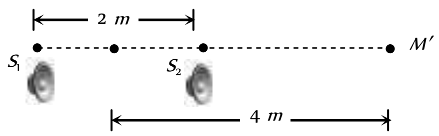
35. (b) Initially $S_1M = S_2M$

$\Rightarrow$ Path Difference $(\Delta x) = S_1M - S_2M = 0$.



Finally when the box is rotated

Path Difference $= S_1M' - S_2M' \Rightarrow \Delta x = 5 - 3 = 2m$



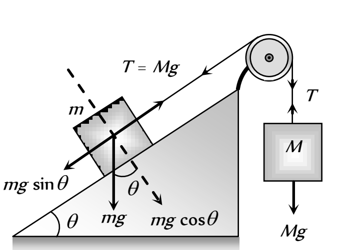
For maxima

Path Difference = (Even multiple) $\frac{\lambda}{2} \Rightarrow \Delta x = (2n)\frac{\lambda}{2}$

For 5 maximum responses

$\Rightarrow 2 = 2(5)\frac{\lambda}{2}$ $\left\{\because \Delta x = (2n)\frac{\lambda}{2}\right\}$ $\Rightarrow \lambda = \frac{2}{5} = 0.4m$.

36. (a) $v = \sqrt{\frac{T}{\mu}}$



For equilibrium $Mg = mg\sin 30 = T$

$\Rightarrow M = \frac{m}{2} \Rightarrow 100 = \sqrt{\frac{Mg}{9.8\times 10^{-3}}} = \sqrt{\frac{M(9.8)}{9.8\times 10^{-3}}}$

$\Rightarrow 100 = \sqrt{M(1000)} \Rightarrow M = 10kg$ and $m = 20kg$

37. (d) For not hearing the echo the time interval between the beats of drum must be equal to time of echo.

$\Rightarrow t_1 = \frac{2d}{v} = \frac{60}{40} = \frac{3}{2}$ ......(i)

and $t_2 = \frac{2(d-90)}{v} = \frac{60}{60} = 1$

$\Rightarrow 2d - 180 = v$ ......(ii)

Form (i), we get $2d = \frac{3}{2}v$. Substituting in (ii), we get

$\Rightarrow \frac{3}{2}v - 180 = v \Rightarrow 180 = \frac{v}{2} \Rightarrow v = 360ms^{-1}$

$\Rightarrow \frac{2(d)}{360} = \frac{3}{2} \Rightarrow d = 270m$.

38. (b) Path difference between the wave reaching at D

$\Delta x = L_2P - L_1P = \sqrt{40^2 + 9^2} - 40 = 41 - 40 = 1m$

For maximum $\Delta x = (2n)\frac{\lambda}{2}$

For first maximum $(n = 1)$ $\Rightarrow 1 = 2(1)\frac{\lambda}{2} \Rightarrow \lambda = 1m$

$\Rightarrow n = \frac{v}{\lambda} = 330Hz$.

39. (a) In a wave equation, x and t must be related in the form $(x - vt)$.

We rewrite the given equations $y = \frac{1}{1+(x-vt)^2}$

For $t = 0$, this becomes $y = \frac{1}{(1+x^2)}$, as given

For $t = 2$, this becomes $y = \frac{1}{[1+(x-2v)^2]} = \frac{1}{[1+(x-1)^2]}$

$\Rightarrow 2v = 1$ or $v = 0.5m/s$.

40. (c) $dB = 10\log_{10}\left(\frac{I}{I_0}\right)$; where $I_0 = 10^{-12}Wm^{-2}$

Since $40 = 10\log_{10}\left(\frac{I_1}{I_0}\right) \Rightarrow \frac{I_1}{I_0} = 10^4$ ....(i)

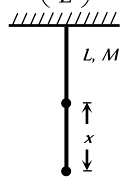
Also $20 = 10\log_{10}\left(\frac{I_2}{I_0}\right) \Rightarrow \frac{I_2}{I_0} = 10^2$ ....(ii)

$\Rightarrow \frac{I_2}{I_1} = 10^{-2} = \frac{r_1^2}{r_2^2} \Rightarrow r_2^2 = 100r_1^2 \Rightarrow r_2 = 10m$

$\{\because r_1 = 1m\}$

41. (b) Velocity $v = \sqrt{\frac{T}{m}}$; where T = weight of part of rope hanging below the point under consideration $= \left(\frac{M}{L}\right)xg$

$\Rightarrow v = \sqrt{\frac{\left(\frac{M}{L}\right)xg}{\left(\frac{M}{L}\right)}} = \sqrt{xg}$.



42. (b) When the piston is moved through a distance of 8.75cm, the path difference produced is $2\times 8.75\,cm = 17.5\,cm$. This must be equal to $\frac{\lambda}{2}$ for maximum to change to minimum. $\therefore$

$\frac{\lambda}{2} = 17.5\ cm \Rightarrow \lambda = 35cm = 0.35m$

So, $v = n\lambda \Rightarrow n = \frac{v}{\lambda} = \frac{350}{0.35} = 1000Hz$

43. (c) Frequency of vib. is stretched string $n = \frac{1}{2(\text{Length})}\sqrt{\frac{T}{m}}$

When the stone is completely immersed in water, length changes but frequency doesn't ($\because$ unison reestablished)

Hence length $\propto \sqrt{T} \Rightarrow \frac{L}{l} = \sqrt{\frac{T_{air}}{T_{water}}} = \sqrt{\frac{V\rho g}{V(\rho-1)g}}$

(Density of stone = ρ and density of water =1)

$\Rightarrow \frac{L}{l} = \sqrt{\frac{\rho}{\rho-1}} \Rightarrow \rho = \frac{L^2}{L^2 - l^2}$

44. (a,c) $y = \cos kx \sin\omega t$ and $y = \cos(kx + \omega t)$ represent wave motion, because they satisfies the wave equation $\frac{\partial^2}{\partial t^2} = v^2\frac{\partial^2 y}{\partial x^2}$.

45. (c) The wave 1 and 3 reach out of phase. Hence resultant phase difference between them is π.

$\therefore$ Resultant amplitude of 1 and 3 = $10 - 7 = 3$ μm

This wave has phase difference of $\frac{\pi}{2}$ with 4 μm

$\therefore$ Resultant amplitude = $\sqrt{3^2 + 4^2} = 5$ μm

46. (b) Let $n-1$ (= 400), n (= 401) and $n+1$ (= 402) be the frequencies of the three waves. If a be the amplitude of each then

$y = a\sin 2\pi(n-1)t,\ \ y = a\sin 2\pi nt$ and

$y_3 = a\sin 2\pi(n+1)t$

Resultant displacement due to all three waves is

$$y = y_1 + y_2 + y_3$$

$$= a\sin 2\pi nt + a[\sin 2\pi(n-1)t + \sin 2\pi(n+1)t]$$

$$= a\sin 2\pi nt + a[2\sin 2\pi nt\cos 2\pi t]$$

$$\left[\text{Using} \sin C + \sin D = 2\sin\frac{C+C}{2}\cos\frac{C-D}{2}\right]$$

$$\Rightarrow y = a(1+\cos 2\pi t)\sin 2\pi nt$$

This is the resultant wave having amplitude $=(1+\cos 2\pi t)$

For maximum amplitude $\cos 2\pi t = 1 \Rightarrow 2\pi t = 2m\pi$ where m = 0, 1, 2, 3, ...

$\Rightarrow t$ = 0, 1, 2, 3 ...

Hence time interval between two successive maximum is 1 *sec*. So beat frequency = 1

Also for minimum amplitude ($2\cos 2\pi t$) = 0

$$\Rightarrow \cos 2\pi t = -\frac{1}{2}$$

$$\Rightarrow 2\pi t = 2m\pi + \frac{2\pi}{3} \Rightarrow t = +\frac{1}{3}$$

$$\Rightarrow t = \frac{1}{3}, \frac{4}{3}, \frac{7}{3}, \frac{10}{3}, ...\quad \text{(for } m = 0, 1, 2, ..)$$

Hence time interval between two successive minima is 1 *sec* so, number of beats per second = 1

Note : PET/PMT Aspirants can remember result only.

47. (d) Because the tuning fork is in resonance with air column in the pipe closed at one end, the frequency is $n = \frac{(2N-1)v}{4l}$ where

N = 1, 2, 3 .... corresponds to different mode of vibration

putting n = 340*Hz*, v = 340 *m/s*, the length of air column in the pipe can be

$$l = \frac{(2N-1)340}{4\times 340} = \frac{(2N-1)}{4}m = \frac{(2N-1)\times 100}{4}cm$$

For N = 1, 2, 3, ... we get l = 25 *cm*, 75 *cm*, 125 *cm* ...

As the tube is only 120 *cm* long, length of air column after water is poured in it may be 25 *cm* or 75 *cm* only, 125 *cm* is not possible, the corresponding length of water column in the tube will be (120 – 25) *cm* = 95 *cm* or (120 – 75) *cm* = 45 *cm*.

Thus minimum length of water column is 45 *cm*.

48. (c) Critical hearing frequency for a person is 20,000*Hz*.

If a closed pipe vibration in N^{th} mode then frequency of vibration $n = \frac{(2N-1)v}{4l} = (2N-1)n_1$

(where n_1 = fundamental frequency of vibration)

Hence 20,000 $=(2N-1)\times 1500 \Rightarrow N = 7.1 \approx 7$

Also, in closed pipe

Number of over tones = (No. of mode of vibration) –1

= 7 – 1 = 6.

49. (c) Frequency of vibration of string is given by

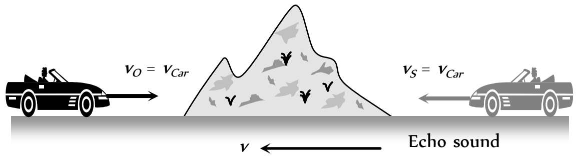
$$n = \frac{p}{2l}\sqrt{\frac{T}{m}} \Rightarrow p\sqrt{T} = \text{constant} \Rightarrow \frac{p_1}{p_2} = \sqrt{\frac{T_2}{T_1}}$$

Hence $\frac{4}{6} = \sqrt{\frac{T_2}{(50+15)gm\text{-}force}} \Rightarrow T_2 = 28.8\ gm\text{-}f$

Hence weight removed from the pan

$= T_1 - T_2 = 65 - 28.8 = 3.62$ *gm-force* = 0.036 *kg-f*.

50. (c) Frequency of reflected sound heard by driver $n' = n\left(\frac{v+v_O}{v-v_S}\right)$



It is given that $n' = 2n$

Hence, $2n = n\left(\frac{v+v_{car}}{v-v_{car}}\right) \Rightarrow v_{car} = v/3.$

51. (c) Suppose d = distance of epicenter of Earth quake from point of observation

v_s = Speed of *S*-wave and v_p = Speed of *P*-wave then $d = v_P t_P = v_S t_S$ or $8\,t_P = 4.5\,t_S$

$$\Rightarrow t_P = \frac{45}{8}t_S,\ \text{given that } t_S - t_P = 240$$

$$\Rightarrow t_S - \frac{4.5}{8}t_S = 240 \Rightarrow t_S = \frac{240\times 8}{3.5} = 548.5\,s$$

$$\therefore d = v_S t_S = 4.5\times 548.5 = 2468.6 \approx 2500\,km$$

Graphical Questions

1. (c) Speed = $n\lambda = n(4ab) = 4n \times ab$ $\left(\text{As}\, ab = \frac{\lambda}{4}\right)$

Path difference between b and e is $\frac{3\lambda}{4}$

So the phase difference = $\frac{2\pi}{\lambda}$. Path difference

$= \frac{2\pi}{\lambda} \cdot \frac{3\lambda}{4} = \frac{3\pi}{2}$

2. (b) After 2 sec the pulses will overlap completely. The string becomes straight and therefore does not have any potential energy and its entire energy must be kinetic.

3. (a) When the train is approaching the stationary observer frequency heard by the observer $n' = \frac{v + v_0}{v} n$

when the train is moving away from the observer then frequency heard by the observer $n'' = \frac{v - v_0}{v} n$

it is clear that n' and n'' are constant and independent of time. Also and $n' > n''$.

4. (b) Equation of *A, B, C* and *D* are

$y_A = A \sin \omega t$, $y_B = A \sin(\omega t + \pi/2)$

$y_C = A \sin(\omega t - \pi/2)$, $y_D = A \sin(\omega t - \pi)$

It is clear that wave C lags behind by a phase angle of $\pi/2$ and the wave B is ahead by a phase angle at $\pi/2$.

5. (d) Points B and F are in same phase ass they are λ distance apart.

6. (c) The particle velocity is maximum at B and is given by $\frac{dy}{dt} = (v_p)_{max} = \omega A$

Also wave velocity is $\frac{dx}{dt} = v = \frac{\omega}{k}$

So slope $\frac{dy}{dx} = \frac{(v_p)_{max}}{v} = kA$

7. (d) When pulse is reflected from a rigid support, the pulse is inverted both lengthwise and sidewise

8. (d) Given equation $y = y_0 \sin(\omega t - \phi)$

at $t = 0$, $y = -y_0 \sin\phi$

this is the case with curve marked *D*.

9. (c) We know frequency $n = \frac{p}{2l}\sqrt{\frac{T}{\pi r^2 \rho}} \Rightarrow n \propto \frac{1}{\sqrt{\rho}}$

i.e., graph between n and $\sqrt{\rho}$ will be hyperbola.

10. (c) Energy density (E) $= \frac{I}{v} = 2\pi^2 \rho n^2 A^2$

$v_{max} = \omega A = 2\pi n A \Rightarrow E \propto (v_{max})^2$

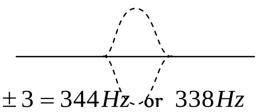
i.e., graph between E and v_{max} will be a parabola symmetrical about E axis.

11. (c) Here $A = 0.05 m$, $\frac{5\lambda}{2} = 0.025 \Rightarrow \lambda = 0.1 m$

Now standard equation of wave

$y = A \sin \frac{2\pi}{\lambda}(vt - x) \Rightarrow y = 0.05 \sin 2\pi(33t - 10x)$

12. (c) After two seconds each wave travel a distance of 2.5 × 2 = 5 *cm i.e.* the two pulses will meet in mutually opposite phase and hence the amplitude of resultant will be zero.



13. (c) $n_Q = 341 \pm 3 = 344 Hz$ or $338 Hz$

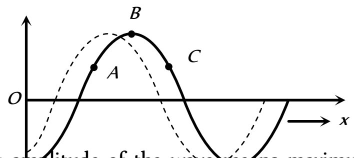
on waxing *Q*, the number of beats decreases hence $n_Q = 344 Hz$

14. (b) For observer approaching a stationary source

$n' = \frac{v + v_0}{v} . n$ and given $v_0 = at \Rightarrow n' = \left(\frac{an}{v}\right) t + n$

this is the equation of straight line with positive intercept n and positive slope $\left(\frac{n}{v}\right)$.

15. (b,d) Since A is moving upwards, therefore, after an elemental time interval the wave will be as shown dotted in following fig. It means, the wave is travelling leftward. Therefore, (a) is wrong.



Displacement amplitude of the wave means maximum possible displacement of medium particles due to propagation of the wave, which is equal to the displacement at B at the instant shown in fig. Hence (b) is correct.

From figure, it is clear that C is moving downwards at this instant. Hence (c) is wrong.

The phase difference between two points will be equal to $\frac{\pi}{2}$ if distance between them is equal to $\frac{\lambda}{4}$. Between A and C, the distance is less than $\frac{\lambda}{2}$. It may be equal to $\frac{\lambda}{4}$. Hence, phase difference between these two points may be equal to $\frac{\pi}{2}$.

16. (d) Intensity $\propto a^2\omega^2$

here $\frac{a_A}{a_B} = \frac{2}{1}$ and $\frac{\omega_A}{\omega_B} = \frac{1}{2} \Rightarrow \frac{I_A}{I_B} = \left(\frac{2}{1}\right)^2 \times \left(\frac{1}{2}\right)^2 = \frac{1}{1}$

17. (b) At $t = 0$ and $x = \frac{\pi}{2k}$. The displacement

$y = a_0 \sin\left(\omega x_0 - k \times \frac{\pi}{2x}\right) = -a_0 \sin\frac{\pi}{2} = -a_0$

from graph. Point of maximum displacement (a) in negative direction is *Q*.

18. (d) Particle velocity $(v_p) = -v \times$ Slope of the graph at that point

At point 1 : Slope of the curve is positive, hence particle velocity is negative or downward (↓)

At point 2 : Slope negative, hence particle velocity is positive or upwards (↑)

At point 3 : Again slope of the curve is positive, hence particle velocity is negative or downward (↓)

Assertion and Reason

1. (a) Sound waves require material medium to travel. As there is no atmosphere (vacuum) on the surface of moon, therefore the sound waves cannot reach from one person to another.

2. (b) Transverse waves travel in the form of crests and troughs involving change in shape of the medium. As liquids and gases do not possess the elasticity of shape, therefore, transverse waves cannot be produced in liquid and gases. Also light wave is one example of transverse wave.

3. (b) Sound waves cannot propagate through vacuum because sound waves are mechanical waves. Light waves can propagate through vacuum because light waves are electromagnetic waves. Since sound waves are longitudinal waves, the particles moves in the direction of propagation, therefore these waves cannot be polarised.

4. (c) Velocity of sound in gas medium is $v = \sqrt{\frac{K}{\rho}} = \sqrt{\frac{\gamma p}{\rho}}$

γ is ratio of its principal heat capacities (C_P / C_v). For moist air ρ is less than that for dry air and γ is slightly greater.

∴ velocity of sound increases with increase in humidity.

5. (c) Ocean waves are transverse waves travelling in concentric circles of ever increasing radius. When they hit the shore, their radius of curvature is so large that they can be treated as plane waves. Hence they hit the shore nearly normal to the shore.

6. (a) A compression is a region of medium in which particles come closer *i.e.*, distance between the particles becomes less than the normal distance between them. Thus there is a temporary decrease in volume and a consequent increase in density of medium. Similarly in rarefaction, particle get farther apart and a consequent decrease in density.

7. (e) Since transverse wave can propagate through medium which posses elasticity of shape. Air posses only volume elasticity therefore transverse wave cannot propagate through air.

8. (c) The velocity of sound in a gas is directly proportional to the square root of its absolute temperature (as $v = \sqrt{\frac{\gamma RT}{M}}$). Since temperature of a hot day is more than cold winter day, therefore sound would travel faster on a hot summer day than on a cold winter day.

9. (c) According to Laplace, the changes in pressure and volume of a gas, when sound waves propagated through it, are not isothermal, but adiabatic. A gas is a bad conductor of heat. It does not allow the free exchange of heat between compressed layer, rarefied layer and surrounding.

10. (e) The velocity of every oscillating particle of the medium is different of its different positions in one oscillation but the velocity of wave motion is always constant *i.e.*, particle velocity vary with respect to time, while the wave velocity is independent of time.

Also for wave propagation medium must have the properties of elasticity and inertia.

11. (d) A bucket can be treated as a pipe closed at one end. The frequency of the note produced $= \frac{v}{4L}$, here L equal to depth of water level from the open end. As the bucket is filled with water L decreases, hence frequency increases. Therefore, frequency or pitch of sound produced goes on increasing.

Also, the frequency of woman voice is usually higher than that of man.

12. (b) A tuning fork is made of a material for which elasticity does not change. Since the alloy of nickel, steel and chromium (elinvar) has constant elasticity, therefore it is used for the preparation of tuning fork.

13. (e) Speed of sound in cases in independent of pressure because $v = \sqrt{\frac{\gamma P}{\rho}}$. At constant temperature, if P changes then ρ also changes in such a way that the ratio $\frac{P}{\rho}$ remains constant hence there is no effect of the pressure change on the speed of sound.

14. (a) For the propagation of transverse waves, medium must have the property of rigidity. Because gases have no rigidity, (they do not posses shear elasticity), hence transverse waves cannot be produced is gases. On the other hand, the solids possess both volume and shear elasticity and likewise both the longitudinal and transverse waves can be transmitted through them.

15. (c) Velocity of sound in a gas $v = \sqrt{\frac{\gamma P}{\rho}}$. For monoatomic gas $\gamma = 1.67$; for diatomic $\gamma = 1.40$. Therefore v is larger in case of monoatomic gas compared to its values in diatomic gas.

16. (a) The velocity of sound in solid is given by, $v = \sqrt{E/\rho}$.

Though ρ is large for solids, but their coefficient of elasticity E is much larger (compared to that of liquids and gases). That is why v is maximum in case of solid.

17. (d) When moisture is present in air, the density of air decreases. It is because the density of water vapours is less than that of dry air. The velocity of sound is inversely proportional to the square root of density, hence sound travel faster in moist air than in the dry air. Therefore, on a rainy day sound travels faster than on a dry day.

18. (b) According to the property of persistence of hearing, the impression of a sound heard persists on our mind for $\frac{1}{10}$ *sec*.

Therefore, number of beats per *sec* should be less than 10. Hence difference in frequencies of two sources must be less than 10.

19. (b) Sound produced by an open organ pipe is richer because it contains all harmonics and frequency of fundamental note in an open organ pipe is twice the fundamental frequency in a closed organ pipe of same length.

Reason is also correct, but it is not explaining the assertion.

20. (a) Since the initial phase difference between the two waves coming from different violins changes, therefore, the waves produced by two different violins does not interfere because two waves interfere only when the phase difference between them remain constant throughout.

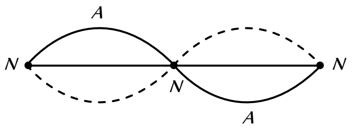
21. (d) As emission of light from atom is a random and rapid phenomenon. The phase at a point due to two independent light source will change rapidly and randomly. Therefore,

instead of beats, we shall get uniform intensity. However if light sources are LASER beams of nearly equal frequencies, it may possible to observe the phenomenon of beats in light.

22. (c) The person will hear the loud sound at nodes than at antinodes. We know that at anti-nodes the displacement is maximum and pressure change is minimum while at nodes the displacement is zero and pressure change is maximum. The sound is heard due to variation of pressure.

Also in stationary waves particles in two different segment vibrates in opposite phase.

23. (a) Stationary wave



A node is a place of zero amplitude and an antinode is a place of maximum amplitude.

24. (c) The principle of superposition does not state that the frequencies of the oscillation should be nearly equal. For beats to be heard the condition is that difference in frequencies of the two oscillations should not be more than 10 times per seconds for a normal human ear to recognise it. Hence we cannot hear beats in the case of two tuning forks vibrating at frequencies 256 *Hz* and 512 *Hz* respectively.

25. (a) The fundamental frequency of an open organ pipe is $n = \frac{v}{2l}$.

As temperature increases, both v and l increase but v increases more rapidly than l. Hence, the fundamental frequency increases as the temperature increases.

26. (b) Since, velocity of sound,

$$v = \sqrt{\frac{E}{\rho}}$$

As, the elasticity of solid is large than that of gases. Hence, it is obvious that velocity of sound is greater in solids than in gases.

27. (d)

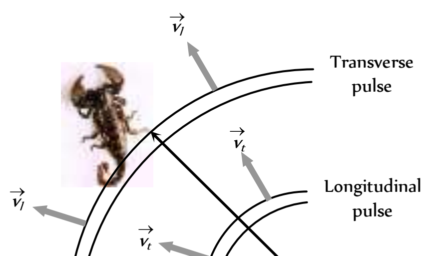
28. (b) Velocity of wave $= \frac{\text{Distance travelled by wave } (\lambda)}{\text{Time period } (T)}$

Wavelength is also defined as the distance between two nearest points in phase.

29. (c) Speed of light is greater than that of sound, hence flash of lightening is seen before the sound of thunder.

30. (a) A beetle motion sends fast longitudinal pulses and slower transverse waves along the sends surface. The sand scorpion first intercept the longitudinal pulses and learns the direction of the beetle; it is in the direction of which ever leg is disturbed earliest by the pulses. The scorpion then senses the time interval (Δt) between that first interception and the interception of slower transverse waves and uses it to determine the distance of the beetle. The distance is given by

$$\Delta t = \frac{d}{v_t} - \frac{d}{v_l}$$

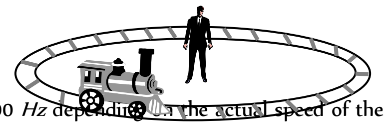


31. (e)

Waves and Sound

SET Self Evaluation Test -17

1. An engine is moving on a circular track with a constant speed. It is blowing a whistle of frequency 500 *Hz*. The frequency received by an observer standing stationary at the centre of the track is



(a) 500 *Hz*
(b) More than 500 *Hz*
(c) Less than 500 *Hz*
(d) More or less than 500 *Hz* depending on the actual speed of the engine

2. In a resonance tube, the first resonance is obtained when the level of water in the tube is at 16*cm* from the open end. Neglecting end correction, the next resonance will be obtained when the level of water from the open end is

(a) 24*cm* (b) 32*cm*
(c) 48*cm* (d) 64*cm*

3. To raise the pitch of a stringed musical instrument the player can

(a) Loosen the string (b) Tighten the string
(c) Shorten the string (d) Both (b) and (c)

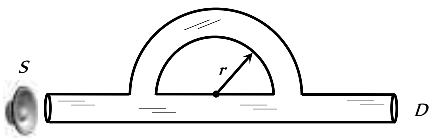
4. A wave travelling along positive *x*-axis is given by $y = A\sin(\omega t - kx)$. If it is reflected from rigid boundary such that 80% amplitude is reflected, then equation of reflected wave is

(a) $y = A\sin(\omega t + kx)$ (b) $y = -0.8A\sin(\omega t + kx)$
(c) $y = 0.8A\sin(\omega t + kx)$ (d) $y = A\sin(\omega t + 0.8\,kx)$

5. The frequency of the first harmonic of a string stretched between two points is 100 *Hz*. The frequency of the third overtone is

(a) 200 *Hz* (b) 300 *Hz*
(c) 400 *Hz* (d) 600 *Hz*

6. A sound wave of wavelength 32 *cm* enters the tube at *S* as shown in the figure. Then the smallest radius *r* so that a minimum of sound is heard at detector *D* is



(a) 7*cm* (b) [illegible]
(c) 21*cm* (d) 28 *cm*

7. A stretched wire of length 110 *cm* is divided into three segments whose frequencies are in ratio 1 : 2 : 3. Their lengths must be

(a) 20 *cm* ; 30 *cm* ; 60 *cm*
(b) 60 *cm* ; 30 *cm* ; 20 *cm*
(c) 60 *cm* ; 20 *cm* ; 30 *cm*
(d) 30 *cm* ; 60 *cm* ; 20 *cm*

8. Unlike a laboratory sonometer, a stringed instrument is seldom plucked in the middle. Supposing a sitar string is plucked at about $\frac{1}{4}$ *th* of its length from the end. The most prominent harmonic would be

(a) Eighth (b) Fourth
(c) Third (d) Second

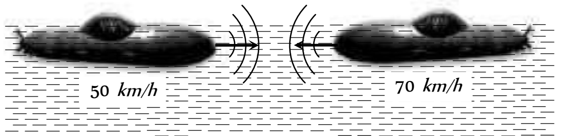
9. If n_1, n_2, n_3......... are the frequencies of segments of a stretched string, the frequency *n* of the string is given by

(a) $n = n_1 + n_2 + n_3 + ...$ (b) $n = \sqrt{n_1 \times n_2 \times n_3 \times ....}$
(c) $\frac{1}{n} = \frac{1}{n_1} + \frac{1}{n_2} + \frac{1}{n_3} + ...$ (d) None of these

10. The equation of stationary wave along a stretched string is given by $y = 5\sin\frac{\pi x}{3}\cos 40\pi t$ where *x* and *y* are in centimetre and *t* in second. The separation between two adjacent nodes is :

(a) 6 *cm* (b) 4 *cm*
(c) 3 *cm* (d) 1.5 *cm*

11. An Indian submarine and an enemy submarine move towards each other during maneuvers in motionless water in the Indian ocean. The Indian submarine moves at 50 *km/h*, and the enemy submarine at 70 *km/h*. The Indian sub sends out a sonar signal (sound wave in water) at 1000 *Hz*. Sonar waves travel at 5500 *km/h*. What is the frequency detected by the Indian submarine



(a) 1.02 *kHz* (b) 2 *kHz*
(c) 2.5 *kHz* (d) 4.7 *kHz*

12. Two trains, one coming towards and another going away from an observer both at 4 *m/s* produce whistle simultaneously of frequency 300 *Hz*. Find the number of beats produced

(a) 5 (b) 6
(c) 7 (d) 12

13. A source of sound emits $200\pi W$ power which is uniformly distributed over a sphere of 10 *m* radius. What is the loudness of sound on the surface of a sphere

(a) 200 *dB* (b) 200 π *dB*
(c) 120 *dB* (d) 120 π *dB*

14. When a wave travels in a medium, the particle displacement is given by $y(x, t) = 0.03\sin\pi(2t - 0.01x)$ where *y* and *x* are meters and *t* in seconds. The phase difference, at a given instant of time between two particle 25 *m*. apart in the medium, is

(a) $\frac{\pi}{8}$ (b) $\frac{\pi}{4}$

(c) $\frac{\pi}{2}$ (d) π

15. A sine wave has an amplitude A and wavelength λ. Let V be the wave velocity and v be the maximum velocity of a particle in the medium. Then **[KCET 2001]**

(a) $V = v \text{ if } \lambda = \frac{3A}{2\pi}$ (b) $V = v \text{ if } A = 2\pi\lambda$

(c) $V = v \text{ if } A = \frac{\lambda}{2\pi}$ (d) V can not be equal to v

16. A pipe open at both ends produces a note of frequency f_1. When the pipe is kept with $\frac{3}{4}$ *th* of its length it water, it produced a note of frequency f_2. The ratio $\frac{f_1}{f_2}$ is

[KCET 1998]

(a) $\frac{3}{4}$ (b) $\frac{4}{3}$

(c) $\frac{1}{2}$ (d) 2

17. A man fires a bullet standing between two cliffs. First echo is heard after 3 seconds and second echo is heard after 5 seconds. If the velocity of sound is 330 *m/s*, then the distance between the cliffs is

(a) 1650 *m* (b) 1320 *m*

(c) 990 *m* (d) 660 *m*

18. The equation for spherical progressive wave is (where r is the distance from the source) **[CPMT 2002]**

(a) $y = a\sin(\omega t - kx)$ (b) $y = \frac{a}{\sqrt{r}}\sin(\omega t - kx)$

(c) $y = \frac{a}{2}\sin(\omega t - kx)$ (d) $y = \frac{a}{r}\sin(\omega t - kx)$

19. A tuning fork A produces 4 *beats/sec* with another tuning fork B of frequency 320 *Hz*. On filing the fork A, 4 *beats/sec* are again heard. The frequency of fork A, after filing is

[KCET (Engg./Med.) 1999]

(a) 324 *Hz* (b) 320 *Hz*

(c) 316 *Hz* (d) 314 *Hz*

20. The number of beats produced per second by two vibrations: $x_1 = x_0 \sin 646\pi t$ and $x_2 = x_0 \sin 652\pi t$ is

[UPSEAT 2005]

(a) 2 (b) 3

(c) 4 (d) 6

21. 50 tuning forks are arranged in increasing order of their frequencies such that each gives 4 beats/sec with its previous tuning fork. If the frequency of the last fork is octave of the first, then the frequency of the first tuning fork is **[DPMT 2005]**

(a) 200 *Hz* (b) 204 *Hz*

(c) 196 *Hz* (d) None of these

22. The fundamental frequency of a closed pipe is 220 *Hz*. If $\frac{1}{4}$ of the pipe is filled with water, the frequency of the first overtone of the pipe now is

[EAMCET (Med.) 2000]

(a) 220 *Hz* (b) 440 *Hz*

(c) 880 *Hz* (d) 1760 *Hz*

23. A glass tube 1.5 *m* long and open at both ends, is immersed vertically in a water tank completely. A tuning fork of 660 *Hz* is vibrated and kept at the upper end of the tube and the tube is gradually raised out of water. The total number of resonances heard before the tube comes out of water, taking velocity of sound air 330 *m/sec* is

[EAMCET (Engg.) 1999]

(a) 12 **[AFMC 2000]** (b) 6

(c) 8 (d) 4

24. In the 5^{th} overtone of an open organ pipe, these are (N-stands for nodes and A-for antinodes)

(a) 2N, 3A (b) 3N, 4A

(c) 4N, 5A (d) 5N, 4A

25. An engine approaches a hill with a constant speed. When it is at a distance of 0.9 *km* it blows a whistle, whose echo is heard by the driver after 5 *sec*. If speed of sound in air is 330 *m/s*, the speed of engine is

(a) 10 *m/s* (b) 20 *m/s*

(c) 30 *m/s* (d) 40 *m/s*

Answers and Solutions

(SET -17)

1. (a) Since there is no relative motion between the source and listener, So apparent frequency equals original frequency.

2. (c) Next resonance length after the fundamental is $3l_1 = 3 \times 16 = 48 cm$.

3. (d) Higher pitch means higher frequency

Frequency of a stringed system is given by

$$n = \frac{p}{2l}\sqrt{\frac{T}{m}} \Rightarrow n \propto \frac{\sqrt{T}}{l}$$

Hence, to get higher frequency (higher pitch) tension should be increase and length should be shorten.

4. (b) On getting reflected from a rigid boundary the wave suffers

Hence if $y_{incident} = A\sin(\omega t - kx)$

then $y_{reflected} = (0.8A)\ \sin\{\omega t - k(-x) + \pi\}$

$= -0.8A\sin(\omega t + kx)$ an additional phase change of π.

5. (c) Third overtone is the fourth harmonic i.e., $n_4 = 4n_1 = 4 \times 100 = 400$ Hz

6. (b) Path difference $(\pi r - 2r) = \frac{\lambda}{2} = \frac{32}{2} = 16$,

$$r = \frac{16}{\pi - 2} = 14 cm.$$

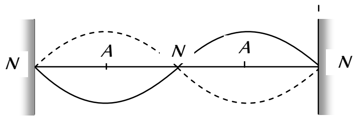
7. (b) $l_1 + l_2 + l_3 = 110\ cm$ and $n_1 l_1 = n_2 l_2 = n_3 l_3$

$n_1 : n_2 : n_3 :: 1 : 2 : 3$

$\because \frac{n_1}{n_2} = \frac{1}{2} = \frac{l_2}{l_1} \Rightarrow l_2 = \frac{l_1}{2}$ and $\frac{n_1}{n_3} = \frac{1}{3} = \frac{l_3}{l_1} \Rightarrow l_3 = \frac{l_1}{3}$

$\therefore l_1 + \frac{l_1}{2} + \frac{l_1}{3} = 110$ so $l_1 = 60cm, l_2 = 30cm, l_3 = 20cm$.

8. (d) When plucked at one fourth it gives two loops, and hence 2nd harmonic is produced.



9. (c) For a vibrating string

$n_1 l_1 = n_2 l_2 = n_3 l_3 ..... =$ constant = k (say) = nl

Also $l_1 + l_2 + l_3 + l_4 + ... = 1$

$$\frac{k}{n_1} + \frac{k}{n_2} + \frac{k}{n_3} + \frac{k}{n_4} + ... = \frac{k}{n} \Rightarrow \frac{1}{n} = \frac{1}{n_1} + \frac{1}{n_2} + \frac{1}{n_3} + ...$$

10. (c) Given $y = 5\sin\frac{\pi x}{3}\cos 40\pi t$

Comparing with $y = 2a\cos\frac{2\pi vt}{\lambda}\sin\frac{2\pi x}{\lambda} \Rightarrow \lambda = 6\ cm.$

$\therefore$ The separation between adjacent nodes $= \frac{\lambda}{2} = 3\ cm.$

11. (a) Frequency detected by Indian submarine

$$n' = n\left[\frac{v + v_{sub}}{v - v_{sub}}\right] = 1000\left[\frac{5500 + 50}{5500 - 50}\right] \approx 1.02 kHz.$$

12. (c) $\Delta n = \left[\frac{v}{v - u} - \frac{v}{v + u}\right] n = \frac{2uv}{v^2 - u^2} n$

$$= \frac{2 \times 4 \times 332}{(332)^2 - (4)^2} \times 300 \approx 7$$

13. (c) Intensity $= \frac{\text{power}}{\text{area}} = \frac{200\pi}{2\pi \times 10^{-2}} = 1\ Watt/m$

Now $L = 10\log_{10}\frac{I}{I_0} = 10\log_{10}\left(\frac{1}{10^{-12}}\right)$

$= 10\log_{10} 10^{12} = 120\ dB$

14. (b) $y(x, t) = 0.03\sin\pi(2t - 0.01x) = 0.03\sin(2\pi t - 0.01\pi x)$

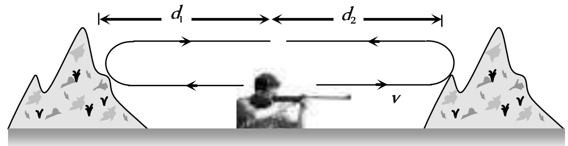
$$k = 0.01\pi = \frac{2\pi}{\lambda} \Rightarrow \Delta\phi = \frac{2\pi}{\lambda}\Delta x = 0.01\pi \times 25 = \frac{\pi}{4}$$

15. (c) Let wave velocity (V) = maximum particle velocity $\Rightarrow$ $n\lambda = \omega A = 2\pi\ nA \Rightarrow A = \frac{\lambda}{2\pi}$

16. c) For open pipe $f_1 = \frac{v}{2l}$ and for closed pipe

$$f_2 = \frac{v}{4 \times \left(\frac{l}{4}\right)} = \frac{v}{l} = 2f_1 \Rightarrow \frac{f_1}{f_2} = \frac{1}{2}$$

17. (b)



$$2(d_1 + d_2) = v(t_1 + t_2) \Rightarrow d_1 + d_2 = \frac{330 \times (3 + 5)}{2} = 1320\ m$$

18. (d) For spherical wave intensity $(I) \propto \frac{1}{(\text{Distancer})^2}$

also $I \propto a^2 \Rightarrow a \propto \frac{1}{r}$. Hence equation of a cylindrical wave is $y = \frac{1}{r}\sin(\omega t - kx)$

19. (a) n_A = ?, n_B = Known frequency = 320 *Hz*

x = 4 *bps*, which remains same after filing.

Unknown fork *A* is filed so $n_A\uparrow$

Hence $n_A\uparrow - n_B = x$ ⟶ Wrong

$n_B - n_A\uparrow = x$ ⟶ Correct

$\Rightarrow$ $n_A = n_B - x = 320 - 4 = 316$ *Hz.*

This is the frequency before filing.

But in question frequency after filing is asked which must be greater than 316 *Hz*, such that it produces 4 *beats per sec.* Hence it is 324 *Hz*.

20. (b) From the given equation $\omega_1 = 2\pi n_1 = 646\pi \Rightarrow n_1 = 323$

and $\omega_2 = 2\pi n_2 = 652\pi \Rightarrow n_2 = 326$

Hence, beat frequency $= 326 - 323 = 3$

21. (c) Frequencies of tuning forks is given by

$$n_{\text{last}} = n_{\text{first}} + (N - 1)x$$

$$2n = n + (50 - 1) \times 4 \Rightarrow n = 196 Hz.$$

***

22. (c) Fundamental frequency of closed pipe

$$n = \frac{v}{4l} = 220\ Hz \Rightarrow v = 220 \times 4l$$

If $\frac{1}{4}$ of the pipe is filled with water then remaining length of air column is $\frac{3l}{4}$

Now fundamental frequency = $\frac{v}{4\left(\frac{3l}{4}\right)} = \frac{v}{3l}$ and

First overtone = $3\times$ fundamental frequency

$$= \frac{3v}{3l} = \frac{v}{l} = \frac{220 \times 4l}{l} = 880\ Hz.$$

23. (b) Suppose N resonance occurred before tube coming out.

Hence by using $l = \frac{(2N-1)v}{4n}$

$$\Rightarrow 1.5 = \frac{(2N-1)\times 330}{4 \times 660} \Rightarrow N \approx 6.$$

24. (c) In open organ pipe 5^{th} overtone corresponds to 4^{th} harmonic mode.

Also in open pipe, Number of nodes = Order of mode of vibration and number of antinodes = (Number of nodes + 1). Here number of nodes = 4, Number of antinodes = 4 + 1 =5.

25. (c) If the speed of engine is v, the distance traveled by engine in 5 *sec* will be $5v$, and hence the distance traveled by sound in reaching the hill and coming back to the moving driver = 900 + (900 – $5v$) = 1800 – $5v$

So the time interval between original sound and it's echo $t = \frac{(1800 - 5v)}{330} = 5 \Rightarrow v = 30\ m/s.$

Chapter

19

Current Electricity

Electric Current

(1) The time rate of flow of charge through any cross-section is called current. $i = \lim_{\Delta t \to 0} \frac{\Delta Q}{\Delta t} = \frac{dQ}{dt}$. If flow is uniform then $i = \frac{Q}{t}$. Current is a scalar quantity. It's S.I. unit is *ampere* (*A*) and C.G.S. unit is *emu* and is called *biot* (*Bi*), or *ab ampere*. 1*A* = (1/10) *Bi* (*ab amp.*)

(2) *Ampere* of current means the flow of 6.25 × 10^{18} *electrons/sec* through any cross-section of the conductor.

(3) The conventional direction of current is taken to be the direction of flow of positive charge, *i.e.* field and is opposite to th gative cha

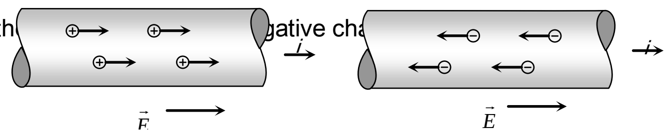


Fig. 19.1

(4) The net charge in a current carrying conductor is zero.

(5) For a given conductor current does not change with change in cross-sectional area. In the following figure $i_1 = i_2 = i_3$

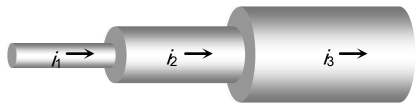

Fig. 19.2

(6) **Current due to translatory motion of charge :** If n particle each having a charge q, pass through a given area in time t then $\boldsymbol{i = \frac{nq}{t}}$

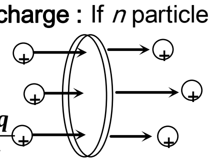

Fig. 19.3

If n particles each having a charge q pass per second per unit area, the current associated with cross-sectional area A is $\boldsymbol{i = nqA}$

If there are n particle per unit volume each having a charge q and moving with velocity v, the current thorough, cross section A is $\boldsymbol{i = nqvA}$

Table : 19.1 Types of current

Alternating current (ac)	Direct current (dc)
(i) 	(i) (Pulsating dc)  (Constant dc) 
Magnitude and direction both varies with time ac → Rectifier → dc	dc → Inverter → ac
(ii) Shows heating effect only	(ii) Shows heating effect, chemical effect and magnetic effect of current
(iii) It's symbol is —(~)—	(iii) It's symbol is $+\|\|-$

(7) **Current due to rotatory motion of charge** : If a point charge *q* is moving in a circle of radius *r* with speed *v* (frequency ν, angular speed ω and time period *T*) then corresponding current $i = q\nu = \frac{q}{T} = \frac{qv}{2\pi r} = \frac{q\omega}{2\pi}$

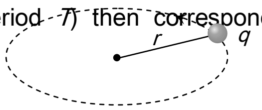

Fig. 19.4

(8) **Current carriers :** The charged particles whose flow in a definite direction constitutes the electric current are called current carriers. In different situation current carriers are different.

(i) Solids : In solid conductors like metals current carriers are free electrons.

(ii) Liquids : In liquids current carriers are positive and negative ions.

(iii) Gases : In gases current carriers are positive ions and free electrons.

(iv) Semi conductor : In semi conductors current carriers are holes and free electrons.

Current Density (*J*)

Current density at any point inside a conductor is defined as a vector having magnitude equal to current per unit area surrounding that point. Remember area is normal to the direction of charge flow (or current passes) through that point.

(1) Current density at point *P* is given by $\vec{J} = \frac{di}{dA}\vec{n}$

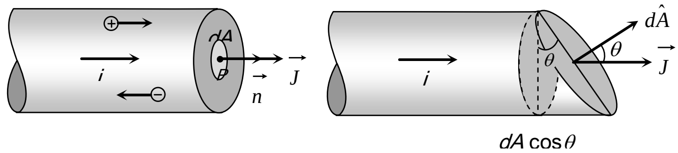

Fig. 19.5

(2) If the cross-sectional area is not normal to the current, but makes an angle θ with the direction of current then

$$J = \frac{di}{dA\cos\theta} \Rightarrow di = JdA\cos\theta = \vec{J}.\vec{dA} \Rightarrow i = \int \vec{J}\cdot\vec{dA}$$

(3) If current density $\vec{J}$ is uniform for a normal cross-section $\vec{A}$ then $J = \frac{i}{A}$

(4) Current density $\vec{J}$ is a vector quantity. It's direction is same as that of $\vec{E}$. It's S.I. unit is *amp/m*^{2} and dimension $[L^{-2}A]$.

(5) In case of uniform flow of charge through a cross-section normal to it as $i = nqvA \Rightarrow J = \frac{i}{A} = nqv$.

(6) Current density relates with electric field as $\vec{J} = \sigma\vec{E} = \frac{\vec{E}}{\rho}$; where σ = conductivity and ρ = resistivity or specific resistance of substance.

Drift Velocity

Drift velocity is the average uniform velocity acquired by free electrons inside a metal by the application of an electric field which is responsible for current through it. Drift velocity is very small it is of the order of 10^{-4} *m/s* as compared to thermal speed ($\simeq 10^5\ m/s$) of electrons at room temperature.

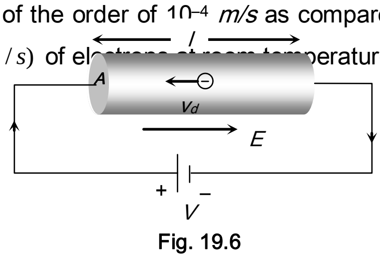

Fig. 19.6

If suppose for a conductor

n = Number of electron per unit volume of the conductor

A = Area of cross-section

V = potential difference across the conductor

E = electric field inside the conductor

i = current, J = current density, ρ = specific resistance, σ = conductivity $\left(\sigma = \frac{1}{\rho}\right)$ then current relates with drift velocity as $\boldsymbol{i = neAv_d}$ we can also write

$$\boldsymbol{v_d = \frac{i}{neA} = \frac{J}{ne} = \frac{\sigma E}{ne} = \frac{E}{\rho ne} = \frac{V}{\rho l n e}}.$$

(1) The direction of drift velocity for electron in a metal is opposite to that of applied electric field (*i.e.* current density $\vec{J}$).

$v_d \propto E$ *i.e.*, greater the electric field, larger will be the drift velocity.

(2) When a steady current flows through a conductor of non-uniform cross-section drift velocity varies inversely with area of cross-section $\left(v_d \propto \frac{1}{A}\right)$

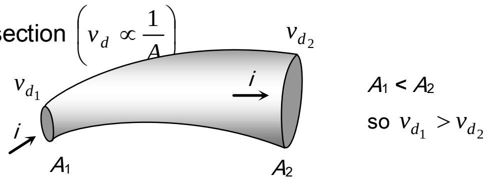

Fig. 19.7

(3) If diameter (d) of a conductor is doubled, then drift velocity of electrons inside it will not change.

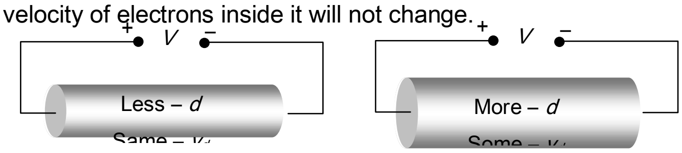

Fig. 19.8

(1) **Relaxation time (τ) :** The time interval between two successive collisions of electrons with the positive ions in the metallic lattice is defined as relaxation time $\tau = \frac{\text{mean free path}}{\text{r.m.s. velocity of electrons}} = \frac{\lambda}{v_{rms}}$. With rise in temperature v_{rms} increases consequently τ decreases.

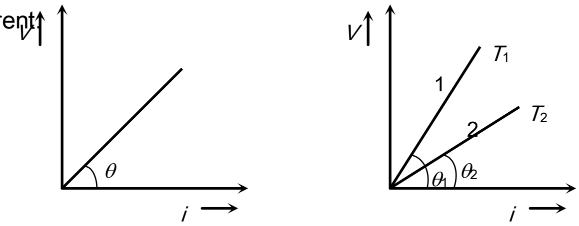
(2) **Mobility :** Drift velocity per unit electric field is called mobility of electron *i.e.* $\mu = \frac{v_d}{E}$. It's unit is $\frac{m^2}{volt - \sec}$.

Ohm's Law

If the physical conditions of the conductor (length, temperature, mechanical strain etc.) remains some, then the current flowing through the conductor is directly proportional to the potential difference across it's two ends *i.e.* $\boldsymbol{i \propto V} \Rightarrow \boldsymbol{V = iR}$ where R is a proportionality constant, known as electric resistance.

(1) Ohm's law is not a universal law, the substances, which obey ohm's law are known as ohmic substance.

(2) Graph between V and i for a metallic conductor is a straight line as shown. At different temperatures V-i curves are different.



(A) Slope of the line $= \tan\theta = \frac{V}{i} = R$

(B) Here $\tan\theta_1 > \tan\theta_2$ So $R_1 > R_2$

Fig. 19.9

(3) The device or substances which don't obey ohm's law *e.g.* gases, crystal rectifiers, thermoionic valve, transistors etc. are known as non-ohmic or non-linear conductors. For these V-i curve is not linear.

Static resistance $R_{st} = \frac{V}{i} = \frac{1}{\tan\theta}$

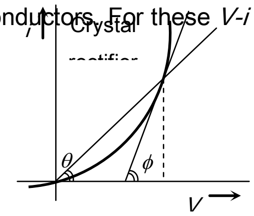


Fig. 19.10

Dynamic resistance $R_{dyn} = \frac{\Delta V}{\Delta I} = \frac{1}{\tan\phi}$

Resistance

(1) The property of substance by virtue of which it opposes the flow of current through it, is known as the resistance.

(2) **Formula of resistance :** For a conductor if l = length of a conductor A = Area of cross-section of conductor, n = No. of free electrons per unit volume in conductor, τ = relaxation time then resistance of conductor $\boldsymbol{R = \rho \frac{l}{A} = \frac{m}{ne^2\tau} \cdot \frac{l}{A}}$; where ρ = resistivity of the material of conductor

(3) **Unit and dimension :** It's S.I. unit is *Volt/Amp.* or *Ohm* (Ω). Also 1 *ohm* $= \frac{1 volt}{1 Amp} = \frac{10^8 \, emu \text{ of potential}}{10^{-1} emu \text{ of current}}$ = 10^9 *emu* of resistance. It's dimension is $[ML^2T^{-3}A^{-2}]$.

(4) **Dependence of resistance :** Resistance of a conductor depends upon the following factors.

(i) Length of the conductor : Resistance of a conductor is directly proportional to it's length *i.e.* $R \propto l$ and inversely proportional to it's area of cross-section *i.e.* $\boldsymbol{R \propto \frac{1}{A}}$

(ii) Temperature : For a conductor

$$\textbf{Resistance} \propto \textbf{temperature}.$$

If R_0 = resistance of conductor at 0°*C*

R_t = resistance of conductor at *t*°*C*

and α, β = temperature co-efficient of resistance

then $R_t = R_0(1 + \alpha t + \beta t^2)$ for $t > 300°C$ and

$\boldsymbol{R_t = R_0(1 + \alpha t)}$ for $t \le 300°C$ or $\alpha = \frac{R_t - R_0}{R_0 \times t}$

If R_1 and R_2 are the resistances at t_1°*C* and t_2°*C* respectively then $\frac{R_1}{R_2} = \frac{1 + \alpha t_1}{1 + \alpha t_2}$.

The value of α is different at different temperature. Temperature coefficient of resistance averaged over the temperature range t_1°*C* to t_2°*C* is given by $\alpha = \frac{R_2 - R_1}{R_1(t_2 - t_1)}$ which gives $R_2 = R_1 [1 + \alpha (t_2 - t_1)]$. This formula gives an approximate value.

Table 19.2 : Variation of resistance of some electrical material with temperature

Material	Temp. coefficient of resistance (α)	Variation of resistance with temperature rise
Metals	Positive	Increases
Solid non-metal	Zero	Independent
Semi-conductor	Negative	Decreases
Electrolyte	Negative	Decreases
Ionised gases	Negative	Decreases
Alloys	Small positive value	Almost constant

Resistivity (ρ), Conductivity (σ) and Conductance (C)

(1) **Resistivity :** From $R = \rho \frac{l}{A}$; If l = 1*m*, A = 1 m^2 then $\boldsymbol{R = \rho}$ *i.e.* resistivity is numerically equal to the resistance of a substance having unit area of cross-section and unit length.

(i) Unit and dimension : It's S.I. unit is *ohm* × *m* and dimension is $[ML^3T^{-3}A^{-2}]$

(ii) It's formula : $\rho = \frac{m}{ne^2\tau}$

(iii) Resistivity is the intrinsic property of the substance. It is independent of shape and size of the body (*i.e.* l and A).

(iv) For different substances their resistivity is also different *e.g.* ρ_{silver} = minimum = 1.6 × 10^{-8} Ω-*m* and $\rho_{fused\ quartz}$ = maximum ≈ 10^{16} Ω-*m*

$$\underset{(\text{Maximum for fused quartz})}{\rho_{insulator}} > \rho_{alloy} > \rho_{semi\text{-}conductor} > \underset{(\text{Minimum for silver})}{\rho_{conductor}}$$

(v) Resistivity depends on the temperature. For metals $\rho_t = \rho_0(1 + \alpha\Delta t)$ *i.e.* resitivity increases with temperature.

(vi) Resistivity increases with impurity and mechanical stress.

(vii) Magnetic field increases the resistivity of all metals except iron, cobalt and nickel.

(viii) Resistivity of certain substances like selenium, cadmium, sulphides is inversely proportional to intensity of light falling upon them.

(2) **Conductivity :** Reciprocal of resistivity is called conductivity (σ) *i.e.* $\sigma = \frac{1}{\rho}$ with unit *mho/m* and dimensions $[M^{-1}L^{-3}T^{3}A^{2}]$.

(3) **Conductance :** Reciprocal of resistance is known as conductance. $C = \frac{1}{R}$ It's unit is $\frac{1}{\Omega}$ or Ω^{-1} or "Siemen".

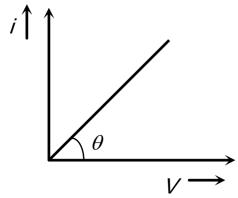

Fig. 19.11

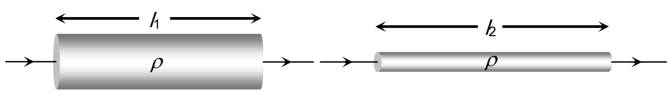
Stretching of Wire

If a conducting wire stretches, it's length increases, area of cross-section decreases so resistance increases but volume remain constant.

Suppose for a conducting wire before stretching it's length = l_1, area of cross-section = A_1, radius = r_1, diameter = d_1, and resistance $R_1 = \rho \frac{l_1}{A_1}$

Before stretching After stretching



Volume remains constant *i.e.* $A_1l_1 = A_2l_2$

Fig. 19.12

After stretching length = l_2, area of cross-section = A_2, radius = r_2, diameter = d_2 and resistance $= R_2 = \rho \frac{l_2}{A_2}$

Ratio of resistances before and after stretching

$$\frac{R_1}{R_2} = \frac{l_1}{l_2} \times \frac{A_2}{A_1} = \left(\frac{l_1}{l_2}\right)^2 = \left(\frac{A_2}{A_1}\right)^2 = \left(\frac{r_2}{r_1}\right)^4 = \left(\frac{d_2}{d_1}\right)^4$$

(1) If length is given then $R \propto l^2 \Rightarrow \frac{R_1}{R_2} = \left(\frac{l_1}{l_2}\right)^2$

(2) If radius is given then $R \propto \frac{1}{r^4} \Rightarrow \frac{R_1}{R_2} = \left(\frac{r_2}{r_1}\right)^4$

Electrical Conducting Materials For Specific Use

(1) **Filament of electric bulb :** Is made up of tungsten which has high resistivity, high melting point.

(2) **Element of heating devices (such as heater, geyser or press) :** Is made up of nichrome which has high resistivity and high melting point.

(3) **Resistances of resistance boxes (standard resistances) :** Are made up of alloys (manganin, constantan or nichrome) these materials have moderate resistivity which is practically independent of temperature so that the specified value of resistance does not alter with minor changes in temperature.

(4) **Fuse-wire :** Is made up of tin-lead alloy (63% tin + 37% lead). It should have low melting point and high resistivity. It is used in series as a safety device in an electric circuit and is designed so as to melt and thereby open the circuit if the current exceeds a predetermined value due to some fault. The function of a fuse is independent of its length.

Safe current of fuse wire relates with it's radius as $\boldsymbol{i} \propto \boldsymbol{r}^{3/2}$.

(5) **Thermistors** : A thermistor is a heat sensitive resistor usually prepared from oxides of various metals such as nickel, copper, cobalt, iron etc. These compounds are also semi-conductor. For thermistors α is very high which may be positive or negative. The resistance of thermistors changes very rapidly with change of temperature.

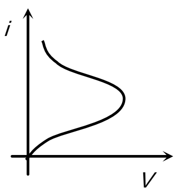


Fig. 19.13

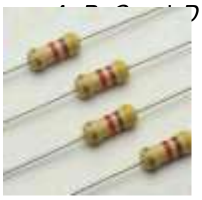
Thermistors are used to detect small temperature change and to measure very low temperature.

Colour Coding of Resistance

To know the value of resistance colour code is used. These code are printed in form of set of rings or strips. By reading the values of colour bands, we can estimate the value of resistance.

The carbon resistance has normally four coloured rings or bands A, B, C and D as shown in following figure.



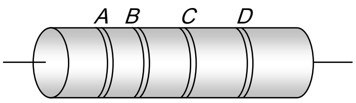


Fig. 19.14

Colour band *A* and *B* : Indicate the first two significant figures of resistance in *ohm*.

Band *C* : Indicates the decimal multiplier *i.e.* the number of zeros that follows the two significant figures *A* and *B*.

Band *D* : Indicates the tolerance in percent about the indicated value or in other words it represents the percentage accuracy of the indicated value.

The tolerance in the case of gold is ± 5% and in silver is ± 10%. If only three bands are marked on carbon resistance, then it indicate a tolerance of 20%.

Table 19.3 : Colour code for carbon resistance

Letters as an aid to memory	Colour	Figure (*A*, *B*)	Multiplier (C)
B	Black	0	10^0
B	Brown	1	10^1
R	Red	2	10^2
O	Orange	3	10^3
Y	Yellow	4	10^4
G	Green	5	10^5
B	Blue	6	10^6
V	Violet	7	10^7
G	Grey	8	10^8
W	White	9	10^9

To remember the sequence of colour code following sentence should kept in memory.

B B R O Y Great Britain Very Good Wife.

Grouping of Resistance

(1) **Series grouping**

(i) Same current flows through each resistance but potential difference distributes in the ratio of resistance *i.e.* $V \propto R$

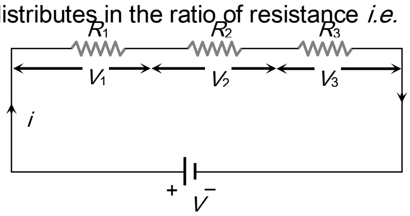

Fig. 19.15

(ii) $R_{eq} = R_1 + R_2 + R_3$ equivalent resistance is greater than the maximum value of resistance in the combination.

(iii) If *n* identical resistance are connected in series $R_{eq} = nR$ and potential difference across each resistance $V' = \frac{V}{n}$

(2) **Parallel grouping**

(i) Same potential difference appeared across each resistance but current distributes in the reverse ratio of their resistance *i.e.* $i \propto \frac{1}{R}$

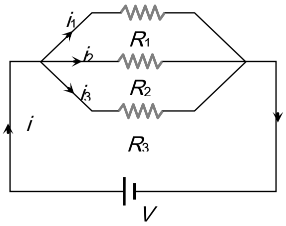

Fig. 19.16

(ii) Equivalent resistance is given by $\frac{1}{R_{eq}} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}$

or $R_{eq} = (R_1^{-1} + R_2^{-1} + R_3^{-1})^{-1}$ or $R_{eq} = \frac{R_1 R_2 R_3}{R_1 R_2 + R_2 R_3 + R_2 R_1}$

Equivalent resistance is smaller than the minimum value of resistance in the combination.

(iv) If two resistance in parallel

$$R_{eq} = \frac{R_1 R_2}{R_1 + R_2} = \frac{\text{Multiplication}}{\text{Addition}}$$

(v) Current through any resistance

$$i' = i \times \left[\frac{\text{Resistance of opposite branch}}{\text{Total resistance}}\right]$$

Where *I* = required current (branch current),

i = main current

$$i_1 = i\left(\frac{R_2}{R_1 + R_2}\right)$$

and $i_2 = i\left(\frac{R_1}{R_1 + R_2}\right)$

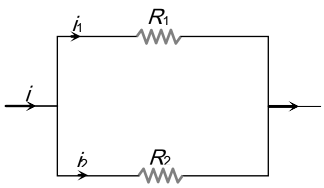

Fig. 19.17

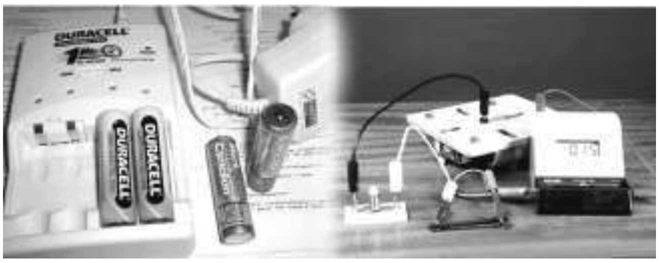
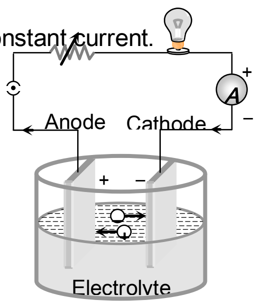
(vi) In *n* identical resistance are connected in parallel

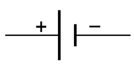
$R_{eq} = \frac{R}{n}$ and current through each resistance $i' = \frac{i}{n}$

Cell



The device which converts chemical energy into electrical energy is known as electric cell. Cell is a source of constant emf but not constant current.





Symbol of cell

Fig. 19.18

(1) **Emf of cell (*E*) :** The potential difference across the terminals of a cell when it is not supplying any current is called it's emf.

(2) **Potential difference (*V*) :** The voltage across the terminals of a cell when it is supplying current to external resistance is called potential difference or terminal voltage. Potential difference is equal to the product of current and resistance of that given part *i.e.* *V* = *iR*.

(3) **Internal resistance (*r*) :** In case of a cell the opposition of electrolyte to the flow of current through it is called internal resistance of the cell. The internal resistance of a cell depends on the distance between electrodes ($r \propto d$), area of electrodes [$r \propto (1/A)$] and nature, concentration ($r \propto C$) and temperature of electrolyte [$r \propto$ (1/ temp.)].

A cell is said to be ideal, if it has zero internal resistance.

Cell in Various Positions

(1) **Closed circuit :** Cell supplies a constant current in the circuit.

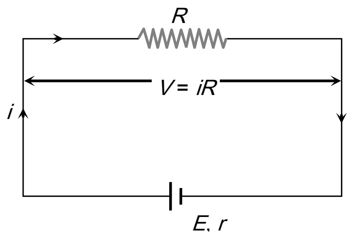


Fig. 19.19

(i) Current given by the cell $i = \frac{E}{R + r}$

(ii) Potential difference across the resistance $V = iR$

(iii) Potential drop inside the cell = *ir*

(iv) Equation of cell $E = V + ir$ ($E > V$)

(v) Internal resistance of the cell $r = \left(\frac{E}{V} - 1\right) \cdot R$

(vi) Power dissipated in external resistance (load)

$$P = Vi = i^2 R = \frac{V^2}{R} = \left(\frac{E}{R+r}\right)^2 .R$$

Power delivered will be maximum when $R = r$ so $P_{max} = \frac{E^2}{4r}$.

This statement in generalised from is called "*maximum power transfer theorem*".

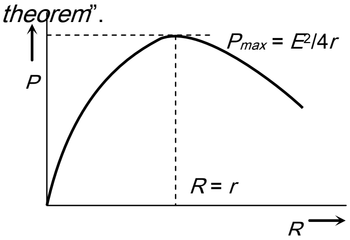

Fig. 19.20

(vii) When the cell is being charged *i.e.* current is given to the cell then $E = V - ir$ and $E < V$.

(2) **Open circuit :** When no current is taken from the cell it is said to be in open circuit

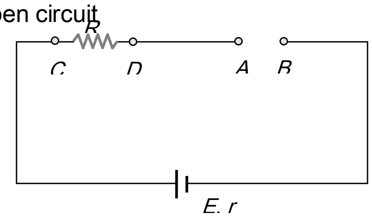

Fig. 19.21

(i) Current through the circuit $i = 0$

(ii) Potential difference between A and B, $V_{AB} = E$

(iii) Potential difference between C and D, $V_{CD} = 0$

(3) **Short circuit :** If two terminals of cell are join together by a thick conducting wire

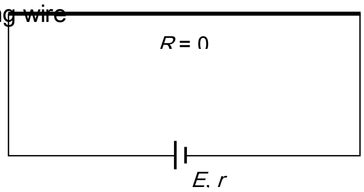

Fig. 19.22

(i) Maximum current (called short circuit current) flows momentarily $i_{sc} = \frac{E}{r}$

(ii) Potential difference $V = 0$

Grouping of Cells

Group of cell is called a battery.

In series grouping of cell's their emf's are additive or subtractive while their internal resistances are always additive. If dissimilar plates of cells are connected together their emf's are added to each other while if their similar plates are connected together their emf's are subtractive.

$E_{eq} = E_1 + E_2$ $\qquad$ $E_{eq} = E_1 - E_2$ $(E_1 > E_2)$

$r_{eq} = r_1 + r_2$ $\qquad$ $r_{eq} = r_1 + r_2$

Fig. 19.23

(1) **Series grouping :** In series grouping anode of one cell is connected to cathode of other cell and so on. If n identical cells are connected in series

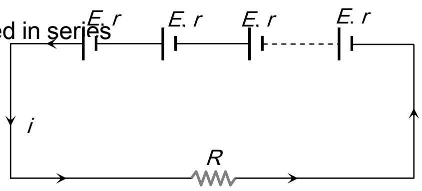

Fig. 19.24

(i) Equivalent emf of the combination $E_{eq} = nE$

(ii) Equivalent internal resistance $r_{eq} = nr$

(iii) Main current = Current from each cell $= i = \frac{nE}{R + nr}$

(iv) Potential difference across external resistance $V = iR$

(v) Potential difference across each cell $V' = \frac{V}{n}$

(vi) Power dissipated in the external circuit $= \left(\frac{nE}{R+nr}\right)^2 . R$

(vii) Condition for maximum power $R = nr$ and $P_{\max} = n\left(\frac{E^2}{4r}\right)$

(viii) This type of combination is used when *nr* << *R*.

(2) **Parallel grouping :** In parallel grouping all anodes are connected at one point and all cathode are connected together at other point. If *n* identical cells are connected in parallel

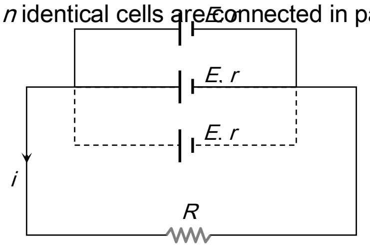

Fig. 19.25

(i) Equivalent emf $E_{eq} = E$

(ii) Equivalent internal resistance $R_{eq} = r/n$

(iii) Main current $i = \frac{E}{R + r/n}$

(iv) potential difference across external resistance = p.d. across each cell = $V = iR$

(v) Current from each cell $i' = \frac{i}{n}$

(vi) Power dissipated in the circuit $P = \left(\frac{E}{R + r/n}\right)^2 . R$

(vii) Condition for max. power is $R = r/n$ and $P_{\max} = n\left(\frac{E^2}{4r}\right)$

(viii) This type of combination is used when *nr* >> *R*

(3) **Mixed Grouping :** If *n* identical cell's are connected in a row and such *m* row's are connected in parallel as shown.

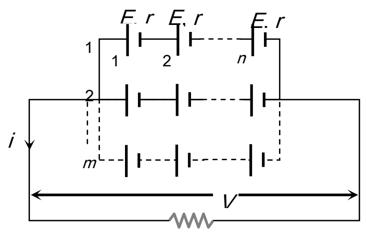

Fig. 19.26

(i) Equivalent emf of the combination $E_{eq} = nE$

(ii) Equivalent internal resistance of the combination $r_{eq} = \frac{nr}{m}$

(iii) Main current flowing through the load $i = \frac{nE}{R + \frac{nr}{m}} = \frac{mnE}{mR + nr}$

(iv) Potential difference across load $V = iR$

(v) Potential difference across each cell $V' = \frac{V}{n}$

(vi) Current from each cell $i' = \frac{i}{n}$

(vii) Condition for maximum power $R = \frac{nr}{m}$ and $P_{\max} = (mn)\frac{E^2}{4r}$

(viii) Total number of cell = *mn*

Kirchoff's Laws

(1) **Kirchoff's first law :** This law is also known as junction rule or current law (*KCL*). According to it the algebraic sum of currents meeting at a junction is zero *i.e.* $\Sigma i = 0$.

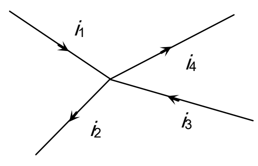

Fig. 19.27

In a circuit, at any junction the sum of the currents entering the junction must equal the sum of the currents leaving the junction. $i_1 + i_3 = i_2 + i_4$

(ii) This law is simply a statement of "*conservation of charge*".

(2) **Kirchoff's second law :** This law is also known as loop rule or voltage law (KVL) and according to it "the algebraic sum of the changes in potential in complete traversal of a mesh (closed loop) is zero", *i.e.* $\Sigma V = 0$

(i) This law represents "*conservation of energy*".

(ii) If there are n meshes in a circuit, the number of independent equations in accordance with loop rule will be $(n-1)$.

(3) **Sign convention for the application of Kirchoff's law :** For the application of Kirchoff's laws following sign convention are to be considered

(i) The change in potential in traversing a resistance in the direction of current is $-iR$ while in the opposite direction $+iR$

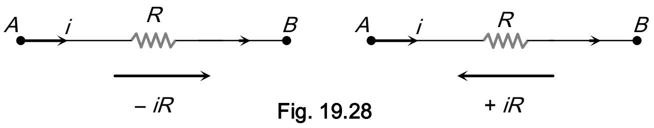

Fig. 19.28

(ii) The change in potential in traversing an emf source from negative to positive terminal is $+E$ while in the opposite direction $-E$ irrespective of the direction of current in the circuit.

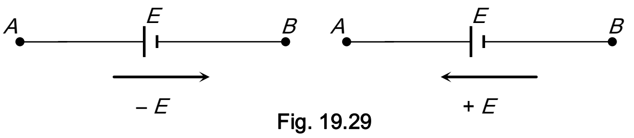

Fig. 19.29

(iii) The change in potential in traversing a capacitor from the negative terminal to the positive terminal is $+\frac{q}{C}$ while in opposite direction $-\frac{q}{C}$.

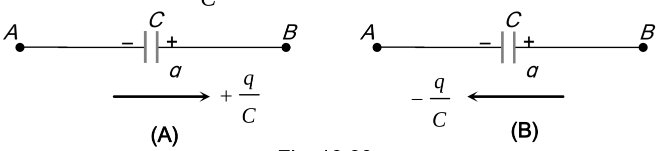

Fig. 19.30

(iv) The change in voltage in traversing an inductor in the direction of current is $-L\frac{di}{dt}$ while in opposite direction it is $+L\frac{di}{dt}$.

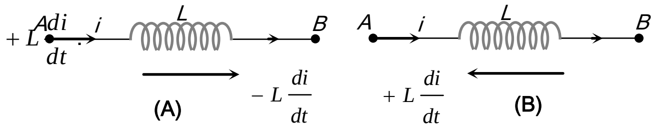

Fig. 19.31

Different Measuring Instruments

(1) **Galvanometer :** It is an instrument used to detect small current passing through it by showing deflection. Galvanometers are of different types *e.g.* moving coil galvanometer, moving magnet galvanometer, hot wire galvanometer. In dc circuit usually moving coil galvanometer are used.

(i) **It's symbol :**  ; where G is the total internal resistance of the galvanometer.

(ii) **Full scale deflection current :** The current required for full scale deflection in a galvanometer is called full scale deflection current and is represented by i_g.

(iii) **Shunt :** The small resistance connected in parallel to galvanometer coil, in order to control current flowing through the galvanometer is known as shunt.

Table 19.4 : Merits and demerits of shunt

Merits of shunt	Demerits of shunt

To protect the galvanometer coil from burning It can be used to convert any galvanometer into ammeter of desired range.	Shunt resistance decreases the sensitivity of galvanometer.

(2) **Ammeter :** It is a device used to measure current and is always connected in series with the 'element' through which current is to be measured.

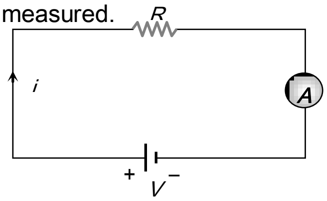

Fig. 19.32

(i) The reading of an ammeter is always lesser than actual current in the circuit.

(ii) Smaller the resistance of an ammeter more accurate will be its reading. An ammeter is said to be ideal if its resistance *r* is zero.

(iii) **Conversion of galvanometer into ammeter** : A galvanometer may be converted into an ammeter by connecting a low resistance (called shunt *S*) in parallel to the galvanometer *G* as shown in figure.

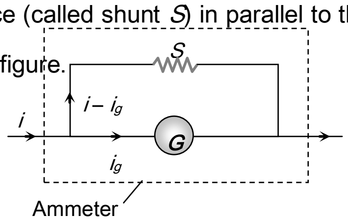

Fig. 19.33

(a) Equivalent resistance of the combination $= \frac{GS}{G+S}$

(b) *G* and *S* are parallel to each other hence both will have equal potential difference *i.e.* $i_g G = (i - i_g)S$; which gives

Required shunt $\boldsymbol{S = \frac{i_g}{(i - i_g)} G}$

(c) To pass *n*th part of main current (*i.e.* $i_g = \frac{i}{n}$) through the galvanometer, required shunt $\boldsymbol{S = \frac{G}{(n-1)}}$.

(3) **Voltmeter :** It is a device used to measure potential difference and is always put in parallel with the 'circuit element' across which potential difference is to be measured.

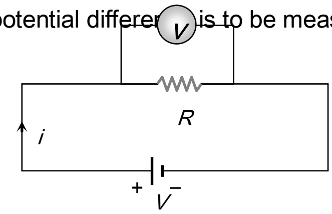

Fig. 19.34

(i) The reading of a voltmeter is always lesser than true value.

(ii) Greater the resistance of voltmeter, more accurate will be its reading. A voltmeter is said to be ideal if its resistance is infinite, *i.e.,* it draws no current from the circuit element for its operation.

(iii) **Conversion of galvanometer into voltmeter** : A galvanometer may be converted into a voltmeter by connecting a large resistance *R* in series with the galvanometer as shown in the figure.

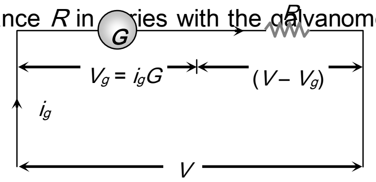

Fig. 19.35

(a) Equivalent resistance of the combination = *G* + *R*

(b) According to ohm's law $V = i_g(G + R)$; which gives

Required series resistance $\boldsymbol{R = \frac{V}{i_g} - G = \left(\frac{V}{V_g} - 1\right) G}$

(c) If n^{th} part of applied voltage appeared across galvanometer (*i.e.* $V_g = \frac{V}{n}$) then required series resistance $\boldsymbol{R = (n-1)\,G}$.

(4) **Wheatstone bridge :** Wheatstone bridge is an arrangement of four resistance which can be used to measure one of them in terms of rest. Here arms AB and BC are called ratio arm and arms AC and BD are called conjugate arms

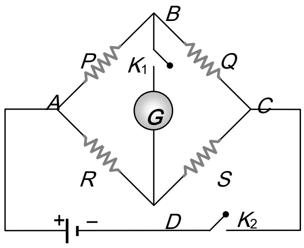

Fig. 19.36

(i) **Balanced bridge :** The bridge is said to be balanced when deflection in galvanometer is zero *i.e.* no current flows through the galvanometer or in other words $V_B = V_D$. In the balanced condition $\frac{P}{Q} = \frac{R}{S}$, on mutually changing the position of cell and galvanometer this condition will not change.

(ii) **Unbalanced bridge :** If the bridge is not balanced current will flow from D to B if $V_D > V_B$ *i.e.* $(V_A - V_D) < (V_A - V_B)$ which gives $PS > RQ$.

(iii) **Applications of wheatstone bridge :** Meter bridge, post office box and Carey Foster bridge are instruments based on the principle of wheatstone bridge and are used to measure unknown resistance.

(5) **Meter bridge :** In case of meter bridge, the resistance wire AC is 100 cm long. Varying the position of tapping point B, bridge is balanced. If in balanced position of bridge $AB = l$, BC $(100 - l)$ so that $\frac{Q}{P} = \frac{(100-l)}{l}$. Also $\frac{P}{Q} = \frac{R}{S} \Rightarrow S = \frac{(100-l)}{l}R$

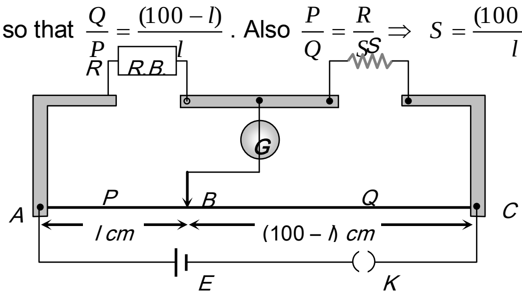

Fig. 19.37

Potentiometer

Potentiometer is a device mainly used to measure emf of a given cell and to compare emf's of cells. It is also used to measure internal resistance of a given cell.

(1) **Circuit diagram :** Potentiometer consists of a long resistive wire AB of length L (about 6m to 10 m long) made up of mangnine or constantan and a battery of known voltage e and internal resistance r called supplier battery or driver cell. Connection of these two forms primary circuit.

One terminal of another cell (whose emf E is to be measured) is connected at one end of the main circuit and the other terminal at any point on the resistive wire through a galvanometer G. This forms the secondary circuit. Other details are as follows

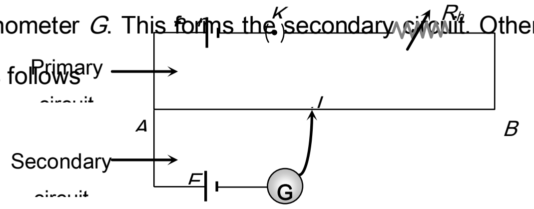

Fig. 19.38

J = Jockey

K = Key

R = Resistance of potentiometer wire,

ρ = Specific resistance of potentiometer wire.

R_h = Variable resistance which controls the current through the wire AB

(i) The specific resistance (ρ) of potentiometer wire must be high but its temperature coefficient of resistance (α) must be low.

(ii) All higher potential points (terminals) of primary and secondary circuits must be connected together at point A and all lower potential points must be connected to point B or jockey.

(iii) The value of known potential difference must be greater than the value of unknown potential difference to be measured.

(iv) The potential gradient must remain constant. For this the current in the primary circuit must remain constant and the jockey must not be slided in contact with the wire.

(v) The diameter of potentiometer wire must be uniform everywhere.

(2) **Potential gradient (x) :** Potential difference (or fall in potential) per unit length of wire is called potential gradient *i.e.* $x = \frac{V}{L}\frac{volt}{m}$ where $V = iR = \left(\frac{e}{R + R_h + r}\right).R$.

So $\boldsymbol{x = \frac{V}{L} = \frac{iR}{L} = \frac{i\rho}{A} = \frac{e}{(R + R_h + r)}.\frac{R}{L}}$

(i) Potential gradient directly depends upon

(a) The resistance per unit length (R/L) of potentiometer wire.

(b) The radius of potentiometer wire (*i.e.* Area of cross-section)

(c) The specific resistance of the material of potentiometer wire (*i.e.* ρ)

(d) The current flowing through potentiometer wire (i)

(ii) potential gradient indirectly depends upon

(a) The emf of battery in the primary circuit (*i.e.* e)

(b) The resistance of rheostat in the primary circuit (*i.e.* R_h)

(3) **Working :** Suppose jocky is made to touch a point J on wire then potential difference between A and J will be $V = xl$

At this length (l) two potential difference are obtained

(i) V due to battery e and

(ii) E due to unknown cell

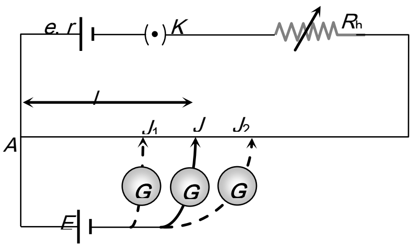

Fig. 19.39

If $V > E$ then current will flow in galvanometer circuit in one direction

If $V < E$ then current will flow in galvanometer circuit in opposite direction

If $V = E$ then no current will flow in galvanometer circuit this condition to known as null deflection position, length l is known as balancing length.

In balanced condition $\boldsymbol{E = xl}$

or $\boldsymbol{E = xl = \frac{V}{L}l = \frac{iR}{L}l = \left(\frac{e}{R + R_h + r}\right).\frac{R}{L} \times l}$

If V is constant then $L \propto l$ $\Rightarrow \frac{x_1}{x_2} = \frac{L_1}{L_2} = \frac{l_1}{l_2}$

(6) **Standardization of potentiometer :** The process of determining potential gradient experimentally is known as standardization of potentiometer.

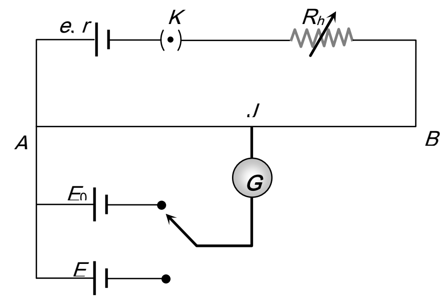

Fig. 19.40

Let the balancing length for the standard emf E_0 is l_0 then by the principle of potentiometer $E_0 = xl_0 \Rightarrow x = \frac{E_0}{l_0}$

(7) **Sensitivity of potentiometer :** A potentiometer is said to be more sensitive, if it measures a small potential difference more accurately.

(i) The sensitivity of potentiometer is assessed by its potential gradient. The sensitivity is inversely proportional to the potential gradient.

(ii) In order to increase the sensitivity of potentiometer

(a) The resistance in primary circuit will have to be decreased.

(b) The length of potentiometer wire will have to be increased so that the length may be measured more accuracy.

Table 19.5 : Difference between voltmeter and potentiometer

Voltmeter	Potentiometer
It's resistance is high but finite	Its resistance is infinite
It draws some current from source of emf	It does not draw any current from the source of unknown emf
The potential difference measured by it is lesser than the actual potential difference	The potential difference measured by it is equal to actual potential difference
Its sensitivity is low	Its sensitivity is high
It is a versatile instrument	It measures only emf or potential difference
It is based on deflection method	It is based on zero deflection method

Application of Potentiometer

(1) **To determine the internal resistance of a primary cell**

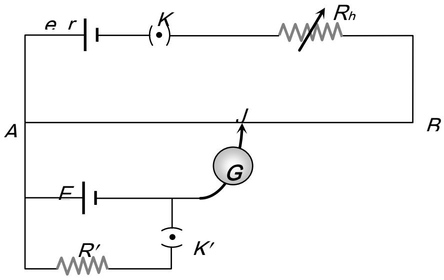

Fig. 19.41

(i) Initially in secondary circuit key K' remains open and balancing length (l_1) is obtained. Since cell E is in open circuit so it's emf balances on length l_1 *i.e.* $E = xl_1$ .... (i)

(ii) Now key K' is closed so cell E comes in closed circuit. If the process of balancing repeated again then potential difference V balances on length l_2 *i.e.* $V = xl_2$ .... (ii)

(iii) By using formula internal resistance $r = \left(\frac{E}{V} - 1\right).R'$

$$r = \left(\frac{l_1 - l_2}{l_2}\right).R'$$

(2) **Comparison of emf's of two cell :** Let l_1 and l_2 be the balancing lengths with the cells E_1 and E_2 respectively then $E_1 = xl_1$ and $E_2 = xl_2$ $\Rightarrow \frac{E_1}{E_2} = \frac{l_1}{l_2}$

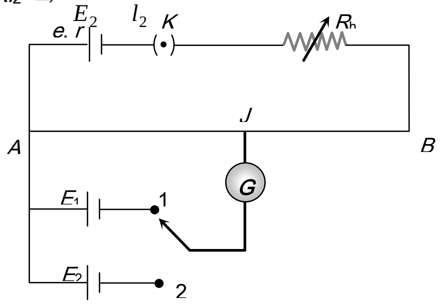

Fig. 19.42

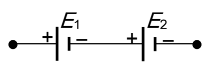
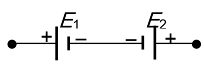
Let $E_1 > E_2$ and both are connected in series. If balancing length is l_1 when cell assist each other and it is l_2 when they oppose each other as shown then :





$(E_1 + E_2) = xl_1$ $\qquad$ $(E_1 - E_2) = xl_2$

$$\Rightarrow \frac{E_1 + E_2}{E_1 - E_2} = \frac{l_1}{l_2} \quad \text{or} \quad \frac{E_1}{E_2} = \frac{l_1 + l_2}{l_1 - l_2}$$

(3) **Comparison of resistances :** Let the balancing length for resistance R_1 (when XY is connected) is l_1 and let balancing length for resistance $R_1 + R_2$ (when YZ is connected) is l_2.

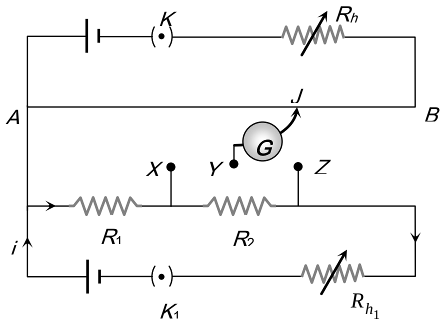


Fig. 19.43

Then $iR_1 = xl_1$ and $i(R_1 + R_2) = xl_2$ $\Rightarrow$ $\frac{R_2}{R_1} = \frac{l_2 - l_1}{l_1}$

(4) **To determine thermo emf**

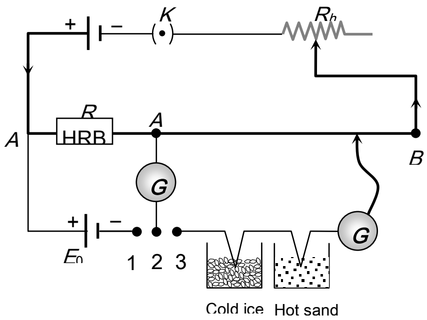

Fig. 19.44

(i) The value of thermo-emf in a thermocouple for ordinary temperature difference is very low (10^{-6} *volt*). For this the potential gradient x must be also very low (10^{-4} *V/m*). Hence a high resistance (R) is connected in series with the potentiometer wire in order to reduce current.

(ii) The potential difference across R must be equal to the emf of standard cell *i.e.* $iR = E_0$ $\therefore$ $i = \frac{E_0}{R}$

(iii) The small thermo emf produced in the thermocouple $e = xl$

(iv) $x = i\rho = \frac{iR}{L}$ $\therefore$ $e = \frac{iRl}{L}$ where L = length of potentiometer wire, ρ = resistance per unit length, l = balancing length for e

(5) **Calibration of ammeter :** Checking the correctness of ammeter readings with the help of potentiometer is called calibration of ammeter.

(i) In the process of calibration of an ammeter the current flowing in a circuit is measured by an ammeter and the same current is also measured with the help of potentiometer. By comparing both the values, the errors in the ammeter readings are determined.

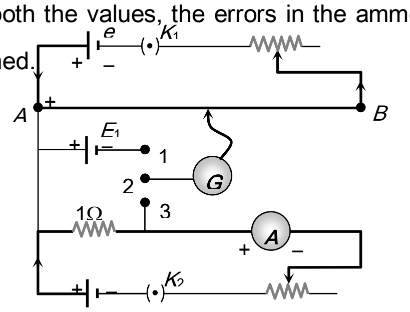

Fig. 19.45

(ii) For the calibration of an ammeter, 1 Ω standard resistance coil is specifically used in the secondary circuit of the potentiometer, because the potential difference across 1 Ω is equal to the current flowing through it *i.e.* $V = i$.

(iii) If the balancing length for the emf E_0 is l_0 then $E_0 = xl_0$

$\Rightarrow x = \frac{E_0}{l_0}$ (Process of standardisation)

(iv) Let i' current flows through 1Ω resistance giving potential difference as $V' = i'(1) = xl_1$ where l_1 is the balancing length. So error can be found as $\Delta i = i - i' = i - xl_1 = i - \frac{E_0}{l_0} \times l_1$

(6) **Calibration of voltmeter**

(i) Practical voltmeters are not ideal, because these do not have infinite resistance. The error of such practical voltmeter can be found by comparing the voltmeter reading with calculated value of p.d. by potentiometer.

(ii) If l_0 is balancing length for E_0 the emf of standard cell by connecting 1 and 2 of bi-directional key, then $x = E_0/l_0$.

(iii) The balancing length l_1 for unknown potential difference V is given by (by closing 2 and 3) $V' = xl_1 = (E_0 / l_0)l_1$.

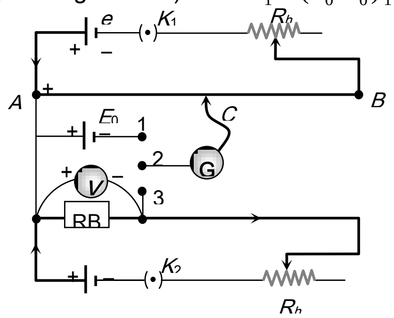

Fig. 19.46

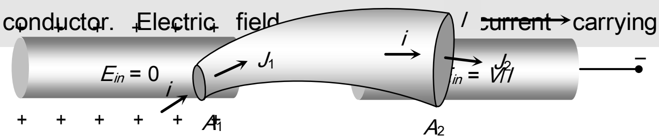
If the voltmeter reading is V then the error will be (V – V) which may be +ve, – ve or zero.

Tips & Tricks

✍ Human body, though has a large resistance of the order of $k\Omega$ (say 10 $k\Omega$), is very sensitive to minute currents even as low as a few mA. Electrocution, excites and disorders the nervous system of the body and hence one fails to control the activity of the body.

✍ dc flows uniformly throughout the cross-section of conductor while ac mainly flows through the outer surface area of the conductor. This is known as skin effect.

✍ It is worth noting that electric field inside a charged conductor is zero, but it is non zero inside a current carrying conductor and is given by $E = \frac{V}{l}$ where V = potential difference across the conductor and l = length of the conductor. Electric field / current carrying



conductor is zero.

✍ For a given conductor $JA = i$ = constant so that $J \propto \frac{1}{A}$ *i.e.*, $J_1A_1 = J_2A_2$; this is called equation of continuity

✍ The drift velocity of electrons is small because of the frequent collisions suffered by electrons.

✍ The small value of drift velocity produces a large amount of electric current, due to the presence of extremely large number of free electrons in a conductor.

The propagation of current is almost at the speed of light and involves electromagnetic process. It is due to this reason that the electric bulb glows immediately when switch is on.

✍ In the absence of electric field, the paths of electrons between successive collisions are straight line while in presence of electric field the paths are generally curved.

✍ Free electron density in a metal is given by $n = \frac{N_A x\, d}{A}$ where N_A = Avogadro number, x = number of free electrons per atom, d = density of metal and A = Atomic weight of metal.

✍ In the absence of radiation loss, the time in which a fuse will melt does not depends on it's length but varies with radius as $t \propto r^4$.

✍ If length (l) and mass (m) of a conducting wire is given then $R \propto \frac{l^2}{m}$.

✍ Macroscopic form of Ohm's law is $R = \frac{V}{i}$, while it's microscopic form is J = σ E.

✍ After stretching if length increases by n times then resistance will increase by n^2 times *i.e.* $R_2 = n^2 R_1$. Similarly if radius be reduced to $\frac{1}{n}$ times then area of cross-section decreases $\frac{1}{n^2}$ times so the resistance becomes n^4 times *i.e.* $R_2 = n^4 R_1$.

✍ After stretching if length of a conductor increases by x% then resistance will increases by $2x$ % (valid only if x < 10%)

✍ Decoration of lightning in festivals is an example of series grouping whereas all household appliances connected in parallel grouping.

✍ Using n conductors of equal resistance, the number of possible combinations is 2^{n-1}.

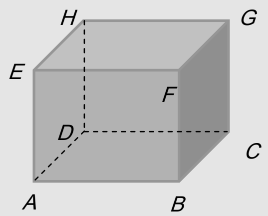
✍ If the resistance of n conductors are totally different, then the number of possible combinations will be 2^n.

✍ If n identical resistances are first connected in series and then in parallel, the ratio of the equivalent resistance is given by $\frac{R_p}{R_s} = \frac{n^2}{1}$.

✍ If a wire of resistance R, cut in n equal parts and then these parts are collected to form a bundle then equivalent resistance of combination will be $\frac{R}{n^2}$.

✍ If equivalent resistance of R_1 and R_2 in series and parallel be R_s and R_p respectively then $R_1 = \frac{1}{2}\left[R_s + \sqrt{R_s^2 - 4R_sR_p}\right]$ and $R_2 = \frac{1}{2}\left[R_s - \sqrt{R_s^2 - 4R_sR_p}\right]$.

✍ If a skeleton cube is made with 12 equal resistance each having resistance R then the net resistance across

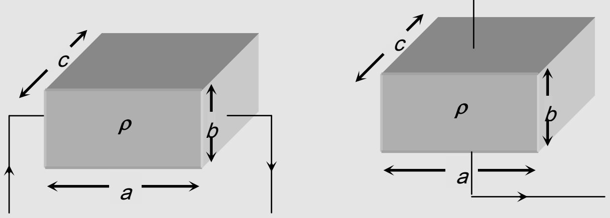


The longest diagonal (EC or AG) $= \frac{5}{6}R$

The diagonal of face (*e.g. AC, ED, ...*) $= \frac{3}{4}R$

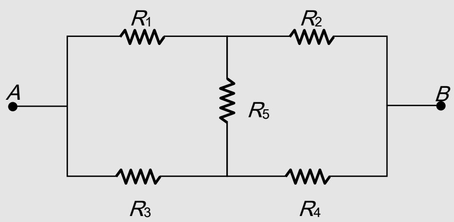
A side (*e.g. AB, BC.....*) $= \frac{7}{12}R$

✍ Resistance of a conducting body is not unique but depends on it's length and area of cross-section *i.e.* how the potential difference is applied. See the following figures

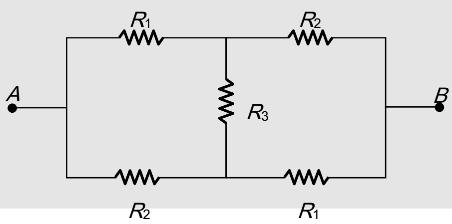


Length = a	Length = b
Area of cross-section = $b \times c$	Area of cross-section = $a \times c$
Resistance $R = \rho\left(\frac{a}{b \times c}\right)$	Resistance $R = \rho\left(\frac{b}{a \times c}\right)$

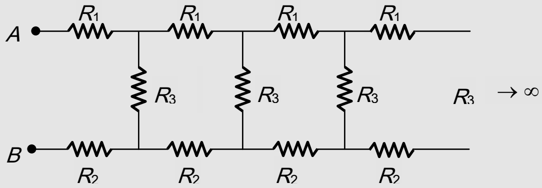
✍ Some standard results for equivalent resistance



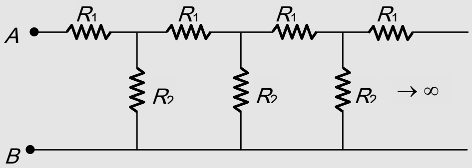
$$R_{AB} = \frac{R_1R_2(R_3+R_4)+(R_1+R_2)R_3R_4+R_5(R_1+R_2)(R_3+R_4)}{R_5(R_1+R_2+R_3+R_4)+(R_1+R_3)(R_2+R_4)}$$



$$R_{AB} = \frac{2R_1R_2 + R_3(R_1+R_2)}{2R_3 + R_1 + R_2}$$



$$R_{AB} = \frac{1}{2}(R_1+R_2) + \frac{1}{2}\left[(R_1+R_2)^2 + 4R_3(R_1+R_2)\right]^{1/2}$$



$$R_{AB} = \frac{1}{2}R_1\left[1 + \sqrt{1 + 4\left(\frac{R_2}{R_1}\right)}\right]$$

✍ It is a common misconception that "current in the circuit will be maximum when power consumed by the load is maximum."

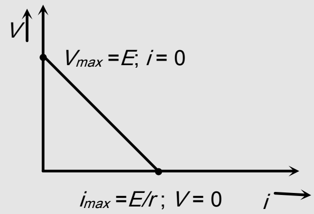
Actually current $i = E/(R+r)$ is maximum (= E/r) when R = min = 0 with $P_L = (E/r)^2 \times 0 = 0$ min. while power consumed by the load $E^2R/(R+r)^2$ is maximum (= $E^2/4r$) when $R = r$ and $i = (E/2r) \neq \max(= E/r)$.

✍ Emf is independent of the resistance of the circuit and depends upon the nature of electrolyte of the cell while potential difference depends upon the resistance between the two points of the circuit and current flowing through the circuit.

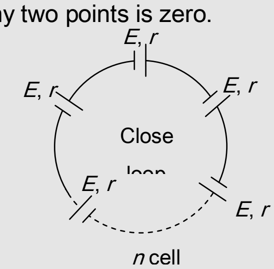
✍ Whenever a cell or battery is present in a branch there must be some resistance (internal or external or both) present in that branch. In practical situation it always happen because we can never have an ideal cell or battery with zero resistance.

✍ In series grouping of identical cells. If one cell is wrongly connected then it will cancel out the effect of two cells *e.g.* If in the combination of n identical cells (each having emf E and internal resistance r) if x cell are wrongly connected then equivalent emf $E_{eq} = (n-2x)E$ and equivalent internal resistance $r_{eq} = nr$.

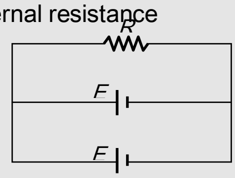
✍ Graphical view of open circuit and closed circuit of a cell.

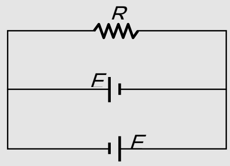


✍ If n identical cells are connected in a loop in order, then emf between any two points is zero.



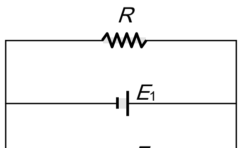
✍ In parallel grouping of two identical cell having no internal resistance





$E_{eq} = E$ $\qquad$ $E_{eq} = 0$

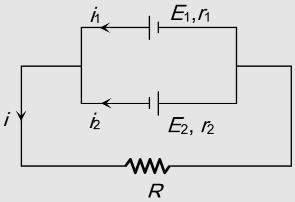
☞ When two cell's of different emf and no internal resistance are connected in parallel then equivalent emf is



indeterminate, note that connecting a wire with a cell with no resistance is equivalent to short circuiting. Therefore the total current that will be flowing will be infinity.

✍ In the parallel combination of non-identical cell's if they are connected with reversed polarity as shown then equivalent emf

$$E_{eq} = \frac{E_1r_2 - E_2r_1}{r_1 + r_2}$$



✍ Wheatstone bridge is most sensitive if all the arms of bridge have equal resistances *i.e.* $P = Q = R = S$

✍ If the temperature of the conductor placed in the right gap of metre bridge is increased, then the balancing length decreases and the jockey moves towards left.

✍ In Wheatstone bridge to avoid inductive effects the battery key should be pressed first and the galvanometer key afterwards.

✍ The measurement of resistance by Wheatstone bridge is not affected by the internal resistance of the cell.

✍ In case of zero deflection in the galvanometer current flows in the primary circuit of the potentiometer, not in the galvanometer circuit.

✍ A potentiometer can act as an ideal voltmeter.

Ordinary Thinking

Objective Questions

Electric Conduction, Ohm's Law and Resistance

1. Current of 4.8 amperes is flowing through a conductor. The number of electrons per second will be **[CPMT 1986]**

(a) 3×10^{19} (b) 7.68×10^{21}

(c) 7.68×10^{20} (d) 3×10^{20}

2. When the current i is flowing through a conductor, the drift velocity is v. If $2i$ current is flowed through the same metal but having double the area of cross-section, then the drift velocity will be

(a) $v/4$ (b) $v/2$

(c) v (d) $4v$

3. When current flows through a conductor, then the order of drift velocity of electrons will be **[CPMT 1986]**

(a) $10^{10}\ m/\sec$ (b) $10^{-2}\ cm/\sec$

(c) $10^{4}\ cm/\sec$ (d) $10^{-1}\ cm/\sec$

4. Every atom makes one free electron in copper. If 1.1 ampere current is flowing in the wire of copper having 1 mm diameter, then the drift velocity (approx.) will be (Density of copper $= 9 \times 10^3\ kg\ m^{-3}$ and atomic weight = 63) **[CPMT 1989]**

(a) $0.3\ mm/\sec$ (b) $0.1\ mm/\sec$

(c) $0.2\ mm/\sec$ (d) $0.2\ cm/\sec$

5. Which one is not the correct statement **[NCERT 1978]**

(a) $1\ volt \times 1\ coulomb = 1\ joule$

(b) $1\ volt \times 1\ ampere = 1\ joule/second$

(c) $1\ volt \times 1\ watt = 1\ H.P.$

(d) Watt-hour can be expressed in eV

6. If a 0.1 % increase in length due to stretching, the percentage increase in its resistance will be **[MNR 1990; MP PMT 1996; UPSEAT 1999; MP PMT 2000]**

(a) 0.2 % (b) 2 %

(c) 1 % (d) 0.1 %

7. The specific resistance of manganin is $50 \times 10^{-8}\ ohm \times m$.

The resistance of a cube of length $50\ cm$ will be

(a) $10^{-6}\ ohm$ (b) $2.5 \times 10^{-5}\ ohm$

(c) $10^{-8}\ ohm$ (d) $5 \times 10^{-4}\ ohm$

8. The resistivity of iron is $1 \times 10^{-7}\ ohm - m$. The resistance of a iron wire of particular length and thickness is 1 *ohm*. If the length and the diameter of wire both are doubled, then the resistivity in $ohm - m$ will be [CPMT 1983; DPMT 1999]

(a) 1×10^{-7} (b) 2×10^{-7}

(c) 4×10^{-7} (d) 8×10^{-7}

9. The temperature coefficient of resistance for a wire is $0.00125/°C$. At 300K its resistance is 1 *ohm*. The temperature at which the resistance becomes 2 *ohm* is

[IIT 1980; MP PET 2002; KCET 2003; MP PMT 2001; Orissa JEE 2002]

(a) 1154 K (b) 1100 K

(c) 1400 K (d) 1127 K

10. When the length and area of cross-section both are doubled, then its resistance [MP PET 1989]

(a) Will become half (b) Will be doubled

(c) Will remain the same (d) Will become four times

11. The resistance of a wire is 20 *ohms*. It is so stretched that the length becomes three times, then the new resistance of the wire will be

(a) 6.67 *ohms* (b) 60.0 *ohms*

(c) 120 *ohms* (d) 180.0 *ohms*

12. The resistivity of a wire [MP PMT 1984; DPMT 1982]

(a) Increases with the length of the wire

(b) Decreases with the area of cross-section

(c) Decreases with the length and increases with the cross-section of wire

(d) None of the above statement is correct

13. *Ohm*'s law is true

(a) For metallic conductors at low temperature

(b) For metallic conductors at high temperature

(c) For electrolytes when current passes through them

(d) For diode when current flows

14. The example for non-*ohm*ic resistance is [MP PMT 1978]

(a) Copper wire (b) Carbon resistance

(c) Diode (d) Tungsten wire

15. Drift velocity v_d varies with the intensity of electric field as per the relation [CPMT 1981; BVP 2003]

(a) $v_d \propto E$ (b) $v_d \propto \frac{1}{E}$

(c) $v_d = \text{constant}$ (d) $v_d \propto E^2$

16. On increasing the temperature of a conductor, its resistance increases because [CPMT 1982]

(a) Relaxation time decreases

(b) Mass of the electrons increases

(c) Electron density decreases

(d) None of the above

17. In a conductor 4 *coulombs* of charge flows for 2 *seconds*. The value of electric current will be [CPMT 1984]

(a) 4 *volts* (b) 4 *amperes*

(c) 2 *amperes* (d) 2 *volts*

18. The specific resistance of a wire is ρ, its volume is $3\,m^3$ and its resistance is 3 *ohms*, then its length will be

[CPMT 1984]

(a) $\sqrt{\frac{1}{\rho}}$ (b) $\frac{3}{\sqrt{\rho}}$

(c) $\frac{1}{\rho}\sqrt{3}$ (d) $\rho\sqrt{\frac{1}{3}}$

19. 62.5×10^{18} electrons per second are flowing through a wire of area of cross-section $0.1\,m^2$, the value of current flowing will be

(a) 1 A (b) 0.1 A

(c) 10 A (d) 0.11 A

20. A piece of wire of resistance 4 *ohms* is bent through $180°$ at its mid point and the two halves are twisted together, then the resistance is [CPMT 1971]

(a) 8 *ohms* (b) 1 *ohm*

(c) 2 *ohms* (d) 5 *ohms*

[MP PET 1989]

21. When a piece of aluminium wire of finite length is drawn through a series of dies to reduce its diameter to half its original value, its resistance will become

[NCERT 1974; AIIMS 1997; MH CET 2000; UPSEAT 2001; CBSE PMT 2002]

(a) Two times (b) Four times

(c) Eight times (d) Sixteen times

22. A wire 100 cm long and 2.0 mm diameter has a resistance of 0.7 *ohm*, the electrical resistivity of the material is

(a) $4.4 \times 10^{-6}\, ohm \times m$ (b) $2.2 \times 10^{-6}\, ohm \times m$

(c) $1.1 \times 10^{-6}\, ohm \times m$ (d) $0.22 \times 10^{-6}\, ohm \times m$

23. A certain wire has a resistance R. The resistance of another wire identical with the first except having twice its diameter is

(a) $2R$ (b) $0.25R$

(c) $4R$ (d) $0.5R$

24. In hydrogen atom, the electron makes 6.6×10^{15} revolutions per second around the nucleus in an orbit of radius $0.5 \times 10^{-10}\,m$. It is equivalent to a current nearly

(a) 1 A (b) 1 mA

(c) 1 μA (d) $1.6 \times 10^{-19}\,A$

25. A wire of length 5 m and radius 1 mm has a resistance of 1 *ohm*. What length of the wire of the same material at the same temperature and of radius 2 mm will also have a resistance of 1 *ohm*

(a) 1.25 m (b) 2.5 m

(c) 10 m (d) 20 m

26. When there is an electric current through a conducting wire along its length, then an electric field must exist

(a) Outside the wire but normal to it

(b) Outside the wire but parallel to it

(c) Inside the wire but parallel to it

(d) Inside the wire but normal to it

27. Through a semiconductor, an electric current is due to drift of

(a) Free electrons

(b) Free electrons and holes

(c) Positive and negative ions

(d) Protons

28. In an electrolyte 3.2×10^{18} bivalent positive ions drift to the right per second while 3.6×10^{18} monovalent negative ions drift to the left per second. Then the current is

(a) 1.6 amp to the left (b) 1.6 amp to the right
(c) 0.45 amp to the right (d) 0.45 amp to the left

29. A metallic block has no potential difference applied across it, then the mean velocity of free electrons is T = absolute temperature of the block)

(a) Proportional to T
(b) Proportional to $\sqrt{T}$
(c) Zero
(d) Finite but independent of temperature

30. The specific resistance of all metals is most affected by

(a) Temperature (b) Pressure
(c) Degree of illumination (d) Applied magnetic field

31. The positive temperature coefficient of resistance is for

(a) Carbon (b) Germanium
(c) Copper (d) An electrolyte

32. The fact that the conductance of some metals rises to infinity at some temperature below a few Kelvin is called

(a) Thermal conductivity (b) Optical conductivity
(c) Magnetic conductivity (d) Superconductivity

33. Dimensions of a block are $1\,cm\times1\,cm\times100\,cm$. If specific resistance of its material is $3\times10^{-7}\,ohm-m$, then the resistance between the opposite rectangular faces is [MP PET 1993]

(a) $3\times10^{-9}\,ohm$ (b) $3\times10^{-7}\,ohm$
(c) $3\times10^{-5}\,ohm$ (d) $3\times10^{-3}\,ohm$

34. In the above question, the resistance between the square faces is

(a) $3\times10^{-9}\,ohm$ (b) $3\times10^{-7}\,ohm$
(c) $3\times10^{-5}\,ohm$ (d) $3\times10^{-3}\,ohm$

35. There is a current of 20 amperes in a copper wire of 10^{-6} square metre area of cross-section. If the number of free electrons per cubic metre is 10^{29}, then the drift velocity is

(a) $125\times10^{-3}\,m/sec$ (b) $12.5\times10^{-3}\,m/sec$
(c) $1.25\times10^{-3}\,m/sec$ (d) $1.25\times10^{-4}\,m/sec$

36. The electric intensity E, current density j and specific resistance k are related to each other by the relation [DPMT 2001]

(a) $E=j/k$ (b) $E=jk$
(c) $E=k/j$ (d) $k=jE$

37. The resistance of a wire of uniform diameter d and length L is R. The resistance of another wire of the same material but diameter $2d$ and length $4L$ will be [CPMT 1984; MP PET 2002]

(a) $2R$ (b) R
(c) $R/2$ (d) $R/4$

38. There is a current of 1.344 *amp* in a copper wire whose area of cross-section normal to the length of the wire is $1\,mm^2$. If the number of free electrons per cm^3 is 8.4×10^{22}, then the drift velocity would be [CPMT 1990]

(a) 1.0 mm/sec (b) 1.0 m/sec
(c) 0.1 mm/sec (d) 0.01 mm/sec

39. It is easier to start a car engine on a hot day than on a cold day. This is because the internal resistance of the car battery

(a) Decreases with rise in temperature
(b) Increases with rise in temperature
(c) Decreases with a fall in temperature
(d) Does not change with a change in temperature

40. 5 *amperes* of current is passed through a metallic conductor. The charge flowing in one minute in coulombs will be [MP PET 1984]

(a) 5 (b) 12
(c) 1/12 (d) 300

41. Two wires of the same material are given. The first wire is twice as long as the second and has twice the diameter of the second. The resistance of the first will be [MP PMT 1993]

(a) Twice of the second (b) Half of the second
(c) Equal to the second (d) Four times of the second

42. An electric wire is connected across a cell of e.m.f. *E*. The current I is measured by an ammeter of resistance *R*. According to *ohm*'s law

(a) $E=I^2R$ (b) $E=IR$
(c) $E=R/I$ (d) $E=I/R$

43. The resistances of a wire at temperatures $t°C$ and $0°C$ are related by [MP PMT 1993]

(a) $R_t=R_0(1+\alpha t)$ (b) $R_t=R_0(1-\alpha t)$
(c) $R_t=R_0^2(1+\alpha t)$ (d) $R_t=R_0^2(1-\alpha t)$

44. An electric wire of length '*l*' and area of cross-section a has a resistance *R ohms*. Another wire of the same material having same length and area of cross-section 4*a* has a resistance of [MP PET 1993]

(a) 4*R* (b) *R*/4
(c) *R*/16 (d) 16*R*

45. For which of the following the resistance decreases on increasing the temperature [MP PET 1993]

(a) Copper (b) Tungsten
(c) Germanium (d) Aluminium

46. If n, e, τ and m respectively represent the density, charge relaxation time and mass of the electron, then the resistance of a wire of length l and area of cross-section A will be [CPMT 1992]

(a) $\frac{ml}{ne^2\tau A}$ (b) $\frac{m\tau^2A}{ne^2l}$
(c) $\frac{ne^2\tau A}{2ml}$ (d) $\frac{ne^2A}{2m\tau l}$

47. The relaxation time in conductors [DPMT 2003]

(a) Increases with the increase of temperature
(b) Decreases with the increase of temperature
(c) It does not depend on temperature
(d) All of sudden changes at 400 K

48. Which of the following statement is correct

(a) Liquids obey fully the *ohm*'s law
(b) Liquids obey partially the *ohm*'s law
(c) There is no relation between current and p.d. for liquids

(d) None of the above

49. A certain piece of silver of given mass is to be made like a wire. Which of the following combination of length (L) and the area of cross-sectional (A) will lead to the smallest resistance [MP PMT 1995; CBSE PMT 1997]

(a) L and A

(b) $2L$ and $A/2$

(c) $L/2$ and $2A$

(d) Any of the above, because volume of silver remains same

50. The resistance of a wire is $10\,\Omega$. Its length is increased by 10% by stretching. The new resistance will now be

[CPMT 2000; Pb PET 2004]

(a) $12\,\Omega$ (b) $1.2\,\Omega$

(c) $13\,\Omega$ (d) $11\,\Omega$

51. Resistance of tungsten wire at $150°C$ is $133\,\Omega$. Its resistance temperature coefficient is $0.0045/°C$. The resistance of this wire at $500°C$ will be [DPMT 2004]

(a) $180\,\Omega$ (b) $225\,\Omega$

(c) $258\,\Omega$ (d) $317\,\Omega$

52. A metal wire of specific resistance $64\times10^{-6}\,ohm-cm$ and length 198 *cm* has a resistance of 7 *ohm*, the radius of the wire will be [MP PET 1994]

(a) 2.4 *cm* (b) 0.24 *cm*

(c) 0.024 *cm* (d) 24 *cm*

53. A copper wire of length 1 *m* and radius 1 *mm* is joined in series with an iron wire of length 2 *m* and radius 3 *mm* and a current is passed through the wires. The ratio of the current density in the copper and iron wires is

[MP PMT 1994]

(a) 18 : 1 (b) 9 : 1

(c) 6 : 1 (d) 2 : 3

54. For a metallic wire, the ratio V/i ($V =$ the applied potential difference, i = current flowing) is [MP PMT 1994; BVP 2003]

(a) Independent of temperature

(b) Increases as the temperature rises

(c) Decreases as the temperature rises

(d) Increases or decreases as temperature rises, depending upon the metal

55. The resistance of a wire is R. If the length of the wire is doubled by stretching, then the new resistance will be

[Roorkee 1992; AFMC 1995; KCET 1993; AMU (Med.) 1999; CBSE PMT 1999; MP PET 2001; UPSEAT 2001]

(a) $2R$ (b) $4R$

(c) R (d) $\frac{R}{4}$

56. Which of the following has a negative temperature coefficient

(a) C (b) Fe

(c) Mn (d) Ag

57. The reciprocal of resistance is [AFMC 1995]

(a) Conductance (b) Resistivity

(c) Voltage (d) None of the above

58. A solenoid is at potential difference 60 V and current flows through it is 15 *ampere*, then the resistance of coil will be

[AFMC 1995]

(a) $4\,\Omega$ (b) $8\,\Omega$

(c) $0.25\,\Omega$ (d) $2\,\Omega$

59. All of the following statements are true except

[Manipal MEE 1995]

(a) Conductance is the reciprocal of resistance and is measured in *Siemens*

(b) *Ohm*'s law is not applicable at very low and very high temperatures

(c) *Ohm*'s law is applicable to semiconductors

(d) *Ohm*'s law is not applicable to electron tubes, discharge tubes and electrolytes

60. A potential difference of V is applied at the ends of a copper wire of length l and diameter d. On doubling only d, drift velocity

(a) Becomes two times (b) Becomes half

(c) Does not change (d) Becomes one fourth

61. If the resistance of a conductor is 5 Ω at 50°C and 7 Ω at 100°C then the mean temperature coefficient of resistance of the material is

(a) 0.008/°C (b) 0.006/°C

(c) 0.004/°C (d) 0.001/°C

62. The resistance of a discharge tube is

[AFMC 1996; CBSE PMT 1999]

(a) *Ohm*ic (b) Non-*ohm*ic

(c) Both (a) and (b) (d) Zero

63. We are able to obtain fairly large currents in a conductor because

(a) The electron drift speed is usually very large

(b) The number density of free electrons is very high and this can compensate for the low values of the electron drift speed and the very small magnitude of the electron charge

(c) The number density of free electrons as well as the electron drift speeds are very large and these compensate for the very small magnitude of the electron charge

(d) The very small magnitude of the electron charge has to be divided by the still smaller product of the number density and drift speed to get the electric current

64. A platinum resistance thermometer has a resistance of $50\,\Omega$ at $20°C$. When dipped in a liquid the resistance becomes $76.8\,\Omega$. The temperature coefficient of resistance for platinum is $\alpha = 3.92\times10^{-3}/°C$. The temperature of the liquid is

(a) $100°C$ (b) $137°C$

(c) $167°C$ (d) $200°C$

[AFMC 1995]

65. In a wire of circular cross-section with radius r, free electrons travel with a drift velocity V when a current I flows through the wire. What is the current in another wire of half the radius and of the same material when the drift velocity is $2V$

[MP PET 1997]

(a) $2I$ (b) I

(c) $I/2$ (d) $I/4$

66. The resistivity of a wire depends on its [MP PMT/PET 1998]

(a) Length (b) Area of cross-section

(c) Shape (d) Material

67. The conductivity of a superconductor is

[Similar to KCET 1993; MP PMT/PET 1998]

(a) Infinite (b) Very large

(c) Very small (d) Zero

68. In a neon discharge tube 2.9×10^{18} Ne^+ ions move to the right each *second* while 1.2×10^{18} electrons move to the left per *second*. Electron charge is $1.6 \times 10^{-19} C$. The current in the discharge tube

(a) 1 A towards right (b) 0.66 A towards right

(c) 0.66 A towards left (d) Zero

69. A steady current flows in a metallic conductor of non-uniform cross-section. The quantity/ quantities constant along the length of the conductor is/are

[KCET 1994, IIT 1997 Cancelled; CBSE PMT 2001]

(a) Current, electric field and drift speed

(b) Drift speed only

(c) Current and drift speed

(d) Current only

70. The resistivity of alloys $= R_{alloy}$; the resistivity of constituent metals R_{metal}. Then, usually [KCET 1994]

(a) $R_{alloy} = R_{metal}$

(b) $R_{alloy} < R_{metal}$

(c) There is no simple relation between R_{alloy} and R_{metal}

(d) $R_{alloy} > R_{metal}$

71. Two wires A and B of same material and same mass have radius $2r$ and r. If resistance of wire A is $34\,\Omega$, then resistance of B will be

(a) $544\,\Omega$ (b) $272\,\Omega$

(c) $68\,\Omega$ (d) $17\,\Omega$

72. Two rods of same material and length have their electric resistance in ratio $1:2$. When both rods are dipped in water, the correct statement will be [RPMT 1997]

(a) A has more loss of weight

(b) B has more loss of weight

(c) Both have same loss of weight

(d) Loss of weight will be in the ratio $1:2$

73. $20\,\mu A$ current flows for 30 *seconds* in a wire, transfer of charge will be [RPMT 1997]

(a) $2 \times 10^{-4} C$ (b) $4 \times 10^{-4} C$

(c) $6 \times 10^{-4} C$ (d) $8 \times 10^{-4} C$

74. σ_1 and σ_2 are the electrical conductivities of *Ge* and *Na* respectively. If these substances are heated, then

(a) Both σ_1 and σ_2 increase

(b) σ_1 increases and σ_2 decreases

(c) σ_1 decreases and σ_2 increases

(d) Both σ_1 and σ_2 decrease

75. 1.6 *mA* current is flowing in conducting wire then the number of electrons flowing per *second* is [RPMT 1999]

(a) 10^{11} (b) 10^{16}

(c) 10^{19} (d) 10^{15}

76. A current I is passing through a wire having two sections P and Q of uniform diameters d and $d/2$ respectively. If the mean drift velocity of electrons in sections P and Q is denoted by v_P and v_Q respectively, then [MP PET 1999] [Roorkee 1999]

(a) $v_P = v_Q$ (b) $v_P = \frac{1}{2} v_Q$

(c) $v_P = \frac{1}{4} v_Q$ (d) $v_P = 2\, v_Q$

77. If an electric current is passed through a nerve of a man, then man

(a) Begins to laugh

(b) Begins to weep

(c) Is excited

(d) Becomes insensitive to pain

78. The resistance of a coil is 4.2 Ω at 100° C and the temperature coefficient of resistance of its material is 0.004/° C. Its resistance at 0° C is [KCET 1999]

(a) 6.5 Ω (b) 5 Ω

(c) 3 Ω (d) 4 Ω

79. Masses of three wires of copper are in the ratio of 1 : 3 : 5 and their lengths are in the ratio of $5:3:1$. The ratio of their electrical resistances are [AFMC 2000]

(a) 1 : 3 : 5 (b) 5 : 3 : 1

(c) 1 : 15 : 125 (d) 125 : 15 : 1

80. Conductivity increases in the order of [RPET 1997] [AFMC 2000]

(a) *Al, Ag, Cu* (b) *Al, Cu, Ag*

(c) *Cu, Al, Ag* (d) *Ag, Cu, Al*

81. A uniform wire of resistance R is uniformly compressed along its length, until its radius becomes n times the original radius. Now resistance of the wire becomes

[KCET 2000]

(a) $\frac{R}{n^4}$ (b) $\frac{R}{n^2}$

(c) $\frac{R}{n}$ (d) nR

82. The resistance of a conductor is 5 *ohm* at 50°C and 6 *ohm* at 100°C. Its resistance at 0°C is [KCET 2000]

(a) 1 *ohm* (b) 2 *ohm*

(c) 3 *ohm* (d) 4 *ohm*

83. If an electron revolves in the path of a circle of radius of 0.5×10^{-10} *m* at frequency of 5×10^{15} *cycles/s* the electric current in the circle is (Charge of an electron = 1.6×10^{-19} C)

[EAMCET 2000]

(a) 0.4 mA (b) 0.8 mA

(c) 1.2 mA (d) 1.6 mA

84. Equal potentials are applied on an iron and copper wire of same length. In order to have the same current flow in the two wires, the ratio r (iron)/r (copper) of their radii must be (Given that specific resistance of iron = 1.0×10^{-7} *ohm–m* and specific resistance of copper = 1.7×10^{-8} *ohm-m*)

[MP PMT 2000]

(a) About 1.2 (b) About 2.4

(c) About 3.6 (d) About 4.8

85. An electron (charge = 1.6×10^{-19} *coulomb*) is moving in a circle of radius 5.1×10^{-11} m at a frequency of 6.8×10^{15} *revolutions/sec*. The equivalent current is approximately

[MP PET 2000]

(a) 5.1×10^{-3} *amp* (b) 6.8×10^{-3} *amp*

(c) 1.1×10^{-3} *amp* (d) 2.2×10^{-3} *amp*

86. A rod of a certain metal is 1.0 m long and 0.6 cm in diameter. Its resistance is 3.0×10^{-3} *ohm*. Another disc made of the same metal is 2.0 cm in diameter and 1.0 mm thick. What is the resistance between the round faces of the disc

(a) 1.35×10^{-8} *ohm* (b) 2.70×10^{-7} *ohm*

(c) 4.05×10^{-6} *ohm* (d) 8.10×10^{-5} *ohm*

87. At what temperature will the resistance of a copper wire become three times its value at $0^\circ C$ (Temperature coefficient of resistance for copper = 4×10^{-3} *per* $^\circ C$)

[MP PET 2000]

(a) $400^\circ C$ (b) $450^\circ C$

(c) $500^\circ C$ (d) $550^\circ C$

88. An electron revolves 6×10^{15} *times/sec* in circular loop. The current in the loop is [MNR 1995; UPSEAT 2000]

(a) 0.96 mA (b) 0.96 μA

(c) 28.8 A (d) None of these

89. The charge of an electron is 1.6×10^{-19} C. How many electrons strike the screen of a cathode ray tube each *second* when the beam current is 16 mA [AMU (Med.) 2000]

(a) 10^{17} (b) 10^{19}

(c) 10^{-19} (d) 10^{-17}

90. If potential $V = 100 \pm 0.5\, Volt$ and current $I = 10 \pm 0.2$ *amp* are given to us. Then what will be the value of resistance

(a) $10 \pm 0.7\, ohm$ (b) $5 \pm 2\, ohm$

(c) $0.1 \pm 0.2 ohm$ (d) None of these

91. A nichrome wire 50 cm long and one square *millimetre* cross-section carries a current of $4A$ when connected to a $2V$ battery. The resistivity of nichrome wire in *ohm metre* is

[EAMCET 2001]

(a) 1×10^{-6} (b) 4×10^{-7}

(c) 3×10^{-7} (d) 2×10^{-7}

92. If an observer is moving with respect to a stationary electron, then he observes [DCE 2001]

(a) Only magnetic field (b) Only electric field

(c) Both (a) and (b) (d) None of the above

93. Calculate the amount of charge flowing in 2 *minutes* in a wire of resistance 10 Ω when a potential difference of 20 V is applied between its ends [Kerala (Engg.) 2001]

(a) 120 C (b) 240 C

(c) 20 C (d) 4 C

94. If a wire of resistance R is melted and recasted to half of its length, then the new resistance of the wire will be

[KCET (Med.) 2001]

(a) $R/4$ (b) $R/2$

(c) R (d) $2R$

95. The drift velocity does not depend upon [BHU 2001]

(a) Cross-section of the wire (b) Length of the wire

(c) Number of free electrons (d) Magnitude of the current

96. There is a current of 40 *ampere* in a wire of $10^{-6}\, m^2$ area of cross-section. If the number of free electron per m^3 is 10^{29}, then the drift velocity will be [Pb. PMT 2001]

(a) 1.25×10^{3} m/s (b) 2.50×10^{-3} m/s

(c) 25.0×10^{-3} m/s (d) 250×10^{-3} m/s

[MP PET 2000]

97. At room temperature, copper has free electron density of 8.4×10^{28} per m^3. The copper conductor has a cross-section of 10^{-6} m^2 and carries a current of 5.4 A. The electron drift velocity in copper is [UPSEAT 2002]

(a) 400 m/s (b) 0.4 m/s

(c) 0.4 mm/s (d) 72 m/s

98. The resistance of a 5 cm long wire is 10 Ω. It is uniformly stretched so that its length becomes 20 cm. The resistance of the wire is

(a) 160 Ω (b) 80 Ω

(c) 40 Ω (d) 20 Ω

99. The resistance of an incandescent lamp is [KCET 2002]

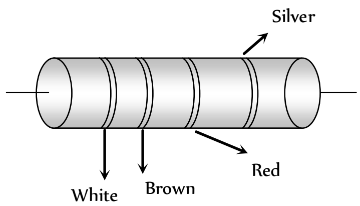
(a) Greater when switched off

(b) Smaller when switched on

(c) Greater when switched on

(d) The same whether it is switched off or switched on

100. In the figure a carbon resistor has bands of different colours on its body as mentioned in the figure. The value of the resistance is



(a) 2.2 $k\Omega$

(b) 3.3 $k\Omega$ [RPET 2001]

(c) 5.6 $k\Omega$

(d) 9.1 $k\Omega$

101. By increasing the temperature, the specific resistance of a conductor and a semiconductor [AIEEE 2002]

(a) Increases for both

(b) Decreases for both

(c) Increases, decreases

(d) Decreases, increases

102. Which of the following is vector quantity [AFMC 2002]

(a) Current density (b) Current

(c) Wattless current (d) Power

103. Masses of 3 wires of same metal are in the ratio 1 : 2 : 3 and their lengths are in the ratio 3 : 2 : 1. The electrical resistances are in ratio [CPMT 2002]

(a) 1 : 4 : 9 (b) 9 : 4 : 1

(c) 1 : 2 : 3 (d) 27 : 6 : 1

104. A current of 1 *mA* is flowing through a copper wire. How many electrons will pass a given point in one *second*

[$e = 1.6 \times 10^{-}$ *Coulomb*] [RPMT 2000; MP PMT 2002]

(a) 6.25×10^{19} (b) 6.25×10^{15}

(c) 6.25×10^{31} (d) 6.25×10^{8}

105. The drift velocity of free electrons in a conductor is '*v*' when a current '*i*' is flowing in it. If both the radius and current are doubled, then drift velocity will be [BHU 2002]

(a) v (b) $\frac{v}{2}$

(c) $\frac{v}{4}$ (d) $\frac{v}{8}$

106. A wire of radius *r* has resistance *R*. If it is stretched to a radius of $\frac{3r}{4}$, its resistance becomes [BHU 2002]

(a) $\frac{9R}{16}$ (b) $\frac{16R}{9}$

(c) $\frac{81R}{256}$ (d) $\frac{256R}{81}$

107. The resistance of a conductor increases with [CBSE PMT 2002]

(a) Increase in length

(b) Increase in temperature

(c) Decrease in cross–sectional area

(d) All of these

108. A copper wire has a square cross-section, 2.0 *mm* on a side. It carries a current of 8 *A* and the density of free electrons is $8 \times 10^{28}\ m^{-3}$. The drift speed of electrons is equal to [AMU (Med.) 2002]

(a) 0.156×10^{-3} *m.s* (b) 0.156×10^{-2} *m.s*

(c) 3.12×10^{-3} *m.s* (d) 3.12×10^{-2} *m.s*

109. Two wires of same material have length L and $2L$ and cross–sectional areas $4A$ and A respectively. The ratio of their specific resistance would be [MHCET 2002]

(a) 1 : 2 (b) 8 : 1

(c) 1 : 8 (d) 1 : 1

110. When a current flows through a conductor its temperature [MHCET 2002]

(a) May increase or decrease

(b) Remains same

(c) Decreases

(d) Increases

111. What length of the wire of specific resistance $48 \times 10^{-8}\ \Omega\ m$ is needed to make a resistance of $4.2\ \Omega$ (diameter of wire = 0.4 *mm*) [CBSE PMT 2000; Pb. PMT 2002]

(a) 4.1 *m* (b) 3.1 *m*

(c) 2.1 *m* (d) 1.1 *m*

112. A strip of copper and another of germanium are cooled from room temperature to 80 *K*. The resistance of [AIEEE 2003]

(a) Each of these increases

(b) Each of these decreases

(c) Copper strip increases and that of germanium decreases

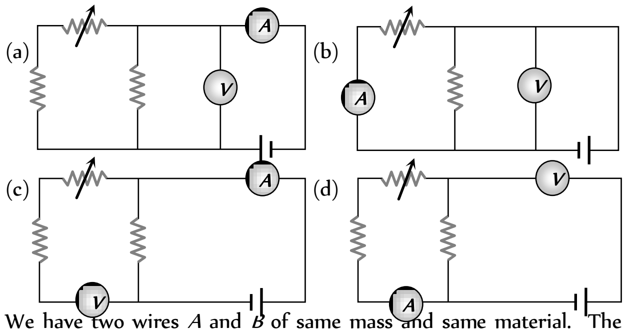
(d) Copper strip decreases and that of germanium increases

113. The length of a given cylindrical wire is increased by 100 %. Due to the consequent decrease in diameter the change in the resistance of the wire will be [AIEEE 2003]

(a) 300 % (b) 200 %

(c) 100 % (d) 50 %

114. Express which of the following setups can be used to verify Ohm's law [IIT-JEE (Screening) 2003]



115. We have two wires *A* and *B* of same mass and same material. The diameter of the wire *A* is half of that *B*. If the resistance of wire *A* is 24 *ohm* then the resistance of wire *B* will be

(a) 12 *Ohm* (b) 3.0 *Ohm*

(c) 1.5 *Ohm* (d) None of the above

116. In a hydrogen discharge tube it is observed that through a given cross-section 3.13×10^{15} electrons are moving from right to left and 3.12×10^{15} protons are moving from left to right. What is the electric current in the discharge tube and what is its direction

(a) $1 mA$ towards right (b) $1 mA$ towards left

(c) $2 mA$ towards left (d) $2 mA$ towards right

117. A steady current *i* is flowing through a conductor of uniform cross-section. Any segment of the conductor has [MP PET 1996]

(a) Zero charge

(b) Only positive charge

(c) Only negative charge

(d) Charge proportional to current *i*

118. The length of the wire is doubled. Its conductance will be [Kerala PMT 2004]

(a) Unchanged (b) Halved

(c) Quadrupled (d) 1/4 of the original value

119. A source of e.m.f. $E = 15\ V$ and having negligible internal resistance is connected to a variable resistance so that the current in the circuit increases with time as $i = 1.2\ t + 3$. Then, the total charge that will flow in first five second will be

(a) 10 *C* (b) 20 *C*

(c) 30 *C* (d) 40 *C*

120. The new resistance of wire of $R\,\Omega$, whose radius is reduced half, is [J & K CET

(a) 16 *R* (b) 3 *R*

(c) 2*R* (d) *R*

121. A resistance *R* is stretched to four times its length. Its new resistance will be [ISM Dhanbad 1994; UPSEAT 2003]

(a) 4 *R* (b) 64 *R*

(c) $R/4$ (d) 16 R

122. What is the resistance of a carbon resistance which has bands of colours brown, black and brown [DCE 1999]

(a) 100 Ω (b) 1000 Ω

(c) 10 Ω (d) 1 Ω

123. The lead wires should have [Pb. PMT 2000]

(a) Larger diameter and low resistance

(b) Smaller diameter and high resistance

(c) Smaller diameter and low resistance

(d) Larger diameter and high resistance

124. The alloys constantan and manganin are used to make standard resistance due to they have

[MH CET 2000; NCERT 1990]

(a) Low resistivity

(b) High resistivity

(c) Low temperature coefficient of resistance

(d) Both (b) and (c)

125. When a potential difference is applied across the ends of a linear metallic conductor [MP PET 1997]

(a) The free electrons are accelerated continuously from the lower potential end to the higher potential end of the conductor

(b) The free electrons are accelerated continuously from the higher potential end to the lower potential end of the conductor

(c) The free electrons acquire a constant drift velocity from the lower potential end to the higher potential end of the conductor

(d) The free electrons are set in motion from their position of rest

126. The electric resistance of a certain wire of iron is *R*. If its length and radius are both doubled, then [CBSE PMT 2004]

(a) The resistance will be doubled and the specific resistance will be halved

(b) The resistance will be halved and the specific resistance will remain unchanged

(c) The resistance will be halved and the specific resistance will be doubled

(d) The resistance and the specific resistance, will both remain unchanged

127. A wire of diameter 0.02 *metre* contains 10^{28} free electrons per cubic metre. For an electrical current of 100 *A*, the drift velocity of the free electrons in the wire is nearly

[UPSEAT 2004]

(a) 1×10^{-19} *m/s* (b) 5×10^{-10} *m/s*

(c) 2×10^{-4} *m/s* (d) 8×10^{3} *m/s*

128. The following four wires are made of the same material and are at the same temperature. Which one of them has highest electrical resistance [UPSEAT 2004]

(a) Length = 50 *cm*, diameter = 0.5 *mm*

(b) Length = 100 *cm*, diameter = 1 *mm*

(c) Length = 200 *cm*, diameter = 2 *mm*

(d) Length = 300 *cm*, diameter = 3 *mm*

129. The colour sequence in a carbon resistor is red, brown, orange and silver. The resistance of the resistor is

[DCE 2004]

(a) $21 \times 10^{3} \pm 10\%$ (b) $23 \times 10^{1} \pm 10$

(c) $21 \times 10^{3} \pm 5\%$ (d) $12 \times 10^{3} \pm 5\%$

130. A thick wire is stretched so that its length become two times. Assuming that there is no change in its density, then what is the ratio of change in resistance of wire to the initial resistance of wire

(a) 2 : 1 (b) 4 : 1

(c) 3 : 1 (d) 1 : 4

131. The length of the resistance wire is increased by 10%. What is the corresponding change in the resistance of wire

[MH CET 2004]

(a) 10% (b) 25%

(c) 21% (d) 9%

132. The electric field *E*, current density *J* and conductivity σ of a conductor are related as [Kerala PMT 2005]

(a) $\sigma = E/j$ (b) $\sigma = j/E$

(c) $\sigma = jE$ (d) $\sigma = 1/jE$

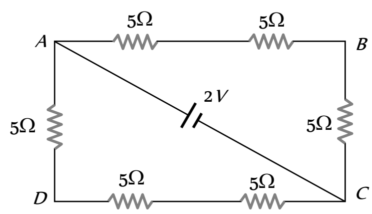
133. Two wires that are made up of two different materials whose specific resistance are in the ratio 2 : 3, length 3 : 4 and area 4 : 5. The ratio of their resistances is [Kerala PMT 2005]

(a) 6 : 5 (b) 6 : 8

(c) 5 : 8 (d) 1 : 2

Grouping of Resistances

1. The potential difference between points A and B of adjoining figure is [CPMT 1991]



(a) $\frac{2}{3}V$

(b) $\frac{8}{9}V$

(c) $\frac{4}{3}V$

(d) 2 V

2. Two resistors of resistance R_1 and R_2 having $R_1 > R_2$ are connected in parallel. For equivalent resistance R, the correct statement is [CPMT 1978; KCET (Med.) 2000]

(a) $R > R_1 + R_2$ (b) $R_1 < R < R_2$

(c) $R_2 < R < (R_1 + R_2)$ (d) $R < R_1$

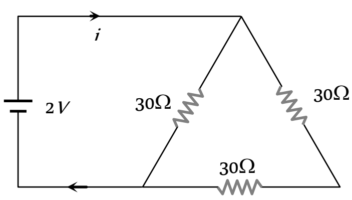
3. A wire of resistance R is divided in 10 equal parts. These parts are connected in parallel, the equivalent resistance of such connection will be [CPMT 1973, 91]

(a) 0.01 *R* (b) 0.1 *R*

(c) 10 *R* (d) 100 *R*

4. The current in the adjoining circuit will be

[IIT 1983; CPMT 1991, 92; MH CET 2002; Pb. PMT 2001; Kerala PMT 2004]



(a) $\frac{1}{45}$ *ampere*

(b) $\frac{1}{15}$ *ampere*

(c) $\frac{1}{10}$ *ampere*

(d) $\frac{1}{5}$ *ampere*

5. There are 8 equal resistances *R*. Two are connected in parallel, such four groups are connected in series, the total resistance of the system will be [MP PMT 1987]

(a) $R/2$ (b) $2R$

(c) $4R$ (d) $8R$

6. Three resistances of one *ohm* each are connected in parallel. Such connection is again connected with $2/3\,\Omega$ resistor in series. The resultant resistance will be [MP PMT 1985]

(a) $\frac{5}{3}\Omega$ (b) $\frac{3}{2}\Omega$

(c) 1Ω (d) $\frac{2}{3}\Omega$

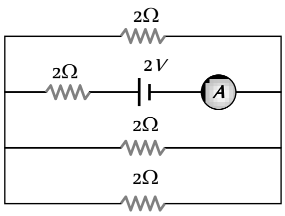
7. The lowest resistance which can be obtained by connecting 10 resistors each of 1/10 *ohm* is

[MP PMT 1984; EAMCET 1994]

(a) $1/250\,\Omega$ (b) $1/200\,\Omega$

(c) $1/100\,\Omega$ (d) $1/10\,\Omega$

8. The reading of the ammeter as per figure shown is



(a) $\frac{1}{8}A$

(b) $\frac{3}{4}A$

(c) $\frac{1}{2}A$

(d) 2 A

9. Three resistors each of 2 *ohm* are connected together in a triangular shape. The resistance between any two vertices will be

[CPMT 1983; MP PET 1990; MP PMT 1993; DCE 2004]

(a) 4/3 *ohm* (b) 3/4 *ohm*

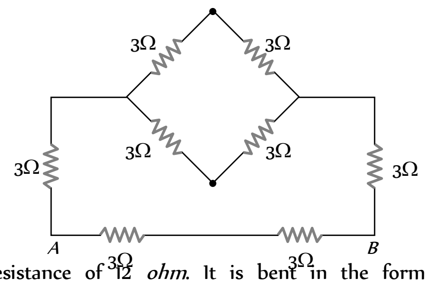
(c) 3 *ohm* (d) 6 *ohm*

10. There are n similar conductors each of resistance R. The resultant resistance comes out to be x when connected in parallel. If they are connected in series, the resistance comes out to be

(a) x/n^2 (b) n^2x

(c) x/n (d) nx

11. Equivalent resistance between *A* and *B* will be [CPMT 1981]



(a) 2 *ohm*

(b) 18 *ohm*

(c) 6 *ohm*

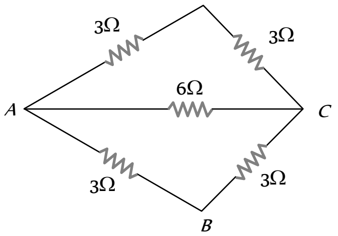
(d) 3.6 *ohm*

12. A wire has a resistance of 12 *ohm*. It is bent in the form of equilateral triangle. The effective resistance between any two corners of the triangle is

(a) 9 *ohms* (b) 12 *ohms*

(c) 6 *ohms* (d) 8/3 *ohms*

13. The effective resistance between the points A and B in the figure is [MP PET 1994]



(a) $5\,\Omega$

(b) $2\,\Omega$

(c) $3\,\Omega$

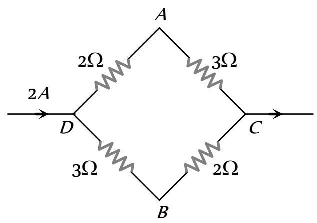
(d) $4\,\Omega$

14. Three resistances of magnitude 2, 3 and 5 *ohm* are connected in parallel to a battery of 10 volts and of negligible resistance. The potential difference across $3\,\Omega$ resistance will be

(a) 2 *volts* (b) 3 *volts*

(c) 5 *volts* (d) 10 *volts*

15. A current of 2 A flows in a system of conductors as shown. The potential difference $(V_A - V_B)$ will be [CPMT 1975, 76]



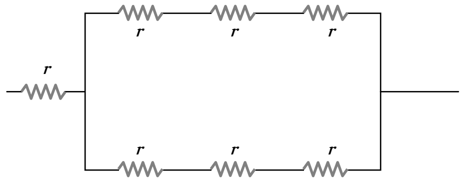
(a) $+2\,V$

(b) $+1\,V$

(c) $-1\,V$

(d) $-2\,V$

16. Referring to the figure below, the effective resistance of the network is [NCERT 1973, 75]



(a) $2r$

(b) $4r$

(c) $10\,r$

(d) $5r/2$

17. Two resistances are joined in parallel whose resultant is $\frac{6}{8}$ *ohm*. One of the resistance wire is broken and the effective resistance becomes $2\,\Omega$. Then the resistance in *ohm* of the wire that got broken was

[DPMT 2004] [CPMT 1976; DPMT 1982]

(a) 3/5 (b) 2

(c) 6/5 (d) 3

18. Given three equal resistors, how many different combination of all the three resistors can be made [NCERT 1970]

(a) Six (b) Five

(c) Four (d) Three

19. Lamps used for household lighting are connected in

(a) Series (b) Parallel

(c) Mixed circuit (d) None of the above

20. The equivalent resistance of resistors connected in series is always [CPMT 1984;

(a) Equal to the mean of component resistors

(b) Less than the lowest of component resistors

(c) In between the lowest and the highest of component resistors

(d) Equal to sum of component resistors

21. A cell of negligible resistance and e.m.f. 2 volts is connected to series combination of 2, 3 and 5 *ohm*. The potential difference in volts between the terminals of 3 *ohm* resistance will be

(a) 0.6 (b) 2/3

(c) 3 (d) 6

22. Four wires of equal length and of resistances 10 *ohms* each are connected in the form of a square. The equivalent resistance between two opposite corners of the square is [NCERT 1977]

(a) 10 ohm (b) 40 ohm

(c) 20 ohm (d) 10/4 ohm

23. Two resistors are connected (a) in series (b) in parallel. The equivalent resistance in the two cases are 9 ohm and 2 ohm respectively. Then the resistances of the component resistors are

(a) 2 ohm and 7 ohm (b) 3 ohm and 6 ohm

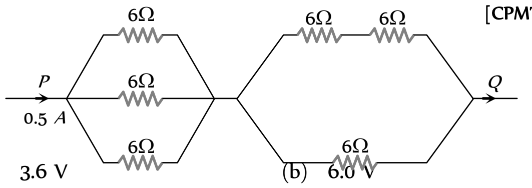
(c) 3 ohm and 9 ohm (d) 5 ohm and 4 ohm

24. Resistors of 1, 2, 3 *ohm* are connected in the form of a triangle. If a 1.5 volt cell of negligible internal resistance is connected across 3 *ohm* resistor, the current flowing through this resistance will be

(a) 0.25 *amp* (b) 0.5 *amp*

(c) 1.0 *amp* (d) 1.5 *amp*

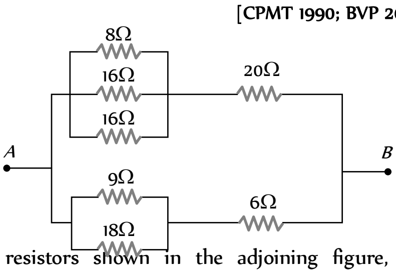
25. Resistances of 6 *ohm* each are connected in the manner shown in adjoining figure. With the current 0.5 *ampere* as shown in figure, the potential difference $V_P - V_Q$ is [CPMT 1989]



(a) 3.6 V (b) 6.0 V

(c) 3.0 V (d) 7.2 V

26. The equivalent resistance of the arrangement of resistances shown in adjoining figure between the points *A* and *B* is [CPMT 1990; BVP 2003]



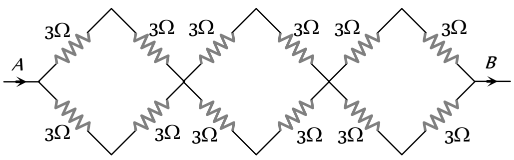
(a) 6 *ohm*

(b) 8 *ohm*

(c) 16 *ohm*

(d) 24 *ohm*

27. In the network of resistors shown in the adjoining figure, the equivalent resistance between *A* and *B* is



(a) 54 *ohm* (b) 18 *ohm*

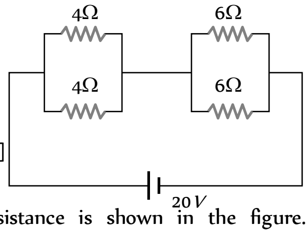
(c) 36 *ohm* (d) 9 *ohm*

28. A wire is broken in four equal parts. A packet is formed by keeping the four wires together. The resistance of the packet in comparison to the resistance of the wire will be [MP PET 1985; AFMC 2005]

(a) Equal (b) One fourth

(c) One eight (d) $\frac{1}{16}th$

29. Four resistances are connected in a circuit in the given figure. The electric current flowing through 4 *ohm* and 6 *ohm* resistance is respectively [MP PET 1993]



(a) 2 *amp* and 4 *amp*

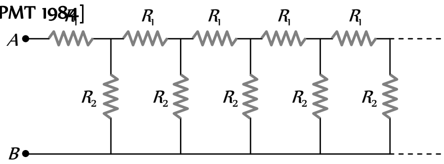
(b) 1 *amp* and 2 *amp*

(c) 1 *amp* and 1 *amp* [CPMT 1984]

(d) 2 *amp* and 2 *amp*

30. An infinite sequence of resistance is shown in the figure. The resultant resistance between *A* and *B* will be, when $R_1 = 1\,ohm$ and $R_2 = 2\,ohm$ [MP PET 1993]

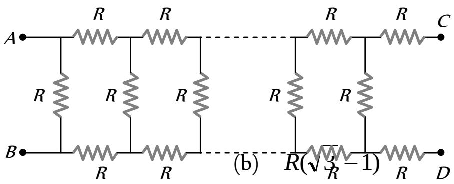
[CPMT 1984]



(a) Infinity (b) 1Ω

(c) 2Ω (d) 1.5Ω

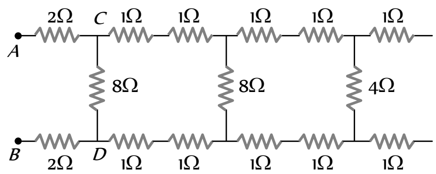
31. In the figure, the value of resistors to be connected between *C* and *D* so that the resistance of the entire circuit between *A* and *B* does not change with the number of elementary sets used is



(a) *R* (b) $R(\sqrt{3}-1)$

(c) 3 *R* (d) $R(\sqrt{3}+1)$

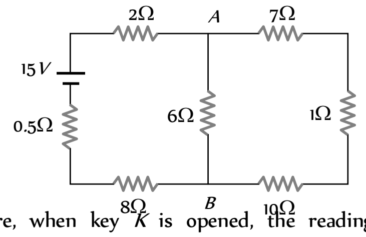
32. In the figure shown, the total resistance between *A* and *B* is



(a) 12Ω (b) 4Ω

(c) 6Ω (d) 8Ω

33. The current from the battery in circuit diagram shown is [IIT 1989]



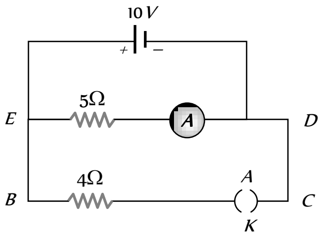
(a) 1 *A*

(b) 2 *A*

(c) 1.5 *A*

(d) 3 *A*

34. In the given figure, when key *K* is opened, the reading of the ammeter *A* will be



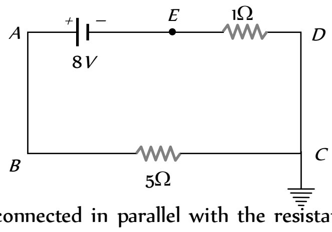
(a) 50 *A*

(b) 2 A

(c) 0.5 A

(d) $\frac{10}{9}A$

35. In the given circuit, the potential of the point E is [MP PMT 2003]



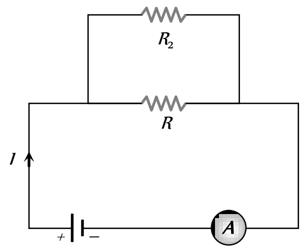
(a) Zero

(b) $-8\,V$

(c) $-4/3\,V$

(d) 4/3 V

36. If a resistance R_2 is connected in parallel with the resistance R in the circuit shown, then possible value of current through R and the possible value of R_2 will be



(a) $\frac{I}{3}, R$

(b) $I, 2R$

(c) $\frac{I}{3}, 2R$

(d) $\frac{I}{2}, R$

37. Four wires *AB, BC, CD, DA* of resistance 4 *ohm* each and a fifth wire *BD* of resistance 8 *ohm* are joined to form a rectangle *ABCD* of which *BD* is a diagonal. The effective resistance between the points *A* and *B* is [MP PMT 1994]

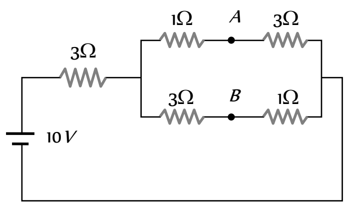
(a) 24 *ohm*

(b) 16 *ohm*

(c) $\frac{4}{3}ohm$

(d) $\frac{8}{3}ohm$

38. A battery of e.m.f. 10 V is connected to resistance as shown in figure. The potential difference $V_A - V_B$ between the points A and B is



(a) $-2V$

(b) $2V$

(c) $5V$

(d) $\frac{20}{11}V$

39. Three resistances, each of 1 *ohm*, are joined in parallel. Three such combinations are put in series, then the resultant resistance will be

(a) 9 *ohm*

(b) 3 *ohm*

(c) 1 *ohm*

(d) $\frac{1}{3}ohm$

40. A student has 10 resistors of resistance 'r'. The minimum resistance made by him from given resistors is [AFMC 1995]

(a) 10 r

(b) $\frac{r}{10}$

(c) $\frac{r}{100}$

(d) $\frac{r}{5}$

41. Two wires of same metal have the same length but their cross-sections are in the ratio $3:1$. They are joined in series. The resistance of the thicker wire is $10\,\Omega$. The total resistance of the combination will be [CBSE PMT 1995]

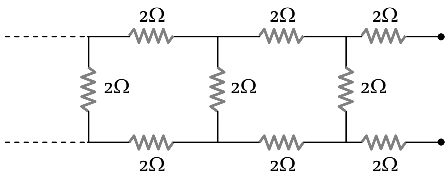
(a) $40\,\Omega$

(b) $\frac{40}{3}\Omega$

(c) $\frac{5}{2}\Omega$

(d) $100\,\Omega$

42. The equivalent resistance of the following infinite network of resistances is [AIIMS 1995]



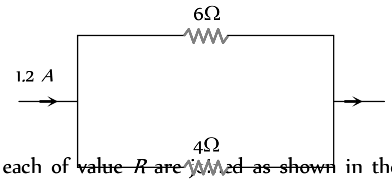
(a) Less than $4\,\Omega$

(b) $4\,\Omega$

(c) More than $4\,\Omega$ but less than $12\,\Omega$

(d) $12\,\Omega$

43. In the figure given below, the current passing through $6\,\Omega$ resistor is [Manipal MEE 1995]



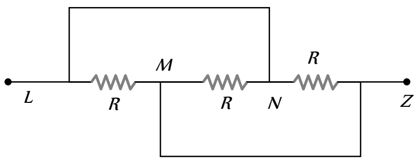
(a) 0.40 *ampere*

(b) 0.48 *ampere*

(c) 0.72 *ampere*

(d) 0.80 *ampere*

44. Three equal resistances each of value R are joined as shown in the figure. The equivalent resistance between M and N is [MP PET 1995]



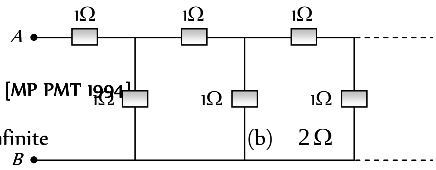
(a) R

(b) $2R$

(c) $\frac{R}{2}$ [MP PMT 1994]

(d) $\frac{R}{3}$

45. The equivalent resistance between points A and B of an infinite network of resistances each of $1\,\Omega$ connected as shown, is



[MP PMT 1994]

(a) Infinite

(b) $2\,\Omega$

(c) $\frac{1+\sqrt{5}}{2}\Omega$

(d) Zero

46. A copper wire of resistance R is cut into ten parts of equal length. Two pieces each are joined in series and then five such combinations are joined in parallel. The new combination will have a resistance

(a) R

(b) $\frac{R}{4}$

(c) $\frac{R}{5}$

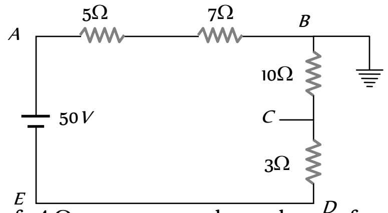
(d) $\frac{R}{25}$

47. A wire has resistance 12Ω. It is bent in the form of a circle. The effective resistance between the two points on any diameter is equal to [JIPMER 1999]

(a) 12Ω (b) 6Ω

(c) 3Ω (d) 24Ω

48. In the circuit shown, the point '*B*' is earthed. The potential at the point '*A*' is



(a) 14 *V*

(b) 24 *V*

(c) 26 *V*

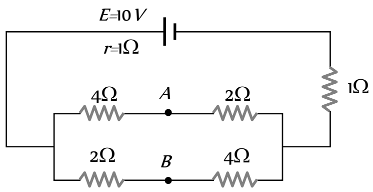
(d) 50 *V*

49. Three resistors each of 4Ω are connected together to form a network. The equivalent resistance of the network cannot be

(a) 1.33Ω (b) 3.0Ω

(c) 6.0Ω (d) 12.0Ω

50. In the circuit shown below, the cell has an e.m.f. of 10 *V* and internal resistance of 1 *ohm*. The other resistances are shown in the figure. The potential difference $V_A - V_B$ is [MP PMT 1997]



(a) 6 *V*

(b) 4 *V*

(c) 2 *V*

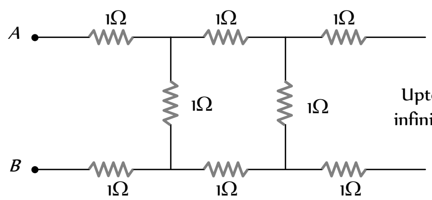
(d) -2 *V*

51. *A* wire of resistance *R* is cut into '*n*' equal parts. These parts are then connected in parallel. The equivalent resistance of the combination will be [MP PMT/PET 1998; BHU 2005]

(a) nR (b) $\frac{R}{n}$

(c) $\frac{n}{R}$ (d) $\frac{R}{n^2}$

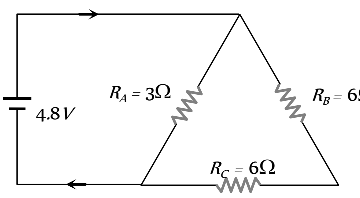
52. The resistance between the terminal points *A* and *B* of the given infinitely long circuit will be [MP PMT/PET 1998]



(a) $(\sqrt{3}-1)$ (b) $(1-\sqrt{3})$

(c) $(1+\sqrt{3})$ (d) $(2+\sqrt{3})$

53. The current in the given circuit is [CBSE PMT 1999]



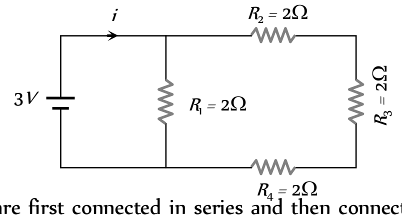
(a) 8.31 *A*

(b) 6.82 *A*

(c) 4.92 *A*

(d) 2 *A*

54. What is the current (i) in the circuit as shown in figure [AIIMS 1998]



(a) 2 *A*

(b) 1.2 *A*

(c) 1 *A*

(d) 0.5 *A*

55. *n* equal resistors are first connected in series and then connected in parallel. What is the ratio of the maximum to the minimum resistance [KCET 1994]

(a) n (b) $\frac{1}{n^2}$

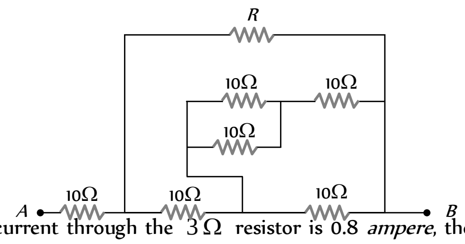
(c) n^2 (d) $\frac{1}{n}$

56. A uniform wire of 16Ω is made into the form of a square. Two opposite corners of the square are connected by a wire of resistance 16Ω. The effective resistance between the other two opposite corners is [EAMCET (Med.) 1995]

(a) 32Ω (b) 20Ω

(c) 8Ω (d) 4Ω

57. For what value of *R* the net resistance of the circuit will be 18 *ohms*



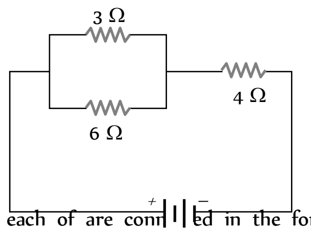
(a) 8Ω

(b) 10Ω

(c) 16Ω

(d) 24Ω

58. In the figure, current through the 3Ω resistor is 0.8 *ampere*, then potential drop through 4Ω resistor is [CBSE PMT 1993; AFMC 1999; MP PMT 2004]



(a) 9.6 *V*

(b) 2.6 *V*

(c) 4.8 *V*

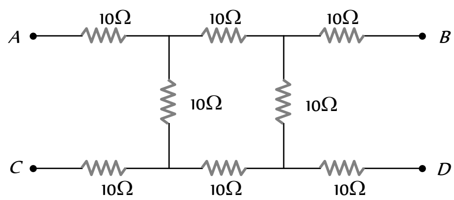
(d) 1.2 *V*

59. Three resistances 4Ω each of are connected in the form of an equilateral triangle. The effective resistance between two corners is

(a) 8Ω (b) 12Ω

(c) $\frac{3}{8}\Omega$ (d) $\frac{8}{3}\Omega$

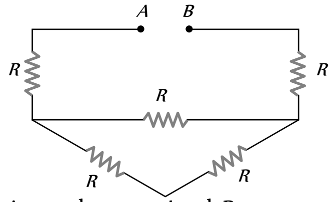
60. What will be the equivalent resistance between the two points *A* and *D* [CBSE PMT 1996]



(a) $10\,\Omega$ (b) $20\,\Omega$

(c) $30\,\Omega$ (d) $40\,\Omega$

61. What is the equivalent resistance between A and B in the figure below if $R = 3\,\Omega$ [SCRA 1996]



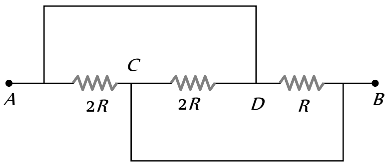
(a) $9\,\Omega$

(b) $12\,\Omega$

(c) $15\,\Omega$

(d) None of these

62. What is the equivalent resistance between A and B [BHU 1997; MP PET 2001]



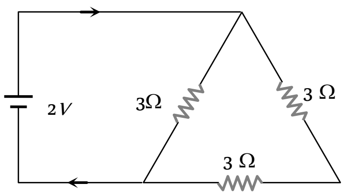
(a) $\frac{2}{3}R$

(b) $\frac{3}{2}R$

(c) $\frac{R}{2}$

(d) $2R$

63. The current in the following circuit is [CBSE PMT 1997]



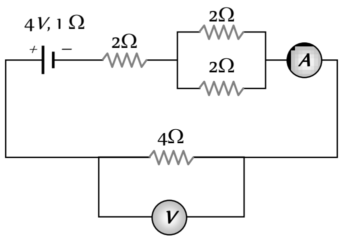
(a) $\frac{1}{8}A$

(b) $\frac{2}{9}A$

(c) $\frac{2}{3}A$

(d) $1A$

64. What is the equivalent resistance of the circuit [KCET 1998]



(a) $6\,\Omega$

(b) $7\,\Omega$

(c) $8\,\Omega$

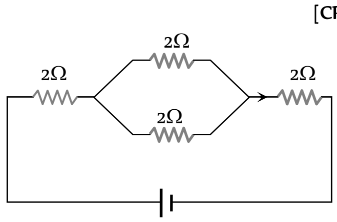
(d) $9\,\Omega$

65. 10 wires (same length, same area, same material) are connected in parallel and each has 1Ω resistance, then the equivalent resistance will be [RPMT 1999]

(a) $10\,\Omega$ (b) $1\,\Omega$

(c) $0.1\,\Omega$ (d) $0.001\,\Omega$

66. The equivalent resistance of the circuit shown in the figure is [CPMT 1999]



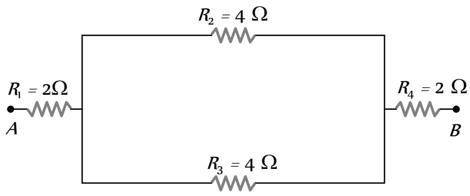
(a) $8\,\Omega$

(b) $6\,\Omega$

(c) $5\,\Omega$

(d) $4\,\Omega$

67. In the given figure, the equivalent resistance between the points A and B is [AIIMS 1999]



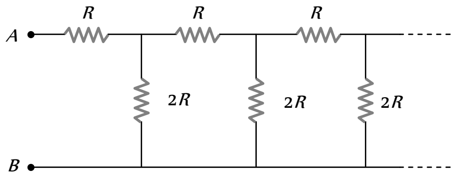
(a) $8\,\Omega$

(b) $6\,\Omega$

(c) $4\,\Omega$

(d) $2\,\Omega$

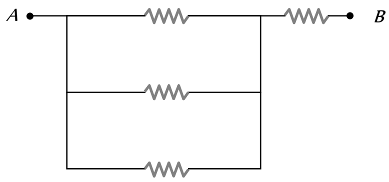
68. An infinite ladder network is arranged with resistances R and $2R$ as shown. The effective resistance between terminals A and B is



(a) ∞ (b) R

(c) $2R$ (d) $3R$

69. If all the resistors shown have the value 2 *ohm* each, the equivalent resistance over AB is [JIPMER 1999]



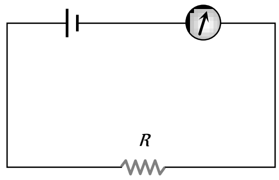
(a) 2 *ohm*

(b) 4 *ohm*

(c) $1\frac{2}{3}$ *ohm*

(d) $2\frac{2}{3}$ *ohm*

70. A battery of *emf* 10 V and internal resistance $3\,\Omega$ is connected to a resistor as shown in the figure. If the current in the circuit is 0.5 A, then the resistance of the resistor will be



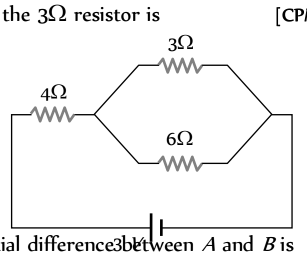
(a) $19\,\Omega$

(b) $17\,\Omega$

(c) $10\,\Omega$

(d) $12\,\Omega$

71. The potential drop across the 3Ω resistor is [CPMT 2000]



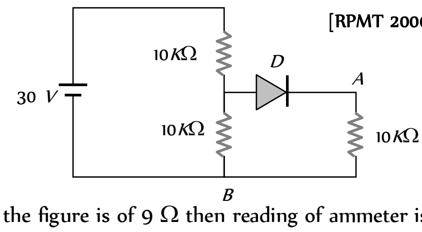
(a) 1 V

(b) 1.5 V

(c) 2 V

(d) 3 V

72. In the given figure, potential difference between A and B is [RPMT 2000]



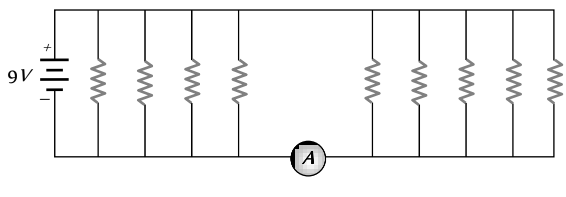
(a) 0

(b) 5 *volt*

(c) 10 *volt*

(d) 15 *volt*

73. If each resistance in the figure is of $9\,\Omega$ then reading of ammeter is



(a) 5 *A* (b) 8 *A*

(c) 2 *A* (d) 9 *A*

74. Four resistances 10 Ω, 5 Ω, 7 Ω and 3 Ω are connected so that they form the sides of a rectangle *AB, BC, CD* and *DA* respectively. Another resistance of 10 Ω is connected across the diagonal *AC*. The equivalent resistance between *A* and *B* is

(a) 2 Ω (b) 5 Ω

(c) 7 Ω (d) 10 Ω

75. Two wires of equal diameters, of resistivities ρ_1 and ρ_2 and lengths l and l, respectively, are joined in series. The equivalent resistivity of the combination is

[EAMCET (Engg.) 2000]

(a) $\dfrac{\rho_1 l_1 + \rho_2 l_2}{l_1 + l_2}$ (b) $\dfrac{\rho_1 l_2 + \rho_2 l_1}{l_1 - l_2}$

(c) $\dfrac{\rho_1 l_2 + \rho_2 l_1}{l_1 + l_2}$ (d) $\dfrac{\rho_1 l_1 - \rho_2 l_2}{l_1 - l_2}$

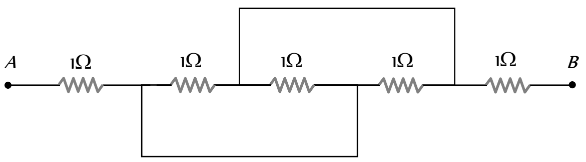
76. Four resistances of 100 Ω each are connected in the form of square. Then, the effective resistance along the diagonal points is

(a) 200 Ω (b) 400 Ω

(c) 100 Ω (d) 150 Ω

77. Equivalent resistance between the points *A* and *B* is (in Ω)

[AMU (Engg.) 2000]



(a) $\dfrac{1}{5}$ (b) $1\dfrac{1}{4}$

(c) $2\dfrac{1}{3}$ (d) $3\dfrac{1}{2}$

78. Two wires of the same material and equal length are joined in parallel combination. If one of them has half the thickness of the other and the thinner wire has a resistance of 8 *ohms*, the resistance of the combination is equal to

[AMU (Engg.) 2000]

(a) $\dfrac{5}{8}$ *ohms* (b) $\dfrac{8}{5}$ *ohms*

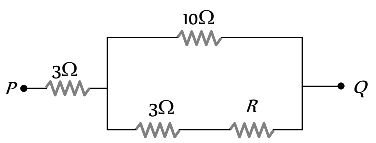
(c) $\dfrac{3}{8}$ *ohms* (d) $\dfrac{8}{3}$ *ohms*

79. In the circuit shown here, what is the value of the unknown resistor *R* so that the total resistance of the circuit between points *P* and *Q* is also equal to *R* [MP PET 2001]

(a) 3 *ohms*

(b) $\sqrt{39}$ *ohms*

(c) $\sqrt{69}$ *ohms*



(d) 10 *ohms*

80. A uniform wire of resistance 9 Ω is cut into 3 equal parts. They are connected in the form of equilateral triangle *ABC*. A cell of e.m.f. 2 *V* and negligible internal resistance is connected across *B* and *C*. Potential difference across *AB* is

[Kerala (Engg.) 2001]

(a) 1 *V* (b) 2 *V*

(c) 3 *V* (d) 0.5 *V*

81. [EAMCET (Med.) 2000] The resistors of resistances 2 Ω, 4 Ω and 8 Ω are connected in parallel, then the equivalent resistance of the combination will be [KCET 2001]

(a) $\dfrac{8}{7}\Omega$ (b) $\dfrac{7}{8}\Omega$

(c) $\dfrac{7}{4}\Omega$ (d) $\dfrac{4}{9}\Omega$

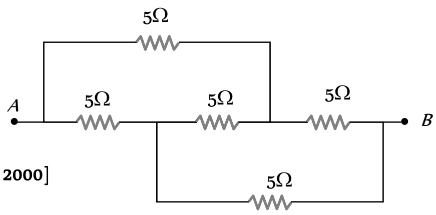
82. Effective resistance between *A* and *B* is [UPSEAT 2001]

(a) 15 Ω

(b) 5 Ω

(c) $\dfrac{5}{2}\Omega$

(d) 20 Ω [MH CET 2000]



83. The effective resistance of two resistors in parallel is $\dfrac{12}{7}\Omega$. If one of the resistors is disconnected the resistance becomes 4 Ω. The resistance of the other resistor is [MH CET 2002]

(a) 4 Ω (b) 3 Ω

(c) $\dfrac{12}{7}\Omega$ (d) $\dfrac{7}{12}\Omega$

84. Two resistance wires on joining in parallel the resultant resistance is $\dfrac{6}{5}$ *ohms*. One of the wire breaks, the effective resistance is 2 *ohms*. The resistance of the broken wire is

[MP PET 2001, 2002]

(a) $\dfrac{3}{5}$ *ohm* (b) 2 *ohm*

(c) $\dfrac{6}{5}$ *ohm* (d) 3 *ohm*

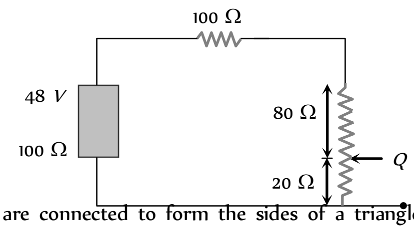
85. In the circuit, the potential difference across *PQ* will be nearest to

(a) 9.6 *V*

(b) 6.6 *V*

(c) 4.8 *V*

(d) 3.2 *V*



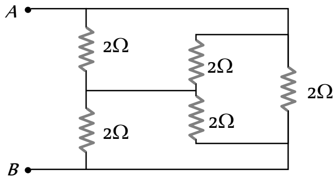
86. Three resistors are connected to form the sides of a triangle *ABC*, the resistance of the sides *AB, BC* and *CA* are 40 *ohms*, 60 *ohms* and 100 *ohms* respectively. The effective resistance between the points *A* and *B* in *ohms* will be

[JIPMER 2002]

(a) 32 (b) 64

(c) 50 (d) 200

87. Find the equivalent resistance across *AB* [Orissa JEE 2002]



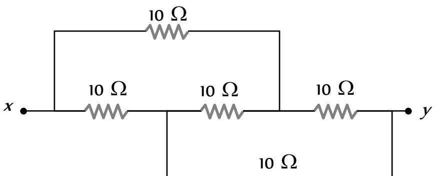
(a) 1 Ω

(b) 2 Ω

(c) 3 Ω

(d) 4 Ω

88. The equivalent resistance between *x* and *y* in the circuit shown is



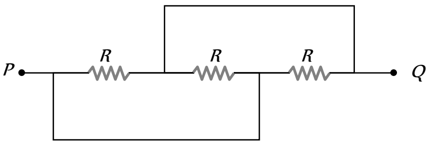
(a) 10 Ω

(b) 40 Ω

(c) 20 Ω

(d) $\frac{5}{2}$ Ω

89. The equivalent resistance between the points *P* and *Q* of the circuit given is [Pb. PMT 2002]



(a) $\frac{R}{4}$

(b) $\frac{R}{3}$

(c) 4 *R*

(d) 2 *R*

90. Two wires of the same dimensions but resistivities ρ_1 and ρ_2 are connected in series. The equivalent resistivity of the combination is

(a) $\rho_1 + \rho_2$ (b) $\frac{\rho_1 + \rho_2}{2}$

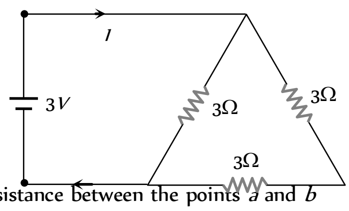
(c) $\sqrt{\rho_1 \rho_2}$ (d) $2(\rho_1 + \rho_2)$

91. Three unequal resistors in parallel are equivalent to a resistance 1 *ohm*. If two of them are in the ratio 1 : 2 and if no resistance value is fractional, the largest of the three resistances in *ohms* is

(a) 4 (b) 6

(c) 8 (d) 12

92. A 3*volt* battery with negligible internal resistance is connected in a circuit as shown in the figure. The current *I*, in the circuit will be



(a) 1/3 *A*

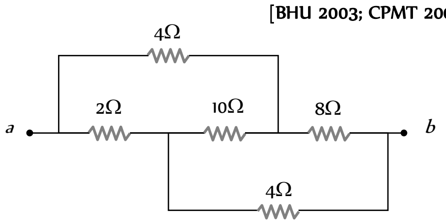
(b) 1 *A*

(c) 1.5 *A*

(d) 2 *A*

93. Find the equivalent resistance between the points *a* and *b*

[BHU 2003; CPMT 2004]



(a) 2 Ω

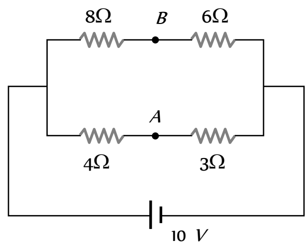
(b) 4 Ω

(c) 8 Ω

(d) 16 Ω

94. The potential difference between point *A* & *B* is

[BHU 2003; CPMT 2004; MP PMT 2005]



(a) $\frac{20}{7}$ *V*

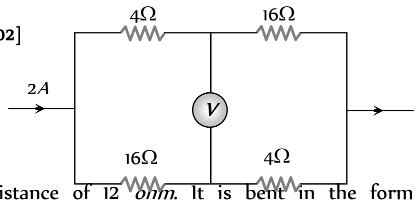
(b) $\frac{40}{7}$ *V*

(c) $\frac{10}{7}$ *V*

(d) 0

95. In the circuit shown below, The reading of the voltmeter *V* is

[MP PMT 2002]



(a) 12 *V*

(b) 8 *V*

(c) 20 *V*

(d) 16 *V*

96. A wire has a resistance of 12 *ohm*. It is bent in the form of equilateral triangle. The effective resistance between any two corners of the triangle is

(a) 9 *ohms* (b) 12 *ohms*

(c) 6 *ohms* (d) 8/3 *ohms*

97. A series combination of two resistors 1 Ω each is connected to a 12 *V* battery of internal resistance 0.4 Ω. The current flowing through it will be [MH CET (Med.) 1999]

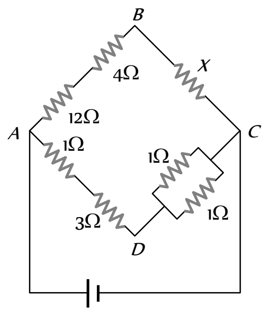
(a) 3.5 *A* (b) 5 *A*

(c) 6 *A* (d) 10 *A*

[KCET 2003]

98. In the circuit shown in the adjoining figure, the current between *B* and *D* is zero, the unknown resistance is of

[CPMT 1986]



(a) 4 Ω

[EAMCET 2003]

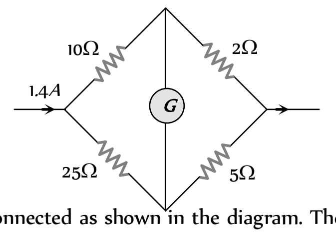
(b) 2 Ω

(c) 3 Ω

(d) *emf* of a cell is required to find the value of *X*

[AIEEE 2003]

99. In the circuit shown in the figure, the current flowing in 2 Ω resistance [CPMT 1989; MP PMT 2004]



(a) 1.4 *A*

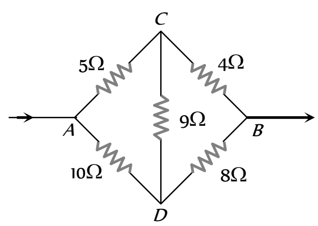
(b) 1.2 *A*

(c) 0.4 *A*

(d) 1.0 *A*

100. Five resistors are connected as shown in the diagram. The equivalent resistance between *A* and *B* is

[MP PMT 1996]



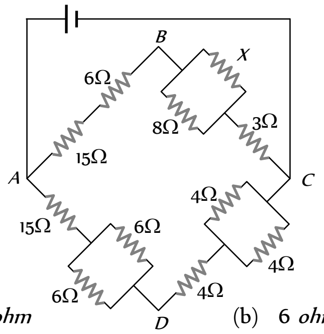
(a) 6 *ohm*

(b) 9 *ohm*

(c) $12\,ohm$

(d) $15\,ohm$

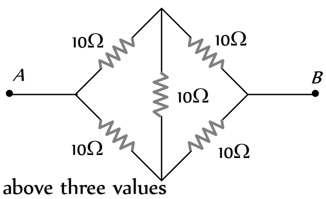
101. In the figure given the value of X resistance will be, when the p.d. between B and D is zero [MP PET 1993]



(a) 4 *ohm* (b) 6 *ohm*

(c) 8 *ohm* (d) 9 *ohm*

102. The effective resistance between points A and B is [NCERT 1974; MP PMT 2000]



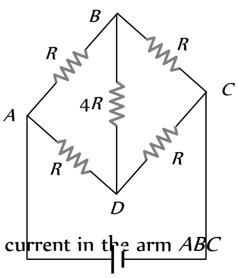
(a) $10\,\Omega$

(b) $20\,\Omega$

(c) $40\,\Omega$

(d) None of the above three values

103. Five resistors of given values are connected together as shown in the figure. The current in the arm *BD* will be [MP PMT 1995]



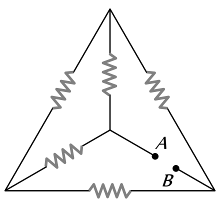
(a) Half the current in the arm *ABC*

(b) Zero

(c) Twice the current in the arm *ABC*

(d) Four times the current in the arm *ABC*

104. In the network shown in the figure, each of the resistance is equal to $2\,\Omega$. The resistance between the points A and B is [CBSE PMT 1995]



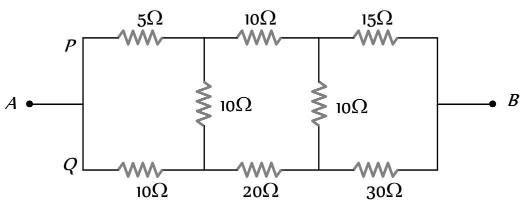
(a) $1\,\Omega$

(b) $4\,\Omega$

(c) $3\,\Omega$

(d) $2\,\Omega$

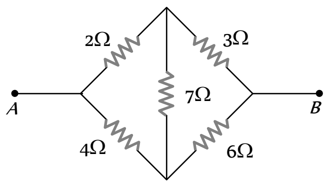
105. In the arrangement of resistances shown below, the effective resistance between points A and B is [MP PMT 1997; RPET 2001]



(a) $20\,\Omega$ (b) $30\,\Omega$

(c) $90\,\Omega$ (d) $110\,\Omega$

106. Five resistances are connected as shown in the figure. The effective resistance between the points A and B is [MP PMT 1999; KCET 2001; BHU 2001, 05]



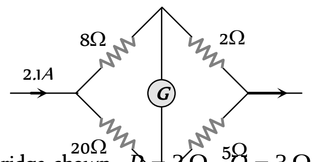
(a) $\frac{10}{3}\,\Omega$

(b) $\frac{20}{3}\,\Omega$

(c) $15\,\Omega$

(d) $6\,\Omega$

107. In the given figure, when galvanometer shows no deflection, the current (in ampere) flowing through $5\,\Omega$ resistance will be



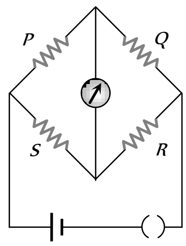
(a) 0.5

(b) 0.6

(c) 0.9

(d) 1.5

108. In the Wheatstone's bridge shown, $P = 2\,\Omega$, $Q = 3\,\Omega$, $R = 6\,\Omega$ and $S = 8\,\Omega$. In order to obtain balance, shunt resistance across 'S' must be [SCRA 1998]



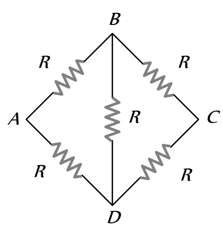
(a) $2\,\Omega$

(b) $3\,\Omega$

(c) $6\,\Omega$

(d) $8\,\Omega$

109. Five equal resistances each of value R are connected in a form shown alongside. The equivalent resistance of the network



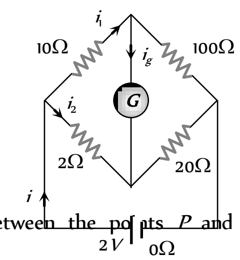
(a) Between the points B and D is R

(b) Between the points B and D is $\frac{R}{2}$

(c) Between the points A and C is R

(d) Between the points A and C is $\frac{R}{2}$

110. In the circuit shown below the resistance of the galvanometer is 20 Ω. In which case of the following alternatives are the currents arranged strictly in the decreasing order



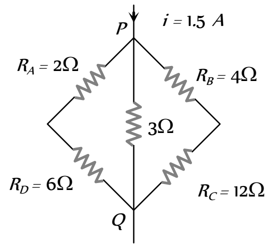
(a) i, i_1, i_2, i_g

(b) i, i_2, i_1, i_g

(c) i, i_2, i_g, i_1

(d) i, i_1, i_g, i_2

111. Potential difference between the points P and Q in the electric circuit shown is [KCET 1999]



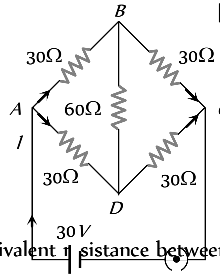
(a) 4.5 V

(b) 1.2 V

(c) 2.4 V

(d) 2.88 *V*

112. The current between *B* and *D* in the given figure is [RPET 2000; DCE 2001]



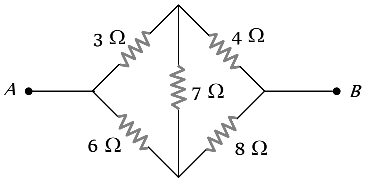
(a) 1 *amp*

(b) 2 *amp*

(c) Zero

(d) 0.5 *amp*

113. In the given figure, equivalent resistance between *A* and *B* will be



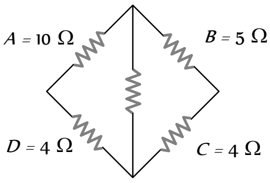
(a) $\frac{14}{3}\ \Omega$

(b) $\frac{3}{14}\ \Omega$

(c) $\frac{9}{14}\ \Omega$

(d) $\frac{14}{9}\ \Omega$

114. In a typical Wheatstone network, the resistances in cyclic order are *A* = 10 Ω, *B* = 5 Ω, *C* = 4 Ω and *D* = 4 Ω for the bridge to be balanced [KCET 2000]



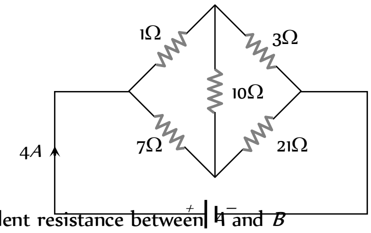
(a) 10 Ω should be connected in parallel with *A*

(b) 10 Ω should be connected in series with *A*

(c) 5 Ω should be connected in series with *B*

(d) 5 Ω should be connected in parallel with *B*

115. In the circuit shown in figure, the current drawn from the battery is 4*A*. If 10 Ω resistor is replaced by 20 Ω resistor, then current drawn from the circuit will be [KCET 2000; CBSE PMT 2001]



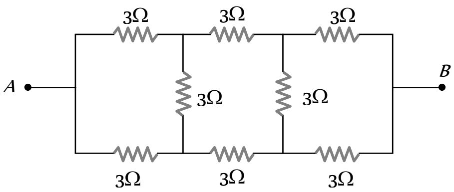
(a) 1 *A*

(b) 2 *A*

(c) 3 *A*

(d) 0 *A*

116. Calculate the equivalent resistance between *A* and *B* [UPSEAT 2001]



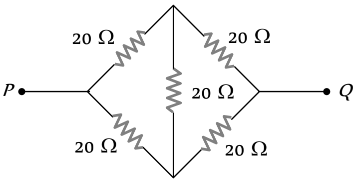
(a) $\frac{9}{2}\Omega$

(b) 3 Ω

(c) 6 Ω

(d) $\frac{5}{3}\Omega$

117. The equivalent resistance between *P* and *Q* in the given figure, is



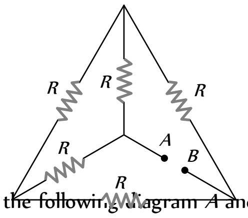
(a) 50 Ω

(b) 40 Ω

(c) 30 Ω

(d) 20 Ω

118. If each of the resistance of the network shown in the figure is *R*, the equivalent resistance between *A* and *B* is [KCET 2002]



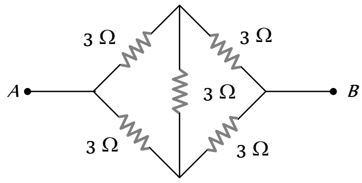
(a) 5 *R*

(b) 3 *R*

(c) *R* [CBSE PMT 2000]

(d) *R*/2

119. The equivalent resistance of the following diagram *A* and *B* is



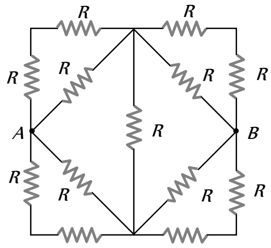
(a) $\frac{2}{3}\Omega$

(b) 9 Ω

(c) 6 Ω

(d) None of these

120. Thirteen resistances each of resistance *R ohm* are connected in the circuit as shown in the figure below. The effective resistance between *A* and *B* is [KCET 2003]



(a) $2R\,\Omega$

(b) $\frac{4R}{3}\ \Omega$

(c) $\frac{2R}{3}\ \Omega$

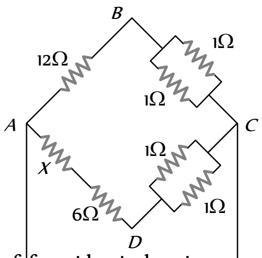
(d) $R\,\Omega$

121. In a Wheatstone's bridge all the four arms have equal resistance *R*. If the resistance of the galvanometer arm is also *R*, the equivalent resistance of the combination as seen by the battery is

(a) $\frac{R}{2}$ (b) *R*

(c) 2 *R* (d) $\frac{R}{4}$

122. For what value of unknown resistance *X*, the potential difference between *B* and *D* will be zero in the circuit shown in the figure



(a) 4 Ω

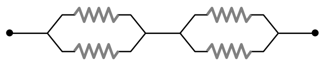
(b) 6 Ω

(c) 2 Ω

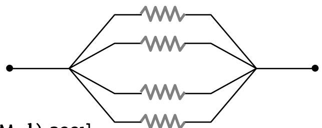
(d) 5 Ω

123. Which arrangement of four identical resistances should be used to draw maximum energy from a cell of voltage *V* [MP PMT 2004]

(a)

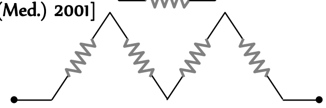


(b)



[MH CET (Med.) 2001]

(c)



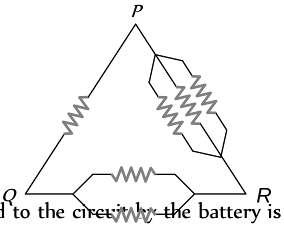
(d) 
124. An unknown resistance R_1 is connected in series with a resistance of 10 Ω. This combinations is connected to one gap of a metre bridge while a resistance R_2 is connected in the other gap. The balance point is at 50 *cm*. Now, when the 10 Ω resistance is removed the balance point shifts to 40 *cm*. The value of R_1 is (in *ohm*)

(a) 60 (b) 40
(c) 20 (d) 10

125. A wire has a resistance of 6 Ω. It is cut into two parts and both half values are connected in parallel. The new resistance is ....

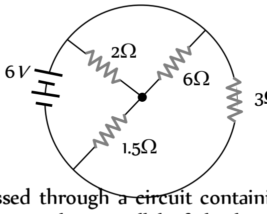
(a) 12 Ω (b) 1.5 Ω
(c) 3 Ω (d) 6 Ω

126. Six equal resistances are connected between points *P*, *Q* and *R* as shown in the figure. Then the net resistance will be maximum between [IIT-JEE (Screening) 2004]



(a) *P* and *Q*
(b) *Q* and *R*
(c) *P* and *R*
(d) Any two points

127. The total current supplied to the circuit by the battery is [AIEEE 2004]



(a) 1 *A*
(b) 2 *A*
(c) 4 *A*
(d) 6 *A*

128. An electric current is passed through a circuit containing two wires of the same material, connected in parallel. If the lengths and radii of the wires are in the ratio of 4/3 and 2/3, then the ratio of the currents passing through the wire will be [AIEEE 2004]

(a) 3 (b) 1/3
(c) 8/9 (d) 2

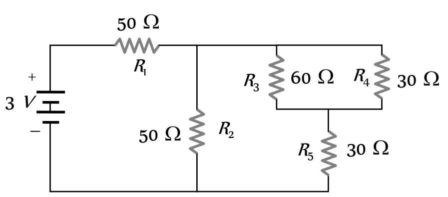
129. If a rod has resistance 4 Ω and if rod is turned as half cycle then the resistance along diameter [BCECE 2004]

(a) 1.56 Ω (b) 2.44 Ω
(c) 4 Ω (d) 2 Ω

130. If three resistors of resistance 2Ω, 4Ω and 5 Ω are connected in parallel then the total resistance of the combination will be [Pb. PMT 2004]

(a) $\frac{20}{19}\Omega$ (b) $\frac{19}{20}\Omega$
(c) $\frac{19}{10}\Omega$ (d) $\frac{10}{19}\Omega$

131. In circuit shown below, the resistances are given in ohms and the battery is assumed ideal with emf equal to 3 *volt*. The voltage across the resistance R_4 is [UPSEAT 2004; Kerala PMT 2004]



(a) 0.4 *V*
(b) 0.6 *V*
(c) 1.2 *V*
(d) 1.5 *V*

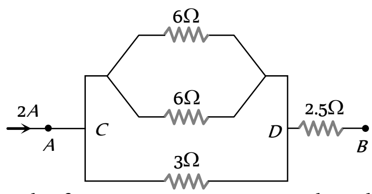
132. A parallel combination of two resistors, of 1 Ω each, is connected in series with a 1.5 Ω resistor. The total combination is connected across a 10 *V* battery. The current flowing in the circuit is

(a) 5 *A* (b) 20 *A*
(c) 0.2 *A* (d) 0.4 *A*

133. [KCET 2004] If you are provided three resistances 2 Ω, 3 Ω and 6 Ω. How will you connect them so as to obtain the equivalent resistance of 4 Ω

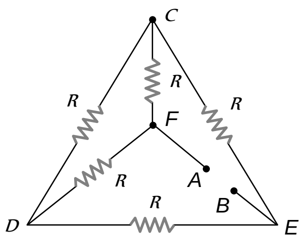
(a) 
(b) 
(c) 
(d) None of these

134. The equivalent resistance and potential difference between *A* and *B* for the circuit is respectively [Pb. PMT 2003]



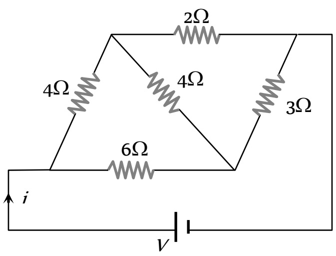
(a) 4 Ω, 8 *V*
(b) 8 Ω, 4 *V*
(c) 2 Ω, 2 *V*
(d) 16 Ω, 8 *V*

135. Five equal resistances each of resistance *R* are connected as shown in the figure. *A* battery of *V* volts is connected between *A* and *B*. The current flowing in *AFCEB* will be [CBSE PMT 2004]



(a) $\frac{3V}{R}$
(b) $\frac{V}{R}$
(c) $\frac{V}{2R}$
(d) $\frac{2V}{R}$

136. For the network shown in the figure the value of the current i is



(a) $\frac{9V}{35}$
(b) $\frac{5V}{18}$
(c) $\frac{5V}{9}$
(d) $\frac{18V}{5}$

137. When a wire of uniform cross-section a, length *l* and resistance *R* is bent into a complete circle, resistance between any two of diametrically opposite points will be [CBSE PMT 2005]

(a) $\frac{R}{4}$ (b) $\frac{R}{8}$
(c) $4R$ (d) $\frac{R}{2}$

138. The current in a simple series circuit is 5.0 *amp*. When an additional resistance of 2.0 *ohms* is inserted, the current drops to 4.0 *amp*. The original resistance of the circuit in ohms was

(a) 1.25 (b) 8

(c) 10 (d) 20

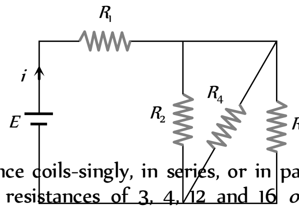
139. In the circuit given $E = 6.0\ V$, $R_1 = 100\ ohms$, $R_2 = R_3 = 50\ ohms$, $R_4 = 75\ ohms$. The equivalent resistance of the circuit, in ohms, is

(a) 11.875

(b) 26.31

(c) 118.75

(d) None of these



140. By using only two resistance coils-singly, in series, or in parallel one should be able to obtain resistances of 3, 4, 12 and 16 *ohms*. The separate resistances of the coil are [KCET 2005]

(a) 3 and 4 (b) 4 and 12

(c) 12 and 16 (d) 16 and 3

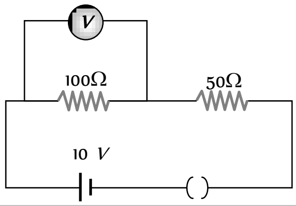
141. In the given circuit, the voltmeter records 5 *volts*. The resistance of the voltmeter in *ohms* is [KCET 2005]

(a) 200

(b) 100

(c) 10

(d) 50



Kirchhoff's Law, Cells

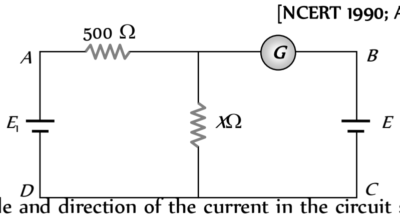
1. In the adjoining circuit, the battery E_1 has an $e.m.f.$ of $12\,volt$ and zero internal resistance while the battery E has an $e.m.f.$ of $2\,volt$. If the galvanometer G reads zero, then the value of the resistance X in *ohm* is [NCERT 1990; AIEEE 2005]

(a) 10

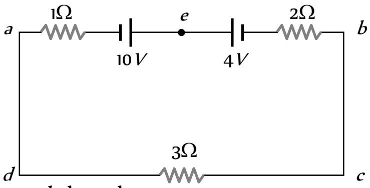
(b) 100

(c) 500

(d) 200



2. The magnitude and direction of the current in the circuit shown will be [CPMT 1986, 88]



(a) $\frac{7}{3}$ *A* from *a* to *b* through *e*

(b) $\frac{7}{3}$ *A* from *b* to *a* through *e*

(c) 1*A* from *b* to *a* through *e*

(d) 1*A* from *a* to *b* through *e*

3. A cell of $e.m.f.$ $1.5\,V$ having a finite internal resistance is connected to a load resistance of $2\,\Omega$. For maximum power transfer the internal resistance of the cell should be [BIT 1988]

(a) 4 *ohm* (b) 0.5 *ohm*

(c) 2 *ohm* (d) None of these

4. By a cell a current of 0.9 A flows through 2 *ohm* resistor and 0.3 A through 7 *ohm* resistor. The internal resistance of the cell is [KCET 2003]

(a) $0.5\,\Omega$ (b) $1.0\,\Omega$

(c) 1.[KCET 2005] (d) $2.0\,\Omega$

5. The e.m.f. of a cell is E volts and internal resistance is r *ohm*. The resistance in external circuit is also r *ohm*. The p.d. across the cell will be [CPMT 1985; NCERT 1973]

(a) *E*/2 (b) 2*E*

(c) 4*E* (d) *E*/4

6. A cell of e.m.f. E is connected with an external resistance R, then p.d. across cell is V. The internal resistance of cell will be [MNR 1987; Kerala P

(a) $\frac{(E-V)R}{E}$ (b) $\frac{(E-V)R}{V}$

(c) $\frac{(V-E)R}{V}$ (d) $\frac{(V-E)R}{E}$

7. Two cells, e.m.f. of each is E and internal resistance r are connected in parallel between the resistance R. The maximum energy given to the resistor will be, only when [MNR 1988; MP PET 2000; UPSEAT 2001]

(a) $R = r/2$ (b) $R = r$

(c) $R = 2r$ (d) $R = 0$

8. Kirchhoff's first law *i.e.* $\Sigma i = 0$ at a junction is based on the law of conservation of [CBSE PMT 1997; AIIMS 2000; MP PMT 2002; RPMT 2001; DPMT 2005]

(a) Charge (b) Energy

(c) Momentum (d) Angular momentum

9. Kirchhoff's second law is based on the law of conservation of [RPET 2003; MH CET 2001]

(a) Charge (b) Energy

(c) Momentum (d) Sum of mass and energy

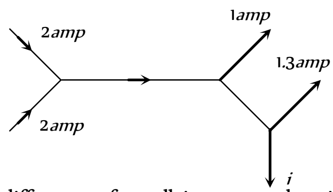
10. The figure below shows currents in a part of electric circuit. The current *i* is [CPMT 1981; RPET 1999]

(a) 1.7 *amp*

(b) 3.7 *amp*

(c) 1.3 *amp*

(d) 1 *amp*



11. The terminal potential difference of a cell is greater than its e.m.f. when it is

(a) Being discharged

(b) In open circuit

(c) Being charged

(d) Being either charged or discharged

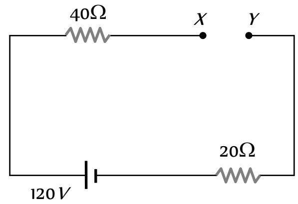
12. In the circuit shown, potential difference between *X* and *Y* will be

(a) Zero

(b) 20 *V*

(c) 60 *V*

(d) 120 *V*



13. In the above question, potential difference across the $40\,\Omega$ resistance will be

(a) Zero (b) 80 V

(c) 40 V (d) 120 V

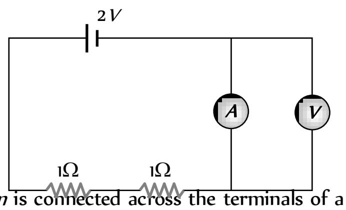
14. In the circuit shown, A and V are ideal ammeter and voltmeter respectively. Reading of the voltmeter will be

(a) 2 V

(b) 1 V

(c) 0.5 V

(d) Zero



15. When a resistance of 2 *ohm* is connected across the terminals of a cell, the current is 0.5 *amperes*. When the resistance is increased to 5 *ohm*, the current is 0.25 *amperes*. The internal resistance of the cell is

(a) $0.5\,ohm$ (b) $1.0\,ohm$

(c) $1.5\,ohm$ (d) $2.0\,ohm$

[MP PMT 1996]

16. The terminal potential difference of a cell when short-circuited is (E = E.M.F. of the cell)

(a) E (b) $E/2$

(c) Zero (d) $E/3$

17. A primary cell has an e.m.f. of 1.5 volts, when short-circuited it gives a current of 3 amperes. The internal resistance of the cell is

(a) 4.5 ohm (b) 2 ohm

(c) 0.5 ohm (d) 1/4.5 ohm

[CPMT 1976, 83]

18. A 50 V battery is connected across a 10 *ohm* resistor. The current is 4.5 *amperes*. The internal resistance of the battery is

(a) Zero (b) 0.5 *ohm*

(c) 1.1 *ohm* (d) 5.0 *ohm*

[CPMT 1985; BHU 1997; Pb. PMT 2001]

19. The potential difference in open circuit for a cell is 2.2 *volts*. When a 4 *ohm* resistor is connected between its two electrodes the potential difference becomes 2 *volts*. The internal resistance of the cell will be

[MP PMT 1984; SCRA 1994; CBSE PMT 2002]

(a) 1 *ohm* (b) 0.2 *ohm*

(c) 2.5 *ohm* (d) 0.4 *ohm*

20. A new flashlight cell of e.m.f. 1.5 *volts* gives a current of 15 *amps*, when connected directly to an ammeter of resistance $0.04\,\Omega$. The internal resistance of cell is [MP PET 1994]

(a) $0.04\,\Omega$ (b) $0.06\,\Omega$

(c) $0.10\,\Omega$ (d) $10\,\Omega$

21. A cell whose e.m.f. is 2 V and internal resistance is $0.1\,\Omega$, is connected with a resistance of $3.9\,\Omega$. The voltage across the cell terminal will be

[CPMT 1990; MP PET 1993; CBSE PMT 1999; AFMC 1999; Pb. PMT 2000; AIIMS 2001]

(a) $0.50\,V$ (b) $1.90\,V$

(c) $1.95\,V$ (d) $2.00\,V$

22. The reading of a high resistance voltmeter when a cell is connected across it is 2.2 V. When the terminals of the cell are also connected to a resistance of $5\,\Omega$ the voltmeter reading drops to 1.8 V. Find the internal resistance of the cell

(a) $1.2\,\Omega$ (b) $1.3\,\Omega$

(c) $1.1\,\Omega$ (d) $1.4\,\Omega$

[KCET 2003; MP PMT 2003]

23. When cells are connected in parallel, then

[MNR 1983]

(a) The current decreases (b) The current increases

(c) The e.m.f. increases (d) The e.m.f. decreases

24. The internal resistance of a cell depends on

(a) The distance between the plates

(b) The area of the plates immersed

(c) The concentration of the electrolyte

(d) All the above

25. n identical cells each of e.m.f. E and internal resistance r are connected in series. An external resistance R is connected in series to this combination. The current through R is

[DPMT 2002]

(a) $\dfrac{nE}{R+nr}$ (b) $\dfrac{nE}{nR+r}$

(c) $\dfrac{E}{R+nr}$ (d) $\dfrac{nE}{R+r}$

26. A cell of internal resistance r is connected to an external resistance R. The current will be maximum in R, if

[CPMT 1982]

(a) $R=r$ (b) $R<r$

(c) $R>r$ (d) $R=r/2$

27. To get the maximum current from a parallel combination of n identical cells each of internal resistance r in an external resistance R, when

[DPMT 1999]

(a) $R>>r$ (b) $R<<r$

(c) $R=r$ (d) None of these

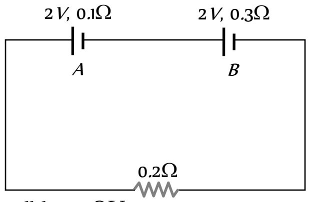
28. Two identical cells send the same current in $2\,\Omega$ resistance, whether connected in series or in parallel. The internal resistance of the cell should be

[NCERT 1982; Kerala PMT 2002]

(a) $1\,\Omega$ (b) $2\,\Omega$

(c) $\dfrac{1}{2}\,\Omega$ (d) $2.5\,\Omega$

29. The internal resistances of two cells shown are $0.1\,\Omega$ and $0.3\,\Omega$. If $R=0.2\,\Omega$, the potential difference across the cell



(a) B will be zero

(b) A will be zero

(c) A and B will be 2 V

(d) A will be $>2V$ and B will be $<2V$

30. A torch battery consisting of two cells of 1.45 *volts* and an internal resistance $0.15\,\Omega$, each cell sending currents through the filament of the lamps having resistance 1.5 *ohms*. The value of current will be [MP PET 19

(a) 16.11 *amp* (b) 1.611 *amp*

(c) 0.1611 *amp* (d) 2.6 *amp*

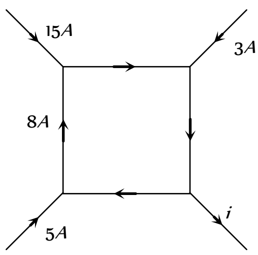
31. The electromotive force of a primary cell is 2 *volts*. When it is short-circuited it gives a current of 4 *amperes*. Its internal resistance in *ohms* is [MP PET 1995]

(a) 0.5 (b) 5.0

(c) 2.0 (d) 8.0

32. The figure shows a network of currents. The magnitude of currents is shown here. The current i will be

[MP PMT 1995]



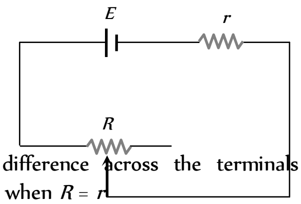
(a) 3 A

(b) 13 A

(c) 23 A

(d) – 3 A

33. A battery of e.m.f. E and internal resistance r is connected to a variable resistor R as shown here. Which one of the following is true



(a) Potential difference across the terminals of the battery is maximum when $R = r$

(b) Power delivered to the resistor is maximum when $R = r$

(c) Current in the circuit is maximum when $R = r$

(d) Current in the circuit is maximum when $R >> r$

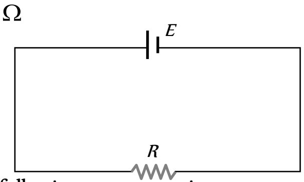
34. A dry cell has an e.m.f. of 1.5 V and an internal resistance of $0.05\,\Omega$. The maximum current obtainable from this cell for a very short time interval is [Haryana CEE 1996]

(a) 30 A (b) 300 A

(c) 3 A (d) 0.3 A

35. Consider the circuit given here with the following parameters

E.M.F. of the cell = 12 V. Internal resistance of the cell $= 2\,\Omega$. Resistance $R = 4\,\Omega$



Which one of the following statements in true

(a) Rate of energy loss in the source is = 8 W

(b) Rate of energy conversion in the source is 16 W

(c) Power output in is = 8 W

(d) Potential drop across R is = 16 V

36. A current of two amperes is flowing through a cell of e.m.f. 5 *volts* and internal resistance 0.5 *ohm* from negative to positive electrode. If the potential of negative electrode is 10 V, the potential of positive electrode will be [MP PMT 1997]

(a) 5 V (b) 14 V

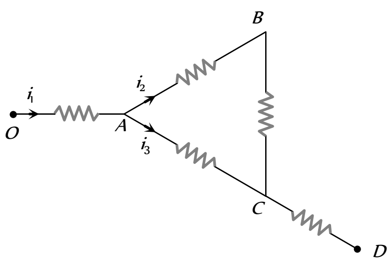
(c) 15 V (d) 16 V

37. 100 cells each of e.m.f. 5 V and internal resistance 1 *ohm* are to be arranged so as to produce maximum current in a 25 *ohms* resistance. Each row is to contain equal number of cells. The number of rows should be [MP PMT 1997]

(a) 2 (b) 4

(c) 5 (d) 10

38. The current in the arm CD of the circuit will be [MP PMT/PET 1998; MP PMT 2000; DPMT 2000]



(a) $i_1 + i_2$

(b) $i_2 + i_3$

(c) $i_1 + i_3$

(d) $i_1 - i_2 + i_3$

39. When a resistance of 2 *ohm* is connected across the terminals of a cell, the current is 0.5 A. When the resistance is increased to 5 *ohm*, the current is 0.25 A. The e.m.f. of the cell is [MP PET 1999, 2000; Pb. PMT 2002; MP PMT 2000]

(a) 1.0 V [MP PMT 1995] (b) 1.5 V

(c) 2.0 V (d) 2.5 V

40. Two non-ideal identical batteries are connected in parallel. Consider the following statements [MP PMT 1999]

(i) The equivalent e.m.f. is smaller than either of the two e.m.f.s

(ii) The equivalent internal resistance is smaller than either of the two internal resistances

(a) Both (i) and (ii) are correct

(b) (i) is correct but (ii) is wrong

(c) (ii) is correct but (i) is wrong

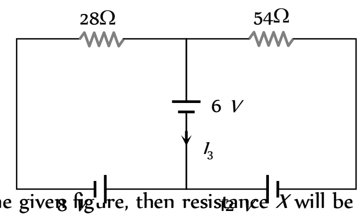
(d) Both (i) and (ii) are wrong

41. If six identical cells each having an e.m.f. of 6 V are connected in parallel, the e.m.f. of the combination is [EAMCET (Med.) 1995; Pb. PMT 1999; CPMT 2000]

(a) 1 V (b) 36 V

(c) $\frac{1}{6}V$ (d) 6 V

42. Consider the circuit shown in the figure. The current I_3 is equal to



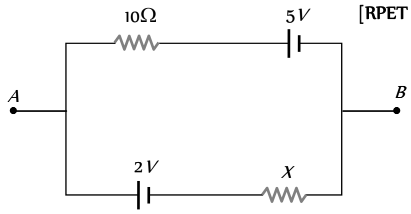
(a) 5 *amp*

(b) 3 *amp*

(c) $-3\,amp$

(d) $-5/6\,amp$

43. If $V_{AB} = 4V$ in the given figure, then resistance X will be [RPET 1997]



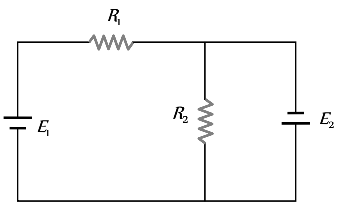
(a) $5\,\Omega$

(b) $10\,\Omega$

(c) $15\,\Omega$

(d) $20\,\Omega$

44. Two resistances R_1 and R_2 are joined as shown in the figure to two batteries of e.m.f. E_1 and E_2. If E_2 is short-circuited, the current through R_1 is [NDA 1995]



(a) E_1 / R_1

(b) E_2 / R_1

(c) E_2 / R_2

(d) $E_1 /(R_2 + R_1)$

45. A storage battery has e.m.f. 15 *volts* and internal resistance 0.05 *ohm*. Its terminal voltage when it is delivering 10 *ampere* is

(a) 30 *volts* (b) 1.00 *volts*

(c) 14.5 *volts* (d) 15.5 *volts*

46. The number of dry cells, each of e.m.f. 1.5 *volt* and internal resistance 0.5 *ohm* that must be joined in series with a resistance of 20 *ohm* so as to send a current of 0.6 *ampere* through the circuit is

(a) 2 (b) 8

(c) 10 (d) 12

47. *Emf* is most closely related to [DCE 1999]

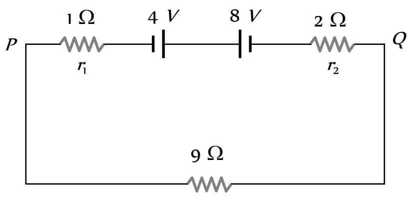
(a) Mechanical force (b) Potential difference

(c) Electric field (d) Magnetic field

48. For driving a current of 2 *A* for 6 *minutes* in a circuit, 1000 *J* of work is to be done. The e.m.f. of the source in the circuit is

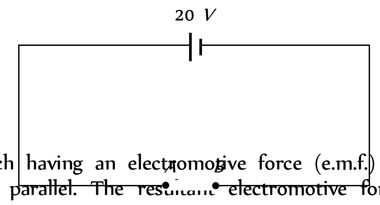
(a) 1.38 *V* (b) 1.68 *V*
(c) 2.04 *V* (d) 3.10 *V*

49. Two batteries of e.m.f. 4 *V* and 8 *V* with internal resistances 1 Ω and 2 Ω are connected in a circuit with a resistance of 9 Ω as shown in figure. The current and potential difference between the points *P* and *Q* are [AFMC 1999]



(a) $\frac{1}{3}A$ and $3V$
(b) $\frac{1}{6}A$ and $4V$
(c) $\frac{1}{9}A$ and $9V$
(d) $\frac{1}{2}A$ and $12V$

50. In the shown circuit, what is the potential difference across *A* and *B*



(a) 50 *V*
(b) 45 *V*
(c) 30 *V*
(d) 20 *V*

51. Four identical cells each having an electromotive force (e.m.f.) of 12 *V*, are connected in parallel. The resultant electromotive force (e.m.f.) of the combination is [CPMT 1999]

(a) 48 *V* (b) 12 *V*
(c) 4 *V* (d) 3 *V*

52. Electromotive force is the force, which is able to maintain a constant

(a) Current (b) Resistance
(c) Power (d) Potential difference

53. A cell of *emf* 6 *V* and resistance 0.5 *ohm* is short circuited. The current in the cell is [JIPMER 1999]

(a) 3 *amp* (b) 12 *amp*
(c) 24 *amp* (d) 6 *amp*

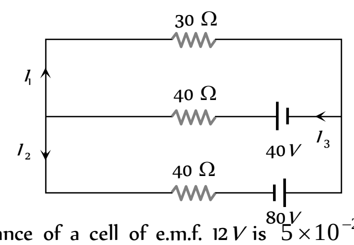
54. A storage cell is charged by 5 *amp* D.C. for 18 *hours*. Its strength after charging will be [JIPMER 1999]

(a) 18 *AH* (b) 5 *AH*
(c) 90 *AH* (d) 15 *AH*

55. A battery having e.m.f. 5 *V* and internal resistance 0.5 Ω is connected with a resistance of 4.5 Ω then the voltage at the terminals of battery is [RPMT 2000]

(a) 4.5 *V* (b) 4 *V*
(c) 0 *V* (d) 2 *V*

56. In the given circuit the current I_1 is [DCE 2000]

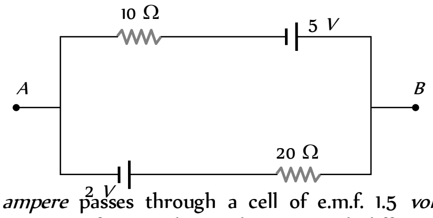


(a) 0.4 *A*
(b) – 0.4 *A*
(c) 0.8 *A*
(d) – 0.8 *A*

57. The internal resistance of a cell of e.m.f. 12 *V* is $5\times10^{-2}\,\Omega$. It is connected across an unknown resistance. Voltage across the cell, when a current of 60 *A* is drawn from it, is [CBSE PMT 2000]

(a) 15 *V* (b) 12 *V*
(c) 9 *V* (d) 6 *V*

58. The current in the given circuit is [CPMT 1999] [AIIMS 2000; MH CET 2003]



(a) 0.1 *A*
(b) 0.2 *A*
(c) 0.3 *A*
(d) 0.4 *A*

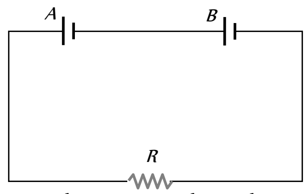
59. A current of 2.0 *ampere* passes through a cell of e.m.f. 1.5 *volts* having internal resistance of 0.15 *ohm*. The potential difference measured, in *volts*, across both the ends of the cell will be

(a) 1.35 (b) 1.50
(c) 1.00 (d) 1.20

60. A battery has e.m.f. 4 *V* and internal resistance *r*. When this battery is connected to an external resistance of 2 *ohms*, a current of 1 *amp*. flows in the circuit. [AIIMS 1999] How much current will flow if the terminals of the battery are connected directly [MP PET 2001]

(a) 1 *amp* (b) 2 *amp*
(c) 4 *amp* (d) Infinite

61. Two batteries *A* and *B* each of e.m.f. 2 *V* are connected in series to an external resistance *R* = 1 *ohm*. If the internal resistance of battery *A* is 1.9 *ohms* and that of *B* is 0.9 *ohm*, what is the potential difference between the terminals of battery *A*



(a) 2 *V*
(b) 3.8 *V* [Pb. PMT 1999]
(c) Zero
(d) None of the above

62. When a resistor of 11 Ω is connected in series with an electric cell, the current flowing in it is 0.5 *A*. Instead, when a resistor of 5 Ω is connected to the same electric cell in series, the current increases by 0.4 *A*. The internal resistance of the cell is

(a) 1.5 Ω (b) 2 Ω
(c) 2.5 Ω (d) 3.5 Ω

63. The internal resistance of a cell is the resistance of [BHU 1999, 2000; AIIMS 2001]

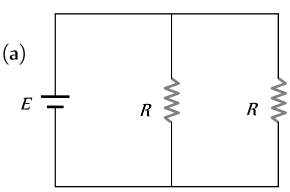
(a) Electrodes of the cell
(b) Vessel of the cell
(c) Electrolyte used in the cell
(d) Material used in the cell

64. How much work is required to carry a 6 μC charge from the negative terminal to the positive terminal of a 9 *V* battery [KCET (Med.) 2001]

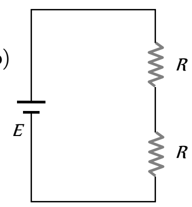
(a) $54\times10^{-3}\,J$ (b) $54\times10^{-6}\,J$
(c) $54\times10^{-9}\,J$ (d) $54\times10^{-12}\,J$

65. Consider four circuits shown in the figure below. In which circuit power dissipated is greatest (Neglect the internal resistance of the power supply) [Orissa JEE 2002]

(a)



(b)



(c) 
(d) 
66. The *emf* of a battery is 2 *V* and its internal resistance is 0.5 Ω. The maximum power which it can deliver to any external circuit will be [AMU (Med.) 2002]

(a) 8 *Watt* (b) 4 *Watt*

(c) 2 *Watt* (d) None of the above

67. Kirchoff's I law and II law of current, proves the [CBSE PMT 1993; BHU 2002; AFMC 2003]

(a) Conservation of charge and energy

(b) Conservation of current and energy

(c) Conservation of mass and charge

(d) None of these

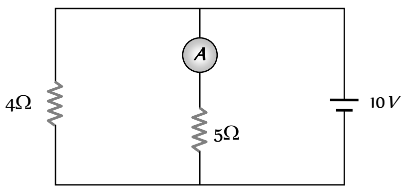
68. In the circuit, the reading of the ammeter is (assume internal resistance of the battery be zero)

(a) $\frac{40}{29}A$

(b) $\frac{10}{9}A$

(c) $\frac{5}{3}A$

(d) 2 *A*

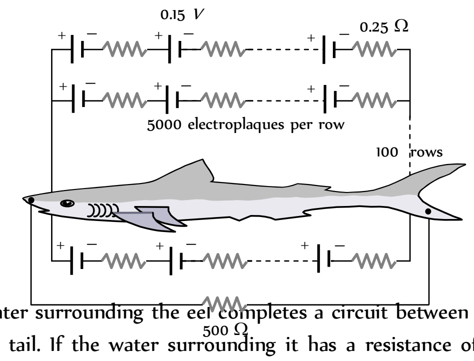


69. In the above question, if the internal resistance of the battery is 1 *ohm*, then what is the reading of ammeter

(a) 5/3 *A* (b) 40/29 *A*

(c) 10/9 *A* (d) 1 *A*

70. Eels are able to generate current with biological cells called electroplaques. The electroplaques in an eel are arranged in 100 rows, each row stretching horizontally along the body of the fish containing 5000 electroplaques. The arrangement is suggestively shown below. Each electroplaques has an emf of 0.15 *V* and internal resistance of 0.25 Ω [AIIMS 2004]



The water surrounding the eel completes a circuit between the head and its tail. If the water surrounding it has a resistance of 500 Ω, the current an eel can produce in water is about

(a) 1.5 *A* (b) 3.0 *A*

(c) 15 *A* (d) 30 *A*

71. Current provided by a battery is maximum when [AFMC 2004]

(a) Internal resistance equal to external resistance

(b) Internal resistance is greater than external resistance

(c) Internal resistance is less than external resistance

(d) None of these

72. A battery is charged at a potential of 15 *V* for 8 *hours* when the current flowing is 10 *A*. The battery on discharge supplies a current of 5 *A* for 15 *hours*. The mean terminal voltage during discharge is 14 *V*. The "*Watt-hour*" efficiency of the battery is

(a) 82.5% (b) 80 %

(c) 90% (d) 87.5%

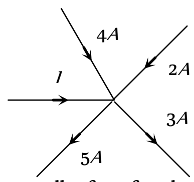
73. In the given current distribution what is the value of *I* [Orissa PMT 2004]

(a) 3*A*

(b) 8 *A*

(c) 2*A*

(d) 5*A*



74. A capacitor is connected to a cell of emf *E* having some internal resistance *r*. The potential difference across the [CPMT 2004; MP PMT 2005]

(a) Cell is < *E* (b) Cell is *E*

(c) Capacitor is > *E* (d) Capacitor is < *E*

75. When the resistance of 9 Ω is connected at the ends of a battery, its potential difference decreases from 40 *volt* to 30 *volt*. The internal resistance of the battery is [DPMT 2003]

(a) 6 Ω (b) 3 Ω

(c) 9 Ω (d) 15 Ω

76. The maximum power drawn out of the cell from a source is given by (where *r* is internal resistance) [DCE 2002]

(a) $E^2/2r$ (b) $E^2/4r$

(c) E^2/r (d) $E^2/3r$

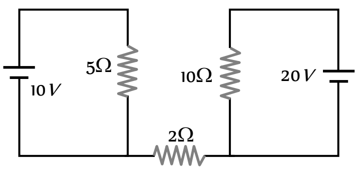
77. Find out the value of current through 2Ω resistance for the given circuit [IIT-JEE (Screening) 2005]

(a) 5 *A*

(b) 2 *A*

(c) Zero

(d) 4 *A*



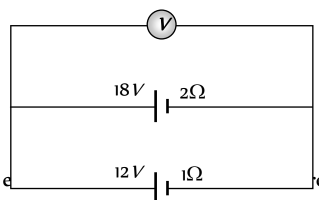
78. Two batteries, one of emf 18 *volts* and internal resistance 2Ω and the other of emf 12 *volt* and internal resistance 1Ω, are connected as shown. The voltmeter *V* will record a reading of

(a) 15 *volt*

(b) 30 *volt*

(c) 14 *volt*

(d) 18 *volt*



79. Two sources of equal e … esistance *R*. The internal resistances of the two sources are R_1 and

$R_2\,(R_2 > R_1)$. If the potential difference across the source having internal resistance R_2 is zero, then

[AIEEE 2005]

(a) $R = R_1R_2/(R_1 + R_2)$

(b) $R = R_1R_2/(R_2 - R_1)$

(c) $R = R_2 \times (R_1 + R_2)/(R_2 - R_1)$

(d) $R = R_2 - R_1$

80. An energy source will supply a constant current into the load if its internal resistance is [AIEEE 2005]

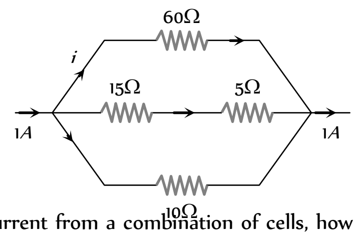
(a) Zero

(b) Non-zero but less than the resistance of the load

(c) Equal to the resistance of the load

(d) Very large as compared to the load resistance

81. The magnitude of *i* in ampere unit is [KCET 2005]



(a) 0.1

(b) 0.3

(c) 0.6

(d) None of these

82. To draw maximum current from a combination of cells, how should the cells be grouped [AFMC 2005]

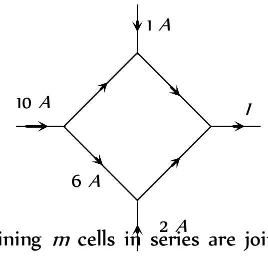
(a) Series

(b) Parallel

(c) Mixed

(d) Depends upon the relative values of external and internal resistance

83. The figure shows a network of currents. The magnitude of currents is shown here. The current *I* will be [BCECE 2005]



(a) 3 *A*

(b) 9 *A*

(c) 13 *A*

(d) 19 *A*

84. The *n* rows each containing *m* cells in series are joined in parallel. Maximum current is taken from this combination across an external resistance of 3Ω resistance. If the total number of cells used are 24 and internal resistance of each cell is 0.5 Ω then [J & K CET 2005]

(a) $m = 8, n = 3$ (b) $m = 6, n = 4$

(c) $m = 12, n = 2$ (d) $m = 2, n = 12$

85. A cell of constant e.m.f. first connected to a resistance R_1 and then connected to a resistance R_2. If power delivered in both cases is then the internal resistance of the cell is

[Orissa JEE 2005]

(a) $\sqrt{R_1R_2}$ (b) $\sqrt{\dfrac{R_1}{R_2}}$

(c) $\dfrac{R_1 - R_2}{2}$ (d) $\dfrac{R_1 + R_2}{2}$

Different Measuring Instruments

1. In meter bridge or Wheatstone bridge for measurement of resistance, the known and the unknown resistances are interchanged. The error so removed is

[MNR 1988; MP PET 1995]

(a) End correction

(b) Index error

(c) Due to temperature effect

(d) Random error

2. A galvanometer can be converted into an ammeter by connecting

[MP PMT 1987, 93; CPMT 1973, 75, 96, 2000; MP PET 1994; AFMC 1993, 95; RPET 2000; DCE 2000]

(a) Low resistance in series

(b) High resistance in parallel

(c) Low resistance in parallel

(d) High resistance in series

3. A cell of internal resistance $1.5\,\Omega$ and of e.m.f. 1.5 volt balances 500 *cm* on a potentiometer wire. If a wire of $15\,\Omega$ is connected between the balance point and the cell, then the balance point will shift [MP PMT 1985]

(a) To zero (b) By 500 *cm*

(c) By 750 *cm* (d) None of the above

4. $10^{-3}\,amp$ is flowing through a resistance of $1000\,\Omega$. To measure the correct potential difference, the voltmeter is to be used of which the resistance should be [MP PMT 1985]

(a) $0\,\Omega$ (b) $500\,\Omega$

(c) $1000\,\Omega$ (d) $>> 1000\,\Omega$

5. A galvanometer of $100\,\Omega$ resistance gives full scale deflection when 10 *mA* of current is passed. To convert it into 10 *A* range ammeter, the resistance of the shunt required will be

(a) $-10\,\Omega$ (b) $1\,\Omega$

(c) $0.1\,\Omega$ (d) $0.01\,\Omega$

6. $50\,\Omega$ and $100\,\Omega$ resistors are connected in series. This connection is connected with a battery of 2.4 *volts*. When a voltmeter of $100\,\Omega$ resistance is connected across $100\,\Omega$ resistor, then the reading of the voltmeter will be

[MP PMT 1985]

(a) 1.6 *V* (b) 1.0 *V*

(c) 1.2 *V* (d) 2.0 *V*

7. A 2 *volt* battery, a $15\,\Omega$ resistor and a potentiometer of 100 cm length, all are connected in series. If the resistance of potentiometer wire is $5\,\Omega$, then the potential gradient of the potentiometer wire is [AIIMS 1982]

(a) 0.005 *V/cm* (b) 0.05 *V/cm*

(c) 0.02 *V/cm* (d) 0.2 *V/cm*

8. An ammeter gives full scale deflection when current of 1.0 A is passed in it. To convert it into 10 A range ammeter, the ratio of its resistance and the shunt resistance will be

[MP PMT 1985]

(a) 1 : 9 (b) 1 : 10

(c) 1 : 11 (d) 9 : 1

9. By ammeter, which of the following can be measured [MP PET 1981; DPMT 2001]

(a) Electric potential (b) Potential difference
(c) Current (d) Resistance

10. The resistance of 1 A ammeter is $0.018\,\Omega$. To convert it into 10 A ammeter, the shunt resistance required will be [MP PET 1982]

(a) $0.18\,\Omega$ (b) $0.0018\,\Omega$
(c) $0.002\,\Omega$ (d) $0.12\,\Omega$

11. For measurement of potential difference, potentiometer is preferred in comparison to voltmeter because [MP PET 1983]

(a) Potentiometer is more sensitive than voltmeter
(b) The resistance of potentiometer is less than voltmeter
(c) Potentiometer is cheaper than voltmeter
(d) Potentiometer does not take current from the circuit

12. In order to pass 10% of main current through a moving coil galvanometer of 99 *ohm*, the resistance of the required shunt is [MP PET 1990, 99; MP PMT 1994; RPET 2001; KCET 2003, 05]

(a) $9.9\,\Omega$ (b) $10\,\Omega$
(c) $11\,\Omega$ (d) $9\,\Omega$

13. An ammeter of 5 *ohm* resistance can read 5 *mA*. If it is to be used to read 100 volts, how much resistance is to be connected in series [MP PET 1991; MP PMT 1996; MP PMT 2000]

(a) $19.9995\,\Omega$ (b) 199.995Ω
(c) $1999.95\,\Omega$ (d) $19995\,\Omega$

14. The potential gradient along the length of a uniform wire is $10\,volt/metre$. B and C are the two points at $30\,cm$ and $60\,cm$ point on a meter scale fitted along the wire. The potential difference between B and C will be [CPMT 1986]

(a) $3\,volt$ (b) $0.4\,volt$
(c) $7\,volt$ (d) $4\,volt$

15. $100\,mA$ current gives a full scale deflection in a galvanometer of $2\,\Omega$ resistance. The resistance connected with the galvanometer to convert it into a voltmeter to measure $5\,V$ is

(a) $98\,\Omega$ (b) $52\,\Omega$
(c) $50\,\Omega$ (d) $48\,\Omega$

16. When a $12\,\Omega$ resistor is connected with a moving coil galvanometer then its deflection reduces from 50 divisions to 10 divisions. The resistance of the galvanometer is [CPMT 2002; DPMT 2003]

(a) $24\,\Omega$ (b) $36\,\Omega$
(c) $48\,\Omega$ (d) $60\,\Omega$

17. A galvanometer can be used as a voltmeter by connecting a [AFMC 1993; MP PMT 1993, 95; CBSE PMT 2004]

(a) High resistance in series (b) Low resistance in series
(c) High resistance in parallel (d) Low resistance in parallel

18. The tangent galvanometer, when connected in series with a standard resistance can be used as [MP PET 1994]

(a) An ammeter
(b) A voltmeter
(c) A wattmeter
(d) Both an ammeter and a voltmeter

19. In Wheatstone's bridge $P = 9$ *ohm*, $Q = 11$ *ohm*, $R = 4$ *ohm* and $S = 6$ *ohm*. How much resistance must be put in parallel to the resistance S to balance the bridge [DPMT 1999]

(a) 24 *ohm* (b) $\frac{44}{9}$ *ohm*
(c) 26.4 *ohm* (d) 18.7 *ohm*

20. A Daniel cell is balanced on 125 cm length of a potentiometer wire. Now the cell is short-circuited by a resistance 2 *ohm* and the balance is obtained at 100 cm. The internal resistance of the Daniel cell is [UPSEAT 2002]

(a) 0.5 *ohm* (b) 1.5 *ohm*
(c) 1.25 *ohm* (d) 4/5 *ohm*

21. Sensitivity of potentiometer can be increased by [MP PET 1994]

(a) Increasing the e.m.f. of the cell
(b) Increasing the length of the potentiometer wire
(c) Decreasing the length of the potentiometer wire
(d) None of the above

22. A potentiometer is an ideal device of measuring potential difference because

(a) It uses a sensitive galvanometer
(b) It does not disturb the potential difference it measures
(c) It is an elaborate arrangement
(d) It has a long wire hence heat developed is quickly radiated

23. A battery of 6 volts is connected to the terminals of a three metre long wire of uniform thickness and resistance of the order of 100 Ω. The difference of potential between two points separated by 50 cm on the wire will be [CPMT 1984; CBSE PMT 2004]

(a) 1 V (b) 1.5 V
(c) 2 V (d) 3 V

24. A galvanometer of 10 *ohm* resistance gives full scale deflection with 0.01 ampere of current. It is to be converted into an ammeter for measuring 10 ampere current. The value of shunt resistance required will be [MP PET 1984] [MNR 1994; UPSEAT 2000]

(a) $\frac{10}{999}$ *ohm* (b) 0.1 *ohm*
(c) 0.5 *ohm* (d) 1.0 *ohm*

25. A potentiometer is used for the comparison of e.m.f. of two cells E_1 and E_2. For cell E_1 the no deflection point is obtained at 20 cm and for E_2 the no deflection point is obtained at 30 cm. The ratio of their e.m.f.'s will be [MP PET 1984]

(a) 2/3 (b) 1/2
(c) 1 (d) 2

26. Potential gradient is defined as [MP PET 1994]

(a) Fall of potential per unit length of the wire
(b) Fall of potential per unit area of the wire
(c) Fall of potential between two ends of the wire

(d) Potential at any one end of the wire

27. In an experiment of meter bridge, a null point is obtained at the centre of the bridge wire. When a resistance of 10 *ohm* is connected in one gap, the value of resistance in other gap is

(a) 10Ω (b) 5Ω

(c) $\frac{1}{5}\Omega$ (d) 500Ω

28. If the length of potentiometer wire is increased, then the length of the previously obtained balance point will

(a) Increase (b) Decrease

(c) Remain unchanged (d) Become two times

29. In potentiometer a balance point is obtained, when

(a) The e.m.f. of the battery becomes equal to the e.m.f. of the experimental cell

(b) The p.d. of the wire between the +*ve* end to jockey becomes equal to the e.m.f. of the experimental cell

(c) The p.d. of the wire between +*ve* point and jockey becomes equal to the e.m.f. of the battery

(d) The p.d. across the potentiometer wire becomes equal to the e.m.f. of the battery

30. In the experiment of potentiometer, at balance, there is no current in the

(a) Main circuit

(b) Galvanometer circuit

(c) Potentiometer circuit

(d) Both main and galvanometer circuits

31. If in the experiment of Wheatstone's bridge, the positions of cells and galvanometer are interchanged, then balance points will

(a) Change

(b) Remain unchanged

(c) Depend on the internal resistance of cell and resistance of galvanometer

(d) None of these

32. The resistance of a galvanometer is 90 *ohms*. If only 10 percent of the main current may flow through the galvanometer, in which way and of what value, a resistor is to be used

(a) 10 *ohms* in series (b) 10 *ohms* in parallel

(c) 810 *ohms* in series (d) 810 *ohms* in parallel

33. Two cells when connected in series are balanced on $8m$ on a potentiometer. If the cells are connected with polarities of one of the cell is reversed, they balance on $2m$. The ratio of e.m.f.'s of the two cells is

(a) $3:5$ (b) $5:3$

(c) $3:4$ (d) $4:3$

34. A voltmeter has a resistance of G *ohms* and range V *volts*. The value of resistance used in series to convert it into a voltmeter of range nV volts is

[MP PMT 1999; MP PET 2002; DPMT 2004; MH CET 2004]

(a) nG (b) $(n-1)G$

(c) $\frac{G}{n}$ (d) $\frac{G}{(n-1)}$

35. Which of the following statement is wrong [MP PET 1994]

(a) Voltmeter should have high resistance

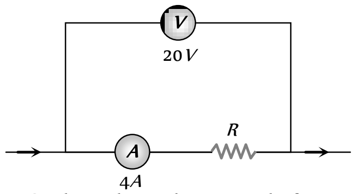
(b) Ammeter should have low resistance

(c) Ammeter is placed in parallel across the conductor in a circuit

(d) Voltmeter is placed in parallel across the conductor in a circuit

36. In the diagram shown, the reading of voltmeter is 20 V and that of ammeter is 4 A. The value of R should be (Consider given ammeter and voltmeter are not ideal) [RPMT 1997]

[MP PET 1994]



(a) Equal to 5Ω

(b) Greater from 5Ω

(c) Less than 5Ω

(d) Greater or less than 5Ω depends on the material of R

37. A moving coil galvanometer has a resistance of 50Ω and gives full scale deflection for 10 mA. How could it be converted into an ammeter with a full scale deflection for 1A

[MP PMT 1996]

(a) $50/99\Omega$ in series (b) $50/99\Omega$ in parallel

(c) 0.01Ω in series (d) 0.01Ω in parallel

38. The current flowing through a coil of resistance 900 *ohms* is to be reduced by 90%. What value of shunt should be connected across the coil [Roorkee 1992]

(a) 90Ω (b) 100Ω

(c) 9Ω (d) 10Ω

39. A galvanometer of resistance 25Ω gives full scale deflection for a current of 10 *milliampere*, is to be changed into a voltmeter of range 100 V by connecting a resistance of 'R' in series with galvanometer. The value of resistance R in Ω is

[MP PET 1994]

(a) 10000 (b) 10025

(c) 975 (d) 9975

40. In a potentiometer circuit there is a cell of e.m.f. 2 *volt*, a resistance of 5 *ohm* and a wire of uniform thickness of length 1000 *cm* and resistance 15 *ohm*. The potential gradient in the wire is [MP PET 1996]

(a) $\frac{1}{500}V/cm$ (b) $\frac{3}{2000}V/cm$

(c) $\frac{3}{5000}V/cm$ (d) $\frac{1}{1000}V/cm$

41. The resistance of a galvanometer is 25 *ohm* and it requires $50\,\mu A$ for full deflection. The value of the shunt resistance required to convert it into an ammeter of 5 *amp* is

[MP PMT 1994; BHU 1997]

(a) $2.5\times10^{-4}\,ohm$ (b) $1.25\times10^{-3}\,ohm$

(c) 0.05 *ohm* (d) 2.5 *ohm*

42. Which is a *wrong* statement [MP PMT 1994]

(a) The Wheatstone bridge is most sensitive when all the four resistances are of the same order

(b) In a balanced Wheatstone bridge, interchanging the positions of galvanometer and cell affects the balance of the bridge

(c) Kirchhoff's first law (for currents meeting at a junction in an electric circuit) expresses the conservation of charge

(d) The rheostat can be used as a potential divider

43. A voltmeter having a resistance of 998 *ohms* is connected to a cell of e.m.f. 2 *volt* and internal resistance 2 *ohm*. The error in the measurement of e.m.f. will be [MP PMT 1994]

(a) $4\times10^{-1}\,volt$ (b) $2\times10^{-3}\,volt$

(c) $4\times10^{-3}\,volt$ (d) $2\times10^{-1}\,volt$

44. For comparing the e.m.f.'s of two cells with a potentiometer, a standard cell is used to develop a potential gradient along the wires. Which of the following possibilities would make the experiment unsuccessful [MP PMT 1994]

(a) The e.m.f. of the standard cell is larger than the E e.m.f.'s of the two cells
(b) The diameter of the wires is the same and uniform throughout
(c) The number of wires is ten
(d) The e.m.f. of the standard cell is smaller than the e.m.f.'s of the two cells

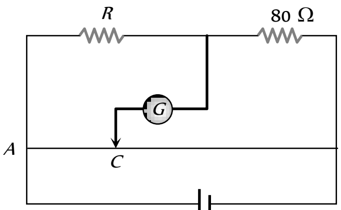
45. Which of the following is correct [BHU 1995]

(a) Ammeter has low resistance and is connected in series
(b) Ammeter has low resistance and is connected in parallel
(c) Voltmeter has low resistance and is connected in parallel
(d) None of the above

46. An ammeter with internal resistance $90\,\Omega$ reads 1.85 A when connected in a circuit containing a battery and two resistors 700 Ω and $410\,\Omega$ in series. Actual current will be [Roorkee 1995]

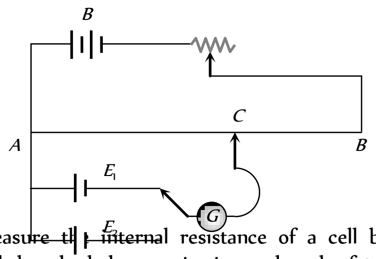
(a) 1.85 A (b) Greater than $1.85\,A$
(c) Less than 1.85 A (d) None of these

47. AB is a wire of uniform resistance. The galvanometer G shows no current when the length AC = 20 cm and CB = 80 cm. The resistance R is equal to [MP PMT 1995; RPET 2001]



(a) $2\,\Omega$
(b) $8\,\Omega$
(c) $20\,\Omega$
(d) $40\,\Omega$

48. The circuit shown here is used to compare the e.m.f. of two cells E_1 and $E_2 (E_1 > E_2)$. The null point is at C when the galvanometer is connected to E_1. When the galvanometer is connected to E_2, the null point will be [MP PMT 1995]

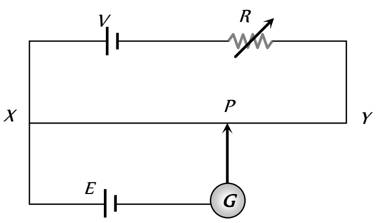


(a) To the left of C
(b) To the right of C
(c) At C itself
(d) Nowhere on AB

49. In an experiment to measure the internal resistance of a cell by potentiometer, it is found that the balance point is at a length of 2 m when the cell is shunted by a $5\,\Omega$ resistance; and is at a length of 3 m when the cell is shunted by a $10\,\Omega$ resistance. The internal resistance of the cell is, then [Haryana CEE 1996]

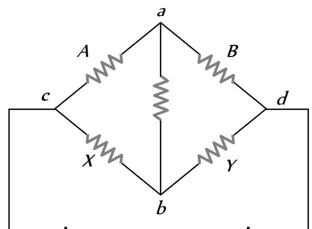
(a) $1.5\,\Omega$ (b) $10\,\Omega$
(c) $15\,\Omega$ (d) $1\,\Omega$

50. A potentiometer circuit shown in the figure is set up to measure e.m.f. of a cell E. As the point P moves from X to Y the galvanometer G shows deflection always in one direction, but the deflection decreases continuously until Y is reached. In order to obtain balance point between X and Y it is necessary to



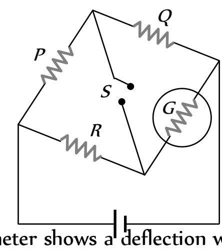
(a) Decreases the resistance R
(b) Increase the resistance R
(c) Reverse the terminals of battery V
(d) Reverse the terminals of cell E

51. In the Wheatstone's bridge (shown in figure) $X = Y$ and $A > B$. The direction of the current between ab will be



(a) From a to b
(b) From b to a
(c) From b to a through c
(d) From a to b through c

52. The figure shows a circuit diagram of a 'Wheatstone bridge' to measure the resistance G of the galvanometer. The relation $\frac{P}{Q} = \frac{R}{G}$ will be satisfied only when

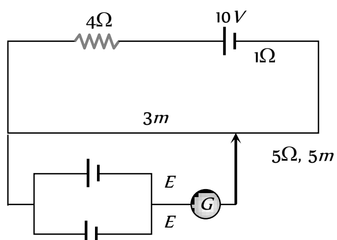


(a) The galvanometer shows a deflection when switch S is closed
(b) The galvanometer shows a deflection when switch S is open
(c) The galvanometer shows no change in deflection whether S is open or closed
(d) The galvanometer shows no deflection

53. The resistance of a galvanometer is 50 $ohms$ and the current required to give full scale deflection is $100\,\mu A$. In order to convert it into an ammeter, reading upto 10A, it is necessary to put a resistance of [MP PMT 1997; AIIMS 1999]

(a) $5 \times 10^{-3}\,\Omega$ in parallel (b) $5 \times 10^{-4}\,\Omega$ in parallel
(c) $10^5\,\Omega$ in series (d) $99{,}950\,\Omega$ in series

54. A resistance of $4\,\Omega$ and a wire of length 5 $metres$ and resistance $5\,\Omega$ are joined in series and connected to a cell of e.m.f. 10 V and internal resistance $1\,\Omega$. A parallel combination of two identical cells is balanced across 300 cm of the wire. The e.m.f. E of each cell is [MP PMT 199



(a) 1.5 V
(b) 3.0 V
(c) 0.67 V
(d) 1.33 V

55. The resistivity of a potentiometer wire is $40 \times 10^{-8}\ ohm - m$ and its area of cross-section is $8 \times 10^{-6}\,m^2$. If 0.2 amp current is flowing through the wire, the potential gradient will be

(a) $10^{-2}\, volt/m$ (b) $10^{-1}\, volt/m$

(c) $3.2\times 10^{-2}\, volt/m$ (d) $1\, volt/m$

56. If only 2% of the main current is to be passed through a galvanometer of resistance *G*, then the resistance of shunt will be

(a) $\frac{G}{50}$ (b) $\frac{G}{49}$

(c) $50\,G$ (d) $49\,G$

57. The resistance of an ideal voltmeter is

[EAMCET (Med.) 1995; MP PMT/PET 1998; Pb. PMT 1999; CPMT 2000]

(a) Zero (b) Very low

(c) Very large (d) Infinite

58. A 100 *V* voltmeter of internal resistance $20\,k\Omega$ in series with a high resistance *R* is connected to a 110 *V* line. The voltmeter reads 5 *V*, the value of *R* is [MP PET 1999]

(a) $210\,k\Omega$ (b) $315\,k\Omega$

(c) $420\,k\Omega$ (d) $440\,k\Omega$

59. Constantan wire is used in making standard resistances because its

(a) Specific resistance is low

(b) Density is high

(c) Temperature coefficient of resistance is negligible

(d) Melting point is high

60. The net resistance of a voltmeter should be large to ensure that

(a) It does not get overheated

(b) It does not draw excessive current

(c) It can measure large potential difference

(d) It does not appreciably change the potential difference to be measured

61. A galvanometer has resistance of $7\,\Omega$ and gives a full scale deflection for a current of 1.0 *A*. How will you convert it into a voltmeter of range 10 *V* [MP PMT 1999]

(a) $3\,\Omega$ in series (b) $3\,\Omega$ in parallel

(c) $17\,\Omega$ in series (d) $30\,\Omega$ in series

62. A potentiometer consists of a wire of length 4 *m* and resistance $10\,\Omega$. It is connected to a cell of e.m.f. 2 *V*. The potential difference per unit length of the wire will be

[CBSE PMT 1999; AFMC 2001]

(a) 0.5 V/m (b) $2\,V/m$

(c) $5\,V/m$ (d) $10\,V/m$

63. In a meter bridge, the balancing length from the left end (standard resistance of one *ohm* is in the right gap) is found to be 20 *cm*. The value of the unknown resistance is

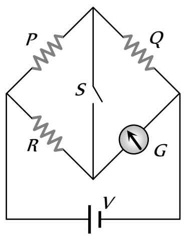
[CBSE PMT 1999; Pb PMT 2004]

(a) $0.8\,\Omega$ (b) $0.5\,\Omega$

(c) $0.4\,\Omega$ (d) $0.25\,\Omega$

64. In the circuit shown $P\neq R$, the reading of the galvanometer is same with switch *S* open or closed. Then

[IIT-JEE (Screening) 1999]



(a) $I_R = I_G$

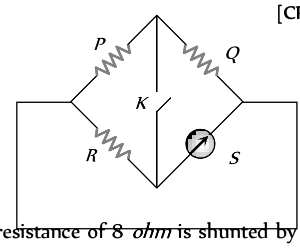
(b) $I_P = I_G$

(c) $I_Q = I_G$ [MP PMT/PET 1998]

(d) $I_Q = I_R$

65. In the following Wheatstone bridge $P/Q = R/S$. If key *K* is closed, then the galvanometer will show deflection

[CPMT 1999]



(a) In left side

(b) In right side

(c) No deflection

(d) In either side

66. A galvanometer having a resistance of 8 *ohm* is shunted by a wire of resistance 2 *ohm*. If the total current is 1 *amp*, the part of it passing through the shunt will be

[CBSE PMT 1998]

(a) 0.25 *amp* [MP PET 1999] (b) 0.8 *amp*

(c) 0.2 *amp* (d) 0.5 *amp*

67. A potentiometer wire has length 10 *m* and resistance $20\,\Omega$. A 2. 5 *V* battery of negligible internal resistance is connected across the wire with an $80\,\Omega$ series resistance. The potential gradient on the wire will be [KCET 1994]

[MP PMT 1999]

(a) $5\times 10^{-5}\, V/mm$ (b) $2.5\times 10^{-4}\, V/cm$

(c) $0.62\times 10^{-4}\, V/mm$ (d) $1\times 10^{-5}\, V/mm$

68. An ammeter whose resistance is $180\,\Omega$ gives full scale deflection when current is 2 *mA*. The shunt required to convert it into an ammeter reading 20 *mA* (in *ohms*) is

[EAMCET (Engg.) 1995]

(a) 18 (b) 20

(c) 0.1 (d) 10

69. A galvanometer whose resistance is $120\,\Omega$ gives full scale deflection with a current of 0.05 *A* so that it can read a maximum current of 10 *A*. A shunt resistance is added in parallel with it. The resistance of the ammeter so formed is

[Bihar MEE 1995]

(a) $0.06\,\Omega$ (b) $0.006\,\Omega$

(c) $0.6\,\Omega$ (d) $6\,\Omega$s

70. In a potentiometer experiment, the galvanometer shows no deflection when a cell is connected across 60 *cm* of the potentiometer wire. If the cell is shunted by a resistance of $6\,\Omega$, the balance is obtained across 50 *cm* of the wire. The internal resistance of the cell is [SCRA 1994]

(a) $0.5\,\Omega$ (b) $0.6\,\Omega$

(c) $1.2\,\Omega$ (d) $1.5\,\Omega$

71. A voltmeter of resistance $1000\,\Omega$ gives full scale deflection when a current of 100 *mA* flow through it. The shunt resistance required across it to enable it to be used as an ammeter reading 1 *A* at full scale deflection is [SCRA 1994]

(a) $10000\,\Omega$ (b) $9000\,\Omega$

(c) $222\,\Omega$ (d) $111\,\Omega$

72. The resistance of 10 *metre* long potentiometer wire is 1*ohm/meter*. A cell of e.m.f. 2.2 *volts* and a high resistance box are connected in series to this wire. The value of resistance taken from resistance box for getting potential gradient of 2.2 *millivolt/metre* will be[RPET 1997]

(a) $790\,\Omega$ (b) $810\,\Omega$

(c) $990\,\Omega$ (d) $1000\,\Omega$

73. We have a galvanometer of resistance $25\,\Omega$. It is shunted by a $2.5\,\Omega$ wire. The part of total current that flows through the galvanometer is given as

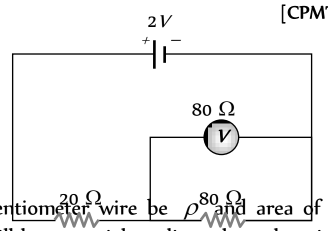
[AFMC 1998; MH CET 1999; Pb. PMT 2002]

(a) $\frac{I}{I_0}=\frac{1}{11}$ (b) $\frac{I}{I_0}=\frac{1}{10}$

(c) $\frac{I}{I_0}=\frac{3}{11}$ (d) $\frac{I}{I_0}=\frac{4}{11}$

74. In the adjoining circuit, the e.m.f. of the cell is 2 *volt* and the internal resistance is negligible. The resistance of the voltmeter is 80 *ohm*. The reading of the voltmeter will be

[CPMT 1991]



(a) 0.80 *volt*

(b) 1.60 *volt*

(c) 1.33 *volt*

(d) 2.00 *volt*

75. If the resistivity of a potentiometer wire be ρ and area of cross-section be *A*, then what will be potential gradient along the wire

(a) $\frac{I\rho}{A}$ (b) $\frac{I}{A\rho}$

(c) $\frac{IA}{\rho}$ (d) $IA\rho$

76. A voltmeter has resistance of 2000 *ohms* and it can measure upto 2*V*. If we want to increase its range to 10 *V*, then the required resistance in series will be

[CPMT 1997, SCRA 1994]

(a) $2000\,\Omega$ (b) $4000\,\Omega$

(c) $6000\,\Omega$ (d) $8000\,\Omega$

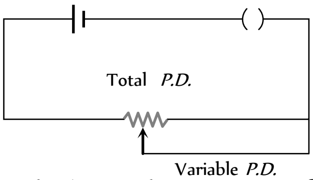
77. For a cell of e.m.f. 2*V*, a balance is obtained for 50 *cm* of the potentiometer wire. If the cell is shunted by a $2\,\Omega$ resistor and the balance is obtained across 40 *cm* of the wire, then the internal resistance of the cell is [SCRA 1998]

(a) $0.25\,\Omega$ (b) $0.50\,\Omega$

(c) $0.80\,\Omega$ (d) $1.00\,\Omega$

78. The arrangement as shown in figure is called as

[CPMT 1999]



(a) Potential divider

(b) Potential adder

(c) Potential substracter

(d) Potential multiplier

79. A potentiometer wire of length $1\,m$ and resistance 10 Ω is connected in series with a cell of *emf* 2 *V* with internal resistance 1 Ω and a resistance box including a resistance *R*. If potential difference between the ends of the wire is 1 *mV*, the value of *R* is [KCET 1999]

(a) 20000 Ω (b) 19989 Ω

(c) 10000 Ω (d) 9989 Ω

80. In a balanced Wheatstone's network, the resistances in the arms *Q* and *S* are interchanged. As a result of this

[KCET 1999]

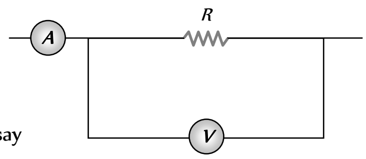
(a) Network is not balanced

(b) Network is still balanced

(c) Galvanometer shows zero deflection

(d) Galvanometer and the cell must be interchanged to balance

81. The ammeter *A* reads 2 *A* and the voltmeter *V* reads 20 *V*. the value of resistance *R* is (Assuming finite resistance's of ammeter and voltmeter) [JIPMER 1999; MP PMT 2004]



(a) Exactly 10 *ohm*

(b) Less than 10 *ohm*

(c) More than 10 *ohm*

(d) We cannot definitely say

82. The resistance of a galvanometer coil is *R*. What is the shunt resistance required to convert it into an ammeter of range 4 times

(a) $\frac{R}{5}$ (b) $\frac{R}{4}$

(c) $\frac{R}{3}$ (d) 4 *R*

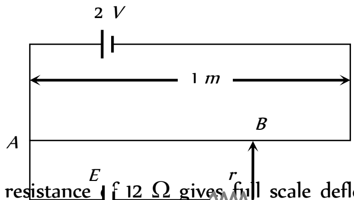
[RPET 1996]

83. If an ammeter is connected in parallel to a circuit, it is likely to be damaged due to excess [BHU 2000; BCECE 2004]

(a) Current (b) Voltage

(c) Resistance (d) All of these

84. In the given figure, battery *E* is balanced on 55 *cm* length of potentiometer wire but when a resistance of 10 Ω is connected in parallel with the battery then it balances on 50 *cm* length of the potentiometer wire then internal resistance *r* of the battery is



(a) 1 Ω

(b) 3 Ω

(c) 10 Ω

(d) 5 Ω

85. A galvanometer with a resistance of 12 Ω gives full scale deflection when a current of 3 *mA* is passed. It is required to convert it into a voltmeter which can read up to 18 *V*. the resistance to be connected is [Pb. PMT 2000]

(a) 6000 Ω (b) 5988 Ω

(c) 5000 Ω (d) 4988 Ω

86. The resistance of an ideal ammeter is [KCET 2000]

(a) Infinite (b) Very high

(c) Small (d) Zero

87. A galvanometer of 25 Ω resistance can read a maximum current of 6*mA*. It can be used as a voltmeter to measure a maximum of 6 *V* by connecting a resistance to the galvanometer. Identify the correct choice in the given answers [EAMCET (Med.) 2000]

(a) 1025 Ω in series (b) 1025 Ω in parallel

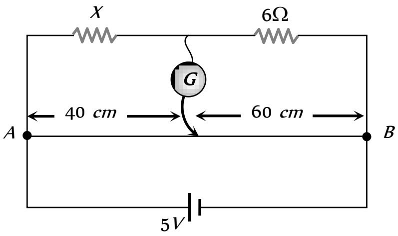
(c) 975 Ω in series (d) 975 Ω in parallel

88. A galvanometer has a resistance of 25 *ohm* and a maximum of 0.01 *A* current can be passed through it. In order to change it into an ammeter of range 10 *A*, the shunt resistance required is

(a) 5/999 *ohm* (b) 10/999 *ohm*
(c) 20/999 *ohm* (d) 25/999 *ohm*

89. In the circuit shown, a *meter* bridge is in its balanced state. The *meter* bridge wire has a resistance 0.1 *ohm/cm*. The value of unknown resistance *X* and the current drawn from the battery of negligible resistance is [AMU (Engg.) 2000]

(a) 6 Ω, 5 *amp*
(b) 10 Ω, 0.1 *amp*
(c) 4 Ω, 1.0 *amp*
(d) 12 Ω, 0.5 *amp*



90. A galvanometer has 30 divisions and a sensitivity 16 $\mu A/\text{div}$. It can be converted into a voltmeter to read 3 *V* by connecting

(a) Resistance nearly 6 $k\Omega$ in series
(b) $6k\Omega$ in parallel
(c) 500Ω in series
(d) It cannot be converted

91. Voltmeters *V* and *V* are connected in series across a *D.C.* line. *V* reads 80 *volts* and has a per *volt* resistance of 200 *ohms*. *V* has a total resistance of 32 *kilo ohms*. The line voltage is

(a) 120 *volts* (b) 160 *volts*
(c) 220 *volts* (d) 240 *volts*

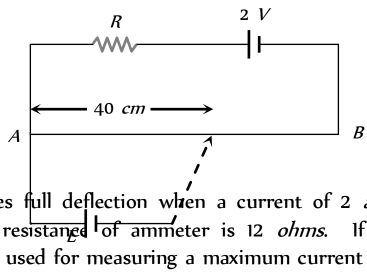
92. A potentiometer having the potential gradient of 2 *mV/cm* is used to measure the difference of potential across a resistance of 10 *ohm*. If a length of 50 *cm* of the potentiometer wire is required to get the null point, the current passing through the 10 *ohm* resistor is (in *mA*)

[AMU (Med.) 2000]

(a) 1 (b) 2
(c) 5 (d) 10

93. *AB* is a potentiometer wire of length 100 *cm* and its resistance is 10 *ohms*. It is connected in series with a resistance *R* = 40 *ohms* and a battery of e.m.f. 2 *V* and negligible internal resistance. If a source of unknown e.m.f. *E* is balanced by 40 *cm* length of the potentiometer wire, the value of *E* is [MP PET 2001]

(a) 0.8 *V*
(b) 1.6 *V*
(c) 0.08 *V*
(d) 0.16 *V*



94. An ammeter gives full deflection when a current of 2 *amp.* flows through it. The resistance of ammeter is 12 *ohms*. If the same ammeter is to be used for measuring a maximum current of 5 *amp.*, then the ammeter must be connected with a resistance of

(a) 8 *ohms* in series (b) 18 *ohms* in series
(c) 8 *ohms* in parallel (d) 18 *ohms* in parallel

95. In a circuit 5 percent of total current passes through a galvanometer. If resistance of the galvanometer is *G* then value of the shunt is [MP PET 2001]

(a) 19 *G* (b) 20 *G*
(c) $\frac{G}{20}$ (d) $\frac{G}{19}$

[MP PET 2000]

96. A voltmeter having resistance of 50 × 10 *ohm* is used to measure the voltage in a circuit. To increase the range of measurement 3 times the additional series resistance required is

(a) 10 *ohm* (b) 150 *k.ohm*
(c) 900 *k.ohm* (d) 9 × 10 *ohm*

97. In a potentiometer experiment two cells of e.m.f. *E* and *E* are used in series and in conjunction and the balancing length is found to be 58 *cm* of the wire. If the polarity of *E* is reversed, then the balancing length becomes 29 *cm*. The ratio $\frac{E_1}{E_2}$ of the e.m.f. of the two cells is

[Kerala (Engg.) 2001]

(a) 1 : 1 (b) 2 : 1
(c) 3 : 1 (d) 4 : 1

98. A milliammeter of range 10 *mA* has a coil of resistance 1 Ω. To use it as voltmeter of range 10 *volt*, the resistance that must be connected in series with it, will be [Kerala PMT 2005] [KCET 2001]

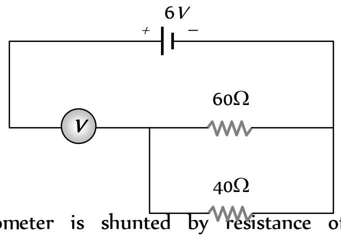
(a) 999 Ω (b) 99 Ω
(c) 1000 Ω (d) None of these

99. A voltmeter has a range 0-*V* with a series resistance *R*. With a series resistance 2*R*, the range is 0-V'. The correct relation between *V* and *V* is [CPMT 2001]

(a) $V' = 2V$ [UPSEAT 2000] (b) $V' > 2V$
(c) $V' >> 2V$ (d) $V' < 2V$

100. The measurement of voltmeter in the following circuit is [AFMC 2001]

(a) 2.4 *V*
(b) 3.4 *V*
(c) 4.0 *V*
(d) 6.0 *V*



101. A 36 Ω galvanometer is shunted by resistance of 4Ω. The percentage of the total current, which passes through the galvanometer is [UPSEAT 2002]

(a) 8 % (b) 9 %
(c) 10 % (d) 91 %

102. An ammeter and a voltmeter of resistance *R* are connected in series to an electric cell of negligible internal resistance. Their readings are *A* and *V* respectively. If another resistance *R* is connected in parallel with the voltmeter

[EAMCET 2000; KCET 2002]

(a) Both *A* and *V* will increase
(b) Both *A* and *V* will decrease
(c) *A* will decrease and *V* will increase
(d) *A* will increase and *V* will decrease [MP PET 2001]

103. A wire of length 100 *cm* is connected to a cell of *emf* 2 *V* and negligible internal resistance. The resistance of the wire is 3 Ω. The additional resistance required to produce a potential drop of 1 *milli volt* per *cm* is [Kerala PET 2002]

(a) 60 Ω (b) 47 Ω
(c) 57 Ω (d) 35 Ω

104. A galvanometer of resistance 20 Ω is to be converted into an ammeter of range 1 *A*. If a current of 1 *mA* produces full scale deflection, the shunt required for the purpose is [Kerala PET 2002]

(a) 0.01 Ω (b) 0.05 Ω

(c) 0.02 Ω (d) 0.04 Ω

105. There are three voltmeters of the same range but of resistances 10000Ω, 8000Ω and 4000Ω respectively. The best voltmeter among these is the one whose resistance is

(a) 10000 Ω (b) 8000 Ω

(c) 4000 Ω (d) All are equally good

106. If an ammeter is to be used in place of a voltmeter then we must connect with the ammeter a [AIEEE 2002; AFMC 2002]

(a) Low resistance in parallel

(b) High resistance in parallel

(c) High resistance in series

(d) Low resistance in series

107. A 10 *m* long wire of 20Ω resistance is connected with a battery of 3 *volt* e.m.f. (negligible internal resistance) and a 10 Ω resistance is joined to it is series. Potential gradient along wire in volt per meter is [MP PMT 2003]

(a) 0.02 (b) 0.3

(c) 0.2 (d) 1.3

108. A potentiometer has uniform potential gradient across it. Two cells connected in series (i) to support each other and (ii) to oppose each other are balanced over $6m$ and $2m$ respectively on the potentiometer wire. The e.m.f.'s of the cells are in the ratio of

(a) 1 : 2 (b) 1 : 1

(c) 3 : 1 (d) 2 : 1

109. The material of wire of potentiometer is [MP PMT 2002]

(a) Copper (b) Steel

(c) Manganin (d) Aluminium

110. To convert a galvanometer into a voltmeter, one should connect a

(a) High resistance in series with galvanometer

(b) Low resistance in series with galvanometer

(c) High resistance in parallel with galvanometer

(d) Low resistance in parallel with galvanometer

111. To convert a 800 *mV* range *milli voltmeter* of resistance 40 Ω into a galvanometer of 100 *mA* range, the resistance to be connected as shunt is [CBSE PMT 2002]

(a) 10 Ω (b) 20 Ω

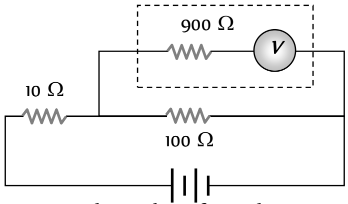
(c) 30 Ω (d) 40 Ω

112. A 100 *ohm* galvanometer gives full scale deflection at 10 *mA*. How much shunt is required to read 100 *mA* [MP PET 2002]

(a) 11.11 *ohm* (b) 9.9 *ohm*

(c) 1.1 *ohm* (d) 4.4 *ohm*

113. The potential difference across the 100Ω resistance in the following circuit is measured by a voltmeter of 900 Ω resistance. The percentage error made in reading the potential difference is [Kerala PET 2002]



(a) $\frac{10}{9}$

(b) 0.1

(c) 1.0

(d) 10.0

114. A cell of internal resistance 3 *ohm* and *emf* 10 *volt* is connected to a uniform wire of length 500 *cm* and resistance 3 *ohm*. The potential gradient in the wire is [MP PET 2003]

(a) 30 *mV/cm* (b) 10 *mV/cm*

(c) 20 *mV/cm* (d) 4 *mV/cm*

115. An ammeter of 100 Ω resistance gives full deflection for the current of 10^{-5} *amp*. Now the shunt resistance required to convert it into ammeter of 1 *amp*. range, will be [RPET 2003]

(a) 10^{-4} Ω (b) 10^{-5} Ω

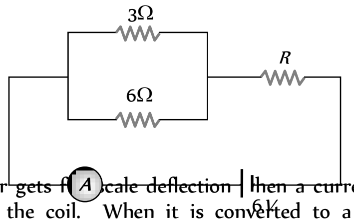
(c) 10^{-3} Ω (d) 10^{-1} Ω

116. A galvanometer of resistance 36 Ω is changed into an ammeter by using a shunt of 4 Ω. The fraction f of total current passing through the galvanometer is [BCECE 2003]

(a) $\frac{1}{40}$ (b) $\frac{1}{4}$

(c) $\frac{1}{140}$ (d) $\frac{1}{10}$

117. If the ammeter in the given circuit reads 2 *A*, the resistance *R* is [MP PMT 2002]



(a) 1 *ohm*

(b) 2 *ohm*

(c) 3 *ohm*

(d) 4 *ohm*

118. A 50 *ohm* galvanometer gets full scale deflection when a current of 0.01 *A* passes through the coil. When it is converted to a 10 *A* ammeter, the shunt resistance is [Orissa JEE 2003]

[CBSE PMT 2002]

(a) 0.01 Ω (b) 0.05 Ω

(c) 2000 Ω (d) 5000 Ω

119. Resistance in the two gaps of a *meter* bridge are 10 *ohm* and 30 *ohm* respectively. If the resistances are interchanged the balance point shifts by [Orissa JEE 2003]

(a) 33.3 *cm* (b) 66.67 *cm*

(c) 25 *cm* (d) 50 *cm*

120. A potentiometer has uniform potential gradient. The specific resistance of the material of the potentiometer wire is 10^{-7} *ohm–meter* and the current passing through it is 0.1 *ampere*; cross-section of the wire is 10^{-6} m^2. The potential gradient along the potentiometer wire is [KCET 2003]

(a) 10^{-4} *V/m* (b) 10^{-6} *V/m*

(c) 10^{-2} *V/m* (d) 10^{-8} *V/m*

121. Two resistances of 400 Ω and 800 Ω are connected in series with 6 *volt* battery of negligible internal resistance. A voltmeter of resistance 10,000 Ω is used to measure the potential difference across 400 Ω. The error in the measurement of potential difference in *volts* approximately is [AMU (Med.) 2002]

(a) 0.01 (b) 0.02

(c) 0.03 (d) 0.05

122. A galvanometer, having a resistance of 50 Ω gives a full scale deflection for a current of 0.05 *A*. The length in *meter* of a resistance wire of area of cross-section 2.97×10^{-2} *cm* that can be used to convert the galvanometer into an ammeter which can read a maximum of 5 *A* current is (Specific resistance of the wire = $5 \times 10^{-7}\ \Omega m$)

(a) 9 (b) 6
(c) 3 (d) 1.5

123. An ammeter reads upto 1 *ampere*. Its internal resistance is 0.81 *ohm*. To increase the range to 10 *A* the value of the required shunt is [AIEEE 2003]

(a) 0.09 Ω (b) 0.03 Ω
(c) 0.3 Ω (d) 0.9 Ω

124. The length of a wire of a potentiometer is 100 *cm*, and the *emf* of its standard cell is *E volt*. It is employed to measure the *e.m.f* of a battery whose internal resistance is 0.5 Ω. If the balance point is obtained at l = 30 *cm* from the positive end, the e.m.f. of the battery is [AIEEE 2003]

(a) $\frac{30E}{100}$

(b) $\frac{30E}{100.5}$

(c) $\frac{30E}{(100-0.5)}$

(d) $\frac{30(E-0.5i)}{100}$, where i is the current in the potentiometer

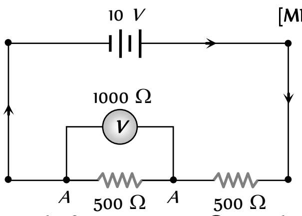
125. Resistance of 100 *cm* long potentiometer wire is 10Ω, it is connected to a battery (2 *volt*) and a resistance *R* in series. A source of 10 *mV* gives null point at 40 *cm* length, then external resistance *R* is

(a) 490 Ω (b) 790 Ω
(c) 590 Ω (d) 990 Ω

126. The e.m.f. of a standard cell balances across 150 *cm* length of a wire of potentiometer. When a resistance of 2 Ω is connected as a shunt with the cell, the balance point is obtained at 100 *cm*. The internal resistance of the cell is [MP PET 1993]

(a) 0.1 Ω (b) 1 Ω
(c) 2 Ω (d) 0.5 Ω

127. What is the reading of voltmeter in the following figure [MP PMT 2004]



(a) 3 *V*
(b) 2 *V*
(c) 5 *V*
(d) 4 *V*

128. The current flowing in a coil of resistance 90 Ω is to be reduced by 90%. What value of resistance should be connected in parallel with it [MP PMT 2004]

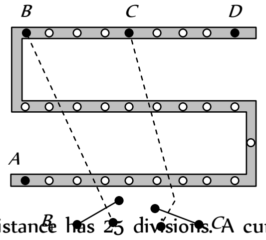
(a) 9 Ω (b) 90 Ω
(c) 1000 Ω (d) 10 Ω

129. The maximum current that can be measured by a galvanometer of resistance 40 Ω is 10 *mA*. It is converted into a voltmeter that can read upto 50 *V*. The resistance to be connected in series with the galvanometer is ... (in *ohm*) [KCET 2004]

(a) 5040 (b) 4960
(c) 2010 (d) 4050

[EAMCET 2003]

130. For the post office box arrangement to determine the value of unknown resistance the unknown resistance should be connected between [IIT-JEE (Screening) 2004]



(a) *B* and *C*
(b) *C* and *D*
(c) *A* and *D*
(d) B_1 and C_1

131. A galvanometer of 50 *ohm* resistance has 25 divisions. A current of 4×10^{-4} *ampere* gives a deflection of one division. To convert this galvanometer into a voltmeter having a range of 25 *volts*, it should be connected with a resistance of [CBSE PMT 2004]

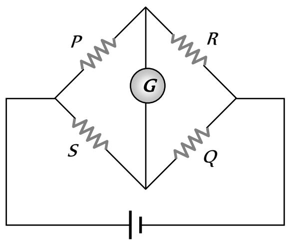
(a) 2500 Ω as a shunt (b) 2450 Ω as a shunt
(c) 2550 Ω in series (d) 2450 Ω in series

132. In a metre bridge experiment null point is obtained at 20 *cm* from one end of the wire when resistance *X* is balanced against another resistance *Y*. If *X* < *Y*, then where will be the new position of the null point from the same end, if one decides to balance a resistance of 4*X* against *Y* [AIEEE 2004]

[MP PMT 2003]

(a) 50 *cm* (b) 80 *cm*
(c) 40 *cm* (d) 70 *cm*

133. In the circuit given, the correct relation to a balanced Wheatstone bridge is [Orissa PMT 2004]



(a) $\frac{P}{Q}=\frac{R}{S}$

(b) $\frac{P}{Q}=\frac{S}{R}$

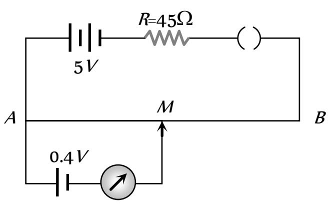
(c) $\frac{P}{R}=\frac{S}{Q}$

(d) None of these

134. A galvanometer coil of resistance 50 Ω, show full deflection of $100\mu A$. The shunt resistance to be added to the galvanometer, to work as an ammeter of range 10 *mA* is [Pb PET 2000]

(a) 5 Ω in parallel (b) 0.5 Ω in series
(c) 5 Ω in series (d) 0.5 Ω in parallel

135. In given figure, the potentiometer wire *AB* has a resistance of 5 Ω and length 10 *m*. The balancing length *AM* for the emf of 0.4 *V* is



(a) 0.4 *m*
(b) 4 *m*
(c) 0.8 *m*
(d) 8 *m*

136. A potentiometer consists of a wire of length 4 *m* and resistance 10 Ω. It is connected to cell of emf 2 *V*. The potential difference per unit length of the wire will be [Pb. PET 2002]

(a) 0.5 *V/m* (b) 10 *V/m*
(c) 2 *V/m* (d) 5 *V/m*

137. A voltmeter essentially consists of [UPSEAT 2004]

(a) A high resistance, in series with a galvanometer
(b) A low resistance, in series with a galvanometer
(c) A high resistance in parallel with a galvanometer
(d) A low resistance in parallel with a galvanometer

138. In a potentiometer experiment the balancing with a cell is at length 240 *cm*. On shunting the cell with a resistance of 2 Ω, the balancing length becomes 120 *cm*. The internal resistance of the cell is

(a) 4 Ω (b) 2 Ω
(c) 1 Ω (d) 0.5 Ω

139. With a potentiometer null point were obtained at 140 *cm* and 180 *cm* with cells of emf 1.1 *V* and one unknown *X* volts. Unknown emf is [DCE 2002]

(a) 1.1 *V* (b) 1.8 *V*
(c) 2.4 *V* (d) 1.41 *V*

140. A moving coil galvanometer of resistance 100Ω is used as an ammeter using a resistance 0.1Ω. The maximum deflection current in the galvanometer is 100μA. Find the minimum current in the circuit so that the ammeter shows maximum deflection

(a) 100.1 *mA* (b) 1000.1 *mA*
(c) 10.01 *mA* (d) 1.01 *mA*

141. Two resistances are connected in two gaps of a metre bridge. The balance point is 20 *cm* from the zero end. A resistance of 15 *ohms* is connected in series with the smaller of the two. The null point shifts to 40 *cm*. The value of the smaller resistance in ohms is

(a) 3 (b) 6
(c) 9 (d) 12

142. If resistance of voltmeter is 10000Ω and resistance of ammeter is 2Ω then find *R* when voltmeter reads 12 *V* and ammeter reads 0.1 *A*

(a) 118 Ω (b) 120 Ω
(c) 124 Ω (d) 114Ω

143. Potentiometer wire of length 1 *m* is connected in series with 490 Ω resistance and 2 *V* battery. If 0.2 *mV/cm* is the potential gradient, then resistance of the potentiometer wire is

(a) 4.9 Ω (b) 7.9 Ω
(c) 5.9 Ω (d) 6.9 Ω

CT Critical Thinking

Objective Questions

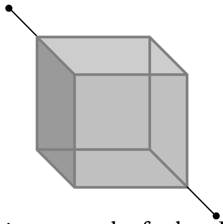
1. In an electrical cable there is a single wire of radius 9 *mm* of copper. Its resistance is $5\,\Omega$. The cable is replaced by 6 different insulated copper wires, the radius of each wire is $3\,mm$. Now the total resistance of the cable will be [CPMT 1988]

(a) $7.5\,\Omega$ (b) $45\,\Omega$
(c) $90\,\Omega$ (d) $270\,\Omega$

2. Two uniform wires A and B are of the same metal and have equal masses. The radius of wire A is twice that of wire B. The total resistance of *A* and B when connected in parallel is

(a) $4\,\Omega$ when the resistance of wire A is $4.25\,\Omega$
(b) $5\,\Omega$ when the resistance of wire A is $4.25\,\Omega$
(c) $4\,\Omega$ when the resistance of wire B is $4.25\,\Omega$
(d) $4\,\Omega$ when the resistance of wire B is $4.25\,\Omega$

3. Twelve [DCE 2002, AIEEE 2005] wires of equal length and same cross-section are connected in the form of a cube. If the resistance of each of the wires is R, then the effective resistance between the two diagonal ends would be [J & K CET 2004]

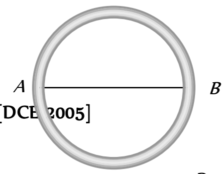


(a) 2 R
(b) 12 R
(c) $\frac{5}{6}R$
(d) 8 R

4. You are given several identical resistances each of value $R = 10\,\Omega$ [IIT-JEE (Screening) 2005] and each capable of carrying maximum current of 1 ampere. It is required to make a suitable combination of these resistances to produce a resistance of $5\,\Omega$ which can carry a current of 4 amperes. The minimum number of resistances of the type R that will be required for this job [CBSE PMT 1990]

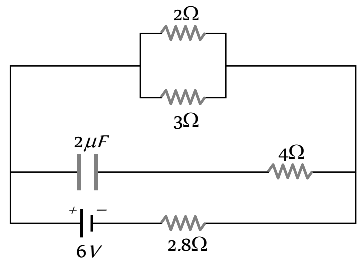
(a) 4 [KCET 2005] (b) 10
(c) 8 (d) 20

5. The resistance of a wire is $10^{-6}\,\Omega$ per metre. It is bend in the form of a circle of diameter $2\,m$. [BCECE 2005] A wire of the same material is connected across its diameter. The total resistance across its diameter *AB* will be



(a) $\frac{4}{3}\pi \times 10^{-6}\,\Omega$ (b) $\frac{2}{3}\pi \times 10^{-6}\,\Omega$
(c) $0.88 \times 10^{-6}\,\Omega$ (d) $14\pi \times 10^{-6}\,\Omega$

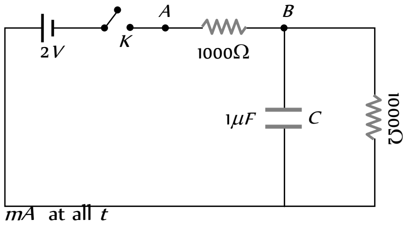
6. In the figure shown, the capacity of the condenser C is $2\,\mu F$. The current in $2\,\Omega$ resistor is [IIT 1982]



(a) 9 A (b) 0.9 A

(c) $\frac{1}{9}A$ (d) $\frac{1}{0.9}A$

7. When the key K is pressed at time $t = 0$, which of the following statements about the current I in the resistor AB of the given circuit is true [CBSE PMT 1995]



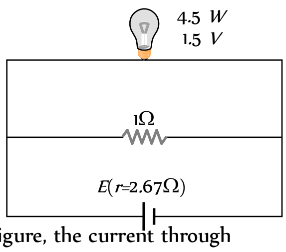
(a) I = 2 mA at all t

(b) I oscillates between 1 mA and 2mA

(c) I = 1 mA at all t

(d) At $t = 0$, I = 2 mA and with time it goes to 1 mA

8. A torch bulb rated as 4.5 W, 1.5 V is connected as shown in the figure. The $e.m.f.$ of the cell needed to make the bulb glow at full intensity is [MP PMT 1999]



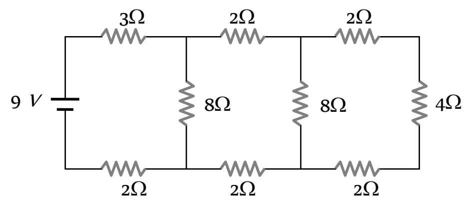
(a) 4.5 V

(b) 1.5 V

(c) 2.67 V

(d) 13.5 V

9. In the circuit shown in the figure, the current through [IIT 1998]



(a) The 3Ω resistor is 0.50A (b) The 3Ω resistor is 0.25 A

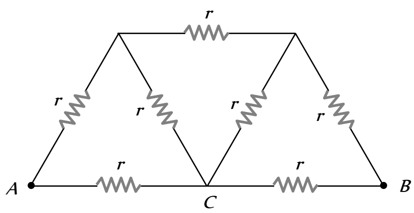
(c) The 4Ω resistor is 0.50A (d) The 4Ω resistor is 0.25 A

10. There are three resistance coils of equal resistance. The maximum number of resistances you can obtain by connecting them in any manner you choose, being free to use any number of the coils in any way is [ISM Dhanbad 1994]

(a) 3 (b) 4

(c) 6 (d) 5

11. In the circuit shown, the value of each resistance is r, then equivalent resistance of circuit between points A and B will be



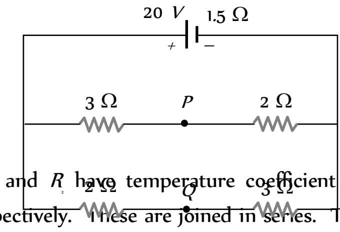
(a) (4/3) r

(b) $3r/2$

(c) $r/3$

(d) $8r/7$

12. If in the circuit shown below, the internal resistance of the battery is 1.5 Ω and V_P and V_Q are the potentials at P and Q respectively, what is the potential difference between the points P and Q



(a) Zero

(b) 4 $volts$ ($V_P > V_Q$)

(c) 4 $volts$ ($V_Q > V_P$)

(d) 2.5 $volts$ ($V_Q > V_P$)

13. Two wires of resistance R_1 and R_2 have temperature coefficient of resistance α_1 and α_2, respectively. These are joined in series. The effective temperature coefficient of resistance is

(a) $\frac{\alpha_1 + \alpha_2}{2}$ (b) $\sqrt{\alpha_1 \alpha_2}$

(c) $\frac{\alpha_1 R_1 + \alpha_2 R_2}{R_1 + R_2}$ (d) $\frac{\sqrt{R_1 R_2 \alpha_1 \alpha_2}}{\sqrt{R_1^2 + R_2^2}}$

14. Two cells of equal $e.m.f.$ and of internal resistances r_1 and $r_2 (r_1 > r_2)$ are connected in series. On connecting this combination to an external resistance R, it is observed that the potential difference across the first cell becomes zero. The value of R will be

[MP PET 1985; KCET 2005; Kerala PMT 2005]

(a) $r_1 + r_2$ (b) $r_1 - r_2$

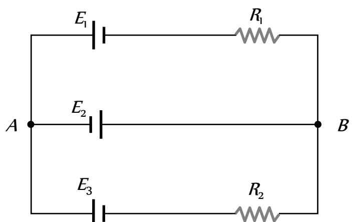
(c) $\frac{r_1 + r_2}{2}$ (d) $\frac{r_1 - r_2}{2}$

15. When connected across the terminals of a cell, a voltmeter measures 5 V and a connected ammeter measures 10 A of current. A resistance of 2 $ohms$ is connected across the terminals of the cell. The current flowing through this resistance will be

(a) 2.5 A (b) 2.0 A

(c) 5.0 A (d) 7.5 A

16. In the circuit shown here, $E_1 = E_2 = E_3 = 2$ V and $R_1 = R_2 = 4$ $ohms$. The current flowing between points A and B through battery E_2 is



(a) Zero

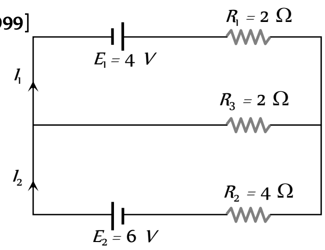
(b) 2 amp from A to B

(c) 2 amp from B to A

(d) None of the above

17. In the circuit shown below E_1 = 4.0 V, R_1 = 2 Ω, E_2 = 6.0 V, R_2 = 4 Ω and R_3 = 2 Ω. The current I_1 is [MP PET 2003]

[Similar to CBSE PMT 1999; RPET 1999]



(a) 1.6 A

(b) 1.8 A

(c) 1.25 A

(d) 1.0 A

18. A microammeter has a resistance of $100\,\Omega$ and full scale range of $50\,\mu A$. It can be used as a voltmeter or as a higher range ammeter provided a resistance is added to it. Pick the correct range and resistance combination

[SCRA 1996; AMU (Med.) 2001; Roorkee 2000]

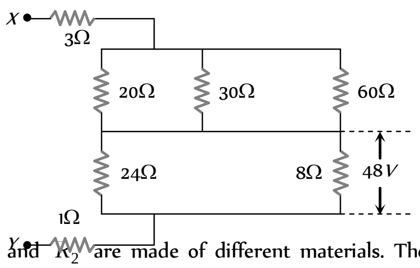
(a) 50 *V* range with $10\,k\Omega$ resistance in series

(b) 10 *V* range with $200\,k\Omega$ resistance in series

(c) 10 *mA* range with $1\,\Omega$ resistance in parallel

(d) 10 *mA* range with $0.1\,\Omega$ resistance in parallel

19. The potential difference across 8 *ohm* resistance is 48 *volt* as shown in the figure. The value of potential difference across *X* and *Y* points will be [MP PET 1996]



(a) 160 *volt*

(b) 128 *volt*

(c) 80 *volt*

(d) 62 *volt*

20. Two resistances R_1 and R_2 are made of different materials. The temperature coefficient of the material of R_1 is α and of the material of R_2 is $-\beta$. The resistance of the series combination of R_1 and R_2 will not change with temperature, if R_1/R_2 equals

(a) $\frac{\alpha}{\beta}$ (b) $\frac{\alpha+\beta}{\alpha-\beta}$

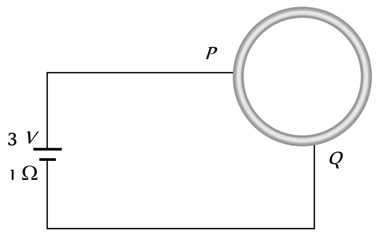
(c) $\frac{\alpha^2+\beta^2}{\alpha\beta}$ (d) $\frac{\beta}{\alpha}$

21. An ionization chamber with parallel conducting plates as anode and cathode has 5×10^7 electrons and the same number of singly-charged positive ions per cm^3. The electrons are moving at 0.4 *m/s*. The current density from anode to cathode is $4\,\mu A/m^2$. The velocity of positive ions moving towards cathode is

(a) 0.4 *m/s* (b) 16 *m/s*

(c) Zero (d) 0.1 *m/s*

22. A wire of resistance 10 Ω is bent to form a circle. *P* and *Q* are points on the circumference of the circle dividing it into a quadrant and are connected to a Battery of 3 *V* and internal resistance 1 Ω as shown in the figure. The currents in the two parts of the circle are



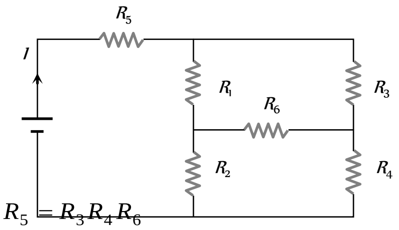
(a) $\frac{6}{23}A$ and $\frac{18}{23}A$

(b) $\frac{5}{26}A$ and $\frac{15}{26}A$

(c) $\frac{4}{25}A$ and $\frac{12}{25}A$

(d) $\frac{3}{25}A$ and $\frac{9}{25}A$

23. In the given circuit, it is observed that the current *I* is independent of the value of the resistance R_6. Then the resistance values must satisfy [IIT-JEE (Screening) 2001]



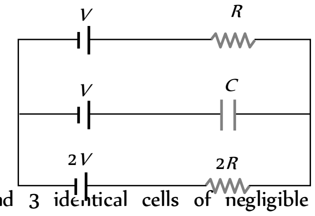
(a) $R_1R_2R_5 = R_3R_4R_6$

(b) $\frac{1}{R_5}+\frac{1}{R_6}=\frac{1}{R_1+R_2}+\frac{1}{R_3+R_4}$

(c) $R_1R_4 = R_2R_3$

(d) $R_1R_3 = R_2R_4 = R_5R_6$

24. In the given circuit, with steady current, the potential drop across the capacitor must be [IIT-JEE (Screening) 2001]



(a) *V*

(b) $V/2$

(c) $V/3$

(d) $2V/3$

25. A wire of length *L* and 3 identical cells of negligible internal resistances are connected in series. Due to current, the temperature of the wire is raised by Δ *T* in a time *t*. A number *N* of similar cells is now connected in series with a wire of the same material and cross–section but of length 2 *L*. The temperature of the wire is raised by the same amount Δ *T* in the same time *t*. the value of *N* is

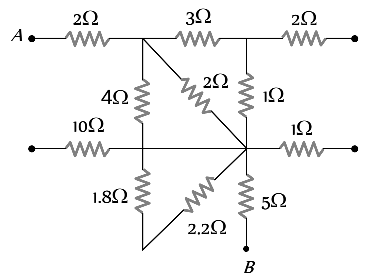
[MP PMT 1997]

[IIT-JEE (Screening) 2001]

(a) 4 (b) 6

(c) 8 (d) 9

26. What is the equivalent resistance between the points *A* and *B* of the network [AMU (Engg.) 2001]



(a) $\frac{57}{7}\Omega$

(b) 8 Ω

(c) 6 Ω

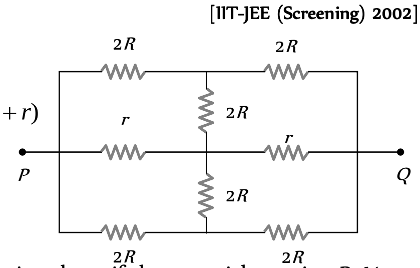
[CBSE PMT 1992]

(d) $\frac{57}{5}\Omega$

27. The effective resistance between points *P* and *Q* of the electrical circuit shown in the figure is

[Roorkee 1999]

[IIT-JEE (Screening) 2002]



(a) $2Rr/(R+r)$

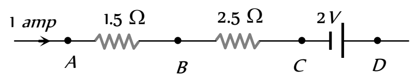
(b) $8R(R+r)/(3R+r)$

(c) $2r+4R$

(d) $5R/2+2r$

28. In the circuit element given here, if the potential at point *B*, V_B = 0, then the potentials of *A* and *D* are given as

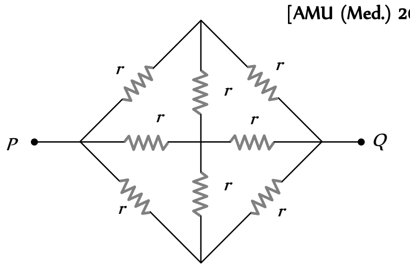
[AMU (Med.) 2002]



(a) $V_A = -1.5\,V, V_D = +2\,V$ (b) $V_A = +1.5\,V, V_D = +2\,V$

(c) $V_A = +1.5\,V, V_D = +0.5\,V$ (d) $V_A = +1.5\,V, V_D = -0.5\,V$

29. The equivalent resistance between the points P and Q in the network given here is equal to (given $r = \frac{3}{2}\Omega$) [AMU (Med.) 2002]



(a) $\frac{1}{2}\Omega$

(b) $1\,\Omega$

(c) $\frac{3}{2}\Omega$

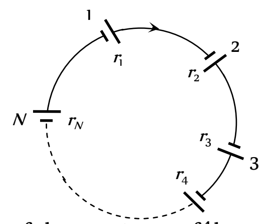
(d) $2\,\Omega$

30. The current in a conductor varies with time t as $I = 2t + 3t^2$ where I is in *ampere* and t in *seconds*. Electric charge flowing through a section of the conductor during $t = 2$ *sec* to $t = 3$ *sec* is

(a) 10 C (b) 24 C

(c) 33 C (d) 44 C

31. A group of N cells whose *emf* varies directly with the internal resistance as per the equation $E = 1.5\,r$ are connected as shown in the figure below. The current I in the circuit is [KCET 2003]



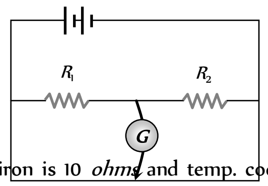
(a) 0.51 *amp*

(b) 5.1 *amp*

(c) 0.15 *amp*

(d) 1.5 *amp*

32. In the shown arrangement of the experiment of the meter bridge if AC corresponding to null deflection of galvanometer is x, what would be its value if the radius of the wire AB is doubled



(a) x

(b) $x/4$

(c) $4x$

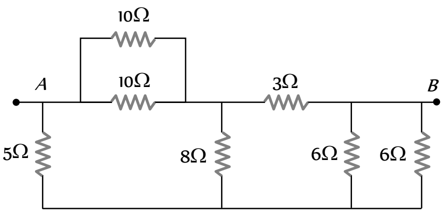
(d) $2x$

33. The resistance of a wire of iron is 10 *ohms* and temp. coefficient of resistivity is $5\times10^{-3}/°C$. At 20°C it carries 30 *milliamperes* of current. Keeping constant potential difference between its ends, the temperature of the wire is raised to $120°C$. The current in *milliamperes* that flows in the wire is

(a) 20 (b) 15

(c) 10 (d) 40

34. Seven resistances are connected as shown in the figure. The equivalent resistance between A and B is [MP PET 2000]



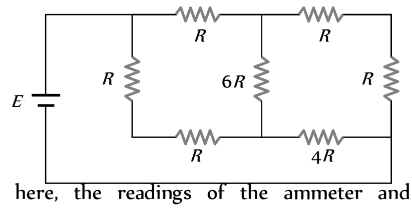
(a) $3\,\Omega$

(b) $4\,\Omega$

(c) $4.5\,\Omega$

(d) $5\,\Omega$

35. A battery of internal resistance 4Ω is connected to the network of resistances as shown. In order to give the maximum power to the network, the value of R (in Ω) should be



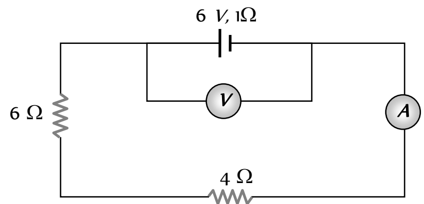
(a) 4/9

(b) 8/9

(c) 2

(d) 18

36. In the circuit shown here, the readings of the ammeter and voltmeter are [Kerala PMT 2002]



(a) 6 A, 60 V

(b) 0.6 A, 6 V

(c) 6/11 A, 60/11 V

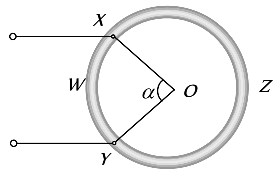
(d) 11/6 A, 11/60 V

37. Length of a hollow tube is $5\,m$, it's outer diameter is 10 *cm* and thickness of it's wall is 5 *mm*. If resistivity of the material of the tube is $1.7\times10^{-8}\,\Omega\times m$ then resistance of tube will be [Orissa JEE 2003]

(a) $5.6\times10^{-}\,\Omega$ (b) $2\times10^{-}\,\Omega$

(c) $4\times10^{-}\,\Omega$ (d) None of these

38. A wire of resistor R is bent into a circular ring of radius r. Equivalent resistance between two points X and Y on its circumference, when angle XOY is α, can be given by



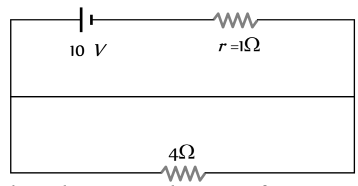
(a) $\frac{R\alpha}{4\pi^2}(2\pi-\alpha)$

(b) $\frac{R}{2\pi}(2\pi-\alpha)$

(c) $R\,(2\pi-\alpha)$

(d) $\frac{4\pi}{R\alpha}(2\pi-\alpha)$ [IIT-JEE (Screening) 2003]

39. Potential difference across the terminals of the battery shown in figure is (r = internal resistance of battery)



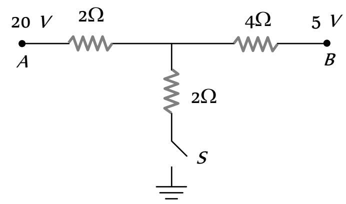
(a) 8 V

(b) 10 V

(c) 6 V

(d) Zero

40. As the switch S is closed in the circuit shown in figure, current passed through it is [MP PMT 1994]



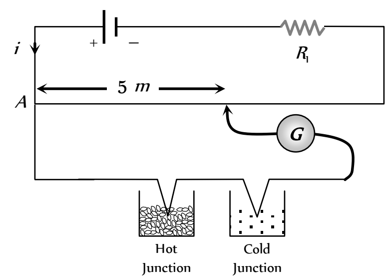
(a) 4.5 A

(b) 6.0 A

(c) 3.0 A

(d) Zero

41. In the following circuit a 10 m long potentiometer wire with resistance 1.2 *ohm/m*, a resistance R_1 and an accumulator of emf 2 V are connected in series. When the emf of thermocouple is 2.4 mV then the deflection in galvanometer is zero. The current supplied by the accumulator will be [IIT 1995]



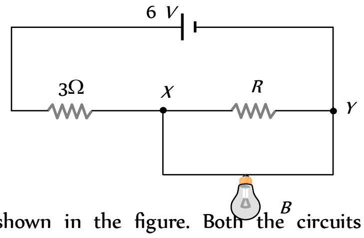
(a) 4×10^{-4}

(b) $8 \times 10^{\cdot}$ *A*

(c) $4 \times 10^{\cdot}$ *A*

(d) $8 \times 10^{\cdot}$ *A*

42. In the following circuit, bulb rated as 1.5 *V*, 0.45 *W*. If bulbs glows with full intensity then what will be the equivalent resistance between *X* and *Y*



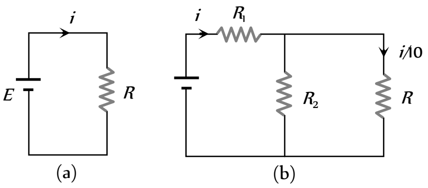
(a) 0.45 Ω

(b) 1 Ω

(c) 3 Ω

(d) 5 Ω

43. Consider the circuits shown in the figure. Both the circuits are taking same current from battery but current through *R* in the second circuit is $\frac{1}{10}$ *th* of current through *R* in the first circuit. If *R* is 11 Ω, the value of *R*



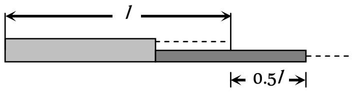
(a) 9.9 Ω

(b) 11 Ω

(c) 8.8 Ω

(d) 7.7 Ω

44. In order to quadruple the resistance of a uniform wire, a part of its length was uniformly stretched till the final length of the entire wire was 1.5 times the original length, the part of the wire was fraction equal to



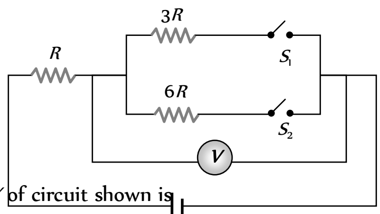
(a) 1 / 8

(b) 1 / 6

(c) 1 / 10

(d) 1 / 4

45. In the circuit shown in figure reading of voltmeter is *V* when only *S* is closed, reading of voltmeter is *V* when only *S* is closed and reading of voltmeter is *V* when both *S* and *S* are closed. Then



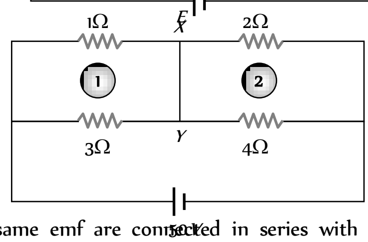
(a) *V* > *V* > *V*

(b) *V* > *V* > *V*

(c) *V* > *V* > *V*

(d) *V* > *V* > *V*

46. Current through wire *XY* of circuit shown is



(a) 1 *A*

(b) 4 *A*

(c) 2 *A*

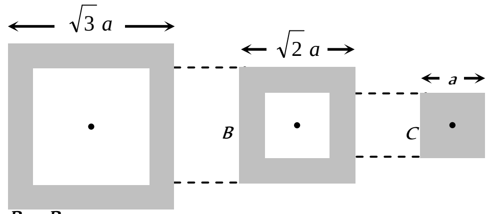
(d) 3 *A*

47. 12 cells each having same emf are connected in series with some cells wrongly connected. The arrangement is connected in series with an ammeter and two cells which are in series. Current is 3 *A* when cells and battery aid each other and is 2 *A* when cells and battery oppose each other. The number of cells wrongly connected is

(a) 4 (b) 1

(c) 3 (d) 2

48. Following figure shows cross-sections through three long conductors of the same length and material, with square cross-section of edge lengths as shown. Conductor *B* will fit snugly within conductor *A*, and conductor *C* will fit snugly within conductor *B*. Relationship between their end to end resistance is



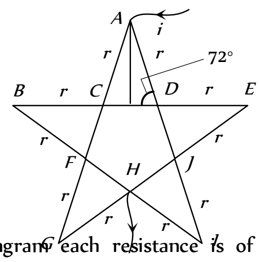
(a) *R* = *R* = *R*

(b) *R* > *R* > *R*

(c) *R* < *R* < *R*

(d) Information is not sufficient

49. In the following star circuit diagram (figure), the equivalent resistance between the points *A* and *H* will be



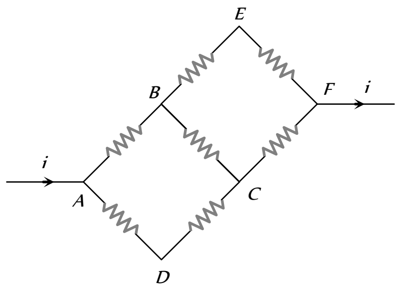
(a) 1.944 *r*

(b) 0.973 *r*

(c) 0.486 *r*

(d) 0.243 *r*

50. In the adjoining circuit diagram each resistance is of 10 Ω. The current in the arm AD will be



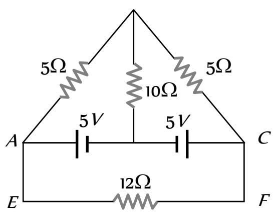
(a) $\frac{2i}{5}$

(b) $\frac{3i}{5}$

(c) $\frac{4i}{5}$

(d) $\frac{i}{5}$

51. In the circuit of adjoining figure the current through 12 Ω resister will be



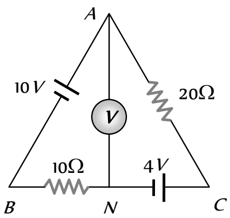
(a) 1 *A*

(b) $\frac{1}{5}$ *A*

(c) $\frac{2}{5}$ *A*

(d) 0 *A*

52. The reading of the ideal voltmeter in the adjoining diagram will be



(a) 4 *V*

(b) 8 *V*

(c) 12 *V*

(d) 14 *V*

53. The resistance of the series combination of two resistance is *S*. When they are joined in parallel the total resistance is *P*. If *S* = *nP*, then the minimum possible value of *n* is

[AIEEE 2004]

(a) 4 (b) 3

(c) 2 (d) 1

54. A moving coil galvanometer has 150 equal divisions. Its current sensitivity is 10 *divisions per milliampere* and voltage sensitivity is 2 *divisions per millivolt*. In order that each division reads 1 *volt*, the resistance in ohms needed to be connected in series with the coil will be [AIEEE 2005]

(a) 99995 (b) 9995

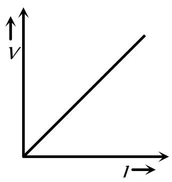
(c) 10^3 (d) 10^5

Graphical Questions

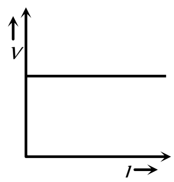
1. Which of the adjoining graphs represents *ohmic* resistance

[CPMT 1981; DPMT 2002]

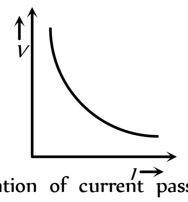
(a)



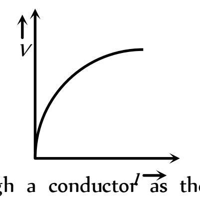
(b)



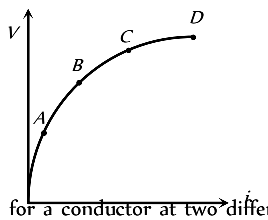
(c)



(d)



2. Variation of current passing through a conductor as the voltage applied across its ends as varied is shown in the adjoining diagram. If the resistance (*R*) is determined at the points *A*, *B*, *C* and *D*, we will find that [CPMT 1988]



(a) $R_C = R_D$

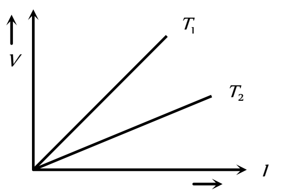
(b) $R_B > R_A$

(c) $R_C > R_B$

(d) None of these

3. The voltage *V* and current *I* graph for a conductor at two different temperatures T_1 and T_2 are shown in the figure. The relation between T_1 and T_2 is

[MP PET 1996; KCET 2002]



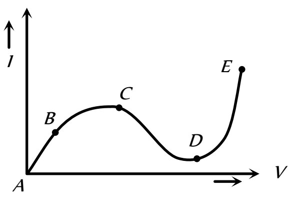
(a) $T_1 > T_2$

(b) $T_1 \approx T_2$

(c) $T_1 = T_2$

(d) $T_1 < T_2$

4. From the graph between current *I* and voltage *V* shown below, identify the portion corresponding to negative resistance



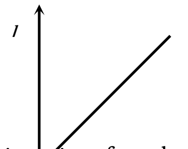
(a) *AB*

(b) *BC*

(c) *CD*

(d) *DE*

5. *I-V* characteristic of a copper wire of length *L* and area of cross-section *A* is shown in figure. The slope of the curve becomes



(a) More if the experiment is performed at higher temperature

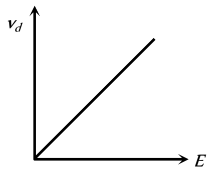
(b) More if a wire of steel of same dimension is used

(c) More if the length of the wire is increased

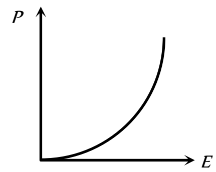
(d) Less if the length of the wire is increased

6. *E* denotes electric field in a uniform conductor, *I* corresponding current through it, v_d drift velocity of electrons and *P* denotes thermal power produced in the conductor, then which of the following graph is incorrect

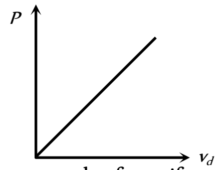
(a)



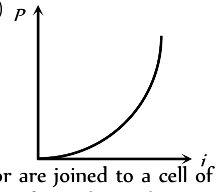
(b)



(c)

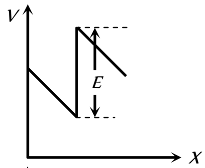


(d)

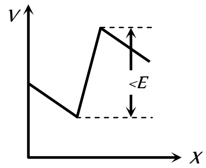


7. The two ends of a uniform conductor are joined to a cell of e.m.f. *E* and some internal resistance. Starting from the midpoint *P* of the conductor, we move in the direction of current and return to *P*. The potential *V* at every point on the path is plotted against the distance covered (*x*). Which of the following graphs best represents the resulting curve

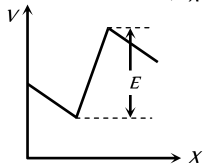
(a)



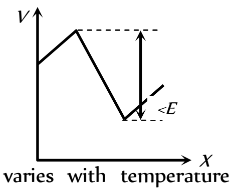
(b)



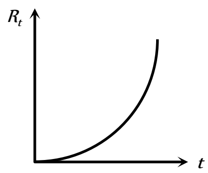
(c)



(d)



8. The resistance R_t of a conductor varies with temperature *t* as shown in the figure. If the variation is represented by $R_t = R_0[1 + \alpha t + \beta t^2]$, then [CPMT 1988]



(a) α and β are both negative

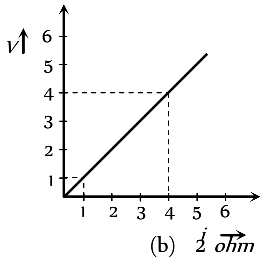
(b) α and β are both positive

(c) α is positive and β is negative

[CBSE PMT 1997]

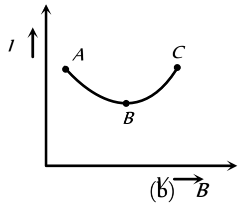
(d) α is negative and β are positive

9. Variation of current and voltage in a conductor has been shown in the diagram below. The resistance of the conductor is.



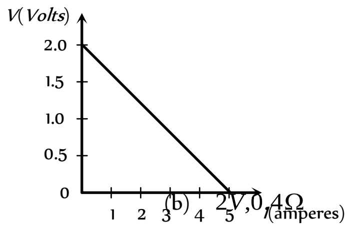
(a) 4 *ohm* (b) 2 *ohm*
(c) 3 *ohm* (d) 1 *ohm*

10. Resistance as shown in figure is negative at [CPMT 1997]



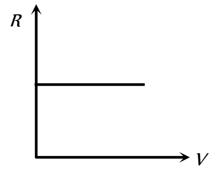
(a) *A* (b) *B*
(c) *C* (d) None of these

11. For a cell, the graph between the potential difference (*V*) across the terminals of the cell and the current (*I*) drawn from the cell is shown in the figure. The e.m.f. and the internal resistance of the cell are

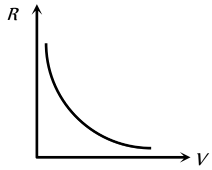


(a) $2V, 0.5\Omega$ (b) $2V, 0.4\Omega$
(c) $> 2V, 0.5\Omega$ (d) $> 2V, 0.4\Omega$

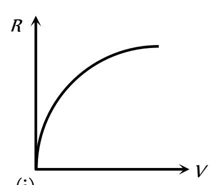
12. The graph which represents the relation between the total resistance *R* of a multi range moving coil voltmeter and its full scale deflection *V* is



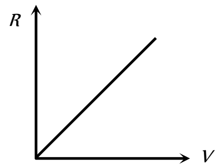
(i)



(ii)



(iii)

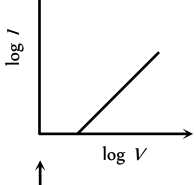


(iv)

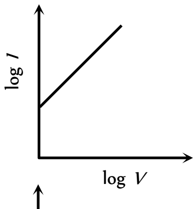
(a) (i) (b) (ii)
(c) (iii) (d) (iv)

13. When a current I is passed through a wire of constant resistance, it produces a potential difference *V* across its ends. The graph drawn between log I and log V will be

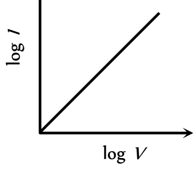
(a)



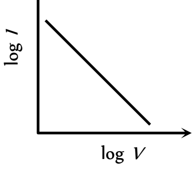
(b)



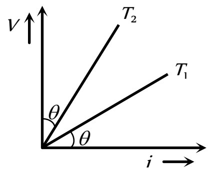
(c)



(d)



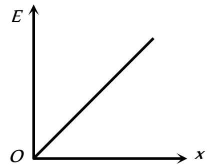
14. The *V-i* graph for a conductor at temperature T_1 and T_2 are as shown in the figure. $(T_2 - T_1)$ is proportional to



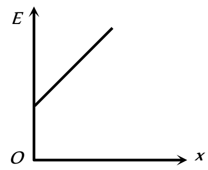
(a) $\cos 2\theta$
(b) $\sin\theta$
(c) $\cot 2\theta$
(d) $\tan\theta$

15. A cylindrical conductor has uniform cross-section. Resistivity of its material increase linearly from left end to right end. If a constant current is flowing through it and at a section distance *x* from left end, magnitude of electric field intensity is *E*, which of the following graphs is correct

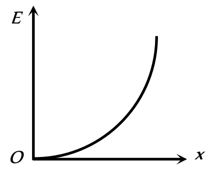
(a)



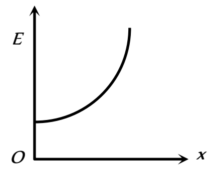
(b)



(c)



(d)

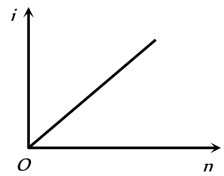


16. The *V-i* graph for a conductor makes an angle θ with *V*-axis. Here *V* denotes the voltage and *i* denotes current. The resistance of conductor is given by

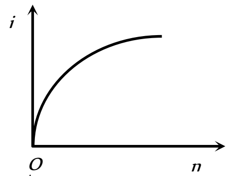
(a) $\sin\theta$ (b) $\cos\theta$
(c) $\tan\theta$ (d) $\cot\theta$

17. A battery consists of a variable number '*n*' of identical cells having internal resistances connected in series. The terminals of battery are short circuited and the current *i* is measured. Which of the graph below shows the relation ship between *i* and *n*

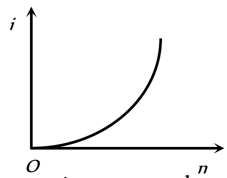
(a)



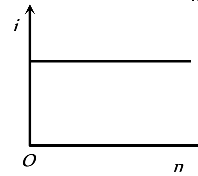
(b)



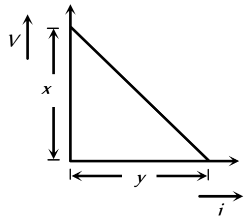
(c)

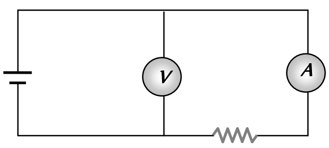


(d)



18. In an experiment, a graph was plotted of the potential difference *V* between the terminals of a cell against the circuit current *i* by varying load rheostat. Internal conductance of the cell is given by

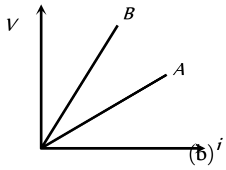




(a) xy (b) $\frac{y}{x}$

(c) $\frac{x}{y}$ (d) $(x - y)$

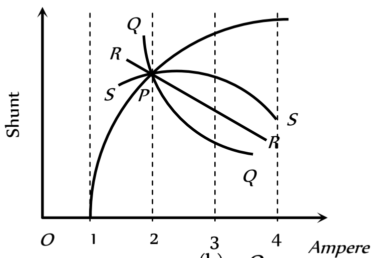
19. V-i graphs for parallel and series combination of two identical resistors are as shown in figure. Which graph represents parallel combination



(a) A (b) B

(c) A and B both (d) Neither A nor B

20. The ammeter has range 1 *ampere* without shunt. the range can be varied by using different shunt resistances. The graph between shunt resistance and range will have the nature



(a) P (b) Q

(c) R (d) S

AR Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

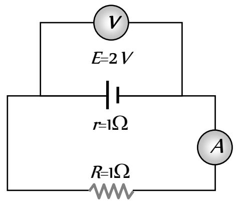
(a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : The resistivity of a semiconductor increases with temperature.
Reason : The atoms of a semiconductor vibrate with larger amplitude at higher temperatures thereby increasing its resistivity [AIIMS 2003]

2. Assertion : In a simple battery circuit the point of lowest potential is positive terminal of the battery
Reason : The current flows towards the point of the higher potential as it flows in such a circuit from the negative to the positive terminal. [AIIMS 2002]

3. Assertion : The temperature coefficient of resistance is positive for metals and negative for p-type semiconductor.
Reason : The effective charge carriers in metals are negatively charged whereas in p-type semiconductor they are positively charged. [AIIMS 1996]

4. Assertion : In the following circuit emf is $2V$ and internal resistance of the cell is $1\ \Omega$ and $R = 1\Omega$, then reading of the voltmeter is $1V$.



Reason : $V = E - ir$ where $E = 2V$, $i = \frac{2}{2} = 1A$ and $R = 1\ \Omega$ [AIIMS 1995]

5. Assertion : There is no current in the metals in the absence of electric field.
Reason : Motion of free electron are randomly. [AIIMS 1994]

6. Assertion : Electric appliances with metallic body have three connections, whereas an electric bulb has a two pin connection.
Reason : Three pin connections reduce heating of connecting wires.

7. Assertion : The drift velocity of electrons in a metallic wire will decrease, if the temperature of the wire is increased.
Reason : On increasing temperature, conductivity of metallic wire decreases.

8. Assertion : The electric bulbs glows immediately when switch is on.
Reason : The drift velocity of electrons in a metallic wire is very high.

9. Assertion : Bending a wire does not effect electrical resistance.
Reason : Resistance of wire is proportional to resistivity of material.

10. Assertion : In meter bridge experiment, a high resistance is always connected in series with a galvanometer.
Reason : As resistance increases current through the circuit increases.

11. Assertion : Voltameter measures current more accurately than ammeter.
Reason : Relative error will be small if measured from voltameter.

12. Assertion : Electric field outside the conducting wire which carries a constant current is zero.
Reason : Net charge on conducting wire is zero.

13. Assertion : The resistance of super-conductor is zero.
Reason : The super-conductors are used for the transmission of electric power.

14. Assertion : A potentiometer of longer length is used for accurate measurement.
Reason : The potential gradient for a potentiometer of longer length with a given source of e.m.f. becomes small.

15. Assertion : The e.m.f. of the driver cell in the potentiometer experiment should be greater than the e.m.f. of the cell to be determined.
Reason : The fall of potential across the potentiometer wire should not be less than the e.m.f. of the cell to be determined.

16. Assertion : A person touching a high power line gets stuck with the line.

Reason : The current carrying wires attract the man towards it.

17. Assertion : The connecting wires are made of copper.

Reason : The electrical conductivity of copper is high.

Answers and Solutions

Electric Conduction, Ohm's Law and Resistance

1. (a) Number of electrons flowing per second

$\frac{n}{t} = \frac{i}{e} = 4.8/1.6 \times 10^{-19} = 3 \times 10^{19}$

2. (c) $v_d = \frac{J}{ne} \Rightarrow v_d \propto J$ (current density)

$J_1 = \frac{i}{A}$ and $J_2 = \frac{2i}{2A} = \frac{i}{A} = J_1$; $\therefore (v_d)_1 = (v_d)_2 = v$

3. (b) Order of drift velocity $= 10^{-4} m/sec = 10^{-2} cm/sec$

4. (b) Density of $Cu = 9 \times 10^3 kg/m^3$ (mass of 1 m^3 of Cu)

$\because$ 6.0 × 10^{23} atoms has a mass = 63 × 10^{-3} kg

$\therefore$ Number of electrons per m^3 are

$= \frac{6.0 \times 10^{23}}{63 \times 10^{-3}} \times 9 \times 10^3 = 8.5 \times 10^{28}$

Now drift velocity $= v_d = \frac{i}{neA}$

$= \frac{1.1}{8.5 \times 10^{28} \times 1.6 \times 10^{-19} \times \pi \times (0.5 \times 10^{-3})^2}$

$= 0.1 \times 10^{-3} m/sec$

5. (c) Because 1 $H.P.$ = 746 J/s = 746 $watt$

6. (a) $R \propto l^2 \Rightarrow \frac{\Delta R}{R} = \frac{2\Delta l}{l} \Rightarrow \frac{\Delta R_0}{R}\% = 2 \times 0.1 = 0.2\%$

7. (a) $R = \frac{\rho l}{A} = 50 \times 10^{-8} \times \frac{50 \times 10^{-2}}{(50 \times 10^{-2})^2} = 10^{-6}\Omega$

8. (a) Resistivity of some material is its intrinsic property and is constant at particular temperature. Resistivity does not depend upon shape.

9. (d) $\frac{\rho_1}{\rho_2} = \frac{(1+\alpha t_1)}{(1+\alpha t_2)} \Rightarrow \frac{1}{2} = \frac{(1+0.00125 \times 27)}{(1+0.00125 \times t)}$

$\Rightarrow t = 854°C \Rightarrow T = 1127K$

10. (c) $R_1 \propto \frac{l}{A} \Rightarrow R_2 \propto \frac{2l}{2A}$ *i.e.* $R_2 \propto \frac{l}{A}$

$\therefore R_1 = R_2$

11. (d) In case of stretching of wire $R \propto l^2$

$\Rightarrow$ If length becomes 3 times so Resistance becomes 9 times *i.e.* $R' = 9 \times 20 = 180\Omega$

12. (d) Resistivity is the property of the material. It does not depend upon size and shape.

13. (a) Because with rise in temperature resistance of conductor increase, so graph between V and i becomes non linear.

14. (c) Because V-i graph of diode is non-linear.

15. (a) $v_d = \frac{e}{m} \times \frac{V}{l}\tau$ or $v_d = \frac{e}{m} \cdot \frac{El}{l}\tau$ (Since $V = El$)

$\therefore v_d \propto E$

16. (a) Resistance of conductor depends upon relation as $R \propto \frac{1}{\tau}$.

With rise in temperature *rms* speed of free electron inside the conductor increase, so relaxation time decrease and hence resistance increases

17. (c) $i = \frac{q}{t} = \frac{4}{2} = 2\,ampere$

18. (b) Volume $= Al = 3 \Rightarrow A = \frac{3}{l}$

Now $R = \rho\frac{l}{A} \Rightarrow 3 = \frac{\rho \times l}{3/l} = \frac{\rho l^2}{3} \Rightarrow l^2 = \frac{9}{\rho} = \frac{3}{\sqrt{\rho}}$

19. (c) $i = \frac{ne}{t} = \frac{62.5 \times 10^{18} \times 1.6 \times 10^{-19}}{1} = 10\,ampere$

20. (b) In twisted wire, two halves each of resistance 2Ω are in parallel, so equivalent resistance will be $\frac{2}{2} = 1\Omega$.

21. (d) In stretching of wire $R \propto \frac{1}{r^4}$

22. (b) $R = \frac{\rho L}{A} \Rightarrow 0.7 = \frac{\rho \times 1}{\frac{22}{7}(1 \times 10^{-3})^2}$

$\rho = 2.2 \times 10^{-6}$ *ohm-m.*

23. (b) $R \propto \frac{1}{A} \Rightarrow R \propto \frac{1}{r^2} \propto \frac{1}{d^2}$ [d = diameter of wire]

24. (b) $i = qv = 1.6 \times 10^{-19} \times 6.6 \times 10^{15} = 10.56 \times 10^{-4} A = 1mA$

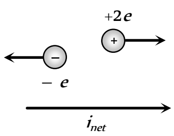
25. (d) $R \propto \frac{l}{r^2} \Rightarrow \frac{R_1}{R_2} = \frac{l_1}{l_2} \times \frac{r_2^2}{r_1^2} \Rightarrow \frac{1}{1} = \frac{5}{l_2} \times \left(\frac{2}{1}\right)^2 \Rightarrow l_2 = 20m$

26. (c)

27. (b) In semiconductors charge carries are free electrons and holes

28. (b) Net current $i_{net} = i_{(+)} + i_{(-)}$

$= \frac{n_{(+)}q_{(+)}}{t} + \frac{n_{(-)}q_{(-)}}{t}$



$= \frac{n_{(+)}}{t} \times 2e + \frac{n_{(-)}}{t} \times e$

= 3.2 × 10^{18} × 2 × 1.6 × 10^{-19} + 3.6 × 10^{18} × 1.6 × 10^{-19}

= 1.6 A (towards right)

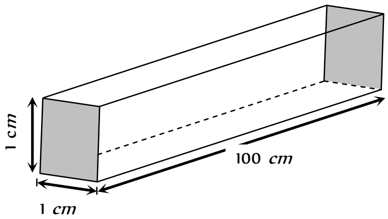
29. (b) In the absence of external electric field mean velocity of free electron (V_-) is given by $V_{rms} = \sqrt{\frac{3KT}{m}} \Rightarrow V_{rms} \propto \sqrt{T}$

30. (a) With rise in temperature specific resistance increases

31. (c) For metallic conductors, temperature co-efficient of resistance is positive.

32. (d)

33. (b) Length l = 1 cm $= 10^{-2} m$



Area of cross-section A = 1 cm × 100 cm

= 100 cm^2 = 10^{-2} m^2

Resistance R = 3 × 10^{-7} × $\frac{10^{-2}}{10^{-2}}$ = 3 × 10^{-7} Ω

34. (d) In the above question for calculating equivalent resistance between two opposite square faces.

l = 100 cm = 1 m, A = 1 cm^2 = 10^{-4} m^2, so resistance R = 3 × 10^{-7} × $\frac{1}{10^{-4}}$ = 3 × 10^{-3} Ω

35. (c) $v_d = \frac{i}{nAe} = \frac{20}{10^{29} \times 10^{-6} \times 1.6 \times 10^{-19}} = 1.25 \times 10^{-3} m/s$

36. (b) Specific resistance $k = \frac{E}{j}$

37. (b) $R \propto \frac{l}{A} \propto \frac{l}{d^2} \Rightarrow \frac{R_1}{R_2} = \frac{l_1}{l_2} \times \left(\frac{d_2}{d_1}\right)^2 = \frac{L}{4L}\left(\frac{2d}{d}\right)^2 = 1$

$\Rightarrow R_2 = R_1 = R.$

38. (c) $v_d = \frac{i}{nAe} = \frac{1.344}{10^{-6} \times 1.6 \times 10^{-19} \times 8.4 \times 10^{22}}$

$= \frac{1.344}{10 \times 1.6 \times 8.4} = 0.01 cm/s = 0.1 mm/s$

39. (a) Internal resistance $\propto \frac{1}{\text{Temperature}}$

40. (d) Charge = Current × Time = 5 × 60 = 300 C

41. (b) By $R = \rho l / A$

42. (b)

43. (a)

44. (b) $R = \frac{\rho l}{a}$ for first wire and $R' = \frac{\rho l}{4a} = \frac{R}{4}$ for second wire.

45. (c) For semiconductors, resistance decreases on increasing the temperature.

46. (a) $R = \rho \frac{l}{A} = \frac{n}{ne^2 \tau} \cdot \frac{l}{A}$

47. (b) Because as temperature increases, the resistivity increases and hence the relaxation time decreases for conductors $\left(\tau \propto \frac{1}{\rho}\right)$.

48. (b) In VI graph, we will not get a straight line in case of liquids.

49. (c) $R = \rho \frac{l}{A}$

50. (a) Since $R \propto l^2 \Rightarrow$ If length is increased by 10%, resistance is increases by almost 20%

Hence new resistance $R' = 10 + 20\%$ of 10

$= 10 + \frac{20}{100} \times 10 = 12\,\Omega.$

51. (c) $\frac{R_{150}}{R_{500}} = \frac{[1 + \alpha(150)]}{[1 + \alpha(500)]}$. Putting $R_{150} = 133\Omega$ and $\alpha = 0.0045/°C$, we get $R_{500} = 258\Omega$

52. (c) $R = \rho \frac{l}{A} \Rightarrow 7 = \frac{64 \times 10^{-6} \times 198}{\frac{22}{7} \times r^2} \Rightarrow r = 0.024 cm$

53. (b) Current density $J = \frac{i}{A} = \frac{i}{\pi r^2} \Rightarrow \frac{J_1}{J_2} = \frac{i_1}{i_2} \times \frac{r_2^2}{r_1^2}$

But the wires are in series, so they have the same current, hence $i_1 = i_2$. So $\frac{J_1}{J_2} = \frac{r_2^2}{r_1^2} = 9:1$

54. (b) As $\frac{V}{i} = R$ and $R \propto$ temperature

55. (b) $R \propto l^2 \Rightarrow$ If l doubled then R becomes 4 times.

56. (a) Temperature coefficient of a semiconductor is negative.

57. (a) The reciprocal of resistance is called conductance

58. (a) $\text{Resistance} = \frac{\text{Potential difference}}{\text{Current}}$

59. (c) Ohm's Law is not obeyed by semiconductors.

60. (c) Drift velocity $v_d = \frac{V}{\rho l n e}$; v_d does not depend upon diameter.

61. (a) Using $R_{T_2} = R_{T_1}[1 + \alpha(T_2 - T_1)]$

$\Rightarrow R_{100} = R_{50}[1 + \alpha(100 - 50)]$

$\Rightarrow 7 = 5[1 + (\alpha \times 50)] \Rightarrow \alpha = \frac{(7-5)}{250} = 0.008/^o C$

62. (b) This is because of secondary ionisation which is possible in the gas filled in it.

63. (b)

64. (c) $\frac{R_1}{R_2} = \frac{(1 + \alpha t_1)}{(1 + \alpha t_2)} \Rightarrow \frac{50}{76.8} = \frac{(1 + 3.92 \times 10^{-3} \times 20)}{(1 + 3.92 \times 10^{-3} t)}$

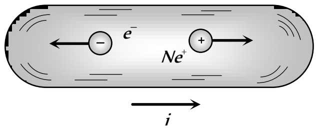
$\Rightarrow t = 167°C$

65. (c) From $v_d = \frac{i}{neA} \Rightarrow i \propto v_d A \Rightarrow i \propto v_d r^2$

66. (d) Resistivity depends only on the material of the conductor.

67. (a) A particular temperature, the resistance of a superconductor is zero $\Rightarrow G = \frac{1}{R} = \frac{1}{0} = \infty$

68. (b) Net current $i = i_+ + i_- = \frac{(n_+)(q_+)}{t} + \frac{(n_-)(q_-)}{t}$



$\Rightarrow i = \frac{(n_+)}{t} \times e + \frac{(n_-)}{t} \times e$

$= 2.9 \times 10^{18} \times 1.6 \times 10^{-19} + 1.2 \times 10^{18} \times 1.6 \times 10^{-19}$

$\Rightarrow i = 0.66\, A$

69. (d) If E be electric field, then current density $j = \sigma E$

Also we know that current density $j = \frac{i}{A}$

Hence j is different for different area of cross-sections. When j is different, then E is also different. Thus E is not constant. The drift velocity v_d is given by $v_d = \frac{j}{ne}$ = different for different j values. Hence only current i will be constant.

70. (d)

71. (a) $R = \rho \frac{l}{A}$ and mass m = volume (V) × density (d) = ($A\, l$) d

Since wires have same material so ρ and d is same for both.

Also they have same mass $\Rightarrow Al$ = constant $\Rightarrow l \propto \frac{1}{A}$

$\Rightarrow \frac{R_1}{R_2} = \frac{l_1}{l_2} \times \frac{A_2}{A_1} = \left(\frac{A_2}{A_1}\right)^2 = \left(\frac{r_2}{r_1}\right)^4$

$\Rightarrow \frac{34}{R_2} = \left(\frac{r}{2r}\right)^4 \Rightarrow R_2 = 544\,\Omega$

72. (a) $R = \rho \frac{l}{A} \Rightarrow \frac{R_1}{R_2} = \frac{A_2}{A_1} (\rho, L \text{ constant}) \Rightarrow \frac{A_1}{A_2} = \frac{R_2}{R_1} = 2$

Now, when a body dipped in water, loss of weight $= V\sigma_L g = AL\sigma_L g$

So, $\frac{(\text{Loss of weight})_1}{(\text{Loss of wight})_2} = \frac{A_1}{A_2} = 2$; so A has more loss of weight.

73. (c) $Q = it = 20 \times 10^{-6} \times 30 = 6 \times 10^{-4}\, C$

74. (b) Ge is semiconductor and Na is a metal. The conductivity of semiconductor increases and that of the metals decreases with the rise in temperature.

75. (b) $i = \frac{ne}{t} \Rightarrow n = \frac{it}{e} = \frac{1.6 \times 10^{-3} \times 1}{1.6 \times 10^{-19}} = 10^{16}$.

76. (c) Drift velocity $v_d = \frac{i}{neA} \Rightarrow v_d \propto \frac{1}{A}$ or $v_d \propto \frac{1}{d^2}$

$\Rightarrow \frac{v_P}{v_Q} = \left(\frac{d_Q}{d_P}\right)^2 = \left(\frac{d/2}{d}\right)^2 = \frac{1}{4} \Rightarrow v_P = \frac{1}{4} v_Q$.

77. (c) Human body, though has a large resistance of the order, of $K\Omega$ (say $10 k\Omega$), is very sensitive to minute currents even as low as a few mA. Electrons, excites and disorders the nervous system of the body and hence one fails to control the activity of the body.

78. (c) $R_t = R_0(1 + \alpha t)$

$\Rightarrow 4.2 = R_0(1 + 0.004 \times 100) = 1.4 R_0 \Rightarrow R_0 = 3\Omega$.

79. (d) $R \propto \frac{l^2}{m} \Rightarrow R_1 : R_2 : R_3 = \left(\frac{l_1}{m_1}\right)^2 : \left(\frac{l_2}{m_2}\right)^2 : \left(\frac{l_3}{m_3}\right)^2$

$= \frac{25}{1} : \frac{9}{3} : \frac{1}{5} = 25 : 3 : \frac{1}{5} \Rightarrow 125 : 15 : 1$.

80. (b)

81. (a) $\frac{R_1}{R_2} = \left(\frac{r_2}{r_1}\right)^4 \Rightarrow \frac{R}{R_2} = \left(\frac{nr}{r}\right)^4 \Rightarrow R_2 = \frac{R}{n^4}$.

82. (d) $\frac{R_1}{R_2} = \frac{(1 + \alpha t_1)}{(1 + \alpha t_2)} \Rightarrow \frac{5}{6} = \frac{(1 + \alpha \times 50)}{(1 + \alpha \times 100)} \Rightarrow \alpha = \frac{1}{200}$ per ^oC

Again by $R_t = R_0(1 + \alpha t)$

$\Rightarrow 5 = R_0\left(1 + \frac{1}{200} \times 50\right) \Rightarrow R_0 = 4\Omega$.

83. (b) $i = \frac{Q}{T} = Q\nu = 1.6 \times 10^{-19} \times 5 \times 10^{15} = 0.8 mA$.

84. (b) $\frac{r_{\text{iron}}}{r_{\text{Copper}}} = \sqrt{\frac{\rho_{\text{iron}}}{\rho_{\text{copper}}}} = \sqrt{\frac{1 \times 10^{-7}}{1.7 \times 10^{-8}}} \approx 2.4$.

85. (c) $i = e\nu = 1.6 \times 10^{-19} \times 6.8 \times 10^{15} = 1.1 \times 10^{-3}\, amp.$

86. (b) Resistivity of the material of the rod

$\rho = \frac{RA}{l} = \frac{3 \times 10^{-3} \pi (0.3 \times 10^{-2})^2}{1} = 27 \times 10^{-9} \pi\, \Omega \times m$

Resistance of disc $R = \frac{(\text{Thickness})}{(\text{Area of cross section})}$

$= 27 \times 10^{-9} \pi \times \frac{(10^{-3})}{\pi \times (1 \times 10^{-2})^2} = 2.7 \times 10^{-7}\Omega$.

87. (c) By using $R_t = R_0(1 + \alpha t)$

$3 \times R_0 = R_0(1 + 4 \times 10^{-3}\, t) \Rightarrow t = 500^o C$.

88. (a) $i = 6 \times 10^{15} \times 1.6 \times 10^{-19} = 0.96 mA$.

89. (a) $i = \frac{ne}{t} \Rightarrow 16 \times 10^{-3} = \frac{n \times 1.6 \times 10^{-19}}{1} \Rightarrow n = 10^{17}$

90. (d) $R = \frac{V}{i} = \frac{100 \pm 0.5}{10 \pm 0.2} = 10 \pm 0.25\,\Omega$.

91. (a) $R = \frac{V}{i} = \rho \frac{l}{A} \Rightarrow \frac{2}{4} = \rho \frac{50 \times 10^{-2}}{(1 \times 10^{-3})^2} \Rightarrow \rho = 1 \times 10^{-6}\Omega m$.

92. (c)

93. (b) $i = \frac{V}{R} = \frac{Q}{t} \Rightarrow Q = \frac{Vt}{R} = \frac{20 \times 2 \times 60}{10} = 240\, C$.

94. (a) $R \propto l^2 \Rightarrow \frac{R_1}{R_2} = \left(\frac{l_1}{l_2}\right)^2 \Rightarrow \frac{R}{R_2} = \left(\frac{l}{l/2}\right)^2 = 4 \Rightarrow R_2 = \frac{R}{4}$.

95. (b)

96. (b) $V_d = \frac{i}{neA} = \frac{40}{10^{29} \times 10^{-6} \times 1.6 \times 10^{-19}}$

$= 2.5 \times 10^{-3}\, m/sec$.

97. (c) $V_d = \frac{i}{nAe} = \frac{5.4}{8.4 \times 10^{28} \times 10^{-6} \times 1.6 \times 10^{-19}}$

$= 0.4 \times 10^{-3}\, m/sec = 0.4 mm/sec$.

98. (a) $\frac{R_1}{R_2} = \left(\frac{l_1}{l_2}\right)^2 \Rightarrow \frac{10}{R_2} = \left(\frac{5}{20}\right)^2 = \frac{1}{16} = R_2 = 160\Omega$.

99. (c) $R \propto \frac{1}{\tau}$; where τ = Relaxation time.

When lamp is switched on, temperature of filament increase, hence τ decrease so R increases

100. (d) $R = 91 \times 10^2 \approx 9.1 k\Omega$.

101. (c)

102. (a)

103. (d) $R \propto \frac{l^2}{m} \Rightarrow R_1 : R_2 : R_3 = \frac{l_1^2}{m_1} : \frac{l_2^2}{m_2} : \frac{l_3^2}{m_3}$

$\Rightarrow R_1 : R_2 : R_3 = \frac{9}{1} : \frac{4}{2} : \frac{1}{3} = 27 : 6 : 1$.

104. (b) $n = \frac{1 \times 10^{-3}}{1.6 \times 10^{-19}} = 6.25 \times 10^{15}$.

105. (b) $v_d = \frac{i}{ne\pi r^2} \Rightarrow v_d \propto \frac{i}{r^2} \Rightarrow \frac{v}{v'} = \frac{i_1}{i_2} \times \left(\frac{r_2}{r_1}\right)^2 \Rightarrow v' = \frac{v}{2}$.

106. (d) $\frac{R_1}{R_2} = \left(\frac{r_2}{r_1}\right)^4 \Rightarrow \frac{R}{R_2} = \left(\frac{3r/4}{r}\right)^4 = \frac{81}{256} = R_2 = \frac{256}{81} R$

107. (d)

108. (a) $v_d = \frac{i}{nAe} = \frac{8}{8 \times 10^{28} \times (2 \times 10^{-3})^2 \times 1.6 \times 10^{-19}}$

$= 0.156 \times 10^{-3}\, m/sec$.

109. (d) Specific resistance doesn't depend upon length and area.

110. (d) Heating effect of current.

111. (d) $l = \frac{R\pi r^2}{\rho} = \frac{4.2 \times 3.14 \times (0.2 \times 10^{-3})^2}{48 \times 10^{-8}} = 1.1 m$

112. (d) For conductors, resistance $\propto$ Temperature and for semi-conductor, resistance $\propto \frac{1}{\text{Temperature}}$

113. (a) If suppose initial length $l_1 = 100$ then $l_2 = 100 + 100 = 200$

$\frac{R_1}{R_2} = \left(\frac{l_1}{l_2}\right)^2 = \left(\frac{100}{200}\right)^2 \Rightarrow R_2 = 4R_1$

$\frac{\Delta R}{R} \times 100 = \frac{R_2 - R_1}{R_1} \times 100 = \frac{4R_1 - R_1}{R_1} \times 100 = 300\%$.

114. (a) Ammeter is always connected in series and Voltmeter is always connected in parallel.

115. (c) Same mass, same material *i.e.* volume is same or Al = constant

Also, $R = \rho \frac{l}{A} \Rightarrow \frac{R_1}{R_2} = \frac{l_1}{l_2} \times \frac{A_2}{A_1} = \left(\frac{A_2}{A_1}\right)^2 \left(\frac{d_2}{d_1}\right)^4$

$\Rightarrow \frac{24}{R_2} = \left(\frac{d}{d/2}\right)^4 = 16 \Rightarrow R_2 = 1.5\Omega$.

116. (a) $I = n_e q_e + n_p q_p = 1 mA$ towards right

117. (a) As steady current is flowing through the conductor, hence the number of electrons entering from one end and outgoing from the other end of any segment is equal. Hence charge will be zero.

118. (b) Conductance $C = \frac{1}{R} = \frac{A}{\rho l} \Rightarrow C \propto \frac{1}{l}$

119. (c) $i = \frac{dQ}{dt} \Rightarrow dQ = idt \Rightarrow Q = \int_{t_1}^{t_2} i dt = \int_0^5 (1.2t + 3) dt$

$= \left[\frac{1.2t^2}{2} + 3t\right]_0^5 = 30C$

120. (a) In stretching, $\frac{R_2}{R_1} = \left(\frac{r_1}{r_2}\right)^4 \Rightarrow \frac{R_2}{R} = \left(\frac{2}{1}\right)^4 \Rightarrow R_2 = 16R$

121. (d) $R' = n^2 R \Rightarrow R' = 16R$

122. (a)

Significant figures		Multiplier
Brown	Black	Brown
1	0	10^1

$\therefore R = 10 \times 10^1 = 100\ \Omega$

123. (a)

124. (d)

125. (c)

126. (b) $R \propto \frac{l}{r^2} \Rightarrow \frac{R_2}{R_1} = \frac{l_2}{l_1} \times \frac{r_1^2}{r_2^2} = \left(\frac{2}{1}\right) \times \left(\frac{1}{2}\right)^2 = \frac{1}{2}$

$\Rightarrow R_2 = \frac{R_1}{2}$, specific resistance doesn't depend upon length, and radius.

127. (c) By using $v_d = \frac{i}{neA} = \frac{100}{10^{28} \times 1.6 \times 10^{-19} \times \frac{\pi}{4} \times (0.02)^2}$

$= 2 \times 10^{-4}\, m/\text{sec}$

128. (a) $R \propto \frac{l}{r^2}$. For highest resistance $\frac{l}{r^2}$ should be maximum, which is correct for option (a)

129. (a) Red, brown, orange, silver red and brown represents the first two significant figures.

Significant figures		Multiplier	Tolerance
Red	Brown	Orange	Silver
2	1	10^3	± 10%

$\therefore R = 21 \times 10^3 \pm 10\%$

130. (c) In stretching $R \propto l^2 \Rightarrow \frac{R_2}{R_1} = \frac{l_2^2}{l_1^2} \Rightarrow \frac{R_2}{R_1} = \left(\frac{2}{1}\right)^2$

$\Rightarrow R_2 = 4R_1$. Change in resistance $= R_2 - R_1 = 3R_1$

Now, $\frac{\text{Change in resistance}}{\text{Original resistance}} = \frac{3R_1}{R_1} = \frac{3}{1}$

131. (c) $\frac{R_1}{R_2} = \left(\frac{l_1}{l_2}\right)^2$, If $l_1 = 100$ then $l = 110$

$\Rightarrow \frac{R_1}{R_2} = \left(\frac{100}{110}\right)^2 \Rightarrow R_2 = 1.21 R_1$

% change $\frac{R_2 - R_1}{R_1} \times 100 = 21\%$

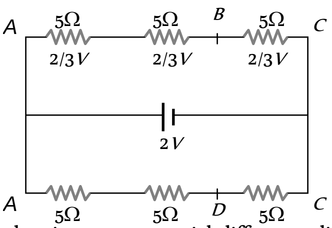
132. (b)

133. (c) Resistance $= \rho \frac{l}{A}$

$\therefore \frac{R_1}{R_2} = \frac{\rho_1}{\rho_2} \times \frac{l_1}{l_2} \times \frac{A_2}{A_1} = \frac{2}{3} \times \frac{3}{4} \times \frac{5}{4} = \frac{5}{8}$

Grouping of Resistances

1. (c) The given circuit can be redrawn as follows



For identical resistances, potential difference distributes equally among all. Hence potential difference across each resistance is $\frac{2}{3}V$, and potential difference between A and B is $\frac{4}{3}V$.

2. (d) Equivalent resistance of parallel resistors is always less than any of the member of the resistance system.

3. (a) Each part will have a resistance $r = R/10$

Let equivalent resistance be r_R, then

$\frac{1}{r_R} = \frac{1}{r} + \frac{1}{r} + \frac{1}{r}$.......... .10 times

$\therefore \frac{1}{r_R} = \frac{10}{r} = \frac{10}{R/10} = \frac{100}{R} \Rightarrow r_R = \frac{R}{100} = 0.01R$

4. (c) $R_{\text{equivalent}} = \frac{(30+30)30}{(30+30)+30} = \frac{60 \times 30}{90} = 20\Omega$

$\therefore i = \frac{V}{R} = \frac{2}{20} = \frac{1}{10}$ *ampere*

5. (b) Resistance of parallel group $= \frac{R}{2}$

$\therefore$ Total equivalent resistance $= 4 \times \frac{R}{2} = 2R$

6. (c) Resistance of 1 *ohm* group $= \frac{R}{n} = \frac{1}{3}\Omega$

This is in series with $\frac{2}{3}\Omega$ resistor.

$\therefore$ Total resistance $= \frac{2}{3} + \frac{1}{3} = \frac{3}{3}\Omega = 1\Omega$

7. (c) Lowest resistance will be in the case when all the resistors are connected in parallel.

$\frac{1}{R} = \frac{1}{0.1} + \frac{1}{0.1}$....... 10 times

$\frac{1}{R} = 10 + 10$....... 10 times

$\frac{1}{R} = 100$ *i.e.* $R = \frac{1}{100}\Omega$

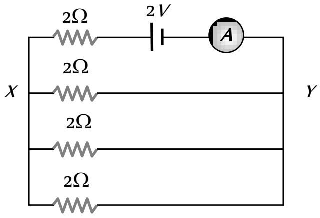
8. (b) Resistance across $XY = \frac{2}{3}\Omega$

Total resistance

$= 2 + \frac{2}{3} = \frac{8}{3}\Omega$

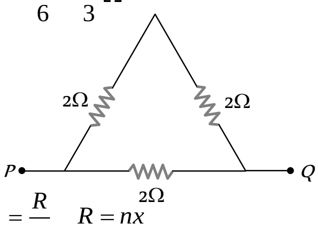
Current through ammeter

$= \frac{2}{8/3} = \frac{6}{8} = \frac{3}{4}A$



9. (a) Equivalent resistance of the combination

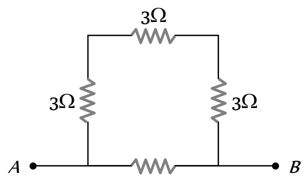
$= \frac{(2+2) \times 2}{2+2+2} = \frac{8}{6} = \frac{4}{3}\Omega$



10. (b) In parallel, $x = \frac{R}{n}$ $R = nx$

In series, $R + R + R$ .... n times $= nR = n(nx) = n x$

11. (d) The circuit reduces to



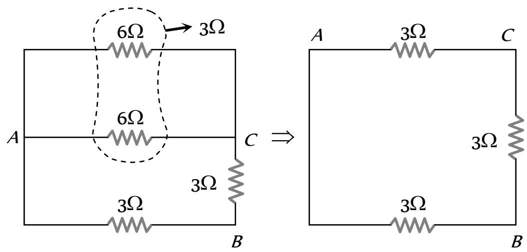
$R_{AB} = \frac{9 \times 6}{9+6} = \frac{9 \times 6}{15} = \frac{18}{5} = 3.6\Omega$

12. (d) As resistance $\propto$ Length

Resistance of each arm $= \frac{12}{3} = 4\Omega$

$\Rightarrow R_{\text{effective}} = \frac{4 \times 8}{4+8} = \frac{8}{3}\Omega$

13. (b) Given circuit is equivalent to



So the equivalent resistance between points A and B is equal to $R=\frac{6\times3}{6+3}=2\Omega$

14. (d) Potential difference across all resistors in parallel combination is same.

15. (b) Current through each arm DAC and DBC = 1A

$V_D-V_A=2$ and $V_D-V_B=3 \Rightarrow V_A-V_B=+1V$

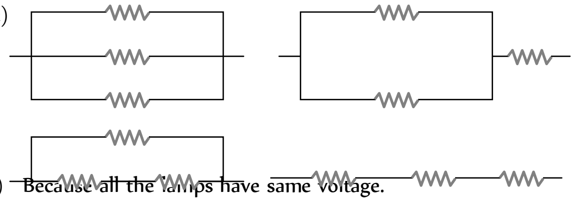
16. (d) $R = r+\frac{3r}{2}=\frac{5r}{2}$

17. (c) If resistances are R_1 and R_2 then $\frac{R_1R_2}{R_1+R_2}=\frac{6}{8}$ .....(i)

Suppose R_2 is broken then $R_1=2\Omega$ .....(ii)

On solving equations (i) and (ii) we get $R_2=6/5\,\Omega$

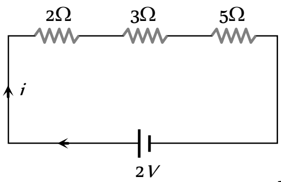
18. (c)



19. (b) Because all the lamps have same voltage.

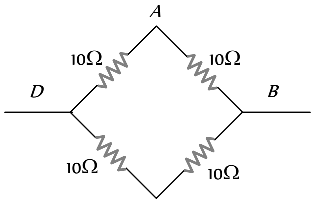
20. (d) $R_{\text{series}}=R_1+R_2+R_3+......$

21. (a) Current supplied by cell $i=\frac{2}{2+3+5}=\frac{1}{5}A$



So potential difference across 3 will be $V=\frac{3\times1}{5}=0.6V$

22. (a) According to the problem, we arrange four resistance as follows



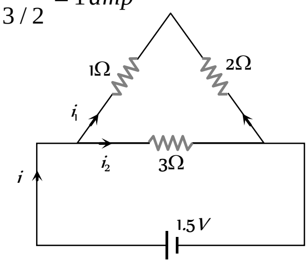
Equivalent resistance $=\frac{20\times20}{40}=10\Omega$

23. (b) $R_1+R_2=9$ and $\frac{R_1R_2}{R_1+R_2}=2 \Rightarrow R_1R_2=18$

$R_1-R_2=\sqrt{(R_1+R_2)^2-4R_1R_2}=\sqrt{81-72}=3$

$R_1=6\Omega, R_2=3\Omega$

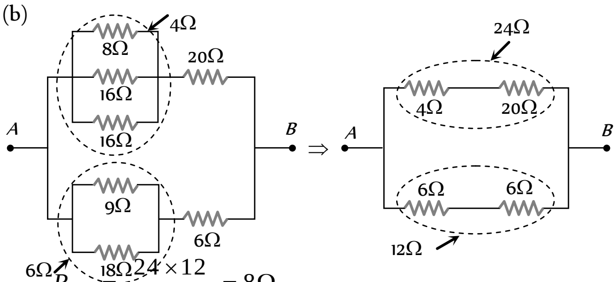
24. (b) $i_1+i_2=\frac{1.5}{3/2}=1\,amp$



$\frac{i_1}{i_2}=\frac{3}{3} \Rightarrow i_1=i_2 \quad \therefore\ i_2=0.5A=i_1$

25. (c) $V_p-V_q=\left(\frac{6}{3}+\frac{12\times6}{12+6}\right)(0.5)=(2+4)(0.5)=3V$

26. (b)



$R_{AB}=\frac{24\times12}{(24+12)}=8\Omega$

27. (d) The network can be redrawn as follows

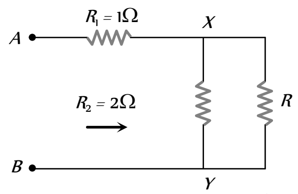
$\Rightarrow R_{eq}=9\Omega$

28. (d) Let the resistance of the wire be R, then we know that resistance is proportional to the length of the wire. So each of the four wires will have $R/4$ resistance and they are connected in parallel. So the effective resistance will be

$\frac{1}{R_1}=\left(\frac{4}{R}\right)4 \Rightarrow R_1=\frac{R}{16}$

29. (d) Equivalent resistance $=\frac{4\times4}{4+4}+\frac{6\times6}{6+6}=5ohm$ So the current in the circuit $=\frac{20}{5}=4$ *ampere* Hence the current flowing through each resistance = 2 *ampere.*

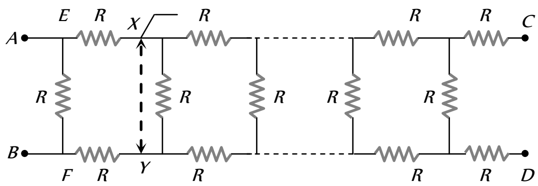
30. (c) Let the resultant resistance be R. If we add one more branch, then the resultant resistance would be the same because this is an infinite sequence.

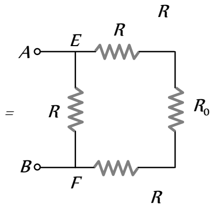


$\therefore \frac{RR_2}{R+R_2}+R_1=R \Rightarrow 2R+R+2=R^2+2R$

$\Rightarrow R^2-R-2=0 \Rightarrow R=-1$ or $R=2ohm$

31. (b) Cut the series from XY and let the resistance towards right of XY be R_0 whose value should be such that when connected across AB does not change the entire resistance. The combination is reduced to as shown below.





The resistance across $EF, = R_{EF} = (R_0 + 2R)$

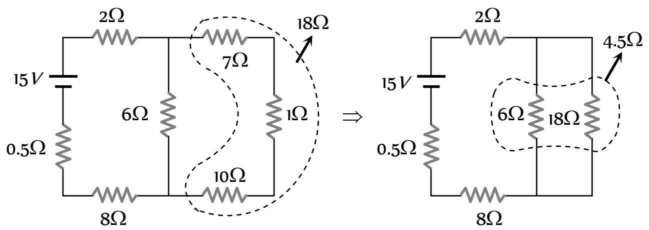
Thus $R_{AB} = \frac{(R_0 + 2R)R}{R_0 + 2R + R} = \frac{R_0 R + 2R^2}{R_0 + 3R} = R_0$

$\Rightarrow R_0^2 + 2RR_0 - 2R^2 + 0 \Rightarrow R_0 = R(\sqrt{3} - 1)$

32. (d) The last two resistance are out of circuit. Now 8Ω is in parallel with $(1 + 1 + 4 + 1 + 1)\Omega$.

$\therefore R = 8\Omega \| \; 8\Omega = \frac{8}{2} = 4\Omega \Rightarrow R_{AB} = 4 + 2 + 2 = 8\Omega$

33. (a) The given circuit can be simplified as follows

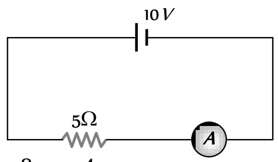


On further solving equivalent resistance $R = 15\,\Omega$

Hence current from the battery $i = \frac{15}{15} = 1A$

34. (b) The circuit will be as shown

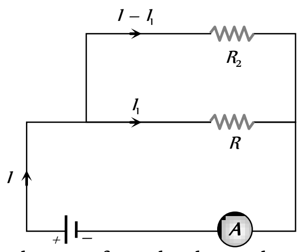
$i = \frac{10}{5} = 2A$



35. (c) The current in the circuit $= \frac{8}{5+1} = \frac{4}{3}$

Now $V_C - V_E = \frac{4}{3} \times 1 \Rightarrow V_E = -\frac{4}{3} V$

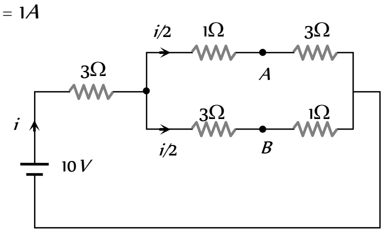
36. (d) According to the figure, $(I - I_1)R_2 = I_1 R$



Only two values satisfying the above relation are $\frac{I}{2}$ and R

37. (d) Effective resistance between the points A and B is $R = \frac{32}{12} = \frac{8}{3}\Omega$

38. (b) $R_{eq} = 5\Omega$, Current $i = \frac{10}{5} = 2A$ and current in each branch = $1A$



Potential difference between C and A,

$V_C - V_A = 1 \times 1 = 1V$ ....(i)

Potential difference between C and B,

$V_C - V_B = 1 \times 3 = 3V$ ......(ii)

On solving (i) and (ii) $V_A - V_B = 2\,volt$

Shot Trick : $(V_A - V_B) = \frac{i}{2}(R_2 - R_1) = \frac{2}{2}(3 - 1) = 2V$

39. (c) $\frac{1}{R} = \frac{1}{1} + \frac{1}{1} + \frac{1}{1} = \frac{3}{1} \Rightarrow R = \frac{1}{3} ohm$

Now such three resistance are joined in series, hence total $R = \frac{1}{3} + \frac{1}{3} + \frac{1}{3} = 1 ohm$

40. (b) To obtain minimum resistance, all resistors must be connected in parallel.

Hence equivalent resistance of combination $= \frac{r}{10}$

41. (a) For same material and same length

$\frac{R_2}{R_1} = \frac{A_1}{A_2} = \frac{3}{2} \Rightarrow R_2 = 3R_1$

Resistance of thick wire $R_1 = 10\Omega$

$\therefore$ Resistance of thin wire $R_2 = 30\Omega$

Total resistance in series = 10 + 30 = 40 Ω

42. (c) Similar to Q. No. 30

$R = 2 + 2 + \frac{2 \times R}{2 + R} \Rightarrow 2R + R^2 = 8 + 4R + 2R$

$\Rightarrow R^2 - 4R - 8 = 0 \Rightarrow R = \frac{4 \pm \sqrt{16 + 32}}{2} = 2 \pm 2\sqrt{3}$

R cannot be negative, hence $R = 2 + 2\sqrt{3} = 5.46\Omega$

43. (b) P.d. across the circuit $= 1.2 \times \frac{6 \times 4}{6 + 4} = 2.88\,volt$

Current through 6 *ohm* resistance $= \frac{2.88}{6} = 0.48\,A$

44. (d) Three resistances are in parallel.

$\therefore \frac{1}{R'} = \frac{1}{R} + \frac{1}{R} + \frac{1}{R} = \frac{3}{R}$

The equivalent resistance $R' = \frac{R}{3}\Omega$

45. (c) Similar to Q. No. 30. By formula $R = R_1 + \frac{R_2 \times R}{R_2 + R}$

$\therefore R = 1 + \frac{1 \times R}{1 + R} \Rightarrow R^2 + R = 1 + R + R$

$\Rightarrow R^2 - R - 1 = 0$ or $R = \frac{1 \pm \sqrt{1 + 4}}{2} = \frac{1 \pm \sqrt{5}}{2}$

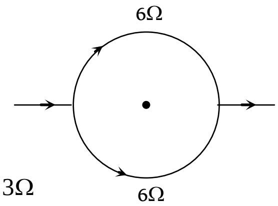
Since R cannot be negative, hence $R = \frac{1 + \sqrt{5}}{2}\Omega$

46. (d) $R \propto l$

Hence every new piece will have a resistance $\frac{R}{10}$. If two pieces are connected in series, then their resistance $= \frac{2R}{10} = \frac{R}{5}$

If 5 such combinations are joined in parallel, then net resistance $= \frac{R}{5\times 5} = \frac{R}{25}$

47. (c)



$R_{eq} = \frac{6}{2} = 3\Omega$

48. (b) Current in the given circuit $i = \frac{50}{(5+7+10+3)} = 2A$

Potential difference between A and B $V_A - V_B = 2\times 12$

$\Rightarrow V_A - 0 = 24V \Rightarrow V_A = 24\ V$

49. (b) If all are in series then $R_{eq} = 12\,\Omega$

If all are in parallel then $R_{eq} = \frac{4}{3}\Omega = 1.33\,\Omega$

If two are in series then parallel with third, $R_{eq} = \frac{8}{3} = 2.6\,\Omega$

If two are in parallel then series with third, $R_{eq} = 6\,\Omega$

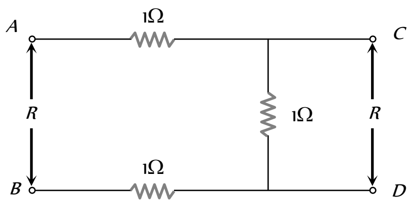
50. (d) Equivalent external resistance of the given circuit $R_{eq} = 4\,\Omega$

Current given by the cell $i = \frac{E}{R_{eq}+r} = \frac{10}{(4+1)} = 2\ A$

Hence, $(V_A - V_B) = \frac{i}{2}\times(R_2 - R_1) = \frac{2}{2}(2-4) = -2\ V.$

51. (d) Resistance of each part will be $\frac{R}{n}$; such n parts are joined in parallel so $R_{eq} = \frac{R}{n^2}$.

52. (c) Let equivalent resistance between A and B be R, then equivalent resistance between C and D will also be R.



$R' = \frac{R}{R+1} + 2 = R$ or $R^2 - 2R - 2 = 0$

$\therefore\ R = \frac{2\pm\sqrt{4+8}}{2} = \sqrt{3}+1$

53. (d) 6Ω and 6Ω are in series, so effective resistance is 12Ω which is in parallel with 3Ω, so

$\frac{1}{R} = \frac{1}{3} + \frac{1}{12} = \frac{15}{36} \Rightarrow R = \frac{36}{15}$

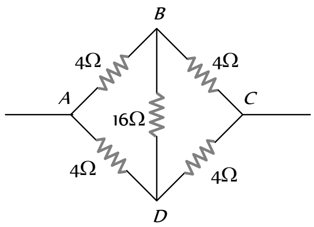
$\therefore\ I = \frac{V}{R} = \frac{4.8\times 15}{36} = 2\ A$

54. (a) Equivalent resistance of the circuit $R = \frac{3}{2}\Omega$

$\therefore$ Current through the circuit $i = \frac{V}{R} = \frac{3}{3/2} = 2A$

55. (c) $R_{max} = nR$ and $R_{min} = R/n \Rightarrow \frac{R_{max}}{R_{min}} = n^2$

56. (d) According to the principle of Wheatstone's bridge, the effective resistance between the given points is 4Ω.



57. (c)

58. (c) Current through 6Ω resistance in parallel with 3Ω resistance = 0.4 A

So total current = 0.8 + 0.4 = 1.2 A

Potential drop across $4\Omega = 1.2\times 4 = 4.8\ V$

59. (d) Two resistances in series are connected parallel with the third. Hence $\frac{1}{R_p} = \frac{1}{4} + \frac{1}{8} = \frac{3}{8} \Rightarrow R_p = \frac{8}{3}\Omega$

60. (c) Resistances at C and B are not in the circuit. Use laws of resistances in series and parallel excluding the two resistance.

61. (d) After simplifying the network, equivalent resistance obtained between A and B is 8Ω.

62. (c) The circuit consists of three resistances (2R, 2R and R) connected in parallel.

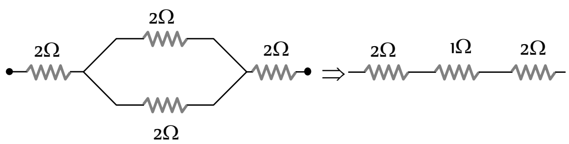
63. (d) Resistance across the battery is

$\frac{1}{R_p} = \frac{1}{3} + \frac{1}{6} = \frac{2+1}{6} = \frac{3}{6} \Rightarrow R_p = 2\Omega \Rightarrow I = \frac{2}{2} = 1\ A$

64. (c) The voltmeter is assumed to have infinite resistance. Hence (1 + 2 + 1) + 4 = 8Ω.

65. (c) $R' = \frac{R}{n} = \frac{1}{10} = 0.1\Omega$

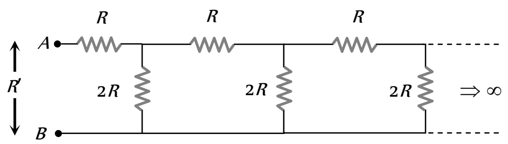
66. (c) The given circuit can be redrawn as follows

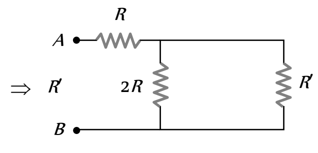


$\Rightarrow\ R_{eq} = 5\Omega$.

67. (b) $R_{AB} = R_1 + \frac{R_2R_3}{R_2+R_3} + R_4 = 2 + \frac{4\times 4}{4+4} + 2 = 6\Omega$.

68. (c) Let equivalent resistance between A and B is R', so given circuit can be reduced as follows





$R' = R + \dfrac{2R \times R'}{(2R + R')} \Rightarrow R'^2 - RR' - 2R^2 = 0$

On solving the equation we get $R' = 2R$.

69. (d) $R_{AB} = \dfrac{R}{3} + R = \dfrac{2}{3} + 2 = \dfrac{8}{3} = 2\dfrac{2}{3}\Omega$.

70. (b) $i = \dfrac{E}{R+r} \Rightarrow 0.5 = \dfrac{10}{R+3} \Rightarrow 10 = 0.5R + 1.5 \Rightarrow R = 17\Omega$.

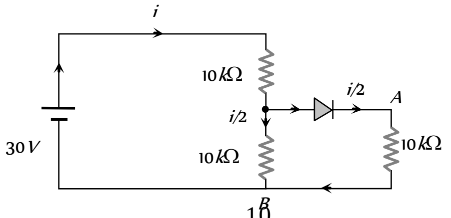
71. (a) Equivalent resistance $R = 4 + \dfrac{3 \times 6}{3+6} = 6\Omega$ and main current

$i = \dfrac{E}{R} = \dfrac{3}{6} = 0.5A$

Now potential difference across the combination of 3Ω and 6Ω, $V = 0.5 \times \left(\dfrac{3 \times 6}{3+6}\right) = 1 Volt$

The same potential difference, also develops across 3Ω resistance.

72. (c)



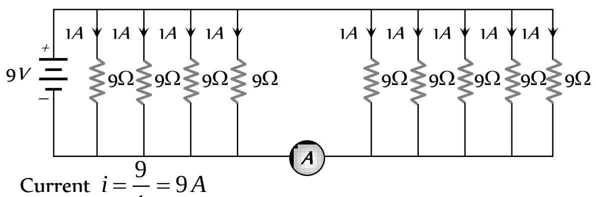
Equivalent resistance $R = 10 + \dfrac{10}{2} = 15\,k\Omega$

Current $i = \dfrac{30}{15} = 2 \times 10^{-3} A$

Hence, potential difference between A and B

$V = \left(\dfrac{2 \times 10^{-3}}{2}\right) \times 10 \times 10^3 = 10\,Volt$

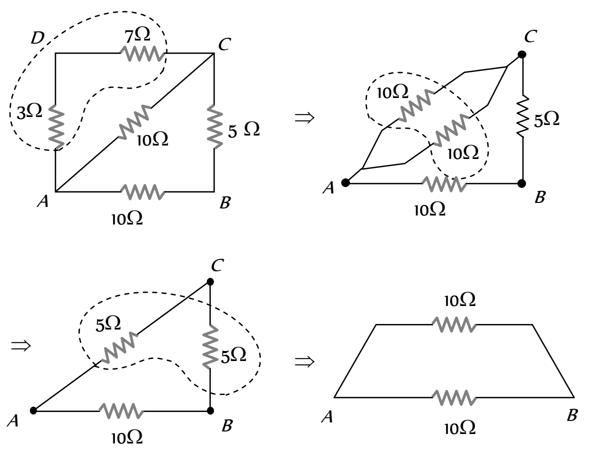
73. (a) Equivalent resistance $R = \dfrac{9}{9} = 1\Omega$



Current $i = \dfrac{9}{1} = 9A$

Current passes through the ammeter = 5A.

74. (b) The figure can be drawn as follows

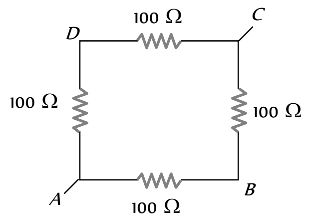


$\Rightarrow R_{AB} = 5\Omega$.

75. (a) $R_1 = \dfrac{\rho_1 l_1}{A}$ and $R_2 = \dfrac{\rho_2 l_2}{A}$. In series $R_{eq} = R_1 + R_2$

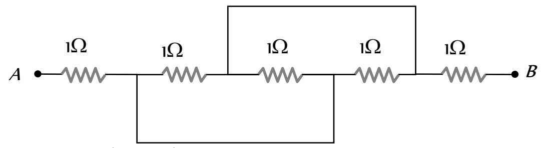
$\dfrac{\rho_{eq.}(l_1 + l_2)}{A} = \dfrac{\rho_1 l_1}{A} + \dfrac{\rho_2 l_2}{A} \Rightarrow \rho_{eq} = \dfrac{\rho_1 l_1 + \rho_2 l_2}{l_1 + l_2}$.

76. (c) The figure can be drawn as follows



$R_{AC} = \dfrac{200 \times 200}{200 + 200} = 100\Omega$.

77. (c)



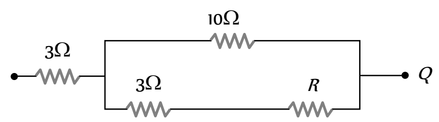
$R_{AB} = 2 + \dfrac{1}{3} = 2\dfrac{1}{3}\Omega$.

78. (b) ρ – same, l – same, $A_2 = \dfrac{1}{4}A_1$ (as $r_2 = \dfrac{r_1}{2}$)

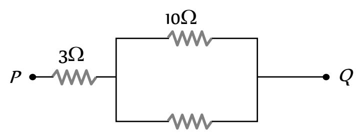
By using $R = \rho\dfrac{l}{A} \Rightarrow \dfrac{R_1}{R_2} = \dfrac{A_2}{A_1} \Rightarrow \dfrac{R_1}{8} = \dfrac{1}{4} \Rightarrow R_1 = 2\Omega$

Hence, $R_{eq} = \dfrac{R_1 R_2}{R_1 + R_2} = \dfrac{2 \times 8}{(2+8)} = \dfrac{8}{5}\Omega$.

79. (c) The given circuit can be simplified as follows



⇒

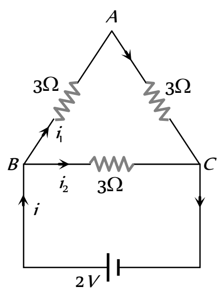


$R = 3 + \dfrac{10 \times (3 + R)}{10 + 3 + R} = 3 + \dfrac{30 + 10R}{13 + R}$

$R = \dfrac{39 + 3R + 30 + 10R}{13 + R} = \dfrac{69 + 13R}{13 + R}$

$13R + R^2 = 69 + 13R \Rightarrow R = \sqrt{69}\Omega$.

80. (a) The circuit can be drawn as follows



Equivalent resistance $R = \frac{3\times(3+3)}{3+(3+3)} = 2\Omega$

Current $i = \frac{2}{2} = 1A$. So, $i_1 = 1\times\left(\frac{3}{3+6}\right) = \frac{1}{3}A$.

Potential difference between A and $B = \frac{1}{3}\times 3 = 1 volt$.

81. (a) $\frac{1}{R_{eq}} = \frac{1}{2}+\frac{1}{4}+\frac{1}{8} = \frac{4+2+1}{8} \Rightarrow R_{eq} = \frac{8}{7}\Omega$.

82. (b) The given figure is balance wheat stone bridge.

83. (b) $\frac{7}{12} = \frac{1}{4}+\frac{1}{R} \Rightarrow R = 3\Omega$

84. (d) Suppose resistance of wires are R_1 and R_2 then $\frac{6}{5} = \frac{R_1R_2}{R_1+R_2}$. If R_2 breaks then $R_1 = 2\Omega$

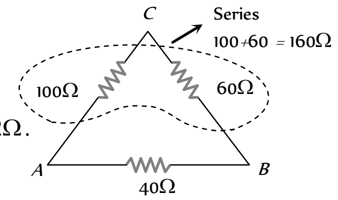
Hence, $\frac{6}{5} = \frac{2\times R_2}{2+R_2} \Rightarrow R_2 = 3\Omega$.

85. (d) Potential difference across PQ *i.e.* p.d. across the resistance of 20Ω, which is $V = i\times 20$

and $i = \frac{48}{(100+100+80+20)} = 0.16A$

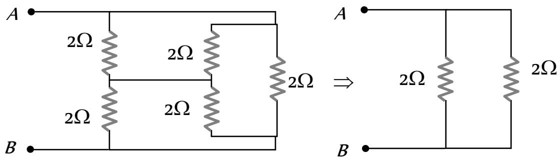
$\therefore\ V = 0.16\times 20 = 3.2V$.

86. (a)



$R = \frac{160\times 40}{160+40} = 32\Omega$.

87. (a)



$R_{AB} = \frac{2\times 2}{2+2} = 1\Omega$.

88. (a) Given circuit is a balance Wheatstone bridge circuit.

89. (b) All of three resistance are in parallel So, $R' = R/n = \frac{R}{3}$.

90. (b) $R_{eq} = R_1 + R_2 \Rightarrow \frac{\rho_{eff.}2l}{A} = \frac{\rho_1 l}{A}+\frac{\rho_2 l}{A} \Rightarrow \rho_{eff.} = \frac{\rho_1+\rho_2}{2}$.

91. (b) Two resistance are in ratio 1 : 2 and third resistance is R

So, $\frac{1}{x}+\frac{1}{2x}+\frac{1}{R} = 1 \Rightarrow x = \frac{3}{2}\left(\frac{R}{R-1}\right)$

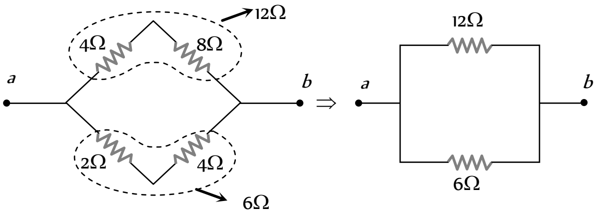
As, resistance is not fractional $\Rightarrow \frac{R}{R-1} = 2$

$\Rightarrow x = 3, R = 2, 2x = 6$

Hence, the value of largest resistance = 6Ω.

92. (c) $R = \frac{(3+3)\times 3}{(3+3)+3} = 2\Omega \Rightarrow i = \frac{3}{2} = 1.5A$.

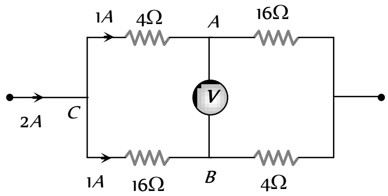
93. (b) Given circuit is a balanced Wheatstone bridge circuit, hence it can be redrawn as follows



$R_{AB} = \frac{12\times 6}{(12+6)} = 4\Omega$.

94. (d) The given circuit is a balanced wheatstone bridge circuit. Hence potential difference between A and B is zero.

95. (a) In the following circuit potential difference between C and A is $V_C - V_A = 1\times 4 = 4$ ......(i)



C and B is $V_C - V_B = 1\times 16 = 16$ ......(ii)

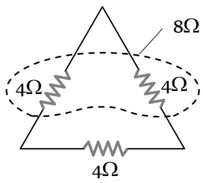
On solving equations (i) and (ii) we get

$V_A - V_B = 12V$.

96. (d) As resistance ∝ Length

$\therefore$ Resistance of each arm $= \frac{12}{3} = 4\,\Omega$

$\therefore\ R_{effective} = \frac{4\times 8}{4+8} = \frac{8}{3}\Omega$



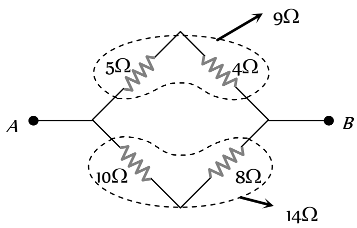
97. (b) $i = \frac{12}{(1+1)+0.4} = 5A$.

98. (b) By balanced Wheatstone bridge condition $\frac{16}{X} = \frac{4}{0.5}$

$\Rightarrow X = \frac{8}{4} = 2\,\Omega$

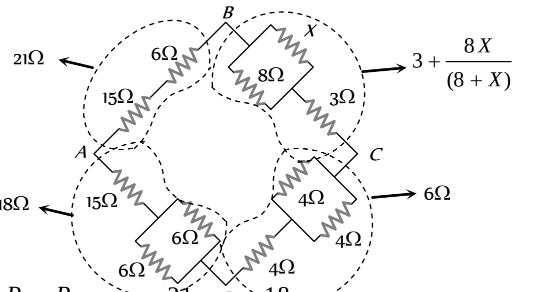
99. (d) Current through $2\Omega = 1.4\left\{\frac{(25+5)}{(10+2)+(25+5)}\right\} = 1A$

100. (a) Since the given bridge is balanced, hence there will be no current through 9Ω resistance. This resistance has no effect and must be ignored in the calculations.



$$R_{AB} = \frac{9\times 18}{27} = 6\,\Omega$$

101. (c) Potential difference between B and D is zero, it means Wheatstone bridge is in balanced condition



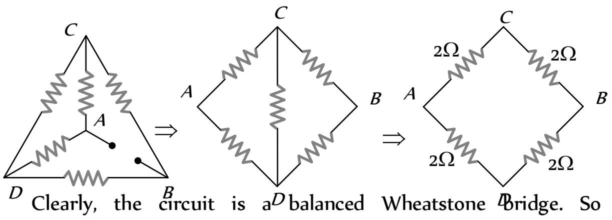
So $\frac{P}{Q} = \frac{R}{S} \Rightarrow \frac{21}{3+\frac{8X}{(8+X)}} = \frac{18}{6} \Rightarrow X = 8\Omega$

102. (a) This is a balanced Wheatstone bridge. Therefore no current will flow from the diagonal resistance $10\,\Omega$

$\therefore$ Equivalent resistance $= \frac{(10+10)\times(10+10)}{(10+10)+(10+10)} = 10\,\Omega$

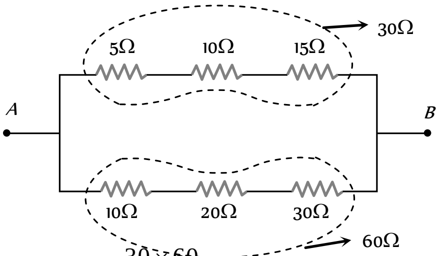
103. (b) This is a balanced Wheatstone bridge circuit. So potential at B and D will be same and no current flows through $4R$ resistance.

104. (d) The equivalent circuits are as shown below



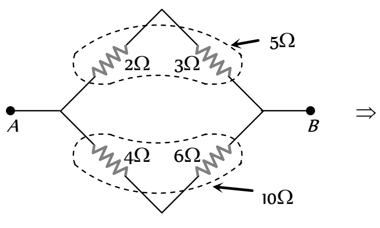
Clearly, the circuit is a balanced Wheatstone bridge. So effective resistance between A and B is $2\,\Omega$.

105. (a) By the concept of balanced Wheatstore bridge, the given circuit can be redrawn as follows



$\Rightarrow R_{AB} = \frac{30\times 60}{(30+60)} = 20\ \Omega$

106. (a) The given circuit is a balanced Wheatstone bridge type, hence it can be simplified as follows



$\Rightarrow \quad R_{AB} = \frac{10}{3}\Omega$

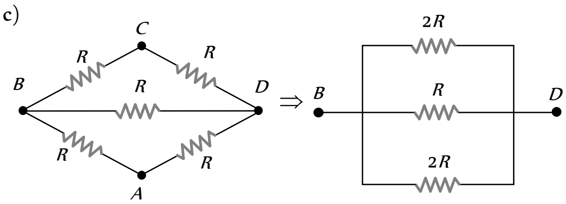
107. (b) Let current through $5\,\Omega$ resistance be i. Then

$$i\times 25 = (2.1 - i)10 \Rightarrow i = \frac{10}{35}\times 2.1 = 0.6\,A$$

108. (d) Let the value of shunt be r. Hence the equivalent resistance of branch containing S will be $\frac{Sr}{S+r}$

In balance condition, $\frac{P}{Q} = \frac{Sr/(S+r)}{R}$. This gives $r = 8\Omega$

109. (b, c)



$$\frac{1}{R_{BD}} = \frac{1}{2R} + \frac{1}{R} + \frac{1}{2R} \Rightarrow R_{BD} = \frac{R}{2}$$

Between A and C circuit becomes equivalent to balanced Wheatstone bridge so $R_{AC} = R$.

110. (b) $i \propto \frac{1}{R}$

111. (d) Equivalent resistance between P and Q

$$\frac{1}{R_{PQ}} = \frac{1}{(6+2)} + \frac{1}{3} + \frac{1}{(4+12)} \Rightarrow R_{PQ} = \frac{48}{25}\Omega$$

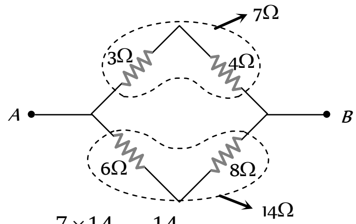
Current between P and Q; $i = 1.5A$

So, potential difference between P and Q

$$V_{PQ} = 1.5\times\frac{48}{25} = 2.88\,V.$$

112. (c) Given circuit is a balanced Wheatstone bridge i.e. potential difference between B and D is zero. Hence, no current flows between B and D.

113. (a) The given circuit is a balanced Wheatstone bridge, hence it can be redrawn as follows



$$\Rightarrow \quad R_{eq} = \frac{7\times 14}{(7+14)} = \frac{14}{3}\Omega.$$

114. (a) For a balance Wheatstone bridge.

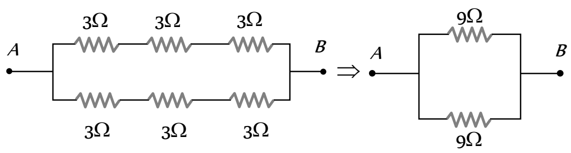
$$\frac{A}{B} = \frac{D}{C} \Rightarrow \frac{10}{5} \neq \frac{4}{4}\,(\text{Unbalanced})$$

$$\frac{A'}{B} = \frac{D}{C} \Rightarrow \frac{A'}{5} = \frac{4}{4} \Rightarrow A' = 5\Omega$$

$A'(5\Omega)$ is obtained by connecting a $10\,\Omega$ resistance in parallel with A.

115. (d) Given circuit is a balanced Wheatstone bridge circuit. So there will be no change in equivalent resistance. Hence no further current will be drawn.

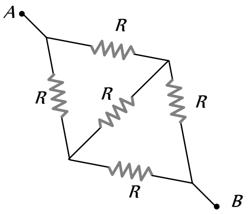
116. (a) No current flow through vertical resistances



$R_{AB} = \frac{9}{2}\Omega$.

117. (d) The given circuit is a balanced Wheatstone bridge.

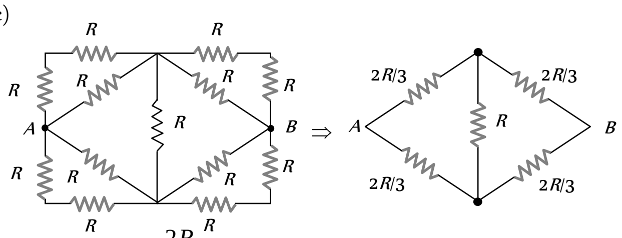
118. (c) The given circuit can be redrawn as follows



Equivalent resistance between *A* to *B* is *R*.

119. (d) Equivalent resistance of the given circuit is 3Ω.

120. (c)



Hence $R_{eq} = \frac{2R}{3}$.

121. (b)

122. (b) For balanced Wheatstone bridge $\frac{P}{Q} = \frac{R}{S}$

$\Rightarrow \frac{12}{(1/2)} = \frac{x+6}{(1/2)} \Rightarrow x = 6\Omega$

123. (b) For maximum energy equivalent resistance of combination should be minimum.

124. (c) For first balancing condition $\frac{10+R_1}{R_2} = \frac{50}{50}$

$\Rightarrow R_2 = 10 + R_1$. For second balancing condition $\frac{R_1}{R_2} = \frac{40}{60} \Rightarrow \frac{R_1}{10+R_1} = \frac{2}{3} \Rightarrow R_1 = 20\Omega$

125. (b) Given $R = 6\Omega$. When resistor is cut into two equal parts and connected in parallel, then

$R_{eq} = \frac{R/2}{2} = \frac{R}{4} = \frac{6}{4} = 1.5\,\Omega$

126. (a) Resistance between *P* and *Q*

$$R_{PQ} = R \,||\, \left(\frac{R}{3} + \frac{R}{2}\right) = \frac{R \times \frac{5}{6}R}{R + \frac{5}{6}R} = \frac{5}{11}R$$

Resistance between *Q* and *R*

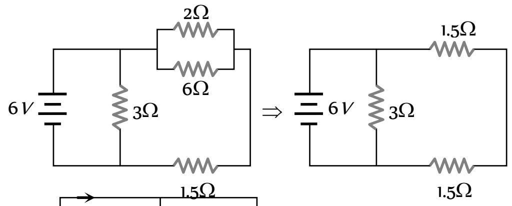
$$R_{QR} = \frac{R}{2} \,||\, \left(R + \frac{R}{3}\right) = \frac{\frac{R}{2} \times \frac{4R}{3}}{\frac{R}{2} + \frac{4R}{3}} = \frac{4}{11}R$$

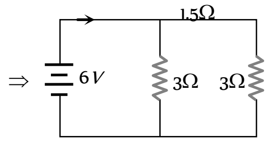
Resistance between *P* and *R*

$$R_{PR} = \frac{R}{3} \,||\, \left(\frac{R}{2} + R\right) = \frac{\frac{R}{3} \times \frac{3R}{2}}{\frac{R}{3} + \frac{3R}{2}} = \frac{3}{11}R$$

Hence it is clear that R_{PQ} is maximum.

127. (c) Given circuit can be redrawn as follows

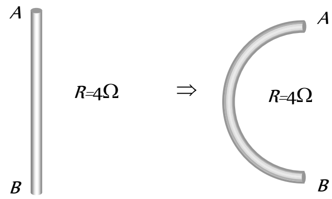




$\Rightarrow i = \frac{6}{1.5} = 4\,A$

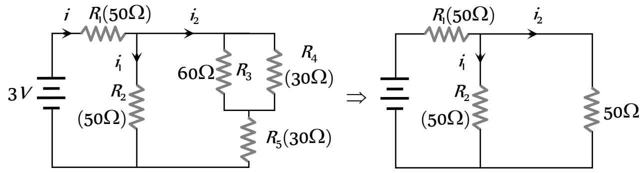
128. (b) $\frac{i_1}{i_2} = \frac{R_2}{R_1} = \frac{l_2}{l_1} \times \left(\frac{r_1}{r_2}\right)^2 = \frac{3}{4}\left(\frac{2}{3}\right)^2 = \frac{1}{3}$

129. (c)



130. (a) $\frac{1}{R_{eq}} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} = \frac{1}{2} + \frac{1}{4} + \frac{1}{5} = \frac{19}{20} \Rightarrow R_{eq} = \frac{20}{19}\Omega$

131. (a) Equivalent resistance of the given network $R_{eq} = 75\,\Omega$



$\therefore$ Total current through battery $i = \frac{3}{75}$

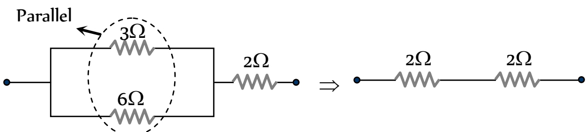
$i_1 = i_2 = \frac{3}{75 \times 2} = \frac{3}{150}$

Current through $R_4 = \frac{3}{150} \times \frac{60}{(30+60)} = \frac{3}{150} \times \frac{60}{90} = \frac{2}{150}A$

$V_4 = i_4 \times R_4 = \frac{2}{150} \times 30 = \frac{2}{5}V = 0.4\,V$

132. (a) $i = \frac{10}{1.5 + (1 \,||\, 1)} = \frac{10}{1.5 + 0.5} = 5A$

133. (c)



$R_{eq} = 4\Omega$

134. (a) The equivalent resistance between *C* and *D* is

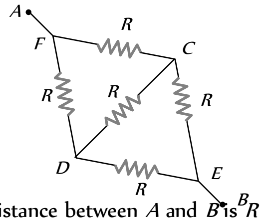
$$\frac{1}{R'}=\frac{1}{6}+\frac{1}{6}+\frac{1}{3}=\frac{2}{3} \text{ or } R'=\frac{3}{2}=1.5\,\Omega$$

Now the equivalent resistance between A and B as $R'=1.5\,\Omega$ and $2.5\,\Omega$ are connected in series, so

$$R''=1.5+2.5=4\,\Omega$$

Now by ohm's law, potential difference between A and B is given by $V_A-V_B=iR=2\times4.0=8\ volt$

135. (b) The given circuit can be redrawn as follows

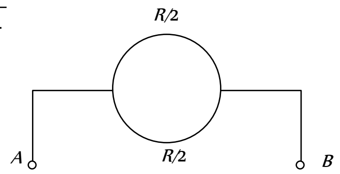


Equivalent resistance between A and B is R and current $i=\frac{V}{R}$

136. (b) The given network is a balanced Wheatstone bridge. It's equivalent resistance will be $R=\frac{18}{5}\Omega$

So current from the battery $i=\frac{V}{R}=\frac{V}{18/5}=\frac{5V}{18}$

137. (a) $\Rightarrow R_{AB}=\frac{R/2}{2}=\frac{R}{4}$



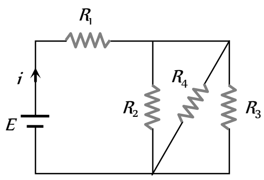
138. (b) $i\propto\frac{1}{R}\Rightarrow\frac{i_1}{i_2}=\frac{R_2}{R_1}\Rightarrow\frac{5}{4}=\frac{(R+2)}{R}\Rightarrow R=8\Omega$

139. (c) In given circuit three resistance R_2, R_4 and R_3 are parallel.

$$\frac{1}{R}=\frac{1}{R_2}+\frac{1}{R_4}+\frac{1}{R_3}$$

$$=\frac{1}{50}+\frac{1}{50}+\frac{1}{75}$$

$$=\frac{75+75+50}{50\times75}$$



$$R=\frac{50\times75}{75+75+50}=\frac{50\times75}{200}=\frac{75}{4}\Omega=18.75\Omega$$

This resistance is in series with R_1

$\therefore$

$$R_{\text{resultant}}=R_1+R=100+18.75=118.75\Omega$$

140. (b) When resistances 4Ω and 12Ω are connected in series $=4+12=16\Omega$

When these resistance are connected in parallel.

$$\frac{1}{R_P}=\frac{1}{4}+\frac{1}{12}\Rightarrow R_P=\frac{4\times12}{4+12}=\frac{4\times12}{16}=3\Omega$$

141. (b) Since voltmeter records $5\,V$, it means the equivalent. Resistance of voltmeter and 100 Ω must be 50, because in series grouping if resistances are equal, they share equal potential difference. It conclude that resistance of voltmeter must be 100 Ω.

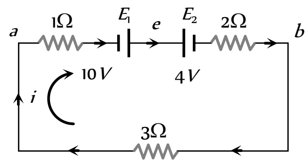
Kirchoff's Law, Cells

1. (b) For no current through galvanometer, we have

$$\left(\frac{E_1}{500+X}\right)X=E\Rightarrow\left(\frac{12}{500+X}\right)X=2\Rightarrow X=100\ \Omega$$

2. (d) Since $E_1(10\ V)>E_2(4V)$

So current in the circuit will be clockwise.



Applying Kirchoff's voltage law

$$-1\times i+10-4-2\times i-3i=0\Rightarrow i=1A(a\text{ to }b\text{ via }e)$$

$$\therefore \text{ Current }=\frac{V}{R}=\frac{10-4}{6}=1.0\ ampere$$

3. (c) For maximum power, external resistance = internal resistance.

4. (a) $0.9\,(2+r)=0.3\,(7+r)\Rightarrow 6+3r=7+r\Rightarrow r=0.5\ \Omega$

5. (a) Since both the resistors are same, therefore potential difference $=V+V=E\Rightarrow V=\frac{E}{2}$

6. (b) Let the current in the circuit $=i=\frac{V}{R}$

Across the cell, $E=V+ir\Rightarrow r=\frac{E-V}{i}=\frac{E-V}{V/R}=\left(\frac{E-V}{V}\right)R$

7. (a) For maximum energy, we have

External resistance of the circuit

= Equivalent internal resistance of the circuit *i.e.* $R=\frac{r}{2}$

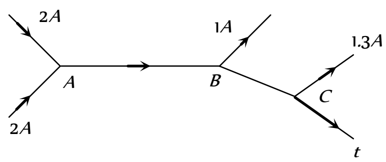
8. (a) Kirchhoff's first law is based on the law of conservation of charge.

9. (b) Kirchhoff's second law is based on the law of conservation of energy.

10. (a) According to Kirchhoff's first law

At junction A, $i_{AB}=2+2=4A$

At junction B, $i_{AB}=i_{BC}-1=3A$



At junction C, $i=i_{BC}-1.3=3-1.3=1.7\ amp$

11. (c) In charging $V>E$.

12. (d) In open circuit of a cell $V=E$

13. (a) Zero (Circuit open means no current and hence no potential difference across resistance).

14. (d) Zero (No potential difference across voltmeter).

15. (b) Let the e.m.f. of cell be E and internal resistance be r. Then

$0.5 = \frac{E}{(r+2)}$ and $0.25 = \frac{E}{(r+5)}$

On dividing, $2 = \frac{5+r}{2+r} \Rightarrow r = 1\Omega$

16. (c) In short circuiting $R = 0$, so $V = 0$

17. (c) Short circuit current $i_{SC} = \frac{E}{r} \Rightarrow 3 = \frac{1.5}{r} \Rightarrow r = 0.5\Omega$

18. (c) $i = \frac{50}{R+r} \Rightarrow r = \frac{50}{4.5} - 10 = \frac{5}{4.5} = 1.1\Omega$

19. (d) $(4+r)i = 2.2$ ......(i)

and $4i = 2 \Rightarrow i = \frac{1}{2}$

Putting the value of i in (i), we get $r = 0.4$ *ohm*.

20. (b) Let the internal resistance of cell be r, then

$i = \frac{E}{R+r} \Rightarrow 15 = \frac{1.5}{0.04+r} \Rightarrow r = 0.06\Omega$

21. (c) The voltage across cell terminal will be given by

$= \frac{E}{R+r} \times R = \frac{2}{(3.9+0.1)} \times 3.9 = 1.95V$

22. (c) $E = 2.2 volt, \quad V = 1.8 volt, \quad R = 5R$

$r = \left(\frac{E}{V} - 1\right)R = \left(\frac{2.2}{1.8} - 1\right) \times 5 = 1.1\Omega$

23. (b) In parallel, equivalent resistance is low $\left(i = \frac{E}{R + \frac{r}{n}}\right)$

24. (d) Internal resistance $\propto$ distance $\propto \frac{1}{\text{Area}} \propto$ concentration

25. (a) Total e.m.f. = nE, Total resistance $R + nr \Rightarrow i = \frac{nE}{R+nr}$

26. (a) Current through R is maximum when total internal resistance of the circuit is equal to external resistance.

27. (b) Cells are joined in parallel when internal resistance is higher then a external resistance. ($R << r$)

$i = \frac{E}{R + \frac{r}{n}}$

28. (b) In series , $i_1 = \frac{2E}{2+2r}$

In parallel, $i_2 = \frac{E}{2 + \frac{r}{2}} = \frac{2E}{4+r}$

Since $i_1 = i_2 \Rightarrow \frac{2E}{4+r} = \frac{2E}{2+2r} \Rightarrow r = 2\Omega$

29. (a) Applying Kirchhoff law

$(2+2) = (0.1+0.3+0.2)i \Rightarrow i = \frac{20}{3}A$

Hence potential difference across A

$= 2 - 0.1 \times \frac{20}{3} = \frac{4}{3}V$ (less than $2V$)

Potential difference across $B = 2 - 0.3 \times \frac{20}{3} = 0$

30. (b) Here two cells are in series.

Therefore total emf = $2E$.

Total resistance = $R + 2r$

$\therefore i = \frac{2E}{R+2r} = \frac{2 \times 1.45}{1.5 + 2 \times 0.15} = \frac{2.9}{1.8} = \frac{29}{18} = 1.611 amp$

31. (a) $E = V + ir$

After short-circuiting, $V = 0; \Rightarrow r = \frac{E}{i} = \frac{2}{4} = 0.5\Omega$

32. (c) By Kirchhoff's current law.

33. (b) For power to be maximum

External resistance = Equivalent internal resistance of the circuit

34. (a) $i = \frac{E}{r} = \frac{1.5}{0.05} = 30A$

35. (a) $i = \frac{12}{(4+2)} = 2A$

Energy loss inside the source $= i^2 r = (2)^2 \times 2 = 8W$

36. (b) $V_2 - V_1 = E - ir = 5 - 2 \times 0.5 = 4 volt$

$\Rightarrow V_2 = 4 + V_1 = 4 + 10 = 14 \, volt$

37. (a) If m = Number of rows

and n = Number of cells in a row

Then $m \times n = 100$ ......(i)

Also condition of maximum current is $R = \frac{nr}{m}$

$\Rightarrow 25 = \frac{1 \times n}{m} \Rightarrow n = 25\,m$ .....(ii)

On solving (i) and (ii) $m = 2$

38. (b) According to Kirchhoff's law $i_{CD} = i_2 + i_3$

39. (b) Since $i = \left(\frac{E}{R+r}\right)$, we get

$0.5 = \frac{E}{2+r}$ ......(i)

$0.25 = \frac{E}{5+r}$ .....(ii)

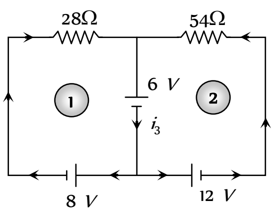
Dividing (i) by (ii), we get $2 = \frac{5+r}{2+r} \Rightarrow r = 1\Omega$

$\therefore 0.5 = \frac{E}{2+1} \Rightarrow E = 1.5V$

40. (c) Because $E_{eq} = E$ and $r_{eq} = \frac{r}{2}$

41. (d) In parallel combination $E_{eq} = E = 6V$

42. (d) Suppose current through different paths of the circuit is as follows.



After applying KVL for loop (1) and loop (2)

We get $28i_1 = -6-8 \Rightarrow i_1 = -\frac{1}{2}A$

and $54i_2 = -6-12 \Rightarrow i_2 = -\frac{1}{3}A$

Hence $i_3 = i_1 + i_2 = -\frac{5}{6}A$

43. (d) $V_{AB} = 4 = \frac{5X + 2\times 10}{X+10} \Rightarrow X = 20\Omega$

44. (a) After short circuiting, R becomes meaningless.

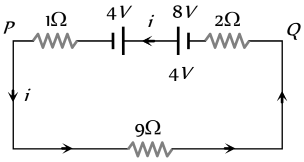
45. (c) $V = E - IR = 15 - 10\times 0.05 = 14.5V$

46. (c) In series $i = \frac{nE}{nr+R} \Rightarrow 0.6 = \frac{n\times 1.5}{n\times 0.5\times 20} \Rightarrow n = 10$

47. (b)

48. (a) $P = \frac{W}{t} = Vi \Rightarrow V = \frac{W}{it} = \frac{1000}{2\times 6\times 60} = 1.38\ V$

49. (a) Applying Kirchoff's voltage law in the given loop.



$-2i + 8 - 4 - 1\times i - 9i = 0 \Rightarrow i = \frac{1}{3}A$

Potential difference across $PQ = \frac{1}{3}\times 9 = 3V$

50. (d) Because cell is in open circuit.

51. (b) In parallel combination $E_{eq} = E = 12V$

52. (d)

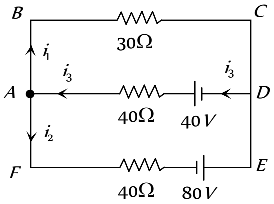
53. (b) $i = \frac{E}{r} = \frac{6}{0.5} = 12\,amp.$

54. (c) Strength = 5 × 18 = 90AH.

55. (a) $i = \frac{E}{R+r} = \frac{5}{4.5+0.5} = 1A$

$V = E - ir = 5 - 1\times 0.5 = 4.5$ Volt

56. (b) The circuit can be simplified as follows



Applying KCL at junction A

$i_3 = i_1 + i_2$ .....(i)

Applying Kirchoff's voltage law for the loop $ABCDA$

$-30i_1 - 40i_3 + 40 = 0$

$\Rightarrow -30i_1 - 40(i_1 + i_2) + 40 = 0$

$\Rightarrow 7i_1 + 4i_2 = 4$ .....(ii)

Applying Kirchoff's voltage law for the loop $ADEFA$.

$-40i_2 - 40i_3 + 80 + 40 = 0$

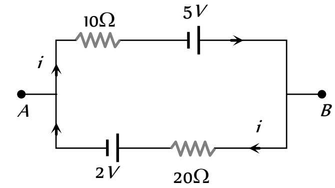
$\Rightarrow -40i_2 - 40(i_1 + i_2) = -120$

$\Rightarrow i_1 + 2i_2 = 3$ ....(iii)

On solving equation (ii) and (iii) $i_1 = -0.4A$.

57. (c) $V = E - ir = 12 - 60\times 5\times 10^{-2} = 9V$.

58. (a) Applying Kirchoff's voltage law in the loop



$-10i + 5 - 20i - 2 = 0 \Rightarrow i = 0.1A$

59. (d) $V = E - ir = 1.5 - 2\times 0.15 = 1.20\,Volt.$

60. (b) $i = \frac{E}{R+r} \Rightarrow 1 = \frac{4}{2+r} = r = 2\Omega$

Short circuit when terminals of battery connected directly then current flows which is $i_{SC} = \frac{E}{r} = \frac{4}{2} = 2A$.

61. (c) $i = \frac{2+2}{1+1.9+0.9} = \frac{4}{3.8}A$

For cell A $E = V + ir \Rightarrow V = 2 - \frac{4}{3.8}\times 1.9 = 0$.

62. (c) By using $i = \frac{E}{R+r}$

$\Rightarrow 0.5 = \frac{E}{11+r} \Rightarrow E = 5.5 + 0.5r$ .....(i)

and $0.9 = \frac{E}{5+r} \Rightarrow E = 4.5 + 0.9r$ .....(ii)

On solving these equation, we have $r = 2.5\Omega$

63. (c)

64. (b) $W = qV = 6\times 10^{-6}\times 9 = 54\times 10^{-6}\,J$.

65. (a) $P = \frac{V^2}{R_{eq}}$; for P to be maximum R_{eq} should be less. Hence option (a) is correct.

66. (c) $P_{max} = \frac{E^2}{4r} = \frac{(2)^2}{4\times 0.5} = 2\,W$

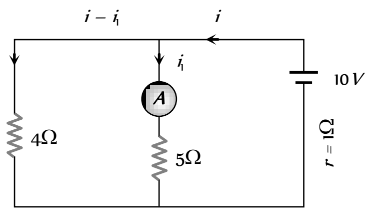
67. (a)

68. (d) Applying Kirchhoff law in the first mesh

$10 = 5\times i \Rightarrow i = \frac{10}{5} = 2\,A$

69. (b) Applying Kirchhoff law in the first mesh

$10 = 5i_1 + i$ .....(i)



Applying in the second mesh

$5i_1 = 4i - 4i_1$ ......(ii)

Solving equation (i) and (ii), we get $i_1 = \frac{40}{29}A$

70. (a) Given problem is the case of mixed grouping of cells

So total current produced $i = \dfrac{nE}{R + \frac{nr}{m}}$

Here $m = 100,\ n = 5000,\ R = 500\,\Omega$

$E = 0.15\,V$ and $r = 0.25\,\Omega$

$$\Rightarrow \quad i = \frac{5000 \times 0.15}{500 + \frac{5000 \times 0.25}{100}} = \frac{750}{512.5} \approx 1.5\,A$$

71. (a)

72. (d) Watt hour efficiency $= \dfrac{\text{Discharging energy}}{\text{Charging energy}}$

$$= \frac{14 \times 5 \times 15}{15 \times 8 \times 10} = 0.875 = 87.5\%$$

73. (c) From Kirchoff's junction Law

$\Rightarrow 4 + 2 + i - 5 - 3 = 0 \Rightarrow i = 2\,A$

74. (b) In the given case cell is in open circuit (i = 0) so voltage across the cell is equal to its e.m.f.

75. (b) The internal resistance of battery is given by

$$r = \left(\frac{E}{V} - 1\right)R = \left(\frac{40}{30} - 1\right) \times 9 = \frac{9 \times 10}{30} = 3\,\Omega$$

76. (b) $i = \dfrac{E}{r + R} \Rightarrow P = i^2 R \Rightarrow P = \dfrac{E^2 R}{(r + R)^2}$

Power is maximum when $r = R \Rightarrow P_{\max} = E^2 / 4r$

77. (c) Since the current coming out from the positive terminal is equal to the current entering the negative terminal, therefore, current in the respective loop will remain confined in the loop itself.

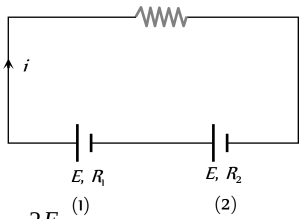
$\therefore$ current through 2Ω resistor = 0

78. (c) Reading of voltmeter

$$= E_{eq} = \frac{E_1 r_2 + E_2 r_1}{r_1 + r_2} = \frac{18 \times 1 + 12 \times 2}{1 + 2} = 14V$$

79. (d) $i = \dfrac{2E}{R + R_1 + R_2}$

From cell (2) $E = V + iR_2 = 0 + iR_2$

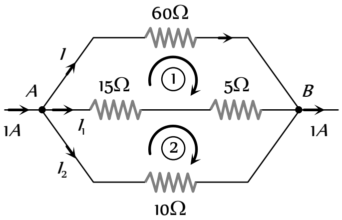


$$\Rightarrow E = \frac{2E}{R + R_1 + R_2} \times R_2 \Rightarrow R = R_2 - R_1$$

80. (d)

81. (a) Applying Kirchoff's law in following figure.

At junction A :



$i + i_1 + i_2 = 1$ .... (i)

For Loop (i)

$-60\,i + (15 + 5)i_1 = 0$

$\Rightarrow i_1 = 3i$ ...(ii)

For loop (2)

$-(15 + 5)\,i_1 + 10\,i_2 = 0$

$\Rightarrow i_2 = i_1 = (3\,i) = 6i$

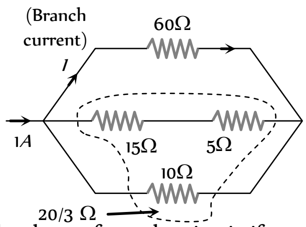
On solving equation (i), (ii) and (iii) we get $i = 0.1\,A$

Short Trick : Branch current =

$$\text{main current}\left(\frac{\text{Resistance of opposite branch}}{\text{Total resistance}}\right)$$

$$\Rightarrow i = 1 \times \left[\frac{\frac{20}{3}}{\frac{20}{3} + 60}\right]$$

= 0.1 A



82. (d) Maximum current will be drawn from the circuit if resultant resistance of all internal resistances is equal to the value of external resistance if the arrangement s mixed. In series, $R >> nr$ and in parallel, the external resistance is negligible.

83. (c) On applying Kirchoff's current law $i = 13\,A$.

84. (c) Total cells = $m \times n = 24$ .... (i)

For maximum current in the circuit $R = \dfrac{mr}{n}$

$\Rightarrow 3 = \dfrac{m}{n} \times (0.5) \Rightarrow m = 6n$ ..... (ii)

On solving equation (i) and (ii), we get m = 12, n =2

85. (a) Power dissipated $= i^2 R = \left(\dfrac{E}{R + r}\right)^2 R$

$$\therefore \left(\frac{E}{R_1 + r}\right)^2 R_1 = \left(\frac{E}{R_2 + r}\right)^2 R_2$$

$\Rightarrow R_1(R_2^2 + r_2 + 2R_2 r) = R_2(R_1^2 + r^2 + 2R_1 r)$

$\Rightarrow R_2^2 R_1 + R_1 r^2 + 2R_2 r = R_1^2 R_2 + R_2 r^2 + 2R_1 R_2 r$

$\Rightarrow (R_1 - R_2)r^2 = (R_1 - R_2)r^2 = (R_1 - R_2)R_1 R_2$

$\Rightarrow r = \sqrt{R_1 R_2}$

Different Measuring Instruments

1. (a) In meter bridge experiment, it is assumed that the resistance of the L shaped plate is negligible, but actually it is not so. The error created due to this is called, end error. To remove this the resistance box and the unknown resistance must be interchanged and then the mean reading must be taken.

2. (c) To convert a galvanometer into an ammeter a low value resistance is to be connected in parallel to it called shunt.

3. (d) Balance point has some fixed position on potentiometer wire. It is not affect by the addition of resistance between balance point and cell.

4. (d) Resistance of voltmeter should be greater than the external circuit resistance. An ideal voltmeter has infinite resistance.

5. (c) $S = \dfrac{i_g G}{i - i_g} = \dfrac{100 \times 0.01}{(10 - 0.01)} = \dfrac{1}{10} = 0.1\Omega$

6. (c) Equivalent resistance of the circuit $R_{eq} = 100\Omega$

current through the circuit $i = \dfrac{2.4}{100} A$

P.D. across combination of voltmeter and 100 Ω resistance

$= \dfrac{2.4}{100} \times 50 = 1.2V$

Since the voltmeter and 100 Ω resistance are in parallel, so the voltmeter reads the same value *i.e.* 1.2 *V*.

7. (a) Potential gradient $= \dfrac{e}{(R + R_h + r)} \cdot \dfrac{R}{L}$

$= \dfrac{2}{(15 + 5 + 0)} \times \dfrac{5}{1} = 0.5 \dfrac{V}{m} = 0.005 \dfrac{V}{cm}$

8. (d) $S = \dfrac{i_g G}{(i - i_g)} \Rightarrow \dfrac{G}{S} = \dfrac{i - i_g}{i_g} = \dfrac{10 - 1}{1} = \dfrac{9}{1}$

9. (c) Ammeter is used to measure the current through the circuit.

10. (c) $S = \dfrac{i_g G}{(i - i_g)} = \dfrac{1 \times 0.018}{10 - 1} = \dfrac{0.018}{9} = 0.002\Omega$

11. (d) Potentiometer works on null deflection method. In balance condition no current flows in secondary circuit.

12. (c) Shunt resistances $S = \dfrac{i_g G}{(i - i_g)} = \dfrac{10 \times 99}{(100 - 10)} = 11\Omega$

13. (d) By using $R = \dfrac{V}{i_g} - G \Rightarrow R = \dfrac{100}{5 \times 10^{-3}} - 5 = 19{,}995\Omega$

14. (a) Potential gradient = Change in voltage per unit length

$\therefore\ 10 = \dfrac{V_2 - V_1}{30/100} \Rightarrow V_2 - V_1 = 3\,volt$

15. (d) $R = \dfrac{V}{i_g} - G = \dfrac{5}{100/10^3} - 2 = \dfrac{5000}{100} - 2 = 48\Omega$

16. (c) $i_g = \dfrac{iS}{S + G} \Rightarrow 10 = \dfrac{50 \times 12}{12 + G} \Rightarrow 12 + G = 60 \Rightarrow G = 48\Omega$

17. (a) To convert a galvanometer into a voltmeter, a high value resistance is to be connected in series with it.

18. (b)

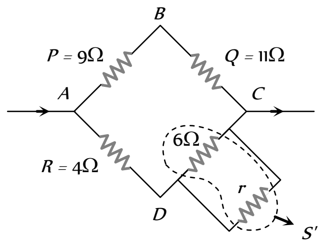
19. (c) $\dfrac{P}{Q} = \dfrac{R}{S'}$ (For balancing bridge)

$\Rightarrow S' = \dfrac{4 \times 11}{9} = \dfrac{44}{9}$

$\Rightarrow \dfrac{1}{S'} = \dfrac{1}{r} + \dfrac{1}{6}$

$\Rightarrow \dfrac{9}{44} - \dfrac{1}{6} = \dfrac{1}{r}$

$\Rightarrow r = \dfrac{132}{5} = 26.4\ \Omega$



20. (a) $r = \left(\dfrac{l_1 - l_2}{l_2}\right) R = \left(\dfrac{25}{100}\right) 2 = 0.5\ \Omega$

21. (b) The sensitivity of potentiometer can be increased by decreasing the potential gradient *i.e.* by increasing the length of potentiometer wire.

(Sensitivity $\propto \dfrac{1}{P.G.} \propto$ Length)

22. (b) In balance condition, potentiometer doesn't take the current from secondary circuit.

23. (a) Here same current is passing throughout the length of the wire, hence $V \propto R \propto l$

$\Rightarrow \dfrac{V_1}{V_2} = \dfrac{l_1}{l_2} \Rightarrow \dfrac{6}{V_2} = \dfrac{300}{50} \Rightarrow V_1 = 1\ V.$

24. (a) $S = \dfrac{i_g G}{i - i_g} = \dfrac{10 \times 0.01}{10 - 0.01} = \dfrac{10}{999} ohm$

25. (a) Ratio will be equal to the ratio of no deflection lengths *i.e.* $\dfrac{E_1}{E_2} = \dfrac{l_1}{l_2} = \dfrac{2}{3}$

26. (a) Potential gradient $= \dfrac{\text{Potential difference}}{\text{Length}}$

27. (a) Wheatstone bridge is balanced, therefore

$\dfrac{P}{Q} = \dfrac{R}{S}$ or $1 = \dfrac{10}{S} \Rightarrow S = 10\,ohm$

28. (a) When the length of potentiometer wire is increased, the potential gradient decreases and the length of previous balance point is increased.

29. (b)

30. (b)

31. (b) The actual circuit is same.

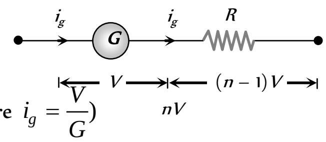
32. (b) $\because\ i_g = 10\%$ of $i = \dfrac{i}{10} \Rightarrow S = \dfrac{G}{(n-1)} = \dfrac{90}{(10-1)} = 10\Omega$

33. (b) $\dfrac{E_1}{E_2} = \dfrac{l_1 + l_2}{l_1 - l_2} = \dfrac{(8+2)}{(8-2)} = \dfrac{5}{3}$

34. (b) Suppose resistance *R* is connected in series with voltmeter as shown.

By Ohm's law

$i_g . R = (n-1)V$



$\Rightarrow R = (n-1)G$ (where $i_g = \dfrac{V}{G}$)

35. (c) Ammeter is always connected in series with circuit.

36. (c) If resistance of ammeter is *r* then

$20 = (R + r)4 \Rightarrow R + r = 5 \Rightarrow R < 5\,\Omega$

37. (b) $S = \dfrac{i_g \times G}{i - i_g} = \dfrac{10 \times 10^{-3} \times 50}{1 - 10^{-3} \times 10} = \dfrac{50}{99}\Omega$ in parallel.

38. (b) $\because\ i_g = (100 - 90)\%$ of $i = \dfrac{i}{10}$

$\Rightarrow$ Required shunt $S = \dfrac{G}{(n-1)} = \dfrac{900}{(10-1)} = 100\,\Omega$

39. (d) $R = \dfrac{V}{i_g} - G = \dfrac{100}{10 \times 10^{-3}} - 25 = 9975\,\Omega$

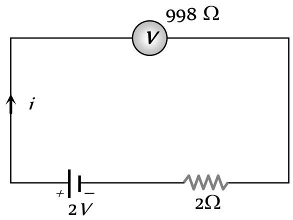
40. (b) Potential gradient $x = \dfrac{V}{L} = \dfrac{iR}{L}$

$\Rightarrow x = \frac{2}{(15+5)} \times \frac{15}{10} = \frac{3}{2000} volt/cm$

41. (a) $S = \frac{G}{\frac{i}{i_g} - 1} = \frac{25}{\frac{5}{50 \times 10^{-6}} - 1} = \frac{25}{10^5 - 1} = \frac{25}{10^5} = 2.5 \times 10^{-4} \Omega$

42. (b) In balanced Wheatstone bridge, the arms of galvanometer and cell can be interchanged without affecting the balance of the bridge.

43. (c) Error in measurement = Actual value – Measured value



Actual value = 2 V

$i = \frac{2}{998+2} = \frac{1}{500} A$

Since $E = V + ir \Rightarrow V = E - ir = 2 - \frac{1}{500} \times 2 = \frac{998}{500} V$

$\therefore$ Measured value $= \frac{998}{500} V$

$\Rightarrow$ Error $= 2 - \frac{998}{500} = 4 \times 10^{-3} volt$

44. (d) The emf of the standard cell must be greater than that of experimental cells, otherwise balance point is not obtained.

45. (a)

46. (b) In general, ammeter always reads less than the actual value because of its resistance.

47. (c) By Wheatstone bridge, $\frac{R}{80} = \frac{AC}{BC} = \frac{20}{80} \Rightarrow R = 20 \Omega$

48. (a) $E \propto l$ (balancing length)

49. (b) $r = \left(\frac{l_1 - l_2}{l_2}\right) \times R' = \left(\frac{l_1 - 2}{2}\right) \times 5$ ... (i)

and $r = \left(\frac{l_1 - 3}{3}\right) \times 10$ ... (ii)

On solving (i) and (ii) $r = 10 \Omega$

50. (a)

51. (b) In the part $c\ b\ d$,

$V_c - V_b = V_b - V_d \Rightarrow V_b = \frac{V_c + V_d}{2}$

In the part $c\ a\ d$

$V_c - V_a > V_a - V_d \Rightarrow \frac{V_c + V_d}{2} > V_a \Rightarrow V_b > V_a$

52. (c) In balance condition, no current will flow through the branch containing S.

53. (b) Resistance in parallel $S = \frac{Gi_g}{i - i_g} = \frac{50 \times 100 \times 10^{-6}}{(10 - 100 \times 10^{-6})}$

$\Rightarrow S = 5 \times 10^{-4} \Omega$

54. (b) $E = x\,l = \frac{V}{l} = \frac{iR}{L} \times l \Rightarrow E = \frac{e}{(R + R_h + r)} \times \frac{R}{L} \times l$

$\Rightarrow E = \frac{10}{(5+4+1)} \times \frac{5}{5} \times 3 = 3\ V$

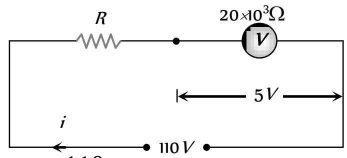
55. (a) Potential gradient $= \frac{V}{L} = \frac{iR}{L} = \frac{i\rho L}{AL} = \frac{i\rho}{A}$

$= \frac{0.2 \times 40 \times 10^{-8}}{8 \times 10^{-6}} = 10^{-2}\ V/m$

56. (b) $i_g = 2\%$ of $i = \frac{i}{50} \Rightarrow S = \frac{G}{(n-1)} = \frac{G}{(50-1)} = \frac{G}{49}$

57. (d) The resistance of an ideal voltmeter is considered as infinite.

58. (c)



Here $i = \frac{110}{20 \times 10^3 + R}$

$\because V = iR \Rightarrow 5 = \left(\frac{110}{20 \times 10^3 + R}\right) \times 20 \times 10^3$

$\Rightarrow 10^5 + 5R = 22 \times 10^5 \Rightarrow R = 21 \times \frac{10^5}{5} = 420\ K\Omega$

59. (c) Due to the negligible temperature co-efficient of resistance of constantan wire, there is no change in it's resistance value with change in temperature.

60. (d) The resistance of voltmeter is too high, so that it draws negligible current from the circuit, hence potential drop in the external circuit is also negligible.

61. (a) By connecting a series resistance

$R = \frac{V}{i_g} - G = \frac{10}{1} - 7 = 3 \Omega$

62. (a) Since potential difference for full length of wire = 2 V

$\therefore$ P.D. per unit length of wire $= \frac{2}{4} = 0.5 \frac{V}{m}$

63. (d) $\frac{X}{1} = \frac{20}{80} \Rightarrow X = \frac{1}{4} \Omega = 0.25 \Omega$.

64. (a) Reading of galvanometer remains same whether switch S is open or closed, hence no current will flow through the switch *i.e.* R and G will be in series and same current will flow through them. $I_R = I_G$.

65. (d) Pressing the key does not disturb current in all resistances as the bridge is balanced. Therefore, deflection in the galvanometer in whatever direction it was, will stay.

66. (b) $i_g S = (i - i_g) G \Rightarrow i_g (S + G) = iG$

$\Rightarrow \frac{i_g}{i} = \frac{G}{S+G} = \frac{8}{2+8} = 0.8$

67. (a) Potential gradient $x = \frac{e}{(R + R_h + r)} \cdot \frac{R}{L}$

$\Rightarrow x = \frac{2.5}{(20+80+0)} \times \frac{20}{10} = 5 \times 10^{-5} \frac{V}{mm}$

68. (b) Given $i_g = 2mA,\ i = 20mA, G = 180\Omega$

$\frac{i_g}{i} = \frac{S}{G+S} \Rightarrow 180 + S = 10S \Rightarrow S = \frac{180}{9} = 20\Omega$

69. (c) Resistance of shunted ammeter $= \frac{GS}{G+S}$

Also $\frac{i}{i_g} = 1 + \frac{G}{S} \Rightarrow \frac{GS}{G+S} = \frac{i_g.G}{i}$

$\Rightarrow \frac{GS}{G+S} = \frac{0.05 \times 120}{10} = 0.6\ \Omega$

70. (c) $r = \frac{(l_1 - l_2)}{l_2} \times R' = \left(\frac{60-50}{50}\right) \times 6 = 1.2\,\Omega$

71. (d) By using $\frac{i}{i_g} = 1 + \frac{G}{S}$

$\Rightarrow \frac{i}{100 \times 10^{-3}} = 1 + \frac{1000}{S} \Rightarrow S = \frac{1000}{9} = 111\Omega$

72. (c) Potential gradient $x = \frac{V}{L} = \frac{e}{(R + R_h + r)} \cdot \frac{R}{L}$

$\Rightarrow 2.2 \times 10^{-3} = \frac{2.2}{(10 + R_h)} \times 1 \Rightarrow R' = 990\,\Omega$

73. (a) $\frac{i}{i_g} = \frac{G+S}{S} \Rightarrow \frac{i_g}{i} = \frac{S}{G+S} = \frac{2.5}{27.5} = \frac{1}{11}$

74. (c) Total resistance of the circuit $= \frac{80}{2} + 20 = 60\,\Omega$

$\Rightarrow$ Main current $i = \frac{2}{60} = \frac{1}{30} A$

Combination of voltmeter and 80Ω resistance is connected in series with 20Ω, so current through 20Ω and this combination will be same $= \frac{1}{30} A$.

Since the resistance of voltmeter is also 80Ω, so this current is equally distributed in 80Ω resistance and voltmeter (*i.e.* $\frac{1}{60}$ *A* through each)

P.D. across 80Ω resistance $= \frac{1}{60} \times 80 = 1.33\ V$

75. (a) Potential gradient $x = \frac{V}{L} = \frac{iR}{L} = \frac{i\left(\frac{\rho L}{A}\right)}{L} = \frac{i\rho}{A}$

76. (d) Here $n = \frac{10}{2} = 5$

$\therefore\ R = (n-1)G = (5-1)2000 = 8000\,\Omega$

77. (b) $r = \left(\frac{l_1 - l_2}{l_1}\right) R = 0.5\,\Omega$.

78. (a)

79. (b) $V = i.R. = \frac{e}{(R + R_h + r)}.R \Rightarrow 10^{-3} = \frac{2}{(10 + R + r)} \times 10$

$\Rightarrow R = 19{,}989\Omega$.

80. (a)

81. (c) $2R > 20 \Rightarrow R > 10\Omega$.

82. (c) $\frac{i}{i_g} = 1 + \frac{G}{S} \Rightarrow \frac{4}{1} = 1 + \frac{R}{S} \Rightarrow S = \frac{R}{3}$.

83. (a) When ammeter is connected in parallel to the circuit, net resistance of the circuit decreases. Hence more current is drawn from the battery, which damages the ammeter.

84. (a) $r = \left(\frac{l_1 - l_2}{l_2}\right) \times R' \Rightarrow r = \left(\frac{55-50}{50}\right) \times 10 = 1\Omega$.

85. (b) $R = \frac{V}{i_g} - G = \frac{18}{3 \times 10^{-3}} - 12 = 5988\,\Omega$

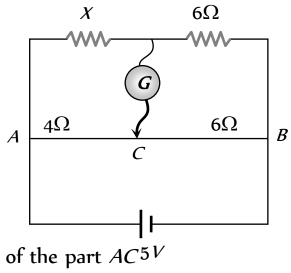
86. (d)

87. (c) $R = \frac{V}{i_g} - G = \frac{6}{6 \times 10^{-3}} - 25 = 975\Omega$ (In series).

88. (d) $i_g = i\frac{S}{G+S} \Rightarrow 0.01 = 10\frac{S}{25+S}$

$\Rightarrow 1000S = 25 + S \Rightarrow S = \frac{25}{999}\Omega$.

89. (c)



Resistance of the part *AC*

$R_{AC} = 0.1 \times 40 = 4\Omega$ and $R_{CB} = 0.1 \times 60 = 6\Omega$

In balanced condition $\frac{X}{6} = \frac{4}{6} \Rightarrow X = 4\Omega$

Equivalent resistance $R_{eq} = 5\Omega$ so current drawn from battery $i = \frac{5}{5} = 1A$.

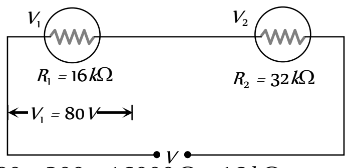
90. (a) $(R+G)i_g = V \Rightarrow (R+G) = \frac{V}{i_g}$

$= \frac{3}{30 \times 16 \times 10^{-6}} = 6.25k\Omega$

$\therefore$ Value of R is nearly equal to $6k\Omega$

This is connected in series in a voltmeter.

91. (d)



$R_1 = 80 \times 200 = 16000\,\Omega = 16\,k\Omega$

Current flowing through V_1 = Current flowing through V_2 = $\frac{80}{16 \times 10^3} = 5 \times 10^{-3} A$.

So, potential differences across V_2 is

$V_2 = 5 \times 10^{-3} \times 32 \times 10^3 = 160$ volt

Hence, line voltage $V = V_1 + V_2 = 80 + 160 = 240V$.

92. (d) $V = xl \Rightarrow iR = xl$

$\Rightarrow i \times 10 = \left(\frac{2 \times 10^{-3}}{10^{-2}}\right) \times 50 \times 10^{-2} = 0.1$

$\Rightarrow i = 10 \times 10^{-3} A = 10\,mA$.

93. (d) $E = \frac{e}{(R + R_h + r)}\frac{R}{L} \times l = \frac{2}{(10 + 40 + 0)} \times \frac{10}{1} \times 0.4 = 0.16V$.

94. (c) $\frac{i}{i_g} = 1 + \frac{G}{S} \Rightarrow \frac{5}{2} = 1 + \frac{12}{S} \Rightarrow S = 8\Omega$. (In parallel).

95. (d) $\frac{i_g}{i} = \frac{S}{G+S} \Rightarrow \frac{5}{100} = \frac{S}{G+S} \Rightarrow S = \frac{G}{19}$

96. (a) $R = G(n-1) = 50 \times 10^3(3-1) = 10^5\,\Omega$.

97. (c) $\frac{E_1}{E_2} = \frac{l_1 + l_2}{l_1 - l_2} = \frac{58+29}{58-29} = \frac{3}{1}$

98. (a) $R = \frac{V}{i_g} - G = \frac{10}{10 \times 10^{-3}} - 1 = 999\Omega$.

99. (d) For conversion of galvanometer (of resistances) into voltmeter, a resistance R is connected in series.

$\therefore\ i_g = \frac{V_1}{R+G}$ and $i_g = \frac{V_2}{2R+G}$

$\Rightarrow \frac{V_1}{R+G} = \frac{V_2}{2R+G} \Rightarrow \frac{V_2}{V_1} = \frac{2R+G}{R+G} = \frac{2(R+G)-G}{(R+G)}$

$= 2 - \frac{G}{(R+G)} \Rightarrow V_2 = 2V_1 - \frac{V_1 G}{(R+G)} \Rightarrow V_2 < 2V_1$

100. (d) If the voltmeter is ideal then given circuit is an open circuit, so reading of voltmeter is equal to the e.m.f. of cell *i.e.*, 6 *V*.

101. (c) $\frac{i_g}{i} = \frac{S}{G+S} = \frac{4}{36+4} = \frac{1}{10}$ *i.e.* 10%.

102. (d) After connecting a resistance R in parallel with voltmeter its effective resistance decreases. Hence less voltage appears across it *i.e.* V will decreases. Since overall resistance decreases so more current will flow *i.e.* A will increase.

103. (c) Potential gradient $x = \frac{e}{(R + R_h + r)} \cdot \frac{R}{L}$

$\Rightarrow \frac{10^{-3}}{10^{-2}} = \frac{2}{(3 + R_h + 0)} \times \frac{3}{1} \Rightarrow R_h = 57\Omega$.

104. (c) $\frac{i}{i_g} = 1 + \frac{G}{S} \Rightarrow \frac{1}{10^{-3}} = 1 + \frac{20}{S} \Rightarrow S = \frac{20}{999} \approx 0.02\Omega$.

105. (a) Resistance of voltmeter should be high.

106. (c) If ammeter is used in place of voltmeter (*i.e.* in parallel) it may damage due to large current in circuit. Hence to control this large amount of current a high resistance must be connected in series.

107. (c) Potential gradient $x = \frac{e}{(R + R_h + r)} \cdot \frac{R}{L}$

$= \frac{3}{(20+10+0)} \times \frac{20}{10} = 0.2$

108. (d) $\frac{E_1}{E_2} = \frac{l_1 + l_2}{l_1 - l_2} = \frac{(6+2)}{(6-2)} = \frac{2}{1}$

109. (c) Manganin or constantan are used for making the potentiometer wire.

110. (a)

111. (a) $\frac{i}{i_g} = 1 + \frac{G}{S} \Rightarrow \frac{i.G}{V_g} = 1 + \frac{G}{S} \Rightarrow \frac{100 \times 10^{-3} \times 40}{800 \times 10^{-3}} = 1 + \frac{40}{S}$

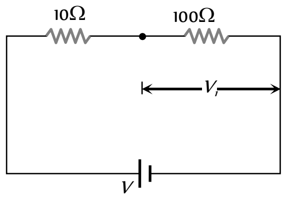
$\Rightarrow S = 10\Omega$.

112. (a) $i_g = i\frac{S}{G+S} \Rightarrow 10 \times 10^{-3} = \frac{S}{100+S} \times 100 \times 10^{-3}$

$90\,S = 1000 \Rightarrow S = \frac{1000}{90} = 11.11\,\Omega$.

113. (c) Before connecting the voltmeter, potential difference across 100Ω resistance

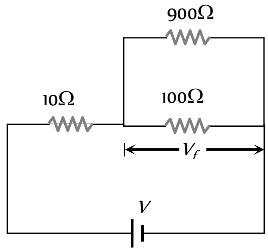
$V_i = \frac{100}{(100+10)} \times V = \frac{10}{11} V$



Finally after connecting voltmeter across 100Ω
Equivalent resistance
$\frac{100 \times 900}{(100+900)} = 90\Omega$

Final potential difference

$V_f = \frac{90}{(90+10)} \times V = \frac{9}{10} V$



% error = $\frac{V_i - V_f}{V_i} \times 100$

$= \frac{\frac{10}{11}V - \frac{9}{10}V}{\frac{10}{11}V} \times 100 = 1.0$.

114. (b) Potential gradient = $\frac{e.R}{(R+r).L} = \frac{10 \times 3}{(3+3) \times 5}$.

$= 1 V/m = 10\, mV/cm$.

115. (c) $\frac{i}{i_g} = 1 + \frac{G}{S} \Rightarrow \frac{1}{10^{-5}} = 1 + \frac{100}{S} \Rightarrow S \approx \frac{100}{10^5} = 10^{-3}\Omega$.

116. (d) $\frac{i_g}{i} = \frac{S}{G+S} = \frac{4}{36+4} = \frac{4}{40} = \frac{1}{10}$

117. (a) $i = \frac{V}{R} \Rightarrow 2 = \frac{6}{\frac{6 \times 3}{6+3} + R} = \frac{6}{2+R} \Rightarrow R = 1\ \Omega$.

118. (b) $i_g = i\frac{S}{G+S} \Rightarrow \frac{0.01}{10} = \frac{5}{50+S} \Rightarrow S = \frac{50}{999} = 0.05\Omega$.

119. (d) $S = \left(\frac{100-l}{l}\right).R$

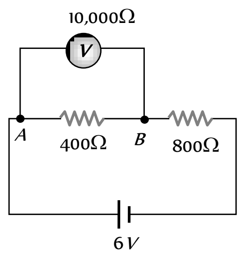
Initially, $30 = \left(\frac{100-l}{l}\right) \times 10 \Rightarrow l = 25cm$

Finally, $10 = \left(\frac{100-l}{l}\right) \times 30 \Rightarrow l = 75cm$

So, shift = 50*cm*.

120. (c) Potential gradient (x) = $\frac{i\rho}{A} = \frac{0.1 \times 10^{-7}}{10^{-6}} = 10^{-2}\ V/m$

121. (d) Before connecting voltmeter potential difference across 400Ω resistance is



$$V_i = \frac{400}{(400+800)} \times 6 = 2V$$

After connecting voltmeter equivalent resistance between A and $B = \frac{400 \times 10{,}000}{(400+10{,}000)} = 384.6\Omega$

Hence, potential difference measured by voltmeter $V_f = \frac{384.6}{(384.6+800)} \times 6 = 1.95V$

Error in measurement = $V_i - V_f = 2 - 1.95$ = 0.05 V.

122. (c) $\frac{i}{i_g} = 1 + \frac{G}{S} \Rightarrow \frac{5}{0.05} = 1 + \frac{50}{S}$

$\Rightarrow S = \frac{50}{99} = \frac{\rho \times l}{A} \Rightarrow l = \frac{50}{99} \times \frac{2.97 \times 10^{-2} \times 10^{-4}}{5 \times 10^{-7}} = 3m$.

123. (a) $\frac{i}{i_g} = 1 + \frac{G}{S} \Rightarrow \frac{10}{1} = 1 + \frac{0.81}{S} \Rightarrow S = 0.09\Omega$.

124. (a) From the principle of potentiometer $V \propto l$

$\Rightarrow \frac{V}{E} = \frac{l}{L}$; where V = emf of battery, E = emf of standard cell, L = Length of potentiometer wire

$V = \frac{El}{L} = \frac{30E}{100}$.

125. (b) $E = \frac{e}{(R+R_h+r)} \cdot \frac{R}{L} \times l$

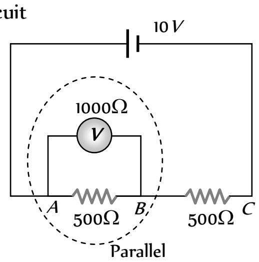
$\Rightarrow 10 \times 10^{-3} = \frac{2}{(10+R+0)} \times \frac{10}{1} \times 0.4 \Rightarrow R = 790\Omega$

126. (b) Using $r = R\left(\frac{l_1}{l_2} - 1\right) = 2\left(\frac{150}{100} - 1\right) = 1\Omega$

127. (d) Resistance between A and $B = \frac{1000 \times 500}{(1500)} = \frac{1000}{3}$

So, equivalent resistance of the circuit

$R_{eq} = 500 + \frac{1000}{3} = \frac{2500}{3}$



$\therefore$ Current drawn from the cell

$i = \frac{10}{(2500/3)} = \frac{3}{250}A$

Reading of voltmeter *i.e.*

potential difference across $AB = \frac{3}{250} \times \frac{1000}{3} = 4\ V$

128. (d) $i_g = \frac{i}{10} \Rightarrow$ Required shunt $S = \frac{G}{(n-1)} = \frac{90}{(10-1)} = 10\ \Omega$

129. (b) $i_g = \frac{50}{10 \times 10^{-3}} - 40 = 4960\ \Omega$

130. (c) Post office box is based on the principle of Wheatstone's bridge

131. (d) Full deflection current $i_g = 25 \times 4 \times 10^{-4} = 100 \times 10^{-4} A$

Using $R = \frac{V}{I_g} - G = \frac{25}{100 \times 10^{-4}} - 50 = 2450\ \Omega$ in series.

132. (a) In balancing condition, $\frac{R_1}{R_2} = \frac{l_1}{l_2} = \frac{l_1}{100 - l_1}$

$\Rightarrow \frac{X}{Y} = \frac{20}{80} = \frac{1}{4}$ .....(i)

and $\frac{4X}{Y} = \frac{l}{100-l}$ .....(ii)

$\Rightarrow \frac{4}{4} = \frac{l}{100-l} \Rightarrow l = 50\ cm$

133. (c)

134. (d) $S = \left(\frac{i_g}{i - i_g}\right) \times G = \frac{100 \times 10^{-6}}{(10 \times 10^{-3} - 100 \times 10^{-6})} \times 50 \approx 0.5\ \Omega$ (in parallel)

135. (d) $E = \frac{e}{(R+R_h+r)} \cdot \frac{R}{L} \times l \Rightarrow 0.4 = \frac{5}{(5+45+0)} \times \frac{5}{10} \times l$

$\Rightarrow l = 8\ m$

136. (a) Potential difference per unit length $= \frac{V}{L} = \frac{2}{4} = 0.5\ V/m$

137. (a)

138. (b) $r = R\left(\frac{l_1}{l_2} - 1\right) = 2\left(\frac{240}{120} - 1\right) = 2\Omega$

139. (d) $E = \frac{V}{l}$; E is constant (volt. gradient).

$\Rightarrow \frac{V_1}{l_1} = \frac{V_2}{l_2} \Rightarrow \frac{1.1}{140} = \frac{V}{180} \Rightarrow V = \frac{180 \times 1.1}{140} = 1.41V$

140. (a) $I_G \times G = (I - I_G)S \Rightarrow I = \left(1 + \frac{G}{S}\right)I_G \Rightarrow I = 100.1\ mA$

141. (c) Let S be larger and R be smaller resistance connected in two gaps of meter bridge.

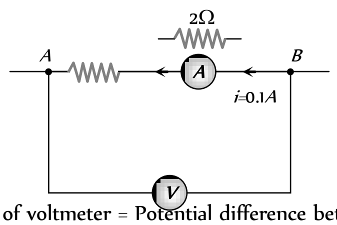
$\therefore S = \left(\frac{100-l}{l}\right)R = \frac{100-20}{20}R = 4R$ .....(i)

When 15Ω resistance is added to resistance R, then

$S = \left(\frac{100-40}{40}\right)(R+15) = \frac{6}{4}(R+15)$ .... (ii)

From equations (i) and (ii) $R = 9\Omega$

142. (a) According to following figure



Reading of voltmeter = Potential difference between A and $B = i(R+2) \Rightarrow 12 = 0.1\ (R+2) \Rightarrow R = 118\ \Omega$.

143. (a) Potential gradient $x = \frac{e}{(R+R_h+r)} \cdot \frac{R}{L}$

$\Rightarrow \frac{0.2 \times 10^{-3}}{10^{-2}} = \frac{2}{(R+490+0)} \times \frac{R}{1} \Rightarrow R = 4.9\ \Omega$.

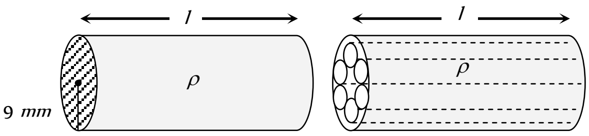
Critical Thinking Questions

1. (a) Initially : Resistance of given cable

$R = \rho \dfrac{l}{\pi \times (9 \times 10^{-3})^2}$ ....(i)

Finally : Resistance of each insulated copper wire is

$R' = \rho \dfrac{l}{\pi \times (3 \times 10^{-3})^2}$. Hence equivalent resistance of cable $R_{eq} = \dfrac{R'}{6} = \dfrac{1}{6} \times \left(\rho \dfrac{l}{\pi \times (3 \times 10^{-3})^2}\right)$ ....(ii)



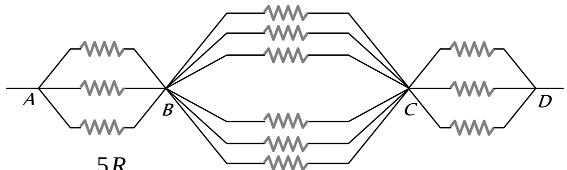
On solving equation (i) and (ii) we get $R = 7.5\ \Omega$

2. (a) $\dfrac{R_A}{R_B} = \left(\dfrac{r_B}{r_A}\right)^4 \Rightarrow \dfrac{R_A}{R_B} = \left(\dfrac{1}{2}\right)^4 = \dfrac{1}{16} \Rightarrow R_B = 16R_A$

When R_A and R_B are connected in parallel then equivalent resistance $R_{eq} = \dfrac{R_A R_B}{(R_A + R_B)} = \dfrac{16}{17} R_A$

If $R_A = 4.25\Omega$ then $R_{eq} = 4\Omega$ *i.e.* option (a) is correct.

3. (c) The given circuit can be simplified as follows



$\therefore R_{AD} = \dfrac{5R}{6}$

4. (c) Suppose *n* resistors are used for the required job. Suppose equivalent resistance of the combination is *R'* and according to energy conservation it's current rating is *i'*.

Energy consumed by the combination = *n* × (Energy consumed by each resistance)

$\Rightarrow i'^2 R' = n \times i^2 R \Rightarrow n = \left(\dfrac{i'}{i}\right)^2 \times \left(\dfrac{R'}{R}\right) = \left(\dfrac{4}{1}\right)^2 \times \left(\dfrac{5}{10}\right) = 8$

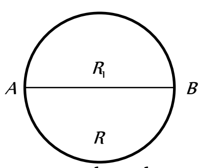
5. (c) Resistance across $AB = \dfrac{1}{R'} = \dfrac{1}{R} + \dfrac{1}{R} + \dfrac{1}{R_1}$

$R_1 = 2 \times 10^{-6}\Omega$

and $R = \pi \times 1 \times 10^{-6}\Omega$

On solving,

$R' = 0.88 \times 10^{-6}\Omega$



6. (b) No current flows through the capacitor branch in steady state. Total current supplied by the battery

$i = \dfrac{6}{2.8 + 1.2} = \dfrac{3}{2}$.

Current through 2 Ω resistor $= \dfrac{3}{2} \times \dfrac{3}{5} = 0.9A$

7. (d) At time $t = 0$ *i.e.* when capacitor is charging, current $i = \dfrac{2}{1000} = 2mA$

When capacitor is full charged, no current will pass through it, hence current through the circuit $i = \dfrac{2}{2000} = 1mA$

8. (d) Current in the bulb $= \dfrac{P}{V} = \dfrac{4.5}{1.5} = 3A$

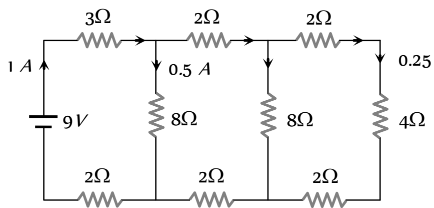
Current in 1 Ω resistance $= \dfrac{1.5}{1} = 1.5A$

Hence total current from the cell $i = 3 + 1.5 = 4.5A$

By using $E = V + ir \Rightarrow E = 1.5 + 4.5 \times (2.67) = 13.5V$

9. (d) Equivalent resistance of the circuit $R = 9\Omega$

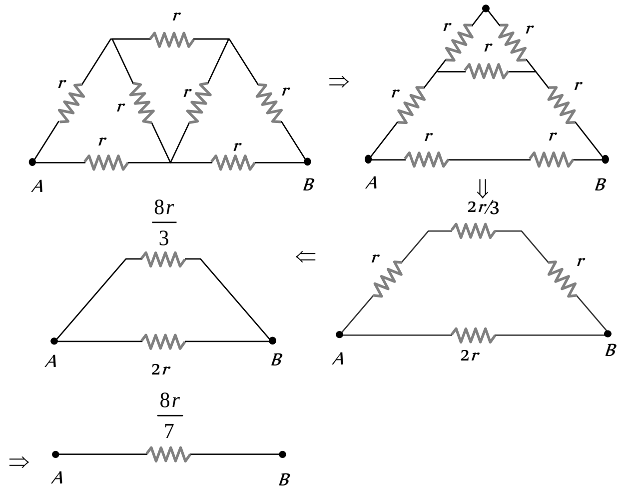
$\therefore$ Main current $i = \dfrac{V}{R} = \dfrac{9}{9} = 1A$



After proper distribution, the current through 4Ω resistance is 0.25 *A*.

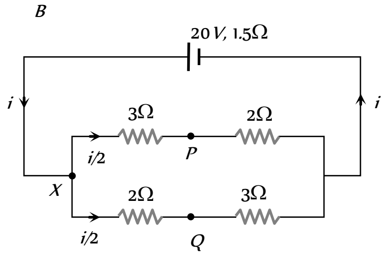
10. (b) Maximum number of resistance $= 2^{n-1} = 2^{3-1} = 4$

11. (d) The given circuit can be simplified as follows.



12. (d) $R_{eq} = \dfrac{5}{2}\Omega$

$i = \dfrac{20}{\dfrac{5}{2} + 1.5} = 5A$



Potential difference between *X* and *P*,

$V_X - V_P = \left(\dfrac{5}{2}\right) \times 3 = 7.5V$ ....(i)

$V_X - V_Q = \frac{5}{2} \times 2 = 5V$ ...(ii)

On solving (i) and (ii) $V_P - V_Q = -2.5\, volt; V_Q > V_P$.

Short Trick : $(V_P - V_Q) = \frac{i}{2}(R_2 - R_1) = \frac{5}{2}(2-3) = -2.5$

$\Rightarrow V_Q > V_P$

13. (c) $R_{t_1} = R_1(1+\alpha_1 t)$ and $R_{t_2} = R_2(1+\alpha_2 t)$

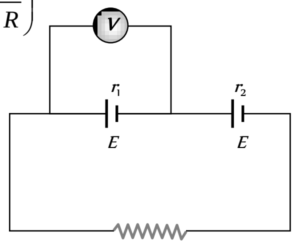
Also $R_{eq.} = R_{t_1} + R_{t_2} \Rightarrow R_{eq} = R_1 + R_2 + (R_1\alpha_1 + R_2\alpha_2)t$

$\Rightarrow R_{eq} = (R_1 + R_2)\left\{1 + \left(\frac{R_1\alpha_1 + R_2\alpha_2}{R_1 + R_2}\right).t\right\}$

So $\alpha_{eff} = \frac{R_1\alpha_1 + R_2\alpha_2}{R_1 + R_2}$

14. (b) Let the voltage across any one cell is V, then

$V = E - ir = E - r_1\left(\frac{2E}{r_1 + r_2 + R}\right)$



But $V = 0$

$\Rightarrow E - \frac{2Er_1}{r_1 + r_2 + R} = 0$

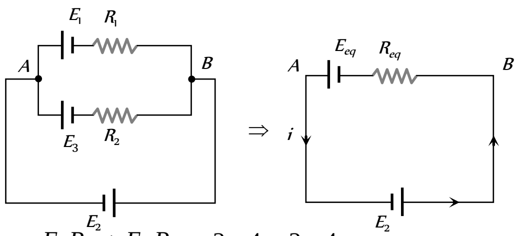
$\Rightarrow r_1 + r_2 + R = 2r_1$

$\Rightarrow R = r_1 - r_2$

15. (b) Emf $E = 5V$, Internal resistance $r = \frac{5}{10} = 0.5\Omega$

Current through the resistance $i = \frac{5}{(2+0.5)} = 2A$

16. (b) The given circuit can be redrawn

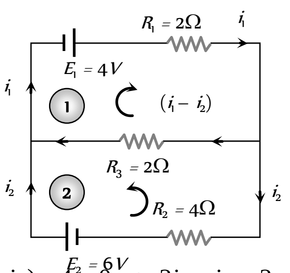


$E_{eq} = \frac{E_1R_2 + E_2R_1}{R_1 + R_2} = \frac{2\times4 + 2\times4}{4+4} = 2V$ and

$R_{eq} = \frac{4}{2} = 2\Omega$. Current $i = \frac{2+2}{2} = 2A$ from A to B through E.

17. (b) Applying Kirchhoff's law for the loops (1) and (2) as shown in figure

For loop (1)



$-2i_1 - 2(i_1 - i_2) + 4 = 0 \Rightarrow 2i_1 - i_2 = 2$ ...(i)

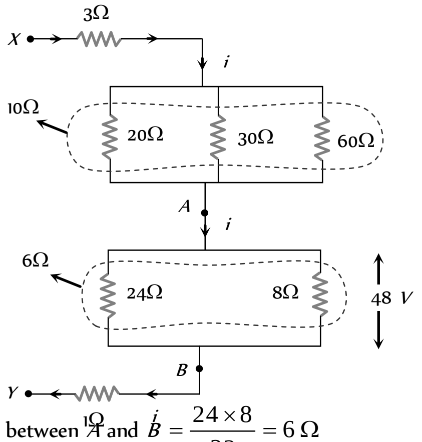
For loop (2)

$-2(i_1 - i_2) + 4i_2 - 6 = 0 \Rightarrow -i_1 + 3i_2 = 3$ ...(ii)

On solving equation (i) and (ii) $i_1 = 1.8A$.

18. (b) To convert a galvanometer into an ammeter, a shunt $S = \frac{I_g}{I - I_g}G$ is connected in parallel with it. To convert a galvanometer into a voltmeter, a resistance $R = \frac{V}{I_g} - G$ is connected in series with it.

19. (a) The given circuit can be redrawn as follows



Resistance between A and $B = \frac{24\times8}{32} = 6\,\Omega$

Current between A and B = Current between X and Y $= i = \frac{48}{6} = 8A$

Resistance between X and $Y = (3+10+6+1) = 20\,\Omega$

$\Rightarrow$ Potential difference between X and $Y = 8 \times 20 = 160\ V$

20. (d) $R_1 + R_2 = R_1(1+\alpha t) + R_2(1-\beta t)$

$\Rightarrow R_1 + R_2 = R_1 + R_2 + R_1\alpha t - R_2\beta t \Rightarrow \frac{R_1}{R_2} = \frac{\beta}{\alpha}$

21. (d) Current density of drifting electrons $j = nev$

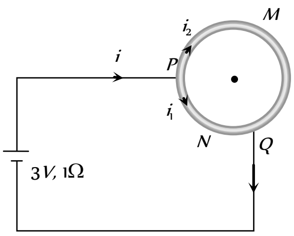
$n = 5\times10^7 cm^{-3} = 5\times10^7 \times 10^6 m^{-3}$.

$v = 0.4ms^{-1}, e = 1.6\times10^{-19}C \Rightarrow j = 3.2\times10^{-6} Am^{-2}$

Current density of ions = $(4 - 3.2) \times 10^{-6} = 0.8\times10^{-6}\ \frac{A}{m^2}$

This gives v for ions = 0.1 ms^{-1}.

22. (a) In the following figure



Resistance of part PNQ;

$R_1 = \frac{10}{4} = 2.5\Omega$ and

Resistance of part PMQ;

$R_2 = \frac{3}{4}\times10 = 7.5\Omega$

$R_{eq} = \frac{R_1R_2}{R_1+R_2} = \frac{2.5\times7.5}{(2.5+7.5)} = \frac{15}{8}\Omega$.

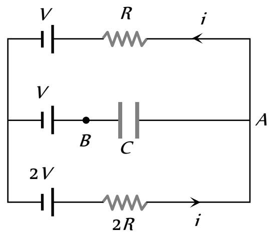
Main Current $i = \frac{3}{\frac{15}{8}+1} = \frac{24}{23}A$

So, $i_1 = i\times\left(\frac{R_2}{R_1+R_2}\right) = \frac{24}{23}\times\left(\frac{7.5}{2.5+7.5}\right) = \frac{18}{23}A$

and $i_2 = i - i_1 = \frac{24}{23} - \frac{18}{23} = \frac{6}{23}A$.

23. (c) As I is independent of R_6, no current flows through R_6 this requires that the junction of R_1 and R_2 is at the same potential as the junction of R_3 and R_4. This must satisfy the condition $\frac{R_1}{R_2} = \frac{R_3}{R_4}$, as in the Wheatstone bridge.

24. (c) Moving anticlockwise from A



$-iR - V + 2V - 2iR = 0$

or $3iR = V$ or $i = \frac{V}{3R}$

$V_A - V_B = iR + V - V = iR$

$\Rightarrow$ Potential drop across $C = \frac{V}{3}$

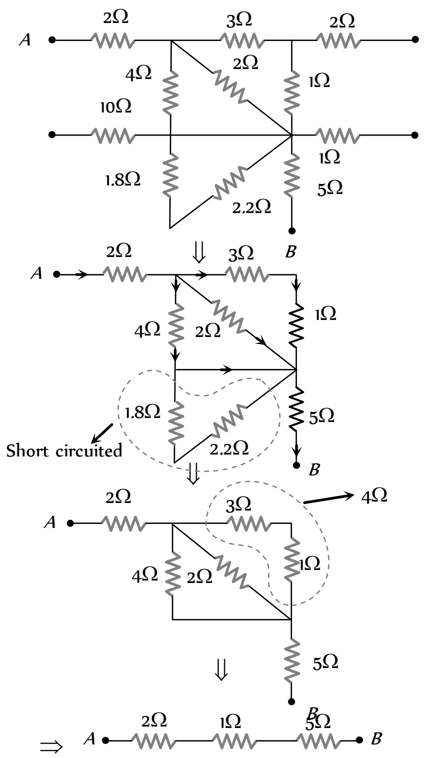
25. (b) Let R and m be the resistance and mass of the first wire, then the second wire has resistance $2R$ and mass $2m$. Let E = emf of each cell, S = specific heat capacity of the material of the wire.

For the first wire, current $i_1 = \frac{3E}{R}$ and $i_1^2 Rt = mS\Delta T$

For the second wire, $i_2 = \frac{NE}{2R}$ and $i_2^2(2R)t = 2mS\Delta T$.

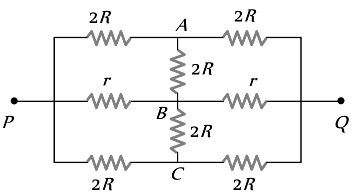
Thus, $i_1 = i_2$ or $N = 6$.

26. (b)



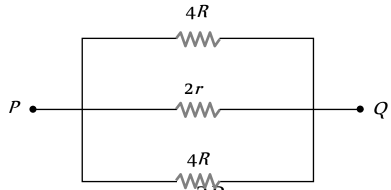
$R_{AB} = 8\Omega$.

27. (a)



In a circuit, any circuit element placed between points at the same potential can be removed, without affecting the rest of the circuit. Here, by symmetry, points A, B and C are at same potential, for any potential difference between P and Q.

The circuit can therefore be reduced as shown below



Effective resistance $R_{eq} = \frac{2Rr}{R+r}$.

28. (d) Potential difference between A and B

$V_A - V_B = 1 \times 1.5$

$\Rightarrow V_A - 0 = 1.5V \Rightarrow V_A = 1.5V$

Potential difference between B and C

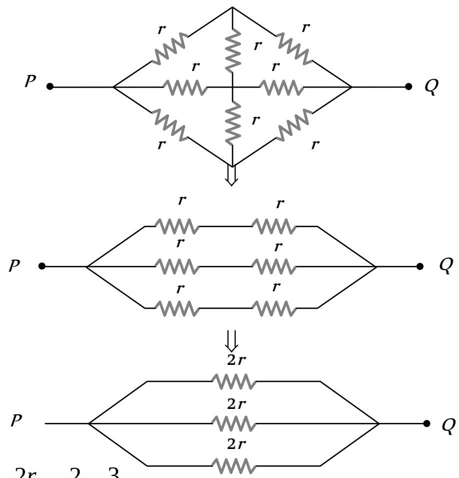
$V_B - V_C = 1 \times 2.5 = 2.5V$

$\Rightarrow 0 - V_C = 2.5V \Rightarrow V_C = -2.5V$

Potential difference between C and D

$V_C - V_D = -2V \Rightarrow -2.5 - V_D = -2 \Rightarrow V_D = -0.5V$.

29. (b) The given circuit can be simplifies as follows



$R' = \frac{2r}{3} = \frac{2}{3} \times \frac{3}{2} = 1\Omega$.

30. (b) $dQ = Idt \Rightarrow Q = \int_{t=2}^{t=3} Idt = \left[2\int_2^3 tdt + 3\int_2^3 t^2 dt\right]$

$= \left[t^2\right]_2^3 + \left[t^3\right]_2^3 = (9-4) + (27-8) = 5 + 19 = 24C$.

31. (d) $i = \frac{E_1 + E_2 + E_3 + ... + E_n}{(r_1 + r_2 + r_3 + ... + r_n)}$

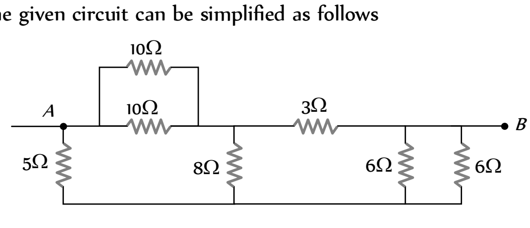
$= \frac{1.5(r_1 + r_2 + r_3 + ... + r_n)}{(r_1 + r_2 + r_3 + ... + r_n)} = 1.5A$.

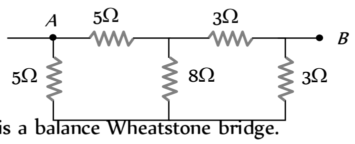
32. (a) Balancing length is independent of the cross sectional area of the wire.

33. (a) $\frac{R_1}{R_2} = \frac{(1+\alpha t_1)}{(1+\alpha t_2)} \Rightarrow \frac{10}{R_2} = \frac{(1+5\times10^{-3}\times20)}{(1+5\times10^{-3}\times120)} \Rightarrow R_2 \approx 15\Omega$

Also $\frac{i_1}{i_2} = \frac{R_2}{R_1} \Rightarrow \frac{30}{i_2} = \frac{15}{10} \Rightarrow i_2 = 20\,mA$

34. (b) The given circuit can be simplified as follows

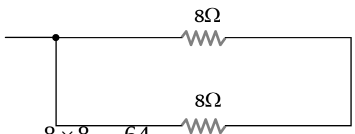




$\Rightarrow$

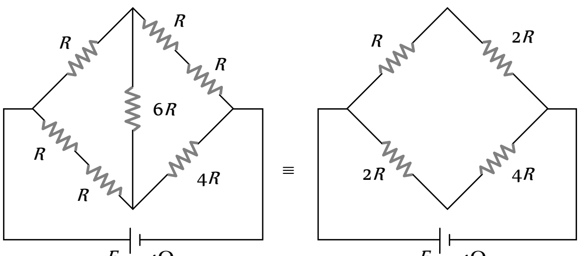
Now it is a balance Wheatstone bridge.

So,



$\Rightarrow R_{AB} = \frac{8 \times 8}{8+8} = \frac{64}{16} = 4\Omega$

35. (c) The equivalent network is

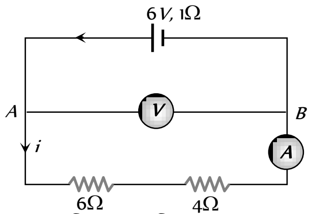


Clearly, the network of resistances is a balanced Wheatstone bridge. So R_{AB} is given by

$$\frac{1}{R_{AB}} = \frac{1}{3R} + \frac{1}{6R} = \frac{2+1}{6R} = \frac{1}{2R} \Rightarrow R_{AB} = 2R$$

For maximum power transfer $2R = 4\Omega \Rightarrow R = \frac{4}{2} = 2\Omega$

36. (c) The given circuit can be redrawn as follows



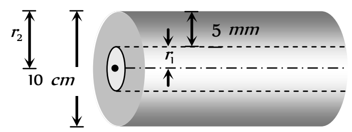
Current $i = \frac{6}{6+4+1} = \frac{6}{11} A$

P.D. between A and B, $V = \frac{6}{11} \times 10 = \frac{60}{11} V$.

37. (a) By using $R = \rho . \frac{l}{A}$; here $A = \pi(r_2^2 - r_1^2)$

Outer radius r_2 = 5cm

Inner radius r_1 = 5 – 0.5 = 4.5 cm



So $R = 1.7 \times 10^{-8} \times \frac{5}{\pi\{(5 \times 10^{-2})^2 - (4.5 \times 10^{-2})^2\}}$

$= 5.6 \times 10^{-5}\Omega$

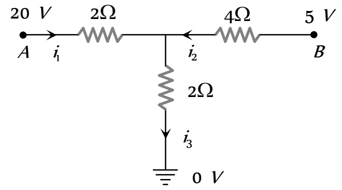
38. (a) Here $R_{XWY} = \frac{R}{2\pi r} \times (r\alpha) = \frac{R\alpha}{2\pi}$ $\left(\because \alpha = \frac{l}{r}\right)$

and $R_{XZY} = \frac{R}{2\pi r} \times r(2\pi - \alpha) = \frac{R}{2\pi}(2\pi - \alpha)$

$$R_{eq} = \frac{R_{XWY} R_{XZY}}{R_{XWY} + R_{XZY}} = \frac{\frac{R\alpha}{2\pi} \times \frac{R}{2\pi}(2\pi - \alpha)}{\frac{R\alpha}{2\pi} + \frac{R(2\pi - \alpha)}{2\pi}} = \frac{R\alpha}{4\pi^2}(2\pi - \alpha)$$

39. (d) Battery is short circuited so potential difference is zero.

40. (a) Let V be the potential of the junction as shown in figure. Applying junction law, we have



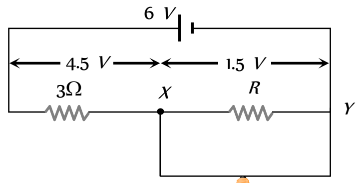
or $\frac{20 - V}{2} + \frac{5 - V}{4} = \frac{V - 0}{2}$

or 40 – 2V + 5 – V = 2V or 5V = 45 $\Rightarrow$ V = 9V

$\therefore \; i_3 = \frac{V}{2} = 4.5A$

41. (a) $E = xl = i\rho l \Rightarrow i = \frac{E}{\rho l} = \frac{E}{\rho l} = \frac{2.4 \times 10^{-3}}{1.2 \times 5} = 4 \times 10^{-4} A$.

42. (b) When bulb glows with full intensity, then voltage across it will be 1.5 V and voltage across 3 Ω resistance will be 4.5 V.



Current through 3 Ω resistance $i = \frac{4.5}{3} = 1.5A$

Same current will flow between X and Y

So $V_{XY} = iR_{XY} \Rightarrow 1.5 = 1.5R_{XY} \Rightarrow R_{XY} = 1\Omega$

43. (a) In figure (b) current through $R_2 = i - \frac{i}{10} = \frac{9i}{10}$

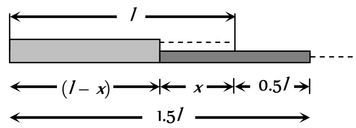
Potential difference across R_2 = Potential difference across R

$\Rightarrow R_2 \times \frac{9}{10} i = R \times \frac{i}{10}$ i.e. $R_2 = \frac{R}{9} = \frac{11}{9}\Omega$

$$R_{eq} = \frac{R_2 \times R}{(R_2 + R)} = \frac{\frac{11}{9} \times \frac{11}{1}}{\frac{11}{9} + \frac{11}{1}} = \frac{11}{10}\Omega$$

Total circuit resistance $= \frac{11}{10} + R_1 = R = 11 \Rightarrow R_1 = 9.9\Omega$

44. (a) Let l be the original length of wire and x be its length stretched uniformly such that final length is 1.5 l



Then $4R = \rho\frac{(l - x)}{A} + \rho\frac{(0.5l + x)}{A'}$ where $A' = \frac{x}{(0.5l + x)} A$

$\therefore\ 4\rho\frac{l}{A}=\rho\frac{l-x}{A}+\rho\frac{(0.5l+x)^2}{xA}$

or $4l=l-x+\frac{1}{4}\frac{l^2}{x}+\frac{x^2}{x}+\frac{lx}{x}$ or $\frac{x}{l}=\frac{1}{8}$

45. (b) In series : Potential difference $\propto R$

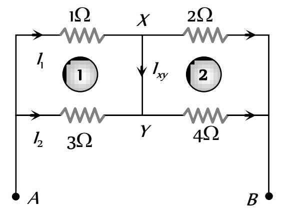
When only S_1 is closed $V_1=\frac{3}{4}E=0.75E$

When only S_2 is closed $V_2=\frac{6}{7}E=0.86E$

and when both S_1 and S_2 are closed combined resistance of $6R$ and $3R$ is $2R$

$\therefore\quad V_3=\left(\frac{2}{3}\right)E=0.67E\ \Rightarrow V_2>V_1>V_3$

46. (c)



$-i_1+0\times i_{xy}+3i_2=0$ *i.e.* $i_1=3i_2$ ......(i)

Also $-2(i_1-i_{xy})+4(i_2+i_{xy})=0$

i.e. $2i_1-4i_2=6i_{xy}$ ....(ii)

Also $V_{AB}-1\times i_1-2(i_1-i_{xy})=0\Rightarrow 50=i_1+2(i_1-i_{xy})$

$=3i_1-2i_{xy}$ .... (iii)

Solving (i), (ii) and (iii), $i_{xy}=2A$

47. (b) Let n be the number of wrongly connected cells.

Number of cells helping one another $=(12-n)$

Total e.m.f. of such cells $=(12-n)E$

Total e.m.f. of cells opposing = nE

Resultant e.m.f. of battery $=(12-n)E-nE=(12-2n)E$

Total resistance of cells = $12r$

($\because$ resistance remains same irrespective of connections of cells)

With additional cells

(a) Total e.m.f. of cells when additional cells help battery = $(12-2n)E+2E$

Total resistance = $12r+2r=14r$

$\therefore\ \frac{(12-2n)E+2E}{14r}=3$ ......(i)

(b) Similarly when additional cells oppose the battery

$\frac{(12-2n)E-2E}{14r}=2$ ......(ii)

Solving (i) and (ii), $n=1$

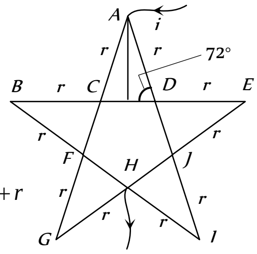
48. (a) All the conductors have equal lengths. Area of cross-section of A is $\{(\sqrt{3}\,a)^2-(\sqrt{2}\,a)^2\}=a^2$

Similarly area of cross-section of B = Area of cross-section of C = a

Hence according to formula $R=\rho\frac{l}{A}$; resistances of all the conductors are equal *i.e.* $R_A=R_B=R_C$

49. (b) Resistance of CD arm = $2r\cos 72^\circ=0.62r$

Resistance of CBFC branch



$\frac{1}{R}=\frac{1}{2r}+\frac{1}{0.62r}=\frac{1}{r}\left(\frac{2.62}{2\times 0.62}\right)$

$\frac{1}{R}=\frac{2.62}{1.24r}\qquad \therefore R=\frac{1.24r}{2.62}$

Equivalent $R'=2R+r=2\times\frac{1.24r}{2.62}+r$

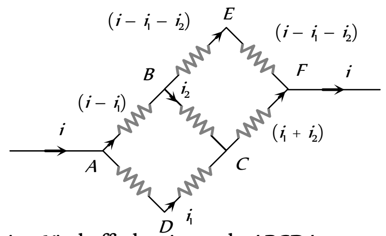
$=r\left(\frac{2.48}{2.62}+1\right)=1.946r$

Because the star circuit is symmetrical about the line AH

$\therefore$ Equivalent resistance between A and H

$\frac{1}{R_{eq}}=\frac{1}{R'}+\frac{1}{R'}\Rightarrow R_{eq}=\frac{R'}{2}=\frac{1.946}{2}r=0.973r$

50. (a)



Applying Kirchoff's law in mesh $ABCDA$

$-10(i-i_1)-10i_2+20i_1=0\ \Rightarrow\ 3i_1-i_2=i$ ....(i)

and in mesh $BEFCB$

$-20(i-i_1-i_2)+10(i_1+i_2)+10i_2=0$

$\Rightarrow\quad 3i_1+4i_2=2i$ ......(ii)

From equation (i) and (ii) $i_1=\frac{2i}{5},i_2=\frac{i}{5}\Rightarrow i_{AD}=\frac{2i}{5}$

51. (d) Let the current in 12 Ω resistance is i

Applying loop theorem in closed mesh $AEFCA$

$12i=-E+E=0\quad\therefore\ i=0$

52. (b) Current flowing in the circuit $i=\frac{E}{R}=\frac{10-4}{20+10}=\frac{1}{5}A$

P.D. across $AC=\frac{1}{5}\times 20=4V$

P.D. across $AN=4+4=8V$

53. (a) If two resistances are R_1 and R_2 then

$S=R_1+R_2$ and $P=\frac{R_1R_2}{(R_1+R_2)}$

From given condition $S=nP$ *i.e.* $(R_1+R_2)=n\left(\frac{R_1R_2}{R_1+R_2}\right)$

$\Rightarrow(R_1+R_2)^2=n\,R_1R_2\Rightarrow(R_1-R_2)^2+4R_1R_2=nR_1R_2$

So $n=4+\frac{(R_1-R_2)^2}{R_1R_2}$. Hence minimum value of n is 4.

54. (b) Voltage sensitivity $=\frac{\text{Current sensitivity}}{\text{Resistance of galvanometer G}}$

$\Rightarrow G = \frac{10}{2} = 5\,\Omega$.

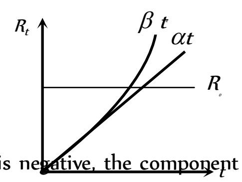
Here i_g = Full scale deflection current $= \frac{150}{10} = 15\,mA$.

V = Voltage to be measured = 150 × 1 = 150 V.

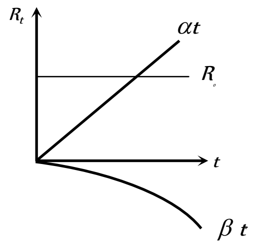
Hence $R = \frac{V}{i_g} - G = \frac{150}{15 \times 10^{-3}} - 5 = 9995\,\Omega$.

Graphical Questions

1. (a) For ohmic resistance $V \propto i \Rightarrow V = Ri$ (here R is constant)
2. (d) From the curve it is clear that slopes at points A, B, C, D have following order $A > B > C > D$.
and also resistance at any point equals to slope of the V-i curve.
So order of resistance at three points will be $R_A > R_B > R_C > R_D$
3. (a) Slope of the V-i curve at any point equal to resistance at that point. From the curve slope for T_1 > slope for T_2
$\Rightarrow R_{T_1} > R_{T_2}$. Also at higher temperature resistance will be higher so $T_1 > T_2$
4. (c) For portion CD slope of the curve is negative *i.e.* resistance be negative.
5. (d) Slope of V-i curve $= R\left(=\frac{\rho l}{A}\right)$. But in given curve axis of i and V are interchanged. So slope of given curve $= \frac{1}{R}\left(=\frac{A}{\rho l}\right)$
i.e. with the increase in length of the wire. Slope of the curve will decrease.
6. (c) $E = \frac{iR}{L} = \frac{i.\rho}{A} = \frac{neAv_d\rho}{A} \Rightarrow v_d \propto E$ (Straight line)
$P = i^2R = \left(\frac{EA}{\rho}\right)^2 R \Rightarrow P \propto E^2$ (Symmetric parabola)
Also $P \propto i^2$ (parabola)
Hence all graphs a, b, d are correct and c is incorrect.
7. (b) When we move in the direction of the current in a uniform conductor, the potential difference decreases linearly. When we pass through the cell, from it's negative to it's positive terminal, the potential increases by an amount equal to it's potential difference. This is less than it's emf, as there is some potential drop across it's internal resistance when the cell is driving current.
8. (b) Since the value of R continuously increases, both α and β must be positive.
Actually the components of the given equation are as follows



It α is positive, β is negative, the component will be shown in the following graph.



In this case, the value of R will not increase continuously. Hence the correct option is (c).

9. (d) Slope of V-i curve = resistance. Hence $R = \frac{1}{1} = 1\Omega$
10. (a) At point A the slope of the graph will be negative. Hence resistance is negative.
11. (b) E.m.f. is the value of voltage, when no current is drawn from the circuit so $E = 2V$. Also r = slope $= \frac{2}{5} = 0.4\Omega$
12. (d) For conversion of a galvanometer into a voltmeter
$\frac{V}{R+G} = i_g \Rightarrow \frac{V}{R_V} = i_g$; where $R_V = R + G$ = Total resistance
$\Rightarrow R_V = \frac{V}{i_g} \Rightarrow R_V \propto V$
13. (a) According to ohm's law $V = iR$
$\Rightarrow \log_e V = \log_e i + \log_e R \Rightarrow \log_e i = \log_e V - \log_e R$
The graph between $\log_e I$ and $\log_e V$ will be a straight line which cut $\log_e V$ axis and it's gradient will be positive.
14. (c) As we know, for conductors resistance ∝ Temperature.
From figure $R_1 \propto T_1 \Rightarrow \tan\theta \propto T_1 \Rightarrow \tan\theta = kT_1$ ... (i)
and $R_2 \propto T_2 \Rightarrow \tan(90 - \theta) \propto T_2 \Rightarrow \cot\theta = kT_2$ ....(ii)
From equation (i) and (ii) $k(T_2 - T_1) = (\cot\theta - \tan\theta)$
$(T_2 - T_1) = \left(\frac{\cos\theta}{\sin\theta} - \frac{\sin\theta}{\cos\theta}\right) = \frac{(\cos^2\theta - \sin^2\theta)}{\sin\theta\cos\theta} = 2\cot 2\theta$
$\Rightarrow (T_2 - T_1) \propto \cot 2\theta$
15. (b) Let resistivity at a distance 'x' from left end be $\rho = (\rho_0 + ax)$. Then electric field intensity at a distance 'x' from left end will be equal to $E = \frac{i\rho}{A} = \frac{i(\rho_0 + ax)}{A}$ where i is the current flowing through the conductor. It means $E \propto \rho$ or E varies linearly with distance 'x'. But at $x = 0$, E has non-zero value. Hence (b) is correct.
16. (d) At an instant approach the student will choose $\tan\theta$ will be the right answer. But it is to be seen here the curve makes the angle θ with the V-axis. So it makes an angle $(90 - \theta)$ with the i-axis.
So resistance = slope = $\tan(90 - \theta) = \cot\theta$.
17. (d) Short circuited current $i = \frac{nE}{nr} = \frac{E}{r}$ *i.e.* i doesn't depend upon n.
18. (b) Here internal resistance is given by the slope of graph *i.e.* $\frac{x}{y}$.
But conductance $= \frac{1}{\text{Resistance}} = \frac{y}{x}$
19. (a) $R_{Parallel} < R_{Series}$. From graph it is clear that slope of the line A is lower than the slope of the line B. Also slope = resistance, so line A represents the graph for parallel combination.
20. (b) To make range n times, the galvanometer resistance should be G/n, where G is initial resistance.

Assertion and Reason

1. (d) Resistivity of a semiconductor decreases with the temperature. The atoms of a semiconductor vibrate with larger amplitudes at higher temperatures thereby increasing it's conductivity not resistivity.

2. (d) It is quite clear that in a battery circuit, the point of lowest potential is the negative terminal of the battery and the current flows from higher potential to lower potential.

3. (b) The temperature co-efficient of resistance for metal is positive and that for semiconductor is negative.

In metals free electrons (negative charge) are charge carriers while in P-type semiconductors, holes (positive charge) are majority charge carriers.

4. (a) Here, $E = 2V$, $1 = \frac{2}{2} = 1A$ and $r = 1\Omega$

Therefore, $V = E - ir = 2 - 1 \times 1 = 1V$

5. (a) It is clear that electrons move in all directions haphazardly in metals. When an electric field is applied, each free electron acquire a drift velocity. There is a net flow of charge, which constitute current. In the absence of electric field this is impossible and hence, there is no current.

6. (c) The metallic body of the electrical appliances is connected to the third pin which is connected to the earth. This is a safety precaution and avoids eventual electric shock. By doing this the extra charge flowing through the metallic body is passed to earth and avoid shocks. There is nothing such as reducing of the heating of connecting wires by three pin connections.

7. (b) On increasing temperature of wire the kinetic energy of free electrons increase and so they collide more rapidly with each other and hence their drift velocity decreases. Also when temperature increases, resistivity increase and resistivity is inversely proportional to conductivity of material.

8. (c) In a conductor there are large number of free electrons. When we close the circuit, the electric field is established instantly with the speed of electromagnetic wave which cause electron drift at every portion of the circuit. Due to which the current is set up in the entire circuit instantly. The current which is set up does not wait for the electrons flow from one end of the conductor to the another end. It is due to this reason, the electric bulb glows immediately when switch is on.

9. (a) Resistance wire $R = \rho \frac{l}{A}$. where ρ is resistivity of material which does not depend on the geometry of wire. Since when wire is banded, resistivity, length and area of cross-section do not change, therefore resistance of wire also remain same.

10. (c) The resistance of the galvanometer is fixed. In meter bridge experiments, to protect the galvanometer from a high current, high resistance is connected to the galvanometer in order to protect it from damage.

11. (a) Voltameter measures current indirectly in terms of mass of ions deposited and electrochemical equivalent of the substance $\left(I = \frac{m}{Zt}\right)$. Since value of m and Z are measured to 3rd decimal place and 5th decimal place respectively. The relative error in the measurement of current by voltmeter will be very small as compared to that when measured by ammeter directly.

12. (a) When current flows through a conductor it always remains uncharged, hence no electric field is produced outside it.

13. (b) Here assertion and reason both are correct but the reason is not the correct explanation of assertion.

14. (a) Sensitivity $\propto \frac{1}{\text{Potential gradient}} \propto (\text{Length of wire})$

15. (a) If either the e.m.f. of the driver cell or potential difference across the whole potentiometer wire is lesser than the e.m.f. of the experimental cell, then balance point will not obtained.

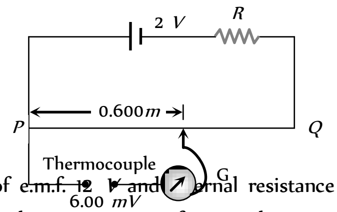
16. (d) Because there is no special attractive force that keeps a person stuck with a high power line. The actual reason is that a current of the order of 0.05 A or even less is enough to bring disorder in our nervous system. As a result of it, the affected person may lose temporarily his ability to exercise his nervous control to get himself free from the high power line.

17. (a) Due to high electrical conductivity of copper, it conducts the current without offering much resistance. The copper being diamagnetic material does not get magnetised due to current through it and hence does not disturb the current in the circuit.

Current Electricity

SET Self Evaluation Test -19

1. Figure shows a simple potentiometer circuit for measuring a small e.m.f. produced by a thermocouple. The meter wire PQ has a resistance 5 Ω and the driver cell has an e.m.f. of 2 V. If a balance point is obtained 0.600 m along PQ when measuring an e.m.f. of 6.00 mV, what is the value of resistance R

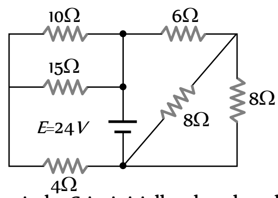


(a) 995 Ω
(b) 1995 Ω
(c) 2995 Ω
(d) None of these

2. A car has a fresh battery of e.m.f. 12 V and internal resistance of 0.05 Ω. If the starter motor draws a current of 90 A, the terminal voltage when the starter is on will be
(a) 12 V (b) 10.5 V
(c) 8.5 V (d) 7.5 V

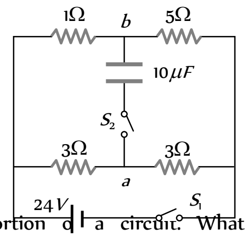
3. If the balance point is obtained at the 35 cm in a metre bridge the resistances in the left and right gaps are in the ratio of
(a) 7 : 13 (b) 13 : 7
(c) 9 : 11 (d) 11 : 9

4. Find the equivalent resistance across the terminals of source of e.m.f. 24 V for the circuit shown in figure



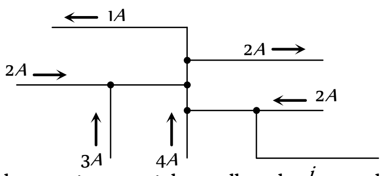
(a) 15 Ω
(b) 10 Ω
(c) 5 Ω
(d) 4 Ω

5. In the circuit shown in figure, switch S_1 is initially closed and S_2 is open. Find $V_a - V_b$



(a) 4 V
(b) 8 V
(c) 12 V
(d) 16 V

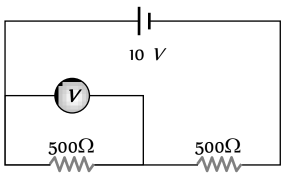
6. The figure here shows a portion of a circuit. What are the magnitude and direction of the current i in the lower right-hand wire



(a) 7 A
(b) 8 A
(c) 6 A
(d) 2 A

7. A carbon resistor has colour strips as violet, yellow brown and golden. The resistance is
(a) 641 Ω (b) 741 Ω
(c) 704 Ω (d) 407 Ω

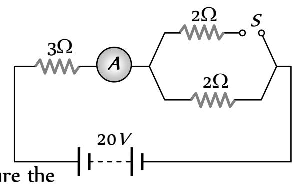
8. A voltmeter of resistance 1000 Ω is connected across a resistance of 500 Ω in the given circuit. What will be the reading of voltmeter



(a) 1 V
(b) 2 V
(c) 6 V
(d) 4 V

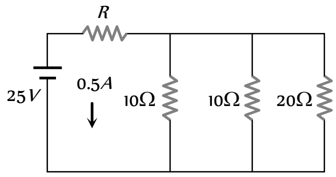
9. A beam contains 2 × 10 doubly charged positive ions per cubic centimeter, all of which are moving with a speed of 10 m/s. The current density is
(a) 6.4 A/m (b) 3.2 A/m
(c) 1.6 A/m (d) None of these

10. In the circuit shown, the reading of ammeter when switch S is open and when switch S is closed respectively are



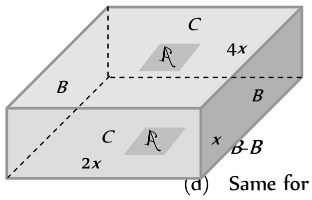
(a) 3 A and 4 A
(b) 4 A and 5 A
(c) 5 A and 6 A
(d) 6 A and 7 A

11. In the circuit as shown in figure the



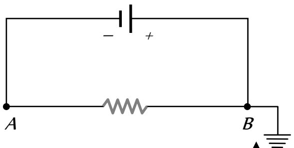
(a) Resistance R = 46 Ω
(b) Current through 20 Ω resistance is 0.1 A
(c) Potential difference across the middle resistance is 2 V
(d) All option are correct

12. In figure shows a rectangular block with dimensions x, $2x$ and $4x$. Electrical contacts can be made to the block between opposite pairs of faces (for example, between the faces labelled A-A, B-B and C-C). Between which two faces would the maximum electrical resistance be obtained (A-A : Top and bottom faces, B-B : Left and right faces, C-C : Front and rear faces)

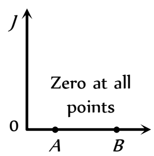


(a) A-A (b) B-B
(c) C-C (d) Same for all three pairs

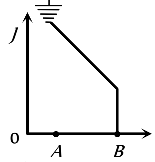
13. A battery is connected to a uniform resistance wire AB and B is earthed. Which one of the graphs below shows how the current density J varies along AB

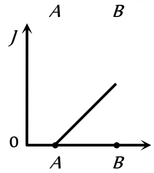


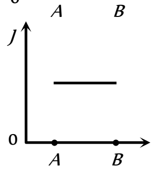
(a)



(b)







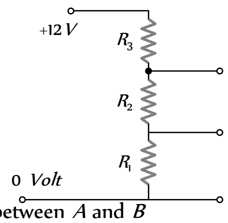
(c) (d)

14. A cylindrical metal wire of length l and cross sections area S, has resistance R, conductance G, conductivity σ and resistivity ρ. Which one of the following expressions for σ is valid

(a) $\frac{GR}{\rho}$ (b) $\frac{\rho R}{G}$

(c) $\frac{GS}{l}$ (d) $\frac{Rl}{S}$

15. A potential divider is used to give outputs of 4 V and 8 V from a 12 V source. Which combination of resistances, (R_1, R_2, R_3) gives the correct voltages ? $R_1 : R_2 : R_3$



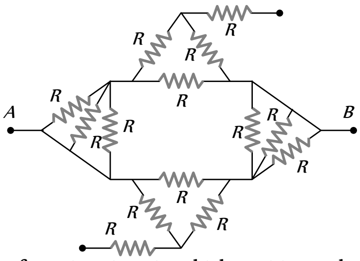
(a) 2 : 1 : 2

(b) 1 : 1 : 1

(c) 2 : 2 : 1

(d) 1 : 1 : 2

16. Find equivalent resistance between A and B



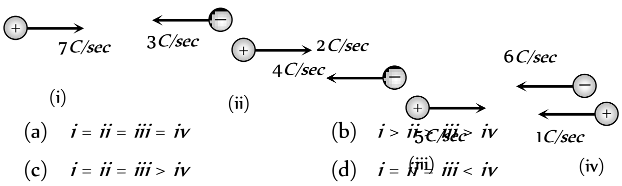
(a) R

(b) $\frac{3R}{4}$

(c) $\frac{R}{2}$

(d) $2R$

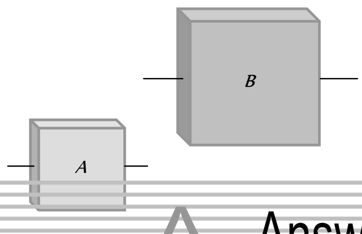
17. Following figure shows four situations in which positive and negative charges moves horizontally through a region and gives the rate at which each charge moves. Rank the situations according to the effective current through the region greatest first



(a) $i = ii = iii = iv$ (b) $i > ii > iii > iv$

(c) $i = ii = iii > iv$ (d) $i = ii = iii < iv$

18. A and B are two square plates of same metal and same thickness but length of B is twice that of A. Ratio of resistances of A and B is



(a) 4 : 1

(b) 1 : 4

(c) 1 : 1

(d) 1 : 2

19. A moving coil galvanometer is converted into an ammeter reading upto $0.03\,A$ by connecting a shunt of resistance $4r$ across it and into an ammeter reading upto $0.06\,A$ when a shunt of resistance r is connected across it. What is the maximum current which can be sent through this galvanometer if no shunt is used

(a) $0.01\,A$ (b) $0.02\,A$

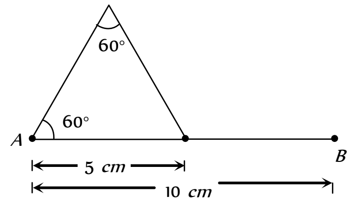
(c) $0.03\,A$ (d) $0.04\,A$

20. Two conductors are made of the same material and have the same length. Conductor A is a solid wire of diameter 1.0 mm. Conductor B is a hollow tube of outside diameter 2.0 mm and inside diameter 1.0 mm. The resistance ratio R_A/R_B will be

(a) 1 (b) 2

(c) 3 (d) 4

21. A wire has resistance of 24 Ω is bent in the following shape. The effective resistance between A and B is



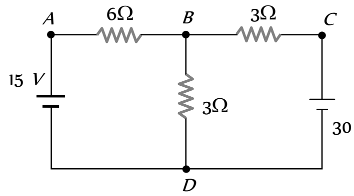
(a) 24 Ω

(b) 10 Ω

(c) $\frac{16}{3}\,\Omega$

(d) None of these

22. In the circuit shown in figure, find the current through the branch BD



(a) 5 A

(b) 0 A

(c) 3 A

(d) 4 A

23. A battery of 24 cells, each of emf 1.5 V and internal resistance 2Ω is to be connected in order to send the maximum current through a 12 Ω resistor. The correct arrangement of cells will be

(a) 2 rows of 12 cells connected in parallel

(b) 3 rows of 8 cells connected in parallel

(c) 4 rows of 6 cells connected in parallel

(d) All of these

Answers and Solutions

(SET - 19)

1. (a) The voltage per unit light of the metre wire PQ is $\left(\frac{6.00\,mV}{0.600\,m}\right)$ *i.e.* $10\,mV/m$. Hence potential difference across the metre wire is $10\,mV/m \times 1m = 10\,mV$. The current drawn from the driver cell is $i = \frac{10\,mV}{5\,\Omega} = 2\,mA$.

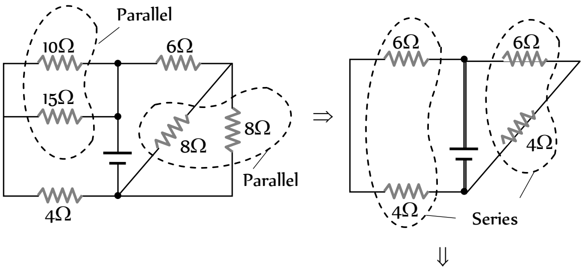
The resistance $R = \frac{(2V - 10mV)}{2\,mA} = \frac{1990\,mV}{2\,mA} = 995\,\Omega$.

2. (d) $V = E - i.r = 12 - 90 \times 0.05 = 12 - 4.5 = 7.5\,V$.

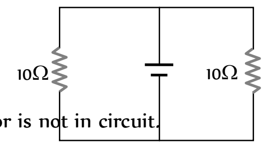
3. (a) Using Wheatstone principle $\frac{P}{Q} = \frac{R}{S} = \frac{R}{100-l}$

$$= \frac{35}{100-35} = \frac{35}{65} = \frac{7}{13}$$

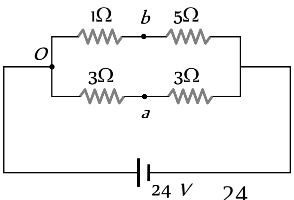
4. (c) Given circuit can be reduced to a simple circuit as shown in figures below



i.e. $R_{eq} = 5\Omega$.



5. (b) Switch S_2 is open so capacitor is not in circuit.



Current through 3Ω resistor $= \frac{24}{3+3} = 4\ A$

Let potential of point '*O*' shown in fig. is V_O

then using ohm's law

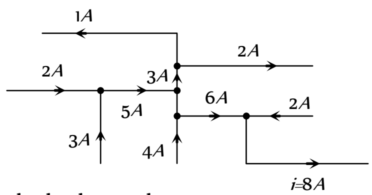
$V_O - V_a = 3 \times 4 = 12V$ ....(i)

Now current through 5Ω resistor $= \frac{24}{5+1} = 4A$

So $V_0 - V_b = 4 \times 1 = 4\ V$
.....(ii)

From equation (i) and (ii) $V_b - V_a = 12 - 4 = 8V$.

6. (b) By using Kirchoff's junction law as shown below.



7. (b) Using standard colour codes

Violet = 7, yellow = 4, brown = 1 and gold = 5 % (tolerance)

So $R = 74 \times 10^1 \pm 5\% = 740 \pm 5\%$

So its value will be nearest to $741\,\Omega$.

8. (d) Total current through the circuit

$$i = \frac{10}{\frac{1000}{3} + 500} = \frac{3}{250}A$$

Now voltmeter reading $= i_v \times R_V = \frac{2}{3} \times \frac{3}{250} \times 500 = 4V$.

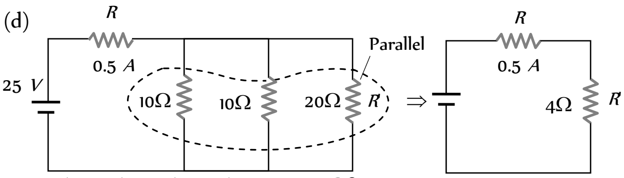
9. (a) $J = nqv = n(ze)v = \frac{2 \times 10^8 \times 2 \times 1.6 \times 10^{-19} \times 10^5}{(10^{-2})^3}$ =6.4A/m

10. (b) When switch *S* is open total current through ammeter.

$$i = \frac{20}{(3+2)} = 4A.$$

When switch is closed $i = \frac{20}{3 + (2\|\ 2)} = 5A$.

11. (d)



$$\frac{1}{R'} = \frac{1}{10} + \frac{1}{10} + \frac{1}{20} \Rightarrow R' = \frac{20}{5} = 4\ \Omega$$

Now using ohm's law $i = \frac{25}{R+R'} \Rightarrow 0.5 = \frac{25}{R+4}$

$$\Rightarrow R + 4 = \frac{25}{0.5} = 50 \Rightarrow R = 50 - 4 = 46\ \Omega$$

Current through 20Ω resistor $= \frac{0.5 \times 5}{20+5} = \frac{2.5}{25} = 0.1A$

Potential difference across middle resistor

= Potential difference across $20\Omega = 20 \times 0.1 = 2V$

12. (c) Let ρ is the resistivity of the material

Resistance for contact *A-A*

$$R_{AA} = \rho\frac{x}{2x \times 4x} = \frac{\rho}{8x}$$

Similar for contacts *B-B* and *C-C* are respectively

$$R_{BB} = \rho.\frac{2x}{x \times 4x} = \frac{\rho}{2x} = \frac{4\rho}{8x}$$

and $R_{CC} = \rho\frac{4x}{x \times 2x} = \frac{2\rho}{x} = \frac{16\rho}{8x}$

It is clear maximum resistance will be for contact *C-C*.

13. (d) Wire *AB* is uniform so current through wire *AB* at every across section will be same. Hence current density $J(= i/A)$ at every point of the wire will be same.

14. (a) Conductivity $\sigma = \frac{1}{\rho}$ .....(i)

and conductance $G = \frac{1}{R}$

$\Rightarrow GR = 1$ .....(ii)

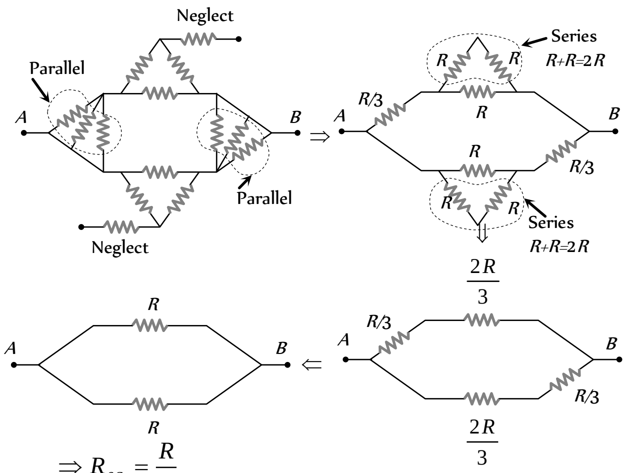
From equation (i) and (ii) $\sigma = \frac{GR}{\rho}$

15. (b) Resistors are connected in series. So current through each resistor will be same

$$\Rightarrow i = \frac{12-8}{R_3} = \frac{8-4}{R_2} = \frac{4-0}{R_1} \Rightarrow \frac{4}{R_3} = \frac{4}{R_2} = \frac{4}{R_1}$$

So, $R_1 : R_2 : R_3 :: 1 : 1 : 1$.

16. (c) Given circuit can be redrawn as follows



$\Rightarrow R_{eq} = \frac{R}{2}$

17. (c) For figure (i) $i_1 = 7A$

For figure (ii) $i_2 = 4 + 3 = 7A$

For figure (iii) $i_3 = 5 + 2 = 7A$

For figure (iv) $i_4 = 6 - 1 = 5A$

18. (c) $R_A = \frac{\rho l}{l \times t} = \frac{\rho}{t}$ and $R_B = \frac{\rho \times 2l}{2l \times t} = \frac{\rho}{t}$ *i.e.* $\frac{R_A}{R_B} = 1:1$

19. (b) $\frac{i_g}{i} = \frac{S}{G+S} \Rightarrow i_g G = (i - i_g)S$

$\therefore\ i_g G = (0.03 - i_g)4r$ .....(i)

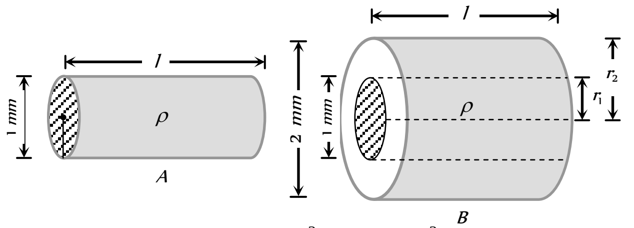
and $i_g G = (0.06 - i_g)r$ .....(ii)

From (i) and (ii)

$0.12 - 4i_g = 0.06 - i_g \Rightarrow i_g = 0.02A$.

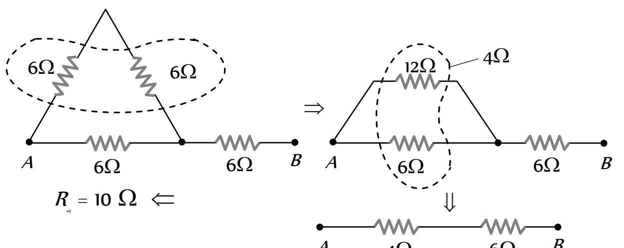
20. (c) For conductor *A*, $R_A = \frac{\rho l}{\pi r_1^2}$,

For conductor *B*, $R_B = \frac{\rho l}{\pi (r_2^2 - r_1^2)}$



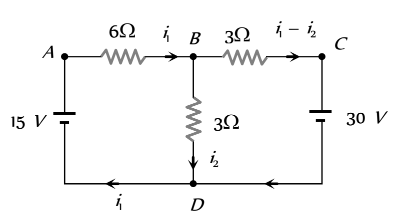
$\Rightarrow \frac{R_A}{R_B} = \frac{r_2^2 - r_1^2}{r_1^2} = \left(\frac{r_2}{r_1}\right)^2 - 1 = \left(\frac{d_2}{d_1}\right)^2 - 1 = \left(\frac{2}{1}\right)^2 - 1 = 3$

21. (b) Given resistance of each part will be



$R_{eq} = 10\ \Omega$

22. (a) The current in the circuit are assumed as shown in the fig.



Applying KVL along the loop *ABDA*, we get

$-6i_1 - 3i_2 + 15 = 0$ or $2i_1 + i_2 = 5$ .....(i)

Applying KVL along the loop *BCDB*, we get

$-3(i_1 - i_2) - 30 + 3i_2 = 0$ or $-i_1 + 2i_2 = 10$ .....(ii)

Solving equation (i) and (ii) for i_2, we get $i_2 = 5\ A$.

23. (a) Suppose *m* rows are connected in parallel and each row contains *n* identical cells (each cell having $E = 15\ V$ and $r = 2\Omega$) For maximum current in the external resistance *R*, the necessary condition is $R = \frac{nr}{m}$

$\Rightarrow 12 = \frac{n \times 2}{m} \Rightarrow n = 6m$ ..... (i)

Total cells = 24 = $n \times m$ ..... (ii)

On solving equations (i) and (ii) $n = 12$ and $m = 2$

i.e. 2 rows of 12 cells are connected in parallel.

Heating and Chemical Effect of Current

Joules Heating

When some potential difference V is applied across a resistance R then the work done by the electric field on charge q to flow through the circuit in time t will be $W = qV = Vit = i^2Rt = \frac{V^2t}{R} Joule$. This work appears as thermal energy in the resistor.

Heat produced by the resistance R is $H = \frac{W}{J} = \frac{Vit}{4 \cdot 2} = \frac{i^2Rt}{4 \cdot 2} = \frac{V^2t}{4 \cdot 2R} Cal.$ This relation is called joules heating.

Electric Power

The rate at which electrical energy is dissipated into other forms of energy is called electrical power *i.e.* $\boldsymbol{P = \frac{W}{t} = Vi = i^2R = \frac{V^2}{R}}$

(1) **Units :** It's S.I. unit is *Joule/sec* or *Watt*

Bigger S.I. units are *KW*, *MW* and *HP*, remember 1 *HP* = 746 *Watt*

(2) **Rated values :** On electrical appliances (Bulbs, Heater, Geyser …. *etc.*). Wattage, voltage, ……. *etc.* are printed called rated values *e.g.* If suppose we have a bulb of 40 *W*, 220 *V* then rated power (P_R) = 40 *W* while rated voltage (V_R) = 220 *V*.

(3) **Resistance of electrical appliance :** If variation of resistance with temperature is neglected then resistance of any electrical appliance can be calculated by rated power and rated voltage *i.e.* by using $\boldsymbol{R = \frac{V_R^2}{P_R}}$.

(4) **Power consumed (illumination) :** An electrical appliance (Bulb, heater, …. *etc.*) consume rated power (P_R) only if applied voltage (V_A) is equal to rated voltage (V_R) *i.e.* If $V_A = V_R$ so $P_{consumed} = P_R$. If $V_A < V_R$ then $P_{consumed} = \frac{V_A^2}{R}$ also we have $R = \frac{V_R^2}{P_R}$ so $\boldsymbol{P_{Consumed}\ (Brightness) = \left(\frac{V_A^2}{V_R^2}\right) . P_R}$

(5) **Long distance power transmission :** When power is transmitted through a power line of resistance R, power-loss will be i^2R

Now if the power P is transmitted at voltage V then $P = Vi$ *i.e.* $i = (P/V)$ So, $\text{Power loss} = \frac{P^2}{V^2} \times R$

Now as for a given power and line, P and R are constant so $\text{Power loss} \propto (1/V^2)$

So if power is transmitted at high voltage, power loss will be small and vice-versa. This is why long distance power transmission is carried out at high voltage.

Electricity Consumption

(1) The price of electricity consumed is calculated on the basis of electrical energy and not on the basis of electrical power.

(2) The unit *Joule* for energy is very small hence a big practical unit is considered known as *kilowatt hour* (*KWH*) or board of trade unit (B.T.U.) or simple unit.

(3) 1 *KWH* or 1 unit is the quantity of electrical energy which dissipates in one hour in an electrical circuit when the electrical power in the circuit is 1 *KW* thus 1 *KWH* = 1000 *W* × 3600 *sec* = 3.6 × 10^6 *J*.

(4) Important formulae to calculate the no. of consumed units is $n = \frac{\text{Total } Watt \times \text{Total } Hours}{1000}$

Combination of Bulbs

(1) **Series combination**

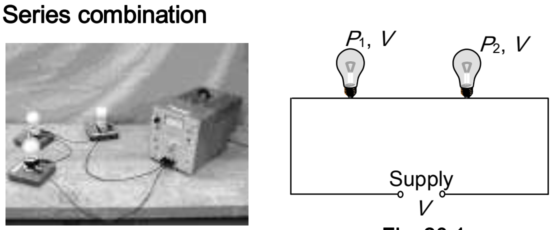

Fig. 20.1

(i) Total power consumed $\frac{1}{P_{total}} = \frac{1}{P_1} + \frac{1}{P_2} + ...$

(ii) If '*n*' bulbs are identical, $P_{total} = \frac{P}{N}$

(iii) $P_{consumed}$ (Brightness) $\propto V \propto R \propto \frac{1}{P_{rated}}$ *i.e.* in series combination bulb of lesser wattage will give more bright light and p.d. appeared across it will be more.

(2) **Parallel combination**

(i) Total power consumed $P_{total} = P_1 + P_2 + P_3 ...... + P_n$

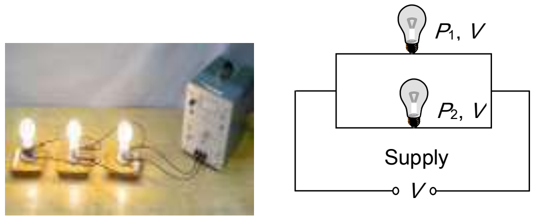

Fig. 20.2

(ii) If '*n*' identical bulbs are in parallel. $P_{total} = nP$

(iii) $P_{consumed}$ (Brightness) $\propto P_R \propto i \propto \frac{1}{R}$ *i.e.* in parallel combination, bulb of greater wattage will give more bright light and more current will pass through it.

Chemical Effect of Current

Current can produce or speed up chemical change, this ability of current is called chemical effect (shown by *dc* not by *ac*).

(1) **Electrolytes :** The liquids which allows the current to pass through them and also dissociates into ions on passing current through them are called electrolytes *e.g.* solutions of salts, acids and bases in water, *etc*.

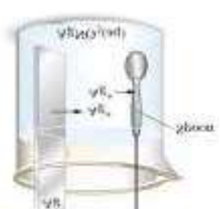
Those liquids which do not allow current to pass through them are called insulators (*e.g.* vegetable oils, distilled water *etc*.)

Solutions of cane sugar, glycerin, alcohol *etc*. are examples of non-electrolytes.

(2) **Electrolysis :** The process of decomposition of electrolyte solution into ions on passing the current through it is called electrolysis.

Practical applications of electrolysis are Electrotyping, extraction of metals from the ores, Purification of metals, Manufacture of chemicals, Production of O_2 and H_2, Medical applications and electroplating.

(3) **Electroplating :** It is a process of depositing a thin layer of one metal over another metal by the method of electrolysis. The articles of cheap metals are coated with precious metals like silver and gold to make their look more attractive. The



article to be electroplated is made the cathode and the metal to be deposited is made the anode. A soluble salt of the precious metal is taken as the electrolyte. (If gold is to be coated then auric chloride is used as electrolyte).

(4) **Voltameter :** The vessel in which the electrolysis is carried out is called a voltameter. It contains two electrodes and electrolyte. It is also known as electrolytic cell.

Table 20.1 : Types of voltameters

Volatameter	Anode/ cathode	Electrolyte	Deposition
Cu voltameter 	Cathode may be of any material but anode must be of *Cu*	$CuSO_4$ or $CuCl_2$	At cathode *Cu* deposited
Ag voltameter 	Cathode may be of any material but anode must be of *Ag*	$AgNO_3$	At cathode *Ag* deposited
Water voltameter 	Both electrode are made of platinum (*Pt*)	Acidulated water	H_2 and O_2 gases are collects over the cathode and anode respectively in the ratio of 2 : 1

Faraday's Law of Electrolysis

(1) **First law :** It states that the mass (*m*) of substance deposited at the cathode during electrolysis is directly proportional to the quantity of electricity (total charge *q*) passed through the electrolyte *i.e.* $m \propto q$ or ***m* = *zq* = *zit***, where the constant of proportionality *z* is called *electrochemical equivalent* (*E.C.E.*) *of the substance.*

Therefore we have $m = zit$. If q = 1 *coulomb*, then we have $m = z \times 1$ or $z = m$

Hence, the electrochemical equivalent of substance may be defined as the mass of its substance deposited at the cathode, when one *coulomb* of charge passes through the electrolyte.

S.I. unit of electrochemical equivalent of a substance is *kilogram coulomb*$^{-1}$ ($kg\text{-}C^{-1}$).

Table 20.2 : E.C.E. for certain substances

Element	Atomic weight	Atomic number	Valency	E.C.E. (*Z*) in *kg / C*
Hydrogen	1.0008	1	1	10.4×10^{-9}
Oxygen	15.999	8	2	82.9×10^{-9}
Aluminium	26.982	13	3	93.6×10^{-9}
Chromium	51.996	24	3	179.6×10^{-9}
Nickel	58.710	28	2	304.0×10^{-9}
Copper	63.546	29	2	329.4×10^{-9}
Zinc	65.380	30	2	338.7×10^{-9}
Silver	107.868	47	1	1118×10^{-9}
Gold	196.966	79	3	681.2×10^{-9}

(2) **Second law :** If same quantity of electricity is passed through different electrolytes, masses of the substance

deposited at the respective cathodes are directly proportional to their chemical equivalents *i.e.* $\boldsymbol{m \propto E \Rightarrow \frac{m_1}{m_2} = \frac{E_1}{E_2}}$

Let m be the mass of the ions of a substance liberated, whose chemical equivalent is E. Then, according to Faraday's second law of electrolysis, $m \propto E$ or m = constant $\times$ E or $\frac{m}{E} = \text{constant}$

Chemical equivalent E also known as equivalent weight in *gm i.e.* $E = \frac{\text{Atomic mass }(A)}{\text{Valancy }(V)}$

(3) **Relation between chemical equivalent and electrochemical equivalent :** Suppose that on passing same amount of electricity q through two different electrolytes, masses of the two substances liberated are m_1 and m_2. If E_1 and E_2 are their chemical equivalents, then from Faraday's second law, we have $\frac{m_1}{m_2} = \frac{E_1}{E_2}$. Also from Faraday's first law $\frac{m_1}{m_2} = \frac{z_1}{z_2}$

So $\frac{z_1}{z_2} = \frac{E_1}{E_2} \Rightarrow z \propto E$

(4) **Faraday constant :** As we discussed above $E \propto z$

$\Rightarrow E = Fz \Rightarrow z = \frac{E}{F} = \frac{A}{VF}$. '$F$' is proportionality constant called Faraday's constant.

As $z = \frac{E}{F}$ and $z = \frac{m}{Q}$ so $\frac{E}{F} = \frac{m}{Q}$ hence if Q = 1 *Faraday* then $E = m$ *i.e.* If electricity supplied to a voltameter is 1 Faraday then amount of substance liberated or deposited is (in *gm*) equal to the chemical equivalent.

Electro Chemical Cell

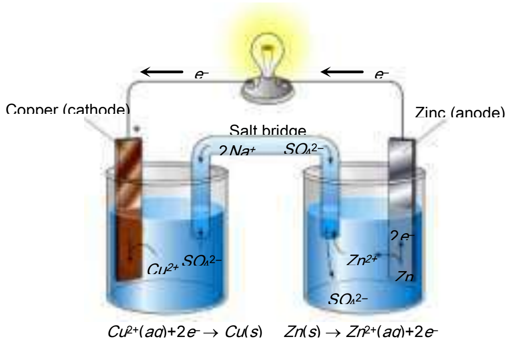


Fig. 20.4

It is an arrangement in which the chemical energy is converted into electrical energy due to chemical action taking place in it.

(1) **Primary cell :** Is that cell in which electrical energy is produced due to chemical energy. In the primary cell, chemical reaction is irreversible. This cell can not be recharged. Examples of primary cells are Voltaic cell, Daniel cell, Leclanche cell and Dry cell *etc.*

(2) **Secondary cell :** A secondary cell is that cell in which the electrical energy is first stored up as a chemical energy and when the current is taken from the cell, the chemical energy is reconverted into electrical energy. In the secondary cell chemical reactions are reversible. The secondary cells are also called storage cell or accumulator. The commonly used secondary cells is lead accumulator.

(3) **Defects In a primary cell :** In voltaic cell there are two main defects arises.

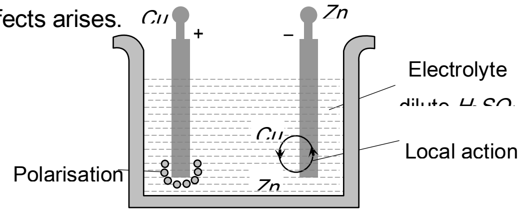

Fig. 20.5

Local action : It arises due to the presence of impurities of iron, carbon etc. on the surface of commercial *Zn* rod used as an electrode. The particles of these impurities and *Zn* in contact with sulphuric acid form minute voltaic cell in which small local electric currents are set up resulting in the wastage of *Zn* even when the cell is not sending the external current.

Removal : By amalgamating *Zn* rod with mercury (*i.e.* the surface of *Zn* is coated with *Hg*).

Polarisation : It arises, when the positive H_2 ions, which are formed by the action of *Zn* on sulphuric acid, travel towards the *Cu* rod and after transferring, the positive charge converted into H_2 gas atoms and get deposited in the form of neutral layer of a gas on the surface of *Cu* rod. This weakens the action of cell.

Removal : Either by brushing the anode the remove the layer or by using a depolariser (*i.e.* some oxidising agent MnO_2, $CuSO_4$ *etc* which may oxidise H_2 into water).

Thermo electric effect of current

If two wires of different metals are joined at their ends so as to form two junctions, then the resulting arrangement is called a "**Thermo couple**".

Seeback Effect

(1) **Definition :** When the two junctions of a thermo couple are maintained at different temperatures, then a current starts flowing through the loop known as thermo electric current. The potential difference between the junctions is called thermo electric emf which is of the order of a few micro-volts per degree temperature difference ($\mu V/^{o}C$).

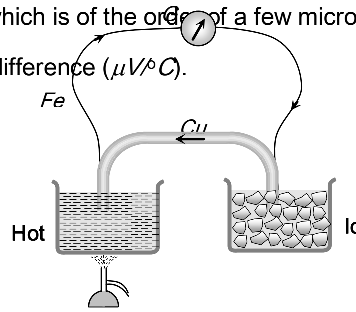

Fig. 20.6

(2) **Seebeck series :** The magnitude and direction of thermo emf in a thermocouple depends not only on the temperature difference between the hot and cold junctions but also on the nature of metals constituting the thermo couple.

(i) Seebeck arranged different metals in the decreasing order of their electron density. Few metals forming the series are as below.

Sb, *Fe*, *Cd*, *Zn*, *Ag*, *Au*, *Cr*, *Sn*, *Pb*, *Hg*, *Mn*, *Cu*, *Pt*, *Co*, *Ni*, *Bi*

(ii) Thermo electric emf is directly proportional to the distance between the two metals in series. Farther the metals in the series forming the thermo couple greater is the thermo emf. Thus maximum thermo emf is obtained for ***Sb-Bi*** thermo couple.

(iii) The current flow at the hot junction of the thermocouple is from the metal occurring later in the series towards that occurring earlier, Thus, in the ***copper-iron*** thermocouple the current flows from copper (*Cu*) to iron (*Fe*) at the hot junction. This may be remembered easily by the **hot coffee**.

(3) **Variation of thermo emf with temperature :** In a thermocouple as the temperature of the hot junction increases keeping the cold junction at constant temperature (say $0^{o}C$). The thermo emf increases till it becomes maximum at a certain temperature.

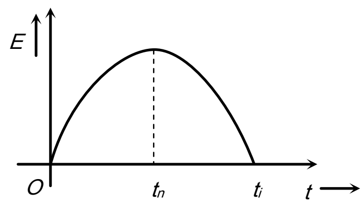

Fig. 20.7

(i) Thermo electric emf is given by the equation $E = \alpha t + \frac{1}{2}\beta t^2$ where α and β are thermo electric constant having units are $volt/^{o}C$ and $volt/^{o}C^2$ respectively (t = temperature of hot junction). For E to be maximum (at $t = t_n$)

$$\frac{dE}{dt} = 0 \;\; i.e. \;\alpha + \beta t_n = 0 \Rightarrow t_\eta = -\frac{\alpha}{\beta}$$

(ii) The temperature of hot junction at which thermo emf becomes maximum is called neutral temperature (t_n). Neutral temperature is constant for a thermo couple (*e.g.* for *Cu-Fe*, $t_n = 270^{o}C$)

(iii) Neutral temperature is independent of the temperature of cold junction.

(iv) If temperature of hot junction increases beyond neutral temperature, thermo emf start decreasing and at a particular temperature it becomes zero, on heating slightly further, the direction of emf is reversed. This temperature of hot junction is called temperature of inversion (t_i).

(v) Relation between t_n, t_i and t_c is $t_n = \frac{t_i + t_c}{2}$

(4) **Thermo electric power :** The rate of change of thermo emf with the change in the temperature of the hot junction is called thermoelectric power.

It is also given by the slope of parabolic curve representing the variation of thermo emf with temperature of the hot junction, as discussed in previous section.

The thermo electric power $\left(\frac{dE}{dt}\right)$ is also called **Seebeck coefficient**. Differentiating both sides of the equation of thermo emf with respect to t, we have thermoelectric power $P = \frac{dE}{dt} = \frac{d}{dt}(\alpha t + \frac{1}{2}\beta t^2)$

$\Rightarrow P = \alpha + \beta t$

The equation of the thermo electric power is of the type $y = mx + c$, so the graph of thermo electric power is as shown.

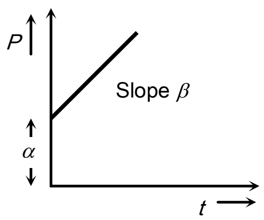

Fig. 20.8

(5) **Laws of thermoelectricity**

(i) **Law of successive temperature :** If initially temperature limits of the cold and the hot junction are t_1 and t_2, say the thermo emf is $E_{t_1}^{t_2}$. When the temperature limits are t_2 and t_3, then say the thermo emf is $E_{t_2}^{t_3}$ then $E_{t_1}^{t_2} + E_{t_2}^{t_3} = E_{t_1}^{t_3}$ where $E_{t_1}^{t_3}$ is the thermo emf when the temperature limits are $E_{t_1}^{t_3}$

(ii) **Law of intermediate metals :** Let *A*, *B* and *C* be the three metals of Seebeck series, where *B* lies between *A* and *C*. According to this law, $E_A^B + E_B^C = E_A^C$

When tin is used as a soldering metal in *Fe-Cu* thermocouple then at the junction, two different thermo couples are being formed. One is between iron and tin and the other is between tin and copper, as shown in figure

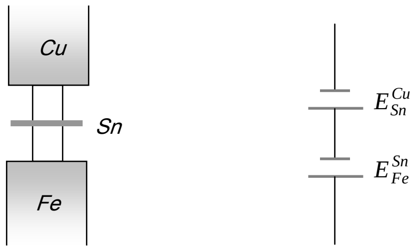

Fig. 20.9

If the soldering metal does not lie between two metals (in Seebeck series) of thermocouple then the resultant emf will be subtractive.

Peltier Effect

When current is passed through a junction of two different metals, the heat is either evolved or absorbed at the junction. This effect is known as Peltier effect. It is the reverse of Seebeck effect. (When a positive charge flows from high potential to low potential, it releases energy and when positive charge flows from low potential to high potential it absorbs energy.)

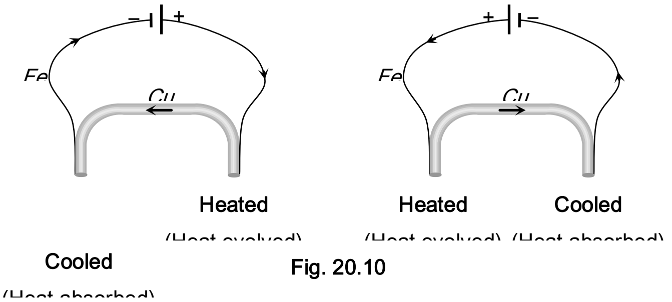

Fig. 20.10

Peltier co-efficient (π) : Heat absorbed or liberated at the junction is directly proportional to the charge passing through the junction *i.e.* $H \propto Q \Rightarrow H = \pi Q$; where π is called Peltier co-efficient. It's unit is *J/C* or *volt*.

Peltier co-efficient of a junction is the amount of heat absorbed or liberated per sec. When 1 *amp* of current is passed to the thermo couple.

It is found that $\pi = T\frac{dE}{dT} = T \times S$; where *T* is in Kelvin and $\frac{dE}{dT} = P =$ Seebeck coefficient *S*

Thomson's Effect

In Thomson's effect we deal with only metallic rod and not with thermocouple as in Peltiers effect and Seebeck's effect. (That's why sometimes it is known as homogeneous thermo electric effect. When a current flows thorough an unequally heated metal, there is an absorption or evolution of heat in the body of the metal. This is Thomson's effect.

(i) **Positive Thomson's effect :** In positive Thomson's effect it is found that hot end is at high potential and cold end is at low potential. Heat is evolved when current is passed from hotter end to the colder end and heat is absorbed when current is passed from colder end to hotter end. The metals which shows positive Thomson's effect are *Cu*, *Sn*, *Ag*, *Cd*, *Zn*... *etc*.

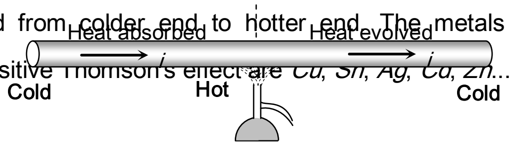

Fig. 28.11

(ii) **Negative Thomson's effect :** In the elements which show negative Thomson's effect, it is found that the hot end is at low potential and the cold end is at higher potential. Heat is evolved when current is passed from colder end to the hotter end and heat is absorbed when current flows from hotter end to colder end. The metals which shows negative. Thomson's effect are *Fe*, *Co*, *Bi*, *Pt*, *Hg* ... *etc*.

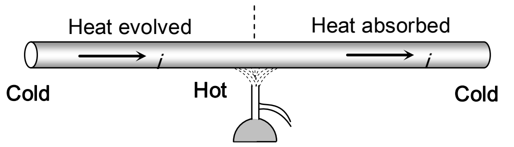

Fig. 20.12

Thomson's co-efficient : In Thomson's effect it is found that heat released or absorbed is proportional to $Q\Delta\theta$ *i.e.* $H \propto Q\Delta\theta$ $\Rightarrow$ $H = \sigma Q\Delta\theta$ where σ = Thomson's coefficient. It's unit is *Joule*/*coulomb*°*C* or *volt*/°*C* and $\Delta\theta$ = temperature difference.

If *Q* = 1 and $\Delta\theta$ = 1 then $\sigma = H$ so the amount of heat energy absorbed or evolved per second between two points of a conductor having a unit temperature difference, when a unit current is passed is known as Thomson's co-efficient for the material of a conductor.

It can be proved that Thomson co-efficient of the material of conductor $\sigma = -T\frac{d^2E}{dT^2} = -T\left(\frac{dS}{dT}\right) = T \times \beta$; where β = Thermo electric constant $= \frac{dS}{dt}$

Application of Thermo Electric Effect

(1) **To measure temperature :** A thermocouple is used to measure very high (2000°*C*) as well as very low (– 200°*C*) temperature in industries and laboratories. The thermocouple used to measure very high temperature is called pyrometer.

(2) **To detect heat radiation :** A thermopile is a sensitive instrument used for detection of heat radiation and measurement of their intensity. It is based upon Seebeck effect.

A thermoppile consists of a number of thermocouples of *Sb-Bi*, all connected in series.

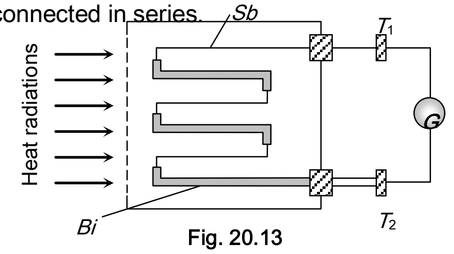

Fig. 20.13

Table 20.3: Heating effect and Thermo-electric effects

S.No.	Joule's effect	Peltier's effect	Seebeck effect	Thomson's effect
1.	Heat produced is directly proportional to the square of the current passing through a	Heat produced or absorbed at a junction is proportional to the current through the junction.	Here temperature difference of junction is used to produce thermo e.m.f. and vice versa.	Thomson's heat is proportional to the current passing through the conductor.

	conductor.			
2.	This effect is produced due to collision of free electrons with positive ions of the current carrying conductor.	This effect is produced when current is passed through junction of suitable materials.	This effect produced when junctions of a themocouple are kept at different temperatures.	This effect is produced when parts of same conductor are kept at different temperature.
3.	It is not a reversible effect.	It is a reversible effect	It is a reversible effect	It is a reversible effect
4.	Heat produced depends upon resistance (and thus temperature also) of the conductor.	Heat exchange depends upon nature of conductors and temperature of the junctions.	This effect depends upon nature of materials used to form junctions and temperature of junctions.	This effect depends upon nature of conductor and temperature difference of different parts of the conductor.
5.	It is basically a heating effect	It can be heating as well as cooling effect.	Different junctions are at different temperature.	It is heating as well as cooling effect.

This instrument is so sensitive that it can detect heat radiations from a match stick lighted at a distance of 50 *metres* from the thermopile.

(3) **Thermoelectric refrigerator :** The working of thermo-electric refrigerator is based on Peltier effect.

(4) **Thermoelectric generator :** Thermocouple can be used to generate electric power using Seebeck effect in remote areas.

(5) **Thero-couple meter :** The current to be measured passes through a resistance where heat is generated in the amount of i^2R *joule/sec*. The hot junction of the thermocouple is in contact with this resistance, and resulting thermoelectic current gives deflection in the galvanometer *G*.

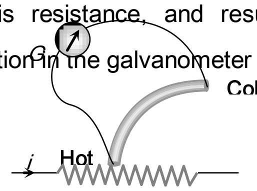

Fig. 20.14

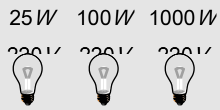
Tips & Tricks

If $V_{Applied} < V_{Rated}$ then % drop in output power of electrical device $= \frac{(P_R - P_{consumed})}{P_R} \times 100$

✍ Different bulbs



⇒ Resistance $R_{25} > R_{100} > R_{1000}$

⇒ Thickness of filament $t_{1000} > t_{100} > t_{40}$

⇒ Brightness $B_{1000} > B_{100} > B_{25}$

✍ Time taken by heater to raise the temperature by $\Delta\theta$ of *m kg* (or *m litre*) water is given by $t = \frac{4180(\text{or } 4200) m\,\Delta\theta}{p}$

✍ Necessary series resistance to glow a bulb, if $V_{Applied} > V_{Rated}$

$$R = \left(\frac{V_{Applied} - V_{Rated}}{P_R}\right) \times V_R$$ (P_R = Rated power of bulb)

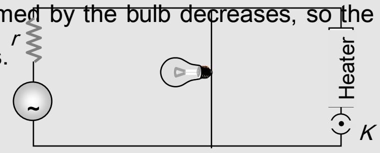
✍ When some potential difference applied across the conductor then collision of free electrons with ions of the lattice result's in conversion of electrical energy into heat energy

✍ If a heating coil of resistance R, (length l) consumed power *P*, when voltage *V* is applied to it then by keeping *V* constant if it is cut in n equal parts then resistance of each part will be R/n and from $P_{consumed} \propto \frac{1}{R}$, power consumed by each part $P' = nP$.

✍ In series a device of higher power rating consumes less power.

✍ Consider that *n* bulbs are connected in series across *V* volt supply. If one bulb gets fused and (*n* – 1) bulbs are again connected in series across same supply, the illumination will be more with (*n* – 1) bulbs then *n* bulbs but risk of fusing of bulbs will increases.

✍ When a heavy current appliance such us motor, heater or geyser is switched on, it will draw a heavy current from the source so that terminal voltage of source decreases. Hence power consumed by the bulb decreases, so the light of bulb becomes less.



✍ *If ρ is the density of the material deposited and A is the area of deposition then the thickness (d) of the layer of the material deposited in electroplating process is* $d = \frac{m}{\rho A} = \frac{Zit}{\rho A}$; *where m = deposited mass, Z = electro chemical equivalent, i = electric current.*

✍ Charging current for a secondary cell

$$= \frac{\text{e.m.f. of charger} - \text{e.m.f. of cell}}{\text{Total resistance of the circuit}}$$

✍ Efficiency of a cell is given by $\eta = \frac{R}{r+R}$ where *R* is external resistance and *r* is internal resistance.

✍ The efficiency of cell is 50% when the power dissipated in the external circuit is maximum.

✍ Thermo couple can be compared to a heat engine. It absorbs heat at the junction (source) converts heat into electric energy (which appears as the circulating electric current) and rejects the remaining heat to cold junction (Sink).

Ordinary Thinking

Objective Questions

Heating Effect of Current

1. One *kilowatt* hour is equal to **[NCERT 1974; MP PMT 2002]**

(a) 36×10^5 *joules* (b) 36×10^3 *joules*

(c) 10^3 *joules* (d) 10^5 *joules*

2. If R_1 and R_2 are respectively the filament resistances of a 200 *watt* bulb and 100 *watt* bulb designed to operate on the same voltage, then **[NCERT 1980; CPMT 1991, 97]**

(a) R_1 is two times R_2 (b) R_2 is two times R_1

(c) R_2 is four times R_1 (d) R_1 is four times R_2

3. Two electric bulbs, one of 200 *volt* 40 *watt* and the other 200 *volt* 100 *watt* are connected in a house wiring circuit

[NCERT 1971; CBSE PMT 2000]

(a) They have equal currents through them

(b) The resistance of the filaments in both the bulbs is same

(c) The resistance of the filament in 40 *watt* bulb is more than the resistance in 100 *watt* bulb

(d) The resistance of the filament in 100 *watt* bulb is more than the resistance in 40 *watt* bulb

4. The two bulbs as in the above question are connected in series to a 200 *volt* line. Then

(a) The potential drop across the two bulbs is the same

(b) The potential drop across the 40 *watt* bulb is greater than the potential drop across the 100 *watt* bulb

(c) The potential drop across the 100 *W* bulb is greater than the potential drop across the 40 *W* bulb

(d) The potential drop across both the bulb is 200 *volt*

5. Forty electric bulbs are connected in series across a 220 *V* supply. After one bulb is fused, the remaining 39 are connected again in series across the same supply. The illumination will be

[NCERT 1972; Haryana CEE 1996; DPMT 2001]

(a) More with 40 bulbs than with 39
(b) More with 39 bulbs than with 40
(c) Equal in both the cases
(d) In the ratio of $49^2 : 39^2$

6. The material of fuse wire should have [BHU 1999; MH CET 2001; CBSE PMT 2003]

(a) A high specific resistance and high melting point
(b) A low specific resistance and low melting point
(c) A high specific resistance and low melting point
(d) A low specific resistance and a high melting point

7. Two electric bulbs whose resistances are in the ratio of 1 : 2 are connected in parallel to a constant voltage source. The powers dissipated in them have the ratio [NCERT 1977; MP PMT 1994, 2000]

(a) 1 : 2 (b) 1 : 1
(c) 2 : 1 (d) 1 : 4

8. A heater coil is cut into two parts of equal length and one of them is used in the heater. The ratio of the heat produced by this half coil to that by the original coil is [NCERT 1972; AIEEE 2005; CBSE PMT 2005]

(a) 2 : 1 (b) 1 : 2
(c) 1 : 4 (d) 4 : 1

9. Resistance of one carbon filament and one tungsten lamp are measured individually when the lamp are lit and compared with their respective resistances when cold. Which one of the following statements will be true [NCERT 972]

(a) Resistance of the carbon filament lamp will increase but that of the tungsten will diminish when hot
(b) Resistance of the tungsten filament lamp will increase but that of carbon will diminish when hot
(c) Resistances of both the lamps will increase when hot
(d) Resistances of both the lamps will decrease when hot

10. The mechanism of the heat produced in a conductor when an electric current flows through it, can be explained on the basis of

(a) Viscosity (b) Friction
(c) Free electron theory (d) Gauss's theorem

11. Two electric bulbs whose resistances are in the ratio of 1 : 2 are connected in series. The powers dissipated in them have the ratio [NCERT 1977]

(a) 1 : 2 (b) 2 : 1
(c) 1 : 1 (d) 1 : 4

12. You are given a resistance wire of length 50 cm and a battery of negligible resistance. In which of the following cases is largest amount of heat generated

(a) When the wire is connected to the battery directly
(b) When the wire is divided into two parts and both the parts connected to the battery in parallel
(c) When the wire is divided into four parts and all the four connected to the battery in parallel
(d) When only half the wire is connected to the battery

13. What is immaterial for an electric fuse wire [MNR 1984; MP PMT 2002; CPMT 1996, 2003]

(a) Its specific resistance
(b) Its radius
(c) Its length
(d) Current flowing through it

14. The electric bulbs have tungsten filaments of same length. If one of them gives 60 *watt* and other 100 *watt*, then [NCERT 1979]

(a) 100 *watt* bulb has thicker filament
(b) 60 *watt* bulb has thicker filament
(c) Both filaments are of same thickness
(d) It is possible to get different wattage unless the lengths are different

15. Three equal resistors connected in series across a source of e.m.f. together dissipate 10 watt. If the same resistors are connected in parallel across the same e.m.f., then the power dissipated will be [CBSE PMT 1998; KCET (Engg.) 1999; MP PMT 2003]

(a) 10 *watt* (b) 30 *watt*
(c) 10/3 *watt* (d) 90 *watt*

16. How much energy in kilowatt hour is consumed in operating ten 50 watt bulbs for 10 hours per day in a month (30 days). [NCERT 1978, 80; CPMT 1991]

(a) 1500 (b) 5,000
(c) 15 (d) 150

17. (1) The product of a volt and a coulomb is a joule.
(2) The product of a volt and an ampere is a joule/second.
(3) The product of volt and watt is horse power.
(4) Watt-hour can be measured in terms of electron volt.

State if [NCERT 1978; MP PMT 2003]

(a) All four are correct
(b) (1), (2) and (4) are correct
(c) (1) and (3) are correct
(d) (3) and (4) are correct

18. A 25 *W*, 220 *V* bulb and a 100 *W*, 220 *V* bulb are connected in parallel across a 440 *V* line [CBSE PMT 2001]

(a) Only 100 *watt* bulb will fuse
(b) Only 25 *watt* bulb will fuse
(c) Both bulbs will fuse
(d) None of the bulbs will fuse

19. Two electric lamps of 40 watt each are connected in parallel. The power consumed by the combination will be [CPMT 1984]

(a) 20 *watt* (b) 60 *watt*
(c) 80 *watt* (d) 100 *watt*

20. Two heating coils, one of fine wire and the other of thick wire of the same material and of the same length are connected in series and in parallel. Which of the following statement is correct

(a) In series fine wire liberates more energy while in parallel thick wire will liberate more energy
(b) In series fine wire liberates less energy while in parallel thick wire will liberate more energy
(c) Both will liberate equally
(d) In series the thick wire will liberate more while in parallel it will liberate less energy

21. An electric bulb is rated 220 *volt* and 100 *watt*. Power consumed by it when operated on 110 *volt* is [CPMT 1986; MP PMT 1986, 94; AFMC 2000]

(a) 50 *watt* (b) 75 *watt*
(c) 90 *watt* (d) 25 *watt*

22. A 25 *watt*, 220 *volt* bulb and a 100 *watt*, 220 *volt* bulb are connected in series across a 220 *volt* lines. Which electric bulb will glow more brightly [MP PET 1999; MP PMT 1999]

(a) 25 *watt* bulb
(b) 100 *watt* bulb
(c) First 25 watt and then 100 *watt*
(d) Both with same brightness

23. A resistor R_1 dissipates the power P when connected to a certain generator. If the resistor R_2 is put in series with R_1, the power dissipated by R_1 [CPMT 1985; MNR 1998]

(a) Decreases
(b) Increases
(c) Remains the same
(d) Any of the above depending upon the relative values of R_1 and R_2

24. An electric fan and a heater are marked as 100 *watt*, 220 *volt* and 1000 *watt*, 220 volt respectively. The resistance of the heater is

(a) Zero
(b) Greater than that of the fan
(c) Less than that of the fan
(d) Equal to that of the fan

25. According to Joule's law, if the potential difference across a conductor having a material of specific resistance remains constant, then the heat produced in the conductor is directly proportional to

(a) ρ (b) ρ^2
(c) $\frac{1}{\sqrt{\rho}}$ (d) $\frac{1}{\rho}$

26. Two heater wires of equal length are first connected in series and then in parallel. The ratio of heat produced in the two cases is [MNR 1987; UPSEAT 1999; MP PMT 1996, 2000, 01; AIIMS 2000; MP PET 1999, 2002; BHU 2004; Pb PET 2004]

(a) 2 : 1 (b) 1 : 2
(c) 4 : 1 (d) 1 : 4

27. Two bulbs of equal wattage, one having carbon filament and the other having a tungsten filament are connected in series to the mains, then

(a) Both bulbs glow equally
(b) Carbon filament bulb glows more
(c) Tungsten filament bulbs glows more
(d) Carbon filament bulb glows less

28. Two identical heaters rated 220 *volt*, 1000 watt are placed in series with each other across 220 *volt* lines. If resistance do not change with temperature, then the combined power is

(a) 1000 *watt* (b) 2000 *watt*
(c) 500 *watt* (d) 4000 *watt*

29. A 25 *watt*, 220 *volt* bulb and a 100 *watt*, 220 *volt* bulb are connected in parallel across a 220 *volt* line. Which bulb will glow more brightly

(a) 25 *watt* bulb
(b) 100 *watt* bulb
(c) Both will have same brightness

(d) First 25 *watt* then 100 *watt*

30. If two bulbs of wattage 25 and 100 respectively each rated at 220 *volt* are connected in series with the supply of 440 *volt*, then which bulbs will fuse [MNR 1988]

(a) 100 *watt* bulb (b) 25 *watt* bulb
(c) None of them (d) Both of them

31. If current in an electric bulb changes by 1%, then the power will change by [AFMC 1996]

(a) 1% (b) 2%
(c) 4% (d) $\frac{1}{2}\%$

32. Two identical batteries, each of e.m.f. 2 *volt* and internal resistance 1.0 ohm are available to produce heat in an external resistance $R = 0.5\ ohm$ by passing a current through it. The maximum Joulean power that can be developed across *R* using these batteries is

[CBSE PMT 1990; BHU 1997]

(a) 1.28 *watt* (b) 2.0 *watt*
(c) $\frac{8}{9} watt$ (d) 3.2 *watt*

33. A constant voltage is applied between the two ends of a metallic wire. If both the length and the radius of the wire are doubled, the rate of heat developed in the wire

[MP PMT 1996]

(a) Will be doubled (b) Will be halved
(c) Will remain the same (d) Will be quadrupled

34. The heating coils rating at 220 *volt* and producing 50 *cal/sec* heat are available with the resistances $55\,\Omega, 110\,\Omega, 220\,\Omega$ and $440\,\Omega$. The heater of maximum power will be of

[MP PMT 1985]

(a) $440\,\Omega$ (b) $220\,\Omega$
(c) $110\,\Omega$ (d) $55\,\Omega$

35. Which of the following statement is false

(a) Heat produced in a conductor is proportional to its resistance
(b) Heat produced in a conductor is proportional to the square of the current
(c) Heat produced in a conductor is proportional to charge
(d) Heat produced in a conductor is proportional to the time for which current is passed

36. On an electric heater 220 *volt* and 1100 *watt* are marked. On using it for 4 hours, the energy consumed in *kWh* will be

(a) 2 (b) 4.4
(c) 6 (d) 8

37. An electric heater kept in vacuum is heated continuously by passing electric current. Its temperature [MP PET 1993]

(a) Will go on rising with time
(b) Will stop after sometime as it will loose heat to the surroundings by conduction
(c) Will rise for sometime and there after will start falling
(d) Will become constant after sometime because of loss of heat due to radiation

38. Heat produced in a wire of resistance R due to current flowing at constant potential difference is proportional to

[MP PET 1993]

(a) $\frac{1}{R^2}$ (b) $\frac{1}{R}$
(c) R (d) R^2

39. The power rating of an electric motor which draws a current of 3.75 *amperes* when operated at 200 *V* is about

(a) 1 H.P. (b) 500 *W*
(c) 54 *W* (d) 750 H.P.

40. An electric bulb of 100 *watt* is connected to a supply of electricity of 220 *V*. Resistance of the filament is

[EAMCET 1981, 82; MP PMT 1993, 97]

(a) $484\,\Omega$ (b) $100\,\Omega$
(c) $22000\,\Omega$ (d) $242\,\Omega$

41. A cable of resistance $10\,\Omega$ carries electric power from a generator producing 250 *kW* at 10000 *volt*. The current in the cable is

(a) 25 *A* (b) 250 *A*
(c) 100 *A* (d) 1000 *A*

42. In the above question, the power lost in the cable during transmission is

(a) 12.5 *kW* (b) 6.25 *kW*
(c) 25 *kW* (d) 3.15 *kW*

43. The heat generated through 2 *ohm* and 8 *ohm* resistances separately, when a condenser of 200 μF capacity charged to 200 *V* is discharged one by one, will be [MP PET 1993]

(a) 4 *J* and 16 *J* respectively
(b) 16 *J* and 4 *J* respectively
(c) 4 *J* and 8 *J* respectively
(d) 4 *J* and 4 *J* respectively

44. Two bulbs are in parallel and they together consume 48 *W* from a battery of 6 *V*. The resistance of each bulb is

(a) $0.67\,\Omega$ (b) $3.0\,\Omega$
(c) $4.0\,\Omega$ (d) $1.5\,\Omega$

45. The heat developed in an electric wire of resistance *R* by a current *I* for a time *t* is [MP PMT 1993; MP PET 2005]

(a) $\frac{I^2Rt}{4.2} cal$ (b)
(c) $\frac{I^2R}{4.2\,t} cal$ (d) $\frac{Rt}{4.2\,I^2} cal$

46. Two bulbs, one of 50 *watt* and another of 25 *watt* are connected in series to the mains. The ratio of the currents through them is

(a) 2 : 1
(b) 1 : 2
(c) 1 : 1
(d) Without voltage, cannot be calculated

47. The brightness of a bulb will be reduced, if a resistance is connected in

(a) Series with it
(b) Parallel with it
(c) Series or parallel with it
(d) Brightness of the bulb cannot be reduced

48. A 100 *watt* bulb working on 200 *volt* and a 200 *watt* bulb working on 100 *volt* have

(a) Resistances in the ratio of 4 : 1
(b) Maximum current ratings in the ratio of $1:4$
(c) Resistances in the ratio of 2 : 1
(d) Maximum current ratings in the ratio of 1 : 2

49. There are two electric bulbs of 40 *W* and 100 *W*. Which one will be brighter when first connected in series and then in parallel,
(a) 40 *W* in series and 100 *W* in parallel
(b) 100 *W* in series and 40 *W* in parallel
(c) 40 *W* both in series and parallel will be uniform
(d) 100 *W* both in series and parallel will be uniform

50. Two resistances R_1 and R_2 when connected in series and parallel with 120 *V* line, power consumed will be 25 *W* and 100 *W* respectively. Then the ratio of power consumed by R_1 to that consumed by R_2 will be [EAMCET 1983]
(a) 1 : 1 (b) 1 : 2
(c) 2 : 1 (d) 1 : 4

51. A 220 *volt* and 800 *watt* electric kettle and three 220 *volt* and 100 *watt* bulbs are connected in parallel. On connecting this combination with 220 *volt* electric supply, the total current will be
(a) 0.15 *ampere* (b) 5.0 *ampere*
(c) 5.5 *ampere* (d) 6.9 *ampere*

52. You are given three bulbs of 25, 40 and 60 *watt*. Which of them has lowest resistance [NCERT 1982]
(a) 25 *watt* bulb (b) 40 *watt* bulb
(c) 60 *watt* bulb (d) Information is insufficient

53. The value of internal resistance of an ideal cell is [EAMCET 1989]
(a) Zero (b) $0.5\,\Omega$
(c) $1\,\Omega$ (d) Infinity

54. Electric power is transmitted over long distances through conducting wires at high voltage because [MP PET 1994]
(a) High voltage travels faster
(b) Power loss is large
(c) Power loss is less
(d) Generator produced electrical energy at a very high voltage

55. A coil develops heat of 800 *cal/sec*. When 20 *volts* is applied across its ends. The resistance of the coil is (1 *cal* = 4.2 *joule*)
(a) $1.2\,\Omega$ (b) $1.4\,\Omega$
(c) $0.12\,\Omega$ (d) $0.14\,\Omega$

56. Resistances R_1 and R_2 are joined in parallel and a current is passed so that the amount of heat liberated is H_1 and H_2 respectively. The ratio $\frac{H_1}{H_2}$ has the value [MP PMT 1994]
(a) $\frac{R_2}{R_1}$ (b) $\frac{R_1}{R_2}$
(c) $\frac{R_1^2}{R_2^2}$ (d) $\frac{R_2^2}{R_1^2}$

57. The internal resistance of a primary cell is 4 *ohm*. It generates a current of 0.2 *amp* in an external resistance of 21 *ohm*. The rate at which chemical energy is consumed in providing the current is
(a) $0.42\,J/s$ (b) $0.84\,J/s$
(c) $5\,J/s$ (d) $1\,J/s$

58. A heating coil is labelled 100 *W*, 220 *V*. The coil is cut in half and the two pieces are joined in parallel to the same source. The energy now liberated per second is [CBSE PMT 1995]
(a) 200 *J* (b) 400 *J*
(c) 25 *J* [MP PET 1993] (d) 50 *J*

59. Which of the following is not a correct statement [MP PET 1995]
(a) Resistivity of electrolytes decreases on increasing temperature
(b) Resistance of mercury falls on decreasing its temperature
(c) When joined in series a 40 *W* bulb glows more than a 60 *W* bulb
(d) Resistance of 40 *W* bulb is less than the resistance of 60 *W* bulb

60. Three light bulbs of 40 *W*, 60 *W* and 100 *W* are connected in series with 220 *V* source. Which one of the bulbs will glow brightest[MP PMT 1995; UI
(a) 40 *W*
(b) 60 *W*
(c) 100 *W*
(d) All with the same brightness [MP PMT 1975]

61. The energy consumed in 1 *kilowatt* electric heater in 30 *seconds* will be
(a) $6\times10^2\ J$ (b) $4.99\times10^7\ J$
(c) $9.8\times10^6\ J$ (d) $3\times10^4\ J$

62. Two bulbs of 500 *watt* and 200 *watt* are manufactured to operate on 220 *volt* line. The ratio of heat produced in 500 *W* and 200 *W*, in two cases, when firstly they are joined in parallel and secondly in series, will be [MP PET 1996; DPMT 1999]
(a) $\frac{5}{2},\frac{2}{5}$ (b) $\frac{5}{2},\frac{5}{2}$
(c) $\frac{2}{5},\frac{5}{2}$ (d) $\frac{2}{5},\frac{2}{5}$

63. A 60 *watt* bulb carries a current of 0.5 *amp*. The total charge passing through it in 1 *hour* is [MP PMT 1996]
(a) 3600 *coulomb* (b) 3000 *coulomb*
(c) 2400 *coulomb* (d) 1800 *coulomb*

64. An electric heater of resistance 6 *ohm* is run for 10 *minutes* on a 120 *volt* line. The energy liberated in this period of time is [MP PET 1994]
(a) $7.2\times10^3\ J$ (b) $14.4\times10^5\ J$
(c) $43.2\times10^4\ J$ (d) $28.8\times10^4\ J$

65. Two bulbs are working in parallel order. Bulb *A* is brighter than bulb *B*. If R_A and R_B are their resistance respectively then
(a) $R_A > R_B$ (b) $R_A < R_B$
(c) $R_A = R_B$ (d) None of these

66. Two conductors made of the same material are connected across a common potential difference. Conductor *A* has twice the diameter and twice the length of conductor *B*. The power delivered to the two conductors P_A and P_B respectively is such that P_A/P_B equals to
(a) 0.5 (b) 1.0
(c) 1.5 (d) 2.0

67. A heating coil can heat the water of a vessel from $20°C$ to $60°C$ in 30 *minutes*. [MP PMT 1994] Two such heating coils are put in series and then used to heat the same amount of water through the same temperature range. The time taken now will be (neglecting thermal capacity of the coils) [MP PMT 1997]
(a) 60 *minutes* (b) 30 *minutes*
(c) 15 *minutes* (d) 7.5 *minutes*

68. If 2.2 *kilowatt* power is transmitted through a 10 *ohm* line at 22000 *volt*, the power loss in the form of heat will be [MP PMT/PET 1998]

(a) 0.1 *watt* (b) 1 *watt*
(c) 10 *watt* (d) 100 *watt*

69. Two resistors having equal resistances are joined in series and a current is passed through the combination. Neglect any variation in resistance as the temperature changes. In a given time interval

(a) Equal amounts of thermal energy must be produced in the resistors
(b) Unequal amounts of thermal energy may be produced
(c) The temperature must rise equally in the resistors
(d) The temperature must rise unequally in the resistors

70. A $5°C$ rise in temperature is observed in a conductor by passing a current. When the current is doubled the rise in temperature will be approximately [CBSE PMT 1998]

(a) $16°C$ (b) $10°C$
(c) $20°C$ (d) $12°C$

71. *Watt-hour* meter measures [KCET 1994]

(a) Electric energy (b) Current
(c) Voltage (d) Power

72. An electric lamp is marked 60 *W*, 230 *V*. The cost of 1 *kilowatt* hour of power is *Rs.* 1.25. The cost of using this lamp for 8 hours is

(a) *Rs.* 1.20 (b) *Rs.* 4.00
(c) *Rs.* 0.25 (d) *Rs.* 0.60

73. 4 bulbs marked 40 *W*, 250 *V* are connected in series with 250 *V* mains. The total power is [EAMCET (Engg.) 1995]

(a) 10 *W* (b) 40 *W*
(c) 320 *W* (d) 160 *W*

74. Pick out the wrong statement [AMU 1995]

(a) In a simple battery circuit, the point of lowest potential is the negative terminal of the battery
(b) The resistance of an incandescent lamp is greater when the lamp is switched off
(c) An ordinary 100 *W* lamp has less resistance than a 60 *W* lamp
(d) At constant voltage, the heat developed in a uniform wire varies inversely as the length of the wire used

75. Two resistors of $6\,\Omega$ and 9Ω are connected in series to a 120 *volt* source. The power consumed by the $6\,\Omega$ resistor is [SCRA 1994]

(a) 384 *W* (b) 576 *W*
(c) 1500 *W* (d) 1200 *W*

76. Electric room radiator which operates at 225 *volts* has resistance of 50 *ohms*. Power of the radiator is approximately

(a) 100 *W* (b) 450 *W*
(c) 750 *W* (d) 1000 *W*

77. If a power of 100 *W* is being supplied across a potential difference of 200 *V*, current flowing is [AFMC 1993]

(a) 2 *A* (b) 0.5 *A*
(c) 1 *A* (d) 20 *A*

78. A current of 2 *A* passing through conductor produces 80 *J* of heat in 10 *seconds*. The resistance of the conductor is [CBSE PMT 1993]

(a) $0.5\,\Omega$ (b) $2\,\Omega$
(c) $4\,\Omega$ (d) $20\,\Omega$

79. A $4\mu F$ conductor is charged to 400 *volts* and then its plates are joined through a resistance of $1k\Omega$. The heat produced in the resistance is [CBSE PMT 1994]

(a) 0.16 *J* (b) 1.28 *J*
(c) 0.64 *J* (d) 0.32 *J*

80. A 10 *ohm* electric heater operates on a 110 *V* line. Calculate the rate at which it develops heat in watts [MP PMT 1999] [AFMC 1997]

(a) 1310 *W* (b) 670 *W*
(c) 810 *W* (d) 1210 *W*

81. A (100 *W*, 200 *V*) bulb is connected to a 160 *V* power supply. The power consumption would be [CBSE PMT 1997; JIPMER 2000]

(a) 64 *W* (b) 80 *W*
(c) 100 *W* (d) 125 *W*

82. A battery of e.m.f. 10 *V* and internal resistance 0.5 *ohm* is connected across a variable resistance *R*. The value of *R* for which the power delivered in it is maximum is given by [BHU 1998; JIPMER 2001, 02; CBSE PMT 2001]

(a) 2.0 *ohm* (b) 0.25 *ohm*
(c) 1.0 *ohm* (d) 0.5 *ohm*

83. A piece of fuse wire melts when a current of 15 *ampere* flows through it. With this current, if it dissipates 22.5 *W*, the resistance of fuse wire will be [KCET 1994] [MNR 1998]

(a) Zero (b) $10\,\Omega$
(c) 1Ω (d) $0.10\,\Omega$

84. Two wires '*A*' and '*B*' of the same material have their lengths in the ratio 1 : 2 and radii in the ratio 2 : 1. The two wires are connected in parallel across a battery. The ratio of the heat produced in '*A*' to the heat produced in '*B*' for the same time is

(a) $1:2$ (b) $2:1$
(c) $1:8$ (d) $8:1$

85. A heater draws a current of 2*A* when connected to a 250 *V* source. The rate of energy dissipation is [JIPMER 1999]

(a) 500 *W* (b) 1000 *W*
(c) 250 *W* (d) 125 *W*

86. A bulb rated at (100 *W* – 200 *V*) is used on a 100 *V* line. The current in the bulb is [JIPMER 1999]

(a) $\frac{1}{4}$ *amp* (b) 4 *amp*
(c) $\frac{1}{2}$ *amp* [SCRA 1994] (d) 2 *amp*

87. A steel wire has a resistance twice that of an aluminium wire. Both of them are connected with a constant voltage supply. More heat will be dissipated in [Roorkee 1999]

(a) Steel wire when both are connected in series
(b) Steel wire when both are connected in parallel
(c) Aluminium wire when both are connected in series
(d) Aluminium wire when both are connected in parallel

88. A current *i* passes through a wire of length *l*, radius of cross-section *r* and resistivity ρ. The rate of heat generation is [AMU (Med.) 1999]

(a) $\frac{i^2 l\rho}{\pi r^2}$ (b) $i^2\left(\frac{l\rho}{\pi r^2}\right)^2$

(c) $i^2 l\rho / r$ (d) $il\rho / r$

89. Which of the following is not equal to *watt* [DPMT 1999]

(a) $(Amp)^2 \times ohm$ (b) *Amp / Volt*

(c) *Amp* × *Volt* (d) *Joule / sec*

90. Two wires with resistances R and $2R$ are connected in parallel, the ratio of heat generated in $2R$ and R is

[DCE 1999, 2000]

(a) 1 : 2 (b) 2 : 1

(c) 1 : 4 (d) 4 : 1

91. If a high power heater is connected to electric mains, then the bulbs in the house become dim, because there is a

[BHU 1999; Pb. PMT 2000]

(a) Current drop (b) Potential drop

(c) No current drop (d) No potential drop

92. If three bulbs 60 *W*, 100 *W* and 200 *W* are connected in parallel, then

(a) 200 *W* bulb will glow more

(b) 60 *W* bulb will glow more

(c) 100 *W* bulb will glow more

(d) All the bulbs will glow equally

93. An expression for rate of heat generated, if a current of *I* ampere flows through a resistance of $R\,\Omega$, is [Pb. PMT 2000]

(a) $I^2 Rt$ (b) $I^2 R$

(c) $V^2 R$ (d) $I\,R$

94. On giving 220 *V* to a resistor the power dissipated is 40 *W* then value of resistance is [RPMT 2000]

(a) 1210 Ω (b) 2000 Ω

(c) 1000 Ω (d) None of these

95. A 60 *watt* bulb operates on 220 *V* supply. The current flowing through the bulb is [MP PMT 2000]

(a) 11/3 *amp* (b) 3/11 *amp*

(c) 3 *amp* (d) 6 *amp*

96. If two bulbs of wattage 25 and 30, each rated at 220 *volts*, are connected in series with a 440 *volt* supply, which bulb will fuse

[MP PET 2000]

(a) 25 *W* bulb (b) 30 *W* bulb

(c) Neither of them (d) Both of them

97. Two electric bulbs (60 *W* and 100 *W* respectively) are connected in series. The current passing through them is

[AMU (Med.) 2000]

(a) More in 100 *W* bulb (b) More in 60 *W* bulb

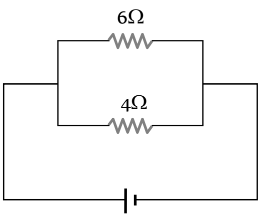
(c) Same in both (d) None of these

98. In the circuit shown below, the power developed in the 6Ω resistor is 6 watt. The power in watts developed in the 4Ω resistor is

(a) 16

(b) 9

(c) 6



(d) 4

99. Two wires *A* and *B* of same material and mass have their lengths in the ratio 1 : 2. On connecting them to the same source, the rate of heat dissipation in *B* is found to be 5 *W*. The rate of heat dissipation in *A* is [AMU (Engg.) 2000]

(a) 10 *W* (b) 5 *W*

(c) 20 *W* (d) None of these

100. If two electric bulbs have 40 *W* and 60 *W* rating at $220V$, then the ratio of their resistances will be

[BHU 1999; KCET 2001]

(a) 3 : 2 (b) 2 : 3

(c) 3 : 4 (d) 4 : 3

101. An electric bulb is designed to draw power P_0 at voltage V_0. If the voltage is *V* it draws a power *P*. Then [KCET 2001]

(a) $P = \left(\frac{V_0}{V}\right)^2 P_0$ (b) $P = \left(\frac{V}{V_0}\right)^2 P_0$

[BHU 2000]

(c) $P = \left(\frac{V}{V_0}\right) P_0$ (d) $P = \left(\frac{V_0}{V}\right) P_0$

102. Three bulbs of 40 *W*, 60 *W* and 100 *W* are arranged in series with 220 *V*. Which bulb has minimum resistance

[AFMC 2001]

(a) 40 *W* (b) 60 *W*

(c) 100 *W* (d) Equal in all bulbs

103. An electric kettle has two heating coils. When one coil is used, water in the kettle boils in 5 minutes, while when second coil is used, same water boils in 10 minutes. If the two coils, connected in parallel are used simultaneously, the same water will boil in time

(a) 3 *min* 20 *sec* (b) 5 *min*

(c) 7 *min* 30 *sec* (d) 2 *min* 30 *sec*

104. An external resistance *R* is connected to a battery of e.m.f. *V* and internal resistance *r*. The joule heat produced in resistor *R* is maximum when *R* is equal to [MP PET 2001]

(a) r (b) $\frac{r}{2}$

(c) $2r$ (d) Infinitely large

105. The amount of heat produced in a resistor when a current is passed through it can be found using [Kerala PET 2001]

(a) Faraday's Law (b) Kirchhoff's Law

(c) Laplace's Law (d) Joule's Law

106. Two wires have resistance of 2Ω and 4Ω connected to same voltage, ratio of heat dissipated at resistance is

[UPSEAT 2001]

(a) 1 : 2 (b) 4 : 3

(c) 2 : 1 (d) 5 : 2

[AMU (Med.) 2000]

107. Two electric bulbs rated P_1 watt *V* volts and P_2 watt *V* volts are connected in parallel and *V* volts are applied to it. The total power will be [MP PMT 2001; MP PET 2002]

(a) $P_1 + P_2 watt$ (b) $\sqrt{P_1 P_2}$ watt

(c) $\frac{P_1 P_2}{P_1 + P_2} watt$ (d) $\frac{P_1 + P_2}{P_1 P_2} watt$

108. n identical bulbs, each designed to draw a power p from a certain voltage supply, are joined in series across that supply. The total power which they will draw is [KCET 2002]

(a) p/n^2 (b) p/n

(c) p (d) np

109. A wire when connected to 220 V mains supply has power dissipation P_1. Now the wire is cut into two equal pieces which are connected in parallel to the same supply. Power dissipation in this case is P_2. Then $P_2 : P_1$ is [AIEEE 2002]

(a) 1 (b) 4

(c) 2 (d) 3

110. An electric bulb marked 40 W and 200 V, is used in a circuit of supply voltage 100 V. Now its power is [AIIMS 2002]

(a) 100 W (b) 40 W

(c) 20 W (d) 10 W

111. Electric bulb 50 W-100 V glowing at full power are to be used in parallel with battery 120 V, 10 Ω. Maximum number of bulbs that can be connected so that they glow in full power is

(a) 2 (b) 8

(c) 4 (d) 6

112. A bulb has specification of one kilowatt and 250 *volts*, the resistance of bulb is [MP PMT 2002]

(a) 125 Ω (b) 62.5 Ω

(c) 0.25 Ω (d) 625 Ω

113. If a 30 V, 90 W bulb is to be worked on a 120 V line, a resistance of how many ohms should be connected in series with the bulb [MP PMT 2002; KCET 2003]

(a) 10 *ohm* (b) 20 *ohm*

(c) 30 *ohm* (d) 40 *ohm*

114. A fuse wire with radius 1 *mm* blows at 1.5 *amp*. The radius of the fuse wire of the same material to blow at 3A will be [KCET 2003]

(a) $4^{1/3} mm$ (b) $3^{1/4} mm$

(c) $2^{1/2} mm$ (d) $3^{1/2} mm$

115. Three electric bulbs of rating 60 W each are joined in series and then connected to electric mains. The power consumed by these three bulbs will be [MP PET 2003; CBSE PMT 2004]

(a) 180 W (b) 60 W

(c) 20 W (d) $\frac{20}{3} W$

116. An electric bulb is rated 60 W, 220 V. The resistance of its filament is [MP PET 2003]

(a) 708 Ω (b) 870 Ω

(c) 807 Ω (d) 780 Ω

117. A 220 *volt*, 1000 W bulb is connected across a 110 volt mains supply. The power consumed will be [AIEEE 2003]

(a) 1000 W (b) 750 W

(c) 500 W (d) 250 W

118. Two bulbs of 100 W and 200 W working at 220 *volt* are joined in series with 220 *volt* supply. Total power consumed will be approximately. [Pb. PET 2003; BHU 2005]

(a) 65 *watt* (b) 33 *watt*

(c) 300 *watt* (d) 100 *watt*

119. How many calories of heat will be produced approximately in a 210 *watt* electric bulb in 5 minutes [Pb. PET 2004]

(a) 80000 *cal* (b) 63000 *cal*

(c) 1050 *cal* (d) 15000 *cal*

120. A $5^o C$ rise in the temperature is observed in a conductor by passing some current. When the current is doubled, then rise in temperature will be equal to [BHU 2004]

(a) $5^o C$ (b) $10^o C$

(c) $20^o C$ (d) $40^o C$

121. If a 2 kW boiler is used everyday for 1 hour, then electrical energy consumed by boiler in thirty days is [BHU 2004]

(a) 15 unit (b) 60 unit

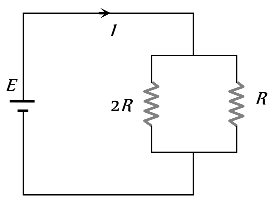
(c) 120 unit (d) 240 unit

122. What will happen when a 40 *watt*, 220 *volt* lamp and 100 *watt*, 220 *volt* lamp are connected in series across 40 *volt* supply [CPMT 2002]

(a) 100 *watt* lamp will fuse (b) 40 *watt* lamp will fuse

(c) Both lamps will fuse (d) Neither lamp will fuse

123. What is the ratio of heat generated in R and $2R$ [DCE 2003]



(a) 2 : 1

(b) 1 : 2

(c) 4 : 1

(d) 1 : 4

124. In an electric heater 4 *amp* current passes for 1 *minute* at potential difference of 250 *volt*, the power of heater and energy consumed will be respectively [DPMT 2003]

(a) 1 kW, 60 kJ (b) 0.5 kW, 30 kJ

(c) 10 kW, 600 kJ (d) None of these

125. Some electric bulbs are connected in series across a 220 V supply in a room. If one bulb is fused then remaining bulbs are connected again in series across the same supply. The illumination in the room will [J & K CET 2004]

(a) Increase (b) Decrease

(c) Remains the same (d) Not continuous

126. The resistor of resistance 'R' is connected to 25 V supply and heat produced in it is 25 J/sec. The value of R is [Orissa PMT 2004]

(a) 225Ω (b) 1Ω

(c) 25Ω (d) 50Ω

127. Three bulbs of 40 W, 60 W, 100 W are arranged in series with 220 *volt* supply which bulb has minimum resistance [Pb. PET 2000]

(a) 100 W (b) 40 W

(c) 60 W (d) Equal in all bulbs

128. If two electric bulbs have 40 W and 60 W rating at 220 V, then the ratio of their resistances will be [Pb. PET 2001]

(a) 9 : 4 (b) 4 : 3

(c) 3 : 8 (d) 3 : 2

129. A 10 V storage battery of negligible internal resistance is connected across a $50\,\Omega$ resistor. How much heat energy is produced in the resistor in 1 hour [Pb. PET 2001]

(a) 7200 J (b) 6200 J

(c) 5200 J (d) 4200 J

130. A hot electric iron has a resistance of $80\,\Omega$ and is used on a 200 V source. The electrical energy spent, if it is used for two hours, will be [Pb. PET 2002]

(a) 8000 Wh (b) 2000 Wh

(c) 1000 Wh (d) 800 Wh

131. The heat produced by a 100 *watt* heater in 2 minute will be equal to [BCECE 2004]

(a) $12\times10^3\ J$ (b) $10\times10^3\ J$

(c) $6\times10^3\ J$ (d) $3\times10^3\ J$

132. If two wires having resistance R and $2R$. Both joined in series and in parallel then ratio of heat generated in this situation, applying the same voltage, [BCECE 2004]

(a) 2 : 1 (b) 1 : 2

(c) 2 : 9 (d) 9 : 2

133. Two electric bulbs A and B are rated as 60 W and 100 W. They are connected in parallel to the same source. Then, [KCET 2004]

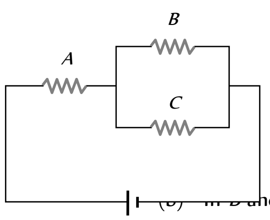
(a) Both draw the same current

(b) A draws more current than B

(c) B draws more current than A

(d) Current drawn are in the ratio of their resistances

134. Three identical resistances A, B and C are connected as shown in the given figure. The heat produced will be maximum



(a) In B (b) In B and C

(c) In A (d) Same for A, B and C

135. If $2.2\,kW$ power is transmitted through a 100Ω line at $22{,}000V$, the power loss in the form of heat will be [MP PET 2004]

(a) 0.1 W (b) 1 W

(c) 10 W (d) 100 W

136. A heater coil connected to a supply of a 220 V is dissipating some power P_1. The coil is cut into half and the two halves are connected in parallel. The heater now dissipates a power P_2. The ratio of power $P_1 : P_2$ is [AFMC 2004]

(a) 2 : 1 (b) 1 : 2

(c) 1 : 4 (d) 4 : 1

137. An electric lamp is marked 60 W, 230 V. The cost of a 1 kWh of energy is *Rs.* 1.25. The cost of using this lamp 8 *hrs* a day for 30 day is [Kerala (Med.) 2002]

(a) *Rs.* 10 (b) *Rs.* 16

(c) *Rs.* 18 (d) *Rs.* 20

138. An electric iron draws 5 *amp*, a TV set draws 3 *amp* and refrigerator draws 2 *amp* from a 220 *volt* main line. The three appliances are connected in parallel. If all the three are operating at the same time, the fuse used may be of [ISM Dhanbad 1994]

(a) 20 *amp* (b) 5 *amp*

(c) 15 *amp* (d) 10 *amp*

139. Match the List I with the List II from the combination shown. In the left side (List I) there are four different conditions and in the right side (List II), there are ratios of heat produced in each resistance for each condition : [ISM Dhanbad 1994]

	List I	List II
(I)	Two wires of same resistance are connected in series and same current is passed through them	(A) 1 : 2
(II)	Two wires of resistance R and $2R$ *ohm* are connected in series and same P.D. is applied across them	(B) 4 : 1
(III)	Two wires of same resistance are connected in parallel and same current is flowing through them	(C) 1 : 1
(IV)	Two wires of resistances in the ratio 1 : 2 are connected in parallel and same P.D. is applied across them	(D) 2 : 1

(a) $I-B; II-A; III-C; IV-D$

(b) $I-C; II-D; III-C; IV-D$

(c) $I-B; II-D; III-A; IV-C$

[MP PMT 2004]

(d) $I-A; II-B; III-D; IV-C$

140. The electric current passing through a metallic wire produces heat because of [BHU 1994]

(a) Collisions of conduction electrons with each other

(b) Collisions of the atoms of the metal with each other

(c) The energy released in the ionization of the atoms of the metal

(d) Collisions of the conduction electrons with the atoms of the metallic wires

141. The maximum current that flows through a fuse wire before it blows out varies with its radius as [SCRA 1998]

(a) $r^{3/2}$ (b) r

(c) $r^{2/3}$ (d) $r^{1/2}$

142. What is immaterial for an electric fuse wire [UPSEAT 1999]

(a) Specific resistance of the wire

(b) Radius of the wire

(c) Length of the wire

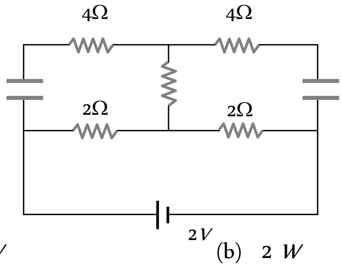
(d) Current flowing through the wire

143. The current flowing through a lamp marked as 50 W and 250 V is

(a) 5 *amp* (b) 2.5 *amp*

(c) 2 *amp* (d) 0.2 *amp*

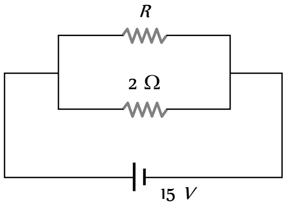
144. Find the power of the circuit [AIEEE 2002]



(a) 1.5 *W* (b) 2 *W*

(c) 1 *W* (d) None of these

145. If in the circuit, power dissipation is 150 *W*, then *R* is [AIEEE 2002]



(a) 2 Ω (b) 6 Ω

(c) 5 Ω (d) 4 Ω

146. Two resistors whose value are in ratio 2 : 1 are connected in parallel with one cell. Then ratio of power dissipated is [RPMT 2000]

(a) 2 : 1 (b) 4 : 1

(c) 1 : 2 (d) 1 : 1

147. A heater coil is cut into two equal parts and only one part is now used in the heater. The heat generated will now be [AIEEE 2005]

(a) One fourth (b) Halved

(c) Doubled (d) Four times

148. The resistance of hot tungsten filament is about 10 times the cold resistance. What will be the resistance of 100 *W* and 200 *V* lamp when not in use [AIEEE 2005]

(a) 400 Ω (b) 200 Ω

(c) 40 Ω (d) 20 Ω

149. A 5.0 *amp* current is setup in an external circuit by a 6.0 *volt* storage battery for 6.0 minutes. The chemical energy of the battery is reduced by [KCET 2005]

(a) 1.08×10^4 *J* (b) 1.08×10^4 *volt*

(c) 1.8×10^4 *J* (d) 1.8×10^4 *volt*

150. A railway compartment is lit up by thirteen lamps each taking 2.1 amp at 15 volts. The heat generated per second in each lamp will be

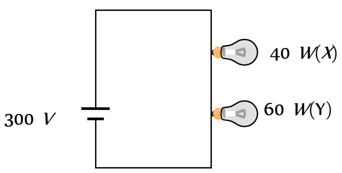
(a) 4.35 *cal* (b) 5.73 *cal*

(c) 7.5 *cal* (d) 2.5 *cal*

151. Two bulbs *X* and *Y* having same voltage rating and of power 40 watt and 60 watt respectively are connected in series across a potential difference of 300 volt, then [Orissa JEE 2005]

(a) *X* will glow brighter

(b) Resistance of *Y* is greater than *X*



(c) Heat produced in *Y* will be greater than *X*

(d) Voltage drop in *X* will be greater than *Y*

152. 3 identical bulbs are connected in series and these together dissipate a power *P*. If now the bulbs are connected in parallel, then the power dissipated will be [DPMT 2005]

(a) $\frac{P}{3}$ (b) $3P$

(c) $9P$ (d) $\frac{P}{9}$

153. A coil takes 15 *min* to boil a certain amount of water, another coil takes 20 *min* for the same process. Time taken to boil the same amount of water when both coil are connected in series

(a) 5 *min* (b) 8.6 *min*

(c) 35 *min* (d) 30 *min*

Chemical Effect of Current

1. Water can not be made conducting by adding small amount of any of the following except

(a) Sodium chloride (b) Copper sulphate

(c) Ammonium chloride (d) Sugar

2. The electrochemical equivalent Z of any element can be obtained by multiplying the electrochemical equivalent of hydrogen with

(a) Atomic weight (b) Molecular weight

(c) Chemical equivalent (d) A constant

3. A silver and zinc voltameter are connected in series and a current *i* is passed through them for a time *t* liberating *W gm* of zinc. The weight of silver deposited is nearly [NCERT 1973, 76]

(a) *W* (b) 1.7 *W*

(c) 2.4 *W* (d) 3.5 *W*

4. To deposit one gm equivalent of an element at an electrode, the quantity of electricity needed is [IIT 1984; DPMT 1982; MP PET 1998; MP PMT 1998; 2003]

(a) One *ampere* (b) 96000 *amperes*

(c) 96500 *farads* (d) 96500 *coulombs*

5. In an electrolysis experiment, a current *i* passes through two different cells in series, one containing a solution of $CuSO_4$ and the other a solution of $AgNO_3$. The rate of increase of the weight of the cathodes in the two cells will be [NCERT 1972] [J & K CET 2005]

(a) In the ratio of the densities of *Cu* and *Ag*

(b) In the ratio of the at. weights of *Cu* and *Ag*

(c) In the ratio of half the atomic weight of *Cu* to the atomic weight of *Ag*

(d) In the ratio of half the atomic weight of *Cu* to half the atomic weight of *Ag*

6. To deposit one litre of hydrogen at 22.4 atmosphere from acidulaled water, the quantity of electricity that must pass through is

(a) 1 *coulomb* (b) 22.4 *coulomb*

(c) 96500 *coulomb* (d) 193000 *coulomb*

7. The amount of substance liberated on electrodes during electrolysis when 1 coulomb of electricity is passed, is

(a) Chemical equivalent
(b) Electrochemical equivalent
(c) Equivalent weight
(d) One mol

8. For goldplating on a copper chain, the substance required in the form of solution is

(a) Copper sulphate
(b) Copper chloride
(c) Potassium cyanide
(d) Potassium aurocyanide

9. On passing the current in water voltameter, the hydrogen

(a) Liberated at anode (b) Liberated at cathode
(c) Does not liberate (d) Remains in the solution

10. In water voltameter, the electrolysis of ...... takes place [DPMT 1999]

(a) H_2O (b) H_2SO_4
(c) H_2O and H_2SO_4 both (d) H_2 and O_2

11. For depositing 1 *gm* of *Cu* in copper voltameter on passing 2 *amperes* of current, the time required will be (For copper Z = 0.00033 *gm/C*)

(a) Approx. 20 *minutes* (b) Approx. 25 *minutes*
(c) Approx. 30 *minutes* (d) Approx. 35 *minutes*

12. A battery of e.m.f. 3 volt and internal resistance 1.0 *ohm* is connected in series with copper voltameter. The current flowing in the circuit is 1.5 amperes. The resistance of voltameter will be

(a) Zero (b) 1.0 *ohm*
(c) 1.5 *ohm* (d) 2.0 *ohm*

13. According to Faraday's laws of electrolysis, the amount of decomposition is proportional to [MP PMT 1993]

(a) $\frac{1}{\text{Time for which curent passes}}$
(b) Electrochemical equivalent of the substance
(c) $\frac{1}{\text{Current}}$
(d) $\frac{1}{\text{Electrochemical equivalent}}$

14. If in a voltaic cell 5 gm of zinc is consumed, then we get how many ampere hours ? (Given that E.C.E. of *Zn* is 3.387×10^{-7} *kg/coulomb*)

(a) 2.05 (b) 8.2
(c) 4.1 (d) $5\times3.387\times10^{-7}$

15. The current flowing in a copper voltameter is 1.6 *A*. The number of Cu^{++} ions deposited at the cathode per minute are

(a) 1.5×10^{20} (b) 3×10^{20}
(c) 6×10^{20} (d) 1×10^{19}

16. In a copper voltameter experiment, current is decreased to one-fourth of the initial value but it is passed for four times the earlier duration. Amount of copper deposited will be [MP PMT 1993]

(a) Same
(b) One-fourth the previous value
(c) Four times the previous value
(d) $\frac{1}{16}th$ of the previous value

17. A certain charge liberates 0.8 *gm* of O_2. The same charge will liberate how many gm of silver [MP PET 1999]

(a) 108 *gm* (b) 10.8 *gm*
(c) 0.8 *gm* (d) $\frac{108}{0.8}gm$

18. In charging a battery of motor-car, the following effect of electric current is used [MP PET 1993; AFMC 2003]

(a) Magnetic (b) Heating
(c) Chemical (d) Induction

19. The Avogadro's number is 6×10^{23} per gm mole and electronic charge is $1.6\times10^{-19}\,C$. The Faraday's number is [DPMT 2001]

(a) $6\times10^{23}\times1.6\times10^{-19}$ (b) $\frac{6\times10^{23}}{1.6\times10^{-19}}$
(c) $\frac{2}{6\times10^{23}\times1.6\times10^{-19}}$ (d) $\frac{1.6\times10^{-19}}{6\times10^{23}}$

20. In $CuSO_4$ solution when electric current equal to 2.5 *faraday* is passed, the gm equivalent deposited on the cathode is

(a) 1 (b) 1.5
(c) 2 (d) 2.5

21. The atomic weight of silver and copper are 108 and 64. A silver voltameter and a copper voltameter are connected in series and when current is passed 10.8 *gm* of silver is deposited. The mass of copper deposited will be

(a) 6.4 *gm* (b) 12.8 *gm*
(c) 3.2 *gm* (d) 10.8 *gm*

22. Faraday's laws of electrolysis are related to [IIT 1983]

(a) The atomic number of positive ion
(b) The equivalent weight of electrolyte
(c) The atomic number of negative ion
(d) The velocity of positive ion

23. In the process of electrolysis, the current is carried out inside the electrolyte by [AMU (Engg.) 1999]

(a) Electrons
(b) Atoms
(c) Positive and negative ions
(d) All the above

24. The mass of ions deposited during a given interval of time in the process of electrolysis depends on [DPMT 2002]

(a) The current (b) The resistance
(c) The temperature (d) The electric power

25. The amount of charge required to liberate 9 *gm* of aluminium (atomic weight = 27 and valency = 3) in the process of electrolysis is (Faraday's number = 96500 *coulombs/gm* equivalent) [MP PMT 1994; MP PET 2000]

(a) 321660 *coulombs* (b) 69500 *coulombs*
(c) 289500 *coulombs* (d) 96500 *coulombs*

26. In an electroplating experiment, *m gm* of silver is deposited when 4 *ampere* of current flows for 2 *minute*. The amount (in *gm*) of silver deposited by 6 *ampere* of current for 40 *second* will be [MNR 1991; UPSEAT 200

Pb. PET 2004; Orissa JEE 2005]

(a) 4 m (b) $m/2$

(c) $m/4$ (d) 2 m

27. In electrolysis, if the duration of the passage of current is doubled, the mass liberated is [EAMCET 1979]

(a) Doubled (b) Halved

(c) Increased four times (d) Remains the same

28. A current of 16 *ampere* flows through molten $NaCl$ for 10 *minute*. The amount of metallic sodium that appears at the negative electrode would be [EAMCET 1984]

(a) 0.23 *gm* (b) 1.15 *gm*

(c) 2.3 *gm* (d) 11.5 *gm*

29. The mass of a substance liberated when a charge 'q' flows through an electrolyte is proportional to [EAMCET 1984]

(a) q (b) $1/q$

(c) q^2 (d) $1/q^2$

30. A steady current of 5 *amps* is maintained for 45 *mins*. During this time it deposits 4.572 *gms* of zinc at the cathode of a voltameter. E.C.E. of zinc is [MP PET 1994]

(a) $3.387 \times 10^{-4}\, gm/C$ (b) $3.387 \times 10^{-4}\, C/gm$

(c) $3.384 \times 10^{-3}\, gm/C$ (d) $3.394 \times 10^{-3}\, C/gm$

31. The relation between faraday constant F, electron charge e and avogadro number N is [MP PET 1995]

(a) $F = N/e$ (b) $F = Ne$

(c) $N = F^2$ (d) $F = N^2e$

32. The electrochemical equivalent of magnesium is $0.126\, mg/C$. A current of 5 A is passed in a suitable solution for 1 *hour*. The mass of magnesium deposited will be

(a) 0.0378 *gm* (b) 0.227 *gm*

(c) 0.378 *gm* (d) 2.27 *gm*

33. Two electrolytic cells containing $CuSO_4$ and $AgNO_3$ respectively are connected in series and a current is passed through them until 1 *mg* of copper is deposited in the first cell. The amount of silver deposited in the second cell during this time is approximately

[Atomic weights of copper and silver are respectively 63.57 and 107.88] [MP PMT 1996]

(a) 1.7 *mg* (b) 3.4 *mg*

(c) 5.1 *mg* (d) 6.8 *mg*

34. A current I is passed for a time t through a number of voltameters. If m is the mass of a substance deposited on an electrode and z is its electrochemical equivalent, then

[MP PMT 1997]

(a) $\frac{zIt}{m} = \text{constant}$ (b) $\frac{z}{mIt} = \text{constant}$

(c) $\frac{I}{zmt} = \text{constant}$ (d) $\frac{It}{zm} = \text{constant}$

35. For electroplating a spoon, it is placed in the voltameter at

[MP PMT/PET 1998]

(a) The position of anode

(b) The position of cathode

(c) Exactly in the middle of anode and the cathode

(d) Anywhere in the electrolyte

36. If nearly 10^5 *coulomb* liberate 1 *gm* equivalent of aluminium, then the amount of aluminium (equivalent weight 9) deposited through electrolysis in 20 minutes by a current of 50 *amp* will be

(a) 0.6 *gm* (b) 0.09 *gm*

(c) 5.4 *gm* (d) 10.8 *gm*

37. Electroplating does not help in [AIIMS 1998]

(a) Fine finish to the surface

(b) Shining appearance

(c) Metals to become hard

(d) Protect metal against corrosion

38. When a current is passed through water, acidified with a dilute sulphuric acid, the gases formed at the platinum electrodes are

(a) 1 vol. hydrogen (cathode) and 2 vol. oxygen (anode)

(b) 2 vol. hydrogen (cathode) and 1 vol. oxygen (anode)

(c) 1 vol. hydrogen (cathode) and 1 vol. oxygen (anode)

(d) 1 vol. oxygen (cathode) and 2 vol. hydrogen (anode)

39. The negative Zn pole of a Daniel cell, sending a constant current through a circuit, decreases in mass by 0.13*g* in 30 *minutes*. If the electrochemical equivalent of Zn and Cu are 32.5 and 31.5 respectively, the increase in the mass of the positive Cu pole in this time is [AIEEE 2003]

(a) 0.242 *g* (b) 0.190 *g*

(c) 0.141 *g* (d) 0.126 *g*

40. When a copper voltameter is connected with a battery of e.m.f. 12 *volts*. 2 *gms* of copper is deposited in 30 *minutes*. If the same voltameter is connected across a 6 volt battery, then the mass of copper deposited in 45 minutes would be

[SCRA 1994]

(a) 1 *gm* (b) 1.5 *gm*

(c) 2 *gm* (d 2.5 *gm*

[MP PMT 1995]

41. The value of current required to deposit 0.972 *gm* of chromium in 3 *hours* if the E.C.E. of chromium is 0.00018 *gm* per coulomb, is

(a) 1 *amp* (b) 1.5 *amp*

(c) 0.5 *amp* (d) 2 *amp*

42. The current inside a copper voltameter [Roorkee 1992]

(a) Is half the outside value

(b) Is the same as the outside value

(c) Is twice the outside value

(d) Depends on the concentration of $CuSO_4$

43. The resistance of a cell does not depend on [RPET 1996]

(a) Current drawn from the cell

(b) Temperature of electrolyte

(c) Concentration of electrolyte

(d) The e.m.f. of the cell

44. The electrochemical equivalent of a metal is $3.3 \times 10^{-7}\, kg/coulomb$. The mass of the metal liberated at the cathode when a 3 A current is passed for 2 seconds will be

(a) $19.8 \times 10^{-7}\, kg$ (b) $9.39 \times 10^{-7}\, kg$

(c) $6.6 \times 10^{-7}\, kg$ (d) $1.1 \times 10^{-7}\, kg$

45. Faraday's 2nd law states that mass deposited on the electrode is directly proportional to [DCE 1999]

(a) Atomic mass (b) Atomic mass × Velocity

(c) Atomic mass/Valency (d) Valency

46. The relation between Faraday constant (F), chemical equivalent (E) and electrochemical equivalent (Z) is [SCRA 1994; AFMC 2000]

(a) $F = EZ$ (b) $F = \frac{Z}{E}$

(c) $F = \frac{E}{Z}$ (d) $F = \frac{E}{Z^2}$

47. The electrochemical equivalent of a material in an electrolyte depends on [MP PET 2001]

(a) The nature of the material

(b) The current through the electrolyte

(c) The amount of charge passed through electrolyte

(d) The amount of material present in electrolyte

48. On passing 96500 *coulomb* of charge through a solution $CuSO_4$ the amount of copper liberated is [MP PMT 2001]

(a) 64 *gm* (b) 32 *gm*

(c) 32 *kg* (d) 64 *kg*

49. If 96500 *coulombs* of electricity liberates one gram equivalent of any substance, the time taken for a current of 0.15 *amperes* to deposite 20*mg* of copper from a solution of copper sulphate is (Chemical equivalent of copper = 32)

[Kerala (Engg.) 2002]

(a) 5 *min* 20 *sec* (b) 6 *min* 42 *sec*

(c) 4 *min* 40 *sec* (d) 5 *min* 50 *sec*

50. How much current should be passed through acidified water for 100 *s* to liberate 0.224 *litre* of H_2 [DCE 2002]

(a) 22.4 *A* (b) 19.3 *A*

(c) 9.65 *A* (d) 1 *A*

51. Who among the following scientists made the statement –"Chemical change can produce electricity" [DCE 2004]

(a) Galvani (b) Faraday

(c) Coulomb (d) Thomson

52. If a steady current of 4 *amp* maintained for 40 *minutes,* deposits 4.5 *gm* of zinc at the cathode and then the electro chemical equivalent will be [MH CET 2003]

(a) $51 \times 10^{-17}\ gm/C$ (b) $28 \times 10^{-6}\ gm/C$

(c) $32 \times 10^{-5}\ gm/C$ (d) $47 \times 10^{-5}\ gm/C$

53. The current flowing in a copper voltameter is 3.2 *A*. The number of copper ions (Cu^{2+}) deposited at the cathode per minute is

(a) 0.5×10^{20} (b) 1.5×10^{20}

(c) 3×10^{20} (d) 6×10^{20}

54. A copper voltameter is connected in series with a heater coil of resistance 0.1Ω. A steady current flows in the circuit for twenty minutes and mass of 0.99 *g* of copper is deposited at the cathode. If electrochemical equivalent of copper is 0.00033 *gm/C*, then heat generated in the coil is

[Pb. PET 2002]

(a) 750 *J* (b) 650 *J*

(c) 350 *J* (d) 250 *J*

55. E.C.E. of *Cu* and *Ag* are 7×10^{-6} and 1.2×10^{-6}. A certain current deposits 14 *gm* of *Cu*. Amount of *Ag* deposited is

[Orissa PMT 2004]

(a) 1.2 *gm* (b) 1.6 *gm*

(c) 2.4 *gm* (d) 1.8 *gm*

56. The chemical equivalent of silver is 108. If the current in a silver voltameter is 2 *Amp.*, the time required to deposit 27 *grams* of silver will be [MP PMT 2004]

(a) 8.57 *hrs* (b) 6.70 *hrs*

(c) 3.35 *hrs* (d) 12.50 *hrs*

57. Two voltameters, one of copper and another of silver, are joined in parallel. When a total charge q flows through the voltameters, equal amount of metals are deposited. If the electrochemical equivalents of copper and silver are z_1 and z_2 respectively the charge which flows through the silver voltameter is

(a) $q\frac{z_1}{z_2}$ (b) $q\frac{z_2}{z_1}$

(c) $\frac{q}{1+\frac{z_1}{z_2}}$ (d) $\frac{q}{1+\frac{z_2}{z_1}}$

58. The chemical equivalent of copper and zinc are 32 and 108 respectively. When copper and silver voltameter are connected in series and electric current is passed through for sometimes, 1.6 *g* of copper is deposited. Then, the mass of silver deposited will be

(a) 3.5 *g* (b) 2.8 *g*

(c) 5.4 *g* (d) None of these

59. Ampere hour is the unit of [Orissa JEE 2005]

(a) Quantity of charge (b) Potential

(c) Energy (d) Current

Thermo-Electricity

1. The production of e.m.f. by maintaining a difference of temperature between the two junctions of two different metals is known as

(a) Joule effect (b) Seebeck effect

(c) Peltier effect (d) Thomson effect

2. When a current passes through the junction of two different metals, evolution or absorption of heat at the junction is known as

(a) Joule effect [Pb. PET 2001] (b) Seebeck effect

(c) Peltier effect (d) Thomson effect

3. When a current passes through a wire whose different parts are maintained at different temperatures, evolution or absorption of heat all along the length of wire is known as

(a) Joule effect (b) Seebeck effect

(c) Peltier effect (d) Thomson effect

4. The thermocouple is based on the principle of

[MP PET 1984; AFMC 1998; BCECE 2003]

(a) Seebeck effect (b) Thomson effect

(c) Peltier effect (d) Joule effect

5. For a thermocouple, the neutral temperature is $270°C$ and the temperature of its cold junction is $20°C$. If there is no deflection in the galvanometer, the temperature of the hot junction should be
(a) $210°C$ (b) $540°C$
(c) $520°C$ (d) $209°C$

6. Thermocouple is a device for the measurement of
(a) Absolute temperature of a metal
(b) The temperature difference between two substances
(c) The couple acting on a wire
(d) Thermal conductivity of a substance

7. The true statement for thermo e.m.f. of a thermocouple
(a) Depends on the nature of metals
(b) Depends only on temperature of cold junction
(c) Depends only on temperature of hot junction
(d) Depends on the length of the wires used for thermocouple

8. The direction of current in an iron-copper thermocouple is [MP PET 1995]
(a) From copper to iron at the hot junction
(b) From iron to copper at the hot junction
(c) From copper to iron at cold junction
(d) No current will flow

9. Peltier coefficient for the junction of a pair of metals is proportional to [MP PMT 1993; MP PET 1997]
(a) T absolute temperature of the junction
(b) Square of absolute temperature of the junction
(c) $\frac{1}{\text{Absolute temperature of the junction}}$
(d) $\frac{1}{\text{Square of absolute temperature of the junction}}$

10. If for a thermocouple T_n is the neutral temperature, T_c is the temperature of the cold junction and T_i is the temperature of inversion, then [MP PET 2001; AIEEE 2002]
(a) $T_i = 2T_n - T_c$ (b) $T_n = T_i - 2T_c$
(c) $T_i = T_n - T_c$ (d) None of these

11. For a thermocouple, the temperature of inversion is that temperature at which thermo e.m.f. is
(a) Zero (b) Maximum
(c) Minimum (d) None of the above

12. For a given thermocouple, the thermo e.m.f. can be
(a) Zero (b) Positive
(c) Negative (d) All of the above

13. When current is passed in antimony-bismuth couple, then
(a) The junction becomes hot when the current is from bismuth to antimony
(b) The junction becomes hot when current flows from antimony to bismuth
(c) Both junctions become hot
(d) Both junctions become cold

14. A thermocouple is made of *Cu* and *Fe*. If a battery is connected in it, then
(a) Both junctions will be at the same temperature
(b) Both junctions will become hot
(c) One junction will be hotter than the other
(d) None of these

15. Thermopile is used for [AMU Engg. 2000]
(a) Collecting the heat energy
(b) The measurement of radiant heat energy
(c) The measurement of current
(d) The change of atomic energy into heat energy

16. When a current of 1 ampere is passed through a conductor whose ends are maintained at temperature difference of $1°C$, the amount of heat evolved or absorbed is called
(a) Peltier coefficient (b) Thomson coefficient
(c) Thermoelectric power (d) Thermo e.m.f.

17. In a thermocouple, the temperature that does not depend on the temperature of the cold junction is called
(a) Neutral temperature (b) Temperature of inversion
(c) Both the above (d) None of the above

18. At neutral temperature, the thermoelectric power $\left(\frac{dE}{dT}\right)$ has the value [MP PET 2003; MP PMT 2004]
(a) Zero (b) Maximum but negative
(c) Maximum but positive (d) Minimum but positive

19. In *Cu-Fe* couple, the flow of current at the temperature of inversion is
(a) From *Fe* to *Cu* through the hot junction
(b) From *Cu* to *Fe* through the hot junction
(c) Maximum
(d) None of the above

20. In Seebeck series *Sb* appears before *Bi*. In a $Sb - Bi$ thermocouple current flows from [MP PET 1994]
(a) *Sb* to *Bi* at the hot junction
(b) *Sb* to *Bi* at the cold junction
(c) *Bi* to *Sb* at the cold junction
(d) None of the above

21. Which of the following statement is correct [MP PET 1994]
(a) Both Peltier and Joule effects are reversible
(b) Both Peltier and Joule effects are irreversible
(c) Joule effect is reversible, whereas Peltier effect is irreversible
(d) Joule effect is irreversible, whereas Peltier effect is reversible

22. For a given temperature difference, which of the following pairs will generate maximum thermo e.m.f. [MP PMT 1994]
(a) Antimony-bismuth (b) Silver-gold
(c) Iron-copper (d) Lead-nickel

23. The cold junction of a thermocouple is maintained at $10°C$. No thermo e.m.f. is developed when the hot junction is maintained at $530°C$. The neutral temperature is [MP PMT 1994]
(a) $260°C$ (b) $270°C$
(c) $265°C$ (d) $520°C$

24. Which of the following is not reversible [Manipal MEE 1995; DPMT 2001]
(a) Joule effect (b) Peltier effect

(c) Seebeck effect (d) Thomson effect

25. Neutral temperature of a thermocouple is defined as the temperature at which [MP PMT 1996]

(a) The thermo e.m.f. changes sign

(b) The thermo e.m.f. is maximum

(c) The thermo e.m.f. is minimum

(d) The thermo e.m.f. is zero

26. As the temperature of hot junction of a thermo-couple is increased (while cold junction is at constant temperature), the thermo e.m.f.

(a) Increases uniformly at constant rate

(b) Increases slowly in the beginning and more rapidly at higher temperatures

(c) Increases more rapidly in the beginning but less rapidly at higher temperatures

(d) In minimum at neutral temperature

27. As the temperature of hot junction increases, the thermo e.m.f.

(a) Always increases

(b) Always decreases

(c) May increase or decrease

(d) Always remains constant

28. The e.m.f. in a thermoelectric circuit with one junction at $0°C$ and the other at $t°C$ is given by $E = At - Bt^2$. The neutral temperature is then [AMU 1995; BCECE 2004]

(a) $\frac{A}{B}$ (b) $-\frac{A}{2B}$

(c) $-\frac{B}{2A}$ (d) $\frac{A}{2B}$

29. The temperature of cold junction and neutral temperature of a thermocouple are $15^o C$ and $280^o C$ respectively. The temperature of inversion is [AMU (Engg.) 1999]

(a) $295^o C$ (b) $265^o C$

(c) $545^o C$ (d) $575^o C$

30. Above neutral temperature, thermo e.m.f. in a thermocouple [AMU (Engg.) 1999]

(a) Decreases with rise in temperature

(b) Increases with rise in temperature

(c) Remains constant

(d) Changes sign

31. Consider the following two statements A and B, and identify the correct choice out of given answers

A. Thermo e.m.f. is minimum at neutral temperature of a thermocouple

B. When two junctions made of two different metallic wires are maintained at different temperatures, an electric current is generated in the circuit. [EAMCET (Med.) 2000]

(a) A is false and B is true (b) A is true and B is false

(c) Both A and B are false (d) Both A and B are true

32. The temperature at which thermal electric power of a thermo couple becomes zero is called [MP PMT 2001]

(a) Inversion temperature (b) Neutral temperature

(c) Junction temperature (d) Null temperature

33. Thomson coefficient of a conductor is $10 \mu V/K$. The two ends of it are kept at $50^o C$ and $60^o C$ respectively. Amount of heat absorbed by the conductor when a charge of 10 C flows through it is

(a) 1000 J (b) 100 J

(c) 100 mJ (d) 1 mJ

34. For a thermocouple the neutral temperature is $270^o C$ when its cold junction is at $20^o C$. What will be the neutral temperature and the temperature of inversion when the temperature of cold junction is increased to $40^o C$ [Kerala PET 2001]

(a) $290^o C, 580^o C$ (b) $270^o C, 580^o C$

(c) $270^o C, 500^o C$ (d) $290^o C, 540^o C$

35. Two ends of a conductor are at different temperatures the electromotive force generated between two ends is [MP PMT 2001; MP PET 2002]

(a) Seebeck electro motive force (e.m.f.)

(b) Peltier electro motive force (e.m.f.)

(c) Thomson electro motive force (e.m.f.)

(d) None of these

36. The neutral temperature of a thermocouple is $350^o C$ when the cold junction is at $0^o C$. When the cold junction is immersed in a bath of $30^o C$, the inversion temperature is [MP PET 1999] [Kerala (Med.) 2002]

(a) $700^o C$ (b) $600^o C$

(c) $350^o C$ (d) $670^o C$

37. A thermoelectric refrigerator works on [JIPMER 2002]

(a) Joule effect (b) Seeback effect

(c) Peltier effect (d) Thermonic emission

38. If the temperature of cold junction of thermocouple is lowered, then the neutral temperature [JIPMER 2002]

(a) Increases

(b) Approaches inversion temperature

(c) Decreases

(d) Remains the same

39. Consider the following two statements A and B and identify the correct choice given in the answers

(A) Duddells thermo-galvanometer is suitable to measure direct current only

(B) Thermopile can measure temperature differences of the order of $10^{-3}\ ^oC$ [EAMCET 2003]

(a) Both A and B are true (b) Both A and B are false

(c) A is true but B is false (d) A is false but B is true

40. If $E = at + bt^2$, what is the temperature of inversion [DCE 2003]

(a) $-\frac{a}{2b}$ (b) $+\frac{a}{2b}$

(c) $-\frac{a}{b}$ (d) $+\frac{a}{b}$

41. Antimony and bismuth are usually used in a thermocouple, because

(a) Negative thermal e.m.f. produced

(b) Constant thermal e.m.f. produced

(c) Lower thermal e.m.f. produced

(d) Higher thermal e.m.f. produced [EAMCET 2001]

42. The smallest temperature difference that can be measured with a combination of a thermocouple of thermo e.m.f. 30μV per degree and a galvanometer of 50 *ohm* resistance, capable of measuring a minimum current of $3 \times 10^{-}$ *amp* is [MP PET 2000]

(a) 0.5 degree (b) 1.0 degree
(c) 1.5 degree (d) 2.0 degree

43. $e = \alpha t - \frac{1}{2}\beta t^2$, If temperature of cold junction is $0^o C$ then temperature of inversion is
$(\text{if}\,\alpha = 500.0 \mu V/^o C, \beta = 5.0 \mu V/\text{Square}\,^o C)$ [DCE 2001]

(a) 100 (b) 200
(c) 300 (d) 400

44. If the emf of a thermocouple, one junction of which is kept 0° *C* is given by $e = at + 1/2\ bt^2$ then the neutral temperature will be [J & K CET 2005]

(a) *a/b* (b) – *a/b*
(c) *a/2b* (d) –1/ *ab*

Critical Thinking

Objective Questions

1. The resistance of the filament of an electric bulb changes with temperature. If an electric bulb rated 220 volt and 100 watt is connected $(220 \times .8)$ *volt* sources, then the actual power would be

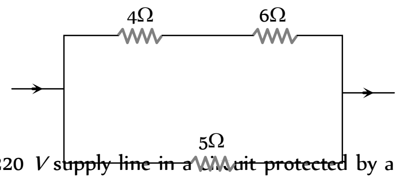
(a) $100 \times 0.8\, watt$
(b) $100 \times (0.8)^2 watt$
(c) Between 100×0.8 *watt* and 100 *watt*
(d) Between $100 \times (0.8)^2 watt$ and 100×0.8 *watt*

2. An immersion heater is rated 836 *watt*. It should heat 1 *litre* of water from $10°C$ to $40°C$ in about [AIEEE 2004]

(a) 200 *sec* (b) 150 *sec*
(c) 836 *sec* (d) 418 *sec*

3. In the circuit shown in figure, the heat produced in 5 *ohm* resistance is 10 *calories* per *second*. The heat produced in 4 resistance is [IIT 1981; UPSEAT 2002]

(a) 1 *cal / sec*
(b) 2 *cal/sec*
(c) 3 *cal / sec*
(d) 4 *cal/sec*



4. A house is served by 220 *V* supply line in a circuit protected by a 9 *ampere* fuse. The maximum number of 60 W lamps in parallel that can be turned on, is

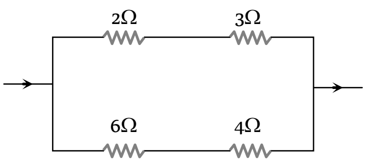
(a) 44 (b) 20
(c) 22 (d) 33

5. Water boils in an electric kettle in 15 *minutes* after switching on. If the length of the heating wire is decreased to $2/3$ of its initial value, then the same amount of water will boil with the same supply voltage in [MP PMT 1994]

(a) 15 *minutes* (b) 12 *minutes*
(c) 10 *minutes* (d) 8 *minutes*

6. In the circuit as shown in the figure, the heat produced by 6 *ohm* resistance due to current flowing in it is 60 *calorie* per *second*. The heat generated across 3 *ohm* resistance per second will be

(a) 30 *calorie*



(b) 60 *calorie*
(c) 100 *calorie*
(d) 120 *calorie*

7. The resistance of a heater coil is 110 *ohm*. A resistance *R* is connected in parallel with it and the combination is joined in series with a resistance of 11 *ohm* to a 220 *volt* main line. The heater operates with a power of 110 *watt*. The value of *R* in *ohm* is

(a) 12.22
(b) 24.42
(c) Negative
(d) That the given values are not correct

8. A 500 *W* heating unit is designed to operate from a 115 *volt* line. If the line voltage drops to 110 volt, the percentage drop in heat output will be [ISM Dhanbad 1994]

(a) 10.20% (b) 8.1%
(c) 8.6% (d) 7.6%

9. A heater of 220 *V* heats a volume of water in 5 minute time. A heater of 110 *V* heats the same volume of water in [AFMC 1993]

(a) 5 *minutes* (b) 8 *minutes*
(c) 10 *minutes* (d) 20 *minutes*

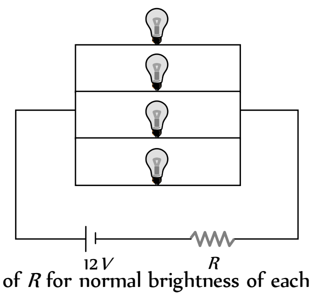
10. An electric kettle takes 4 *A* current at 220 *V*. How much time will it take to boil 1 *kg* of water from room temperature $20°C$? The temperature of boiling water is $100°C$ [CPMT 1989] [RPET 1996]

(a) 6.4 *minutes* (b) 6.3 *minutes*
(c) 12.6 *minutes* (d) 12.8 *minutes*

11. If a wire of resistance $20\,\Omega$ is covered with ice and a voltage of 210 *V* is applied across the wire, then the rate of melting of ice is

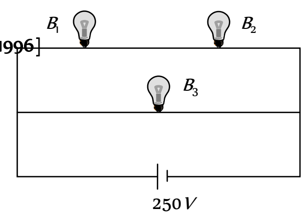
(a) $0.85\, g/s$ (b) $1.92\, g/s$
(c) $6.56\, g/s$ (d) All of these

12. Four identical electrical lamps are labelled 1.5 *V*, 0.5*A* which describes the condition necessary for them to operate at normal brightness. A 12 *V* battery of negligible internal resistance is connected to lamps as shown, then [UPSEAT 2001]



(a) The value of *R* for normal brightness of each lamp is (3/4) Ω
(b) The value of *R* for normal brightness of each lamp is (21/4) Ω
(c) Total power dissipated in circuit when all lamps are normally bright is 24 *W*
(d) Power dissipated in *R* is 21 *W* when all lamps are normally bright

13. A 100 *W* bulb B_1 and two 60-*W* bulbs B_2 and B_3, are connected to a 250 *V* source, as shown in the figure. Now W_1, W_2 and W_3 are the output powers of the bulbs B_1, B_2 and B_3 respectively. Then [MP PET 1996]

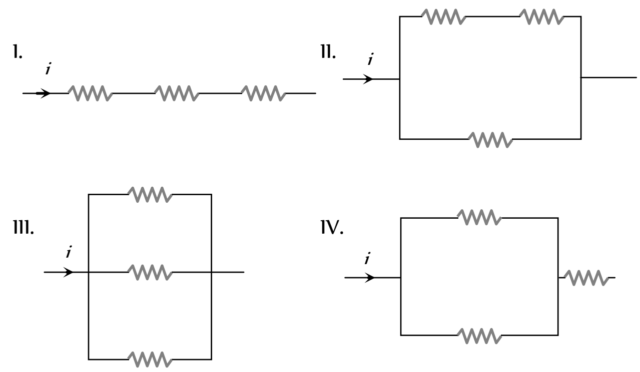


(a) $W_1 > W_2 = W_3$ (b) $W_1 > W_2 > W_3$

(c) $W_1 < W_2 = W_3$ (d) $W_1 < W_2 < W_3$

14. The three resistance of equal value are arranged in the different combinations shown below. Arrange them in increasing order of power dissipation

[IIT-JEE (Screening) 2003]



(a) III < II < IV < I (b) II < III < IV < I

(c) I < IV < III < II (d) I < III < II < IV

15. Silver and copper voltameter are connected in parallel with a battery of e.m.f. 12 *V*. In 30 *minutes*, 1 *gm* of silver and 1.8 *gm* of copper are liberated. The power supplied by the battery is

(a) 24.13 *J/sec* (b) 2.413 *J/sec*

(c) 0.2413 *J/sec* (d) 2413 *J/sec*

$(Z_{Cu} = 6.6 \times 10^{-4}\ gm/C$ and $Z_{Ag} = 11.2 \times 10^{-4}\ gm/C)$

16. A silver voltameter of resistance 2 *ohm* and a 3 *ohm* resistor are connected in series across a cell. If a resistance of 2 *ohm* is connected in parallel with the voltameter, then the rate of deposition of silver [EAMCET 1983]

(a) Decreases by 25%

(b) Increases by 25%

(c) Increases by 37.5%

(d) Decreases by 37.5%

17. The expression for thermo e.m.f. in a thermocouple is given by the relation $E = 40\,\theta - \frac{\theta^2}{20}$, where θ is the temperature difference of two junctions. For this, the neutral temperature will be

(a) $100°C$ (b) $200°C$

(c) $300°C$ (d) $400°C$

18. For copper-iron (*Cu-Fe*) couple, the thermo e.m.f. (temperature of cold junction $= 0°C$) is given by $E = (14\theta - 0.02\theta^2)\mu V$. The neutral temperature will be

(a) $350°C$ (b) 350 *K*

(c) $560°C$ (d) 560 *K*

19. One junction of a certain thermoelectric couple is at a fixed temperature T_r and the other junction is at temperature *T*. The thermo electromotive force for this is expressed by $E = K(T - T_r)\left[T_0 - \frac{1}{2}(T + T_r)\right]$. At temperature $T = \frac{1}{2}T_0$, the thermoelectric power is [MP PMT 1994]

(a) $\frac{1}{2}KT_0$ (b) KT_0

(c) $\frac{1}{2}KT_0^2$ (d) $\frac{1}{2}K(T_0 - T_r)^2$

20. The temperature of the cold junction of thermo-couple is $0°C$ and the temperature of hot junction is $T°C$. The e.m.f. is $E = 16T - 0.04T^2\,\mu$ volts. The temperature of inversion is

(a) $200°C$ (b) $400°C$

(c) $100°C$ (d) $300°C$

21. The temperature of the cold junction of a thermocouple is $0°C$ and temperature of the hot junction is $T°C$. The thermo e.m.f. is given by the relation $E = AT - \frac{1}{2}BT^2$ (where *A* = 16 and *B* = 0.08). The temperature of inversion is

(a) $100°C$ (b) $300°C$

(c) $400°C$ (d) $500°C$

22. The thermo e.m.f. of a thermo-couple is $25\mu V/°C$ at room temperature. A galvanometer of 40 ohm resistance, capable of detecting current as low as $10^{-5} A$, is connected with the thermocouple. The smallest temperature difference that can be detected by this system is [IIT 1975] [AIEEE 2003]

(a) $20°C$ (b) $16°C$

(c) $12°C$ (d) $8°C$

23. An electric bulb rated for 500 watts at 100 volts is used in a circuit having a 200-volt supply. The resistance *R* that must be put in series with the bulb, so that the bulb draws 500 *W* is

(a) $10\,\Omega$ (b) $20\,\Omega$

(c) $50\,\Omega$ (d) $100\,\Omega$

24. A thermo couple develops $200\,\mu V$ between $0°C$ and $100°C$. If it develops $64\,\mu V$ and $76\,\mu V$ respectively between $(0°C - 32°C)$ and $(32°C - 70°C)$ then what will be the thermo *emf* it develops between $70°C$ and $100°C$

(a) $65\,\mu V$ (b) $60\,\mu V$

(c) $55\,\mu V$ [AMU (Engg.) 2000] (d) $50\,\mu V$

25. A thermo couple is formed by two metals *X* and *Y* metal *X* comes earlier to *Y* in Seebeck series. If temperature of hot junction increases beyond the temperature of inversion. Then direction of current in thermocouple will so

(a) *X* to *Y* through cold junction

(b) *X* to *Y* through hot junction

(c) *Y* to *X* through cold junction

(d) Both (b) and (c)

26. Peltier co-efficient of a thermo couple is 2 *nano volts.* How much heat is developed at a junction if 2.5 *amp* current flows for 2 *minute*

(a) 6 *ergs* (b) 6×10^{-7} *ergs*

(c) 16 *ergs* (d) 6×10^{-3} *erg*

27. Resistance of a voltameter is 2Ω, it is connected in series to a battery of 10 *V* through a resistance of 3Ω. In a certain time mass deposited on cathode is 1 *gm*. Now the voltameter and the 3Ω resistance are connected in parallel with the battery. Increase in the deposited mass on cathode in the same time will be

(a) 0 (b) 1.5 *gm*

(c) 2.5 *gm* (d) 2 *gm*

28. A current of 1.5 *A* flows through a *copper* voltameter. The thickness of *copper* deposited on the electrode surface of area $50\,cm^2$ in 20 *minutes* will be (Density of *copper* = 9000 kg/m^3 and E.C.E. of *copper* = 0.00033 *g/C*)

(a) $2.6 \times 10^{-5}\,m$ (b) $2.6 \times 10^{-4}\,m$

(c) $1.3 \times 10^{-5}\,m$ (d) $1.3 \times 10^{-4}\,m$

29. An ammeter, suspected to give inaccurate reading, is connected in series with a *silver* voltameter. The ammeter indicates 0.54 *A*. A steady current passed for one hour deposits 2.0124 *gm* of *silver*. If the E.C.E. of *silver is* $1.118 \times 10^{-3}\,gmC^{-1}$, then the error in ammeter reading is

(a) + 0.04 *A* (b) + 0.02 *A*

(c) – 0.03 *A* (d) – 0.01 *A*

30. If 1 *A* of current is passed through $CuSO_4$ solution for 10 seconds, then the number of copper ions deposited at the cathode will be about

(a) 1.6×10^{19} (b) 3.1×10^{19}

(c) 4.8×10^{19} (d) 6.2×10^{19}

31. A silver and a copper voltmeters are connected in parallel across a 6 *volt* battery of negligible resistance. In half an hour, 1 *gm* of copper and 2 *gm* of silver are deposited. The rate at which energy is supplied by the battery will approximately be (Given E.C.E. of copper $= 3.294 \times 10^{-4}\,g/C$ and *E.C.E.* of silver $= 1.118 \times 10^{-3}\,g/C$)

(a) 64 *W* (b) 32 *W*

(c) 96 *W* (d) 16 *W*

32. A thermocouple of resistance $1.6\,\Omega$ is connected in series with a galvanometer of $8\,\Omega$ resistance. The thermocouple develops and e.m.f. of $10\mu V$ per degree temperature difference between two junctions. When one junction is kept at $0^o C$ and the other in a molten metal, the galvanometer reads 8 *millivolt*. The temperature of molten metal, when e.m.f. varies linearly with temperature difference, will be

(a) $960^o C$ (b) $1050^o C$

(c) $1275^o C$ (d) $1545^o C$

33. The *emf* of a thermocouple, one junction of which is kept at $0^o C$, is given by $e = at + bt^2$ the Peltier co-efficient will be

(a) $(t+273)\,(a+2bt)$ (b) $(t+273)\,(a-2bt)$

(c) $(t-273)\,(a-2bt)$ (d) $(t-273)\,(a-2bt)$

34. A coil of wire of resistance $50\,\Omega$ is embedded in a block of ice. If a potential difference of 210 *V* is applied across the coil, the amount of ice melted per second will be

(a) 4.12 *gm* (b) 4.12 *kg*

(c) 3.68 *kg* (d) 2.625 *gm*

35. The same mass of copper is drawn into two wires 1 *mm* and 2 *mm* thick. Two wires are connected in series and current is passed through them. Heat produced in the wire is in the ratio

(a) 2 : 1 (b) 1 : 16

(c) 4 : 1 (d) 16 : 1

36. The temperature of hot junction of a thermo-couple changes from $80^o C$ to $100^o C$. The percentage change in thermoelectric power is

(a) 8% (b) 10%

(c) 20% (d) 25%

37. A thermo couple uses Bismuth and Tellurium as the dissimilar metals. The sensitivity of bismuth is $-72\mu V/^o C$ and that of the tellurium is $500\mu\ V/^o C$. If the difference between hot and cold junction is $100^o C$, then the maximum output will be

(a) $50\ mV$ (b) $7.2\ mV$

(c) $42.8\ mV$ (d) $57.2\ mV$

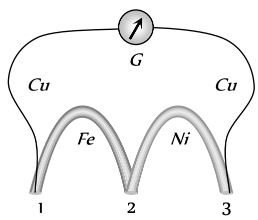
38. Three wires of copper, iron and nickel are joined to form three junctions as shown in Fig. When the temperature of junction 1 is kept $50^o C$ with the other two junctions at $0^o C$, the sensitive galvanometer gives a deflection of 14 divisions. When the temperature of junction 3 is kept $50^o C$, with the other two junctions at $0^o C$, the galvanometer gives a deflection of 11 divisions. Then the deflection given by the galvanometer, when temperature of the junction 2 is kept at $50^o C$, with the other two junctions at $0^o C$, will be

(a) 3 *div*

(b) 11 *div*

(c) 14 *div*

(d) 25 *div*



39. The wiring of a house has resistance $6\,\Omega$. A 100 *W* bulb is glowing. If a geyser of 1000 *W* is switched on, the change in potential drop across the bulb is nearly **[MNR 1998]**

(a) Nil (b) 23 *V*

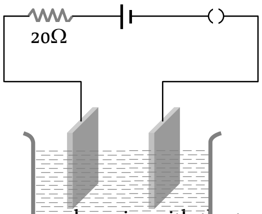
(c) 32 V (d) 12 V

40. A 12 V lead accumulator is being charged using 24 V supply with an external resistance 2Ω. The internal resistance of the accumulator is 1Ω. Find the time in which it will store 360 W-hour energy.

(a) 1 hr (b) 7.5 hr

(c) 10 hr (d) None of these

41. In a Ag voltameter 2.68 gm of silver is deposited in 10 min. The heat developed in $20\,\Omega$ resistor during the same period will be



(a) 192 kJ

(b) 192 J

(c) 200 J

(d) 132 kJ

42. The thermo e.m.f. of a thermocouple varies with the temperature θ of the hot junction as $E = a\theta + b\theta^2$ in $volts$ where the ratio a/b is $700^o C$. If the cold junction is kept at $0^o C$, then the neutral temperature is [AIEEE 2004]

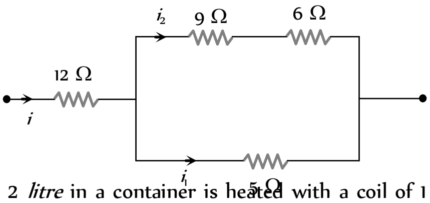
(a) $700^o C$

(b) $350^o C$

(c) $1400^o C$

(d) No neutral temperature is possible for this thermocouple

43. In the following circuit, 5 Ω resistor develops 45 J/s due to current flowing through it. The power developed per second across 12 Ω resistor is [AMU (Engg.) 1999]



(a) 16 W

(b) 192 W

(c) 36 W

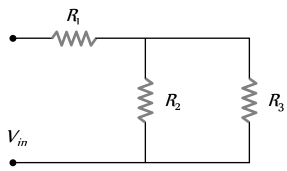
(d) 64 W

44. Water of volume 2 $litre$ in a container is heated with a coil of 1 kW at 27°C. The lid of the container is open and energy dissipates at rate of 160 J/s. In how much time temperature will rise from 27°C to 77°C [Given specific heat of water is 4.2 kJ/kg]

(a) 8 min 20 s (b) 6 min 2 s

(c) 7 min (d) 14 min

45. For ensuring dissipation of same energy in all three resistors (R_1, R_2, R_3) connected as shown in figure, their values must be related as] [AIIMS 2005]



(a) $R_1 = R_2 = R_3$

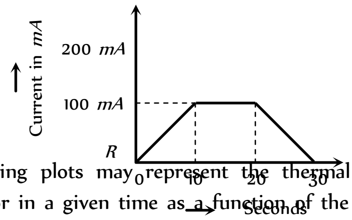
(b) $R_2 = R_3$ and $R_1 = 4R_2$

(c) $R_2 = R_3$ and $R_1 = \frac{1}{4}R_2$

(d) $R_1 = R_2 + R_3$

Graphical Questions

1. In a copper voltameter, mass deposited in 30 $second$ is m gm. If the time-current graph is as shown in figure, ECE of copper is



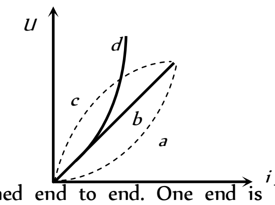
(a) m

(b) $m/2$

(c) 0.1 m

(d) 0.6 m

2. Which of the following plots may represent the thermal energy produced in a resistor in a given time as a function of the electric current [MP PMT 1999]



(a) a

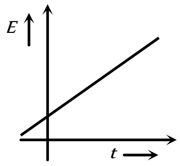
(b) b

(c) c

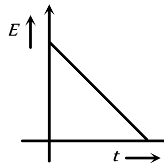
(d) d

3. Two different metals are joined end to end. One end is kept at constant temperature and the other end is heated to a very high temperature. The graph depicting the thermo e.m.f. is

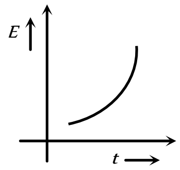
(a)



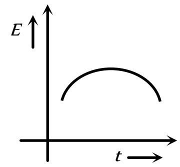
(b)



(c)

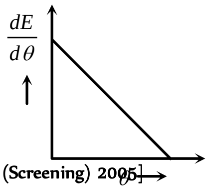


(d)

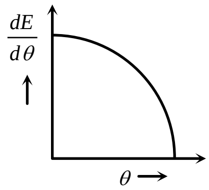


4. Which of the following graphs shows the variation of thermoelectric power with temperature difference between hot and cold junction in thermocouples

(a)

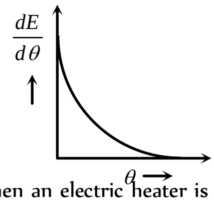


(b)

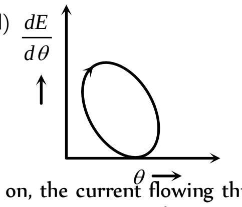


[IIT-JEE (Screening) 2005]

(c)

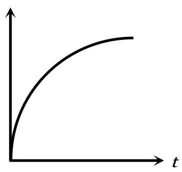


(d)

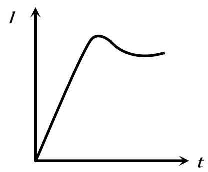


5. When an electric heater is switched on, the current flowing through it (i) is plotted against time (t). Taking into account the variation of resistance with temperature, which of the following best represents the resulting curve

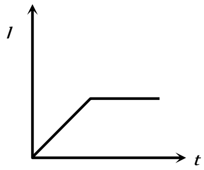
(a)



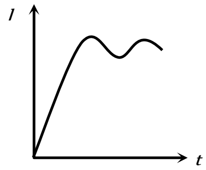
(b)



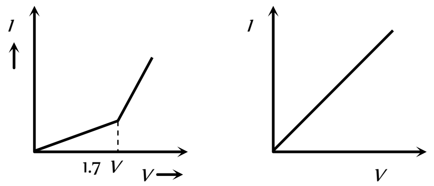
(c)



(d)



6. The V-i graphs A and B drawn for two voltameters. Identify each graph

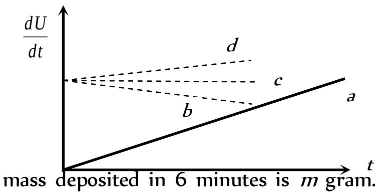


(A) (B)

(a) A for water voltameter and B for Cu voltameter
(b) A for Cu voltameter and B for water voltameter
(c) Both A and B represents Cu voltameter
(d) None of these

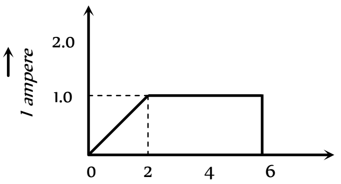
7. A constant current i is passed through a resistor. Taking the temperature coefficient of resistance into account, indicate which of the plots shown in figure best represents the rate of production of thermal energy in the resistor

(a) a
(b) b
(c) c
(d) d

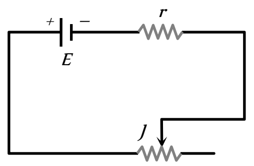


8. In a copper voltameter, mass deposited in 6 minutes is m gram. If the current-time graph for the voltameter is as shown here, then the E.C.E of the copper is

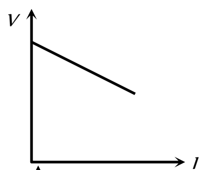
(a) $m/5$
(b) $m/300$
(c) $5m$
(d) $m/18000$



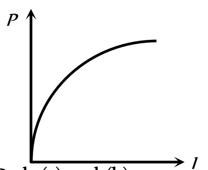
9. Battery shown in figure has e.m.f. E and internal resistance r. Current in the circuit can be varied by sliding the contact J. If at any instant current flowing through the circuit is I, potential difference between terminals of the cell is V, thermal power generated in the cell is equal to η fraction of total electrical power generated in it.; then which of the following graph is correct



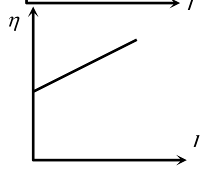
(a)



(b)



(c)



(d) Both (a) and (b) are correct

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below :

(a) *If both assertion and reason are true and the reason is the correct explanation of the assertion.*
(b) *If both assertion and reason are true but reason is not the correct explanation of the assertion.*
(c) *If assertion is true but reason is false.*
(d) *If the assertion and reason both are false.*
(e) *If assertion is false but reason is true.*

1. Assertion : The possibility of an electric bulb fusing is higher at the time of switching ON and OFF
Reason : Inductive effects produce a surge at the time of switch ON and OFF [AIIMS 2003]

2. Assertion : The 200 W bulbs glows with more brightness then 100 W bulbs.
Reason : A 100 W bulb has more resistance than a 200 W bulb.

3. Assertion : Fuse wire must have high resistance and low melting point.
Reason : Fuse is used for small current flow only.

4. Assertion : Two electric bulbs of 50 and 100 W are given. When connected in series 50 W bulb glows more but when connected parallel 100 W bulb glows more.
Reason : In series combination, power is directly proportional to the resistance of circuit. But in parallel combination, power is inversely proportional to the resistance of the circuit.

5. Assertion : Two bulbs of same wattage, one having a carbon filament and the other having a metallic filament are connected in series. Metallic bulbs will glow more brightly than carbon filament bulb.
Reason : Carbon is a semiconductor.

6. Assertion : An electric bulb is first connected to a dc source and then to a ac source having the same brightness in both the cases.
Reason : The peak value of voltage for an A.C. source is $\sqrt{2}$ times the root mean square voltage.

7. Assertion : Current is passed through a metallic wire, heating it red. When cold water is poured on half of its portion, then rest of the half portion become more hot.
Reason : Resistances decreases due to decrease in temperature and so current through wire increases.

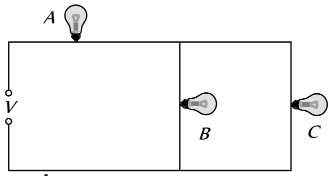
8. Assertion : Through the same current flows through the line wires and the filament of the bulb but heat produced in the filament is much higher then that in line wires.
Reason : The filament of bulbs is made of a material of high resistance and high melting point.

9. Assertion : Neutral temperature of a thermocouple does not depend upon temperature of cold junction.
Reason : Its value is constant for the given metals of the couple.

10. Assertion : In practical application, power rating of resistance is not important.
Reason : Property of resistance remain same even at high temperature.

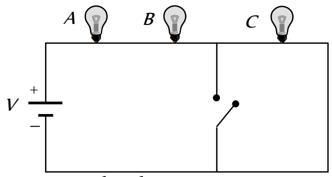
11. Assertion : Leclanche cell is used, when constant supply of electric current is not required.
Reason : The e.m.f. of a Leclanche cell falls, if it is used continuously.

12. Assertion : In the given circuit if lamp B or C fuses then light emitted by lamp A decreases.



Reason : Voltage on A decreases.

13. Assertion : If three identical bulbs are connected in series as shown in figure then on closing the switches. Bulb C short circuited and hence illumination of bulbs A and B decreases.



Reason : Voltage on A and B decreases

14. Assertion : Heat is generated continuously is an electric heater but its temperature becomes constant after some time.

Reason : At the stage when heat produced in heater is equal to the heat dissipated to its surrounding the temperature of heater becomes constant.

15. Assertion : Electric appliances with metallic body; *e.g.* heaters, presses etc, have three pin connections, whereas an electric bulb has a two pin connection. [AIIMS 1996]

Reason : Three pin connections reduce heating of connecting cables.

16. Assertion : A laser beam 0.2 W power can drill holes through a metal sheet, whereas 1000 W torch-light cannot.

Reason : The frequency of laser light is much higher then that of torch light. [AIIMS 1996]

17. Assertion : A domestic electrical appliance, working on a three pin will continue working even if the top pin is removed. [AIIMS 1995]

Reason : The third pin is used only as a safety device.

18. Assertion : In all conductors, for studying the thermoelectric behaviour or metals, lead is taken as a reference metal.

Reason : In lead, the Thomson effect is negative.

19. Assertion : The presence of water molecules makes separation of ions easier in electrolyte.

Reason : The presence of water molecules in electrolyte decreases the resistance of electrolyte.

20. Assertion : Thermocouple acts as a heat engine.

Reason : When two junctions of thermocouple are at different temperature, thermo e.m.f. is produced.

21. Assertion : When temperature of cold junction of a thermocouple is lowered, the value of neutral temperature of this thermocouple is raised.

Reason : When the difference of temperature of two junction is raised, more thermo e.m.f. is produced.

Answers and Solutions

Heating Effect of Current

1. (a) $1\ kWh = 1000\ W \times 3600\ sec = 36 \times 10^5\ W\text{-}sec$ (or J)

2. (b) $P \propto \frac{1}{R} \Rightarrow \frac{P_1}{P_2} = \frac{R_2}{R_1} \Rightarrow \frac{200}{100} = \frac{R_2}{R_1} \Rightarrow R_2 = 2R_1$

3. (c) $P = \frac{V^2}{R} \Rightarrow R_1 = \frac{V_1^2}{P_1} = \frac{(200)^2}{40} = 1000\Omega$

   and $R_2 = \frac{V_2^2}{P_2} = \frac{(200)^2}{100} = 400\Omega$

4. (b) When two bulbs are connected in series, the current will be same in both the bulbs. As a result potential drop will be more in the bulb of higher resistance *i.e.,* bulb of lower wattage.

5. (b) When 1 bulb fuses, the total resistance of the circuit decreases hence the current increases. Since $P = i^2R$, therefore illumination increases.

6. (c)

7. (c) We know that $\frac{P_1}{P_2} = \frac{R_2}{R_1} = \frac{2}{1}$

8. (a) $P = \frac{V^2}{R} \Rightarrow P \propto \frac{1}{R}$ and $R \propto l$ $\therefore P \propto \frac{1}{l} \Rightarrow \frac{P_1}{P_2} = \frac{l_1}{l_2} = \frac{2}{1}$

9. (b) $R_{conductor} \propto$ Temperature and $R_{semiconductor} \propto \frac{1}{\text{Temperature}}$

10. (c)

11. (a) In series, current is same in both the bulbs, hence $P \propto R (P = i^2R)$ $\therefore \frac{P_1}{P_2} = \frac{R_1}{R_2} = \frac{1}{2}$

12. (c) In this case, $P = \frac{V^2}{R}$ or $P \propto \frac{1}{R}$ and R will be minimum, when divided four parts are joints in parallel to the battery.

13. (c) Length is immaterial for an electric fuse wire.

14. (a) $P_{Rated} \propto \frac{1}{R}$ and $R \propto \frac{1}{(\text{Thickness of filament})^2}$

    So $P_{Rated} \propto (\text{Thickness of filament})^2$

15. (d) In series $P_S = \frac{P}{n} \Rightarrow 10 = \frac{P}{3} \Rightarrow P = 30\ W$

    In parallel $P_P = nP = 3 \times 30 = 90\ W$

16. (d) Energy consumed in $kWh = \frac{Watt \times hour}{1000}$

    $\Rightarrow$ For 30 days, $P = \frac{10 \times 50 \times 10}{1000} \times 30 = 150 kWh$

17. (b) $W = qV$ also $P = i \times V = \frac{W}{t}$

18. (c) Because given voltage is very high,

19. (c) $P_p = nP = 2 \times 40 = 80\ W$

20. (a) In series, $P \propto R (\because i$ is same), *i.e.* in series Fine wire (high R) liberates more energy.

    In parallel, $P \propto \frac{1}{R} (V$ is same) *i.e.* thick wire (less R) liberates more energy.

21. (d) Resistance of the bulb $= \frac{V^2}{P_{Ratate}} = \frac{220 \times 220}{100} = 484\Omega$

When connected with 110 *V*, the power consumed

$$P_{Consumed} = \frac{V^2}{R} = \frac{110 \times 110}{484} = 25W$$

22. (a) The resistance of 25 *W* bulb is greater than 100 *W* bulb. So for the same current, heat produced will be more in 25 *W* bulb. So it will glow more brightly.

23. (a) Equivalent resistance in the second case $= R_1 + R_2 = R$

Now, we know that $P \propto \frac{1}{R}$

Since in the second case the resistance $(R_1 + R_2)$ is higher than that in the first case (R).

Therefore power dissipation in the second case will be decreased.

24. (c) For constant voltage, we know that $P \propto \frac{1}{R}$

So higher the power, lower will be the resistance.

25. (d) $P = \frac{V^2}{R}$ but $R = \frac{\rho l}{A}$ $\Rightarrow$ $P = \frac{V^2}{\rho l / A} = \frac{AV^2}{\rho l}$. Since $\frac{AV^2}{l}$ is constant as per given conditions So $P \propto \frac{1}{\rho}$.

26. (d) Power consumed means heat produced.

For constant potential difference $P_{\text{consumed}} = \text{Heat} \propto \frac{1}{R_{eq}}$

$$\therefore \frac{H_1}{H_2} = \frac{R_2}{R_1} = \frac{R/2}{2R} = \frac{1}{4}$$

(Since $R_2 = \frac{R.R}{R+R} = \frac{R}{2}$ and $R_1 = R + R = 2R$)

27. (c) Resistance of carbon filament decreases with temperature while that of tungsten increases with temperature

In series $P_{Consumed} \propto R$ *i.e.* tungsten bulb will glow more brightly

28. (c) Power of the combination $P_s = \frac{P}{n} = \frac{1000}{2} = 500\,W$

29. (b) For parallel combination $P_{Consumed} \propto Brightness \propto P_{Rated}$

30. (b) Resistance of 25 *W* bulb $= \frac{220 \times 220}{25} = 1936\,\Omega$

Its safe current $= \frac{220}{1936} = 0.11\ amp.$

Resistance of 100 *W* bulb $= \frac{220 \times 220}{100} = 484\,\Omega$

Its safe current $= \frac{220}{484} = 0.48\ amp.$

When connected in series to 440 *V* supply, then the current $I = \frac{440}{(1936+484)} = 0.18\,amp.$

Thus current is greater for 25 *W* bulb, so it will fuse.

31. (b) $P = i^2R \Rightarrow \frac{\Delta P}{P} = \frac{2\Delta i}{t}$ ($R \rightarrow$ Constant)

$\Rightarrow$ % change in power $= 2\times$ % change in current

$= 2 \times 1 = 2\%$

32. (b) $P_{\max} = n\left(\frac{E^2}{4\,r}\right) = 2\left(\frac{2\times 2}{4\times 1}\right) = 2\,W$

33. (a) $H \propto \frac{1}{R}$ (If *V* = constant) $\Rightarrow \frac{H_1}{H_2} = \frac{R_2}{R_1} = \frac{l_2 A_1}{l_1 A_2} = \frac{l_2 r_1^2}{l_1 r_2^2}$

$\Rightarrow H_2 = 2H_1$

34. (d) $\frac{H}{t} = \frac{V^2}{R} \Rightarrow \frac{H}{t} \propto \frac{1}{R}$

35. (c) $H = i^2Rt$ and $i = \frac{q}{t}$. Hence $H = \frac{q^2R}{t}$; $\therefore H \propto q^2$

36. (b) $E = \frac{1100 \times 4}{1000} = 4.4\ kWh$

37. (d) After some time, thermal equilibrium will reach.

38. (b) At constant p.d., heat produced $= \frac{V^2}{R}$ *i.e.* $H \propto \frac{1}{R}$

39. (a) Power $= 3.75 \times 200\,W = 750\,W \approx 1\,H.P.$

40. (a) $\frac{V^2}{R} = P \Rightarrow R = \frac{V^2}{P} = \frac{220 \times 220}{100} = 484\Omega$

41. (a) Since $P = VI \Rightarrow I = \frac{P}{V} = \frac{250000}{10000} = 25\ A$

42. (b) Power lost in cable $= 10 \times (25)^2 = 6250\,W = 6.25\ kW$

43. (d) Heat generated in both the cases will be same because the capacitor has the same energy initially

$= \frac{1}{2}CV^2 = \frac{1}{2} \times 200 \times 10^{-6} \times (200)^2 = 4\,J$

44. (d) The bulbs are connected in parallel, hence each bulb consumes $\frac{48}{2} = 24\,W$. Therefore $\frac{V^2}{R} = 24$

$\Rightarrow R = \frac{6 \times 6}{24} = 1.5\,\Omega$

45. (a)

46. (c) The bulbs are in series, hence they will have the same current through them.

47. (a) When resistance is connected in series, brightness of bulb decreases because voltage across the bulb decreases.

48. (b) $R = \frac{V^2}{P} \Rightarrow R_1 = \frac{200 \times 200}{100} = 400\,\Omega$ and $R_2 = \frac{100 \times 100}{200} = 50\,\Omega$. Maximum current rating $i = \frac{P}{V}$

So $i_1 = \frac{100}{200}$ and $i_2 = \frac{200}{100} \Rightarrow \frac{i_1}{i_2} = \frac{1}{4}$.

49. (a) $\frac{R_1}{R_2} = \frac{P_2}{P_1} = \frac{100}{40} = \frac{5}{2}$. Resistance of 40 *W* bulb is $\frac{5}{2}$ times than 100 *W*. In series, $P = i^2R$ and in parallel, $P = \frac{V^2}{R}$. So 40 *W* in series and 100 *W* in parallel will glow brighter.

50. (a) $P = \frac{V^2}{R} \Rightarrow \frac{P_P}{P_S} = \frac{R_S}{R_P} = \frac{(R_1+R_2)}{R_1R_2/(R_1+R_2)} = \frac{(R_1+R_2)^2}{R_1\,R_2}$

$\Rightarrow \frac{100}{25} = \frac{(R_1+R_2)^2}{R_1R_2} \Rightarrow \frac{R_1}{R_2} = \frac{1}{1}$

51. (b) Total power $P = (800 + 3 \times 100)$

Also $P = Vi \Rightarrow 1100 = 220 \times i \Rightarrow i = 5A$

52. (c) Because $R \propto \frac{1}{P}$

53. (a) An ideal cell has zero resistance.

54. (c) Power loss in transmission $P_L = \frac{P^2R}{V^2} \Rightarrow P_L \propto \frac{1}{V^2}$

55. (c) $H = \frac{V^2 t}{4.2\,R}$ or $\frac{H}{t} = \frac{V^2}{4.2\,R}$

$\Rightarrow 800 = \frac{20 \times 20}{4.2 \times R} \Rightarrow R = \frac{5}{42} = 0.119 \approx 0.12\,\Omega$

56. (a) Heat produced $H = \frac{V^2 t}{4.2R} = H \propto \frac{1}{R}$ Hence $\frac{H_1}{H_2} = \frac{R_2}{R_1}$

57. (d) $\frac{H}{t} = i^2 R$. Here total $R = (21 + 4) = 25\ \Omega$

$\Rightarrow$ Rate of energy consumed $= 0.2 \times 0.2 \times 25 = 1\ J/s$

58. (b) When the heating coil is cut into two equal parts and these parts are joined in parallel, the resistance of coil is reduced to one fourth, so power consumed will become 4 times *i.e.* 400 Js^{-1}.

59. (d) The resistance of 40 *W* bulb will be more and 60 *W* bulb will be less.

60. (a) In series $P_{Consumed} \propto \text{Brightness} \propto \frac{1}{P_{Rated}}$

61. (d) *E* = *P* × *t* $= 1000\,W \times 30\ sec = 3 \times 10^4\ J$

62. (a) Resistance R_1 of 500 *W* bulb $= \frac{(220)^2}{500}$

Resistance R_2 of 200 *W* bulb $= \frac{(220)^2}{200}$

When joined in parallel, the potential difference across both the bulbs will be same.

Ratio of heat produced $= \frac{V^2/R_1}{V^2/R_2} = \frac{R_2}{R_1} = \frac{5}{2}$

When joined in series, the same current will flow through both the bulbs.

Ratio of heat produced $= \frac{i^2 R_1}{i^2 R_2} = \frac{R_1}{R_2} = \frac{2}{5}$

63. (d) Charge $q = it = 0.5\,A \times 3600\,\text{sec} = 1800\ culoumb$

64. (b) $H = i^2 Rt = \frac{V^2 t}{R} = \frac{120 \times 120 \times (10 \times 60)}{6} = 14.4 \times 10^5\,joule$

65. (b) In parallel $P_{consumed} \propto \text{Brightness} \propto \frac{1}{R}$

$P_A > P_B$ (given) $\quad \therefore\ R_A < R_B$

66. (d) $R = \rho \frac{l}{A}$ and $P \propto \frac{1}{R} \Rightarrow P \propto \frac{A}{l} \Rightarrow P \propto \frac{d^2}{l} \Rightarrow\ P_A = 2P_B$

67. (a) $t_S = t_1 + t_2 = 30 + 30 = 60\ minutes$

68. (a) For power transmission power loss in line $P_L = i^2 R$

If power of electricity is *P* and it is transmitted at voltage *V*, then $P = Vi \Rightarrow i = \frac{P}{V}$

$P_L = \left(\frac{P}{V}\right)^2 R = \frac{P^2 R}{V^2} = \frac{2.2 \times 10^3 \times 2.2 \times 10^3 \times 10}{22000 \times 22000} = 0.1W$

69. (a) $P = i^2 R$ (*i* and *R* are same)

So *P* will be same for given resistors.

70. (c) Since $H \propto i^2$, so on doubling the current, the heat produced and hence the rise in temperature becomes four times.

71. (a) *Watt-hour meter* measures electric energy.

72. (d) Total energy consumed $= \frac{60 \times 8}{1000} = 0.48\ kWH$

So cost $= 0.48 \times 1.25 = 0.6\ Rs.$

73. (a) $P_S = \frac{P}{n} = \frac{40}{4} = 10\ W.$

74. (b) As temperature increases resistance of filament also increases.

75. (a) Current through the combination $i = \frac{120}{(6+9)} = 8\ A$

So, power consumed by $6\,\Omega$ resistance

$P = (8)^2 \times 6 = 384\ W$

76. (d) $P = \frac{V^2}{R} = \frac{(225)^2}{50} = 1012.5 \approx 1000\ W$

77. (b) $P = Vi \Rightarrow\ i = \frac{P}{V} = \frac{100}{200} = 0.5\ A$

78. (b) $H = i^2 Rt\ \Rightarrow\ R = \frac{H}{i^2 t} = \frac{80}{4 \times 10} = 2\,\Omega$

79. (d) Heat produced = Energy stored in capacitor

$= \frac{1}{2} CV^2 = \frac{1}{2} \times 4 \times 10^{-6} \times (400)^2 = 0.32\ J$

80. (d) $P = \frac{V^2}{R} = \frac{(110)^2}{10} = \frac{12100}{10} = 1210\ W$

81. (a) $P_{consumed} = \left(\frac{V_A}{V_R}\right)^2 \times P_R = \frac{(160)^2}{(200)^2} \times 100 = 64\ W$

82. (d) For maximum power *r* = *R*

83. (d) $P = i^2 R\ \Rightarrow\ 22.5 = (15)^2 \times R \Rightarrow\ R = 0.10\ \Omega$

84. (d) $R_1 = \rho \frac{l_1}{A_1}$ and $R_2 = \rho \frac{l_2}{A_2} \Rightarrow\ \frac{R_1}{R_2} = \frac{l_1}{l_2} . \frac{A_2}{A_1} = \frac{l_1}{l_2}\left(\frac{r_2}{r_1}\right)^2$

Given $\frac{l_1}{l_2}=\frac{1}{2}$ and $\frac{r_1}{r_2}=\frac{2}{1}$ or $\frac{r_2}{r_1}=\frac{1}{2}\Rightarrow\frac{R_1}{R_2}=\frac{1}{8}$

$\therefore$ Ratio of heats $\frac{H_1}{H_2}=\frac{V^2/R_1}{V^2/R_2}=\frac{R_2}{R_1}=\frac{8}{1}$

85. (a) $P=Vi=250\times 2=500\,W$

86. (a) $P=\frac{V^2}{R}\Rightarrow 100=\frac{(200)^2}{R}\Rightarrow R=\frac{4\times10^4}{10^2}=400\,\Omega$

Now, $i=\frac{V}{R}=\frac{100}{400}=\frac{1}{4}amp$

87. (a, d) $R_{steel}=2R_{Al}$. In series $H\propto R$ (i is Same)

So, H will be more in steel wire . In parallel $H\propto\frac{1}{R}$ (V is Same), so H will be more in aluminium wire.

88. (a) $H=i^2Rt\Rightarrow\frac{H}{t}=i^2R=\frac{i^2\rho l}{\pi r^2}$

89. (b)

90. (a) $H=\frac{V^2}{R}.t\Rightarrow\frac{H_1}{H_2}=\frac{R_2}{R_1}=\frac{R}{2R}=\frac{1}{2}$

91. (b)

92. (a) In parallel $P_{Consumed}\propto P_{Rated}$

93. (b)

94. (a) $P=\frac{V^2}{R}\Rightarrow R=\frac{V^2}{P}=\frac{(220)^2}{40}=1210\,\Omega$

95. (b) $P=Vi\Rightarrow i=\frac{P}{V}=\frac{60}{220}=\frac{3}{11}amp$

96. (a) In series, $P_{Consumed}\propto\frac{1}{P_{Rated}}\propto V_{Applied}$

i.e. more voltage appears on smaller wattage bulb, so 25 *W* bulb will fuse

97. (c) Because in series current is same.

98. (b) $P=\frac{V^2}{R}\Rightarrow\frac{P_1}{P_2}=\frac{R_2}{R_1}\Rightarrow\frac{6}{P_2}=\frac{4}{6}=\frac{2}{3}\Rightarrow P_2=9\,W$

99. (c) $\frac{H}{t}=P=\frac{V^2}{R}\Rightarrow P\propto\frac{1}{R}$ also $R\propto\frac{l}{A}\propto\frac{l^2\rho}{A.l\rho}$

$\Rightarrow R\propto\frac{l^2}{m}\Rightarrow R\propto l^2$ (for same mass)

So $\frac{P_A}{P_B}=\frac{l_B^2}{l_A^2}=\frac{4}{1}\Rightarrow P_A=20\,W$

100. (a) $P=\frac{V^2}{R}\Rightarrow\frac{R_1}{R_2}=\frac{P_2}{P_1}=\frac{60}{40}=\frac{3}{2}$

101. (b) $P\propto V^2\Rightarrow\frac{P}{P_0}=\left(\frac{V}{V_0}\right)^2\Rightarrow P=\left(\frac{V}{V_0}\right)^2P_0$

102. (c) $P=\frac{V^2}{R}\Rightarrow R\propto\frac{1}{P}$

So resistance of the 100 *W* bulb will be minimum

103. (a) In parallel $\frac{1}{t_p}=\frac{1}{t_1}+\frac{1}{t_2}\Rightarrow t_p=\frac{t_1t_2}{t_1+t_2}$

$=\frac{5\times10}{5+10}=\frac{50}{15}=3.33\min=3\,min.\,20\,sec$

104. (a) For maximum joule heat produced in resistor external resistance = Internal resistance.

105. (d)

106. (c) $H=\frac{V^2}{R}t\Rightarrow\frac{H_1}{H_2}=\frac{R_2}{R_1}=\frac{4}{2}=\frac{2}{1}$

107. (a) If resistances of bulbs are R_1 and R_2 respectively then in parallel $\frac{1}{R_P}=\frac{1}{R_1}+\frac{1}{R_2}\Rightarrow$

$\frac{1}{\left(\frac{V^2}{P_p}\right)}=\frac{1}{\left(\frac{V^2}{P_1}\right)}+\frac{1}{\left(\frac{V^2}{P_2}\right)}$

$\Rightarrow P_P=P_1+P_2$

108. (b)

109. (b) When wire is cut into two equal parts then power dissipated by each part is $2P_1$

So their parallel combination will dissipate power $P_2=2P_1+2P_1=4P_1$

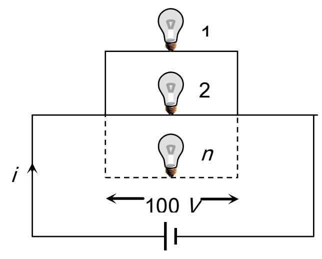
Which gives $\frac{P_2}{P_1}=4$

110. (d) $P=\frac{V^2}{R}\Rightarrow\frac{P_2}{P_1}=\frac{V_2^2}{V_1^2}$ ($\because R$ is constant)

$\Rightarrow\frac{P_2}{P_1}=\left(\frac{100}{200}\right)^2=\frac{1}{4}\Rightarrow P_2=\frac{P_1}{4}=\frac{40}{4}=10\,W$

111. (c) When each bulb is glowing at full power,

Current from each bulb $=i'=\frac{50}{100}=\frac{1}{2}A$



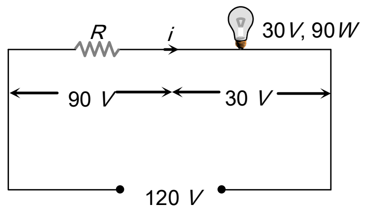
So main current $i=\frac{n}{2}A$

Also $E=V+ir \Rightarrow 120=100+\left(\frac{n}{2}\right)\times 10 \Rightarrow n=4$

112. (b) $R=\frac{V^2}{P}=\frac{(250)^2}{10^3}=62.5\,\Omega$

113. (c) Suppose resistance R is corrected in series with bulb.

Current through the bulb $i=\frac{90}{30}=3\,A$



Hence for resistance $V=iR \Rightarrow 90=3\times R \Rightarrow R=30\,\Omega$

114. (a) $i\propto r^{3/2} \Rightarrow \frac{r_2}{r_1}=\left(\frac{i_2}{i_1}\right)^{3/2}=\left(\frac{3}{1.5}\right)^{2/3}=(4)^{1/3}$

$\Rightarrow r_2=(4)^{1/3}\times r_1=4^{1/3}$ ($\because$ r_1 = 1 *mm*)

115. (c) In series $P'=\frac{P}{n}=\frac{60}{3}=20\,watts$

116. (c) $R=\frac{V^2}{P}=\frac{(220)^2}{60}=807\,\Omega$

117. (d) $\frac{P_1}{P_2}=\left(\frac{V_1}{V_2}\right)^2 \Rightarrow \frac{1000}{P_2}=\left(\frac{220}{110}\right)^2=4 \Rightarrow P_2=250\,W$

118. (a) $P_S=\frac{P_1P_2}{P_1+P_2}=\frac{100\times 200}{100+200}=\frac{200}{3}\approx 65\,watt$

119. (d) $H=\frac{V^2t}{R\times J}Calories=\frac{P\,t}{J}=\frac{210\times 5\times 60}{4.2}=15000\,cal$

120. (c) Using conservation of energy

Supplied electric energy = absorbed heat energy

$\Rightarrow i^2Rt=mST$

$\Rightarrow T\propto i^2$ (T - change in temperature)

i.e. when i is doubled T will be four times *i.e.* $5\times 4=20^oC$

121. (b) Energy $=P\times t$ = 2 × 1 × 30 = 60 *kWH* = 60 unit

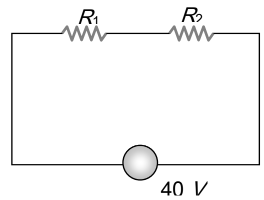
122. (d) Bulb (I) : Rated current $I_1=\frac{P}{V}=\frac{40}{220}=\frac{2}{11}amp.$

Resistance $R_1=\frac{V^2}{P}=\frac{(220)^2}{40}=1210\,\Omega$

Bulb (II) : Rated current $I_2=\frac{100}{220}=\frac{5}{11}amp$

Resistance $R_2=\frac{(220)^2}{100}=484\,\Omega$

When both are connected in series across 40 V supply



Total current through supply

$I=\frac{40}{P_1+P_2}=\frac{40}{1210+484}=\frac{40}{1254}=0.03A$

This current is less than the rated current of each bulb. So neither bulb will fuse.

Short Trick : Since $V_{Applied} < V_{Rated}$, neither bulb will fuse.

123. (a) Both R and $2R$ in parallel (V – constant)

So using $P=\frac{V^2}{R} \Rightarrow \frac{P_1}{P_2}=\frac{R_2}{R_1} \Rightarrow \frac{H_1}{H_2}=\frac{R_2}{R_1}=\frac{2}{1}$

124. (a) Power $P=Vit=250\times 4=1000\,W=1kW$

Energy = $P\times t$ = 1 *kW* × 60 *sec* = 60 *kJ*

125. (a) $P=\frac{V^2}{R} \Rightarrow P\propto \frac{1}{R}$ (V - constant)

$\therefore$ When one bulb will fuse out resistance of the series combination will be reduced.

Hence from $P_{Consumed}\propto \frac{1}{R}$ illumination will increase.

126. (c) $P=\frac{V^2}{R} \Rightarrow R=\frac{V^2}{P}=\frac{25\times 25}{25}=25\,\Omega$

127. (a) $P_{Rated}=\frac{V_{Rated}^2}{R} \Rightarrow R\propto \frac{1}{P_{Rated}}$ (V - constant)

So bulb of high power will have less resistance.

128. (d) $P_{Rated} \propto \frac{1}{R} \Rightarrow \frac{R_1}{R_2} = \frac{P_2}{P_1} = \frac{60}{40} = \frac{3}{2}$

129. (a) Energy $= \frac{V^2}{R} \times t = \frac{10 \times 10}{50} \times 3600 = 7200\,J$

130. (c) Energy $\frac{V^2}{R} t = \frac{200 \times 200 \times 2}{80} = 1000\,Wh$

131. (a) Energy $= P \times t = 100 \times 2 \times 60 = 12000\,J = 12 \times 10^3\,J$

132. (c) Heat $H = \frac{V^2 t}{R} \Rightarrow H \propto \frac{1}{R}$ (If *V*, *t* constant)

$\Rightarrow \frac{H_S}{H_P} = \frac{R_P}{R_S} = \frac{\left(\frac{R \times 2R}{3R}\right)}{(R + 2R)} = \frac{2}{9}$

133. (c) $i \propto \frac{1}{R}$ and $P \propto \frac{1}{R} \Rightarrow i \propto P$ *i.e.* in parallel bulb of higher power will draw more current.

134. (c) Resistance of *A* is greater than the resistance of combination of *B* and *C*, hence voltage drop across *A* will be greater than that across *B* or *C*. Also $H = \frac{V^2 t}{R}$

$\Rightarrow H \propto V^2$ so $H_A > (H_B = H_C)$ (*R* = constant)

135. (b) $P = Vi \Rightarrow i = \frac{2.2 \times 10^3}{22000} = \frac{1}{10} A$

Now loss of power $= i^2 R = \left(\frac{1}{10}\right)^2 \times 100$ = 1 *W*

136. (c) $P = \frac{V^2}{R}$. If resistance of heater coil is *R*, then resistance of parallel combination of two halves will be $\frac{R}{4}$

So $\frac{P_1}{P_2} = \frac{R_2}{R_1} = \frac{R/4}{R} = \frac{1}{4}$

137. (c) Total *kWh* consumed $= \frac{60 \times 8 \times 30}{1000} = 14.4$

Hence cost $= 14.4 \times 1.25 = 18\,Rs$

138. (c) Current capacity of a fuse wire should be slightly greater then the total rated load current.

139. (b)

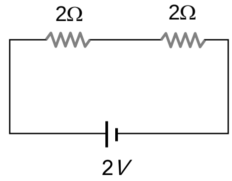
140. (d) Colliding electrons lose their kinetic energy as heat.

141. (a) It is called safe current and is proportional to $r^{3/2}$.

142. (c)

143. (d) $i = \frac{P}{V} = \frac{50}{250} = 0.2\,amp.$

144. (c) In steady state the branch containing capacitors, can be neglected. So reduced circuit is as follows



Power $P = \frac{V^2}{R} = \frac{(2)^2}{4} = 1\,W$.

145. (b) $P = \frac{V^2}{R_{eq}} \Rightarrow 150 = \frac{(15)^2}{[2R/(R+2)]} = \frac{225 \times (R+2)}{2R}$

$\Rightarrow R = \frac{450}{75} = 6\Omega$.

146. (c) $P = \frac{V^2}{R} \Rightarrow \frac{P_1}{P_2} = \frac{R_2}{R_1} = \frac{1}{2}$.

147. (c) $H = \frac{V^2 t}{R} \Rightarrow \frac{H_{Half}}{H_{Full}} = \left(\frac{R_{Full}}{R_{Half}}\right) = \frac{R}{R/2} = 2$

$\Rightarrow H_{Half} = 2 \times H_{Full}$.

148. (c) It is given $R_{Hot} = 10\,R_{Cold}$ also resistance at rated temperature $R = \frac{V^2}{P} = \frac{200 \times 200}{100} = 400\,\Omega$.

So resistance when lamp not in use.

$R_{Cold} = \frac{R_{Hot}}{10} = \frac{400}{10} = 40\,\Omega$

149. (a) The chemical energy reduced in battery

$= VIt = 6 \times 5 \times 6 \times 60\,J = 10800\,J = 1.08 \times 10^4\,J$

150. (c) The heat generated = $IVt = 2.1 \times 15 \times 1 = 31.5 J$

$= 31.5/4.2\,cal = 7.5 cal.$ $[\because 1\,cal = 4.2 J]$

151. (a) Resistance $\propto \frac{1}{\text{power}}$. Thus, 40 *W* bulb has a high resistance. Because of which there will be more potential drop across 40 *W* bulb. Thus 40 *W* bulb will glow brighter.

152. (c) When bulbs are connected in series, $P = \frac{V^2}{R'} = \frac{V^2}{3R}$

When bulbs are connected in parallel,

$P' = \frac{V^2}{R''} = \frac{V^2 \times 3}{R} = 3 \times 3P = 9P.$

153. (c) Time $t_S = t_1 + t_2 = 35$ min.

Chemical Effect of Current

1. (d) As sugar cannot be decomposed into ions and ions are responsible for conduction.

2. (c) $\because \frac{Z_1}{Z_2} = \frac{E_1}{E_2} \Rightarrow Z_2 = \left(\frac{E_2}{E_1}\right). Z_1$

3. (d) $\frac{m_{Zn}}{m_{Ag}} = \frac{E_{Zn}}{E_{Ag}} \Rightarrow m_{Ag} = W\left(\frac{E_{Ag}}{E_{Zn}}\right)$ = 3.3 *W* = 3.5 *W*

4. (d) 96500 *coulombs* of charge is needed to deposit one gram equivalent of an element at an electrode.

5. (c) As $\frac{m_{Cu}}{m_{Ag}} = \frac{E_{Cu}}{E_{Ag}} = \frac{\frac{1}{2}(\text{Atomic weight})_{Cu}}{(\text{Atomic weight})_{Ag}}$

6. (d) $V_2 = \frac{22.4 \times 1}{1} = 22.4\, litre$ at NTP

$\because$ 11.2 *litre* of H_2 is liberated by 96,500 *C*

$\therefore$ 22.4 *litre* of H_2 is liberated by 96500 × 2 = 1,93,000 *C*

7. (b) From *m* = *ZQ*, if *Q* = 1*C* ⇒ *m* = *Z*

8. (d)

9. (b) Because *H* has positive charge.

10. (a) Because H_2O is used as electrolyte.

11. (b) $m = Zit \Rightarrow 1 = 0.00033 \times 2 \times t$

$\therefore\ t = \frac{1}{0.00066 \times 60} min = \frac{100000}{3960} \approx 25\, min$

12. (b) $3 = 1.5(1 + r) \Rightarrow r = 1\Omega$

13. (b)

14. (c) $m = Zit = Zq$; $q = \frac{5 \times 10^{-3}}{3.387 \times 10^{-7}} amp\text{-}sec$

or $q = \frac{5 \times 10^{-3}}{3.387 \times 10^{-7} \times 3600} amp\text{-}hr = 4.1$

15. (b) Charge *Q* = *I t* = 1.6 × 60 = 96 *C*

Let *n* be the number of Cu^{+2} ions, then

$ne = Q \Rightarrow n = \frac{Q}{e} = \frac{96}{2 \times 1.6 \times 10^{-19}} = 3 \times 10^{20}$

16. (a) In the first case, $Zit = m$

In the second case, $Z \times \frac{i}{4} \times 4t = m$

17. (b) $\frac{\text{Mass of } O_2 \text{ ions}}{\text{Mass of } Ag \text{ ions}} = \frac{\text{Chemical equivalent of } O_2}{\text{Chemical equivalent of } Ag}$

$\Rightarrow \frac{0.8}{m} = \frac{8}{108} \Rightarrow m = 10.8\, gm$

18. (c)

19. (a) $F = Ne = 6 \times 10^{23} \times 1.6 \times 10^{-19}$

20. (d) Since 1 *faraday* deposits 1 *gm* equivalent.

21. (c) Equivalent weight of copper $= \frac{64}{2} = 32$

$\frac{\text{Equivalent weight of } Cu}{\text{Equivalent weight of } Ag} = \frac{\text{Weight of } Cu \text{ deposited}}{\text{Weight of } Ag \text{ deposited}}$

Weight of copper deposited $= \frac{10.8 \times 32}{108} = 3.2gm$

22. (b)

23. (c)

24. (a) $m \propto q \Rightarrow m \propto it$

25. (d) Equivalent weight of aluminium $= \frac{27}{3} = 9$

So 1 *faraday* = 96500 *C* are required to liberate 9 *gm* of *Al*.

26. (b) By Faraday's law, $m \propto it$.

$\therefore\ \frac{m_1}{m_2} = \frac{i_1 t_1}{i_2 t_2} \Rightarrow \frac{m}{m_2} = \frac{4 \times 120}{6 \times 40} \Rightarrow m_2 = \frac{m}{2}$

27. (a) $m \propto it$

28. (c) Amount of metallic sodium appears

$m = Zit = \left(\frac{A}{VF}\right) it$

$= \left(\frac{23}{1 \times 96500}\right) \times 16 \times 10 \times 60$ =2.3 *gm*

29. (a)

30. (a) $m = Zit \Rightarrow Z = \frac{m}{it} = \frac{4.572}{5 \times 45 \times 60} = 3.387 \times 10^{-4}\, gm/C$

31. (b) Faraday constant = 1 mole electron charge = *Ne*

$= 6.02 \times 10^{23} \times 1.6 \times 10^{-19} = 96500$

32. (d) $m = Zit = 0.126 \times 10^{-3} \times 5 \times 3600 = 2.27\, gm$

33. (b) $\frac{m_1}{m_2} = \frac{E_1}{E_2}$ (By faraday law for same current and time)

Where E_1 and E_2 are the chemical equivalents and m_1 and m_2 are the masses of copper and silver respectively.

$E = \frac{\text{Atomic weight}}{\text{Valency}}$. $E_1 = \frac{63.57}{2} = 31.79$ and

$E_2 = \frac{107.88}{1} = 107.88$

$\therefore\ \frac{1\, mg}{m_2} = \frac{31.79}{107.88} \Rightarrow m_2 = \frac{107.88}{31.79} mg = 3.4\, mg$

34. (a) $m = Zit \Rightarrow \frac{m}{Zit} = 1(\text{constant})$

35. (b) Positive ions get deposited on cathode.

36. (c) $m = Zit$ or $m \propto it$

$\therefore \frac{m_1}{m_2} = \frac{i_1t_1}{i_2t_2} \Rightarrow \frac{9}{m_2} = \frac{10^5}{50 \times 20 \times 60} \Rightarrow m_2 = 5.4\ gm$

37. (c) Electroplating only provides a thin deposition of a metal on the surface which in no way can give hardness to the metal.

38. (b)

39. (d) $m = Zit \Rightarrow \frac{m_{Cu}}{m_{Zn}} = \frac{Z_{Cu}}{Z_{Zn}}$

$m_{Cu} = m_{Zn}\frac{Z_{Cu}}{Z_{Zn}} = 0.13 \times \frac{31.5}{32.5} = 0.126\ g$

40. (b) $m = Zit \Rightarrow m = \frac{ZVt}{R} \Rightarrow m \propto Vt \Rightarrow \frac{m_1}{m_2} = \frac{V_1t_1}{V_2t_2}$

$\Rightarrow \frac{2}{m_2} = \frac{12 \times 30}{6 \times 45} \Rightarrow m_2 = 1.5\ gm$

41. (c) $i = \frac{m}{Zt} = \frac{0.972}{0.00018 \times 3 \times 3600} = 0.5\ A$

42. (b) The current through the voltameter is same as drawn from the battery outside it.

43. (d) The resistance of the cell is independent of e.m.f.

44. (a) $m = Zit = 3.3 \times 10^{-7} \times 3 \times 2 = 19.8 \times 10^{-7} kg$

45. (c) $m = zq$, z = atomic mass / valence

46. (c)

47. (a)

48. (b) 1 faraday (96500*C*) is the electricity which liberated that amount of substance which is equal to equivalent wt. So liberated amount of *Cu* is $\frac{63.5}{2}$ $= 31.25\ gm \approx 32\ gm$

49. (b) $m = Zit \Rightarrow 20 \times 10^{-3} = \left(\frac{32}{96500}\right) \times 0.15 \times t$

$= 6.7\ min = 6\ min.42\ sec$

50. (b) 22.4 *litre* H_2 = 1 mole H_2 = *N* molecules of H_2

= 2*N* atom of *H*

So charge required to liberate 22.4 *litre* of H_2 = 2*Ne* = 2*F*

Hence charge required to liberate 0.224 *litre* of H_2

$= \frac{2F}{22.4} \times 0.224 = \frac{2F}{100} = 2 \times 965\ C$

So current $i = \frac{Q}{t} = \frac{2 \times 965}{100} = 19.3\ amp$

51. (a)

52. (d) $m = Zit \Rightarrow Z = \frac{m}{it} = \frac{4.5}{4 \times 40 \times 60} = 47 \times 10^{-5}\ g/C$

53. (d) Charge supplied per minute = 3.2 × 60 = 192 *C*

Charge 2*e* liberates one Cu^{+2} ion

$\therefore$ No of Cu^{+2} ion liberate by 192 *C*

$= \frac{192}{2e} = \frac{192}{2 \times 1.6 \times 10^{-19}} = 6 \times 10^{20}$

54. (a) $m = Zit \Rightarrow i = \frac{m}{Zt} = \frac{0.99}{0.00033 \times 1200} = 2.5A$

Hence heat generated in the coil is

$H = i^2Rt = (2.5)^2 \times 0.1 \times 1200$ = 750 *J*

55. (c) $\frac{m_1}{m_2} = \frac{Z_1}{Z_2} \Rightarrow m_2 = \frac{m_1Z_2}{Z_1} = \frac{14 \times 1.2 \times 10^{-6}}{7 \times 10^{-6}}$ = 2.4 *g*

56. (c) $m = Zit \Rightarrow t = \frac{m}{Zi} = \frac{m \times F}{E \times i}$ $\left(\because Z = \frac{E}{F}\right)$

$t = \frac{27 \times 96500}{108 \times 2} = 12062.5\ \sec = \frac{12062.5}{3600}hr = 3.35\ hr$

57. (d) $m = zq \Rightarrow z \propto \frac{1}{q} \Rightarrow \frac{z_1}{z_2} = \frac{q_2}{q_1}$ ......(i)

also $q = q_1 + q_2 \Rightarrow \frac{q}{q_2} = \frac{q_1}{q_2} + 1$

$\Rightarrow q_2 = \frac{q}{1 + \frac{q_1}{q_2}}$ ......(ii)

From equation (i) and (ii) $q_2 = \frac{q}{1 + \frac{z_2}{z_1}}$

58. (c) From Faraday's law, *m/E* = constant

where *m* = mass of substance deposited, *E* = chemical equivalent.

$\therefore \frac{m_2}{m_1} = \frac{E_2}{E_1} \Rightarrow m_2 = \frac{108}{32} \times 1.6 = 5.4g$

59. (a) $q = it = \text{current} \times \text{time}$

Thermo-Electricity

1. (b) Production of e.m.f. by temperature difference is known Seeback effect.

2. (c) Production of heat at junctions due to current is known as Peltier effect.

3. (d)

4. (a)

5. (c) When there is no deflection, then this temperature is called inversion temperature. It is given by the relation

$\theta_n = \frac{\theta_i + \theta_c}{2}$

Where θ_c is temperature of cold junction $= 20^o C$ and neutral temperature $\theta_n = 270^o C$

$\therefore\ \theta_i = 2\theta_n - \theta_c = 540 - 20 = 520^o C$

6. (b)

7. (a) Thermo e.m.f. of a thermo couple depends on the nature of metals.

8. (a)

9. (a) According to the definition.

10. (a) $T_n = \frac{T_i + T_C}{2} \Rightarrow T_i = 2T_n - T_C$

11. (a)

12. (d)

13. (b) Based on Peltier effect.

14. (c) Peltier effect

15. (b) Thermopile is used for detection of heat radiation and measurement.

16. (b) $H = \sigma i t \Delta\theta \Rightarrow$ If i = 1 A, $\Delta\theta$ = 1°C, t = 1 *sec* then $H = \sigma$.

17. (a) According to Seebeck effect

18. (a) At neutral temperature, $\frac{dE}{dT} = 0$

19. (a) According to Seebeck effect.

20. (b)

21. (d)

22. (a) As a rule, more the metals are separated from each other in the thermoelectric series, the greater will be the thermo *emf.*

23. (b) $T_n = \frac{T_i + T_c}{2} = \frac{10 + 530}{2} = 270^o C$

24. (a) Joule effect is not reversible.

25. (b)

26. (c)

27. (c) The graph between thermo *emf* and temperature of hot junction is parabolic in shape.

28. (d) At neutral temperature E is maximum so

$\frac{dE}{dt} = 0 \Rightarrow \frac{d}{dt}(At - Bt^2) = 0 \Rightarrow A - 2Bt = 0 \Rightarrow t = \frac{A}{2B}$

29. (c) $t_n = \frac{t_1 + t_c}{2} \Rightarrow 280 = \frac{t_i + 15}{2} \Rightarrow t_i = 545^o C$

30. (a)

31. (a) A is false because at neutral temperature thermo emf is maximum. B is true.

32. (b) Thermo-electric power $P = \frac{dE}{d\theta}$; at t_n, $E \rightarrow$ maximum. So $P \rightarrow$ zero.

33. (d) By using $H = \sigma Q \theta$

$\Rightarrow\ H = (10 \times 10^{-6}) \times 10 \times (60 - 50) = 10^{-3} J = 1\ mJ$

34. (c) No change in neutral temperature but temperature of inversion is $t_i = 2t_n - t_c \Rightarrow t_i = 2 \times 270 - 40 = 500^o C$

35. (c)

36. (d) $t_i = 2t_n - t_c \Rightarrow t_i = 2 \times 350 - 30 = 670^o C$

37. (c)

38. (d) Neutral temperature is independent of temperature of cold junction.

39. (d)

40. (a) $E = at + bt^2$ at inversion temperature E will be minimum

Thus $\frac{dE}{dt} = 0 \Rightarrow \frac{d}{dt}[at + bt^2] = 0$

$\Rightarrow a + 2bt = 0 \Rightarrow t = -\frac{a}{2b}$

41. (d)

42. (a) $i = \frac{e}{R} \Rightarrow 3 \times 10^{-7} = \frac{(30 \times 10^{-6}) \times \theta}{50} \Rightarrow \theta = 0.5°$

43. (b) $t_n = \frac{\alpha}{\beta} = \left(\frac{500}{5}\right) = 100\,°C$

Also $t_n = \frac{t_i + t_c}{2} \Rightarrow 100 = \frac{t_i + 0}{2} \Rightarrow t_i = 200\,°C$

44. (b) At neutral temperature, thermal emf will be maximum.

$\therefore \frac{de}{dt} = a + bt$

For maximum or minima, $a + bt_n = 0$

$\therefore\ t_n = -a/b$

Critical Thinking Questions

1. (d) $P_1 = \frac{(220)^2}{R_1}$ and $P_2 = \frac{(220 \times 0.8)^2}{R_2}$

$\frac{P_2}{P_1} = \frac{(220\times 0.8)^2}{(220)^2}\times\frac{R_1}{R_2} \Rightarrow \frac{P_2}{P_1} = (0.8)^2\times\frac{R_1}{R_2}$ Here $R_2 < R_1$

(because voltage decreases from 220 $V \rightarrow$ 220 × 0.8 V

It means heat produced → decreases)

So $\frac{R_1}{R_2} > 1 \Rightarrow P_2 > (0.8)^2 P_1 \Rightarrow P_2 > (0.8)^2\times 100\,W$

Also $\frac{P_2}{P_1} = \frac{(220\times 0.8)i_2}{220\,i_1}$, Since $i_2 < i_1$ (we expect)

So $\frac{P_2}{P_1} < 0.8 \Rightarrow P_2 < (100\times 0.8)$

Hence the actual power would be between $100\times(0.8)^2 W$ and (100 × 0.8) W

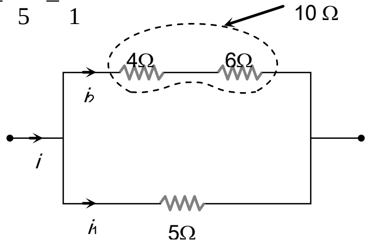
2. (b) $W = JH \Rightarrow P\times t = J\times m\,s\,\Delta\theta$

$\Rightarrow t = \frac{J\times m\times s\Delta\theta}{P}$ (For water 1 *litre* = 1*kg*)

$\Rightarrow t = \frac{4.2\times 1\times 1000\times(40-10)}{836} = 150\,sec$

Short Trick : use formula $t = \frac{4200\times m\times\Delta\theta}{P}$

3. (b) $\frac{i_1}{i_2} = \frac{R_2}{R_1} = \frac{10}{5} = \frac{2}{1}$



Also heat produced per sec *i.e.* $\frac{H}{t} = P = i^2R$

$\Rightarrow \frac{P_5}{P_4} = \left(\frac{i_1}{i_2}\right)^2\times\frac{5}{4} = \left(\frac{2}{1}\right)^2\times\frac{5}{4} = \frac{5}{1} \Rightarrow P_4 = \frac{10}{5} = 2\,cal/s$

4. (d) $220\times 9 = n(60) \Rightarrow n = 33$

5. (c) $H = \frac{V^2}{R}t$

Since supply voltage is same and equal amount of heat will produce, therefore

$\frac{R_1}{t_1} = \frac{R_2}{t_2}$ or $\frac{R_1}{R_2} = \frac{t_1}{t_2}$ .....(i)

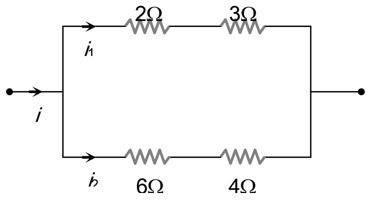
But $R \propto l \Rightarrow \frac{R_1}{R_2} = \frac{l_1}{l_2}$ .....(ii)

By (i) and (ii), $\frac{l_1}{l_2} = \frac{t_1}{t_2}$ .....(iii)

Now $l_2 = \frac{2}{3}l_1 \Rightarrow \frac{l_1}{l_2} = \frac{3}{2}$

∴ By equation (iii), $\frac{3}{2} = \frac{15}{t_2} \Rightarrow t_2 = 10$ *minutes*

6. (d)



Resistance of upper branch $R_1 = 2+3 = 5\,\Omega$

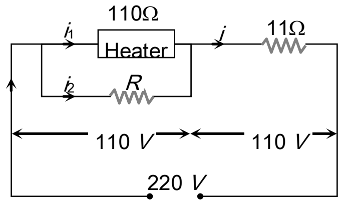
Resistance of lower branch $R_2 = 4+6 = 10\,\Omega$

Hence $\frac{i_1}{i_2} = \frac{R_2}{R_1} = \frac{10}{5} = 2$

$\frac{\text{Heat generated across } 3\,\Omega(H_1)}{\text{Heat generated across } 6\,\Omega(H_2)} = \frac{i_1^2\times 3}{i_2^2\times 6} = \frac{4}{2} = 2$

∴ Heat generated across 3 Ω = 120 *cal/sec*

7. (a) Power consumed by heater is 110 W so by using $P = \frac{V^2}{R}$



$110 = \frac{V^2}{110} \Rightarrow V = 110\,V$. Also from figure

$i_1 = \frac{110}{110} = 1A$ and $i = \frac{110}{11} = 10\,A$. So $i_2 = 10-1 = 9\,A$

Applying *Ohms* law for resistance *R*, *V= iR*

$\Rightarrow 110 = 9\times R \Rightarrow R = 12.22\,\Omega$

8. (c) $P_{consumed} = \left(\frac{V_A}{V_R}\right)^2\times P_R = \left(\frac{110}{115}\right)^2\times 500 = 457.46\;W$

So, percentage drop in power output

$= \frac{(500-457.46)}{500}\times 100 = 8.6\%$

9. (d) Heat produced $= \frac{V^2}{R}t$

i.e. when voltage is halved, heat produced becomes one-fourth. Hence time taken to heat the water becomes four times.

10. (b) Electric power consumed by kettle $P = 220 \times 4\,W$

Heat required

$H = 1000 \times 1(100 - 20) = 1000 \times 80\ cal = 4200 \times 80\ J$

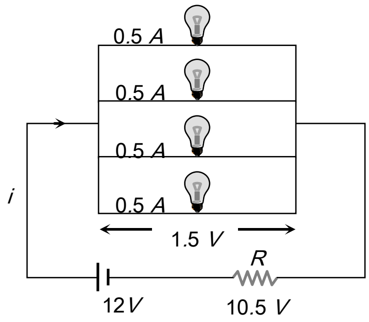
$P = \frac{H}{t} \Rightarrow H = P \times t$

$\therefore\ 220 \times 4 \times t = 4200 \times 80 \Rightarrow\ t = 6.3$ *minutes*

11. (c) $H = \frac{V^2}{R} \times t = \frac{(210)^2}{20} \times 1 = mL$

$\therefore\ \frac{(210)^2}{20} = m \times 80 \times 4.2 \Rightarrow\ m = 6.56\ g/s$

12. (b) For normal brightness of each bulb see following circuit. Current through each bulb = 0.5 *A*



So main current $i = 2A$

Also, voltage across the combination $= 1.5\,V$

So voltage across the resistance $= 10.5\,V$

Hence for resistance $V = iR\ \ \Rightarrow 10.5 = 2 \times R$

$\Rightarrow R = \frac{21}{4}\Omega$

13. (d) $P = \frac{V^2}{R}$ so $R = \frac{V^2}{P} \Rightarrow R_1 = \frac{V^2}{100}$ and $R_2 = R_3 = \frac{V^2}{60}$

Now $W_1 = \frac{(250)^2}{(R_1 + R_2)^2}.R_1$, $W_2 = \frac{(250)^2}{(R_1 + R_2)^2}.R_2$

and $W_3 = \frac{(250)^2}{R_3}$

$W_1 : W_2 : W_3 = 15 : 25 : 64$ or $W_1 < W_2 < W_3$

14. (a) Power dissipated $\propto\ R_{\text{equivalent}}$

15. (a) The current taken by the silver voltameter

$I_1 = \frac{m}{Zt} = \frac{1}{11.2 \times 10^{-4} \times 30 \times 60} = 0.496\ A$

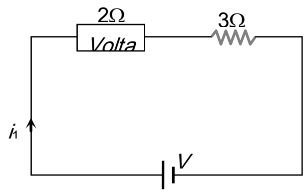
and by copper voltameter

$I_2 = \frac{1.8}{6.6 \times 10^{-4} \times 30 \times 60} = 1.515\ A$

Total current $I = (I_1 + I_2) = 2.011\ A$

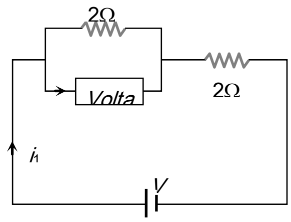
Power $P = IV = 2.011 \times 12 = 24.132\ J/\text{sec}$

16. (d) Initially current through the voltameter $i_1 = \frac{V}{(3+2)} = \frac{V}{5}$



Finally main current $i = \frac{V}{3+1} = \frac{V}{4}$

Hence current through voltameter $i_2 = \frac{V}{8}$



$\because$ Rate of deposition $(R) = \frac{m}{t} = Zi \Rightarrow R \propto i$

$\therefore$ % drop in rate $= \frac{R_2 - R_1}{R_1} \times 100 = \frac{i_2 - i_1}{i_1} \times 100$

$= \frac{\left(\frac{V}{8} - \frac{V}{5}\right)}{\frac{V}{5}} \times 100 = -37.5\%$

17. (d) Comparing the given equation with standard equation

$E = \alpha t + \frac{1}{2}\beta t^2$

$\alpha = 40$ and $\frac{1}{2}\beta = -\frac{1}{20} \Rightarrow \beta = -\frac{1}{10}$

Hence neutral temperature $t_n = -\frac{\alpha}{\beta} = \frac{-40}{-1/10}$

$\Rightarrow t_n = 400^o C$

18. (a) Comparing the given equation with standard equation $E = \alpha t + \frac{1}{2}\beta t^2$, we get $\alpha = 14$ and $\frac{1}{2}\beta = -0.02$

$\Rightarrow \beta = -0.04$

Hence neutral temperature $t_n = -\frac{\alpha}{\beta} = -\frac{14}{-0.04} = 350°C$

19. (a) We know that thermoelectric power $S = \frac{dE}{dT}$

Given $E = k(T - T_r)\left[T_0 - \frac{1}{2}(T + T_r)\right]$

By differentiating the above equation *w.r.t.* T and

Putting $T = \frac{1}{2}T_o$, we get $S = \frac{1}{2}kT_o$

20. (b) Comparing the given equation with $E = \alpha t + \frac{1}{2}\beta t^2$

We get $\alpha = 16$ and $\frac{1}{2}\beta = -0.04 \Rightarrow \beta = -0.08$

$\Rightarrow t_n = -\frac{\alpha}{\beta} = -\frac{16}{-0.08} = 200°C$

Also $t_i = 2t_n - t_c \Rightarrow t_i = 2\times(200) - 0 = 400°C$

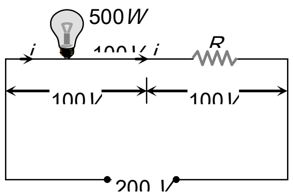
21. (c) $m = Zit \Rightarrow 20\times10^{-3} = \left(\frac{32}{96500}\right)\times 0.15\times t$

$= 6.7 min = 6 min. 42 sec.$

22. (b) $e = iR \Rightarrow 25\times10^{-6}\times\Delta\theta = 10^{-5}\times 40$

$\Delta\theta = \frac{40\times10^{-5}}{25\times10^{-6}} = \frac{400}{25} = 16°C$

23. (b)



Rated current through the circuit $i = \frac{500}{100} = 5A$

Potential difference across R, $100 = 5\times R \Rightarrow R = 20\,\Omega$

24. (b) By using $e_0^{100} = e_0^{32} + e_{32}^{70} + e_{70}^{100}$

$\Rightarrow 200 = 64 + 76 + e_{70}^{100} \Rightarrow e_{70}^{100} = 60\,\mu V$

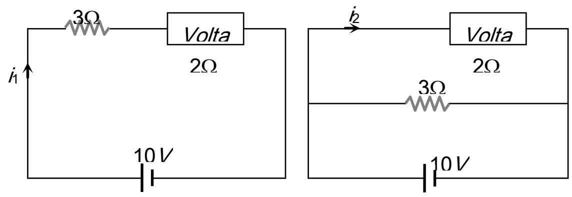
25. (d) In the normal condition current flows from X to Y through cold. While after increasing the temperature of hot junction beyond temperature of inversion. The current is reversed *i.e.* X to Y through hot junction or Y to X through cold junction.

26. (a) $H = \pi it = (2\times10^{-9})\times 2.5\times(2\times60) = 6\times10^{-7}\ J = 6\,erg$

27. (b) Remember mass of the metal deposited on cathode depends on the current through the voltameter and not on the current supplied by the battery. Hence by using $m = Zit$, we can say $\frac{m_{Parallel}}{m_{Series}} = \frac{i_{Parallel}}{i_{Series}}$

$\Rightarrow m_{Parallel} = \frac{5}{2}\times 1 = 2.5\ gm.$

Hence increase in mass = 2.5 – 1 = 1.5 *gm*



28. (c) Mass deposited $m = \text{Density}\times\text{Volume of the metal}$

$\Rightarrow m = \rho\times Ax$. Also $m = Zit$, so $Zit = \rho Ax$

$\Rightarrow x = \frac{Zit}{A\rho} = \frac{0.00033\times10^{-3}\times1.5\times20\times60}{(50\times10^{-4})\times9000} = 1.3\times10^{-5}\ m$

29. (a) $i = \frac{m}{Zt} = \frac{2.0124}{1.118\times10^{-3}\times3600} = 0.5\ A$

$\Rightarrow$ Error $= 0.54 - 0.5 = 0.04\ A$

30. (b) Total charge supplied $= 1\times10 = 10\,C$

$\because$ 2 electronic charge $(3.2\times10^{-19}\,C)$ liberates one Cu^{++} ion

$\therefore$ Number of Cu^{++} ions liberated by 10 C charge

$= \frac{1}{3.2\times10^{-19}}\times10 = 3.1\times10^{19}$

31. (d) $\because\ m = Zit$ or $i = \frac{m}{Zt}$

For silver voltmeter

$$i_1 = \frac{m_1}{Z_1 t} = \frac{2}{1.118\times10^{-3}\times1800} = 0.994\ amp$$

For copper voltameter

$$i_2 = \frac{m_2}{Z_2 t} = \frac{1}{3.294\times10^{-4}\times1800} = 1.687\ amp$$

$\therefore$ Power of circuit $= V(i_1 + i_2) = 6\times(0.994+1.687)$

$= 6\times2.681 \approx 16\ W$

32. (a) Let the temperature of molten metal is $t^o C$.

The thermo-emf $e = 10\times10^{-6}\,t\ volt$

Current in the circuit

$$i = \frac{e}{R+R_G} = \frac{10^{-5}t}{8+1.6} = \frac{10^{-5}t}{9.6}\,amp.$$

But $i = \frac{V}{R_G} = \frac{8\times10^{-3}}{8}$

$\therefore \frac{10^{-5}t}{9.6} = \frac{8\times10^{-3}}{8}$ or $t = \frac{9.6\times10^{-3}}{10^{-5}} = 960^o C$

33. (a) $\because$ Peltier coefficient $\pi = T\frac{de}{dT}$ and $t^o C = T - 273$

$\therefore e = a(T-273) + b(T-273)^2$

Differentiating *w.r.t.* T $\frac{de}{dT} = a + 2b(T-273)$

$\pi = T\frac{de}{dT} = T[a+2b(T-273)] \Rightarrow \pi = (t+273)(a+2bt)$

34. (d) $\frac{Q}{t} = \frac{V^2}{4.2\ R} = \frac{m}{t}.L$

$\therefore \frac{m}{t} = \frac{V^2}{4.2\ RL} = \frac{(210)^2}{4.2\times50\times80} \approx 2.625\ gm$

35. (d) $H = i^2RT = i^2\left(\frac{\rho l}{A}\right)t = \frac{i^2\rho Vt}{A^2}$ (V = volume, = *Al*)

$\Rightarrow H \propto \frac{1}{r^4} \Rightarrow \frac{H_1}{H_2} = \left(\frac{r_2}{r_1}\right)^4 = \left(\frac{2}{1}\right)^4 = \frac{16}{1}$.

36. (d) Thermoelectric power $P \propto \theta$

$\Rightarrow \frac{P_{100} - P_{80}}{P_{80}}\times100 = \frac{100-80}{80}\times100$ = 25%

37. (d) The sensitivity of the thermocouple will be

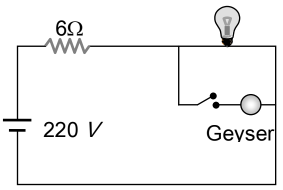
$= 500\mu V/^o C - (-72\mu V/^o C) = 572\mu V/^o C$

Therefore for a $100^o C$ temperature difference, the thermo e.m.f. will be

$E = 572\times10^{-6}\times100(volt) = 57.2\times10^{-3} = 57.2\ mV.$

38. (d) At cold junction, current flows from copper to nickel and from iron to copper, and at hot junction from nickel to iron, thus the contributions add.

39. (b) $R_{Bulb} = \frac{220^2}{100} = 484\ \Omega$, $R_{Geyser} = \frac{220^2}{1000} = 48.4\ \Omega$



(i) When only bulb is ON, $V_{Bulb} = \frac{220\times484}{490} = 217.4\ V$

(ii) When geyser is also switched ON, equivalent resistance of bulb and geyser is $R = \frac{484\times48.4}{484+48.4} = 44\ \Omega$

Voltage across the bulb $V_{Bulb} = \frac{220\times44}{50} = 193.6\ V$

Hence the potential drop is $217.4 - 193.6 = 23.8\ V$

40. (b) $i = \frac{24-12}{3} = 4\ A$, Time of charging $t = \frac{360`}{V.i}$

$\Rightarrow t = \frac{360}{12\times4} = 7.5\ hours.$

41. (a) $I = \frac{m}{Zt} = \frac{2.68}{\frac{108}{96500}\times10\times60} = \frac{2.68}{108}\times\frac{965}{6} \approx 4\ A$

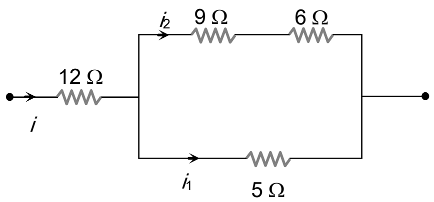
Energy $= I^2Rt = 4^2\times20\times600 = 192\ kJ.$

42. (d) Comparing with standard equation $E = \alpha t + \frac{1}{2}\beta t^2$

α = *a* and β = 2*b* $\Rightarrow t_n = -\frac{a}{2b} = -\frac{1}{2}\times700 = -350^o C$

This is not possible.

43. (b) $\frac{i_1}{i_2} = \frac{15}{5} = \frac{3}{1}$ … (i)



Also $\frac{H}{t} = i^2 R \Rightarrow 45 = (i_1)^2 \times 5$

$\Rightarrow i_1 = 3\,A$ and from equation (i) $i_2 = 1\,A$

So $i = i_1 + i_2 = 4\,A$

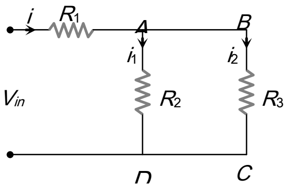
Hence power developed in $12\,\Omega$ resistance

$P = i^2 R = (4)^2 \times 12 = 192\,W$

44. (a) Heat gained by water = Heat supplied by container - heat lost $\Rightarrow$ $mS\Delta\theta$ = 1000*t* – 160*t*

$\Rightarrow t = \frac{2 \times 4.2 \times 1000 \times 50}{840}$ = 8 *min* 20 *sec*

45. (c) As the voltage in R_2 and R_3 is same therefore, according to,



$H = \frac{V^2}{R}.t, \ R_2 = R_3$

Also the energy in all resistance is same.

$\therefore \quad i^2 R_1 t = i_1^2 R_2 t$

Using $i_1 = \frac{R_3}{R_2 + R_3} i = \frac{R_3}{R_3 + R_3} i = \frac{1}{2} i$

Thus $i^2 R_1 t = \frac{i^2}{4} R_2 t$ or, $R_1 = \frac{R_2}{4}$

Graphical Questions

1. (b) Area = *it* = 2 *Coulomb* and $m = zit \Rightarrow z = \frac{m}{it} = \frac{m}{2}$

2. (d) $U \propto i^2$, hence the graph between *U* and *i* is parabolic in nature and should be above graph (*b*).

3. (d) $E = \alpha t + \frac{1}{2} \beta t^2$, graph between *E* and *t* will be a parabola, such that first emf increases and then decreases.

4. (a) Thermo electric power $P = \frac{dE}{d\theta} = \alpha + \beta\theta$

Comparing it with $y = mx + c$, option (a) is correct.

5. (b) The filament of the heater reaches its steady resistance when the heater reaches its steady temperature, which is much higher than the room temperature. The resistance at room temperature is thus much lower than the resistance at its steady state. When the heater is switched on, it draws a larger current than its steady state current. As the filament heats up, its resistance increases and current falls to steady state value.

6. (a) *Cu* voltameter with soluble electrodes obeys ohms law. In water voltameter, in the beginning when *V* is small $(< 1.7\,volt)$, very little current flows, the voltameter does not obey ohms law. As soon as *V* exceeds 1.7 *volt* (back e.m.f.) the current increases steadily according to ohms law.

7. (d) Thermal energy in resistor is $U = i^2 Rt$

where $R = R_0(1 + \alpha t) \Rightarrow U = i^2 R_0 (1 + \alpha t) t = i^2 R_0 t + i^2 R_0 t^2$

So $\frac{dU}{dt} = i^2 R_0 (1 + \alpha t)$

With the time temperature increases, hence dU/dt increases. This is best shown by curve (*d*).

8. (b) $m = Zi\,t$ and $i\,t$ = Area of given curve

= Area of triangle + Area of rectangle

$\Rightarrow i\,t = \frac{1}{2} \times (2 \times 60) \times 1 + (6 - 2) \times 60 \times 1 = 300$

$\therefore \ Z = \frac{m}{i\,t} = \frac{m}{300}$

9. (d) Terminal voltage $V = E - Ir$. Hence the graph between *V* and *i* will be a straight line having negative slope and positive intercept.

Thermal power generated in the external circuit

$P = EI - I^2 r$. Hence graph between *P* and *I* will be a parabola passing through origin.

Also at an instant, thermal power generated in the cell = $i^2 r$ and total electrical power generated in the cell = *Ei*. Hence the fraction $\eta = \frac{I^2 r}{EI} = \left(\frac{r}{E}\right) I$; so

$\eta \propto I$. It means graph between η and I will be a straight line passing through origin.

Assertion and Reason

1. (a) The possibility of an electric bulb fusing is higher at the time of switching ON and switching OFF because inductive effect produces a surge at the time of switching ON and OFF.

2. (a) The resistance, $R = \frac{V^2}{P} \Rightarrow R \propto 1/P$

i.e., higher is the wattage of a bulb, lesser is the resistance and so it will glow bright.

3. (c) Assertion is true but reason is false. Fuse wire must have high resistance because in series current remains same, therefore according to Joule's law $H = \frac{i^2 Rt}{4.2}$, heat produced is high if *R* is high. The melting point must be low so that wire may melt with increase in temperature. As the current equal to maximum safe value, flows through the fuse wire, it heats up, melts and break the circuit.

4. (a) Resistance of 50 *W* bulb is two times the resistance of 100 *W* bulb. When bulbs are connected in series, 50 *W* bulb will glow more as $P = i^2 R$ (current remains same in series). In parallel the 100 *W* bulb will glow more as $P = V^2 / R$ (potential difference remain same in parallel).

5. (d) When two bulbs are connected in series, the resistance of the circuit increases and so the voltage in each decreases, hence the brightness and the temperature also decreases. Due to decrease in temperature, the resistance of the carbon filament will slightly increase while that of metal filament will decrease. Hence, carbon filament bulb will glow more brightly $(P = i^2 R)$. Also carbon is not a semiconductor.

6. (e) Voltage of dc source is constant but in ac, peak value of voltage is $\sqrt{2}$ times the *rms.* voltage. Hence bulb will glow with more brightness when connected to an ac source of the same voltage.

7. (a) When cold water is poured on half portion of the wire, its resistance decreases due to decrease in temperature. As a result of this total resistance of circuit decreases *i.e.* current through each portion of wire increases *i.e.* rest of the half portion becomes still more hot.

8. (a) As filament of bulb and line wire are in series, hence current through both is same. Now, because $H = \frac{i^2 Rt}{4.2}$ and resistance of the filament of the bulb is much higher than that of line wires, hence heat produced in the filament is much higher than that in line wires.

9. (b) Neutral temperature is the temperature of hot junction, at which the thermo e.m.f. produced in the thermocouple becomes maximum. It is independent of cold junction and depends on the nature of materials of two metals used to form thermocouple.

10. (d) Because of heat production every resistance has a maximum power rating, the maximum power that can be dissipated without overheating the device. When this rating is exceeded, heat is produced, due to which resistance may change unpredictably.

11. (a) The e.m.f. of a Leclanche cell falls, because of the partial polarisation due to accumulation of hydrogen gas. In case, Leclanche cell is used in experiment, where current is drawn after short breaks, then during each break, hydrogen gas escapes and

Mn_2O_3 converts into MnO_2 by taking oxygen from the atmosphere. As a result, the cell regains its original e.m.f.

12. (a) When lamp *B* or *C* gets fused equivalent resistance of *B* and *C* increases. In series voltage distributes in the ratio of resistance, so voltage appears across *B* increases or in other words voltage across *A* decreases.

13. (d) When switch *S* is closed, bul*b C* is short circuited, so voltage *V* distributes only in two parts *i.e.* voltage on Bulb *A* and *B* increases as compared previously. Hence illumination of Bulb *A* and *B* increases.

14. (a)

15. (c) The electrical appliances with metallic body like heater, press *etc*. have three pin connections. Two pins are for supply line and third pin is for earth connection for safety purposes.

16. (c) A laser beam is a beam of light which is light amplification by stimulated emission of radiation.

The energy per unit area of the laser beam is very high as compared to the torch light.

17. (a) Follow hint of question 15 of this section.

18. (c) Thomson e.m.f. in lead is practically zero.

19. (b) The presence of water molecules reduces force between ions by $1/81$ times because the value of dielectric constant of water is 81. That is why the separation between ions becomes easier.

20. (b) Here reason is not the correct explanation of the assertion, which is correct.

21. (d) Here assertion and reason are not correct.

Heating and Chemical Effect of Current

SET Self Evaluation Test -20

1. An electric kettle has two coils. When one of these is switched on, the water in the kettle boils in 6 minutes. When the other coil is switched on, the water boils in 3 minutes. If the two coils are connected in series, the time taken to boil the water in the kettle is

(a) 3 *minutes* (b) 6 *minutes*
(c) 2 *minutes* (d) 9 *minutes*

2. A $3°$ rise in temperature is observed in a conductor by passing a certain current. When the current is doubled, the rise in temperature will be

(a) $15°C$ (b) $12°C$
(c) $9°C$ (d) $3°C$

3. Two indentical electric lamps marked 500 *W*, 220 *V* are connected in series and then joined to a 110 *V* line. The power consumed by each lamp is

(a) $\frac{125}{4}W$ (b) $\frac{25}{4}W$
(c) $\frac{225}{4}W$ (d) 125 *W*

4. When 1 *gm* hydrogen $(e.c.e. = 1.044\times10^{-8} kg/C$ forms water, 34 *kcal* heat is liberated. The minimum voltage required to decompose water is

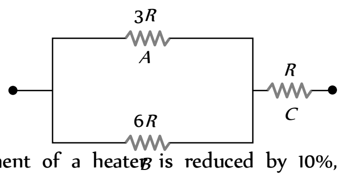
(a) 0.75 *V* (b) 3 *V*
(c) 1.5 *V* (d) 4.5 *V*

5. In how much time, one *litre* of H_2 will be collected by 5 *A* current ? (If $Z = 1\times10^{-8}\ kg/C$ and density of $H_2 = 0.09\,kg/m^3$)

(a) 30 *minutes* (b) 15 *minutes*
(c) 45 *minutes* (d) 60 *minutes*

6. The three resistances *A*, *B* and *C* have values 3*R*, 6*R* and *R* respectively. When some potential difference is applied across the network, the thermal powers dissipated by *A*, *B* and *C* are in the ratio

(a) 2 : 3 : 4
(b) 2 : 4 : 3
(c) 4 : 2 : 3
(d) 3 : 2 : 4



7. If the length of the filament of a heater is reduced by 10%, the power of the heater will

(a) Increase by about 9% (b) Increase by about 11%
(c) Increase by about 19% (d) Decrease by about 10%

8. A thermo couple develops 40 $\mu V/kelvin$. If hot and cold junctions be at 40° *C and* 20° *C* respectively then the emf develops by a thermopile using such 150 thermo couples in series shall be

(a) $150mV$ (b) $80mV$
(c) $144mV$ (d) $120mV$

9. Amount of electricity required to pass through the H_2O voltmeter so as to liberate 11.2 *litre* of hydrogen will be

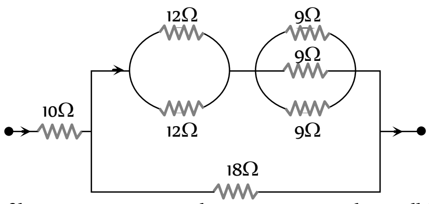
(a) 1 *Faraday* (b) $\frac{1}{2}Faraday$
(c) 2 *Faraday* (d) 3 *Faraday*

10. The resistance of the filament of a lamp increases with the increase in temperature. A lamp rated 100 *W*, 220 *V* is connected across 220 *V* power supply. If the voltage drops by 10% then the power of lamp will be

(a) 90 *W* (b) 81 *W*
(c) Between 90 *W* and 100 *W* (d) Between 81 *W* and 90 *W*

11. In the following circuit, 18Ω resistor develops $2\,J/sec$ due to current flowing through it. The power developed across 10Ω resistance is

(a) 125 *W*
(b) 10 *W*
(c) $\frac{4}{5}W$
(d) 25 *W*



12. If resistance of the filament increases with temperature, what will be power dissipated in a 220 *V*- 100 *W* lamp when connected to 110 *V* power supply

(a) 25 *W* (b) < 25 *W*
(c) > 25 *W* (d) None of these

13. Total surface area of a cathode is $0.05m^2$ and 1 *A* current passes through it for 1 *hour*. Thickness of nickle deposited on the cathode is (Given that density of nickle = $9gm/cc$ and it's E.C.E. = $3.04\times10^{-4}gm/C$)

(a) 2.4 *m* (b) $2.4\mu m$
(c) 2.4 μm (d) None of these

14. Two bulbs consume same power when operated at 200 *V* and 300 *V* respectively. When these bulbs are connected in series across a D.C. source of 500 *V*, then

(a) Ratio of potential difference across them is 3/2
(b) Ratio of potential difference across them is 9/4
(c) Ratio of power consumed across them is 4/9
(d) Ratio of power consumed across them is 2/3

AS Answers and Solutions

(SET -20)

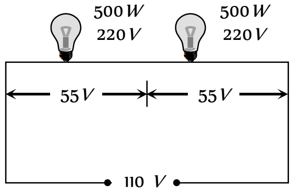
1. (d) In series $\frac{1}{P_S}=\frac{1}{P_1}+\frac{1}{P_2} \Rightarrow \frac{1}{(H_s/t_s)}=\frac{1}{(H_1/t_1)}+\frac{1}{(H_2/t_2)}$

$\because H_s = H_1 = H_2$ So $t_s = t_1 + t_2 = 6+3 = 9 min$

2. (b) $i^2Rt = C\theta = 3C;$ C = Thermal capacity

when $i_1 = 2i \Rightarrow C\theta_1 = 4i^2Rt = 4\times 3C \Rightarrow \theta_1 = 12^o C$

3. (a) Voltage across each bulb $V'=\frac{110}{2}=55W$ so, power consumed by each bulb will be



$P'=\left(\frac{55}{220}\right)^2\times 500$

$=\frac{125}{4}W$

4. (c) $m = Zit \Rightarrow it = \frac{m}{Z}=\frac{1\times 10^{-3}}{1.044\times 10^{-8}}C=\frac{10^5}{1.044}C$

Given $H = 34\,kcal$ = $4.2 \times 34 \times 10^3$ J

$\Rightarrow$ Heat generated $H = Vit = V.\frac{10^5}{1.044}$

$\Rightarrow V = \frac{4.2\times 34\times 1.044}{10^2}$ = $4.2 \times 0.34 \times 1.044 = 1.5$ V

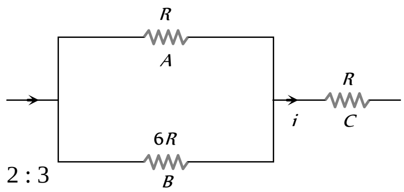
5. (a) $m = zit \Rightarrow 10^{-3}\times 0.09 = 1\times 10^{-8}\times 5\times t \Rightarrow t = 30\,min$

6. (c) Thermal power in $A = P_A = \left(\frac{2i}{3}\right)^2 3R = \frac{4}{3}i^2R$

Thermal power in $B = P_B = \left(\frac{i}{3}\right)^2 6R = \frac{2}{3}i^2R$

Thermal power in

$C = P_C = i^2R$



$\Rightarrow P_A : P_B : P_C$

$=\frac{4}{3}:\frac{2}{3}:1 = 4:2:3$

7. (b) $P \propto \frac{1}{R}$ and $R \propto l \Rightarrow P \propto \frac{1}{l}$

$\Rightarrow \frac{P_1}{P_2}=\frac{l_2}{l_1}\Rightarrow \frac{P_1}{P_2}=\frac{(100-10)}{100}=\frac{90}{100}\Rightarrow P_2 = 1.11P_1$

% change in power = $\frac{P_2-P_1}{P_1}\times 100 = 11\%$

8. (d) The temperature difference is 20°C = 20 K. So that thermo emf developed $E = \alpha\theta = 40\frac{\mu V}{K}\times 20K = 800\mu V$

Hence total emf = $150\times 800 = 12\times 10^4\,\mu V = 120mV$

9. (a) 22.4 *litre* H_2 =1 mole of H_2 = N molecules of H_2

= $2N$ atoms of H.

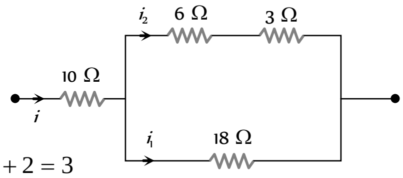
So charge required to liberate 22.4 *litre* of H_2 = $2Ne$ = $2F$.

Hence charge required to liberate 11.2 *litre* of H_2 = F.

10. (d) Let the resistance of the lamp filament be R. Then $100=\frac{(220)^2}{R}$. When then voltage drops, expected power is $P=\frac{(220\times 0.9)^2}{R'}$. Here R' will be less than R, because now the rise in temperature will be less. Therefore P is more than $\frac{(220\times 0.9)^2}{R}=81W$

But it will not be 90% of earlier value, because fall in temperature is small. Hence (d) is correct.

11. (b) The given circuit can be redrawn as follows



$\frac{i_1}{i_2}=\frac{9}{18}=\frac{1}{2}$

and $i = i_1 + i_2$

$\Rightarrow \frac{i}{i_1}=1+\frac{i_2}{i_1}=1+2=3$

From $P = i^2R \Rightarrow \frac{P_{10\Omega}}{P_{18\Omega}}=\left(\frac{i}{i_1}\right)^2\times\frac{10}{18}\Rightarrow P_{10\Omega}=10W$

12. (c) If resistance does not vary with temperature P consumed = $\left(\frac{V_A}{V_R}\right)^2\times P_R=\left(\frac{110}{220}\right)^2\times 100 = 25W$. But in second cases resistance decreases so consumed power will be more than 25 W

13. (c) Mass deposited = density × volume of the metal

$m = p\times A\times X$ .....(i)

Hence from Faraday's first law $m = Zit$ .....(ii)

So from equation (i) and (ii)

$Zit = \rho\times Ax \Rightarrow x = \frac{Zit}{\rho A}$

$=\frac{3.04\times 10^{-4}\times 10^{-3}\times 1\times 3600}{9000\times 0.05}=2.4\times 10^{-6}m = 2.4\mu m$

14. (c) $P=\frac{V^2}{R}$ $\therefore R=\frac{V^2}{P}$ or $R\propto V^2$ *i.e.* $\frac{R_1}{R_2}=\left(\frac{200}{300}\right)^2=\frac{4}{9}$

When connected in series potential drop and power consumed are in the ratio of their resistances. So, $\frac{P_1}{P_2}=\frac{V_1}{V_2}=\frac{R_1}{R_2}=\frac{4}{9}$

Magnetic Effect of Current

Oersted found that a magnetic field is established around a current carrying conductor.

Magnetic field exists as long as there is current in the wire.

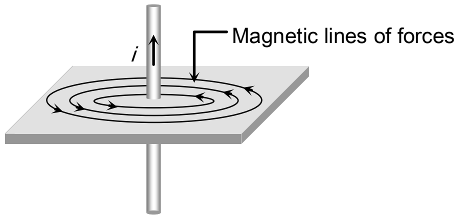

Fig. 21.1

Biot-Savart's Law

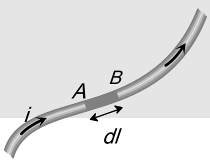
Biot-Savart's law is used to determine the magnetic field at any point due to a current carrying conductor.

This law is although for infinitesimally small conductor yet it can be used for long conductors. In order to understand the Biot-Savart's law, we need to understand the term current-element.

Current element

It is the product of current and length of infinitesimal segment of current carrying wire.

The current element is taken as a vector quantity. Its direction is same as the direction of current.



Current element *AB* = $i\vec{dl}$

According to Biot-Savart Law, magnetic field at point '*P* due to the current element $i\vec{dl}$ is given by the expression, $d\vec{B} = k\frac{i\,dl\sin\theta}{r^2}\hat{n}$ also $\vec{B} = \int d\vec{B} = \frac{\mu_0 i}{4\pi}.\int\frac{dl\sin\theta}{r^2}\hat{n}$

In C.G.S. *k* = 1 and in S.I. : $k = \frac{\mu_0}{4\pi}$

where μ_0 = Absolute permeability of air or vacuum $= 4\pi\times10^{-7}\frac{Wb}{Amp-metre}$. It's other units are

$\frac{Henry}{metre}$ or $\frac{N}{Amp^2}$ or $\frac{Tesla-metre}{Ampere}$

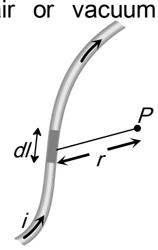


Fig. 21.2

Vectorially, $d\vec{B} = \frac{\mu_0}{4\pi}\cdot\frac{i(\vec{dl}\times\hat{r})}{r^2} = \frac{\mu_0}{4\pi}\cdot\frac{i(\vec{dl}\times\vec{r})}{r^3}$

Direction of Magnetic Field

The direction of magnetic field is determined with the help of the following simple laws :

(1) **Maxwell's cork screw rule :** According to this rule, if we imagine a right handed

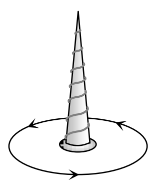

Fig. 21.3

screw placed along the current carrying linear conductor, be rotated such that the screw moves in the direction of flow of current, then the direction of rotation of the thumb gives the direction of magnetic lines of force.

(2) **Right hand thumb rule :** According to this rule if a straight current carrying conductor is held in the right hand such that the thumb of the hand represents the direction of current flow, then the direction of folding fingers will represent the direction of magnetic lines of force.

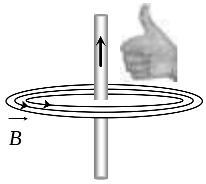

Fig. 21.4

(3) **Right hand thumb rule of circular currents :** According to this rule if the direction of current in circular conducting coil is in the direction of folding fingers of right hand, then the direction of magnetic field will be in the direction of stretched thumb.

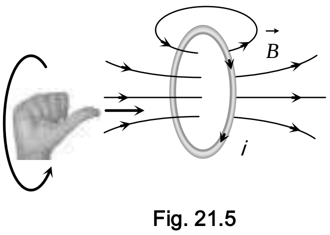

Fig. 21.5

(4) **Right hand palm rule**

If we stretch our right hand such that fingers point towards the point. At which magnetic field is required while thumb is in the direction of current then normal to the palm will show the direction of magnetic field.

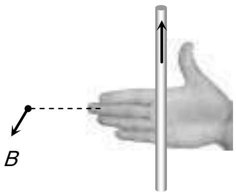

Fig. 21.6

Meaning of Cross ⊗ and dot ⊙

If magnetic field is directed perpendicular and into the plane of the paper it is represented by ⊗ (cross) while if magnetic field is directed perpendicular and out of the plane of the paper it is represented by ⊙ (dot)

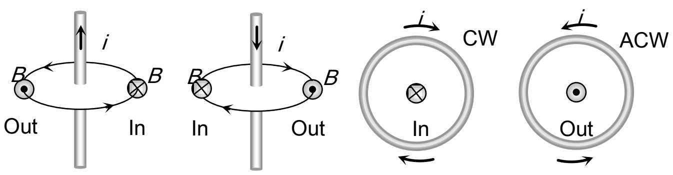

Fig. 21.7

In : Magnetic field is away from the observer or perpendicular inwards.

Out : Magnetic field is towards the observer or perpendicular outwards.

Ampere's Law

Amperes law gives another method to calculate the magnetic field due to a given current distribution.

Line integral of the magnetic field $\vec{B}$ around any closed curve is equal to μ_0 times the net current *i* threading through the area enclosed by the curve *i.e.*

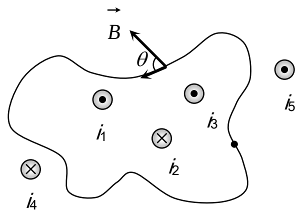

Fig. 21.8

$$\oint \vec{B}\cdot\vec{dl} = \mu_0 \sum i = \mu_0 (i_1 + i_3 - i_2)$$

Also using $\vec{B} = \mu_0 \vec{H}$ (where $\vec{H}$ = magnetising field)

$$\oint \mu_0 \vec{H}.\vec{dl} = \mu_0 \Sigma i \Rightarrow \oint \vec{H}.\vec{dl} = \sum i$$

Total current crossing the above area is $(i_1 + i_3 - i_2)$. Any current outside the area is not included in net current. (Outward ⊙ → +*ve*, Inward ⊗ → – *ve*)

Table 21.1 : Biot-Savart's law v/s Ampere's law

Biot-Savart's law	Ampere's law
this law is valid for all current distributions	This law is valid for symmetrical current distributions
This law is the differential form of $\vec{B}$ or $\vec{H}$	Basically this law is the integral from of $\vec{B}$ or $\vec{H}$
This law is based only on the principle of magnetism	This law is based on the principle of electromagnetism.

Magnetic Field Due to Circular Current

If a coil of radius r, carrying current i then magnetic field on it's axis at a distance x from its centre given by (Application of B

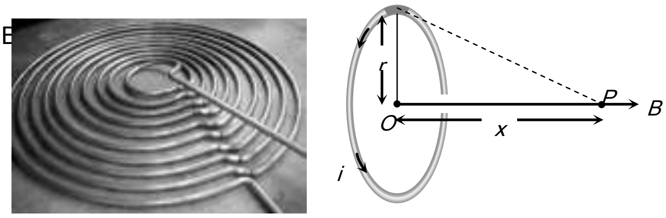

Fig. 21.9

(1) $B_{axis} = \frac{\mu_0}{4\pi} \cdot \frac{2\pi N i r^2}{(x^2 + r^2)^{3/2}}$; where N = number of turns in coil.

(2) At centre $x = 0 \Rightarrow B_{centre} = \frac{\mu_0}{4\pi} \cdot \frac{2\pi Ni}{r} = \frac{\mu_0 Ni}{2r} = B_{\max}$

(3) The ratio of magnetic field at the centre of circular coil and on it's axis is given by $\frac{\boldsymbol{B_{centre}}}{\boldsymbol{B_{axis}}} = \left(\mathbf{1} + \frac{\boldsymbol{x^2}}{\boldsymbol{r^2}}\right)^{3/2}$

(4) If $x >> r \Rightarrow B_{axis} = \frac{\mu_0}{4\pi} \cdot \frac{2\pi\, N i r^2}{x^3} = \frac{\mu_0}{4\pi} \cdot \frac{2NiA}{x^3}$

where $A = \pi r^2$ = Area of each turn of the coil.

(5) ***B-x* curve** : The variation of magnetic field due to a circular coil as the distance x varies as shown in the figure.

B varies non-linearly with distance x as shown in figure and is maximum when $x^2 = \min = 0$, *i.e.*, the point is at the centre of the coil and it is zero at $x = \pm\infty$.

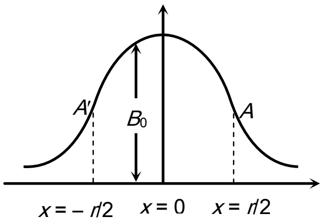

Fig. 21.10

(6) **Point of inflection** (A and A') **:** Also known as points of curvature change or points of zero curvature.

(i) At these points B varies linearly with $x \Rightarrow \frac{dB}{dx} =$ constant $\Rightarrow \frac{d^2B}{dx^2} = 0$.

(ii) These are located at $x = \pm\frac{r}{2}$ from the centre of the coil and the magnetic field at $x = \frac{r}{2}$ is $B = \frac{4\mu_0 Ni}{5\sqrt{5}\, r}$

(7) **Helmholtz coils**

(i) This is the set-up of two coaxial coils of same radius such that distance between their centres is equal to their radius.

(ii) At axial mid point O, magnetic field is given by $B = \frac{8\mu_0 Ni}{5\sqrt{5}R} = 0.716\frac{\mu_0 Ni}{R} = 1.432\,B$, where $B = \frac{\mu_0 Ni}{2R}$

(iii) Current direction is same in both coils otherwise this arrangement is not called Helmholtz's coil arrangement.

(iv) Number of points of inflextion $\Rightarrow$ Three (A, A', A'')

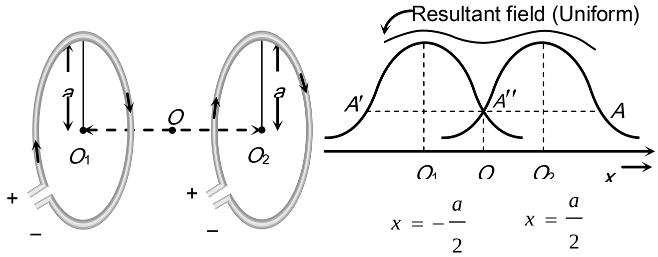

Fig. 21.11

Magnetic Field at Centre *O* in Different Conditions of Circular Current

Condition	Figure	Magnetic field
Arc subtends angle θ at the centre		$B = \frac{\mu_0}{4\pi} \cdot \frac{\theta i}{r}$
Arc subtends		

angle $(2\pi - \theta)$ at the centre		$B = \frac{\mu_0}{4\pi}\cdot\frac{(2\pi-\theta)i}{r}$
Semi-circular arc		$B = \frac{\mu_0}{4\pi}\cdot\frac{\pi i}{r} = \frac{\mu_0 i}{4r}$
Three quarter semi-circular current carrying arc		$B = \frac{\mu_0}{4\pi}\cdot\frac{\left(2\pi - \frac{\pi}{2}\right)i}{r}$ $= \frac{3\mu_0 i}{8r}$
Circular current carrying arc		$B = \frac{\mu_0}{4\pi}\frac{2\pi i}{r}$ $= \frac{\mu_0 i}{2r}$
Concentric co-planer circular loops carries current in the same direction		$B_1 = \frac{\mu_0}{4\pi}2\pi i\left(\frac{1}{r_1}+\frac{1}{r_2}\right)$
Concentric co-planer circular loops carries current in the opposite direction		$B_2 = \frac{\mu_0}{4\pi}2\pi i\left[\frac{1}{r_1}-\frac{1}{r_2}\right]$
Concentric loops but their planes are perpendicular to each other		$B = \sqrt{B_1^2 + B_2^2}$ $= \frac{\mu_0}{2r}\sqrt{i_1^2 + i_2^2}$
Concentric loops but their planes are at an angle θ with each other		$B = \sqrt{B_1^2 + B_2^2 + 2B_1B_2\cos\theta}$
Distribution of current across the diameter		$B = 0$
Distribution of current between any two points on the circumference		$B = 0$

Magnetic Field Due to a Straight Wire

Magnetic field due to a current carrying wire at a point *P* which lies at a perpendicular distance *r* from the wire as shown is given as

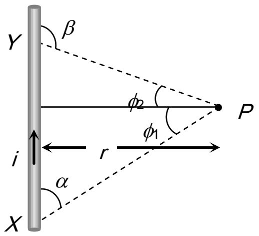

Fig. 21.12

$$B = \frac{\mu_0}{4\pi}.\frac{i}{r}(\sin\phi_1 + \sin\phi_2)$$

From figure $\alpha = (90^o - \phi_1)$

and $\beta = (90^o + \phi_2)$

Hence $B = \frac{\mu_o}{4\pi}.\frac{i}{r}(\cos\alpha - \cos\beta)$

(1) **For a wire of finite length :** Magnetic field at a point which lies on perpendicular bisector of finite length wire

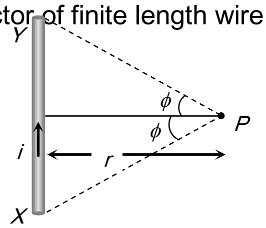

Fig. 21.13

$\phi_1 = \phi_2 = \phi$

So $B = \frac{\mu_0}{4\pi}.\frac{i}{r}(2\sin\phi)$

(2) **For a wire of infinite length :** When the linear conductor *XY* is of infinite length and the point *P* lies near the centre of the conductor $\phi_1 = \phi_2 = 90^o$.

So, $B = \frac{\mu_0}{4\pi}\frac{i}{r}[\sin 90^o + \sin 90^o]$

$= \frac{\mu_0}{4\pi}\frac{2i}{r}$

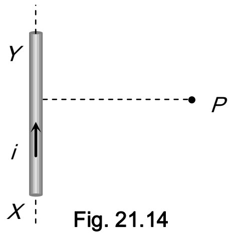

Fig. 21.14

(3) **For a wire of semi-infinite length :** When the linear conductor is of infinite length and the point *P* lies near the end *Y* or *X*. $\phi_1 = 90^o$ and $\phi_2 = 0^o$

So, $B = \frac{\mu_0}{4\pi}\frac{i}{r}[\sin 90^o + \sin 0^o]$

$= \frac{\mu_0 i}{4\pi r}$

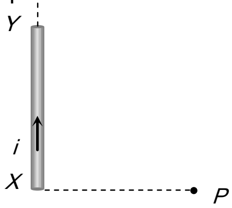

Fig. 21.15

(4) **For axial position of wire :** When point *P* lies on axial position of current carrying conductor then magnetic field at *P*

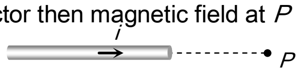

Fig. 21.16

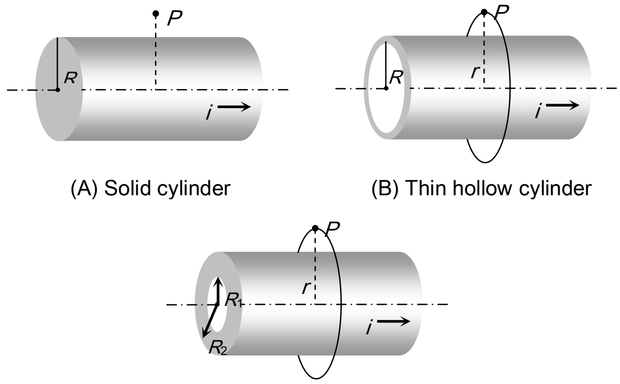
B = 0

Magnetic Field Due to a Cylindrical Wire

Magnetic field due to a cylindrical wire is obtained by the application of Ampere's law

(1) **Outside the cylinder**



(A) Solid cylinder (B) Thin hollow cylinder

(C) Thick hollow cylinder

Fig. 21.17

In all above cases magnetic field outside the wire at *P*

$$\oint \vec{B}.\vec{dl} = \mu_0 i \Rightarrow B\int dl = \mu_0 i \Rightarrow B \times 2\pi r = \mu_0 i \Rightarrow B_{out} = \frac{\mu_0 i}{2\pi r}$$

In all the above cases $B_{surface} = \frac{\mu_0 i}{2\pi R}$

(2) **Inside the hollow cylinder :** Magnetic field inside the hollow cylinder is zero.

(A) Thin hollow cylinder (B) Thick hollow cylinder

Fig. 21.18

(3) **Inside the solid cylinder :** Current enclosed by loop (*i'*) is lesser then the total current (*i*)

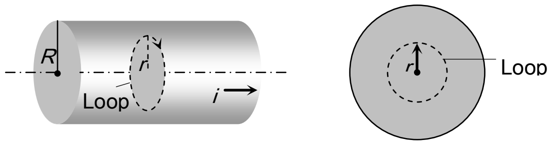


Fig. 21.19

Current density is uniform *i.e.* $J = J' \Rightarrow i' = i \times \frac{A'}{A} = i\left(\frac{r^2}{R^2}\right)$

Hence at inside point $\oint \overrightarrow{B_{in}}.\overrightarrow{dl} = \mu_0 i' \Rightarrow B = \frac{\mu_0}{2\pi}.\frac{ir}{R^2}$

(4) **Inside the thick portion of hollow cylinder :** Current enclosed by loop is given as $i' = i \times \frac{A'}{A} = i \times \frac{(r^2 - R_1^2)}{(R_2^2 - R_1^2)}$

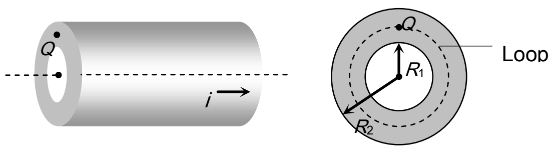

Fig. 21.20

Hence at point *Q* $\oint \vec{B}.\vec{dl} = \mu_0 i' \Rightarrow B = \frac{\mu_0 i}{2\pi r}.\frac{(r^2 - R_1^2)}{(R_2^2 - R_1^2)}$

Magnetic Field Due to an Infinite Sheet Carrying Current

The figure shows an infinite sheet of current with linear current density *j* (*A*/*m*). Due to symmetry the field line pattern above and below the sheet is uniform. Consider a square loop of side *l* as shown in the figure.

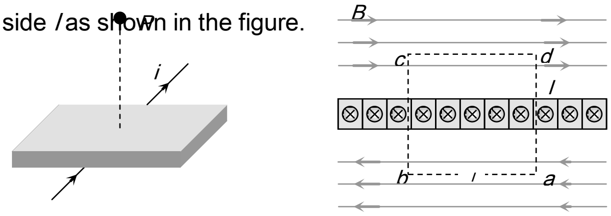

Fig. 21.21

$\int_a^b \vec{B}.\vec{dl} + \int_b^c \vec{B}.\vec{dl} + \int_c^d \vec{B}.\vec{dl} + \int_d^a \vec{B}.\vec{dl} = \mu_0 i$ (By Ampere's law)

Since $B \perp dl$ along the path $b \to c$ and $d \to a$, therefore,

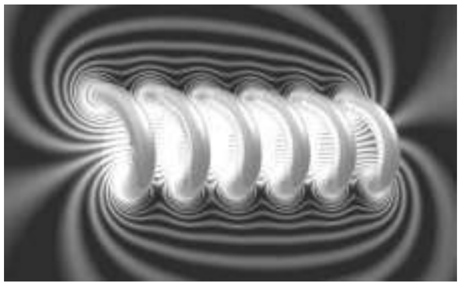
$\int_b^c \vec{B}.\vec{dl} = 0$; $\int_d^a \vec{B}.\vec{dl} = 0$

Also, $B \parallel dl$ along the path $a \to b$ and $c \to d$, thus

$\int_a^b \vec{B}.\vec{dl} + \int_d^a \vec{B}.\vec{dl} = 2Bl$

The current enclosed by the loop is $i = jl$. Therefore, according to Ampere's law $2Bl = \mu_0(jl)$ or $B = \frac{\mu_0 j}{2}$

Solenoid



A cylinderical coil of many tightly wound turns of insulated wire with generally diameter of the coil smaller than its length is called a solenoid.

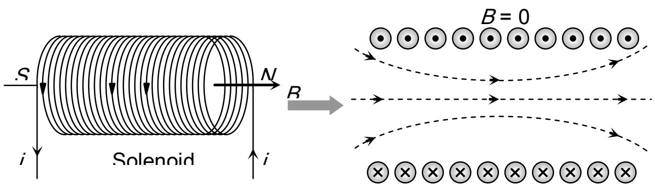


Fig. 21.22

A magnetic field is produced around and within the solenoid. The magnetic field within the solenoid is uniform and parallel to the axis of solenoid.

(1) **Finite length solenoid :**

If *N* = total number of turns, *l* = length of the solenoid, *n* = number of turns per unit length $= \frac{N}{l}$

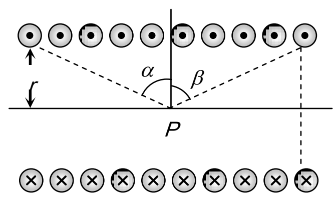

Fig. 21.23

(i) Magnetic field inside the solenoid at point *P* is given by $B = \frac{\mu_0}{4\pi}(2\pi ni)[\sin\alpha + \sin\beta]$

(ii) **Infinite length solenoid :** If the solenoid is of infinite length and the point is well inside the solenoid *i.e.* $\alpha = \beta = (\pi/2)$.

So $\quad \boldsymbol{B_{in} = \mu_0 ni}$

(iii) If the solenoid is of infinite length and the point is near one end *i.e.* $\alpha = 0$ and $\beta = (\pi/2)$ so $\boldsymbol{B_{end} = \frac{1}{2}(\mu_0 ni)}$

($B_{end} = \frac{1}{2}B_{in}$)

Toroid

A toroid can be considered as a ring shaped closed solenoid. Hence it is like an endless cylindrical solenoid.

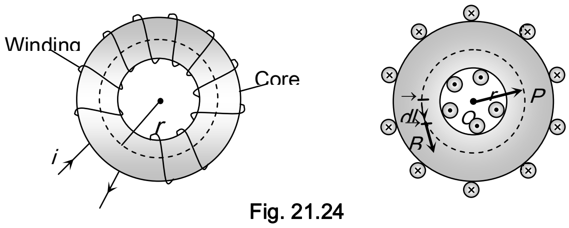

Fig. 21.24

Consider a toroid having *n* turns per unit length. Magnetic field at a point *P* in the figure is given as

$B = \frac{\mu_0 Ni}{2\pi r} = \mu_0 ni$ where $n = \frac{N}{2\pi r}$

Force On a Charged Particle in Magnetic Field

If a particle carrying a positive charge *q* and moving with velocity *v* enters a magnetic field *B* then it experiences a force *F* which is given by the expression $\vec{F} = q(\vec{v} \times \vec{B}) \Rightarrow F = qvB\sin\theta$

where $\vec{v} =$ velocity of the particle, $\vec{B} =$ magnetic field

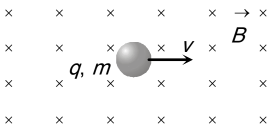

Fig. 21.25

(1) **Zero force :** Force on charged particle will be zero (*i.e.* *F* = 0) if

(i) No field *i.e.* *B* = 0 ⇒ *F* = 0

(ii) Neutral particle *i.e.* *q* = 0 ⇒ *F* = 0

(iii) Rest charge *i.e.* *v* = 0 ⇒ *F* = 0

(iv) Moving charge *i.e.* θ = 0° or θ = 180° ⇒ *F* = 0

(2) **Direction of force :** The force $\vec{F}$ is always perpendicular to both the velocity $\vec{v}$ and the field $\vec{B}$ in accordance with Right Hand Screw Rule, though $\vec{v}$ and $\vec{B}$ themselves may or may not be p[illegible]h other.

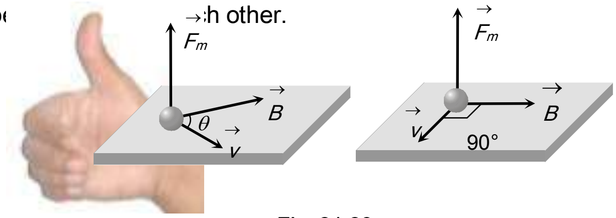

Fig. 21.26

Direction of force on charged particle in magnetic field can also be find by Fleming's Left Hand Rule (FLHR).

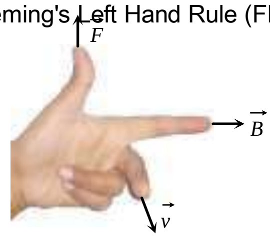

Fig. 21.27

Here, *First finger* (indicates) → Direction of magnetic field

Middle finger → Direction of motion of positive charge or direction, Opposite to the motion of negative charge.

Thumb → Direction of force

Trajectory of a Charged Particle in a Magnetic Field

(1) **Straight line :** If the direction of a $\vec{v}$ is parallel or antiparallel to $\vec{B}$, θ = 0 or θ = 180° and therefore *F* = 0. Hence the trajectory of the particle is a straight line.

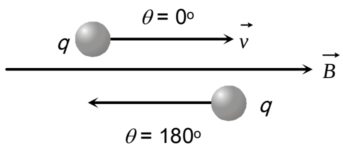

Fig. 21.28

(2) **Circular path :** If $\vec{v}$ is perpendicular to $\vec{B}$ *i.e.* θ = 90°, hence particle will experience a maximum magnetic force ***F_{max} = qvB*** which act's in a direction perpendicular to the motion of charged particle. Therefore the trajectory of the particle is a circle.

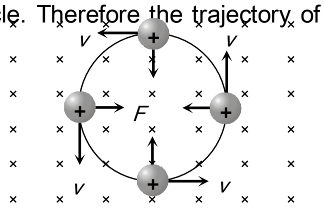

Fig. 21.29

(i) In this case path of charged particle is circular and magnetic force provides the necessary centripetal force *i.e.* $qvB = \frac{mv^2}{r}$ $\Rightarrow$ radius of path $\boldsymbol{r = \frac{mv}{qB} = \frac{p}{qB} = \frac{\sqrt{2mK}}{qB} = \frac{1}{B}\sqrt{\frac{2mV}{q}}}$

where *p* = momentum of charged particle and *K* = kinetic energy of charged particle (gained by charged particle after accelerating through potential difference *V*) then $p = mv = \sqrt{2mK} = \sqrt{2mqV}$

(ii) If *T* is the time period of the particle then $T = \frac{2\pi m}{qB}$ (*i.e.*, time period (or frequency) is independent of speed of particle).

(3) **Helical path :** When the charged particle is moving at an angle to the field (other than 0°, 90°, or 180°). Particle describes a path called helix.

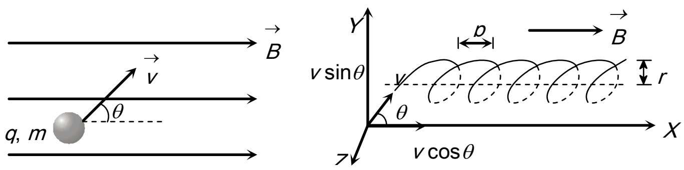

Fig. 21.30

(i) The radius of this helical path is $\boldsymbol{r = \frac{m(v\sin\theta)}{qB}}$

(ii) Time period and frequency do not depend on velocity and so they are given by $T = \frac{2\pi m}{qB}$ and $\nu = \frac{qB}{2\pi m}$

(iii) The *pitch* of the *helix*, (*i.e.*, linear distance travelled in one rotation) will be given by $p = T(v\cos\theta) = 2\pi\frac{m}{qB}(v\cos\theta)$

(iv) If pitch value is *p*, then number of pitches obtained in length *l* given as

Number of pitches $= \frac{l}{p}$ and time required $t = \frac{l}{v\cos\theta}$

Lorentz Force

When the moving charged particle is subjected simultaneously to both electric field $\vec{E}$ and magnetic field $\vec{B}$, the moving charged particle will experience electric force $\vec{F_e} = q\vec{E}$ and magnetic force $\vec{F_m} = q(\vec{v}\times\vec{B})$; so the net force on it will be $\boldsymbol{\vec{F} = q[\vec{E} + (\vec{v}\times\vec{B})]}$. Which is the famous 'Lorentz-force equation'.

Depending on the directions of $\vec{v}, E$ and $\vec{B}$ following situations are possible

(i) **When $\vec{v}, \vec{E}$ and $\vec{B}$ all the three are collinear :** In this situation the magnetic force on it will be zero and only electric force will act and so $\vec{a} = \frac{\vec{F}}{m} = \frac{q\vec{E}}{m}$

(ii) The particle will pass through the field following a straight-line path (parallel field) with change in its speed. So in this situation speed, velocity, momentum and kinetic energy all will change without change in direction of motion as shown

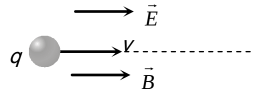

Fig. 21.31

(iii) **$\vec{v}, \vec{E}$ and $\vec{B}$ are mutually perpendicular :** In this situation if $\vec{E}$ and $\vec{B}$ are such that $\vec{F} = \vec{F_e} + \vec{F_m} = 0$ *i.e.*, $\vec{a} = (\vec{F}/m) = 0$

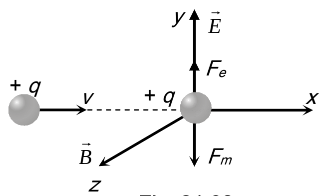

Fig. 21.32

as shown in figure, the particle will pass through the field with same velocity, without any deviation in path.

And in this situation, as $F_e = F_m$ *i.e.*, $qE = qvB \quad v = E/B$

This principle is used in 'velocity-selector' to get a charged beam having a specific velocity.

Cyclotron

Cyclotron is a device used to accelerated positively charged particles (like, α-particles, deutrons *etc.*) to acquire enough energy to carry out nuclear disintegration *etc.*

It is based on the fact that the electric field accelerates a charged particle and the magnetic field keeps it revolving in circular orbits of constant frequency.

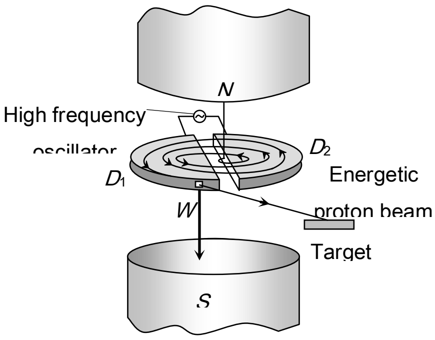

Fig. 21.33

It consists of two hollow *D*-shaped metallic chambers D_1 and D_2 called dees. The two dees are placed horizontally with a small gap separating them. The dees are connected to the source of high frequency electric field. The dees are enclosed in a metal box containing a gas at a low pressure of the order of 10^{-3} *mm* mercury. The whole apparatus is placed between the two poles of a strong electromagnet *NS* as shown in fig. The magnetic field acts perpendicular to the plane of the dees.

(1) **Cyclotron frequency :** Time taken by ion to describe a semicircular path is given by $t = \frac{\pi r}{v} = \frac{\pi m}{qB}$

If T = time period of oscillating electric field then $T = 2t = \frac{2\pi m}{qB}$ the cyclotron frequency $\nu = \frac{1}{T} = \frac{Bq}{2\pi m}$

(2) **Maximum energy of particle :** Maximum energy gained by the charged particle $E_{\max} = \left(\frac{q^2B^2}{2m}\right)r^2$

where r_0 = maximum radius of the circular path followed by the positive ion.

Hall Effect

The Phenomenon of producing a transverse emf in a current carrying conductor on applying a magnetic field perpendicular to the direction of the current is called Hall effect.

Hall effect helps us to know the nature and number of charge carriers in a conductor.

Consider a conductor having electrons as current carriers. The electrons move with drift velocity $\vec{v}$ opposite to the direction of flow of current

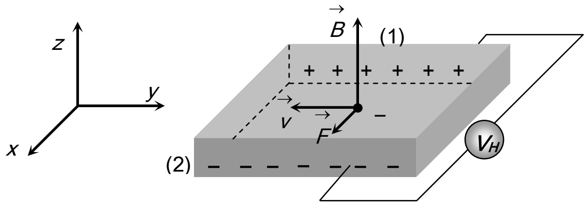

Fig. 21.34

Force acting on electron $F_m = -e(\vec{v} \times \vec{B})$. This force acts along *x*-axis and hence electrons will move towards face (2) and it becomes negatively charged.

Force On a Current Carrying Conductor In Magnetic Field

In case of current carrying conductor in a magnetic field force experienced by its small length element is $d\vec{F} = i\,d\vec{l} \times \vec{B}$; $i\,d\vec{l}$ = current element $d\vec{F} = i(d\vec{l} \times \vec{B})$

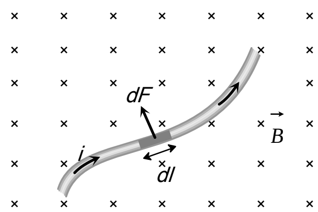

Fig. 21.35

Total magnetic force $\vec{F} = \int d\vec{F} = \int i(d\vec{l} \times \vec{B})$. If magnetic field is uniform *i.e.*, $\vec{B}$ = constant $\vec{F} = i[\int d\vec{l}] \times \vec{B} = i(\vec{L} \times \vec{B})$

$\int \vec{dl} = \vec{L}' =$ vector sum of all the length elements from initial to final point. Which is in accordance with the law of vector addition is equal to length vector $\vec{L}$ joining initial to final point.

(For a straight conductor $F = Bil\sin\theta$)

Direction of force : The direction of force is always perpendicular to the plane containing $i\vec{dl}$ and $\vec{B}$ and is same as that of cross-product of two vectors $(\vec{A} \times \vec{B})$ with $\vec{A} = i\vec{dl}$.

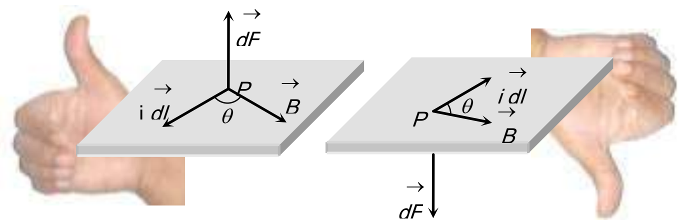

Fig. 21.36

The direction of force when current element $i\vec{dl}$ and $\vec{B}$ are perpendicular to each other can also be determined by applying either of the following rules

Fleming's left-hand rule : Stretch the fore-finger, central finger and thumb of left hand mutually perpendicular. Then if the fore-finger points in the direction of field $\vec{B}$ and the central in the direction of current *i*, the thumb will point in the direction of force.

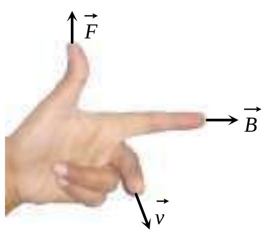

Fig. 21.37

Right-hand palm rule : Stretch the fingers and thumb of right hand at right angles to each other. Then if the fingers point in the direction of field $\vec{B}$ and thumb in the direction of current *i*, then normal to the palm will point in the direction of force

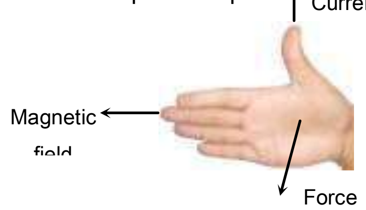

Fig. 21.38

Force Between Two Parallel Current Carrying Conductors

The force on a length *l* of each of two long, straight, parallel wires carrying currents i_1 and i_2 and separated by a distance *a* is

$$F = \frac{\mu_0}{4\pi} \cdot \frac{2i_1 i_2}{a} \times l$$

Hence force per unit length

$$\frac{F}{l} = \frac{\mu_0}{4\pi} \cdot \frac{2i_1 i_2}{a} \left(\frac{N}{m}\right) \text{ or } \frac{F}{l} = \frac{2i_1 i_2}{a} \left(\frac{dyne}{cm}\right)$$

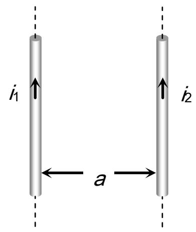

Fig. 21.39

Direction of force : If conductors carries current in same direction, then force between them will be attractive. If conductor carries current in opposite direction, then force between them will be repulsive.

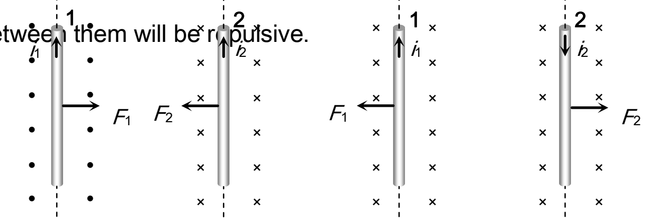

Fig. 21.40

Force Between Two Moving Charges

If two charges q_1 and q_2 are moving with velocities v_1 and v_2 respectively and at any instant the distance between them is r, then

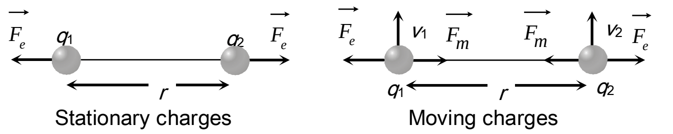

Fig. 21.41

Magnetic force between them is $F_m = \frac{\mu_0}{4\pi}.\frac{q_1 q_2 v_1 v_2}{r^2}$ .... (i)

and Electric force between them is $F_e = \frac{1}{4\pi\varepsilon_0}.\frac{q_1 q_2}{r^2}$ .... (ii)

From equation (i) and (ii) $\frac{F_m}{F_e} = \mu_0 \varepsilon_0 v^2$ but $\mu_0 \varepsilon_0 = \frac{1}{c^2}$;

where c is the velocity of light in vacuum. So $\frac{F_m}{F_e} = \left(\frac{v}{c}\right)^2$

As $v < c$ so $F_m < F_e$

Standard Cases For Force on Current Carrying Conductors

Case 1 : When an arbitrary current carrying loop placed in a magnetic field (⊥ to the plane of loop), each element of loop experiences a magnetic force due to which loop stretches and open into circular loop and tension developed in it's each part.

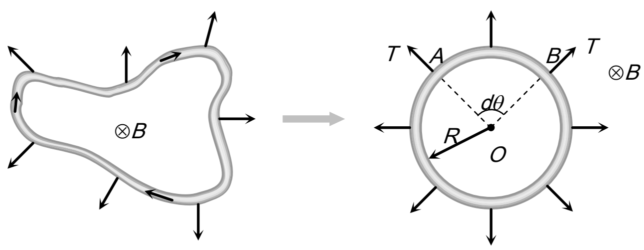

Fig. 21.42

Case 2 : **Equilibrium of a current carrying conductor :** When a finite length current carrying wire is kept parallel to another infinite length current carrying wire, it can suspend freely in air as shown below

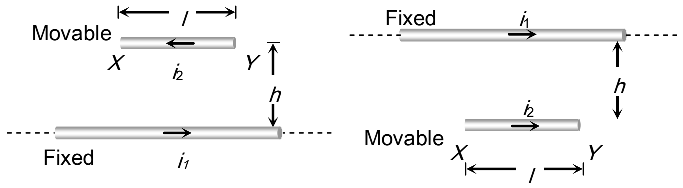

Fig. 21.43

In both the situations for equilibrium of XY it's downward weight = upward magnetic force *i.e.* $mg = \frac{\mu_0}{4\pi}.\frac{2 i_1 i_2}{h}.l$

Case 3 : **Current carrying spring :** If current is passed through a spring, then it will contract because current will flow through all the turns in the same direction.

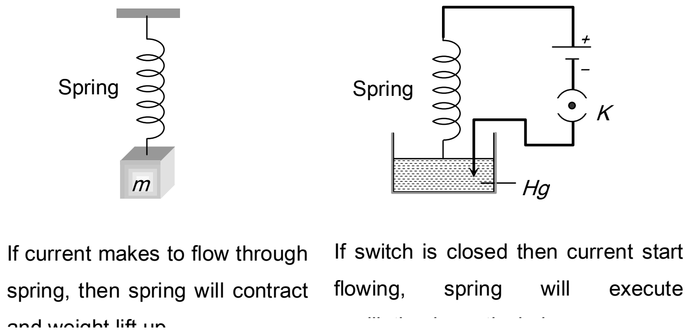

Fig. 21.44

Case 4 : **Tension less strings :** In the following figure the value and direction of current through the conductor XY so that strings becomes tensionless?

Strings becomes tensionless if weight of conductor XY balanced by magnetic force (F_m) .

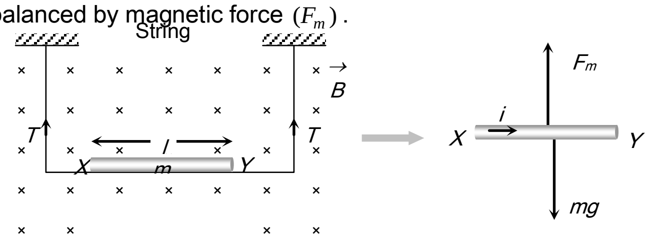

Fig. 21.45

Hence direction of current is from $X \to Y$ and in balanced condition $F_m = mg \Rightarrow Bil = mg \Rightarrow i = \frac{mg}{Bl}$

Case 5 : **Sliding of conducting rod on inclined rails :** When a conducting rod slides on conducting rails.

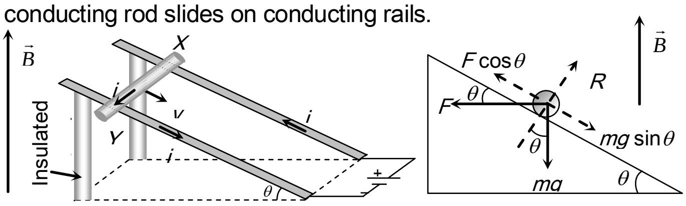

Fig. 21.46

In the following situation conducting rod (*X*, *Y*) slides at constant velocity if

$$F\cos\theta = mg\sin\theta \Rightarrow Bil\cos\theta = mg\sin\theta \Rightarrow B = \frac{mg}{il}\tan\theta$$

Current Loop as a Magnetic Dipole

A current carrying circular coil behaves as a bar magnet whose magnetic moment is $M = NiA$; *Where N* = Number of turns in the coil, i = Current through the coil and A = Area of the coil

Magnetic moment of a current carrying coil is a vector and it's direction is given by right hand thumb rule

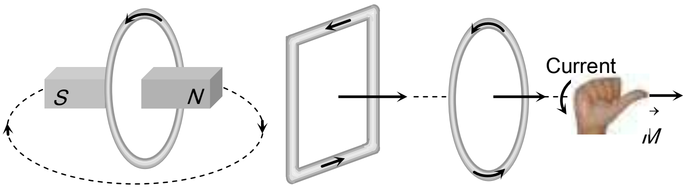

Fig. 21.47

(1) For a given perimeter circular shape have maximum area. Hence maximum magnetic moment.

(2) For a any loop or coil $\vec{B}$ at centre due to current in loop, and $\vec{M}$ are always parallel.

Fig. 21.48

Behaviour of Current Loop in a Magnetic Field

(1) **Torque :** Consider a rectangular current carrying coil *PQRS* having *N* turns and area *A*, placed in a uniform field $\vec{B}$, in such a way that the normal $(\hat{n})$ to the coil makes an angle θ with the direction of $\vec{B}$. the coil experiences a torque given by τ = *NBiA* sinθ. Vectorially $\vec{\tau} = \vec{M} \times \vec{B}$

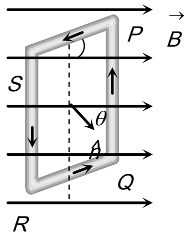

Fig. 21.49

(i) τ is zero when θ = 0, *i.e.*, when the plane of the coil is perpendicular to the field.

(ii) τ is maximum when $\theta = 90^o$, *i.e.*, the plane of the coil is parallel to the field $\tau_{\max} = NBiA$

(2) **Workdone :** If coil is rotated through an angle θ from it's equilibrium position then required work. $W = MB(1 - \cos\theta)$. It is maximum when θ = 180° $\Rightarrow W_{\max}$ = 2 *MB*

(3) **Potential energy :** $U = -MB\cos\theta \Rightarrow U = -\vec{M}.\vec{B}$

Moving Coil Galvanometer

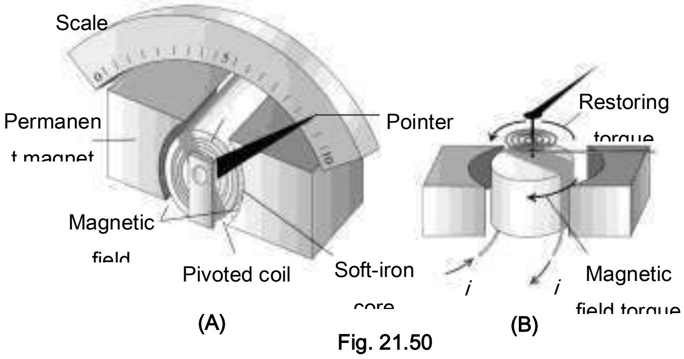

Fig. 21.50

In a moving coil galvanometer the coil is suspended between the pole pieces of a strong horse-shoe magnet. The pole pieces are made cylindrical and a soft iron cylindrical core is placed within the coil without touching it. This makes the field radial. In such a field the plane of the coil always remains parallel to the field. Therefore $\theta = 90^o$ and the deflecting torque always has the maximum value.

$\tau_{\text{def}} = NBiA$ ......(i)

Coil deflects, a restoring torque is set up in the suspension fibre. If α is the angle of twist, the restoring torque is

$\tau_{\text{rest}} = C\alpha$ .....(ii)

where C is the torsional constant of the fibre.

When the coil is in equilibrium $NBiA = C\alpha \Rightarrow i = K\alpha$,

where $K = \frac{C}{NBA}$ is the galvanometer constant. This linear relationship between i and α makes the moving coil galvanometer useful for current measurement and detection.

Current sensitivity (S_i) : The current sensitivity of a galvanometer is defined as the deflection produced in the galvanometer per unit current flowing through it.

$$S_i = \frac{\alpha}{i} = \frac{NBA}{C}$$

Voltage sensitivity (S_V) : Voltage sensitivity of a galvanometer is defined as the deflection produced in the galvanometer per unit voltage applied to it.

$$S_V = \frac{\alpha}{V} = \frac{\alpha}{iR} = \frac{S_i}{R} = \frac{NBA}{RC}$$

Tips & Tricks

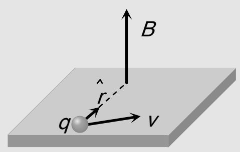
✍ The device whose working principle based on Halmholtz coils and in which uniform magnetic field is used called as "Halmholtz galvanometer".

✍ The value of magnetic field induction at a point, on the centre of separation of two linear parallel conductors carrying equal currents in the same direction is zero.

✍ If a current carrying circular loop (n = 1) is turned into a coil having n identical turns then magnetic field at the centre of the coil becomes n^2 times the previous field *i.e.* $B_{(n\ turn)} = n^2 B_{(single\ turn)}$

✍ When a current carrying coil is suspended freely in earth's magnetic field, it's plane stays in **East-West** direction.

✍ Magnetic field ($\vec{B}$) produced by a moving charge q is given by $\vec{B} = \frac{\mu_0}{4\pi}\frac{q(\vec{v} \times \vec{r})}{r^3} = \frac{\mu_0}{4\pi}\frac{q(\vec{v} \times \hat{r})}{r^2}$; where v = velocity of charge and $v << c$ (speed of light).



✍ If an electron is revolving in a circular path of radius r with speed v then magnetic field produced at the centre of circular path $B = \frac{\mu_0}{4\pi}.\frac{ev}{r^2} \Rightarrow r \propto \sqrt{\frac{v}{B}}$

✍ The line integral of magnetising field $(\vec{H})$ for any closed path called magnetomotive force (MMF). It's S.I. unit is amp.

✍ Ratio of dimension of e.m.f. to MMF is equal to the dimension of resistance.

✍ The positive ions are produced in the gap between the two dees by the ionisation of the gas. To produce proton, hydrogen gas is used; while for producing alpha-particles, helium gas is used.

✍ Cyclotron frequency is also known as magnetic resonance frequency.

✍ Cyclotron can not accelerate electrons because they have very small mass.

✍ The energy of a charged particle moving in a uniform magnetic field does not change because it experiences a force in a direction, perpendicular to it's direction of motion. Due to which the speed of charged particle remains unchanged and hence it's K.E. remains same.

✍ Magnetic force does no work when the charged particle is displaced while electric force does work in displacing the charged particle.

✍ Magnetic force is velocity dependent, while electric force is independent of the state of rest or motion of the charged particle.

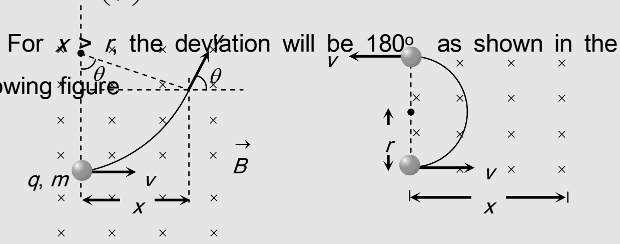
✍ If a particle enters a magnetic field normally to the magnetic field, then it starts moving in a circular orbit. The point at which it enters the magnetic field lies on the circumference. (Most of us confuse it with the centre of the orbit)

✍ Deviation of charged particle in magnetic field : If a charged particle (*q, m*) enters a uniform magnetic field $\vec{B}$ (extends upto a length x) at right angles with speed v as shown in figure. The speed of the particle in magnetic field does not change. But it gets deviated in the magnetic field.

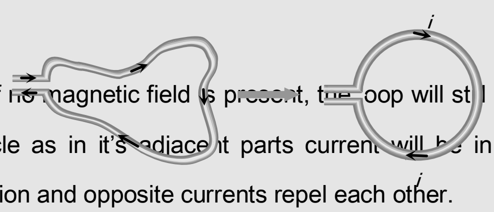
Deviation in terms of time t; $\theta = \omega t = \left(\frac{Bq}{m}\right)t$

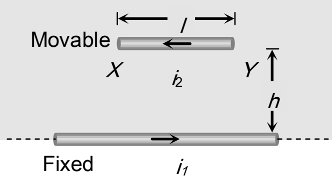
Deviation in terms of length of the magnetic field; $\theta = \sin^{-1}\left(\frac{x}{r}\right)$. This relation can be used only when $x \le r$.

For $x > r$, the deviation will be 180° as shown in the following figure



✍ If no magnetic field is present, the loop will still open into a circle as in it's adjacent parts current will be in opposite direction and opposite currents repel each other.



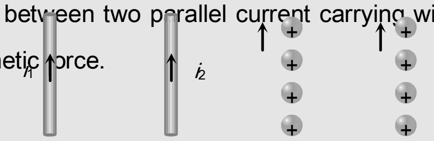


✍ In the following case if wire *XY* is slightly displaced from its equilibrium position, it executes SHM and it's time period is given by $T = 2\pi\sqrt{\frac{h}{g}}$.

✍ In the previous case if direction of current in movable wire is reversed then it's instantaneous acceleration produced is $2g$ ↓.

✍ Electric force is an absolute concept while magnetic force is a relative concept for an observer.

✍ The nature of force between two parallel charge beams decided by electric force, as it is dominator. The nature of force between two parallel current carrying wires decided by magnetic force.



$F_{net} = F_m$ only

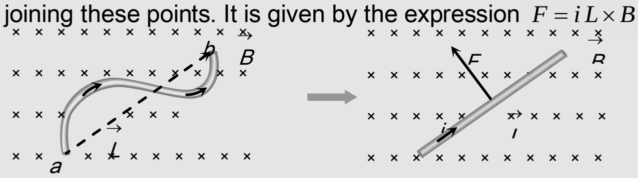
$F_e \rightarrow$ repulsion

$F_m \rightarrow$ attraction

$F_{net} \rightarrow$ repulsion (Due to

✍ If a straight current carrying wire is placed along the axis of a current carrying coil then it will not experience magnetic force because magnetic field produced by the coil is parallel to the wire.

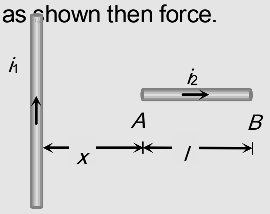
✍ The force acting on a curved wire joining points *a* and *b* as shown in the figure is the same as that on a straight wire joining these points. It is given by the expression $\vec{F} = i\vec{L} \times \vec{B}$



✍ If a current carrying conductor AB is placed transverse to a long current carrying conductor as shown then force.

Experienced by wire AB

$$F = \frac{\mu_0 i_1 i_2}{2\pi} \log_e \left(\frac{x+l}{x} \right)$$



Ordinary Thinking

Objective Questions

Biot-savart's Law and Ampere's Law

1. A length L of wire carries a steady current I. It is bent first to form a circular plane coil of one turn. The same length is now bent more sharply to give a double loop of smaller radius. The magnetic field at the centre caused by the same current is **[NCERT 1980; AIIMS 1980; MP PMT 1995, 99]**
   (a) A quarter of its first value
   (b) Unaltered
   (c) Four times of its first value
   (d) A half of its first value

2. A vertical straight conductor carries a current vertically upwards. A point P lies to the east of it at a small distance and another point Q lies to the west at the same distance. The magnetic field at P is **[MNR 1986; DPMT 2004]**
   (a) Greater than at Q
   (b) Same as at Q
   (c) Less than at Q
   (d) Greater or less than at Q depending upon the strength of the current

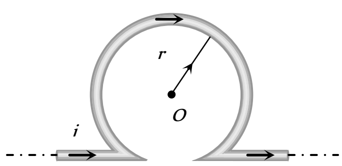
3. If a copper rod carries a direct current, the magnetic field associated with the current will be **[CPMT 1984]**
   (a) Only inside the rod
   (b) Only outside the rod
   (c) Both inside and outside the rod
   (d) Neither inside nor outside the rod

4. If a long hollow copper pipe carries a direct current, the magnetic field associated with the current will be [CBSE PMT 1999; AFMC 1999; CPMT 1984, 2000; Pb. PET 2000; JIPMER 2002]
(a) Only inside the pipe
(b) Only outside the pipe
(c) Neither inside nor outside the pipe
(d) Both inside and outside the pipe

5. The magnetic field $d\vec{B}$ due to a small current element $d\vec{l}$ at a distance $\vec{r}$ and element carrying current *i* is,
or
Vector form of Biot-savart's law is [CBSE PMT 1996; MP PET 2002; MP PMT 2000]
(a) $d\vec{B} = \frac{\mu_0}{4\pi} i \left(\frac{d\vec{l} \times \vec{r}}{r}\right)$ (b) $d\vec{B} = \frac{\mu_0}{4\pi} i^2 \left(\frac{d\vec{l} \times \vec{r}}{r}\right)$
(c) $d\vec{B} = \frac{\mu_0}{4\pi} i^2 \left(\frac{d\vec{l} \times \vec{r}}{r^2}\right)$ (d) $d\vec{B} = \frac{\mu_0}{4\pi} i \left(\frac{d\vec{l} \times \vec{r}}{r^3}\right)$

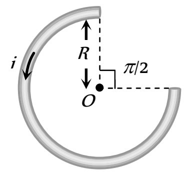
6. A charge *q coulomb* moves in a circle at *n* revolutions per second and the radius of the circle is *r metre*. Then magnetic field at the centre of the circle is
(a) $\frac{2\pi q}{nr} \times 10^{-7}$ *N/amp/metre* (b) $\frac{2\pi q}{r} \times 10^{-7}$ *N/amp/metre*
(c) $\frac{2\pi nq}{r} \times 10^{-7}$ *N/amp/metre* (d) $\frac{2\pi q}{r}$ *N/amp/metre*

7. An infinitely long straight conductor is bent into the shape as shown in the figure. It carries a current of *i ampere* and the radius of the circular loop is *r metre*. Then the magnetic induction at its centre will be [MP PMT 1999]



(a) $\frac{\mu_0}{4\pi} \frac{2i}{r}(\pi + 1)$
(b) $\frac{\mu_0}{4\pi} \frac{2i}{r}(\pi - 1)$
(c) Zero
(d) Infinite

8. A current *i ampere* flows in a circular arc of wire whose radius is *R*, which subtend an angle $3\pi/2$ radian at its centre. The magnetic induction *B* at the centre is



(a) $\frac{\mu_0 i}{R}$
(b) $\frac{\mu_0 i}{2R}$
(c) $\frac{2\mu_0 i}{R}$
(d) $\frac{3\mu_0 i}{8R}$

9. A current *i ampere* flows along the inner conductor of a coaxial cable and returns along the outer conductor of the cable, then the magnetic induction at any point outside the conductor at a distance *r metre* from the axis is
(a) ∞ (b) Zero
(c) $\frac{\mu_0}{4\pi} \frac{2i}{r}$ (d) $\frac{\mu_0}{4\pi} \frac{2\pi i}{r}$

10. A straight section *PQ* of a circuit lies along the *X*-axis from $x = -\frac{a}{2}$ to $x = \frac{a}{2}$ and carries a steady current *i*. The magnetic field due to the section *PQ* at a point $X = +a$ will be
(a) Proportional to *a* (b) Proportional to a^2
(c) Proportional to $1/a$ (d) Zero

11. A helium nucleus makes a full rotation in a circle of radius 0.8 *metre* in two seconds. The value of the magnetic field *B* at the centre of the circle will be [CPMT 1988; KCET 1998; UPSEAT 2001]
(a) $\frac{10^{-19}}{\mu_0}$ (b) $10^{-19} \mu_0$
(c) $2 \times 10^{-10} \mu_0$ (d) $\frac{2 \times 10^{-10}}{\mu_0}$

12. A solenoid of 1.5 *metre* length and 4.0 *cm* diameter posses 10 turn per *cm*. A current of 5 *ampere* is flowing through it. The magnetic induction at axis inside the solenoid is [CPMT 1990]
(a) $2\pi \times 10^{-3}$ *Tesla* (b) $2\pi \times 10^{-5}$ *Tesla*
(c) $4\pi \times 10^{-2}$ *Gauss* (d) $2\pi \times 10^{-5}$ *Gauss*

13. The magnetic induction at a point *P* which is distant 4 *cm* from a long current carrying wire is 10^{-8} *Tesla*. The field of induction at a distance 12 *cm* from the same current would be
(a) 3.33×10^{-9} *Tesla* (b) 1.11×10^{-4} *Tesla*
(c) 3×10^{-3} *Tesla* (d) 9×10^{-2} *Tesla*

14. The strength of the magnetic field at a point *r* near a long straight current carrying wire is *B*. The field at a distance $\frac{r}{2}$ will be
(a) $\frac{B}{2}$ (b) $\frac{B}{4}$
(c) $2B$ (d) $4B$

15. Field at the centre of a circular coil of radius *r*, through which a current *I* flows is [MP PMT 1993]
(a) Directly proportional to *r*
(b) Inversely proportional to *I*
(c) Directly proportional to *I*
(d) Directly proportional to I^2

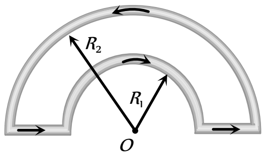
16. A current of 0.1 *A* circulates around a coil of 100 turns and having a radius equal to 5 *cm*. The magnetic field set up at the centre of the coil is
($\mu_0 = 4\pi \times 10^{-7}$ *weber / ampere – metre*) [MP PMT 1993]
(a) $4\pi \times 10^{-5}$ *tesla* (b) $8\pi \times 10^{-5}$ *tesla*
(c) 4×10^{-5} *tesla* (d) 2×10^{-5} *tesla*

17. The magnetic field B with in the solenoid having n turns per metre length and carrying a current of i *ampere* is given by [MP PET 1993]

(a) $\frac{\mu_0 ni}{e}$ (b) $\mu_0 ni$

(c) $4\pi\mu_0 ni$ (d) ni

18. The magnetic induction at the centre O in the figure shown is



(a) $\frac{\mu_0 i}{4}\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$

(b) $\frac{\mu_0 i}{4}\left(\frac{1}{R_1}+\frac{1}{R_2}\right)$

(c) $\frac{\mu_0 i}{4}(R_1-R_2)$

(d) $\frac{\mu_0 i}{4}(R_1+R_2)$

19. Field inside a solenoid is [MP PMT 1993]

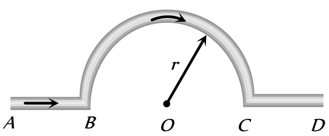
(a) Directly proportional to its length

(b) Directly proportional to current

(c) Inversely proportional to total number of turns

(d) Inversely proportional to current

20. In the figure, shown the magnetic induction at the centre of there arc due to the current in portion AB will be



(a) $\frac{\mu_0 i}{r}$

(b) $\frac{\mu_0 i}{2r}$

(c) $\frac{\mu_0 i}{4r}$

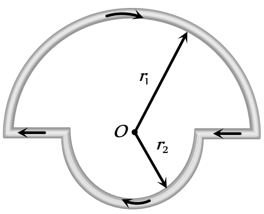
(d) Zero

21. In the above question, the magnetic induction at O due to the whole length of the conductor is [MP PMT/PET 1998; RPET 2002]

(a) $\frac{\mu_0 i}{r}$ (b) $\frac{\mu_0 i}{2r}$

(c) $\frac{\mu_0 i}{4r}$ (d) Zero

22. In the figure shown there are two semicircles of radii r_1 and r_2 in which a current i is flowing. The magnetic induction at the centre O will be



(a) $\frac{\mu_0 i}{r}(r_1+r_2)$

(b) $\frac{\mu_0 i}{4}(r_1-r_2)$

(c) $\frac{\mu_0 i}{4}\left(\frac{r_1+r_2}{r_1 r_2}\right)$

(d) $\frac{\mu_0 i}{4}\left(\frac{r_2-r_1}{r_1 r_2}\right)$

23. The magnetic moment of a current carrying loop is $2.1\times10^{-25}\ amp\times m^2$. The magnetic field at a point on its axis at a distance of $1\,\mathring{A}$ is [IIT 1988; KCET 2002]

(a) $4.2\times10^{-2}\ weber/m^2$ (b) $4.2\times10^{-3}\ weber/m^2$

(c) $4.2\times10^{-4}\ weber/m^2$ (d) $4.2\times10^{-5}\ weber/m^2$

24. Two straight horizontal parallel wires are carrying the same current in the same direction, d is the distance between the wires. You are provided with a small freely suspended magnetic needle. At which of the following positions will the orientation of the needle be independent of the magnitude of the current in the wires

(a) At a distance $d/2$ from any of the wires

(b) At a distance $d/2$ from any of the wires in the horizontal plane

(c) Anywhere on the circumference of a vertical circle of radius d and centre halfway between the wires

(d) At points halfway between the wires in the horizontal plane

25. A particle carrying a charge equal to 100 times the charge on an electron is rotating per second in a circular path of radius 0.8 *metre*. The value of the magnetic field produced at the centre will be (μ_0 = permeability for vacuum) [CPMT 1986; KCET 2001; BHU 2001]

(a) $\frac{10^{-7}}{\mu_0}$ (b) $10^{-17}\mu_0$

(c) $10^{-6}\mu_0$ (d) $10^{-7}\mu_0$

26. A circular coil of radius R carries an electric current. The magnetic field due to the coil at a point on the axis of the coil located at a distance r from the centre of the coil, such that $r >> R$, varies as [EAMCET 1987

(a) $\frac{1}{r}$ (b) $\frac{1}{r^{3/2}}$

(c) $\frac{1}{r^2}$ (d) $\frac{1}{r^3}$

27. In hydrogen atom, an electron is revolving in the orbit of radius $0.53\,\mathring{A}$ with 6.6×10^{15} *rotations/second*. Magnetic field produced at the centre of the orbit is [MP PET 2003]

(a) $0.125\,wb/m^2$ (b) $1.25\,wb/m^2$

(c) $12.5\,wb/m^2$ (d) $125\,wb/m^2$

28. The magnetic induction due to an infinitely long straight wire carrying a current i at a distance r from wire is given by [MP PET 1994]

(a) $|\mathbf{B}|=\left(\frac{\mu_0}{4\pi}\right)\frac{2i}{r}$ (b) $|\mathbf{B}|=\left(\frac{\mu_0}{4\pi}\right)\frac{r}{2i}$

(c) $|\mathbf{B}|=\left(\frac{4\pi}{\mu_0}\right)\frac{2i}{r}$ (d) $|\mathbf{B}|=\left(\frac{4\pi}{\mu_0}\right)\frac{r}{2i}$

29. Magnetic effect of current was discovered by [MP PET 1994]

(a) Faraday (b) Oersted

(c) Ampere (d) Bohr

30. Two concentric circular coils of ten turns each are situated in the same plane. Their radii are 20 and 40 *cm* and they carry respectively

0.2 and 0.3 *ampere* current in opposite direction. The magnetic field in $weber/m^2$ at the centre is

[MP PMT 1994]

(a) $\frac{35}{4}\mu_0$ (b) $\frac{\mu_0}{80}$

(c) $\frac{7}{80}\mu_0$ (d) $\frac{5}{4}\mu_0$

31. A long solenoid has a radius *a* and number of turns per unit length is *n*. If it carries a current *i*, then the magnetic field on its axis is directly proportional to [MP PMT 1994]

(a) *ani* (b) *ni*

(c) $\frac{ni}{a}$ (d) $n^2 i$

32. A cell is connected between two points of a uniformly thick circular conductor. The magnetic field at the centre of the loop will be

(a) Zero (b) $\frac{\mu_0}{2a}(i_1 - i_2)$

(c) $\frac{\mu_0}{2a}(i_1 + i_2)$ (d) $\frac{\mu_0}{a}(i_1 + i_2)$

(Here i_1 and i_2 are the currents flowing in the two parts of the circular conductor of radius '*a*' and μ_0 has the usual meaning)

33. A long solenoid is formed by winding 20 *turns/cm*. The current necessary to produce a magnetic field of 20 *millitesla* inside the solenoid will be approximately

$(\frac{\mu_0}{4\pi} = 10^{-7}\ tesla\text{–}metre/ampere)$ [MP PMT 1994]

(a) 8.0 *A* (b) 4.0 *A*

(c) 2.0 *A* (d) 1.0 *A*

34. A battery is connected between two points *A* and *B* on the circumference of a uniform conducting ring of radius *r* and resistance *R*. One of the arcs *AB* of the ring subtends an angle θ at the centre. The value of the magnetic induction at the centre due to the current in the ring is [IIT 1995]

(a) Proportional to $2(180° - \theta)$

(b) Inversely proportional to *r*

(c) Zero, only if $\theta = 180°$

(d) Zero for all values of θ

35. A current of 1 *ampere* is passed through a straight wire of length 2.0 *metres*. The magnetic field at a point in air at a distance of 3 *metres* from either end of wire and lying on the axis of wire will be

(a) $\frac{\mu_0}{2\pi}$ (b) $\frac{\mu_0}{4\pi}$

(c) $\frac{\mu_0}{8\pi}$ (d) Zero

36. A long copper tube of inner radius *R* carries a current *i*. The magnetic field *B* inside the tube is [MP PMT 1995]

(a) $\frac{\mu_0 i}{2\pi R}$ (b) $\frac{\mu_0 i}{4\pi R}$

(c) $\frac{\mu_0 i}{2R}$ (d) Zero

37. A straight wire of length (π^2) *metre* is carrying a current of 2*A* and the magnetic field due to it is measured at a point distant 1 *cm* from it. If the wire is to be bent into a circle and is to carry the same current as before, the ratio of the magnetic field at its centre to that obtained in the first case would be

(a) 50 : 1 (b) 1 : 50

(c) 100 : 1 (d) 1 : 100

38. The direction of magnetic lines of forces close to a straight conductor carrying current will be

[RPMT 2002; RPET 2003; MP PET 2003]

(a) Along the length of the conductor

(b) Radially outward

(c) Circular in a plane perpendicular to the conductor [MP PMT 1994]

(d) Helical

39. If the strength of the magnetic field produced 10*cm* away from a infinitely long straight conductor is $10^{-5}\ Weber/m^2$, the value of the current flowing in the conductor will be

[MP PET 1996]

(a) 5 *ampere* (b) 10 *ampere*

(c) 500 *ampere* (d) 1000 *ampere*

40. Due to 10 *ampere* of current flowing in a circular coil of 10 *cm* radius, the magnetic field produced at its centre is $3.14\times10^{-3}\ Weber/m^2$. The number of turns in the coil will be

(a) 5000 (b) 100

(c) 50 (d) 25

41. There are 50 turns of a wire in every *cm* length of a long solenoid. If 4 *ampere* current is flowing in the solenoid, the approximate value of magnetic field along its axis at an internal point and at one end will be respectively

[MP PET 1996]

(a) $12.6\times10^{-3}\ Weber/m^2, 6.3\times10^{-3}\ Weber/m^2$

(b) $12.6\times10^{-3}\ Weber/m^2, 25.1\times10^{-3}\ Weber/m^2$

(c) $25.1\times10^{-3}\ Weber/m^2, 12.6\times10^{-3}\ Weber/m^2$

(d) $25.1\times10^{-5}\ Weber/m^2, 12.6\times10^{-5}\ Weber/m^2$

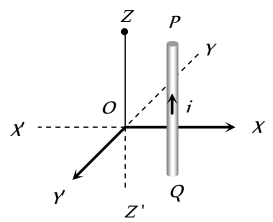
42. A solenoid is 1.0 *metre* long and it has 4250 turns. If a current of 5.0 *ampere* is flowing through it, what is the magnetic field at its centre $[\mu_0 = 4\pi\times10^{-7}\ weber/amp-m]$ [MP PET 1995]

[MP PMT 1996]

(a) $5.4\times10^{-2}\ weber/m^2$ (b) $2.7\times10^{-2}\ weber/m^2$

(c) $1.35\times10^{-2}\ weber/m^2$ (d) $0.675\times10^{-2}\ weber/m^2$

43. A vertical wire kept in *Z-X* plane carries a current from *Q* to *P* (see figure). The magnetic field due to current will have the direction at the origin *O* along



(a) *OX*

(b) *OX'*

(c) OY

(d) OY'

44. One metre length of wire carries a constant current. The wire is bent to form a circular loop. The magnetic field at the centre of this loop is *B*. The same is now bent to form a circular loop of smaller radius to have four turns in the loop. The magnetic field at the centre of this new loop is

(a) 4 B (b) 16 B

(c) $B/2$ (d) $B/4$

45. In a hydrogen atom, an electron moves in a circular orbit of radius $5.2\times10^{-11}\ m$ and produces a magnetic induction of 12.56 T at its nucleus. The current produced by the motion of the electron will be (Given $\mu_0 = 4\pi\times10^{-7}\ Wb/A-m$)

[MP PET 1997]

(a) 6.53×10^{-3} *ampere* (b) 13.25×10^{-10} *ampere*

(c) 9.6×10^{6} *ampere* (d) 1.04×10^{-3} *ampere*

46. An arc of a circle of radius *R* subtends an angle $\frac{\pi}{2}$ at the centre. It carries a current *i*. The magnetic field at the centre will be

(a) $\frac{\mu_0 i}{2R}$ (b) $\frac{\mu_0 i}{8R}$

(c) $\frac{\mu_0 i}{4R}$ (d) $\frac{2\mu_0 i}{5R}$

47. At a distance of 10 *cm* from a long straight wire carrying current, the magnetic field is 0.04 *T*. At the distance of 40 *cm*, the magnetic field will be [MP PMT 1997]

(a) 0.01 T (b) 0.02 T

(c) 0.08 T (d) 0.16 T

48. A uniform wire is bent in the form of a circle of radius *R*. A current *I* enters at *A* and leaves at *C* as shown in the figure :

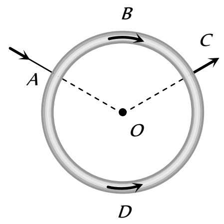
If the length *ABC* is half of the length *ADC*, the magnetic field at the centre *O* will be [MP PMT 1997]

(a) Zero

(b) $\frac{\mu_0 I}{2R}$

(c) $\frac{\mu_0 I}{4R}$

(d) $\frac{\mu_0 I}{6R}$



49. The magnetic induction at any point due to a long straight wire carrying a current is [MP PMT/PET 1998]

(a) Proportional to the distance from the wire

(b) Inversely proportional to the distance from wire

(c) Inversely proportional to the square of the distance from the wire

(d) Does not depend on distance

50. The expression for magnetic induction inside a solenoid of length *L* carrying a current *I* and having *N* number of turns is

(a) $\frac{\mu_0}{4\pi}\frac{N}{LI}$ (b) $\mu_0 NI$

(c) $\frac{\mu_0}{4\pi}NLI$ (d) $\mu_0\frac{N}{L}I$

51. In a current carrying long solenoid, the field produced does not depend upon [MP PET 1999]

(a) Number of turns per unit length

(b) Current flowing

(c) Radius of the solenoid

(d) All of the above three

52. The earth's magnetic induction at a certain point is $7\times10^{-5}\ Wb/m^2$. This is to be annulled by the magnetic induction at the centre of a circular conducting loop of radius 5 *cm*. The required current in the loop is

[MP PET 1999; MP PMT 2002]

(a) 0.56 A (b) 5.6 A

(c) 0.28 A (d) 2.8 A

53. Magnetic field due to 0.1 *A* current flowing through a circular coil of radius 0.1 *m* and 1000 turns at the centre of the coil is

(a) $2\times10^{-1}\ T$ (b) $4.31\times10^{-2}\ T$

(c) $6.28\times10^{-4}\ T$ (d) $9.81\times10^{-4}\ T$

54. Magnetic field intensity at the centre of coil of 50 turns, radius 0.5 *m* and carrying a current of 2 *A* is [MP PET 2003]

[CBSE PMT 1999; BHU 2002]

(a) $0.5\times10^{-5}\ T$ (b) $1.25\times10^{-4}\ T$

(c) $3\times10^{-5}\ T$ (d) $4\times10^{-5}\ T$

55. A circular coil '*A*' has a radius *R* and the current flowing through it is *I*. Another circular coil '*B*' has a radius 2*R* and if 2*I* is the current flowing through it, then the magnetic fields at the centre of the circular coil are in the ratio of (*i.e.* B_A to B_B)

(a) 4 : 1 (b) 2 : 1

(c) 3 : 1 (d) 1 : 1

56. The magnetic field at a distance *r* from a long wire carrying current *i* is 0.4 *Tesla*. The magnetic field at a distance 2*r* is

[CBSE PMT 1992; DPMT 2004]

(a) 0.2 *Tesla* (b) 0.8 *Tesla*

(c) 0.1 *Tesla* (d) 1.6 *Tesla*

57. A current *I* flows along the length of an infinitely long, straight and thin-walled pipe. Then [IIT-JEE 1993]

(a) The magnetic field at all points inside the pipe is the same but not zero

(b) The magnetic field at any point inside the pipe is zero

(c) The magnetic field is zero only on the axis of the pipe

(d) The magnetic field is different at different points inside the pipe

58. The magnetic field at the centre of current carrying coil is

[CPMT 1996; RPET 2002, 03]

(a) $\frac{\mu_0 ni}{2r}$ [MP PMT/PET 1998] (b) $\frac{\mu_0}{2\pi}\frac{ni}{r}$

(c) $\frac{\mu_0 ni}{4r}$ (d) $\mu_0 ni$

59. A straight wire of diameter 0.5 *mm* carrying a current of 1 *A* is replaced by another wire of 1 *mm* diameter carrying the same current. The strength of magnetic field far away is [CBSE PMT 1997, 99]

(a) Twice the earlier value
(b) Half of the earlier value
(c) Quarter of its earlier value
(d) Unchanged

60. A neutral point is obtained at the centre of a vertical circular coil carrying current. The angle between the plane of the coil and the magnetic meridian is [SCRA 1998]

(a) 0 (b) 45° (c) 60° (d) 90°

61. One *Tesla* is equal to [AFMC 1998]

(a) 10^7 *gauss* (b) 10^{-4} *gauss* (c) 10^4 *gauss* (d) 10^{-8} *gauss*

62. A current carrying wire in the neighborhood produces [AFMC 1999]

(a) No field
(b) Electric field only
(c) Magnetic field only
(d) Electric and magnetic fields

63. Tesla is the unit of [AIIMS 1999]

(a) Electric flux (b) Magnetic flux (c) Electric field (d) Magnetic field

64. The magnetic induction in air at a point 1*cm* away from a long wire that carries a current of 1*A*, will be [BHU 1999]

(a) $1\times10^{-5}T$ (b) $2\times10^{-5}T$ (c) $3\times10^{-5}T$ (d) $4\times10^{-5}T$

65. The magnetic field at the centre of coil of *n* turns, bent in the form of a square of side $2l$, carrying current *i*, is [AMU (Engg.) 1999]

(a) $\frac{\sqrt{2}\mu_0 ni}{\pi l}$ (b) $\frac{\sqrt{2}\mu_0 ni}{2\pi l}$ (c) $\frac{\sqrt{2}\mu_0 ni}{4\pi l}$ (d) $\frac{2\mu_0 ni}{\pi l}$

66. Which of the following gives the value of magnetic field according to, Biot-Savart's law' [BHU 2000]

(a) $\frac{i\Delta l\sin\theta}{r^2}$ (b) $\frac{\mu_0}{4\pi}\frac{i\Delta l\sin\theta}{r}$ (c) $\frac{\mu_0}{4\pi}\frac{i\Delta l\sin\theta}{r^2}$ (d) $\frac{\mu_0}{4\pi}i\Delta l\sin\theta$

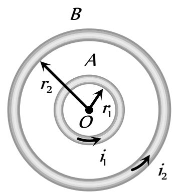
67. A toroid has number of turns per unit length *n*, current *i*, then the magnetic field is [RPET 2000]

(a) $\mu_0 ni$ (b) $\mu_0 n^2 i$ (c) $\mu_0 i/n$ (d) None of these

68. Magnetic field due to a ring having *n* turns at a distance *x* on its axis is proportional to (if *r* = radius of ring) [RPET 2000]

(a) $\frac{r}{(x^2+r^2)}$ (b) $\frac{r^2}{(x^2+r^2)^{3/2}}$ (c) $\frac{nr^2}{(x^2+r^2)^{3/2}}$ (d) $\frac{n^2r^2}{(x^2+r^2)^{3/2}}$

69. *A* and *B* are two concentric circular conductors of centre *O* and carrying currents i_1 and i_2 as shown in the adjacent figure. If ratio of their radii is 1 : 2 and ratio of the flux densities at *O* due to *A* and *B* is 1 : 3, then the value of i_1/i_2 is [KCET 2000]



(a) $\frac{1}{6}$ (b) $\frac{1}{4}$ (c) $\frac{1}{3}$ (d) $\frac{1}{2}$

70. A long straight wire carries an electric current of 2*A*. The magnetic induction at a perpendicular distance of 5*m* from the wire is

(a) $4\times10^{-8}T$ (b) $8\times10^{-8}T$ (c) $12\times10^{-8}T$ (d) $16\times10^{-8}T$

71. A straight wire carrying a current 10 *A* is bent into a semicircular arc of radius 5 *cm*. The magnitude of magnetic field at the center is

(a) $1.5\times10^{-5}T$ (b) $3.14\times10^{-5}T$ (c) $6.28\times10^{-5}T$ (d) $19.6\times10^{-5}T$

72. A long solenoid of length *L* has a mean diameter *D*. It has n layers of windings of *N* turns each. If it carries a current '*i*' the magnetic field at its centre will be [MP PMT 2000]

(a) Proportional to *D*
(b) Inversely proportional to *D*
(c) Independent of *D*
(d) Proportional to *L*

73. A circular loop of radius 0.0157*m* carries a current of 2.0 amp. The magnetic field at the centre of the loop is

$(\mu_0 = 4\pi\times10^{-7}\ weber/amp-m)$

(a) $1.57\times10^{-5}\ weber/m^2$ (b) $8.0\times10^{-5}\ weber/m^2$ (c) $2.5\times10^{-5}\ weber/m^2$ (d) $3.14\times10^{-5}\ weber/m^2$

74. A long solenoid has 200 turns per *cm* and carries a current of 2.5 *amps*. The magnetic field at its centre is $(\mu_0 = 4\pi\times10^{-7}\ weber/amp\text{-}m)$

(a) $3.14\times10^{-2} weber/m^2$
(b) $6.28\times10^{-2} weber/m^2$

(c) $9.42 \times 10^{-2} weber/m^2$

(d) $12.56 \times 10^{-2} weber/m^2$

75. Two concentric coplanar circular loops of radii r_1 and r_2 carry currents of respectively i_1 and i_2 in opposite directions (one clockwise and the other anticlockwise.) The magnetic induction at the centre of the loops is half that due to i_1 alone at the centre. If $r_2 = 2r_1$. the value of i_2/i_1 is

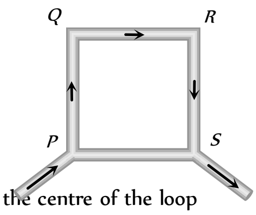
[MP PET 2000]

(a) 2 (b) 1/2

(c) 1/4 (d) 1

76. *PQRS* is a square loop made of uniform conducting wire the current enters the loop at *P* and leaves at *S*. Then the magnetic field will be

[KCET 2000]



(a) Maximum at the centre of the loop

(b) Zero at the centre of loop

(c) Zero at all points inside the loop

(d) Zero at all points outside of the loop

77. Magnetic fields at two points on the axis of a circular coil at a distance of 0.05m and 0.2m from the centre are in the ratio 8 : 1. The radius of the coil is

[KCET 2002]

(a) 1.0 m (b) 0.1 m

(c) 0.15 m (d) 0.2 m

78. An electric current passes through a long straight wire. At a distance 5 *cm* from the wire, The magnetic field is *B*. The field at 20 *cm* from the wire would be

[CPMT 2001; Pb PET 2002]

(a) $\frac{B}{6}$ (b) $\frac{B}{4}$

(c) $\frac{B}{3}$ (d) $\frac{B}{2}$

79. A closely wound flat circular coil of 25 turns of wire has diameter of 10 *cm* and carries a current of 4 *ampere*. Determine the flux density at the centre of a coil

[AIIMS 2001]

(a) $1.679 \times 10^{-5} tesla$ (b) $2.028 \times 10^{-4} tesla$

(c) $1.257 \times 10^{-3} tesla$ (d) $1.512 \times 10^{-6} tesla$

80. The dimension of the magnetic field intensity *B* is

[MP PET 2001]

(a) $MLT^{-2}A^{-1}$ (b) $MT^{-2}A^{-1}$

(c) ML^2TA^{-2} (d) $M^2LT^{-2}A^{-1}$

81. A current of 2 *amp*. flows in a long, straight wire of radius 2 *mm*. The intensity of magnetic field on the axis of the wire is

(a) $\left(\frac{\mu_o}{\pi}\right) \times 10^3$ *Tesla* (b) $\left(\frac{\mu_o}{2\pi}\right) \times 10^3$ *Tesla*

(c) $\left(\frac{2\mu_o}{\pi}\right) \times 10^3$ *Tesla* (d) Zero

82. The magnetic field at the centre of a circular coil of radius *r* carrying current *I* is B_1. The field at the centre of another coil of radius 2 *r* carrying same current *I* is B_2. The ratio $\frac{B_1}{B_2}$ is

(a) $\frac{1}{2}$ (b) 1

(c) 2 (d) 4

83. 1*A* current flows through an infinitely long straight wire. The magnetic field produced at a point 1 *metres* away from it is

[MP PMT 2001]

(a) 2×10^{-3} *Tesla* (b) $\frac{2}{10}$ *Tesla*

(c) 2×10^{-7} *Tesla* (d) $2\pi \times 10^{-6}$ Tesla

84. Two infinitely long parallel wires carry equal current in same direction. The magnetic field at a mid point in between the two wires is [MP PMT 2001]

(a) Twice the magnetic field produced due to each of the wires

(b) Half of the magnetic field produced due to each of the wires

(c) Square of the magnetic field produced due to each of the wires

(d) Zero

85. A wire in the form of a square of side '*a*' carries a current *i*. Then the magnetic induction at the centre of the square wire is (Magnetic permeability of free space = μ_o) [EAMCET 2001]

(a) $\frac{\mu_0 i}{2\pi a}$ (b) $\frac{\mu_0 i\sqrt{2}}{\pi a}$

(c) $\frac{2\sqrt{2}\mu_o i}{\pi a}$ (d) $\frac{\mu_0 i}{\sqrt{2}\pi a}$

86. What should be the current in a circular coil of radius 5*cm* to annul $B_H = 5 \times 10^{-5} T$ [DCE 2001]

(a) 0.4 *A* (b) 4 *A*

(c) 40 *A* (d) 1 *A*

87. A current of 0.1 *A* circulates around a coil of 100 turns and having a radius equal to 5*cm*. The magnetic field set up at the centre of the coil is ($\mu_o = 4\pi \times 10^{-7}$ *weber/amp-metre*)

[DPMT 2002]

(a) 2×10^{-5} *Tesla* (b) 4×10^{-5} *Tesla*

(c) $8\pi \times 10^{-5}$ *Tesla* (d) $4\pi \times 10^{-5}$ *Tesla*

88. An electron moving in a circular orbit of radius *r* makes *n* rotation per second. The magnetic field produced at the centre has a magnitude of

[KCET 2001; UPSEAT 2001, 02]

(a) $\frac{\mu_0 ne}{2r}$ (b) $\frac{\mu_0 n^2 e}{2r}$

(c) $\frac{\mu_0 ne}{2\pi r}$ (d) Zero

89. A long solenoid has n turns per meter and current I A is flowing through it. The magnetic field at the ends of the solenoid is

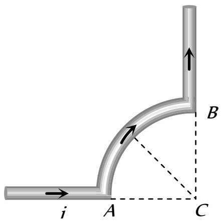
[MP PMT 2001; MP PET 2002]

(a) $\frac{\mu_0 nI}{2}$ (b) $\mu_0 nI$

(c) Zero (d) $2\mu_0 nI$

90. A wire carrying current i is shaped as shown. Section AB is a quarter circle of radius r. The magnetic field is directed

[KCET 2002]



(a) At an angle $\pi/4$ to the plane of the paper

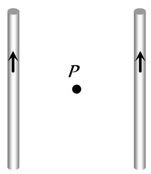
(b) Perpendicular to the plane of the paper and directed in to the paper

(c) Along the bisector of the angle ACB towards AB

(d) Along the bisector of the angle ACB away from AB

91. Two long straight wires are set parallel to each other. Each carries a current i in the same direction and the separation between them is $2r$. The intensity of the magnetic field midway between them is

[Kerala PET 2002; DCE 2002]



(a) $\mu_o i/r$

(b) $4\mu_o i/r$

(c) Zero

(d) $\mu_o i/4r$

92. A magnetic field can be produced by [AIEEE 2002]

(a) A moving charge (b) A changing electric field

(c) None of these (d) Both of these

93. Unit of magnetic permeability is [AFMC 2002]

(a) *Amp/metre* (b) *Amp*/m^2

(c) *Henry* (d) *Henry/metre*

94. A long straight wire carries a current of $\pi\, amp$. The magnetic field due to it will be $5\times10^{-5}\, weber/m^2$ at what distance from the wire $[\mu_o =$ permeability of air$]$

[MP PMT 2002]

(a) $10^4\mu_o$ *metre* (b) $\frac{10^4}{\mu_o}$ *metre*

(c) $10^6\mu_o$ *metre* (d) $\frac{10^6}{\mu_o}$ *metre*

95. When a certain length of wire is turned into one circular loop, the magnetic induction at the centre of coil due to some current flowing is B_1. If the same wire is turned into three loops to make a circular coil, the magnetic induction at the center of this coil for the same current will be

[MP PMT 2002]

(a) B_1 (b) $9B_1$

(c) $3B_1$ (d) $27B_1$

96. Gauss is unit of which quantity [MP PET 2002]

(a) H (b) B

(c) ϕ (d) 1

97. On connecting a battery to the two corners of a diagonal of a square conductor frame of side a the magnitude of the magnetic field at the centre will be [MP PET 2002]

(a) Zero (b) $\frac{\mu_o}{\pi a}$

(c) $\frac{2\mu_o}{\pi a}$ (d) $\frac{4\mu_o i}{\pi a}$

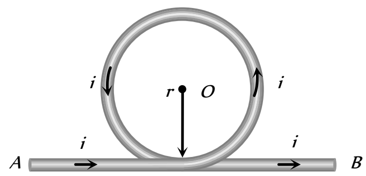
98. The ratio of the magnetic field at the centre of a current carrying coil of the radius a and at a distance 'a' from centre of the coil and perpendicular to the axis of coil is

[MP PET 2002]

(a) $\frac{1}{\sqrt{2}}$ (b) $\sqrt{2}$

(c) $\frac{1}{2\sqrt{2}}$ (d) $2\sqrt{2}$

99. A part of a long wire carrying a current i is bent into a circle of radius r as shown in figure. The net magnetic field at the centre O of the circular loop is [UPSEAT 2002]



(a) $\frac{\mu_o i}{4r}$

(b) $\frac{\mu_o i}{2r}$

(c) $\frac{\mu_o i}{2\pi r}(\pi+1)$

(d) $\frac{\mu_o i}{2\pi r}(\pi-1)$

100. The current in the windings on a toroid is 2.0A. There are 400 turns and the mean circumferential length is 40cm. If the inside magnetic field is 1.0T, the relative permeability is near to

(a) 100 (b) 200

(c) 300 (d) 400

101. "On flowing current in a conducting wire the magnetic field produces around it." It is a law of [RPET 2003]

(a) Lenz (b) Ampere

(c) Ohm (d) Maxwell

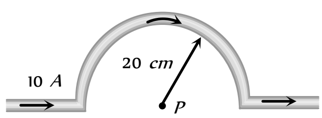
102. The magnetic field near a current carrying conductor is given by

(a) Coulomb's law (b) Lenz' law

(c) Biot-savart's law (d) Kirchoff's law

103. A current of 10A is passing through a long wire which has semicircular loop of the radius 20cm as shown in the figure. Magnetic field produced at the centre of the loop is

[Orissa JEE 2003]



(a) $10\pi\mu T$

(b) $5\pi\mu T$

(c) $4\pi\mu T$

(d) $2\pi\mu T$

104. A wire in the form of a circular loop of one turn carrying a current produces a magnetic field B at the centre. If the same wire is looped into a coil of two turns and carries the same current, the new value of magnetic induction at the centre is [CBSE 2002; KCET 2003]

(a) $5B$ (b) $3B$

(c) $2B$ (d) $4B$

105. A long solenoid carrying a current produces a magnetic field B along its axis. If the current is doubled and the number of turns per *cm* is halved, the new value of the magnetic field is

[CBSE PMT 2003]

(a) B (b) $2\ B$

(c) $4\ B$ (d) $B/2$

106. A long straight wire carrying current of $30A$ is placed in an external uniform magnetic field of induction $4 \times 10^{-4}\ T$. The magnetic field is acting parallel to the direction of current. The magnitude of the resultant magnetic induction in *tesla* at a point 2.0 cm away from the wire is [EAMCET 2003]

(a) 10^{-4} (b) 3×10^{-4}

(c) 5×10^{-4} (d) 6×10^{-4}

107. The earth's magnetic field at a given point is $0.5 \times 10^{-5}\ Wb\text{-}m^{-2}$. This field is to be annulled by magnetic induction at the center of a circular conducting loop of radius $5.0\ cm$. The current required to be flown in the loop is nearly [AIIMS 2003]

(a) $0.2\ A$ (b) $0.4A$

(c) $4A$ (d) $40A$

108. A coil having N turns carry a current I as shown in the figure. The magnetic field intensity at point P is

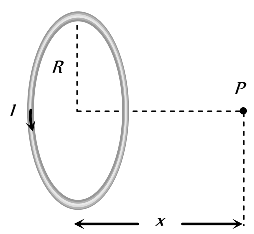
[BHU 2003; CPMT 2004]

(a) $\dfrac{\mu_0 NIR^2}{2(R^2+x^2)^{3/2}}$

(b) $\dfrac{\mu_0 NI}{2R}$

(c) $\dfrac{\mu_0 NIR^2}{(R+x)^2}$

(d) Zero



109. Two similar coils are kept mutually perpendicular such that their centres coincide. At the centre, find the ratio of the magnetic field due to one coil and the resultant magnetic field by both coils, if the same current is flown

[BHU 2003; CPMT 2004]

(a) $1:\sqrt{2}$ (b) $1:2$

(c) $2:1$ (d) $\sqrt{3}:1$

110. In the figure, what is the magnetic field at the point O

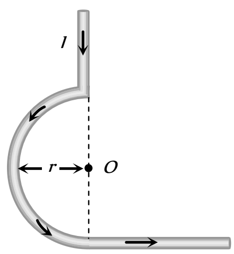
[MP PMT 2004]

(a) $\dfrac{\mu_0 I}{4\pi r}$

(b) $\dfrac{\mu_0 I}{4\pi r} + \dfrac{\mu_0 I}{2\pi r}$

(c) $\dfrac{\mu_0 I}{4r} + \dfrac{\mu_0 I}{4\pi r}$

(d) $\dfrac{\mu_0 I}{4r} - \dfrac{\mu_0 I}{4\pi r}$



111. The magnetic moment of a current (i) carrying circular coil of radius (r) and number of turns (n) varies as [AIIMS 2004]

(a) $1/r$ (b) $1/r$

(c) r (d) r

112. A current flows in a conductor from east to west. The direction of the magnetic field at a points above the conductor is .....

(a) Towards north (b) Towards south

(c) Towards east (d) Towards west

113. A long wire carries a steady current. It is bent into a circle of one turn and the magnetic field at the centre of the coil is B. It is then bent into a circular loop of n turns. The magnetic field at the centre of the coil will be [AIEEE 2004]

(a) nB (b) nB

(c) $2nB$ (d) $2nB$

114. The magnetic field due to a current carrying circular loop of radius 3 *cm* at a point on the axis at a distance of 4 *cm* from the centre is 54 μT. What will be its value at the centre of the loop

(a) 250 $\mu\ T$ (b) 150 $\mu\ T$

(c) 125 $\mu\ T$ (d) 75 $\mu\ T$

115. The magnetic induction at the centre of a current carrying circular of coil radius r, is [J & K CET 2004]

(a) Directly proportional to r

(b) Inversely proportional r

(c) Directly proportional to r

(d) Inversely proportional to r

116. The current is flowing in south direction along a power line. The direction of magnetic field above the power line (neglecting earth's field) is

[Pb. PMT 2004; Kerala PMT 2004]

(a) South (b) East

(c) North (d) West

117. Two wires of same length are shaped into a square and a circle. If they carry same current, ratio of the magnetic moment is

(a) $2:\pi$ (b) $\pi:2$

(c) $\pi:4$ (d) $4:\pi$

118. When the current flowing in a circular coil is doubled and the number of turns of the coil in it is halved, the magnetic field at its centre will become [DPMT 2003]

(a) Four times (b) Same

(c) Half (d) Double

119. An electron is revolving round a proton, producing a magnetic field of 16 *weber/m* in a circular orbit of radius 1Å. It's angular velocity will be [RPMT 2002]

(a) 10^{17} *rad/sec* (b) $1/2\pi \times 10^{12}$ *rad/sec*

(c) $2\ \pi \times 10^{12}$ *rad/sec* (d) $4\ \pi \times 10^{12}$ *rad/sec*

120. 20 *ampere* current is flowing in a long straight wire. The intensity of magnetic field at a distance 10 *cm* from the wire will be

(a) 4×10^{-5} *Wb/m* (b) 9×10^{-5} *Wb/m*

(c) 8×10^{-5} *Wb/m* (d) 6×10^{-5} *Wb/m*

121. The field due to a long straight wire carrying a current I is proportional to [MP PMT 1993]

(a) I (b) I^3

(c) $\sqrt{I}$ (d) $1/I$

122. Two concentric coils each of radius equal to $2\pi\ cm$ are placed at right angles to each other. 3 *ampere* and 4 *ampere* are the currents flowing in each coil respectively. The magnetic induction in

$Weber/m^2$ at the centre of the coils will be $(\mu_0 = 4\pi \times 10^{-7} Wb/A.m)$ [AIEEE 2005]

(a) 5×10^{-5} (b) 7×10^{-5}

(c) 12×10^{-5} (d) 10^{-5}

123. A wire carrying current I and other carrying $2I$ in the same direction produces a magnetic field B at the mid point. What will be the field when $2I$ wire is switched off [AFMC 2005]

(a) $B/2$ (b) $2B$

(c) B (d) $4B$

124. Two long parallel wires P and Q are both perpendicular to the plane of the paper with distance 5 m between them. If P and Q carry current of 2.5 *amp* and 5 *amp* respectively in the same direction, then the magnetic field at a point half way between the wires is

(a) $\frac{\sqrt{3}\mu_0}{2\pi}$ (b) $\frac{\mu_0}{\pi}$

(c) $\frac{3\mu_0}{2\pi}$ (d) $\frac{\mu_0}{2\pi}$

(e) $\frac{\sqrt{3}\mu_0}{\pi}$

125. The direction of magnetic lines of force produced by passing a direct current in a conductor is given by [J & K CET 2005]

(a) Lenz's law (b) Fleming's left hand rule

(c) Right hand palm rule (d) Maxwell's law

126. For the magnetic field to be maximum due to a small element of current carrying conductor at a point, the angle between the element and the line joining the element to the given point must be

(a) 0° (b) 90°

(c) 180° (d) 45°

Motion of Charged Particle In Magnetic Field

1. A proton moving with a constant velocity passes through a region of space without any change in its velocity. If $\vec{E}$ and $\vec{B}$ represent the electric and magnetic fields respectively, then this region of space may have

[IIT-JEE 1985; AMU 1995; AFMC 2001; Roorkee 2000; AMU (Med.) 2000]

(a) $E = 0, B = 0$ (b) $E = 0, B \neq 0$

(c) $E \neq 0, B = 0$ (d) $E \neq 0, B \neq 0$

2. A uniform electric field and a uniform magnetic field are produced, pointed in the same direction. An electron is projected with its velocity pointing in the same direction

[NCERT 1980; CBSE PMT 1993; JIPMER 1997; AIEEE 2005]

(a) The electron will turn to its right

(b) The electron will turn to its left

(c) The electron velocity will increase in magnitude

(d) The electron velocity will decrease in magnitude

3. Two particles X and Y having equal charges, after being accelerated through the same potential difference, enter a region of uniform magnetic field and describes circular path of radius R_1 and R_2 respectively. The ratio of mass of X to that of Y is[IIT-JEE 1988; CBSE PMT1995; M

(a) $\left(\frac{R_1}{R_2}\right)^{1/2}$ (b) $\frac{R_2}{R_1}$

(c) $\left(\frac{R_1}{R_2}\right)^2$ (d) $\frac{R_1}{R_2}$

4. A beam of ions with velocity $2 \times 10^5\ m/s$ enters normally into a uniform magnetic field of $4 \times 10^{-2}\ tesla$. If the specific charge of the ion is $5 \times 10^7\ C/kg$, then the radius of the circular path described will be [NCERT 1983; BVP 2003]

(a) 0.10 m [Kerala PMT 2005] (b) 0.16 m

(c) 0.20 m (d) 0.25 m

5. The radius of curvature of the path of the charged particle in a uniform magnetic field is directly proportional to

[MNR 1995; UPSEAT 1999, 2000]

(a) The charge on the particle

(b) The momentum of the particle

(c) The energy of the particle

(d) The intensity of the field

6. An electron has mass $9 \times 10^{-31}\ kg$ and charge $1.6 \times 10^{-19} C$ is moving with a velocity of $10^6\ m/s$, enters a region where magnetic field exists. If it describes a circle of radius 0.10 m, the intensity of magnetic field must be

[NCERT 1982; CPMT 1989; DCE 2005]

(a) $1.8 \times 10^{-4}\ T$ [J & K CET 2005] (b) $5.6 \times 10^{-5}\ T$

(c) $14.4 \times 10^{-5}\ T$ (d) $1.3 \times 10^{-6}\ T$

7. A proton (mass m and charge $+e$) and an $\alpha-$particle (mass $4m$ and charge $+2e$) are projected with the same kinetic energy at right angles to the uniform magnetic field. Which one of the following statements will be true [NCERT 1983]

(a) The $\alpha-$particle will be bent in a circular path with a small radius that for the proton

(b) The radius of the path of the $\alpha-$particle will be greater than that of the proton

(c) The $\alpha-$particle and the proton will be bent in a circular path with the same radius

(d) The $\alpha-$particle and the proton will go through the field in a straight line

8. A charged particle moving in a magnetic field experiences a resultant force [MP PMT 1994]

(a) In the direction of field

(b) In the direction opposite to that field

(c) In the direction perpendicular to both the field and its velocity

(d) None of the above

9. If the direction of the initial velocity of the charged particle is perpendicular to the magnetic field, then the orbit will be

or

The path executed by a charged particle whose motion is perpendicular to magnetic field is

[MP PMT 1993; CPMT 1996]

(a) A straight line (b) An ellipse

(c) A circle (d) A helix

10. If the direction of the initial velocity of the charged particle is neither along nor perpendicular to that of the magnetic field, then the orbit will be [MP PET 1993]

(a) A straight line (b) An ellipse
(c) A circle (d) A helix

11. Particles having positive charges occasionally come with high velocity from the sky towards the earth. On account of the magnetic field of earth, they would be deflected towards the

(a) North (b) South
(c) East (d) West

12. A 2 *MeV* proton is moving perpendicular to a uniform magnetic field of 2.5 *tesla*. The force on the proton is [CPMT 1989]

(a) $2.5\times10^{-10}\ N$ (b) $7.6\times10^{-11}\ N$
(c) $2.5\times10^{-11}\ N$ (d) $7.6\times10^{-12}\ N$

13. A charged particle moves with velocity v in a uniform magnetic field $\vec{B}$. The magnetic force experienced by the particle is

(a) Always zero
(b) Never zero
(c) Zero, if $\vec{B}$ and $\vec{v}$ are perpendicular
(d) Zero, if $\vec{B}$ and $\vec{v}$ are parallel

14. A proton is moving along *Z*-axis in a magnetic field. The magnetic field is along *X*-axis. The proton will experience a force along

(a) *X*-axis (b) *Y*-axis
(c) *Z*-axis (d) Negative *Z*-axis

15. A proton of mass *m* and charge +*e* is moving in a circular orbit in a magnetic field with energy 1 *MeV*. What should be the energy of $\alpha-$particle (mass = 4*m* and charge = + 2*e*), so that it can revolve in the path of same radius [BHU 1997]

(a) 1 *MeV* (b) 4 *MeV*
(c) 2 *MeV* (d) 0.5 *MeV*

16. An electron is moving with a speed of $10^8\ m/\sec$ perpendicular to a uniform magnetic field of intensity *B*. Suddenly intensity of the magnetic field is reduced to *B*/2. The radius of the path becomes from the original value of *r* [MP PET 1993]

(a) No change (b) Reduces to $r/2$
(c) Increases to 2*r* (d) Stops moving

17. A proton and an $\alpha-$particle enter a uniform magnetic field perpendicularly with the same speed. If proton takes 25 μ sec to make 5 revolutions, then the periodic time for the $\alpha-$particle would be [MP PET 1993]

(a) 50 μ sec (b) 25 μ sec
(c) 10 μ sec (d) 5 μ sec

18. A proton (mass $=1.67\times10^{-27}\ kg$ and charge $=1.6\times10^{-19}\ C$) enters perpendicular to a magnetic field of intensity 2 $weber/m^2$ with a velocity $3.4\times10^7\ m/\sec$. The acceleration of the proton should be [DPMT 1999]

(a) $6.5\times10^{15}\ m/\sec^2$ (b) $6.5\times10^{13}\ m/\sec^2$
(c) $6.5\times10^{11}\ m/\sec^2$ (d) $6.5\times10^{9}\ m/\sec^2$

19. An $\alpha-$particle travels in a circular path of radius 0.45 m in a magnetic field $B=1.2\,Wb/m^2$ with a speed of $2.6\times10^7\ m/\sec$. The period of revolution of the $\alpha-$particle is

(a) 1.1×10^{-5} sec (b) 1.1×10^{-6} sec
(c) 1.1×10^{-7} sec (d) 1.1×10^{-8} sec

20. A uniform magnetic field B is acting from south to north and is of magnitude 1.5 Wb/m^2. If a proton having mass $=1.7\times10^{-27}\ kg$ and charge $=1.6\times10^{-19}\ C$ moves in this field vertically downwards with energy 5 *MeV*, then the force acting on it will be [NCERT 1977]

(a) $7.4\times10^{12}\ N$ (b) $7.4\times10^{-12}\ N$
(c) $7.4\times10^{19}\ N$ (d) $7.4\times10^{-19}\ N$

21. A strong magnetic field is applied on a stationary electron, then [BIT 1989; MP P

(a) The electron moves in the direction of the field
(b) The electron moves in an opposite direction
(c) The electron remains stationary
(d) The electron starts spinning

22. A uniform magnetic field acts at right angles to the direction of motion of electrons. As a result, the electron moves in a circular path of radius 2 *cm*. If the speed of the electrons is doubled, then the radius of the circular path will be [CBSE PMT 1990] [CBSE PMT 1991]

(a) 2.0 *cm* (b) 0.5 *cm*
(c) 4.0 *cm* (d) 1.0 *cm*

23. A deutron of kinetic energy 50 *keV* is describing a circular orbit of radius 0.5 *metre* in a plane perpendicular to magnetic field $\vec{B}$. The kinetic energy of the proton that describes a circular orbit of radius 0.5 *metre* in the same plane with the same $\vec{B}$ is

(a) 25 *keV* (b) 50 *keV*
(c) 200 *keV* (d) 100 *keV*

24. If a proton is projected in a direction perpendicular to a uniform magnetic field with velocity *v* and an electron is projected along the lines of force, what will happen to proton and electron

(a) The electron will travel along a circle with constant speed and the proton will move along a straight line
(b) Proton will move in a circle with constant speed and there will be no effect on the motion of electron
(c) There will not be any effect on the motion of electron and proton
(d) The electron and proton both will follow the path of a parabola

25. An electron is travelling horizontally towards east. A magnetic field in vertically downward direction exerts a force on the electron along

(a) East (b) West
(c) North (d) South

26. Lorentz force can be calculated by using the formula [MP PET 1994, 2002, 03; CBSE PMT 2002]

(a) $\vec{F}=q(\vec{E}+\vec{v}\times\vec{B})$ (b) $\vec{F}=q(\vec{E}-\vec{v}\times\vec{B})$
(c) $\vec{F}=q(\vec{E}+\vec{v}\cdot\vec{B})$ (d) $\vec{F}=q(\vec{E}\times\vec{B}+\vec{v})$

27. A magnetic field [MP PET 1994; Pb PMT 2003]

(a) Always exerts a force on a charged particle
(b) Never exerts a force on a charged particle
(c) Exerts a force, if the charged particle is moving across the magnetic field lines
(d) Exerts a force, if the charged particle is moving along the magnetic field lines

28. A proton enters a magnetic field of flux density $1.5\, weber/m^2$ with a velocity of $2\times10^7\, m/\sec$ at an angle of $30°$ with the field. The force on the proton will be

[MP PET 1994 ; Pb. PMT 2004]

(a) $2.4\times10^{-12}\, N$ (b) $0.24\times10^{-12}\, N$

(c) $24\times10^{-12}\, N$ (d) $0.024\times10^{-12}\, N$

29. If a particle of charge $10^{-12}\, coulomb$ moving along the $\hat{x}-$direction with a velocity $10^5\, m/s$ experiences a force of $10^{-10}\, newton$ in $\hat{y}-$direction due to magnetic field, then the minimum magnetic field is [MP PMT 1994]

(a) $6.25\times10^3\, tesla$ in $\hat{z}-$direction

(b) $10^{-15}\, tesla$ in $\hat{z}-$direction

(c) $6.25\times10^{-3}\, tesla$ in $\hat{z}-$direction

(d) $10^{-3}\, tesla$ in $\hat{z}-$direction

30. If a proton, deutron and $\alpha-$particle on being accelerated by the same potential difference enters perpendicular to the magnetic field, then the ratio of their kinetic energies is

[MP PMT 2003; J & K CET 2005]

(a) 1 : 2 : 2 (b) 2 : 2 : 1

(c) 1 : 2 : 1 (d) 1 : 1 : 2

31. Which of the following statement is true

[Manipal MEE 1995]

(a) The presence of a large magnetic flux through a coil maintains a current in the coil if the circuit is continuous

(b) A coil of a metal wire kept stationary in a non-uniform magnetic field has an e.m.f. induced in it

(c) A charged particle enters a region of uniform magnetic field at an angle of $85°$ to the magnetic lines of force; the path of the particle is a circle

(d) There is no change in the energy of a charged particle moving in a magnetic field although a magnetic force is acting on it

32. An electron and a proton enter region of uniform magnetic field in a direction at right angles to the field with the same kinetic energy. They describe circular paths of radius r_e and r_p respectively. Then

(a) $r_e=r_p$

(b) $r_e<r_p$

(c) $r_e>r_p$

(d) r_e may be less than or greater than r_p depending on the direction of the magnetic field

33. A proton of mass $1.67\times10^{-27}\, kg$ and charge $1.6\times10^{-19}\, C$ is projected with a speed of $2\times10^6\, m/s$ at an angle of $60°$ to the $X-$axis. If a uniform magnetic field of 0.104 *Tesla* is applied along $Y-$axis, the path of proton is [IIT-JEE 1995]

(a) A circle of radius = 0.2 m and time period $\pi\times10^{-7}\, s$

(b) A circle of radius = 0.1 m and time period $2\pi\times10^{-7}\, s$

(c) A helix of radius = 0.1 m and time period $2\pi\times10^{-7}\, s$

(d) A helix of radius = 0.2 m and time period $4\pi\times10^{-7}\, s$

34. A proton and a deutron both having the same kinetic energy, enter perpendicularly into a uniform magnetic field B. For motion of proton and deutron on circular path of radius R_p and R_d respectively, the correct statement is

[MP PET 1995]

(a) $R_d=\sqrt{2}\, R_p$ (b) $R_d=R_p/\sqrt{2}$

(c) $R_d=R_p$ (d) $R_d=2R_p$

35. A proton (or charged particle) moving with velocity v is acted upon by electric field E and magnetic field B. The proton will move undeflected if

[MP PMT 1995, 2003; UPSEAT 2002; DPMT 2003]

(a) E is perpendicular to B

(b) E is parallel to v and perpendicular to B

(c) E, B and v are mutually perpendicular and $v=\frac{E}{B}$

(d) E and B both are parallel to v

36. A proton and an electron both moving with the same velocity v enter into a region of magnetic field directed perpendicular to the velocity of the particles. They will now move in circular orbits such that [MP PMT 1995]

(a) Their time periods will be same

(b) The time period for proton will be higher

(c) The time period for electron will be higher

(d) Their orbital radii will be same

37. A charge + Q is moving upwards vertically. It enters a magnetic field directed to the north. The force on the charge will be towards[MP PMT 1995; AM

(a) North (b) South

(c) East (d) West

38. An electron is moving on a circular path of radius r with speed v in a transverse magnetic field B. e/m for it will be

[MP PMT 2003]

(a) $\frac{v}{Br}$ [Manipal MEE 1995] (b) $\frac{B}{rv}$

(c) Bvr (d) $\frac{vr}{B}$

39. A beam of well collimated cathode rays travelling with a speed of $5\times10^6\, ms^{-1}$ enter a region of mutually perpendicular electric and magnetic fields and emerge undeviated from this region. If $|\boldsymbol{B}|=0.02\, T$, the magnitude of the electric field is

(a) $10^5\, Vm^{-1}$ (b) $2.5\times10^8\, Vm^{-1}$

(c) $1.25\times10^{10}\, Vm^{-1}$ (d) $2\times10^3\, Vm^{-1}$

40. An electron having charge $1.6\times10^{-19}\, C$ and mass $9\times10^{-31}\, kg$ is moving with $4\times10^6\, ms^{-1}$ speed in a magnetic field $2\times10^{-1}\, tesla$ in a circular orbit. The force acting on electron and the radius of the circular orbit will be

[MP PET 1996; JIPMER 2000; BVP 2003]

(a) $12.8\times10^{-13}\, N, 1.1\times10^{-4}\, m$

(b) $1.28\times10^{-14}\,N, 1.1\times10^{-3}m$

(c) $1.28\times10^{-13}\,N, 1.1\times10^{-3}m$

(d) $1.28\times10^{-13}\,N, 1.1\times10^{-4}m$

41. An electron enters a magnetic field whose direction is perpendicular to the velocity of the electron. Then [MP PMT 1996; CBSE PMT 2003]

(a) The speed of the electron will increase

(b) The speed of the electron will decrease

(c) The speed of the electron will remain the same

(d) The velocity of the electron will remain the same

42. An electron is moving in the north direction. It experiences a force in vertically upward direction. The magnetic field at the position of the electron is in the direction of [MP PET 2003]

(a) East (b) West

(c) North (d) South

43. A current carrying long solenoid is placed on the ground with its axis vertical. A proton is falling along the axis of the solenoid with a velocity *v*. When the proton enters into the solenoid, it will

(a) Be deflected from its path

(b) Be accelerated along the same path

(c) Be decelerated along the same path

(d) Move along the same path with no change in velocity

44. A charged particle of mass *m* and charge *q* describes circular motion of radius *r* in a uniform magnetic field of strength *B*. The frequency of revolution is [MP PET 1997; RPET 2001]

(a) $\frac{Bq}{2\pi m}$ (b) $\frac{Bq}{2\pi rm}$

(c) $\frac{2\pi m}{Bq}$ (d) $\frac{Bm}{2\pi q}$

45. An electron is accelerated by a potential difference of 12000 *volts*. It then enters a uniform magnetic field of $10^{-3}\,T$ applied perpendicular to the path of electron. Find the radius of path. Given mass of electron $=9\times10^{-31}\,kg$ and charge on electron $=1.6\times10^{-19}\,C$ [MP PET 1997]

(a) 36.7 *m* (b) 36.7 *cm*

(c) 3.67 *m* (d) 3.67 *cm*

46. The charge on a particle *Y* is double the charge on particle *X*. These two particles *X* and *Y* after being accelerated through the same potential difference enter a region of uniform magnetic field and describe circular paths of radii R_1 and R_2 respectively. The ratio of the mass of *X* to that of *Y* is [MP PET 1997]

(a) $\left(\frac{2R_1}{R_2}\right)^2$ (b) $\left(\frac{R_1}{2R_2}\right)^2$

(c) $\frac{R_1^2}{2R_2^2}$ (d) $\frac{2R_1}{R_2}$

47. A particle with 10^{-11} *coulomb* of charge and $10^{-7}\,kg$ mass is moving with a velocity of $10^8\,m/s$ along the *y*-axis. A uniform static magnetic field $B=0.5\,Tesla$ is acting along the *x*-direction. The force on the particle is [MP PMT 1997]

(a) $5\times10^{-11}\,N$ along $\hat{i}$ (b) $5\times10^{3}\,N$ along $\hat{k}$

(c) $5\times10^{-11}\,N$ along $-\hat{j}$ (d) $5\times10^{-4}\,N$ along $-\hat{k}$

48. A particle of charge *q* and mass *m* moving with a velocity *v* along the *x*-axis enters the region $x > 0$ with uniform magnetic field *B* along the $\hat{k}$ direction. The particle will penetrate in this region in the *x*-direction upto a distance *d* equal to

(a) Zero (b) $\frac{mv}{qB}$

(c) $\frac{2mv}{qB}$ (d) Infinity

49. A charged particle is moving with velocity *v* in a magnetic field of induction *B*. The force on the particle will be maximum when

(a) *v* and *B* are in the same direction

(b) *v* and *B* are in opposite directions

(c) *v* and *B* are perpendicular

(d) *v* and *B* are at an angle of $45°$

50. A charged particle enters a magnetic field *H* with its initial velocity making an angle of $45°$ with *H*. The path of the particle will be [MP PET 1999;

(a) A straight line (b) A circle

(c) An ellipse (d) A helix

51. An electron and a proton enter a magnetic field perpendicularly. Both have same kinetic energy. Which of the following is true

(a) Trajectory of electron is less curved

(b) Trajectory of proton is less curved

(c) Both trajectories are equally curved

(d) Both move on straight-line path

52. A charged particle moves in a uniform magnetic field. The velocity of the particle at some instant makes an acute angle with the magnetic field. The path of the particle will be [MP PMT 1999]

(a) A straight line

(b) A circle

(c) A helix with uniform pitch

(d) A helix with non-uniform pitch

53. An electron is moving along positive *x*-axis. To get it moving on an anticlockwise circular path in *x-y* plane, a magnetic filed is applied

(a) Along positive *y*-axis (b) Along positive *z*-axis

(c) Along negative *y*-axis (d) Along negative *z*-axis

54. A moving charge will gain energy due to the application of [CPMT 1999]

(a) Electric field (b) Magnetic field

(c) Both of these (d) None of these

55. A proton, a deuteron and an $\alpha-$ particle having the same kinetic energy are moving in circular trajectories in a constant magnetic field. If r_p, r_d and r_α denote respectively the radii of the trajectories of these particles, then

[IIT 1997 Re-Exam]

(a) $r_\alpha = r_p < r_d$ (b) $r_\alpha > r_d > r_p$

(c) $r_\alpha = r_d > r_p$ (d) $r_p = r_d = r_\alpha$

56. When a magnetic field is applied in a direction perpendicular to the direction of cathode rays, then their [EAMCET 1994; BHU 2005]

(a) Energy decreases

(b) Energy increases

(c) Momentum increases

(d) Momentum and energy remain unchanged

57. A charge moves in a circle perpendicular to a magnetic field. The time period of revolution is independent of [RPET 1997; AIEEE 2002]

(a) Magnetic field (b) Charge

(c) Mass of the particle (d) Velocity of the particle

58. A proton of energy 200 *MeV* enters the magnetic field of 5 *T*. If direction of field is from south to north and motion is upward, the force acting on it will be [RPET 1997]

(a) Zero (b) $1.6\times10^{-10}\,N$

(c) $3.2\times10^{-8}\,N$ (d) $1.6\times10^{-6}\,N$

59. An electron enters a region where magnetic (*B*) and electric (*E*) fields are mutually perpendicular to one another, then [CBSE PMT1993]

(a) It will always move in the direction of *B*

(b) It will always move in the direction of *E*

(c) It always possess circular motion

(d) It can go undeflected also

60. A charge moving with velocity *v* in *X*-direction is subjected to a field of magnetic induction in the negative *X*-direction. As a result, the charge will [CBSE PMT1993]

(a) Remain unaffected

(b) Start moving in a circular path *Y*-*Z* plane

(c) Retard along *X*-axis

(d) Move along a helical path around *X*-axis

61. An electron and a proton with equal momentum enter perpendicularly into a uniform magnetic field, then [BHU 1997; AIEEE 2002; MH CET (Med.) 2000]

(a) The path of proton shall be more curved than that of electron

(b) The path of proton shall be less curved than that of electron

(c) Both are equally curved

(d) Path of both will be straight line

62. A positively charged particle moving due east enters a region of uniform magnetic field directed vertically upwards. The particle will

(a) Get deflected vertically upwards

(b) Move in a circular orbit with its speed increased

(c) Move in a circular orbit with its speed unchanged

(d) Continue to move due east

63. A particle moving in a magnetic field increases its velocity, then its radius of the circle [BHU 1998]

(a) Decreases (b) Increases

(c) Remains the same (d) Becomes half

64. A particle is moving in a uniform magnetic field, then [BHU 1998]

(a) Its momentum changes but total energy remains the same

(b) Both momentum and total energy remain the same

(c) Both will change

(d) Total energy changes but momentum remains the same

65. If an electron is going in the direction of magnetic field $\vec{B}$ with the velocity of $\vec{v}$ then the force on electron is [RPMT 1999]

(a) Zero (b) $e(\vec{v}\cdot\vec{B})$

(c) $e(\vec{v}\times\vec{B})$ (d) None of these

66. One proton beam enters a magnetic field of $10^{-4}\,T$ normally, Specific charge = $10^{11}\,C/kg$. velocity = $10^{7}\,m/s$. What is the radius of the circle described by it [DCE 1999]

(a) 0.1 *m* (b) 1 *m*

(c) 10 *m* (d) None of these

67. In a cyclotron, the angular frequency of a charged particle is independent of [CPMT 1999]

(a) Mass (b) Speed

(c) Charge (d) Magnetic field

68. A charged particle is moving in a uniform magnetic field in a circular path. Radius of circular path is *R*. When energy of particle is doubled, then new radius will be [CPMT 1999; Pb. PET 2002]

(a) $R\sqrt{2}$ (b) $R\sqrt{3}$

(c) 2 *R* (d) 3 *R*

69. The radius of curvature of the path of a charged particle moving in a static uniform magnetic field is [Roorkee 1999]

(a) Directly proportional to the magnitude of the charge on the particle

(b) Directly proportional to the magnitude of the linear momentum of the particle

(c) Directly proportional to the kinetic energy of the particle

(d) Inversely proportional to the magnitude of the magnetic field

70. A proton moving with a velocity, $2.5\times10^{7}\,m/s$, enters a magnetic field of intensity 2.5 *T* making an angle 30^o with the magnetic field. The force on the proton is [AFMC 2000; CBSE PMT 2000]

(a) $3\times10^{-12}\,N$ (b) $5\times10^{-12}\,N$

(c) $6\times10^{-12}\,N$ (d) $9\times10^{-12}\,N$

71. Maximum kinetic energy of the positive ion in the cyclotron is [CBSE PMT 1997]

(a) $\frac{q^2Br_0}{2m}$ (b) $\frac{qB^2r_o}{2m}$

(c) $\frac{q^2B^2r_0^2}{2m}$ (d) $\frac{qBr_0}{2m^2}$

72. A charge *q* is moving in a magnetic field then the magnetic force does not depend upon [RPET 2000]

(a) Charge (b) Mass

(c) Velocity (d) Magnetic field

73. An electron is travelling in east direction and a magnetic field is applied in upward direction then electron will deflect in

(a) South (b) North

(c) West (d) East

74. A charge of $1C$ is moving in a magnetic field of $0.5\,Tesla$ with a velocity of $10\,m/sec$ Perpendicular to the field. Force experienced is

(a) $5\,N$ (b) $10\,N$

(c) $0.5\,N$ (d) $0\,N$

75. An electron of mass m and charge q is travelling with a speed v along a circular path of radius r at right angles to a uniform of magnetic field B. If speed of the electron is doubled and the magnetic field is halved, then resulting path would have a radius of [Kerala PMT 2004; KCET 2000, 05]

(a) $\frac{r}{4}$ (b) $\frac{r}{2}$

(c) $2r$ (d) $4r$

76. If an electron enters a magnetic field with its velocity pointing in the same direction as the magnetic field, then [MP PMT 2000]

(a) The electron will turn to its right

(b) The electron will turn to its left

(c) The velocity of the electron will increase

(d) The velocity of the electron will remain unchanged

77. A particle of mass m and charge q enters a magnetic field B perpendicularly with a velocity v, The radius of the circular path described by it will be [MP PMT 2000]

(a) Bq/mv (b) mq/Bv

(c) mB/qv (d) mv/Bq

78. An electron moving towards the east enters a magnetic field directed towards the north. The force on the electron will be directed

(a) Vertically upward (b) Vertically downward

(c) Towards the west (d) Towards the south

79. An electron (mass $= 9.0\times10^{-31}\,kg$ and charge $= 1.6\times10^{-19}$ *coulomb*) is moving in a circular orbit in a magnetic field of $1.0\times10^{-4}\,weber/m^2$. Its period of revolution is

(a) $3.5\times10^{-7}\,sec$ (b) $7.0\times10^{-7}\,sec$

(c) $1.05\times10^{-6}\,sec$ (d) $2.1\times10^{-6}\,sec$

80. An electron (charge q coulomb) enters a magnetic field of H $weber/m^2$ with a velocity of $v\,m/s$ in the same direction as that of the field the force on the electron is [MP PET 2000]

(a) Hqv Newton's in the direction of the magnetic field

(b) Hqv dynes in the direction of the magnetic field

(c) Hqv Newton's at right angles to the direction of the magnetic field

(d) Zero

81. A homogeneous electric field E and a uniform magnetic field $\vec{B}$ are pointing in the same direction. A proton is projected with its velocity parallel to $\vec{E}$. It will [Roorkee 2000]

(a) Go on moving in the same direction with increasing velocity

(b) Go on moving in the same direction with constant velocity

(c) Turn to its right

(d) Turn to its left

82. The radius of circular path of an electron when subjected to a perpendicular magnetic field is [Pb. PMT 1999; DCE 2000; MH CET (Med.) 2000]

(a) $\frac{mv}{Be}$ (b) $\frac{me}{Be}$

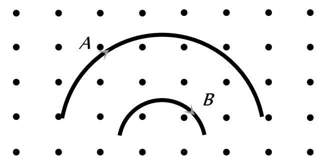
(c) $\frac{mE}{Be}$ [RPMT 2000] (d) $\frac{Be}{mv}$

83. Cyclotron is used to accelerate [AIIMS 2001; BCECE 2004]

(a) Electrons (b) Neutrons

(c) Positive ions (d) Negative ions

84. Two particles A and B of masses m_A and m_B respectively and having the same charge are moving in a plane. A uniform magnetic field exists perpendicular to this plane. The speeds of the particles are v_A and v_B respectively, and the trajectories are as shown in the figure. Then [IIT-JEE (Screening) 2001]



(a) $m_A v_A < m_B v_B$

(b) $m_A v_A > m_B v_B$

(c) $m_A < m_B$ and $v_A < v_B$

(d) $m_A = m_B$ and $v_A = v_B$

85. A proton and an alpha particle are separately projected in a region where a uniform magnetic field exists. Their initial velocities are perpendicular to direction of magnetic field. If both the particles move around magnetic field in circles of equal radii, the ratio of momentum of proton to alpha particle $\left(\frac{P_p}{P_\alpha}\right)$ is

(a) 1 (b) $\frac{1}{2}$

(c) 2 [MP PET 2000] (d) $\frac{1}{4}$

86. A particle of mass 0.6 g and having charge of 25 nC is moving horizontally with a uniform velocity $1.2\times10^4\,ms^{-1}$ in a uniform magnetic field, then the value of the magnetic induction is $(g = 10\,ms^{-2})$ [EAMCET 2001]

[MP PET 2000; Pb PET 2003]

(a) Zero (b) 10 T

(c) 20 T (d) 200 T

87. An α particle and a proton travel with same velocity in a magnetic field perpendicular to the direction of their velocities, find the ratio of the radii of their circular path [AIIMS 2004; DCE 2001, 03; Kerala PMT 2005]

(a) 4 : 1 (b) 1 : 4

(c) 2 : 1 (d) 1 : 2

88. Motion of a moving electron is not affected by [AMU (Engg.) 2001]

(a) An electric field applied in the direction of motion

(b) Magnetic field applied in the direction of motion

(c) Electric field applied perpendicular to the direction of motion

(d) Magnetic field applied perpendicular to the direction of motion

89. When a charged particle enters a uniform magnetic field its kinetic energy [MP PMT 2001; MP PET 2002]

(a) Remains constant (b) Increases

(c) Decreases (d) Becomes zero

90. If cathode rays are projected at right angles to a magnetic field, their trajectory is [JIPMER 2002]

(a) Ellipse (b) Circle

(c) Parabola (d) None of these

91. At a specific instant emission of radioactive compound is deflected in a magnetic field. The compound can emit

(i) Electrons (ii) Protons

(iii) He^{2+} (iv) Neutrons

The emission at the instant can be **[AIEEE 2002]**

(a) i, ii, iii (b) i, ii, iii, iv

(c) iv (d) ii, iii

92. Which particles will have minimum frequency of revolution when projected with the same velocity perpendicular to a magnetic field

(a) Li (b) Electron

(c) Proton (d) He^+

93. Mixed He^+ and O^{2+} ions (mass of $He^+ = 4\ amu$ and that of $O^{2+} = 16\ amu$) beam passes a region of constant perpendicular magnetic field. If kinetic energy of all the ions is same then

(a) He^+ ions will be deflected more than those of O^{2+}

(b) He^+ ions will be deflected less than those of O^{2+}

(c) All the ions will be deflected equally

(d) No ions will be deflected

94. An electron (mass = 9×10^{-31} *kg*. Charge = 1.6×10^{-19} *C*) whose kinetic energy is 7.2×10^{-18} *joule* is moving in a circular orbit in a magnetic field of 9×10^{-5} *weber/m*^{2}. The radius of the orbit is

(a) 1.25 *cm* (b) 2.5 *cm*

(c) 12.5 *cm* (d) 25.0 *cm*

95. An electron enters a region where electrostatic field is 20*N*/*C* and magnetic field is 5*T*. If electron passes undeflected through the region, then velocity of electron will be

[DPMT 2002]

(a) $0.25 ms^{-1}$ (b) $2 ms^{-1}$

(c) $4 ms^{-1}$ (d) $8 ms^{-1}$

96. A charged particle is released from rest in a region of steady uniform electric and magnetic fields which are parallel to each other the particle will move in a

[IIT-JEE 1999; DPMT 2000; UPSEAT 2003]

(a) Straight line (b) Circle

(c) Helix (d) Cycloid

97. A particle of mass *M* and charge *Q* moving with velocity $\vec{v}$ describes a circular path of radius *R* when subjected to a uniform transverse magnetic field of induction *B*. The work done by the field when the particle completes one full circle is

(a) $BQv\,2\pi R$ (b) $\left(\frac{Mv^2}{R}\right) 2\pi R$

(c) Zero (d) $BQ2\pi R$

98. A particle of charge -16×10^{-18} *coulomb* moving with velocity $10\ ms^{-1}$ along the *x*-axis enters a region where a magnetic field of induction *B* is along the *y*-axis, and an electric field of magnitude 10^4 *V*/*m* is along the negative *z*-axis. If the charged particle continues moving along the *x*-axis, the magnitude of *B* is

(a) $10^{-3} Wb/m^2$ (b) $10^3 Wb/m^2$

(c) $10^5 Wb/m^2$ (d) $10^{16} Wb/m^2$

99. Two ions having masses in the ratio 1 : 1 and charges 1 : 2 are projected into uniform magnetic field perpendicular to the field with speeds in the ratio 2 : 3. The ratio of the radii of circular paths along which the two particles move is

[EAMCET 2003]

(a) 4 : 3 (b) 2 : 3

(c) 3 : 1 (d) 1 : 4

100. An electron is travelling along the *x*-direction. It encounters a magnetic field in the *y*-direction. Its subsequent motion will be **[Orissa JEE 2002]**

(a) Straight line along the *x*-direction

(b) A circle in the *xz*-plane

(c) A circle in the *yz*-plane

(d) A circle in the *xy*-plane

101. An electron and a proton have equal kinetic energies. They enter in a magnetic field perpendicularly, Then **[Orissa JEE 2002]**

[UPSEAT 2003]

(a) Both will follow a circular path with same radius

(b) Both will follow a helical path

(c) Both will follow a parabolic path

(d) All the statements are false

102. Electrons move at right angles to a magnetic field of 1.5×10^{-2} *Tesla* with a speed of $6 \times 10^7\ m/s$. If the specific charge of the electron is 1.7×10^{11} *C*/*kg*. The radius of the circular path will be **[MP PMT 2002]** **[BHU 2003]**

(a) 2.9 *cm* (b) 3.9 *cm*

(c) 2.35 *cm* (d) 3 *cm*

103. The cyclotron frequency of an electron grating in a magnetic field of 1 *T* is approximately **[AIIMS 2004]**

(a) 28 *MHz* (b) 280 *MHz*

(c) 2.8 *GHz* (d) 28 *GHz*

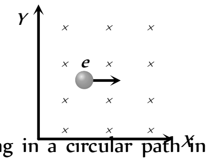
104. In the given figure, the electron enters into the magnetic field. It deflects in ...... direction **[Orissa PMT 2004]**

(a) + *ve X* direction

(b) – *ve X* direction

(c) + *ve Y* direction

(d) – *ve Y* direction



105. A proton of energy 8 *eV* is moving in a circular path in a uniform magnetic field. The energy of an alpha particle moving in the same magnetic field and along the same path will be

(a) 4 *eV* (b) 2 *eV*

(c) 8 *eV* (d) 6 *eV*

106. An electron, a proton, a deuteron and an alpha particle, each having the same speed are in a region of constant magnetic field perpendicular to the direction of the velocities of the particles. The radius of the circular orbits of these particles are respectively R_e, R_p, R_d and R_α. It follows that **[AIEEE 2003]**

(a) $R_e = R_p$ (b) $R_p = R_d$

(c) $R_d = R_\alpha$ (d) $R_p = R_\alpha$

107. An electron moving with a uniform velocity along the positive *x*-direction enters a magnetic field directed along the positive *y*-direction. The force on the electron is directed along **[AIEEE 2003]**

(a) Positive *y*-direction (b) Negative *y*-direction

(c) Positive z-direction (d) Negative z-direction

108. An electron is projected along the axis of a circular conductor carrying some current. Electron will experience force

(a) Along the axis

(b) Perpendicular to the axis

(c) At an angle of 4° with axis

(d) No force experienced

109. A very high magnetic field is applied to a stationary charge. Then the charge experiences [DCE 2004]

(a) A force in the direction of magnetic field

(b) A force perpendicular to the magnetic field

(c) A force in an arbitrary direction

(d) No force

110. A electron ($q = 1.6 \times 10^{-19}$ C) is moving at right angle to the uniform magnetic field 3.534×10^{-5} T. The time taken by the electron to complete a circular orbit is [MH CET 2004]

(a) 2 μs (b) 4 μs

(c) 3 μs (d) 1 μs

111. In case Hall effect for a strip having charge Q and area of cross-section A, the Lorentz force is [DCE 2004]

(a) Directly proportional to Q

(b) Inversely proportional to Q

(c) Inversely proportional to A

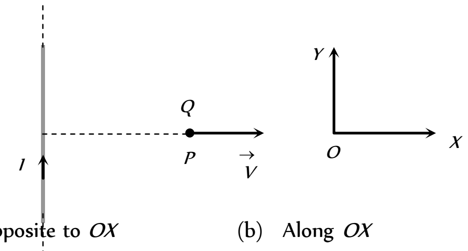
(d) Directly proportional to A

112. A charged particle of mass m and charge q travels on a circular path of radius r that is perpendicular to a magnetic field B. The time taken by the particle to complete one revolution is

(a) $\frac{2\pi qB}{m}$ (b) $\frac{2\pi m}{qB}$

(c) $\frac{2\pi mq}{B}$ (d) $\frac{2\pi q^2 B}{m}$

113. A very long straight wire carries a current I. At the instant when a charge $+Q$ at point P has velocity $\vec{V}$, as shown, the force on the charge is [CBSE PMT 2005]



(a) Opposite to OX (b) Along OX

(c) Opposite to OY (d) Along OY

114. The electron in the beam of a television tube move horizontally from south to north. The vertical component of the earth's magnetic field points down. The electron is deflected towards

(a) West (b) No deflection

(c) East (d) North to south

115. An electron moves in a circular orbit with a uniform speed v. It produces a magnetic field B at the centre of the circle. The radius of the circle is proportional to [CBSE PMT 2005]

(a) $\frac{B}{v}$ (b) $\frac{v}{R}$

(c) $\sqrt{\frac{v}{B}}$ (d) $\sqrt{\frac{B}{v}}$

116. An electric field of 1500 V/m and a magnetic field of 0.40 $weber/meter$ act on a moving electron. The minimum uniform speed along a straight line the electron could have is [DCE 2002]

(a) 1.6×10^{15} m/s (b) 6×10^{-16} m/s

(c) 3.75×10^{3} m/s (d) 3.75×10^{2} m/s

117. An electron (mass = 9.1×10^{-31} kg; charge = 1.6×10^{-19} C) experiences no deflection if subjected to an electric field of 3.2×10^{5} V/m, and a magnetic fields of 2.0×10^{-3} Wb/m. Both the fields are normal to the path of electron and to each other. If the electric field is removed, then the electron will revolve in an orbit of radius [BCECE 2005]

(a) 45 m (b) 4.5 m

(c) 0.45 m (d) 0.045 m

118. An electron, moving in a uniform magnetic field of induction of intensity $\vec{B}$, has its radius directly proportional to [DPMT 2005]

(a) Its charge (b) Magnetic field

(c) Speed (d) None of these

Force and Torque on a Current Carrying Conductor

1. Two free parallel wires carrying currents in opposite direction [CPMT 1977; MP PMT 1993; AFMC 2002; CPMT 2003]

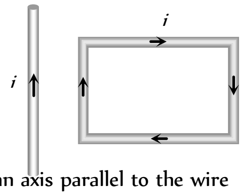
(a) Attract each other

(b) Repel each other

(c) Neither attract nor repel

(d) Get rotated to be perpendicular to each other

2. A rectangular loop carrying a current i is situated near a long straight wire such that the wire is parallel to the one of the sides of the loop and is in the plane of the loop. If a steady current I is established in wire as shown in figure, the loop will [AIEEE 2005] [IIT 1985; MP PET 1995; MP PMT 1995, 99; AIIMS 2003]



(a) Rotate about an axis parallel to the wire

(b) Move away from the wire or towards right

(c) Move towards the wire

(d) Remain stationary

3. A circular coil of radius 4 cm and of 20 turns carries a current of 3 $amperes$. It is placed in a magnetic field of intensity of 0.5 $weber/m^2$. The magnetic dipole moment of the coil is

(a) 0.15 $ampere - m^2$ (b) 0.3 $ampere - m^2$

(c) 0.45 $ampere - m^2$ [KCET 2005] (d) 0.6 $ampere - m^2$

4. A conducting circular loop of radius r carries a constant current i. It is placed in a uniform magnetic field $\vec{B}$, such that $\vec{B}$ is perpendicular to the plane of the loop. The magnetic force acting on the loop is [BIT 1992; MP PET 1994; IIT 1983; MP PMT 1999; AMU (Engg.) 2000]

(a) $ir\vec{B}$ (b) $2\pi ri\vec{B}$

(c) Zero (d) $\pi r i \vec{B}$

5. Two thin long parallel wires separated by a distance b are carrying a current i *amp* each. The magnitude of the force per unit length exerted by one wire on the other is

[CPMT 1991; IIT 1986; Bihar MEE 1995; RPMT 1997; MP PET 1996; MP PMT 1994, 96, 99; UPSEAT 2001, 03]

(a) $\frac{\mu_0 i^2}{b^2}$ (b) $\frac{\mu_0 i^2}{2\pi b}$

(c) $\frac{\mu_0 i}{2\pi b}$ (d) $\frac{\mu_0 i}{2\pi b^2}$

6. Through two parallel wires A and B, 10 and 2 *ampere* of currents are passed respectively in opposite direction. If the wire A is infinitely long and the length of the wire B is 2 *m*, the force on the conductor B, which is situated at 10 *cm* distance from A will be [CPMT 1988; MP PMT 1994]

(a) $8\times10^{-5}\,N$ (b) $4\times10^{-7}\,N$

(c) $4\times10^{-5}\,N$ (d) $4\pi\times10^{-7}\,N$

7. If two streams of protons move parallel to each other in the same direction, then they [MP PET 1999; AIIMS 2004]

(a) Do not exert any force on each other

(b) Repel each other

(c) Attract each other

(d) Get rotated to be perpendicular to each other

8. A straight wire carrying a current $i_1\,amp$ runs along the axis of a circular current $i_2\,amp$. Then the force of interaction between the two current carrying conductors is

(a) ∞ (b) Zero

(c) $\frac{\mu_0}{4\pi}\frac{2i_1i_2}{r}\,N/m$ (d) $\frac{2i_1i_2}{r}\,N/m$

9. Two parallel wires are carrying electric currents of equal magnitude and in the same direction. They exert

[CPMT 1990; MP PET/PMT 1988; Orissa JEE 2003; AFMC 2003]

(a) An attractive force on each other

(b) A repulsive force on each other

(c) No force on each other

(d) A rotational torque on each other

10. Two long and parallel wires are at a distance of 0.1 *m* and a current of 5 *A* is flowing in each of these wires. The force per unit length due to these wires will be [CPMT 1977]

(a) $5\times10^{-5}\,N/m$ (b) $5\times10^{-3}\,N/m$

(c) $2.5\times10^{-5}\,N/m$ (d) $2.5\times10^{-4}\,N/m$

11. Two straight parallel wires, both carrying 10 *ampere* in the same direction attract each other with a force of $1\times10^{-3}\,N$. If both currents are doubled, the force of attraction will be

[MP PET 1994]

(a) $1\times10^{-3}\,N$ (b) $2\times10^{-3}\,N$

(c) $4\times10^{-3}\,N$ (d) $0.25\times10^{-3}\,N$

12. A circular coil of radius 4 *cm* has 50 turns. In this coil a current of 2 *A* is flowing. It is placed in a magnetic field of 0.1 $weber/m^2$. The amount of work done in rotating it through $180°$ from its equilibrium position will be

[CPMT 1977]

(a) 0.1 *J* (b) 0.2 *J*

(c) 0.4 *J* (d) 0.8 *J*

13. 3 *A* of current is flowing in a linear conductor having a length of 40 *cm*. The conductor is placed in a magnetic field of strength 500 *gauss* and makes an angle of $30°$ with the direction of the field. It experiences a force of magnitude

[MP PET 1993]

(a) $3\times10^4\,newton$ (b) $3\times10^2\,newton$

(c) $3\times10^{-2}\,newton$ (d) $3\times10^{-4}\,newton$

14. The radius of a circular loop is r and a current i is flowing in it. The equivalent magnetic moment will be [CPMT 1990]

(a) ir (b) $2\pi ir$

(c) $i\pi r^2$ (d) $\frac{1}{r^2}$

15. A current carrying loop is placed in a uniform magnetic field. The torque acting on it does not depend upon

[CPMT 1985; RPMT 1997; Kerala PMT 2002]

(a) Shape of the loop (b) Area of the loop

(c) Value of the current (d) Magnetic field

16. To make the field radial in a moving coil galvanometer

[MP PET 1993]

(a) The number of turns in the coil is increased

(b) Magnet is taken in the form of horse-shoe

(c) Poles are cylindrically cut

(d) Coil is wounded on aluminium frame

17. The deflection in a moving coil galvanometer is

[MP PMT 1993]

(a) Directly proportional to the torsional constant

(b) Directly proportional to the number of turns in the coil

(c) Inversely proportional to the area of the coil

(d) Inversely proportional to the current flowing

18. A moving coil sensitive galvanometer gives at once much more deflection. To control its speed of deflection

[MP PET 1985]

(a) A high resistance is to be connected across its terminals

(b) A magnet should be placed near the coil

(c) A small copper wire should be connected across its terminals

(d) The body of galvanometer should be earthed

19. In a moving coil galvanometer, the deflection of the coil θ is related to the electrical current i by the relation

[MP PMT 1996, 2000, 03; RPMT 1997; CPMT 1975; MP PET 1999]

(a) $i\propto\tan\theta$ (b) $i\propto\theta$

(c) $i\propto\theta^2$ (d) $i\propto\sqrt{\theta}$

20. The unit of electric current "*ampere*" is the current which when flowing through each of two parallel wires spaced 1 *m* apart in vacuum and of infinite length will give rise to a force between them equal to

[BIT 1987; CBSE PMT1998; MP PET 1999; MP PMT 2002]

(a) $1\,N/m$ (b) $2\times10^{-7}\,N/m$

(c) $1\times10^{-2}\ N/m$ (d) $4\pi\times10^{-7}\ N/m$

21. A moving coil galvanometer has *N* number of turns in a coil of effective area *A*, it carries a current *I*. The magnetic field *B* is radial. The torque acting on the coil is [MP PMT 1994]

(a) NA^2B^2I (b) $NABI^2$

(c) N^2ABI (d) *NABI*

22. A small coil of *N* turns has an effective area *A* and carries a current *I*. It is suspended in a horizontal magnetic field $\vec{B}$ such that its plane is perpendicular to $\vec{B}$. The work done in rotating it by $180°$ about the vertical axis is [MP PMT 1994]

(a) *NAIB* (b) 2*NAIB*

(c) $2\pi NAIB$ (d) $4\pi NAIB$

23. A small coil of *N* turns has area *A* and a current I flows through it. The magnetic dipole moment of this coil will be [MP PMT 1994]

(a) NI/A (b) NI^2A

(c) N^2AI (d) *NIA*

24. A current of 10 *ampere* is flowing in a wire of length 1.5 *m*. A force of 15 *N* acts on it when it is placed in a uniform magnetic field of 2 *tesla*. The angle between the magnetic field and the direction of the current is [MP PMT 1994]

(a) $30°$ (b) $45°$

(c) $60°$ (d) $90°$

25. A rectangular loop carrying a current *i* is placed in a uniform magnetic field *B*. The area enclosed by the loop is *A*. If there are *n* turns in the loop, the torque acting on the loop is given by

(a) $ni\vec{A}\times\vec{B}$ (b) $ni\vec{A}\cdot\vec{B}$

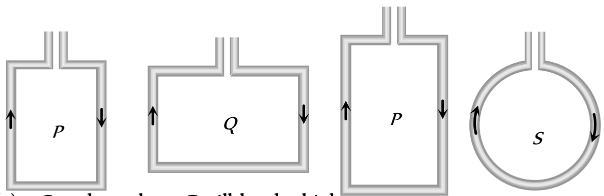
(c) $\frac{1}{n}(i\vec{A}\times\vec{B})$ (d) $\frac{1}{n}(i\vec{A}\cdot\vec{B})$

26. An electron moves with a constant speed *v* along a circle of radius *r*. Its magnetic moment will be (*e* is the electron's charge)

(a) *evr* (b) $\frac{1}{2}evr$

(c) πr^2ev (d) $2\pi rev$

27. Four wires each of length 2.0 *metres* are bent into four loops *P*, *Q*, *R* and *S* and then suspended into uniform magnetic field. Same current is passed in each loop. Which statement is correct



(a) Couple on loop *P* will be the highest

(b) Couple on loop *Q* will be the highest

(c) Couple on loop *R* will be the highest

(d) Couple on loop *S* will be the highest

28. A current carrying rectangular coil is placed in a uniform magnetic field. In which orientation, the coil will not tend to rotate

(a) The magnetic field is parallel to the plane of the coil

(b) The magnetic field is perpendicular to the plane of the coil

(c) The magnetic field is at 45° with the plane of the coil

(d) Always in any orientation

29. A current carrying circular loop is freely suspended by a long thread. The plane of the loop will point in the direction [MP PMT 1995]

(a) Wherever left free

(b) North-south

(c) East-west

(d) At $45°$ with the east-west direction

30. A current carrying loop is free to turn in a uniform magnetic field. The loop will then come into equilibrium when its plane is inclined at [CBSE PMT 1992; Haryana CEE 1996]

(a) $0°$ to the direction of the field

(b) $45°$ to the direction of the field

(c) $90°$ to the direction of the field

(d) $135°$ to the direction of the field

31. The expression for the torque acting on a coil having area of cross-section *A*, number of turns *n*, placed in a magnetic field of strength *B*, making an angle θ with the normal to the plane of the coil, when a current *i* is flowing in it, will be [MP PET 1996]

(a) $niAB\tan\theta$ (b) $niAB\cos\theta$

(c) $niAB\sin\theta$ (d) $niAB$

32. The pole pieces of the magnet used in a pivoted coil galvanometer are [MP PET 1996]

(a) Plane surfaces of a bar magnet

[MP PMT 1994]

(b) Plane surfaces of a horse-shoe magnet

(c) Cylindrical surfaces of a bar magnet

(d) Cylindrical surfaces of a horse-shoe magnet

33. The sensitiveness of a moving coil galvanometer can be increased by decreasing [MP PMT 1996]

(a) The number of turns in the coil [MP PMT 1994]

(b) The area of the coil

(c) The magnetic field

(d) The couple per unit twist of the suspension

34. A metallic loop is placed in a magnetic field. If a current is passed through it, then [UPSEAT 2003]

[MP PET 1995; DPMT 1999]

(a) The ring will feel a force of attraction

(b) The ring will feel a force of repulsion

(c) It will move to and fro about its centre of gravity

(d) None of these

35. Two parallel conductors *A* and *B* of equal lengths carry currents I and 10 I, respectively, in the same direction. Then [MP PET 2003]

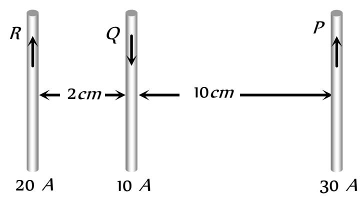
(a) *A* and *B* will repel each other with same force

(b) *A* and *B* will attract each other with same force

(c) A will attract *B*, but *B* will repel *A*

(d) *A* and *B* will attract each other with different forces

36. Three long, straight and parallel wires carrying currents are arranged as shown in figure. The force experienced by 10 *cm* length of wire *Q* is [MP PMT 1995] [MP PET 1997]



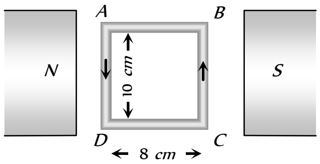
(a) $1.4\times10^{-4}N$ towards the right

(b) $1.4\times10^{-4}N$ towards the left

(c) $2.6\times10^{-4}N$ to the right

(d) $2.6\times10^{-4}N$ to the left

37. A 100 turns coil shown in figure carries a current of 2 *amp* in a magnetic field $B=0.2\,Wb/m^2$. The torque acting on the coil is



(a) 0.32 *Nm* tending to rotate the side *AD* out of the page

(b) 0.32 *Nm* tending to rotate the side *AD* into the page

(c) 0.0032 *Nm* tending to rotate the side *AD* out of the page

(d) 0.0032 *Nm* tending to rotate the side *AD* into the page

38. A current of 5 *ampere* is flowing in a wire of length 1.5 *metres*. A force of 7.5 *N* acts on it when it is placed in a uniform magnetic field of 2 *Tesla*. The angle between the magnetic field and the direction of the current is

[MP PET 1997; Pb. PET 2003]

(a) $30°$ (b) 45°

(c) 60° (d) 90°

39. A conductor in the form of a right angle *ABC* with *AB* = 3 *cm* and *BC* = 4 *cm* carries a current of 10 *A*. There is a uniform magnetic field of 5 *T* perpendicular to the plane of the conductor. The force on the conductor will be

[MP PMT 1997]

(a) 1.5 *N* (b) 2.0 *N*

(c) 2.5 *N* (d) 3.5 *N*

40. The coil of a galvanometer consists of 100 turns and effective area of 1 *square cm*. The restoring couple is $10^{-8}\,N-m/radian$. The magnetic field between the pole pieces is 5 *T*. The current sensitivity of this galvanometer will be

(a) $5\times10^4\,rad/\mu amp$ (b) $5\times10^{-6}\,per\,amp$

(c) $2\times10^{-7}\,per\,amp$ (d) $5\,rad/\mu amp$

41. A rectangular coil $20\,cm\times20\,cm$ has 100 turns and carries a current of 1 *A*. It is placed in a uniform magnetic field *B* =0.5 *T* with the direction of magnetic field parallel to the plane of the coil. The magnitude of the torque required to hold this coil in this position is [MP PMT 1997]

(a) Zero (b) 200 *N-m*

(c) 2 *N-m* (d) 10 *N-m*

42. If a current is passed in a spring, it

[MP PMT/PET 1998; AIEEE 2002]

(a) Gets compressed (b) Gets expanded

(c) Oscillates (d) Remains unchanged

43. A current carrying small loop behaves like a small magnet. If *A* be its area and *M* its magnetic moment, the current in the loop will be

[MP PMT/PET 1998; RPET 2001; MP PMT 2003]

(a) M/A (b) A/M

(c) *MA* (d) A^2M

44. In hydrogen atom, the electron is making $6.6\times10^{15}\,rev/\sec$ around the nucleus in an orbit of radius 0.528 Å. The magnetic moment $(A-m^2)$ will be

[MP PET 1999]

[MP PET 1997]

(a) 1×10^{-15} (b) 1×10^{-10}

(c) 1×10^{-23} (d) 1×10^{-27}

45. A triangular loop of side *l* carries a current *I*. It is placed in a magnetic field *B* such that the plane of the loop is in the direction of *B*. The torque on the loop is [MP PET 2003]

(a) Zero (b) *IBl*

(c) $\frac{\sqrt{3}}{2}Il^2B^2$ (d) $\frac{\sqrt{3}}{4}IBl^2$

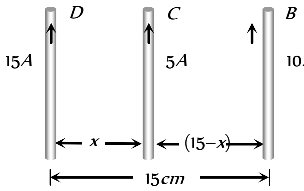
46. Three long, straight and parallel wires carrying currents are arranged as shown in the figure. The wire *C* which carries a current of 5.0 *amp* is so placed that it experiences no force. The distance of wire *C* from wire *D* is then [AMU 1995]

(a) 9 *cm*

(b) 7 *cm*

(c) 5 *cm*

(d) 3 *cm*



47. A vertical wire carrying a current in the upward direction is placed in horizontal magnetic field directed towards north. The wire will experience a force directed towards

[SCRA 1994]

(a) North (b) South

(c) East (d) West

48. A coil carrying electric current is placed in uniform magnetic field, then [CBSE PMT 1993]

(a) Torque is formed

[MP PMT 1997]

(b) E.M.F. is induced

(c) Both (a) and (b) are correct

(d) None of these

49. A circular loop carrying a current is replaced by an equivalent magnetic dipole. A point on the axis of the loop is

(a) An end-on position (b) A broad side-on position

(c) Both (a) and (b) (d) Neither (a) nor (b)

50. A power line lies along the east-west direction and carries a current of 10 *ampere*. The force per metre due to the earth's magnetic field of 10^{-4} *tesla* is [Roorkee 1992]

(a) $10^{-5}N$ (b) $10^{-4}N$

(c) $10^{-3}N$ (d) $10^{-2}N$

51. A straight wire of length 0.5 *metre* and carrying a current of 1.2 *ampere* placed in a uniform magnetic field of induction 2 *Tesla*. The magnetic field is perpendicular to the length of the wire. The force on the wire is

[CBSE PMT 1992; BHU 1998; DPMT 2001; RPET 2003]

(a) 2.4 N (b) 1.2 N

(c) 3.0 N (d) 2.0 N

52. Two parallel wires in free space are 10 cm apart and each carries a current of 10 A in the same direction. The force one wire exerts on the other per metre of length is

[CBSE PMT 1997; AFMC 1999]

(a) $2\times10^{-4}\,N$, attractive (b) $2\times10^{-4}\,N$, repulsive

(c) $2\times10^{-7}\,N$, attractive (d) $2\times10^{-7}\,N$, repulsive

53. The current sensitivity of a moving coil galvanometer can be increased by [Roorkee 1999]

(a) Increasing the magnetic field of the permanent magnet

(b) Increasing the area of the deflecting coil

(c) Increasing the number of turns in the coil

(d) Increasing the restoring couple of the coil

54. A circular coil of diameter 7cm has 24 turns of wire carrying current of 0.75A. The magnetic moment of the coil is

[AMU (Med.) 1999]

(a) $6.9\times10^{-2}\,amp-m^2$ (b) $2.3\times10^{-2}\,amp\text{-}m^2$

(c) $10^{-2}\,amp-m^2$ (d) $10^{-3}\,amp-m^2$

55. Two long parallel wires carrying equal current separated by 1m, exert a force of $2\times10^{-7}\,N/m$ on one another. The current flowing through them is [AMU (Engg.) 1999]

(a) 2.0 A (b) $2.0\times10^{-7}\,A$

(c) 1.0 A (d) $1.0\times10^{-7}\,A$

56. Two parallel beams of electrons moving in the same direction produce a mutual force [MP PET 1996; DCE 1999]

(a) Of attraction in plane of paper

(b) Of repulsion in plane of paper

(c) Upwards perpendicular to plane of paper

(d) Downwards perpendicular to plane of paper

57. A circular loop of area $0.01m^2$ carrying a current of 10 A, is held perpendicular to a magnetic field of intensity 0.1T. The torque acting on the loop is [Pb. PMT 2000]

(a) Zero (b) 0.01 N-m

(c) 0.001 N-m (d) 0.8 N-m

58. Magnetic dipole moment of a rectangular loop is

[RPET 2000]

(a) Inversely proportional to current in loop

(b) Inversely proportional to area of loop

(c) Parallel to plane of loop and proportional to area of loop

(d) Perpendicular to plane of loop and proportional to area of loop

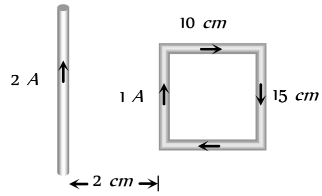
59. If m is magnetic moment and B is the magnetic field, then the torque is given by [DCE 2000]

(a) $\vec{m}.\vec{B}$ (b) $\dfrac{|\vec{m}|}{|\vec{B}|}$

(c) $\vec{m}\times\vec{B}$ (d) $|\vec{m}|.|\vec{B}|$

60. What is the net force on the square coil

[DCE 2000; RPMT 2000]



(a) $25\times10^{-7}\,N$ moving towards wire

(b) $25\times10^{-7}\,N$ moving away from wire

(c) $35\times10^{-7}\,N$ moving towards wire

(d) $35\times10^{-7}\,N$ moving away from wire

61. Two long parallel copper wires carry currents of 5A each in opposite directions. If the wires are separated by a distance of 0.5m, then the force between the two wires is

[EAMCET (Engg.) 2000]

(a) $10^{-5}\,N$, attractive (b) $10^{-5}\,N$, repulsive

(c) $2\times10^{-5}\,N$, attractive (d) $2\times10^{-5}\,N$, repulsive

62. In order to increase the sensitivity of a moving coil galvanometer, one should decrease [MP PMT 2000]

(a) The strength of its magnet

(b) The torsional constant of its suspension

(c) The number of turns in its coil

(d) The area of its coil

63. A circular loop has a radius of 5 cm and it is carrying a current of 0.1 amp. Its magnetic moment is [MP PMT 2000]

(a) $1.32\times10^{-4}\,amp-m^2$

(b) $2.62\times10^{-4}\,amp\text{-}m^2$

(c) $5.25\times10^{-4}\,amp\text{-}m^2$

(d) $7.85\times10^{-4}\,amp\text{-}m^2$

64. Due to the flow of current in a circular loop of radius R, the magnetic induction produced at the centre of the loop is B. The magnetic moment of the loop is

$(\mu_0 = \text{permeability constant})$ [MP PET 2000]

(a) $BR^3/2\pi\mu_0$ (b) $2\pi BR^3/\mu_0$

(c) $BR^2/2\pi\mu_0$ (d) $2\pi BR^2/\mu_0$

65. The magnetic moment of a circular coil carrying current is

[MP PET 2000]

(a) Directly proportional to the length of the wire in the coil

(b) Inversely proportional to the length of the wire in the coil

(c) Directly proportional to the square of the length of the wire in the coil

(d) Inversely proportional to the square of the length of the wire in the coil

66. A long wire A carries a current of 10 amp. Another long wire B, Which is parallel to A and separated by 0.1m from A, carries a current of 5 amp, in the opposite direction to that in A. what is the magnitude and nature of the force experienced per unit length of B

$(\mu_0 = 4\pi\times10^{-7}\,weber/amp\text{-}m)$ [MP PET 2000]

(a) Repulsive force of $10^{-4}\ N/m$

(b) Attractive force of $10^{-4}\ N/m$

(c) Repulsive force of $2\pi \times 10^{-5}\ N/m$

(d) Attractive force of $2\pi \times 10^{-5}\ N/m$

67. A stream of electrons is projected horizontally to the right. A straight conductor carrying a current is supported parallel to electron stream and above it. If the current in the conductor is from left to right then what will be the effect on electron stream

(a) The electron stream will be pulled upward

(b) The electron stream will be pulled downward

(c) The electron stream will be retarted

(d) The electron beam will be speeded up towards the right

68. The relation between voltage sensitivity (σ_V) and current sensitivity (σ_i) of a moving coil galvanometer is (Resistance of Galvanometer = G) **[CPMT 2001]**

(a) $\frac{\sigma_i}{G} = \sigma_V$ (b) $\frac{\sigma_V}{G} = \sigma_i$

(c) $\frac{G}{\sigma_V} = \sigma_i$ (d) $\frac{G}{\sigma_i} = \sigma_V$

69. What is shape of magnet in moving coil galvanometer to make the radial magnetic field **[RPET 2001]**

(a) Concave (b) Horse shoe magnet

(c) Convex (d) None of these

70. If a wire of length 1 *meter* placed in uniform magnetic field 1.5 *Tesla* at angle 30^o with magnetic field. The current in a wire 10 *amp.* Then force on a wire will be **[RPET 2001]**

(a) 7.5 N (b) 1.5 N

(c) 0.5 N (d) 2.5 N

71. A current i flows in a circular coil of radius r. If the coil is placed in a uniform magnetic field B with its plane parallel to the field, magnitude of the torque that acts on the coil is **[MP PET 2001]**

(a) Zero (b) $2\pi r i B$

(c) $\pi r^2 i B$ (d) $2\pi r^2 i B$

72. An arbitrary shaped closed coil is made of a wire of length L and a current I ampere is flowing in it. If the plane of the coil is perpendicular to magnetic field $\vec{B}$, the force on the coil is **[MP PMT 2001]**

(a) Zero (b) IBL

(c) $2IBL$ (d) $\frac{1}{2} IBL$

73. A circular coil having N turns is made from a wire of length L meter. If a current I ampere is passed through it and is placed in a magnetic field of B *Tesla*, the maximum torque on it is

(a) Directly proportional to N

(b) Inversely proportional to N

(c) Inversely proportional to N^2

(d) Independent of N

74. A small cylindrical soft iron piece is kept in a galvanometer so that

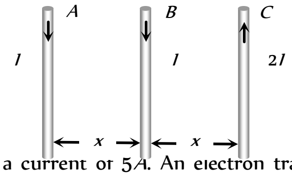
(a) A radial uniform magnetic field is produced

(b) A uniform magnetic field is produced

(c) There is a steady deflection of the coil

(d) All of these

75. *A, B* and *C* are parallel conductors of equal length carrying currents *I*, *I* and 2*I* respectively. Distance between *A* and *B* is *x*. Distance between *B* and *C* is also *x*. F_1 is the force exerted by *B* on *A* and F_2 is the force exerted by *B* on *A* choose the correct answer



(a) $F_1 = 2F_2$

(b) $F_2 = 2F_1$

(c) $F_1 = F_2$

(d) $F_1 = -F_2$

76. A straight conductor carries a current of 5*A*. An electron travelling with a speed of $5 \times 10^6\ ms^{-1}$ parallel to the wire at a distance of 0.1*m* from the conductor, experiences a force of **[Roorkee 2000]**

(a) $8 \times 10^{-20}\ N$ (b) $3.2 \times 10^{-19}\ N$

(c) $8 \times 10^{-18}\ N$ (d) $1.6 \times 10^{-19}\ N$

77. Two galvanometers *A* and *B* require 3*mA* and 5*mA* respectively to produce the same deflection of 10 divisions. Then

(a) *A* is more sensitive than *B*

(b) *B* is more sensitive than *A*

(c) *A* and *B* are equally sensitive

(d) Sensitiveness of *B* is 5/3 times that of *A*

78. Two long straight parallel conductors separated by a distance of 0.5*m* carry currents of 5*A* and 8*A* in the same direction. The force per unit length experienced by each other is

(a) $1.6 \times 10^{-5}\ N$ (attractive) (b) $1.6 \times 10^{-5}\ N$ (repulsive)

(c) $16 \times 10^{-5}\ N$ (attractive) (d) $16 \times 10^{-5}\ N$ (repulsive)

79. If the current is doubled, the deflection is also doubled in **[Orissa JEE 2002]**

(a) A tangent galvanometer

(b) A moving coil galvanometer

(c) Both (a) and (b)

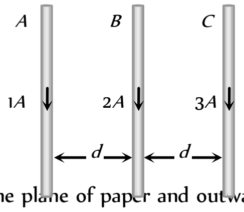
(d) None of these

80. Which is a vector quantity **[AFMC 2003]**

(a) Density (b) Magnetic flux

(c) Intensity of magnetic field (d) Magnetic potential

81. There long straight wires *A*, *B* and *C* are carrying current as shown figure. Then the resultant force on *B* is directed ..... **[KCET 2004]**



(a) Towards *A*

(b) Towards *C*

(c) Perpendicular to the plane of paper and outward

(d) Perpendicular to the plane of paper and inward

82. Two long conductors, separated by a distance d carry current I_1 and I_2 in the same direction. They exert a force F on each other. Now the current in one of them is increased to two times and its directions is reversed. The distance is also increased to 3d. The new value of the force between them is **[AIEEE 2004]** **[MP PMT 2001]**

(a) – 2F (b) F/3

(c) 2F/3 **[MP PMT 2001]** (d) – F/3

83. The resultant magnetic moment of neon atom will be **[J & K CET 2004]**

(a) Infinity (b) μ

(c) Zero (d) μ/2

84. A one metre long wire is lying at right angles to the magnetic field. A force of 1 *kg wt.* is acting on it in a magnetic field of 0.98 *Tesla*. The current flowing in it will be [J & K CET 2004]

(a) 100 *A* (b) 10 *A*

(c) 1 *A* (d) Zero

85. A beam of electrons and protons move parallel to each other in the same direction, then they [DCE 2004]

(a) Attract each other (b) Repel each other

(c) No relation (d) Neither attract nor repel

86. Two parallel wires of length 9 *m* each are separated by a distance 0.15 *m*. If they carry equal currents in the same direction and exerts a total force of 30×10^{-7} *N* on each other, then the value of current must be [MH CET 2003]

(a) 2.5 *amp* (b) 3.5 *amp*

(c) 1.5 *amp* (d) 0.5 *amp*

87. Current *i* is carried in a wire of length *L*. If the wire is turned into a circular coil, the maximum magnitude of torque in a given magnetic field *B* will be [Pb. PET 2004]

(a) $\frac{LiB^2}{2}$ (b) $\frac{Li^2B}{2}$

(c) $\frac{L^2iB}{4\pi}$ (d) $\frac{Li^2B}{4\pi}$

88. In ballistic galvanometer, the frame on which the coil is wound is non-metallic to [MH CET 2004]

(a) Avoid the production of induced e.m.f.

(b) Avoid the production of eddy currents

(c) Increase the production of eddy currents

(d) Increase the production of induced e.m.f.

89. Two thin, long, parallel wires, separated by a distance '*d*' carry a current of '*i*' *A* in the same direction. They will [AIEEE 2005]

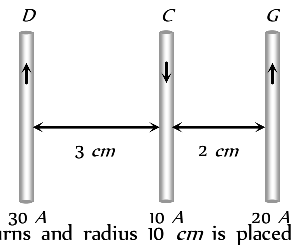
(a) Attract each other with a force of $\mu_0 i^2/(2\pi d^2)$

(b) Repel each other with a force of $\mu_0 i^2/(2\pi d^2)$

(c) Attract each other with a force of $\mu_0 i^2/(2\pi d)$

(d) Repel each other with a force of $\mu_0 i^2/(2\pi d)$

90. Three long, straight parallel wires carrying current, are arranged as shown in figure. The force experienced by a 25 *cm* length of wire *C* is [KCET 2005]



(a) 10^{-3} *N*

(b) 2.5×10^{-3} *N*

(c) Zero

(d) 1.5×10^{-3} *N*

91. A circular coil of 20 turns and radius 10 *cm* is placed in uniform magnetic field of 0.10 T normal to the plane of the coil. If the current in coil is 5 A, then the torque acting on the coil will be [J & K CET 2005]

(a) 31.4 *Nm* (b) 3.14 *Nm*

(c) 0.314 *Nm* (d) Zero

Critical Thinking

Objective Questions

1. A circular current carrying coil has a radius R. The distance from the centre of the coil on the axis where the magnetic induction will be $\frac{1}{8}th$ to its value at the centre of the coil, is

[MP PMT 1997]

(a) $\frac{R}{\sqrt{3}}$ (b) $R\sqrt{3}$

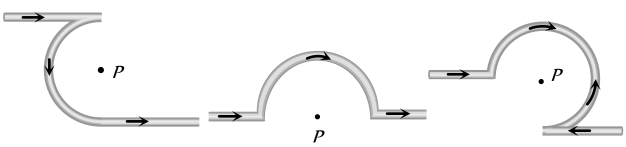
(c) $2\sqrt{3}\,R$ (d) $\frac{2}{\sqrt{3}}R$

2. The field normal to the plane of a wire of n turns and radius r which carries a current i is measured on the axis of the coil at a small distance h from the centre of the coil. This is smaller than the field at the centre by the fraction

(a) $\frac{3}{2}\frac{h^2}{r^2}$ (b) $\frac{2}{3}\frac{h^2}{r^2}$

(c) $\frac{3}{2}\frac{r^2}{h^2}$ (d) $\frac{2}{3}\frac{r^2}{h^2}$

3. The magnetic field at the centre of a circular coil of radius r is π times that due to a long straight wire at a distance r from it, for equal currents. Figure here shows three cases : in all cases the circular part has radius r and straight ones are infinitely long. For same current the B field at the centre P in cases 1, 2, 3 have the ratio [CPMT 1989]



(1) (2) (3)

(a) $\left(-\frac{\pi}{2}\right):\left(\frac{\pi}{2}\right):\left(\frac{3\pi}{4}-\frac{1}{2}\right)$

(b) $\left(-\frac{\pi}{2}+1\right):\left(\frac{\pi}{2}+1\right):\left(\frac{3\pi}{4}+\frac{1}{2}\right)$

(c) $-\frac{\pi}{2}:\frac{\pi}{2}:3\frac{\pi}{4}$

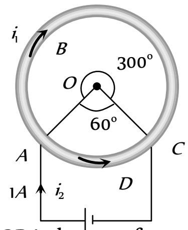
(d) $\left(-\frac{\pi}{2}-1\right):\left(\frac{\pi}{2}-\frac{1}{4}\right):\left(\frac{3\pi}{4}+\frac{1}{2}\right)$

4. Two straight long conductors AOB and COD are perpendicular to each other and carry currents i_1 and i_2. The magnitude of the magnetic induction at a point P at a distance a from the point O in a direction perpendicular to the plane $ACBD$ is

(a) $\frac{\mu_0}{2\pi a}(i_1+i_2)$ (b) $\frac{\mu_0}{2\pi a}(i_1-i_2)$

(c) $\frac{\mu_0}{2\pi a}(i_1^2+i_2^2)^{1/2}$ (d) $\frac{\mu_0}{2\pi a}\frac{i_1 i_2}{(i_1+i_2)}$

5. A cell is connected between the points A and C of a circular conductor $ABCD$ of centre O with angle $AOC=60^o$. If B_1 and B_2 are the magnitudes of the magnetic fields at O due to the currents in ABC and ADC respectively, the ratio $\frac{B_1}{B_2}$ is



(a) 0.2

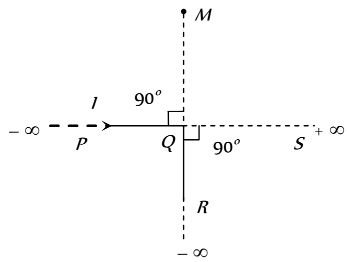
(b) 6

(c) 1

(d) 5

6. An infinitely long conductor PQR is bent to form a right angle as shown. A current I flows through PQR. The magnetic field due to this current at the point M is H. Now another infinitely long straight conductor QS is connected at Q so that the current is $I/2$ in QR as well as in QS. The current in PQ remaining unchanged. The magnetic field at M is now H_2. The ratio H_1/H_2 is given by

[IIT-JEE (Screening) 2000]



(a) $\frac{1}{2}$

(b) 1

(c) $\frac{2}{3}$

(d) 2

7. Two coaxial solenoids 1 and 2 of the same length are set so that one is inside the other. The number of turns per unit length are n_1 and n_2. The currents i_1 and i_2 are flowing in opposite directions. The magnetic field inside the inner coil is zero. This is possible when

(a) $i_1 \neq i_2$ and $n_1 = n_2$

(b) $i_1 = i_2$ and $n_1 \neq n_2$

(c) $i_1 = i_2$ and $n_1 = n_2$

(d) $i_1 n_1 = i_2 n_2$

8. A coil having N turns is wound tightly in the form of a spiral with inner and outer radii a and b respectively. When a current I passes through the coil, the magnetic field at the centre is

(a) $\frac{\mu_0 NI}{b}$ (b) $\frac{2\mu_0 NI}{a}$

(c) $\frac{\mu_0 NI}{2(b-a)}\ln\frac{b}{a}$ (d) $\frac{\mu_0 I^N}{2(b-a)}\ln\frac{b}{a}$

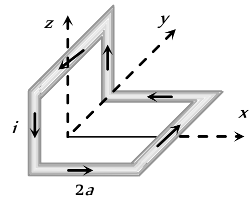
[MP PMT 1994]

9. A non-planar loop of conducting wire carrying a current I is placed as shown in the figure. Each of the straight sections of the loop is of length $2a$. The magnetic field due to this loop at the point P $(a,0,a)$ points in the direction

[IIT-JEE (Screening) 2001]

(a) $\frac{1}{\sqrt{2}}(-\hat{j}+\hat{k})$

(b) $\frac{1}{\sqrt{3}}(-\hat{j}+\hat{k}+\hat{i})$



(c) $\frac{1}{\sqrt{3}}(\hat{i}+\hat{j}+\hat{k})$

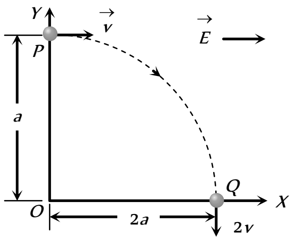
(d) $\frac{1}{\sqrt{2}}(\hat{i}+\hat{k})$

10. A long straight wire along the *z*-axis carries a current *I* in the negative *z* direction. The magnetic vector field $\vec{B}$ at a point having coordinates (*x, y*) in the *z* = 0 plane is [IIT-JEE (Screening) 2002]

(a) $\frac{\mu_o I(y\hat{i}-x\hat{j})}{2\pi(x^2+y^2)}$ (b) $\frac{\mu_o I(x\hat{i}+y\hat{j})}{2\pi(x^2+y^2)}$

(c) $\frac{\mu_o I(x\hat{j}-y\hat{i})}{2\pi(x^2+y^2)}$ (d) $\frac{\mu_o I(x\hat{i}-y\hat{j})}{2\pi(x^2+y^2)}$

11. A particle of charge +*q* and mass *m* moving under the influence of a uniform electric field $E\hat{i}$ and a uniform magnetic field $B\hat{k}$ follows trajectory from *P* to *Q* as shown in figure. The velocities at *P* and *Q* are $v\hat{i}$ and $-2v\hat{j}$ respectively. Which of the following statement(s) is/are correct [IIT 1991; BVP 2003]



(a) $E=\frac{3}{4}\frac{mv^2}{qa}$

(b) Rate of work done by electric field at *P* is $\frac{3}{4}\frac{mv^3}{a}$

(c) Rate of work done by electric field at *P* is zero

(d) Rate of work done by both the fields at *Q* is zero

12. H^+, He^+ and O^{++} ions having same kinetic energy pass through a region of space filled with uniform magnetic field *B* directed perpendicular to the velocity of ions. The masses of the ions H^+, He^+ and O^{++} are respectively in the ratio $1:4:16$. As a result

(a) H^+ ions will be deflected most

(b) O^{++} ions will be deflected least

(c) He^+ and O^{++} ions will suffer same deflection

(d) All ions will suffer the same deflection

13. An ionized gas contains both positive and negative ions. If it is subjected simultaneously to an electric field along the +*x* direction and a magnetic field along the +*z* direction, then [IIT-JEE (Screening) 2000]

(a) Positive ions deflect towards +*y* direction and negative ions towards –*y* direction

(b) All ions deflect towards +*y* direction

(c) All ions deflect towards –*y* direction

(d) Positive ions deflect towards –*y* direction and negative ions towards +*y* direction

14. An electron moves with speed 2×10^5 *m/s* along the positive *x*-direction in the presence of a magnetic induction $B=\hat{i}+4\hat{j}-3\hat{k}$ (in *Tesla*.) The magnitude of the force experienced by the electron in Newton's is (charge on the electron $=1.6\times10^{-19}C$) [EAMCET 2001]

(a) 1.18×10^{-13} (b) 1.28×10^{-13}

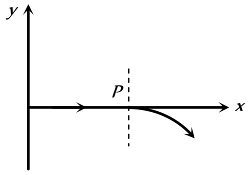
(c) 1.6×10^{-13} (d) 1.72×10^{-13}

15. A particle of mass *m* and charge *q* moves with a constant velocity *v* along the positive *x* direction. It enters a region containing a uniform magnetic field *B* directed along the negative *z* direction, extending from *x* = *a* to *x* = *b*. The minimum value of *v* required so that the particle can just enter the region $x>b$ is

(a) qbB/m (b) $q(b-a)B/m$

(c) qaB/m (d) $q(b+a)B/2m$

16. For a positively charged particle moving in a *x-y* plane initially along the *x*-axis, there is a sudden change in its path due to the presence of electric and/or magnetic fields beyond P. The curved path is shown in the *x-y* plane and is found to be non-circular. Which one of the following combinations is possible



(a) $\vec{E}=0; \vec{B}=b\hat{i}+c\hat{k}$ (b) $\vec{E}=a\hat{i}; \vec{B}=c\hat{k}+a\hat{i}$

(c) $\vec{E}=0; \vec{B}=c\hat{j}+b\hat{k}$ (d) $\vec{E}=a\hat{i}; \vec{B}=c\hat{k}+b\hat{j}$

17. A horizontal rod of mass 10 *gm* and length 10 *cm* is placed on a smooth plane inclined at an angle of $60°$ with the horizontal, with the length of the rod parallel to the edge of the inclined plane. A uniform magnetic field of induction *B* is applied vertically downwards. If the current through the rod is 1.73 *ampere*, then the value of *B* for which the rod remains stationary on the inclined plane is

(a) 1.73 *Tesla* (b) $\frac{1}{1.73}$ *Tesla*

(c) 1 *Tesla* (d) None of the above

18. Two long wires are hanging freely. They are joined first in parallel and then in series and then are connected with a battery. In both cases, which type of force acts between the two wires

(a) Attraction force when in parallel and repulsion force when in series

(b) Repulsion force when in parallel and attraction force when in series

(c) Repulsion force in both cases

(d) Attraction force in both cases

19. A wire of length *L metre* carrying a current of *I ampere* is bent in the form of a circle. Its magnitude of magnetic moment will be[MP PET 1995; M

(a) $\frac{IL}{4\pi}$ (b) $\frac{IL^2}{4\pi}$

(c) $\frac{I^2L^2}{4\pi}$ (d) $\frac{I^2L}{4\pi}$

20. A thin circular wire carrying a current I has a magnetic moment M. The shape of the wire is changed to a square and it carries the same current. It will have a magnetic moment [MP PET 2003; MP PMT 2004]

(a) M (b) $\frac{4}{\pi^2}M$

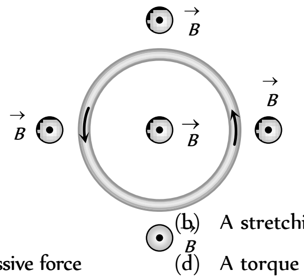
(c) $\frac{4}{\pi}M$ (d) $\frac{\pi}{4}M$

21. A particle of charge q and mass m moves in a circular orbit of radius r with angular speed ω. The ratio of the magnitude of its magnetic moment to that of its angular momentum depends on

(a) ω and q (b) ω q and m

(c) q and m (d) ω and m

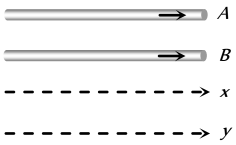
22. An elastic circular wire of length l carries a current I. It is placed in a uniform magnetic field $\vec{B}$ (Out of paper) such that its plane is perpendicular to the direction of $\vec{B}$. The wire will experience



(a) No force (b) A stretching force

(c) A compressive force (d) A torque

23. A and B are two conductors carrying a current i in the same direction. x and y are two electron beams moving in the same direction [Karnataka CET (Engg./Med.) 2002]



(a) There will be repulsion between A and B attraction between x and y
(b) There will be attraction between A and B, repulsion between x and y
(c) There will be repulsion between A and B and also x and y
(d) There will be attraction between A and B and also x and y

24. Wires 1 and 2 carrying currents i_1 and i_2 respectively are inclined at an angle θ to each other. What is the force on a small element dl of wire 2 at a distance of r from wire 1 (as shown in figure) due to the magnetic field of wire1

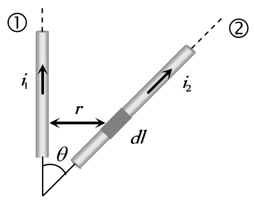
[AIEEE 2002]

(a) $\frac{\mu_0}{2\pi r} i_1 i_2 \, dl \tan\theta$

(b) $\frac{\mu_0}{2\pi r} i_1 i_2 \, dl \sin\theta$

(c) $\frac{\mu_0}{2\pi r} i_1 i_2 \, dl \cos\theta$

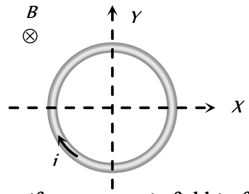
(d) $\frac{\mu_0}{4\pi r} i_1 i_2 \, dl \sin\theta$



25. A conducting loop carrying a current I is placed in a uniform magnetic field pointing into the plane of the paper as shown. The loop will have a tendency to

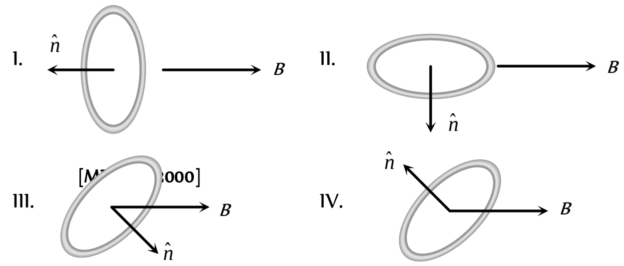
[IIT-JEE (Screening) 2003]

(a) Contract
(b) Expand
(c) Move towards $+ve$ x-axis
(d) Move towards $-ve$ x-axis



26. A current carrying loop is placed in a uniform magnetic field in four different orientations, I,II, III & IV arrange them in the decreasing order of potential Energy

[IIT-JEE (Screening) 2003]



(a) I > III > II > IV (b) I > II >III > IV

(c) I > IV > II > III (d) III > IV > I > II

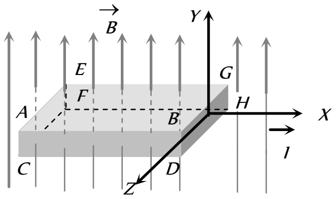
27. A metallic block carrying current I is subjected to a uniform magnetic induction $\vec{B}$ as shown in the figure. The moving charges experience a force $\vec{F}$ given by .... which results in the lowering of the potential of the face .... Assume the speed of the carriers to be v [IIT 1996]

(a) $eVB\hat{k}$, $ABCD$

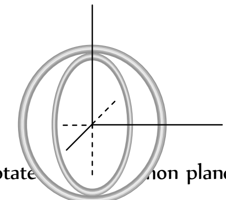
(b) $eVB\hat{k}$, $EFGH$

(c) $-eVB\hat{k}$, $ABCD$

(d) $-eVB\hat{k}$, $EFGH$



28. Two insulated rings, one of slightly smaller diameter than the other are suspended along their common diameter as shown. Initially the planes of the rings are mutually perpendicular. When a steady current is set up in each of them [IIT 1995]



(a) The two rings rotate [illegible] mon plane
(b) The inner ring oscillates about its initial position
(c) The inner ring stays stationary while the outer one moves into the plane of the inner ring
(d) The outer ring stays stationary while the inner one moves into the plane of the outer ring

29. Two particles each of mass m and charge q are attached to the two ends of a light rigid rod of length $2R$. The rod is rotated at constant angular speed about a perpendicular axis passing through its centre. The ratio of the magnitudes of the magnetic moment of the system and its angular momentum about the centre of the rod is [IIT 1998]

(a) $\frac{q}{2m}$ (b) $\frac{q}{m}$

(c) $\frac{2q}{m}$ (d) $\frac{q}{\pi m}$

30. Two very long, straight and parallel wires carry steady currents I and I respectively. The distance between the wires is d. At a certain instant of time, a point charge q is at a point equidistant from the two wires in the plane of the wires. Its instantaneous velocity v is perpendicular to this plane. The magnitude of the force due to the magnetic field acting on the charge at this instant is [IIT 1998]

(a) $\frac{\mu_0 Iqv}{2\pi d}$ (b) $\frac{\mu_0 Iqv}{\pi d}$

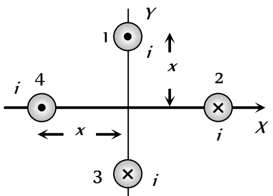
(c) $\frac{2\mu_0 Iqv}{\pi d}$ (d) 0

31. A ring of radius R, made of an insulating material carries a charge Q uniformly distributed on it. If the ring rotates about the axis passing through its centre and normal to plane of the ring with constant angular speed ω, then the magnitude of the magnetic moment of the ring is [MP PET 2001]

(a) $Q\omega R^2$ (b) $\frac{1}{2}Q\omega R^2$

(c) $Q\omega^2 R$ (d) $\frac{1}{2}Q\omega^2 R$

32. What will be the resultant magnetic field at origin due to four infinite length wires. If each wire produces magnetic field 'B' at origin



(a) 4 B (b) $\sqrt{2}\,B$

(c) $2\sqrt{2}\,B$ (d) Zero

33. The ratio of the magnetic field at the centre of a current carrying circular wire and the magnetic field at the centre of a square coil made from the same length of wire will be

(a) $\frac{\pi^2}{4\sqrt{2}}$ (b) $\frac{\pi^2}{8\sqrt{2}}$

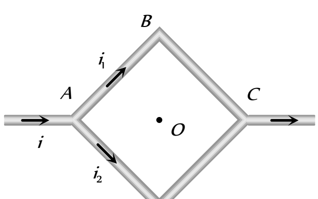
(c) $\frac{\pi}{2\sqrt{2}}$ (d) $\frac{\pi}{4\sqrt{2}}$

34. Two infinite length wires carries currents 8A and 6A respectively and placed along X and Y-axis. Magnetic field at a point $P(0,0,d)m$ will be

(a) $\frac{7\mu_0}{\pi d}$ (b) $\frac{10\mu_0}{\pi d}$

(c) $\frac{14\mu_0}{\pi d}$ (d) $\frac{5\mu_0}{\pi d}$

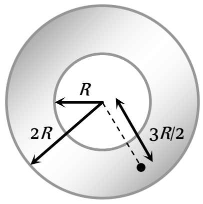
35. Figure shows a square loop $ABCD$ with edge length a. The resistance of the wire ABC is r and that of ADC is $2r$. The value of magnetic field at the centre of the loop assuming uniform wire is



(a) $\frac{\sqrt{2}\,\mu_0 i}{3\pi a}\odot$ (b) $\frac{\sqrt{2}\,\mu_0 i}{3\pi a}\otimes$

(c) $\frac{\sqrt{2}\,\mu_0 i}{\pi a}\odot$ (d) $\frac{\sqrt{2}\,\mu_0 i}{\pi a}\otimes$

36. Figure shows the cross-sectional view of the hollow cylindrical conductor with inner radius 'R' and outer radius '$2R$', cylinder carrying uniformly distributed current along it's axis. The magnetic induction at point 'P' at a distance $\frac{3R}{2}$ from the axis of the cylinder will be



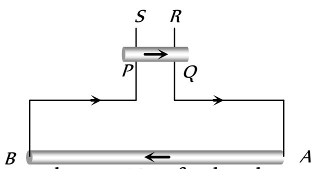
(a) Zero

(b) $\frac{5\mu_0 i}{72\pi R}$

(c) $\frac{7\mu_0 i}{18\pi R}$

(d) $\frac{5\mu_0 i}{36\pi R}$

37. A long wire AB is placed on a table. Another wire PQ of mass 1.0 g and length 50 cm is set to slide on two rails PS and QR. A current of 50A is passed through the wires. At what distance above AB, will the wire PQ be in equilibrium



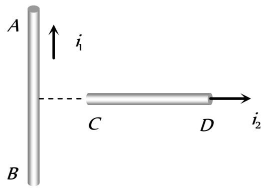
(a) 25 mm

(b) 50 mm

(c) 75 mm

(d) 100 mm

38. An infinitely long, straight conductor AB is fixed and a current is passed through it. Another movable straight wire CD of finite length and carrying current is held perpendicular to it and released. Neglect weight of the wire



(a) The rod CD will move upwards parallel to itself

(b) The rod CD will move downward parallel to itself

(c) The rod CD will move upward and turn clockwise at the same time

(d) The rod CD will move upward and turn anti –clockwise at the same time

39. A steady current i flows in a small square loop of wire of side L in a horizontal plane. The loop is now folded about its middle such that half of it lies in a vertical plane. Let $\vec{\mu_1}$ and $\vec{\mu_2}$ respectively denote the magnetic moments due to the current loop before and after folding. Then

[IIT-JEE 1993]

(a) $\overrightarrow{\mu_2} = 0$

(b) $\overrightarrow{\mu_1}$ and $\overrightarrow{\mu_2}$ are in the same direction

(c) $\frac{|\overrightarrow{\mu_1}|}{|\overrightarrow{\mu_2}|} = \sqrt{2}$

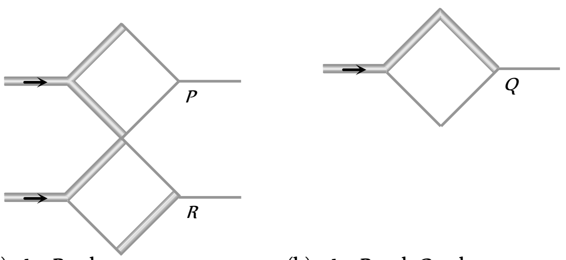
(d) $\frac{|\overrightarrow{\mu_1}|}{|\overrightarrow{\mu_2}|} = \left(\frac{1}{\sqrt{2}}\right)$

40. A current i is flowing in a straight conductor of length L. The magnetic induction at a point distant $\frac{L}{4}$ from its centre will be

(a) $\frac{4\mu_0 i}{\sqrt{5}\pi L}$ (b) $\frac{\mu_0 i}{2\pi L}$

(c) $\frac{\mu_0 i}{\sqrt{2}L}$ (d) Zero

41. Two thick wires and two thin wires, all of the same materials and same length form a square in the three different ways P, Q and R as shown in fig with current connection shown, the magnetic field at the centre of the square is zero in cases



(a) In P only (b) In P and Q only

(c) In Q and R only (d) P and R only

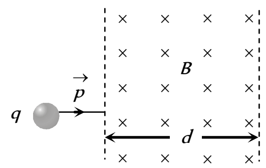
42. A particle with charge q, moving with a momentum p, enters a uniform magnetic field normally. The magnetic field has magnitude B and is confined to a region of width d, where $d < \frac{p}{Bq}$, The particle is deflected by an angle θ in crossing the field

(a) $\sin\theta = \frac{Bqd}{p}$

(b) $\sin\theta = \frac{p}{Bqd}$

(c) $\sin\theta = \frac{Bp}{qd}$

(d) $\sin\theta = \frac{pd}{Bq}$



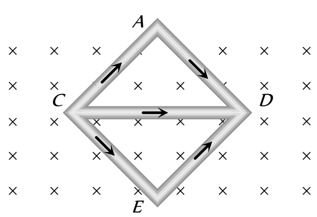
43. Same current i = 2A is flowing in a wire frame as shown in figure. The frame is a combination of two equilateral triangles ACD and CDE of side 1m. It is placed in uniform magnetic field B = 4T acting perpendicular to the plane of frame. The magnitude of magnetic force acting on the frame is

(a) 24 N

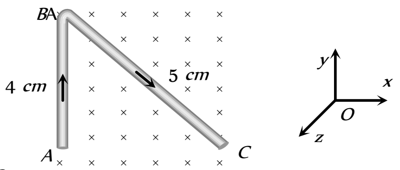
(b) Zero

(c) 16 N

(d) 8 N



44. A uniform conducting wire ABC has a mass of 10g. A current of 2A flows through it. The wire is kept in a uniform magnetic field $B = 2T$. The acceleration of the wire will be



(a) Zero

(b) $12\,ms^{-2}$ along y-axis

(c) $1.2\times10^{-3}ms^{-2}$ along y-axis

(d) $0.6\times10^{-3}ms^{-2}$ along y - axis

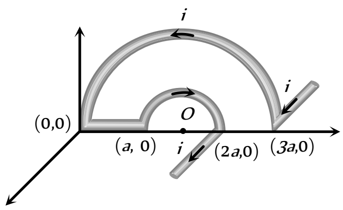
45. In the given figure net magnetic field at O will be

(a) $\frac{2\mu_0 i}{3\pi a}\sqrt{4-\pi^2}$

(b) $\frac{\mu_0 i}{3\pi a}\sqrt{4+\pi^2}$

(c) $\frac{2\mu_0 i}{3\pi a^2}\sqrt{4+\pi^2}$

(d) $\frac{2\mu_0 i}{3\pi a}\sqrt{(4-\pi^2)}$



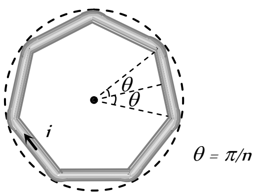
46. In the following figure a wire bent in the form of a regular polygon of n sides is inscribed in a circle of radius a. Net magnetic field at centre will be

(a) $\frac{\mu_0 i}{2\pi a}\tan\frac{\pi}{n}$

(b) $\frac{\mu_0 n i}{2\pi a}\tan\frac{\pi}{n}$

(c) $\frac{2}{\pi}\frac{ni}{a}\mu_0\tan\frac{\pi}{n}$

(d) $\frac{ni}{2a}\mu_0\tan\frac{\pi}{n}$



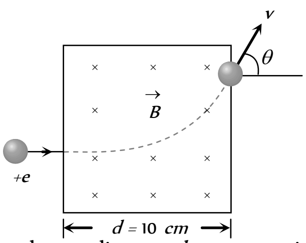
47. A proton accelerated by a potential difference $500\,KV$ moves though a transverse magnetic field of $0.51\,T$ as shown in figure. The angle θ through which the proton deviates from the initial direction of its motion is

(a) 15^o

(b) 30^o

(c) 45^o

(d) 60^o



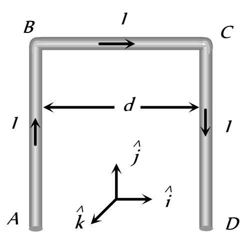
48. AB and CD are long straight conductor, distance d apart, carrying a current I. The magnetic field at the midpoint of BC is

(a) $\frac{-\mu_0 I}{2\pi d}\hat{k}$

(b) $\frac{-\mu_0 I}{\pi d}\hat{k}$

(c) $\frac{-\mu_0 I}{4\pi d}\hat{k}$

(d) $\frac{-\mu_0 I}{8\pi d}\hat{k}$



49. An electron is moving along the positive X-axis. You want to apply a magnetic field for a short time so that the electron may reverse its direction and move parallel to the negative X-axis. This can be done by applying the magnetic field along

(a) Y-axis (b) X-axis

(c) Y-axis only (d) None of these

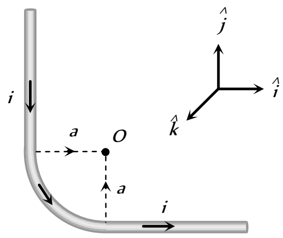
50. The unit vectors $\hat{i}, \hat{j}$ and $\hat{k}$ are as shown below. What will be the magnetic field at O in the following figure

(a) $\frac{\mu_0}{4\pi}\frac{i}{a}\left(2-\frac{\pi}{2}\right)\hat{j}$

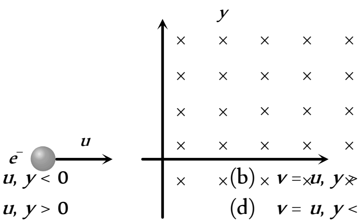
(b) $\frac{\mu_0}{4\pi}\frac{i}{a}\left(2+\frac{\pi}{2}\right)\hat{j}$

(c) $\frac{\mu_0}{4\pi}\frac{i}{a}\left(2+\frac{\pi}{2}\right)\hat{i}$

(d) $\frac{\mu_0}{4\pi}\frac{i}{a}\left(2+\frac{\pi}{2}\right)\hat{k}$



51. An electron moving with a speed u along the positive x-axis at $y = 0$ enters a region of uniform magnetic field $\vec{B} = -B_0\hat{k}$ which exists to the right of y-axis. The electron exits from the region after some time with the speed v at co-ordinate y, then [IIT-JEE (Screening 2004)]



(a) $v > u, y < 0$ (b) $v = u, y > 0$

(c) $v > u, y > 0$ (d) $v = u, y < 0$

GQ Graphical Questions

1. Which of the following graphs shows the variation of magnetic induction B with distance r from a long wire carrying current [NCERT 1984; MNR 1998; MP PMT 1999]

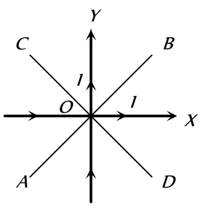
(a) 
(b) 
(c) 
(d) 
2. Two very thin metallic wires placed along X and Y-axis carry equal currents as shown here. AB and CD are lines at $45°$ with the axes with origin of axes at O. The magnetic field will be zero on the line [MP PMT 1995; CBSE PMT 1996]

(a) AB

(b) CD

(c) Segment OB only of line AB

(d) Segment OC only of line CD



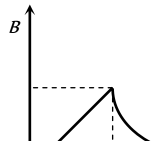
3. Two long parallel wires are at a distance $2d$ apart. They carry steady equal currents flowing out of the plane of the paper, as shown. The variation of the magnetic field B along the line XX' is given by

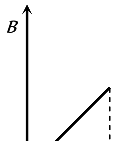
(a) 
(b) 
(c) 
(d) 
4. The magnetic field due to a straight conduct ... rm cross section of radius a and carrying a steady current is represented by

(a) 
(b) 
(c) 
(d) 
5. Two parallel beams of protons and electrons, carrying equal currents are fixed at a separation d. The protons and electrons move in opposite directions. P is a point on a line joining the beams, at a distance x from any one beam. The magnetic field at P is B. If B is plotted against x, which of the following best represents the resulting curve

(a) 
(b) 
(c) 
(d) 
6. A long thin hollow metallic cylinder of radius 'R' has a current i ampere. The magnetic induction 'B'-away from the axis at a distance r from the axis varies as shown in

(a) 
(b) 



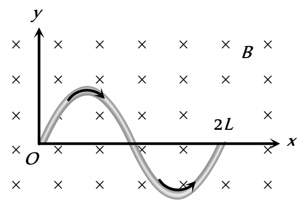


(c) (d)

7. The correct curve between the magnetic induction (B) along the axis of a long solenoid due to current flow i in it and distance x from one end is

(a) 
(b) 
(c) 
(d) 
8. A particle of charge q and mass m is moving along the x-axis with a velocity v and enters a region of electric field E and magnetic field B as shown in figure below for which figure the net force on the charge may be zero

(a) 
(b) 
(c) 
(d) 
9. A wire carrying a current i is placed in a uniform magnetic field in the form of the curve $y = a\sin\left(\frac{\pi x}{L}\right) 0 \le x \le 2L.$ The force acting on the wire is



(a) $\frac{iBL}{\pi}$

(b) $iBL\pi$

(c) $2iBL$

(d) Zero

10. The $(\tau - \theta)$ graph for a coil is

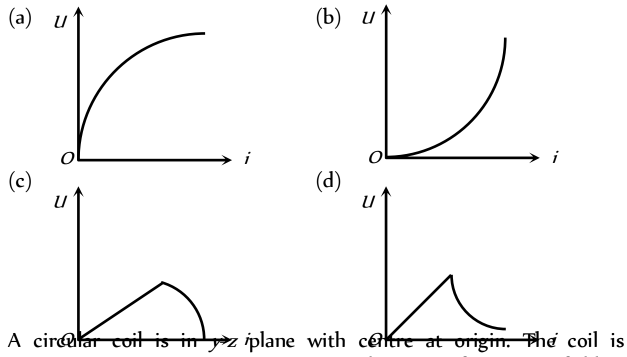
(a) 
(b) 
(c) 
(d) 
11. A uniform magnetic field B and a uniform electric field E act in a common region. An electron is entering this region of space. The correct arrangement for it to escape undeviated is

(a) 
(b) 
(c) 
(d) 
12. If induction of magnetic field at a point is B and energy density is U then which of the following graphs is correct

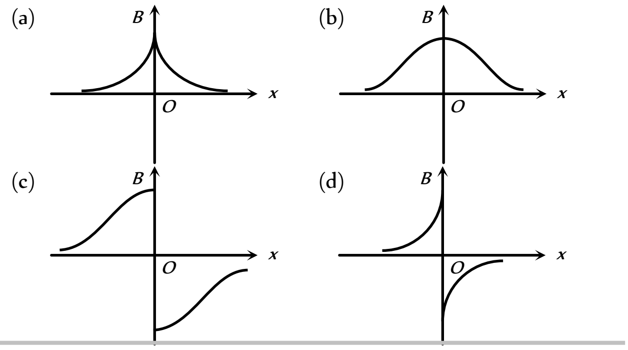
(a) 
(b) 
(c) 
(d) 
13. A thin wire of length l is carrying a constant current. The wire is bent to form a circular coil. If radius of the coil, thus formed, is equal to R and number of turns in it is equal to n, then which of the following graphs represent (s) variation of magnetic field induction (B) at centre of the coil

(a) 
(b) 
(c) 
(d) 
14. A current is flowing through a thin cylindrical shell of radius R. If energy density in the medium, due to magnetic field, at a distance r from axis of the shell is equal to U then which of the following graphs is correct

(a) 
(b) 
(c) 
(d) 
15. If current flowing through shell of previous objective is equal to i, then energy density at a point distance $2R$ from axis of the shell varies according to the graph



16. A circular coil is in y-z plane with centre at origin. The coil is carrying a constant current. Assuming direction of magnetic field at $x = -25\ cm$ to be positive direction of magnetic field, which of the following graphs shows variation of magnetic field along x-axis



Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) *If both assertion and reason are true and the reason is the correct explanation of the assertion.*
(b) *If both assertion and reason are true but reason is not the correct explanation of the assertion.*
(c) *If assertion is true but reason is false.*
(d) *If the assertion and reason both are false.*
(e) *If assertion is false but reason is true.*

1. Assertion : Cyclotron does not accelerate electron.
   Reason : Mass of the electron is very small.
   [AIIMS 2000]

2. Assertion : Cyclotron is a device which is used to accelerate the positive ion.
   Reason : Cyclotron frequency depends upon the velocity. [AIIMS 1997]

3. Assertion : Magnetic field interacts with a moving charge and not with a stationary charge.
   Reason : A moving charge produces a magnetic field.

4. Assertion : If an electron is not deflected while passing through a certain region of space, then only possibility is that there is no magnetic region.
   Reason : Force is directly proportional to the magnetic field applied.

5. Assertion : Free electron always keep on moving in a conductor even then no magnetic force act on them in magnetic field unless a current is passed through it.
   Reason : The average velocity of free electron is zero.

6. Assertion : The ion cannot move with a speed beyond a certain limit in a cyclotron.
   Reason : As velocity increases time taken by ion increases.

7. Assertion : The coil is bound over the metallic frame in moving coil galvanometer.
   Reason : The metallic frame help in making steady deflection without any oscillation.

8. Assertion : A circular loop carrying current lies in XY plane with its center at origin having a magnetic flux in negative Z-axis.
   Reason : Magnetic flux direction is independent of the direction of current in the conductor.

9. Assertion : The energy of charged particle moving in a uniform magnetic field does not change.
   Reason : Work done by magnetic field on the charge is zero.

10. Assertion : If an electron, while coming vertically from outerspace, enter the earth's magnetic field, it is deflected towards west.
    Reason : Electron has negative charge.

11. Assertion : A direct current flows through a metallic rod, produced magnetic field only outside the rod.
    Reason : There is no flow of charge carriers inside the rod.

12. Assertion : An electron and proton enters a magnetic field with equal velocities, then, the force experienced by the proton will be more than electron.
    Reason : The mass of proton is 1837 times more than electron.

13. Assertion : Torque on the coil is the maximum, when coil is suspended in a radial magnetic field.
    Reason : The torque tends to rotate the coil on its own axis.

14. Assertion : A loosely round helix made of stiff wire is suspended vertically with the lower end just touching a dish of mercury. When a current is passed through the wire, the helical wire executes oscillatory motion with the lower end jumping out of and inside of mercury.
    Reason : When electric current is passed through helix, a magnetic field is produced both inside and outside the helix.

15. Assertion : The magnetic filed at the ends of a very long current carrying solenoid is half of that at the center.
    Reason : If the solenoid is sufficiently long, the field within it is uniform.

16. Assertion : If a charged particle is moving on a circular path in a perpendicular magnetic field, the momentum of the particle is not changing,.
    Reason : Velocity of the particle in not changing in the magnetic field.

17. Assertion : If a proton and an α-particle enter a uniform magnetic field perpendicularly, with the same speed, then the time period of revolution of the α-particle is double than that of proton.
    Reason : In a magnetic field, the time period of revolution of a charged particle is directly proportional to mass.

18. Assertion : If two long wires, hanging freely are connected to a battery in series, they come closer to each other.

Reason : Force of attraction acts between the two wires carrying current.

19. Assertion : A current I flows along the length of an infinitely long straight and thin walled pipe. Then the magnetic field at any point inside the pipe is zero.

Reason : $\oint \vec{B}.d\vec{l} = \mu_o I$

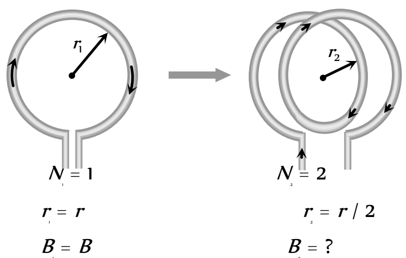
Answers and Solutions

Biot-Savart's Law and Amperes Law

1. (c) Magnetic field at the centre of current carrying coil is given by $B = \frac{\mu_0}{4\pi}\cdot\frac{2\pi Ni}{r} \Rightarrow B \propto \frac{N}{r} \Rightarrow \frac{B_1}{B_2} = \frac{N_1}{N_2}\times\frac{r_2}{r_1}$.

The following figure shows that single turn coil changes to double turn coil.



$\Rightarrow \frac{B}{B_2} = \frac{1}{2}\times\frac{r/2}{r} = \frac{1}{4} \Rightarrow B_2 = 4B$

Short trick : For such type of problems remember $B_2 = n^2 B_1$

2. (b) If distance is same field will be same $\left(\because B = \frac{\mu_0}{4\pi}\cdot\frac{2i}{r}\right)$

3. (c) Magnetic field lies inside as well as outside the solid current carrying conductor.

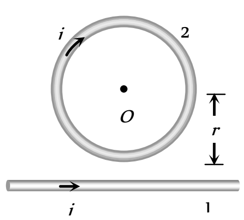
4. (b) Because for inside the pipe $i = 0$

$\therefore B = \frac{\mu_0 i}{2\pi r} = 0$

5. (d) $dB = \frac{\mu_0}{4\pi}\cdot\frac{idl\sin\theta}{r^2} \Rightarrow d\vec{B} = \frac{\mu_0}{4\pi}\cdot\frac{i(d\vec{l}\times\vec{r})}{r^3}$

6. (c) The magnetic field at the centre of the circle $= \frac{\mu_o}{4\pi}\times\frac{2\pi i}{r} = 10^{-7}\times\frac{2\pi(nq)}{r} = \frac{2\pi nq}{r}\times 10^{-7}\, N/A\text{-}m$

7. (b) The given shape is equivalent to the following diagram



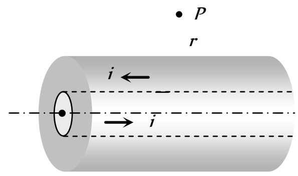
The field at O due to straight part of conductor is $B_1 = \frac{\mu_o}{4\pi}\cdot\frac{2i}{r}\odot$. The field at O due to circular coil is $B_2 = \frac{\mu_0}{4\pi}\cdot\frac{2\pi i}{r}\otimes$. Both fields will act in the opposite direction, hence the total field at O.

i.e. $B = B_2 - B_1 = \left(\frac{\mu_o}{4\pi}\right)\times(\pi-1)\frac{2i}{r} = \frac{\mu_o}{4\pi}\cdot\frac{2i}{r}(\pi-1)$

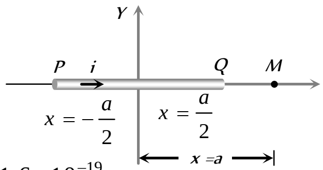
8. (d) $B = \frac{\mu_0}{4\pi}\frac{(2\pi-\theta)i}{R} = \frac{\mu_0}{4\pi}\frac{\left(2\pi-\frac{\pi}{2}\right)\times i}{R} = \frac{3\mu_0 i}{8R}$

9. (b) The respective figure is shown below

Magnetic field at P due to inner and outer conductors are equal and opposite. Hence net magnetic field at P will be zero.



10. (d) Magnetic field at a point on the axis of a current carrying wire is always zero.



11. (b) $i = \frac{q}{T} = \frac{2\times 1.6\times 10^{-19}}{2} = 1.6\times 10^{-19}\,A$

$\therefore B = \frac{\mu_o i}{2r} = \frac{\mu_o\times 1.6\times 10^{-19}}{2\times 0.8} = \mu_o\times 10^{-19}$

12. (a) $B = \mu_o ni = 4\pi\times 10^{-7}\times 5\times 1000 = 2\pi\times 10^{-3}$ *Tesla*

13. (a) $B = \frac{\mu_0}{4\pi}\cdot\frac{2i}{r} \Rightarrow \frac{B_1}{B_2} = \frac{r_2}{r_1} \Rightarrow \frac{10^{-8}}{B_2} = \frac{12}{4}$

$\Rightarrow B_2 = 3.33\times 10^{-9}$ *Tesla*

14. (c) $B \propto \frac{1}{r} \Rightarrow \frac{B_1}{B_2} = \frac{r_2}{r_1} \Rightarrow \frac{B}{B_2} = \frac{r/2}{r} \Rightarrow B_2 = 2B$

15. (c) Field at the centre of a circular coil of radius r is $B = \frac{\mu_o I}{2r}$

16. (a) $B = \frac{\mu_0 Ni}{2r} = \frac{4\pi\times 10^{-7}\times 100\times 0.1}{2\times 5\times 10^{-2}} = 4\pi\times 10^{-5}$ *Tesla*

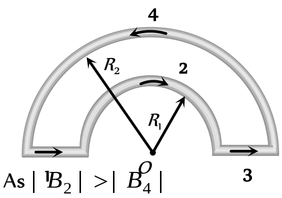
17. (b) Magnetic field inside the solenoid $B_{in} = \mu_0 ni$

18. (a) In the following figure, magnetic fields at O due to sections 1, 2, 3 and 4 are considered as B_1, B_2, B_3 and B_4 respectively.

$B_1 = B_3 = 0$

$B_2 = \frac{\mu_0}{4\pi}\cdot\frac{\pi i}{R_1}\otimes$

$B_4 = \frac{\mu_0}{4\pi}\cdot\frac{\pi i}{R_2}\odot$



As $|B_2| > |B_4|$

So $B_{net}=B_2-B_4 \Rightarrow B_{net}=\frac{\mu_0 i}{4}\left(\frac{1}{R_1}-\frac{1}{R_2}\right)\otimes$

19. (b) $B=\mu_o ni$

20. (d) The magnetic induction at O due to the current in portion AB will be zero because O lies on AB when extended.

21. (c) The induction due to AB and CD will be zero. Hence the whole induction will be due to the semicircular part BC.

$B=\frac{\mu_o i}{4r}$

22. (c) The magnetic induction due to both semicircular parts will be in the same direction perpendicular to the paper inwards.

$\therefore B=B_1+B_2=\frac{\mu_0 i}{4r_1}+\frac{\mu_0 i}{4r_2}=\frac{\mu_0 i}{4}\left(\frac{r_1+r_2}{r_1 r_2}\right)\otimes$

23. (a) Field at a point x from the centre of a current carrying loop on the axis is

$\mathrm{B}=\frac{\mu_0}{4\pi}\cdot\frac{2M}{x^3}=\frac{10^{-7}\times 2\times 2.1\times 10^{-25}}{(10^{-10})^3}$

$=4.2\times 10^{-32}\times 10^{30}=4.2\times 10^{-2}\,W/m^2$

24. (d) At these points, the resultant field $=0$

25. (b) $i=\frac{q}{t}=100\times e$

$B_{\text{centre}}=\frac{\mu_o}{4\pi}\cdot\frac{2\pi i}{r}=\frac{\mu_o}{4\pi}\cdot\frac{2\pi\times 100e}{r}$

$=\frac{\mu_o\times 200\times 1.6\times 10^{-19}}{4\times 0.8}=10^{-17}\mu_o$

26. (d) $B=\frac{\mu_o}{4\pi}\cdot\frac{2\pi NiR^2}{r^3}\Rightarrow B\propto\frac{1}{r^3}$

27. (c) $B=\frac{\mu_0}{4\pi}\cdot\frac{2\pi(q\nu)}{r}$

$=10^{-7}\times\frac{2\times 3.14\times(1.6\times 10^{-19}\times 6.6\times 10^{15})}{0.53\times 10^{-10}}=12.5\,Wb/m^2$

28. (a)

29. (b)

30. (d) Two coils carrying current in opposite direction, hence net magnetic field at centre will be difference of the two fields.

i.e. $B_{net}=\frac{\mu_0}{4\pi}\cdot 2\pi N\left[\frac{Ni_1}{r_1}-\frac{i_2}{r_2}\right]=\frac{10\mu_0}{2}\left[\frac{0.2}{0.2}-\frac{0.3}{0.4}\right]=\frac{5}{4}\mu_0$

31. (b) Because $B=\mu_0 ni\Rightarrow B\propto ni$.

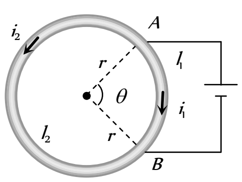
32. (a) See solution 34.

33. (a) $B=\mu_0 ni\Rightarrow i=\frac{B}{\mu_0 n}=\frac{20\times 10^{-3}}{4\pi\times 10^{-7}\times 20\times 100}$

$=7.9\,amp=8\,amp$

34. (d) Directions of currents in two parts are different, so directions of magnetic fields due to these currents are opposite. Also applying Ohm's law across AB

$i_1R_1=i_2R_2\Rightarrow i_1l_2=i_2l_2$



$\left(\because R=\rho\frac{l}{A}\right)$

Also $B_1=\frac{\mu_o}{4\pi}\times\frac{i_1l_1}{r^2}$ and $B_2=\frac{\mu_o}{4\pi}\times\frac{i_2l_2}{r^2}$ $\quad(\because l=r\theta)$

$\therefore\frac{B_2}{B_1}=\frac{i_1l_1}{i_2l_2}=1$

Hence, two field induction's are equal but of opposite direction. So, resultant magnetic induction at the centre is zero and is independent of θ.

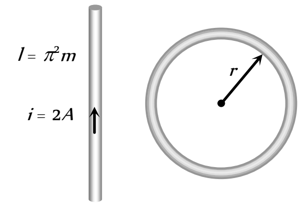
35. (d) The magnetic field at any point on the axis of wire be zero.

36. (d) Magnetic field inside the hollow conductor (tube) is zero.

37. (b) If a wire of length l is bent in the form of a circle of radius r then $2\pi r=l\Rightarrow$

$r=\frac{l}{2\pi}$

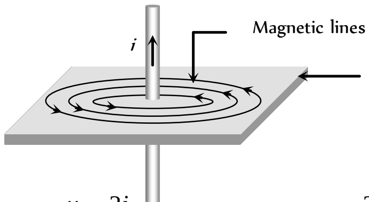
$r=\frac{l}{2\pi}=\frac{\pi^2}{2\pi}=\frac{\pi}{2}$



Magnetic field due to straight wire $B_1=\frac{\mu_0}{4\pi}\cdot\frac{2i}{r}=\frac{\mu_0}{4\pi}\times\frac{2\times 2}{1\times 10^{-2}}$ also magnetic field due to circular loop $B_2=\frac{\mu_0}{4\pi}\cdot\frac{2\pi i}{r}=\frac{\mu_0}{4\pi}\cdot\frac{2\pi\times 2}{\pi/2}\Rightarrow$

$\frac{B_2}{B_1}=\frac{1}{50}$

38. (c) See the following figure



39. (a) $B=\frac{\mu_0}{4\pi}\cdot\frac{2i}{r}\Rightarrow 10^{-5}=10^{-7}\times\frac{2i}{(10\times 10^{-2})}\Rightarrow i=5A$

40. (c) $B=\frac{\mu_0}{4\pi}\cdot\frac{2\pi Ni}{r}$

$\Rightarrow 3.14\times 10^{-3}=\frac{10^{-7}\times 2\times 3.14\times N\times 10}{(10\times 10^{-2})}\Rightarrow N=50$

41. (c) The magnetic field in the solenoid along its axis (i) At an internal point $=\mu_o ni$

$=4\pi\times 10^{-7}\times 5000\times 4=25.1\times 10^{-3}Wb/m^2$

(Here $n=50\,turns/cm=5000\,turns/m$)

(ii) At one end

$B_{end}=\frac{1}{2}B_{in}=\frac{\mu_0 ni}{2}=\frac{25.1\times 10^{-3}}{2}=12.6\times 10^{-3}Wb/m^2$

42. (b) Magnetic field at the centre of solenoid $(B)=\mu_0 ni$

Where n = Number of *turns* /*meter*

$\therefore B=4\pi\times 10^{-7}\times 4250\times 5=2.7\times 10^{-2}Wb/m^2$

43. (d) Use Right hand palm rule, or Maxwell's Cork screw rule or any other.

44. (b) $B' = n^2 B \Rightarrow B' = (4)^2 B = B' = 16B$

45. (d) $B = \frac{\mu_0}{4\pi}.\frac{2\pi i}{r} \Rightarrow 12.56 = 10^{-7} \times \frac{2\pi \times i}{5.2 \times 10^{-11}}$

$\Rightarrow i = 1.04 \times 10^{-3}\ A$

46. (b) $B = \frac{\mu_0}{4\pi}\frac{\theta i}{r} = \frac{\mu_0}{4\pi} \times \frac{\pi}{2} \times \frac{i}{R} = \frac{\mu_0 i}{8R}$

47. (a) $B \propto \frac{1}{r} \Rightarrow \frac{B_1}{B_2} = \frac{r_2}{r_1} \Rightarrow \frac{0.04}{B_2} = \frac{40}{10} \Rightarrow B_2 = 0.01\,T$

48. (a) See solution 34.

49. (b) $B = \frac{\mu_0 i}{2\pi r}$ or $B \propto \frac{1}{r}$

50. (d) $B = \mu_0 ni = \mu_0 \frac{N}{L} i$

51. (c) Here $B = \mu_0 ni$

where n is number of turns per unit length $= \frac{N}{l}$

52. (b) $\frac{\mu_0}{4\pi} \times \frac{2\pi i}{r} = H \Rightarrow \frac{(10^{-7}) \times 2 \times 3.142 \times i}{0.05} = 7 \times 10^{-5}$

$\therefore i = \frac{7 \times 0.05 \times 10^{-5}}{2 \times 3.142 \times 10^{-7}} = \frac{35}{2 \times 3.142} = 5.6$ *amp*

53. (c) $B = \frac{\mu_0 Ni}{2r} = \frac{4\pi \times 10^{-7} \times 1000 \times 0.1}{2 \times 0.1} = 6.28 \times 10^{-4}\ T$

54. (b) $B = \frac{\mu_0 Ni}{2r} = \frac{4\pi \times 10^{-7} \times 50 \times 2}{2 \times 0.5} = 1.25 \times 10^{-4}\ T$

55. (d) $B \propto \frac{i}{r}$

56. (a) $B = \frac{\mu_0 i}{2\pi r}$ *i.e.* $B \propto \frac{1}{r}$ *i.e.* when r is doubled, B is halved.

57. (b) Applying Ampere's law $\oint B.dl = \mu_0 i$ to any closed path inside the pipe we find no current is enclosed. Hence $B = 0$.

58. (a) Magnetic field at the centre of current carrying coil is

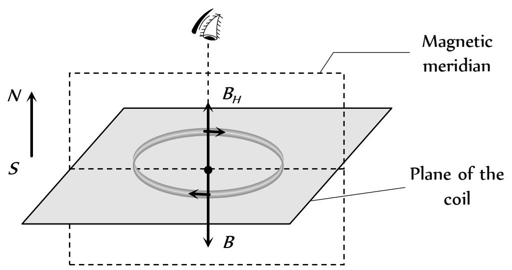
$B = \frac{\mu_0}{4\pi}\cdot\frac{2\pi ni}{r} = \frac{\mu_0 ni}{2r}$

59. (d) The magnetic field is given by $B = \frac{\mu_0}{4\pi}\frac{2i}{r}$.

It is independent of the radius of the wire.

60. (d) Magnetic meridian is a vertical *N-S* plane, the earth's magnetic field (B_H) lies in it. (For more details see magnetism).

To obtain neutral point at the centre of coil, magnetic field due to current (*B*) and B_H must cancel each other. Hence plane of the coil and magnetic meridian must be perpendicular to each other as shown



61. (c) 1 *Tesla* $= 10^4$ *Gauss*

62. (c)

63. (d)

64. (b) $B = \frac{\mu_0}{4\pi} \times \frac{2i}{r} = 10^{-7} \times \frac{2 \times 1}{10^{-2}} = 2 \times 10^{-5}$ *Tesla*

65. (a) Magnetic field due to one side of the square at centre O

$B_1 = \frac{\mu_0}{4\pi}.\frac{2i \sin 45^o}{a/2} \Rightarrow B_1 = \frac{\mu_0}{4\pi}.\frac{2\sqrt{2}\,i}{a}$

Hence magnetic field at centre due to all side

$B = 4B_1 = \frac{\mu_0(2\sqrt{2}i)}{\pi a}$

Magnetic field due to n turns

$B_{net} = nB = \frac{\mu_0 2\sqrt{2}ni}{\pi a} = \frac{\mu_0 2\sqrt{2}ni}{\pi(2l)} = \frac{\sqrt{2}\mu_0 ni}{\pi l}$ $(\because a = 2l)$

66. (c)

67. (a)

68. (c) Magnetic field on the axis of circular current

$B = \frac{\mu_0}{4\pi}\cdot\frac{2\pi nir^2}{(x^2 + r^2)^{3/2}} \Rightarrow B \propto \frac{nr^2}{(x^2 + r^2)^{3/2}}$

69. (a) $r_1 : r_2 = 1 : 2$ and $B_1 : B_2 = 1 : 3$ We know that

$B = \frac{\mu_0}{4\pi}.\frac{2\pi ni}{r} \Rightarrow \frac{i_1}{i_2} = \frac{B_1 r_1}{B_2 r_2} = \frac{1 \times 1}{3 \times 2} = \frac{1}{6}$

70. (b) $B = 10^{-7}\frac{2i}{r} = 10^{-7} \times \frac{2 \times 2}{5} = 8 \times 10^{-8}\ T$

71. (c) $B = \frac{\mu_0}{4\pi} \times \frac{\pi i}{r} \Rightarrow B = 10^{-7} \times \frac{\pi \times 10}{5 \times 10^{-2}} = 6.28 \times 10^{-5}\ T$

72. (c) Magnetic field due to solenoid is independent of diameter (Because $B = \mu_0 ni$).

73. (b) $B = \frac{\mu_0}{4\pi}\frac{2\pi i}{r} = 10^{-7} \times \frac{2\pi \times 2}{0.0157} = 8 \times 10^{-5}\,Wb/m^2$

74. (b) $B = \mu_0 ni = 4\pi \times 10^{-7} \times \frac{200}{10^{-2}} \times 2.5 = 6.28 \times 10^{-2}\,Wb/m^2$

75. (d) Magnetic field at centre due to smaller loop

$B_1 = \frac{\mu_0}{4\pi}.\frac{2\pi i_1}{r_1}$ ..... (i)

Due to Bigger loop $B_2 = \frac{\mu_0}{4\pi}.\frac{2\pi i_2}{r_2}$ So net magnetic field at centre

$B = B_1 - B_2 = \frac{\mu_0}{4\pi} \times 2\pi\left(\frac{i_1}{r_1} - \frac{i_2}{r_2}\right)$

According to question $B = \frac{1}{2} \times B_1$

$$\Rightarrow \frac{\mu_0}{4\pi}.2\pi\left(\frac{i_1}{r_1}-\frac{i_2}{r_2}\right)=\frac{1}{2}\times\frac{\mu_0}{4\pi}.\frac{2\pi i_1}{r_1}$$

$$\frac{i_1}{r_1}-\frac{i_2}{r_2}=\frac{i_1}{2r_1}\Rightarrow\frac{i_1}{2r_1}=\frac{i_2}{r_2}\Rightarrow\frac{i_1}{i_2}=1 \qquad \{r_2=2r_1\}$$

76. (b)

77. (b) $B=\frac{\mu_0}{4\pi}\times\frac{2\pi NiR^2}{(R^2+x^2)^{3/2}}\Rightarrow B\propto\frac{1}{(r^2+x^2)^{3/2}}$

$$\Rightarrow\frac{8}{1}=\frac{(R^2+x_2^2)^{3/2}}{(R^2+x_1^2)^{3/2}}\Rightarrow\left(\frac{8}{1}\right)^{2/3}=\frac{R^2+0.04}{R^2+0.0025}$$

$$\Rightarrow\frac{4}{1}=\frac{R^2+0.04}{R^2+0.0025}$$. On solving $R=0.1m$

78. (b) $B=10^{-7}\frac{2i}{r}\Rightarrow\frac{B}{B'}=\frac{20}{5}\Rightarrow B'=B/4$

79. (c) $B=10^{-7}\frac{2\pi ni}{r}=10^{-7}\times\frac{2\times\pi\times25\times4}{5\times10^{-2}}=1.257\times10^{-3}\,T$

80. (b) $F=Bil\Rightarrow[B]=\frac{[F]}{[i][l]}=\frac{MLT^{-2}}{AL}=MT^{-2}A^{-1}$

81. (d) Magnetic field on the axis of conductor is zero.

82. (c) $B\propto\frac{1}{r}\Rightarrow\frac{B_1}{B_2}=\frac{r_2}{r_1}=\frac{2r}{r}=2$

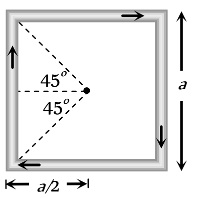
83. (c) $B=10^{-7}\times\frac{2i}{r}=10^{-7}\times\frac{2\times1}{1}=2\times10^{-7}\,T$

84. (d) At midpoint, magnetic fields due to both the wires are equal and opposite. So $B=0$.

85. (c) $B_0=4\times\frac{\mu_0}{4\pi}\times\frac{i}{(a/2)}(\sin45°+\sin45°)$

$$=4\times\frac{\mu_0}{4\pi}\times\frac{2i}{a}\times\frac{2}{\sqrt{2}}$$

$$=\frac{\mu_0 i2\sqrt{2}}{\pi a}$$



86. (b) $B=10^{-7}\frac{2\pi i}{r}$; according to question $B=B$

$$\Rightarrow5\times10^{-5}=10^{-7}\times\frac{2\times3.14\times i}{5\times10^{-2}}\Rightarrow i=4A$$

87. (d) $B=\frac{\mu_0}{4\pi}.\frac{2\pi Ni}{r}=\frac{10^{-7}\times2\pi\times100\times0.1}{5\times10^{-2}}=4\pi\times10^{-5}T$

88. (a) Corresponding current $i=en$

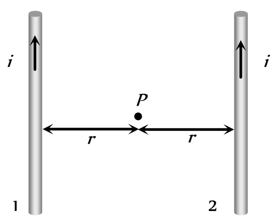
So $B=\frac{\mu_0}{4\pi}.\frac{2\pi(en)}{r}=\frac{\mu_0 ne}{2r}$

89. (a) B at ends of solenoid is $\frac{\mu_0}{2}ni$

90. (b) Use Right hand palm rule or Maxwell's Cork screw rule.

91. (c) At P

$$\Rightarrow B_{net}=B_1-B_2$$



Since $|B_1|=|B_2|$

So, $B=0$

92. (d) A moving charge and changing electric field both produces magnetic field.

93. (d)

94. (a) $B=\frac{\mu_0}{2\pi}\frac{i}{r}\Rightarrow5\times10^{-5}=\frac{\mu_0}{2\pi}\times\frac{\pi}{r}\Rightarrow r=10^4\mu_0\ metre$

95. (b) $B'=n^2B=(3)^2B=9B$

96. (b) B represents the magnetic field.

97. (a)

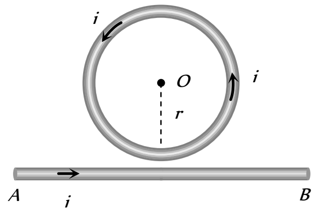
98. (d) $\frac{B_c}{B_a}=\left(1+\frac{x^2}{a^2}\right)^{3/2}=\left(1+\frac{a^2}{a^2}\right)^{3/2}=(1+1)^{3/2}=2\sqrt{2}$

99. (c) The given circuit can be considered as follows

$$B_{\text{loop}}=\frac{\mu_0 i}{2r}\odot$$

$$B_{\text{conductor}}=\frac{\mu_0 i}{2\pi r}\odot$$

$$B_{\text{net}}=\frac{\mu_0 i}{2\pi r}(\pi+1)\odot$$



100. (d) $B=\frac{\mu_0\mu_r Ni}{2\pi r}\Rightarrow1=\frac{4\pi\times10^{-7}\times\mu_r\times400\times2}{0.4}\Rightarrow\mu_r=400$

101. (b)

102. (c)

103. (b) $B=10^{-7}\times\frac{\pi\times i}{r}=10^{-7}\times\frac{\pi\times10}{20\times10^{-2}}=B=5\pi\mu T$

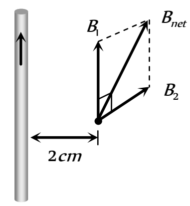
104. (d) $B'=n^2B=(2)^2B=4B$

105. (a) $B=\mu_0 ni\Rightarrow\frac{B}{B'}=\frac{n}{n'}\times\frac{i}{i'}=\frac{1}{(1/2)}\times\frac{1}{2}=1\Rightarrow B'=B$

106. (c) $B_1=4\times10^{-4}T$

$$B_2=10^{-7}\times\frac{2\times30}{2\times10^{-2}}=3\times10^{-4}T$$

$$\therefore\ B_{\text{net}}=\sqrt{B_1^2+B_2^2}=5\times10^{-4}T$$



107. (b) Magnetic field at the centre of circular loop

$$B=\frac{\mu_0}{4\pi}\frac{2\pi i}{r}\Rightarrow0.5\times10^{-5}=\frac{10^{-7}\times2\times3.14\times i}{5\times10^{-2}}$$

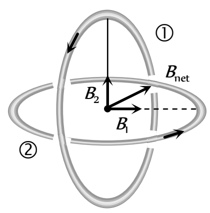
$i=0.4\ A$

108. (a)

109. (a) $B_1=B_2=B=\frac{\mu_0}{4\pi}\times\frac{2\pi i}{r}$

$$B_{net}=\sqrt{2}B$$

$$\Rightarrow\frac{B}{B_{net}}=\frac{1}{\sqrt{2}}$$



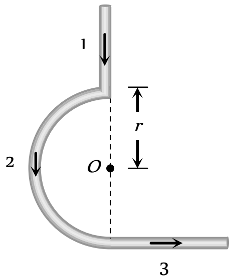
110. (c) Magnetic field due to different parts are

$B = 0$

$B_2 = \frac{\mu_0}{4\pi}.\frac{\pi i}{r} \odot$

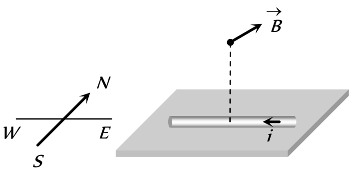
$B_3 = \frac{\mu_0}{4\pi}.\frac{i}{r} \odot$

$\therefore B_{net} = B_2 + B_3 = \frac{\mu_0 i}{4r} + \frac{\mu_0 i}{4\pi r}$



111. (d) $M = niA = ni(\pi r^2) \Rightarrow M \propto r^2$

112. (a)



113. (b) Magnetic field at the center of single turn loop $B = \frac{\mu_0}{4\pi}.\frac{2\pi i}{r}$, magnetic field at the center of n-turn loop

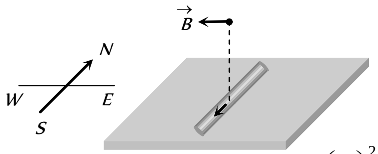
$B_n = \left(\frac{\mu_0}{4\pi}.\frac{2\pi i}{r/n}\right) \times n \Rightarrow B_n = n^2 B$

114. (a) $\frac{B_{center}}{B_{axis}} = \left(1 + \frac{x^2}{r^2}\right)^{3/2} \Rightarrow \frac{B_{center}}{54} = \left(1 + \left(\frac{4}{3}\right)^2\right)^{3/2} = \frac{125}{27}$

$B_{center} = 250\mu T$

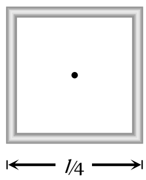
115. (b) $B = \frac{\mu_0}{4\pi}.\frac{2\pi i}{r} \Rightarrow B \propto \frac{1}{r}$

116. (d)



117. (c) Suppose length of each wire *is l*. $A_{square} = \left(\frac{l}{4}\right)^2 = \frac{l^2}{16}$

$A_{cirde} = \pi r^2 = \pi\left(\frac{l}{2\pi}\right)^2 = \frac{l^2}{4\pi}$

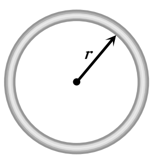


$\because$ Magnetic moment

$M = iA$

$\Rightarrow \frac{M_{square}}{M_{cirde}} = \frac{A_{square}}{A_{cirde}}$

$= \frac{l^2/16}{l^2/4\pi} = \frac{\pi}{4}$



118. (b) $B = \frac{\mu_0}{4\pi}.\frac{2\pi ni}{r} \Rightarrow B \propto ni$

119. (a) Magnetic field due to revolution of electron

$$B = \frac{\mu_0}{4\pi}.\frac{2\pi i}{r} = \frac{\mu_0}{4\pi}.\frac{2\pi.\left(\frac{e\omega}{2\pi}\right)}{r} = 10^{-7} \times \frac{e\omega}{r}$$

$$\Rightarrow 16 = 10^{-7} \times \frac{1.6 \times 10^{-19}\omega}{1 \times 10^{-10}} \Rightarrow \omega = 10^{17} rad/\sec.$$

120. (a) $B = \frac{\mu_0}{4\pi}.\frac{2i}{r} = 10^{-7} \times \frac{2 \times 20}{10 \times 10^{-2}} = 4 \times 10^{-5} Wb/m^2$

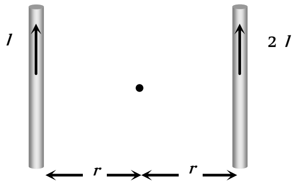
121. (a) $B = \frac{\mu_0}{4\pi}.\frac{2i}{r} \Rightarrow B \propto i$

122. (a) $B_{net} = \sqrt{B_1^2 + B_2^2} = \frac{\mu_0}{4\pi}.\frac{2\pi}{r}\sqrt{i_1^2 + i_2^2}$

$= 10^{-7} \times \frac{2\pi}{2\pi \times 10^{-2}}\sqrt{(3)^2 + (4)^2} = 5 \times 10^{-5}\ wb/m^2$

123. (c) When two parallel conductors carrying current I and $2I$ in same direction, then magnetic field at the midpoint is

$B = \frac{\mu_0 2I}{2\pi r} - \frac{\mu_0 I}{2\pi r} = \frac{\mu_0 I}{2\pi r}$



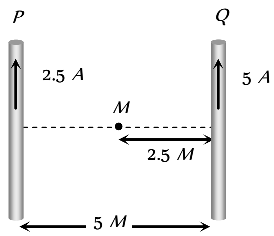
When current $2I$ is switched off then magnetic field due to conductor carrying current I is $B = \frac{\mu_0 I}{2\pi r}$.

124. (d) In the following figure magnetic field at mid point M is given by

$B_{net} = B_Q - B_P$

$= \frac{\mu_0}{4\pi}.\frac{2}{r}(i_Q - i_P)$

$= \frac{\mu_0}{4\pi} \times \frac{2}{2.5}(5 - 2.5) = \frac{\mu_0}{2\pi}$



125. (c)

126. (b) The magnetic field due to small element of conductor of length is given by $dB = \frac{\mu_0}{4\pi}\frac{Idl\sin\theta}{r^2}$

This value will be maximum when

$\sin\theta = 1 = \sin 90°$ or, $\theta = 90°$

Motion of Charged Particle in Magnetic Field

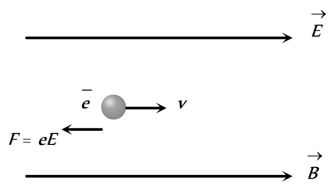
1. (a, b, d)

Here the proton has no acceleration so $E = B = 0$.

When $E = 0$ but $B \neq 0$, but parallel to the motion of proton, there will be no force acting.

When $E \neq 0$ and $B \neq 0$ and E, B and motion of proton (v) are mutually perpendicular, there may be no net force. Forces due to E and B cancel each other.

2. (d) Since electron is moving is parallel to the magnetic field, hence magnetic force on it $F_m = 0$.



The only force acting on the electron is electric force which reduces it's speed.

3. (c) $r = \dfrac{\sqrt{2mk}}{qB} = \dfrac{1}{B}\sqrt{\dfrac{2mV}{q}} \Rightarrow r \propto \sqrt{m} \Rightarrow \dfrac{m_1}{m_2} = \left(\dfrac{R_1}{R_2}\right)^2$

4. (a) $r = \dfrac{mv}{Bq} = \dfrac{v}{(q/m)B} = \dfrac{2\times10^5}{5\times10^7\times4\times10^{-2}} = 0.1m$

5. (b) $r = \dfrac{p}{qB} \Rightarrow r \propto p$

6. (b) $B = \dfrac{mv}{qr} = \dfrac{9\times10^{-31}\times10^6}{1.6\times10^{-19}\times0.1} = 5.6\times10^{-5}T$

7. (c) $r = \dfrac{\sqrt{2mK}}{qB}$ *i.e.* $r \propto \dfrac{\sqrt{m}}{q}$

Here kinetic energy K and B are same.

$\therefore \dfrac{r_p}{r_\alpha} = \dfrac{\sqrt{m_p}}{\sqrt{m_\alpha}}.\dfrac{q_\alpha}{q_p} = \dfrac{\sqrt{m_p}}{\sqrt{4m_p}}.\dfrac{2q_p}{q_p} = 1$

8. (c) $\vec{F} = q\vec{v}\times\vec{B}$

9. (c)

10. (d)

11. (c) East, (By $\vec{F} = q(\vec{v}\,v\times\vec{B})$) or by applying Fleming's left hand rule.

12. (d) $F = qvB = 1.6\times10^{-19}\times\left[\sqrt{\dfrac{2E}{m}}\right]2.5$

$= 4\times10^{-19}\sqrt{\dfrac{2\times2\times1.6\times10^{-19}\times10^6}{1.66\times10^{-27}}} = 7.6\times10^{-12}N$

13. (d) $\vec{F} = q(\vec{v}\times\vec{B})$; if $\vec{v}\,||\,\vec{B}$ then $\vec{F} = 0$

14. (b) This is according to the cross product $\vec{F} = q(\vec{v}\times\vec{B})$ otherwise can be evaluated by the left-hand rule of Fleming.

15. (a) $r = \dfrac{\sqrt{2mK}}{qB} \Rightarrow K \propto \dfrac{q^2}{m} \Rightarrow \dfrac{K_p}{K_\alpha} = \left(\dfrac{q_p}{q_\alpha}\right)^2 \times \dfrac{m_\alpha}{m_p}$

$\Rightarrow \dfrac{1}{K_\alpha} = \left(\dfrac{q_p}{2q_p}\right)^2 \times \dfrac{4m_p}{m_p} = 1 \Rightarrow K_\alpha = 1\,MeV$.

16. (c) $r \propto \dfrac{1}{B}$ *i.e.* $\dfrac{r_1}{r_2} = \dfrac{B_2}{B_1} \Rightarrow r_2 = \dfrac{B_1}{B_1/2}\times r = 2r$

17. (c) Time period of proton $T_p = \dfrac{25}{5} = 5\mu\,\text{sec}$

By using $T = \dfrac{2\pi m}{qB} \Rightarrow \dfrac{T_\alpha}{T_p} = \dfrac{m_\alpha}{m_p}\times\dfrac{q_p}{q_\alpha} = \dfrac{4m_p}{m_p}\times\dfrac{q_p}{2q_p}$

$\Rightarrow T_\alpha = 2T_p = 10\mu$ sec.

18. (a) $F = ma = qvB \Rightarrow a = \dfrac{qvB}{m} = \dfrac{1.6\times10^{-19}\times2\times3.4\times10^7}{1.67\times10^{-27}}$

$= 6.5\times10^{15}\,m/sec^2$

19. (c) $T = \dfrac{2\pi m}{qB} = \dfrac{2\pi r}{v} = \dfrac{2\times3.14\times0.45}{2.6\times10^7} = 1.08\times10^{-7}$ sec

20. (b) $F = qvB$ and $K = \dfrac{1}{2}mv^2 \Rightarrow F = qB\sqrt{\dfrac{2k}{m}}$

$= 1.6\times10^{-19}\times1.5\sqrt{\dfrac{2\times5\times10^6\times1.6\times10^{-19}}{1.7\times10^{-27}}}$

$= 7.344\times10^{-12}\,N$

21. (c) Magnetic force acts on a moving charge.

22. (c) $r = \dfrac{mv}{qB} \Rightarrow r \propto v, \Rightarrow r_2 = 2r_1 = 2\times2 = 4cm$

23. (d) $r = \dfrac{\sqrt{2mK}}{qB} \Rightarrow K \propto \dfrac{q^2}{m}$

$\Rightarrow \dfrac{K_p}{K_d} = \left(\dfrac{q_p}{q_d}\right)^2 \times \dfrac{m_d}{m_p} = \left(\dfrac{1}{1}\right)^2 \times \dfrac{2}{1} = \dfrac{2}{1}$

$\Rightarrow K_p = 2\times50 = 100\,keV$.

24. (b) Maximum force will act on proton so it will move on a circular path. Force on electron will be zero because it is moving parallel to the field.
