25. (d) Fleming's left hand rule is used to the determine the direction of force.

26. (a) Lorentz force is given by

$\vec{F} = \vec{F_e} + \vec{F_m} = q\vec{E} + q(\vec{v}\times\vec{B}) = q[\vec{E} + (\vec{v}\times\vec{B})]$

27. (c) $\vec{F} = q\vec{v}\times\vec{B}$

28. (a) $F = qvB\sin\theta$

$= 1.6\times10^{-19}\times2\times10^7\times1.5\sin30^o$

$= 1.6\times10^{-19}\times2\times10^7\times1.5\times\dfrac{1}{2} = 2.4\times10^{-12}N$

29. (d) $F = qvB\sin\theta \Rightarrow B = \dfrac{F}{qv\sin\theta}$

$B_{\min} = \dfrac{F}{qv}$ (when $\theta = 90$)

$\therefore B_{\min} = \dfrac{F}{qv} = \dfrac{10^{-10}}{10^{-12}\times10^5} = 10^{-3}$ *Tesla* in $\hat{z}$ -direction.

30. (d) Kinetic energy in magnetic field remains constant and it is $K = qV \Rightarrow K \propto q$ (V = constant)

$\therefore K_p : K_d : K_\alpha = q_p : q_d : q_a = 1:1:2$

31. (d) When charged particle enters perpendicularly in a magnetic field, it moves on a circular path with a constant speed. Hence it's kinetic energy also remains constant.

32. (b) $r = \dfrac{\sqrt{2mK}}{qB}$ *i.e.* $r \propto \dfrac{\sqrt{m}}{q}$

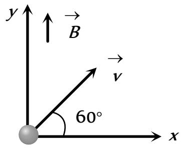
Here kinetic energy K and B are same.

$\therefore \dfrac{r_e}{r_p} = \sqrt{\dfrac{m_e}{m_p}}\times\dfrac{q_p}{q_e} \Rightarrow \dfrac{r_e}{r_p} = \sqrt{\dfrac{m_e}{m_p}}$ $(\because q_e = q_p)$

Since $m_e < m_p$, therefore $r_e < r_p$

33. (c) Path of the proton will be a helix of radius $r = \frac{mv\sin\theta}{qB}$

(where θ = Angle between $\vec{B}$ and $\vec{v}$)



$\Rightarrow r = \frac{1.67\times10^{-27}\times2\times10^{6}\times\sin30^{o}}{1.6\times10^{-19}\times0.104}$

$= 0.1m$

Time period $T = \frac{2\pi m}{qB} = \frac{2\pi\times1.67\times10^{-27}}{1.6\times10^{-19}\times0.104}$

$= 2\pi\times10^{-7}\, sec$

34. (a) $\frac{mv^2}{R} = qvB$. For proton $R_p = \frac{mv}{qB} = \frac{\sqrt{2m_pE}}{qB}$

and for deutron $R_d = \frac{\sqrt{2m_dE}}{qB}$

$\Rightarrow \frac{R_d}{R_p} = \sqrt{\frac{m_d}{m_p}} = \sqrt{2} \Rightarrow R_d = \sqrt{2}R_p$

35. (c) In this case $|\vec{F_e}| = |\vec{F_m}|$ and both forces are opposite to each other.

36. (b) We know that time period $T = \frac{2\pi m}{qB}$ *i.e.* $T \propto m$

(Since q and B are same)

∵ Mass of proton > Mass of electron

∴ Time period of proton > Time period of electron

37. (d) According to Fleming's right hand rule.

38. (a) $r = \frac{mv}{eB} \Rightarrow \frac{e}{m} = \frac{v}{rB}$

39. (a) Using $eE = evB \Rightarrow E = vB = 5\times10^{6}\times0.02 = 10^{5}\,Vm^{-1}$

40. (d) $F = evB = 1.6\times10^{-19}\times4\times10^{6}\times2\times10^{-1} = 1.28\times10^{-13}\,N$

Also $\frac{mv^2}{r} = evB \Rightarrow r = \frac{mv}{eB}$

$\Rightarrow r = \frac{9\times10^{-31}\times4\times10^{6}}{1.6\times10^{-19}\times2\times10^{-1}} = 1.1\times10^{-4}m$

41. (c) Force acts perpendicular to the velocity in a magnetic field, so speed of electron will remain same.

42. (a) By Fleming left hand rule.

43. (d) Direction of motion of proton is same as that of direction of magnetic field.

44. (a) Time period is given by $T = \frac{2\pi m}{qB}$

$\Rightarrow$ Frequency $\nu = \frac{1}{T} = \frac{qB}{2\pi m}$

45. (b) $r = \frac{\sqrt{2mK}}{qB} = \frac{1}{B}\sqrt{\frac{2mV}{q}}$

$= \frac{1}{10^{-3}}\sqrt{\frac{2\times9\times10^{-31}\times12000}{1.6\times10^{-19}}}$ =0.367 m = 36.7 cm

46. (c) $r = \frac{1}{B}\sqrt{\frac{2mV}{q}} \Rightarrow r \propto \sqrt{\frac{m}{q}} \Rightarrow \frac{r_x}{r_y} = \sqrt{\frac{m_x}{q_x}\times\frac{q_y}{m_y}}$

$\Rightarrow \frac{R_1}{R_2} = \sqrt{\frac{m_x}{m_y}\times\frac{2}{1}} \Rightarrow \frac{m_x}{m_y} = \frac{R_1^2}{2R_2^2}$

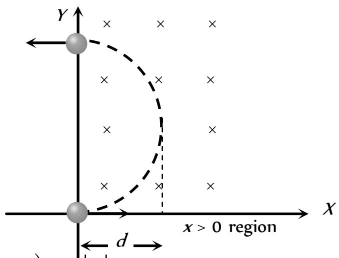
47. (d) $\vec{F} = q(\vec{v}\times\vec{B}) = 10^{-11}(10^{8}\hat{j}\times0.5\hat{i})$

$= 5\times10^{-4}(\hat{j}\times\hat{i}) = 5\times10^{-4}\,N(-\hat{k})$

48. (b) It is easy to understand the given problem, along with the following figure.

d = radius of path

$= \frac{mv}{qB}$



49. (c) Lorentz force $F = q(v\times B)$ or $|F| = qvB\sin\theta$

F will be maximum. when $\theta = 90^o$

50. (d) The component of velocity perpendicular to H will make the motion circular while that parallel to H will make it move along a straight line. The two together will make the motion helical.

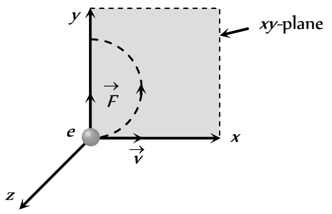
51. (b) We have $qvB = \frac{mv^2}{r}$ or $r = \frac{mv}{qB} = \frac{\sqrt{2mK}}{qB}$

For same kinetic energy K, we have $r \propto \sqrt{m}$

Hence path of proton will have larger r and is therefore less curved.

52. (c) When particle enters at angle other than 0° or 90° or 180°, path followed is helix.

53. (b) To move the electron in xy plane, force on it must be acting in the y-direction initially. The direction of $\vec{F}$ is known, and the direction of v is known, hence by applying Fleming's left hand rule, the direction of magnetic field is also determined.



54. (a) A moving charge gains energy in electric field only because in magnetic field energy remains constant.

55. (a) Given that $K_p = K_d = K_\alpha = K$ (say)

We know that $m_p = m$, $m_d = 2m$ and $m_\alpha = 4m$ and $q_p = e$, $q_d = e$ and $q_\alpha = 2e$

Further $r=\frac{\sqrt{2mK}}{qB} \Rightarrow r_p=\frac{\sqrt{2mK}}{eB}$, $r_d=\frac{\sqrt{2(2m)K}}{eB}=\sqrt{2}r_p$

and $r_\alpha=\frac{\sqrt{2(4m)K}}{(2e)B}=r_p$. Hence $r_\alpha=r_p<r_d$

56. (d) Since force is perpendicular to direction of motion. energy and magnitude of momentum remains constant.

57. (d) $T=\frac{2\pi m}{qB} \Rightarrow T \; \alpha \; v^o$

58. (b) $F=qvB$ also Kinetic energy $K=\frac{1}{2}mv^2 \Rightarrow v=\sqrt{\frac{2K}{m}}$

$\therefore \; F=q\sqrt{\frac{2K}{m}}B$

$=1.6\times10^{-19}\sqrt{\frac{2\times200\times10^6\times1.6\times10^{-19}}{1.67\times10^{-27}}}\times5$

$=1.6\times10^{-10}\,N$

59. (d) The deflection produced by the electric field may be nullified by that produced by magnetic field.

60. (a) $\vec{F_m}=q(\vec{v}\times\vec{B})$

When the angle between $\vec{v}$ and $\vec{B}$ is 180°, $F_m = 0$

61. (c) $r=mv/qB$

Since both have same momentum, therefore the circular path of both will have the same radius.

62. (c) When particle enters perpendicularly in a magnetic field, it moves along a circular path with constant speed.

63. (b) For motion of a charged particle in a magnetic field, we have $r = mv/qB$ *i.e.* $r \propto v$

64. (a) The charged particle moving in a magnetic field does not gain energy. However, the direction of its velocity changes continuously. Hence momentum changes.

65. (a) $F=qvB\sin\theta=qvB\sin0=0$

66. (b) $r=\frac{mv}{qB}=\frac{10^7}{10^{11}\times10^{-4}}=1m \; (\because q/m=10^{11}\,C/kg)$

67. (b) $\omega=\frac{2\pi}{T}=\frac{qB}{m} \Rightarrow \omega \propto v^o \; \left(\because T=\frac{2\pi m}{qB}\right)$

68. (a) $r=\frac{\sqrt{2mK}}{qB} \Rightarrow r \propto \sqrt{K} \Rightarrow \frac{R}{R_2}=\sqrt{\frac{K}{2K}} \Rightarrow R_2=R\sqrt{2}$

69. (b, d) $r=\frac{mv}{qB}=\frac{P}{qB}$

70. (b) $F=qvB\sin\theta=1.6\times10^{-19}\times2.5\times2.5\times10^7\sin30^o$

$F=1.6\times10^{-19}\times6.25\times10^7\times\frac{1}{2}=5\times10^{-12}\,N$

71. (c) $K_{\max}=\frac{1}{2}mv^2$ and $r_0=\frac{mv}{qB} \Rightarrow v=\frac{qBr_0}{m}$

$\Rightarrow K_{\max}=\frac{1}{2}m\left(\frac{qBr_0}{m}\right)^2=\frac{q^2B^2r_0^2}{2m}$

72. (b) $F=qvB\sin\theta$; Independent of mass

73. (b) By Fleming left hand rule.

74. (a) $F=qBv=1\times0.5\times10=5N$

75. (d) $r=\frac{mv}{qB} \Rightarrow \frac{r_1}{r_2}=\frac{v_1}{v_2}\times\frac{B_2}{B_1} \Rightarrow \frac{r_1}{r_2}=\frac{1}{2}\times\frac{1}{2}=\frac{1}{4}$

$r_2=4r_1$

76. (d) Magnetic force on charge will be zero.

77. (d)

78. (b) Apply Fleming's left hand rule.

79. (a) $T=\frac{2\pi m}{qB}=\frac{2\times3.14\times9\times10^{-31}}{1.6\times10^{-19}\times1\times10^{-4}}=3.5\times10^{-7}$ *sec*

80. (d) $\vec{F}=q(\vec{v}\times\vec{B})=0$ as $\vec{v}$ and $\vec{B}$ are parallel.

81. (a) Here magnetic force is zero, but the velocity increases due to electric force.

82. (a)

83. (c)

84. (b) $r=\frac{mv}{qB} \Rightarrow r \propto mv$ (q and B are constant)

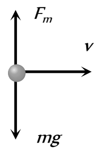
$\because r_A>r_B \Rightarrow m_Av_A>m_Bv_B$

85. (b) $r=\frac{p}{qB} \Rightarrow p \propto q$ ($\because$ r and B are constant)

$\frac{p_p}{p_\alpha}=\frac{q_p}{q_\alpha}=\frac{q_p}{(2q_p)}=\frac{1}{2}$

86. (c) Particle will move with uniform velocity when it's acceleration is zero.

i.e. $|F_m|=mg \Rightarrow mg=qvB$



$\Rightarrow B=\frac{mg}{qv}=\frac{0.6\times10^{-3}\times10}{25\times10^{-9}\times1.2\times10^4}=20\,T$

87. (c) $r=\frac{mv}{qB} \Rightarrow \frac{r_\alpha}{r_p}=\frac{m_\alpha}{m_p}\times\frac{q_p}{q_\alpha}=\frac{4}{1}\times\frac{1}{2}=\frac{2}{1}$

88. (b) When field is parallel to the direction of motion of charge, magnetic force on it is zero.

89. (a) Since $\vec{F}$ and $\vec{v}$ are perpendicular to each other work done by force is zero. Hence K.E. is constant.

90. (b)

91. (a) Charged particles deflects in magnetic field.

92. (a) $v=\frac{qB}{2\pi m} \Rightarrow v \propto \frac{q}{m}$

$\left(\frac{q}{m}\right)_{Li^+}$ is minimum so v_{Li^+} is minimum.

93. (c) $r=\frac{\sqrt{2mK}}{qB} \Rightarrow r \propto \frac{\sqrt{m}}{q} \Rightarrow \frac{r_{He^+}}{r_{O^{++}}}=\sqrt{\frac{m_{He^+}}{m_{O^{++}}}}\times\frac{q_{O^{++}}}{q_{He^+}}$

$= \sqrt{\frac{4}{16} \times \frac{2}{1}} = \frac{1}{1}$. Then will deflect equally.

94. (d) $r = \frac{\sqrt{2mE}}{qB} = \frac{\sqrt{2 \times 9 \times 10^{-31} \times 7.2 \times 10^{-18}}}{1.6 \times 10^{-19} \times 9 \times 10^{-5}}$

= 0.25 m = 25 cm

95. (c) $v = \frac{E}{B} = \frac{20}{5} = 4m/\sec$

96. (a) Because magnetic force on charge will be zero.

97. (c) $W = F.d\cos 90^o = 0$

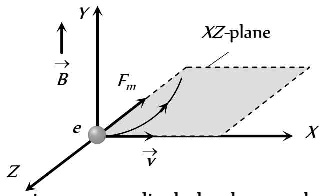
98. (b) Since particle is moving undeflected.

So $qE = qvB \Rightarrow B = E/v = \frac{10^4}{10} = 10^3 Wb/m^2$

99. (a) $r = \frac{mv}{qB} \Rightarrow \frac{r_1}{r_2} = \frac{m_1 v_1}{m_2 v_2} \times \frac{q_2}{q_1} = \frac{1 \times 2}{1 \times 3} \times \frac{2}{1} = \frac{4}{3}$

100. (b) $\vec{F} = -e(\vec{v} \times \vec{B}) \Rightarrow \vec{F} = -e[v\hat{i} \times B\hat{j}] = evB[-\hat{k}]$

i.e. Force on electron is acting towards negative *z*-axis. Hence particle will move on a circle in *xz*-plane.



101. (d) Particles entering perpendicularly, hence they will describe circular path. Since their masses are different so they will describe path of different radii.

102. (c) $r = \frac{mv}{qB} = \frac{6 \times 10^7}{1.7 \times 10^{11} \times 1.5 \times 10^{-2}} = 2.35\, cm$

103. (d) Cyclotron frequency $v = \frac{Bq}{2\pi m}$

$\Rightarrow v = \frac{1 \times 1.6 \times 10^{-19}}{2 \times 3.14 \times 9.1 \times 10^{-31}} = 2.79 \times 10^{10} H_z$

$= 27.9 \times 10^9\, HZ \cong 28\, GHZ$

104. (d) By Fleming's left hand rule.

105. (c) $r = \frac{\sqrt{2mK}}{qB} \Rightarrow q \propto \sqrt{mK} \Rightarrow K \propto \frac{q^2}{m}$

$\Rightarrow \frac{K_\alpha}{K_p} = \left(\frac{q_\alpha}{q_p}\right)^2 \times \frac{m_p}{m_\alpha} \Rightarrow \frac{K_\alpha}{8} = \left(\frac{2q_p}{q_p}\right)^2 \times \frac{m_p}{4m_p} = 1$

$\Rightarrow K_\alpha = 8\, eV$

106. (c) By using $r = \frac{mv}{qB} = \frac{v}{\left(\frac{q}{m}\right)B} \Rightarrow r \propto \frac{1}{(q/m)}$

$\because \left(\frac{q}{m}\right)_{e^-} > \left(\frac{q}{m}\right)_{p^+} > \left\{\left(\frac{q}{m}\right)_d = \left(\frac{q}{m}\right)_\alpha\right\}$

$\therefore R_d = R_\alpha$

107. (d) By using Fleming's left hand rule.

108. (d) Along the axis of coil. $\vec{v}$ and $\vec{B}$ are parallel, so $F = 0$

109. (d) $F_m = qvB\sin\theta$, if $v = 0 \Rightarrow F_m = 0$

110. (d) $T = \frac{2\pi m}{qB} = \frac{2 \times 3.14 \times 9.1 \times 10^{-31}}{1.6 \times 10^{-19} \times 3.534 \times 10^{-5}}$

$= 1 \times 10^{-6} sec = 1\mu sec.$

111. (a)

112. (b)

113. (d) Magnetic field produced by wire at the location of charge is perpendicular to the paper inwards. Hence by applying Fleming's left hand rule, force is directed along *OY*.

114. (c) From Fleming's left hand rule the force on electron is towards the east means it is deflected towards east.

115. (c) Electric current corresponds to the revolution of electron is $i = \frac{ev}{2\pi r}$

Magnetic field due to circular current at the centre $B = \frac{\mu_0}{4\pi} \cdot \frac{2\pi i}{r} = \frac{\mu_0}{4\pi} \cdot \frac{ev}{r^2} \Rightarrow r = \sqrt{\frac{\mu_0}{4\pi} \cdot \frac{ev}{B}} \Rightarrow r \propto \sqrt{\frac{v}{B}}$.

116. (c) When electron moves in both electric and magnetic field then $qE = qvB$.

$\therefore\ v = \frac{E}{B} = \frac{1500}{0.40} = 3750\ m/s = 3.75 \times 10^3 m/s$.

117. (c) For no deflection in mutually perpendicular electric and magnetic field $v = \frac{E}{B} = \frac{3.2 \times 10^5}{2 \times 10^{-3}} = 1.6 \times 10^8\ m/s$.

If electric field is removed then due to only magnetic field radius of the path described by electron $r = \frac{mv}{qB} = \frac{9.1 \times 10^{-31} \times 1.6 \times 10^8}{1.6 \times 10^{-19} \times 2 \times 10^{-3}} = 0.45\, m$

118. (c) $r = \frac{mv}{qB} \Rightarrow r \propto v$

Force and Torque on Current Carrying Conductor

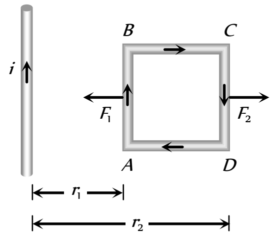
1. (b) Two wires, if carries current in opposite direction, they repel each other.

2. (c) $\because r_1 < r_2$

So $F_1 > F_2$

$\Rightarrow F_{net} = (F_1 - F_2)$

towards the wire.



3. (b) $M = NiA = 20 \times \frac{22}{7}(4 \times 10^{-2})^2 3 = 0.3\ A - m^2$

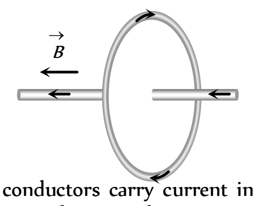
4. (c) Net force on a current carrying closed loop is always zero, if it is placed in an uniform magnetic field.

5. (b) Force per unit length $= \frac{\mu_0}{4\pi} \cdot \frac{2i_1 i_2}{r} = \frac{\mu_0}{2\pi} \cdot \frac{i^2}{b}$

6. (a) $F = \frac{\mu_0}{4\pi} \cdot \frac{2i_1 i_2}{a} \times l \Rightarrow F = 10^{-7} \times \frac{2 \times 10 \times 2}{(10 \times 10^{-2})} \times 2 = 8 \times 10^{-5} N$

7. (b) For charge particles, if they are moving freely in space, electrostatic force is dominant over magnetic force between them. Hence due to electric force they repel each other.

8. (b) As shown in the following figure straight wire is placed parallel to the magnetic field produced by circular current. Hence force on wire $F = 0$



9. (a) Two straight conductors carry current in same direction, then attractive force acts between them.

10. (a) $F = \frac{\mu_0}{4\pi} \frac{2 \times i_1 i_2}{a} = \frac{10^{-7} \times 2 \times 5 \times 5}{0.1} = 5 \times 10^{-5} N/m$

11. (c) $F = \frac{\mu_0}{4\pi} \frac{2i_1 i_2}{a} = 10^{-3} N$

When current in both the wires is doubled, then

$F' = \frac{\mu_0}{4\pi} \frac{2(2i_1 \times 2i_2)}{a} = 4 \times 10^{-3} N$

12. (a) The magnetic moment of current carrying loop

$M = niA = ni(\pi r^2)$

Hence the work done in rotating it through 180°

$W = MB(1 - \cos\theta) = 2MB = 2(ni\pi r^2)B$

$= 2 \times (50 \times 2 \times 3.14 \times 16 \times 10^{-4}) \times 0.1 = 0.1 J$

13. (c) $F = Bil \sin\theta$

$= 500 \times 10^{-4} \times 3 \times (40 \times 10^{-2}) \times \frac{1}{2} = 3 \times 10^{-2} N$

14. (c) $M = i\pi r^2$

15. (a) Because $\tau = NiAB \cos\theta$

16. (c)

17. (b) $\theta = \frac{NiAB}{C} \Rightarrow \theta \propto N$ (Number of turns)

18. (b) Magnet provides damping.

19. (b) $i = \frac{C\theta}{NAB} \Rightarrow i \propto \theta$

20. (b) Force per unit length on two parallel current carrying conductor is given by $\frac{F}{l} = 10^{-7} \times 2 \frac{i_1 i_2}{a}$

$\Rightarrow \frac{F}{l} = 10^{-7} \times 2 \times \frac{1 \times 1}{1} = 2 \times 10^{-7} N/m$

21. (d) $\tau = MB \sin\theta \Rightarrow \tau_{\max} = NiAB$, ($\theta = 90°$)

22. (b) $W = MB(\cos\theta_1 - \cos\theta_2)$

$= (NiA) B(\cos 0° - \cos 180°) = 2NAIB$

23. (d) Magnetic dipole moment of coil = NIA

24. (a) $F = Bil \sin\theta \Rightarrow \sin\theta = \frac{F}{Bil} = \frac{15}{2 \times 10 \times 1.5} = \frac{1}{2} \Rightarrow \theta = 30°$

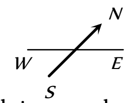
25. (a)

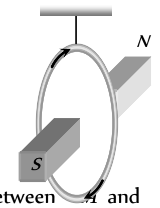
26. (b) $M = i(\pi r^2) = \frac{ev}{2\pi r} \times \pi r^2 \Rightarrow M = \frac{1}{2} evr$

27. (d) Couple of force on loop S will be maximum because for same perimeter the area of loop will be maximum and magnetic moment of loop $= i \times A$. So, it will also be maximum for loop S.

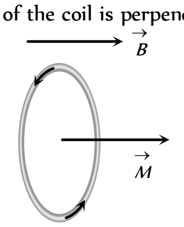
28. (b) According to the definition.

29. (c) Current carrying loop, behaves as a bar magnet. A freely suspended bar magnet stays in the $N - S$ direction.





30. (c) In equilibrium angle between $\vec{M}$ and $\vec{B}$ is zero. It is happened, when plane of the coil is perpendicular to $\vec{B}$



31. (c)

32. (d)

33. (d) Sensitivity $S = \frac{\theta}{i} = \frac{nBA}{C}$

34. (d)

35. (b) By Fleming left hand rule.

36. (a) Force on wire Q due to wire P is

$F_P = 10^{-7} \times \frac{2 \times 30 \times 10}{0.1} \times 0.1 = 6 \times 10^{-5} N$ (Towards left)

Force on wire Q due to wire R is

$F_R = 10^{-7} \times \frac{2 \times 20 \times 10}{0.02} \times 0.1 = 20 \times 10^{-5} N$ (Towards right)

Hence $F_{net} = F_R - F_P = 14 \times 10^{-5} N = 1.4 \times 10^{-4} N$

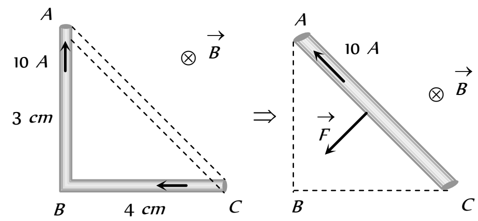
(Towards right)

37. (a) $\tau = NBiA = 100 \times 0.2 \times 2 \times (0.08 \times 0.1) = 0.32 N \times m$

Direction can be found by Fleming's left hand rule.

38. (a) $F = Bil \sin\theta \Rightarrow 7.5 = 2 \times 5 \times 1.5 \sin\theta \Rightarrow \theta = 30°$

39. (c) According to the question figure can be drawn as shown below.



Force on the conductor ABC = Force on the conductor AC

$= 5 \times 10 \times (5 \times 10^{-2}) = 2.5\ N$

40. (d) Current sensitivity $\frac{\theta}{i} = \frac{NBA}{C}$

$\Rightarrow \frac{\theta}{i} = \frac{100 \times 5 \times 10^{-4}}{10^{-8}} = 5\ rad/\mu\ Amp$

41. (c) $\tau = NBiA = 100 \times 0.5 \times 1 \times 400 \times 10^{-4} = 2\ N-m$

42. (a) When current is passed through a spring, it gets compressed.

43. (a) $M = iA \Rightarrow i = M/A$

44. (c) $i = 6.6 \times 10^{15} \times 1.6 \times 10^{-19} = 10.5 \times 10^{-4} amp$

$A = \pi R^2 = 3.142 \times (0.528)^2 \times 10^{-20} m^2$

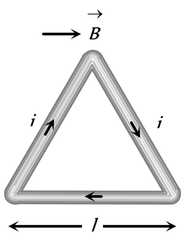
$\Rightarrow M = iA = 10.5 \times 10^{-4} \times 3.142 \times (0.528)^2 \times 10^{-20}$

$= 10 \times 10^{-24} units = 1 \times 10^{-23} units$

45. (d) Since $\theta = 90°$

Hence $\tau = NIAB = 1 \times I \times \left(\frac{\sqrt{3}}{4} l^2\right) B$

$= \frac{\sqrt{3}}{4} l^2 B$



46. (a) For no force on wire C, force on wire C due to wire D = force on wire C due to wire B

$\Rightarrow \frac{\mu_0}{4\pi} \times \frac{2 \times 15 \times 5}{x} \times l = \frac{\mu_0}{4\pi} \times \frac{2 \times 5 \times 10}{(15 - x)} \times l \Rightarrow x = 9cm.$

47. (d) By Fleming's left hand rule.

48. (a)

49. (a)

50. (c) Force on the wire = Bil

Force per unit length $= Bi = 10^{-4} \times 10 = 10^{-3}\ N$

51. (b) $F = Bil = 2 \times 1.2 \times 0.5 = 1.2N$

52. (a) $F = \frac{\mu_0}{4\pi} \frac{2i_1 i_2}{a} = 10^{-7} \times \frac{2 \times 10 \times 10}{0.1} = 2 \times 10^{-4}\ N$

Direction of current is same, so force is attractive.

53. (a,b,c) Sensitivity $\frac{\theta}{i} = \frac{NAB}{C}$

54. (a) $M = NiA = 24 \times 0.75 \times 3.14 \times (3.5 \times 10^{-2})^2$

$= 6.9 \times 10^{-2} A\text{-}m^2$

55. (c) $\frac{F}{l} = \frac{\mu_0}{4\pi} \times \frac{2i_1 i_2}{a} = \frac{\mu_0}{4\pi} \frac{2i^2}{a}$ $(\because i_1 = i_2 = i)$

$\Rightarrow 2 \times 10^{-7} = 10^{-7} \times \frac{2i^2}{1} \Rightarrow i = 1A$

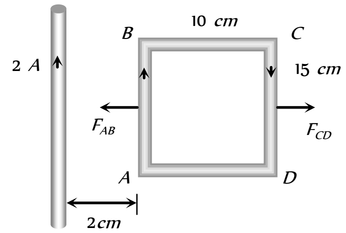
56. (b)

57. (a) $\tau = NiAB \sin\theta = 0$ $(\because \theta = 0^o)$

58. (d) $M = NiA$

59. (c)

60. (a) Force on side BC and AD are equal but opposite so their net will be zero.



But $F_{AB} = 10^{-7} \times \frac{2 \times 2 \times 1}{2 \times 10^{-2}} \times 15 \times 10^{-2} = 3 \times 10^{-6}\ N$

and $F_{CD} = 10^{-7} \times \frac{2 \times 2 \times 1}{(12 \times 10^{-2})} \times 15 \times 10^{-2} = 0.5 \times 10^{-6}\ N$

$\Rightarrow F_{net} = F_{AB} - F_{CD} = 2.5 \times 10^{-6}\ N$

$= 25 \times 10^{-7}\ N$, towards the wire.

61. (b) $F = 10^{-7} \frac{2i_1 i_2}{a} = 10^{-7} \times \frac{2 \times 5 \times 5}{0.5} = 10^{-5}\ N$ (repulsive)

62. (b) Sensitivity $= \frac{NAB}{C}$

63. (d) $M = iA = 0.1 \times \pi \times (0.05)^2$

$= (0.1) \times 3.14 \times 25 \times 10^{-4} = 7.85 \times 10^{-4} amp - m^2$

64. (b) $B = \frac{\mu_0 i}{2R} \Rightarrow i = \frac{B \times 2R}{\mu_0}$

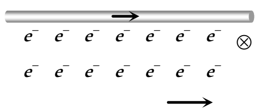
Now, $M = i \times A = i\pi R^2 = \frac{B \times 2R}{\mu_0} \times \pi R^2 = \frac{2\pi BR^3}{\mu_0}$

65. (c) $M = NiA \Rightarrow M \propto A \Rightarrow M \propto r^2$ $(\text{As}\, l = 2\pi r \Rightarrow l \propto r)$

$\Rightarrow M \propto l^2$

66. (a) $F = \frac{\mu_0}{4\pi} \frac{2i_1 i_2}{a} = 10^{-7} \times \frac{2 \times 10 \times 5}{0.1} = 10^{-4}\ N$ (Repulsive)

67. (b) According to Fleming's left hand rule, magnetic force on electrons will be downward.

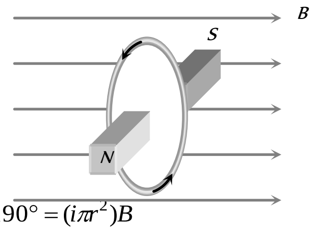


68. (a) $\sigma_i = \frac{\theta}{i} = \frac{\theta}{iG} \cdot G = \sigma_V G \Rightarrow \frac{\sigma_i}{G} = \sigma_V$

69. (a)

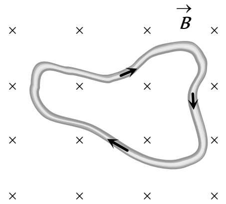
70. (a) $F = Bil \sin 30^o = 1.5 \times 10 \times 1 \times \frac{1}{2} = 7.5N$

71. (c) As shown in the following figure, the given situation is similar to a bar magnet placed in a uniform magnetic field perpendicularly. Hence torque on it



$\tau = MB\sin 90° = (i\pi r^2)B$

72. (a) As shown in figure, since $\vec{L} = 0$



Hence according to $\vec{F} = i(\vec{L} \times \vec{B}) \Rightarrow \vec{F} = 0$

73. (a) Because $\tau_{max} = BiNA \Rightarrow \tau \propto N$.

74. (d)

75. (d) $F = \frac{\mu_0}{4\pi}\frac{2i_1 i_2}{a}$

$F_1 = \frac{\mu_0}{4\pi} = \frac{2i^2}{x}$ (Attraction)

$F_2 = \frac{\mu_0}{4\pi} = \frac{2i \times 2i}{2x} = \frac{\mu_0}{4\pi}\frac{2i^2}{x}$ (Repulsion)

Thus $F_1 = -F_2$

76. (c) Magnetic field produced by wire is perpendicular to the motion of electron and it is given by

$B = \frac{\mu_0}{4\pi}\cdot\frac{2i}{a} = 10^{-7} \times \frac{2 \times 5}{0.1} = 10^{-5}\, Wb/m^2$

Hence force on electron

$F = qvB = (1.6 \times 10^{-19}) \times 5 \times 10^6 \times 10^{-5} = 8 \times 10^{-18}\, N$

77. (a) Sensitivity (S) = $\frac{\theta}{i} \Rightarrow \frac{S_A}{S_B} = \frac{i_B}{i_A} = \frac{5}{3} \Rightarrow S_A > S_B$

78. (a) $F = 10^{-7}\frac{2i_1 i_2}{a} = 10^{-7} \times \frac{2 \times 5 \times 8}{0.5} = 1.6 \times 10^{-5}$ (Attractive)

79. (b) In moving coil galvanometer $i \propto \theta$.

80. (c)

81. (b) $F \propto i_1 i_2$, so force on B due to C will be greater than that due A. Hence net force on B acts towards C.

82. (c) $F \propto \frac{i_1 i_2}{a}$; Since one of the current increase two times and distance increases three times, so force become $\frac{2}{3}$ times. Also due to the reversal of direction of current force becomes negative.

83. (c) Neon molecule is diatomic, so it's net magnetic moment is zero.

84. (b) $F = Bil \Rightarrow 1 \times 9.8 = 0.98 \times i \times 1 \Rightarrow i = 10A$

85. (a)

86. (d) $F = 10^{-7} \times \frac{2i^2}{a} \times l \Rightarrow 30 \times 10^{-7} = 10^{-7} \times \frac{2i^2}{0.15} \times 9$

$\Rightarrow i = 0.5A$

87. (c) $\tau_{max} = NiAB = 1 \times i \times (\pi r^2) \times B \quad \left(2\pi r = L, \Rightarrow r = \frac{L}{2\pi}\right)$

$\tau_{max} = \pi i\left(\frac{L}{2\pi}\right)^2 B = \frac{L^2 iB}{4\pi}$

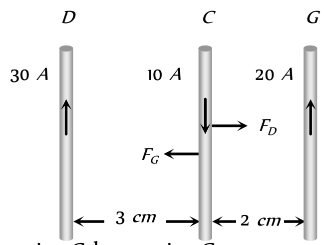
88. (b)

89. (c) $\left(\frac{F}{l}\right) = \frac{\mu_0}{4\pi}.\frac{2i_1 i_2}{a} \Rightarrow \left(\frac{F}{l}\right) = \frac{\mu_0}{4\pi}.\frac{2i^2}{d} = \frac{\mu_0 i^2}{2\pi d}$ (Attractive)

90. (c) Force on wire C due to wire D

$F_D = 10^{-7} \times \frac{2 \times 30 \times 10}{2 \times 10^{-2}} \times 25 \times 10^{-2} = 5 \times 10^{-4}\, N$

(towards right)



Force on wire C due to wire G

$F_G = 10^{-7} \times \frac{2 \times 20 \times 10}{2 \times 10^{-2}} \times 25 \times 10^{-2} = 5 \times 10^{-4}\, N$

(towards left)

$\Rightarrow$ Net force on wire C is $F_{net} = F_D - F_G = 0$

91. (d) Since $\theta = 0°$ so $\tau = 0$ ($\because \tau = NiAB\sin\theta$)

Critical Thinking Questions

1. (b) $\frac{B_{centre}}{B_{axis}} = \left(1 + \frac{x^2}{R^2}\right)^{3/2}$, also $B_{axis} = \frac{1}{8}B_{centre}$

$\Rightarrow \frac{8}{1} = \left(1 + \frac{x^2}{R^2}\right)^{3/2} \Rightarrow 2 = \left(1 + \frac{x^2}{R^2}\right)^{1/2}$

$\Rightarrow 4 = 1 + \frac{x^2}{R^2} \Rightarrow 3 = \frac{x^2}{R^2} \Rightarrow x^2 = 3R^2 \Rightarrow x = \sqrt{3}R$

2. (a) Field at the centre $B_1 = \frac{\mu_0}{4\pi} \times \frac{2\pi in}{r} = \frac{\mu_0}{2}.\frac{ni}{r}$

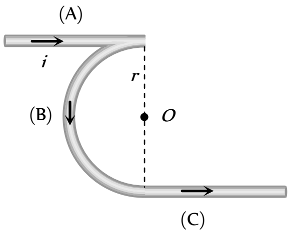
Field at a distance h from the centre

$B_2 = \frac{\mu_0}{4\pi}.\frac{2\pi nir^2}{(r^2 + h^2)^{3/2}} = \frac{\mu_0}{2}.\frac{nir^2}{r^3\left(1 + \frac{h^2}{r^2}\right)^{3/2}}$

$= B_1\left(1+\frac{h^2}{r^2}\right)^{-3/2} = B_1\left(1-\frac{3}{2}.\frac{h^2}{r^2}\right)$ (By binomial theorem)

Hence B_2 is less than B_1 by a fraction $= \frac{3}{2}\frac{h^2}{r^2}$

3. (a) ***Case* 1 :** $B_A = \frac{\mu_0}{4\pi}.\frac{i}{r}\otimes$



$B_B = \frac{\mu_0}{4\pi}.\frac{\pi i}{r}\odot$

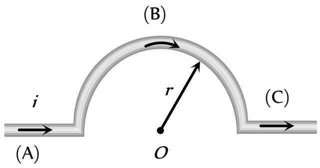
$B_C = \frac{\mu_0}{4\pi}.\frac{i}{r}\odot$

So net magnetic field at the centre of case 1

$B_1 = B_B - B_C - B_A \Rightarrow B_1 = \frac{\mu_0}{4\pi}.\frac{\pi i}{r}\odot$ ..... (i)

***Case* 2 :** As we discussed before magnetic field at the centre O in this case

$B_2 = \frac{\mu_0}{4\pi}.\frac{\pi i}{r}\otimes$ ..... (ii)

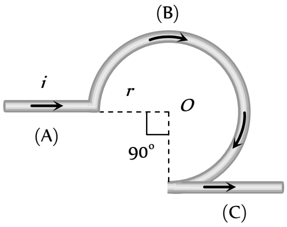


***Case 3* :** $B_A = 0$

$B_B = \frac{\mu_0}{4\pi}.\frac{(2\pi - \pi/2)i}{r}\otimes$

$B_C = \frac{\mu_0}{4\pi}.\frac{i}{r}\odot$

$= \frac{\mu_0}{4\pi}.\frac{3\pi i}{2r}\otimes$



So net magnetic field at the centre of case 3

$B_3 = \frac{\mu_0}{4\pi}.\frac{i}{r}\left(\frac{3\pi}{2}-1\right)\otimes$ ..... (iii)

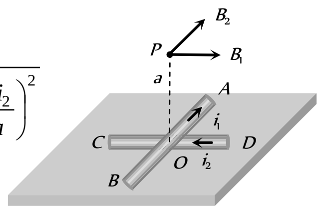
From equation (i), (ii) and (iii)

$B_1 : B_2 : B_3 = \pi\odot : \pi\otimes \left(\frac{3\pi}{2}-1\right)\otimes = -\frac{\pi}{2}:\frac{\pi}{2}:\left(\frac{3\pi}{4}-\frac{1}{2}\right)$

4. (c) At P: $B_{net} = \sqrt{B_1^2 + B_2^2}$

$= \sqrt{\left(\frac{\mu_0}{4\pi}\frac{2i_1}{a}\right)^2 + \left(\frac{\mu_0}{4\pi}\frac{2i_2}{a}\right)^2}$

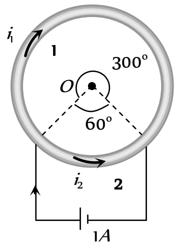
$= \frac{\mu_0}{2\pi a}(i_1^2 + i_2^2)^{1/2}$



5. (c) $B = \frac{\mu_0}{4\pi}\frac{\theta i}{r} \Rightarrow B \propto \theta i$ (but $\frac{i_1}{i_2} = \frac{l_2}{l_1} = \frac{\theta_2}{\theta_1}$)

$\Rightarrow \frac{B_1}{B_2} = \frac{\theta_1}{\theta_2}.\frac{i_1}{i_2}$

So, $\frac{B_1}{B_2} = \frac{\theta_1}{\theta_2}\times\frac{\theta_2}{\theta_1}$



$\Rightarrow B_1 = B_2$

6. (c) Magnetic field at any point lying on the current carrying straight conductor is zero.

Here H_1 = Magnetic field at M due to current in PQ.

H_2 = Magnetic field at M due to QR

+ magnetic field at M due to QS

+ magnetic field at M due to PQ

$= 0 + \frac{H_1}{2} + H_1 = \frac{3}{2}H_1 \Rightarrow \frac{H_1}{H_2} = \frac{2}{3}$

7. (c, d) $B_{net} = B_1 - B_2 \Rightarrow B_1 - B_2 = 0 \Rightarrow B_1 = B_2$

$\Rightarrow B \propto ni$. So $n_1 i_1 = n_2 i_2$ or $n_1 = n_2$ and $i_1 = i_2$

8. (c) Number of turns per unit width $= \frac{N}{b-a}$

Consider an elemental ring of radius x and with thickness dx

Number of turns in the ring $= dN = \frac{Ndx}{b-a}$

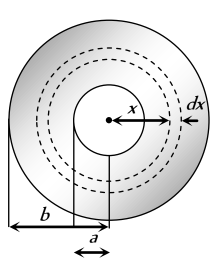
Magnetic field at the centre due to the ring element

$dB = \frac{\mu_0 (dN) i}{2x} = \frac{\mu_0 i}{2}.\frac{Ndx}{(b-a)}.\frac{1}{x}$

$\therefore$ Field at the centre

$= \int dB = \frac{\mu_0 Ni}{2(b-a)}\int_a^b \frac{dx}{x}$

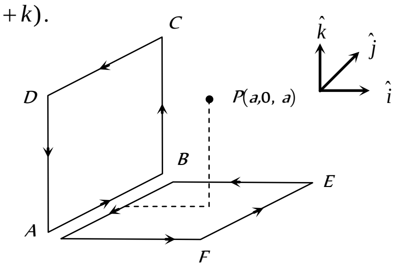
$= \frac{\mu_0 Ni}{2(b-a)}\ln\frac{b}{a}.$



9. (d) The magnetic field at $P(a, 0, a)$ due to the loop is equal to the vector sum of the magnetic fields produced by loops *ABCDA* and *AFEBA* as shown in the figure.

Magnetic field due to loop *ABCDA* will be along $\hat{i}$ and due to loop *AFEBA*, along $\hat{k}$. Magnitude of magnetic field due to both the loops will be equal.

Therefore, direction of resultant magnetic field at P will be $\frac{1}{\sqrt{2}}(\hat{i}+\hat{k})$.

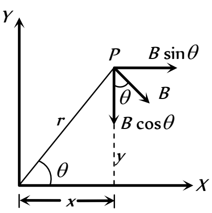


10. (a) Magnetic field at P is $\vec{B}$, perpendicular to OP in the direction shown in figure.

So, $\vec{B} = B\sin\theta\hat{i} - B\cos\theta\hat{j}$

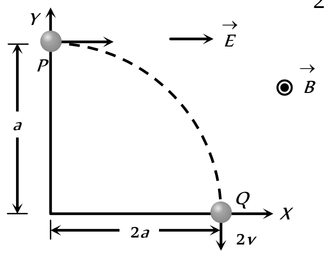
Here $B = \frac{\mu_0}{2\pi}\frac{I}{r}$

$\sin\theta = \frac{y}{r}$ and $\cos\theta = \frac{x}{r}$



$$\therefore\ \vec{B} = \frac{\mu_0 I}{2\pi}\cdot\frac{1}{r^2}(y\hat{i} - x\hat{j}) = \frac{\mu_0 I(y\hat{i} - x\hat{j})}{2\pi(x^2 + y^2)} \text{ (as } r^2 = x^2 + y^2\text{)}$$

11. (a, b, d) Kinetic energy of the particle at point $P = \frac{1}{2}mv^2$



K.E. of the particle at point $Q = \frac{1}{2}m(2v)^2$

Increase in K.E. $= \frac{3}{2}mv^2$

It comes from the work done by the electric force qE on the particle as it covers a distance $2a$ along the x-axis. Thus $\frac{3}{2}mv^2 = qE\times 2a \Rightarrow E = \frac{3}{4}\frac{mv^2}{qa}$. The rate of work done by the electric field at P $= F\times v = qE\times v = 3\frac{mv^3}{4a}$

At $Q, \vec{F_e} = q\vec{E}$ is along x-axis while velocity is along negative y-axis. Hence rate of work done by electric field $= \vec{F_e}.\vec{v} = 0$ $(\because \theta = 90^o)$ Similarly, according to equation $\vec{F_m} = q(\vec{v}\times\vec{B})$

Force $\vec{F_m}$ is also perpendicular to velocity vector $\boldsymbol{v}$.

Hence the rate of work done by the magnetic field = 0

12. (a, c) $r \propto \frac{\sqrt{m}}{q} \Rightarrow r_H : r_{He} : r_o = \frac{\sqrt{1}}{1} : \frac{\sqrt{4}}{1} : \frac{\sqrt{16}}{2} = 1:2:2$

Radius is smallest for H^+, so it is deflected most.

13. (c) As the electric field is switched on, positive ion will start to move along positive x-direction and negative ion along negative x-direction. Current associated with motion of both types of ions is along positive x-direction. According to Fleming's left hand rule force on both types of ions will be along negative y-direction.

14. (c) $\vec{v} = 2\times 10^5\hat{i}$ and $\vec{B} = (\hat{i} + 4\hat{j} - 3\hat{k})$

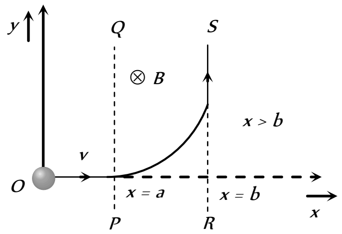
$$\vec{F} = q(\vec{v}\times\vec{B}) = -1.6\times 10^{-19}[2\times 10^5\hat{i}\times(\hat{i} + 4\hat{j} - 3\hat{k})]$$

$$= -1.6\times 10^{-19}\times 2\times 10^5[\hat{i}\times\hat{i} + 4(\hat{i}\times\hat{j}) - 3(\hat{i}\times\hat{k})]$$

$$= -3.2\times 10^{-14}[0 + 4\hat{k} + 3\hat{j}] = 3.2\times 10^{-14}(-4\hat{k} - 3\hat{k})$$

$$\Rightarrow |\vec{F}| = 3.2\times 10^{-14}\times 5 = 1.6\times 10^{-13}\,N.$$

15. (b) In the figure, the z-axis points out of the paper, and the magnetic field is directed into the paper, existing in the region between PQ and RS. The particle moves in a circular path of radius r in the magnetic field. It can just enter the region $x > b$ for $r \geq (b - a)$



Now, $r = \frac{mv}{qB} \geq (b - a)$

or $v \geq \frac{q(b-a)B}{m} \Rightarrow v_{\min} = \frac{q(b-a)B}{m}$

16. (b) Electric field can deviate the path of the particle in the shown direction only when it is along negative y-direction. In the given options $\vec{E}$ is either zero or along x-direction. Hence it is the magnetic field which is really responsible for its curved path. Options (a) and (c) can't be accepted as the path will be helix in that case (when the velocity vector makes an angle other than 0°, 180° or 90° with the magnetic field, path is a helix) option (d) is wrong because in that case component of net force on the particle also comes in k direction which is not acceptable as the particle is moving in x-y plane. Only in option (b) the particle can move in x-y plane.

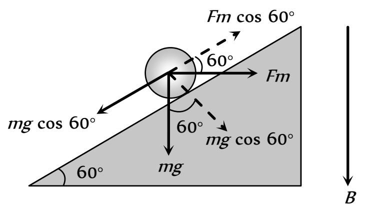
In option (d) : $\vec{F}_{net} = q\vec{E} + q(\vec{v}\times\vec{B})$

Initial velocity is along x-direction. So let $\vec{v} = v\hat{i}$

$$\therefore\ \vec{F}_{net} = qa\hat{i} + q[(v\hat{i})\times(c\hat{k} + b\hat{j}] = qa\hat{i} - qvc\hat{j} + qvb\hat{k}$$

In option (b) $\vec{F}_{net} = q(a\hat{i}) + q[(v\hat{i})\times(c\hat{k} + a\hat{i}) = qa\hat{i} - qvc\hat{j}$

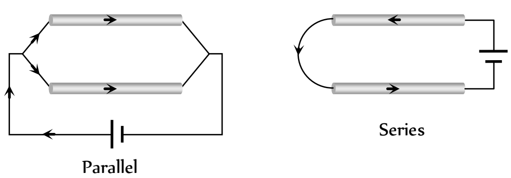
17. (c) The given situation can be drawn as follows



$$F = ilB \Rightarrow mg\sin 60^o = ilB\cos 60^o$$

$$\Rightarrow B = \frac{0.01\times 10\times\sqrt{3}}{0.1\times 1.73} = 1\,T$$

18. (a) When connected in parallel the current will be in the same direction and when connected in series the current will be in the opposite direction.



19. (b) If the radius of circle is r, then $2\pi r = L \Rightarrow r = \frac{L}{2\pi}$

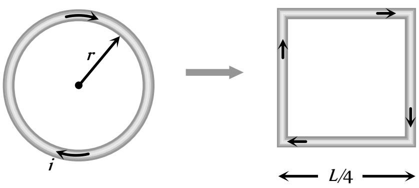
Area $= \pi r^2 = \dfrac{\pi L^2}{4\pi^2} = \dfrac{L^2}{4\pi}$

Magnetic moment $= IA = \dfrac{IL^2}{4\pi}$

20. (d) Initially for circular coil $L = 2\pi r$ and $M = i\times\pi r^2$

$= i\times\pi\left(\dfrac{L}{2\pi}\right)^2 = \dfrac{iL^2}{4\pi}$ ..... (i)

Finally for square coil $M' = i\times\left(\dfrac{L}{4}\right)^2 = \dfrac{iL^2}{16}$ ..... (ii)



Solving equation (i) and (ii) $M' = \dfrac{\pi M}{4}$

21. (c) The effective current $i = \dfrac{q\omega}{2\pi}$ and $A = \pi r^2$.

Magnetic moment $M = iA = \dfrac{1}{2}q\omega r^2$

Angular moment $L = I\omega = mr^2\omega \Rightarrow \dfrac{M}{L} = \dfrac{q}{2m}$

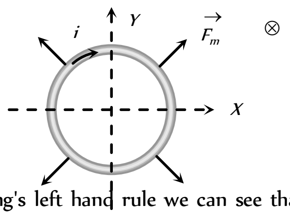
22. (b) On applying Fleming's left hand rule.

23. (b) Current carrying conductors will attract each other, while electron beams will repel each other.

24. (c) Length of the component dl which is parallel to wire (1) is $dl\cos\theta$, so force on it.

$F = \dfrac{\mu_0}{4\pi}.\dfrac{2i_1i_2}{r}(dl\cos\theta) = \dfrac{\mu_0 i_1 i_2 dl\cos\theta}{2\pi r}$

25. (b) Net force on a current carrying loop in uniform magnetic field is zero. Hence the loop can't translate. So, options (c) and (d) are wrong.



From Fleming's left hand rule we can see that if magnetic field is perpendicular to paper inwards and current in the loop is clockwise (as shown) the magnetic force $\vec{F_m}$ on each element of the loop is radially outwards, or the loops will have a tendency to expand.

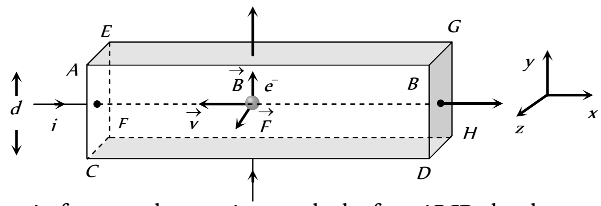
26. (c) $U = -MB\cos\theta$; where $\theta =$ Angle between normal to the plane of the coil and direction of magnetic field.

27. (a) As the block is of metal, the charge carriers are electrons, so for current along positive x-axis, the electrons are moving along negative x-axis, *i.e.* $\vec{v} = -v\hat{i}$

and as the magnetic field is along the y-axis, *i.e.* $\vec{B} = B\hat{j}$

so $\vec{F} = q(\vec{v}\times\vec{B})$ for this case yield $\vec{F} = (-e)[-v\hat{i}\times B\hat{j})]$

i.e., $\vec{F} = evB\hat{k}$ [As $\hat{i}\times\hat{j} = \hat{k}$]



As force on electrons is towards the face *ABCD,* the electrons will accumulate on it an hence it will acquire lower potential.

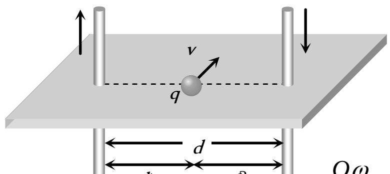
28. (a)

29. (a) $i = \dfrac{2q\omega}{2\pi} = \dfrac{q\omega}{\pi}$; $\therefore M = iA = \dfrac{q\omega}{\pi}\pi R^2 = q\omega R^2$

$L = 2R.mv = 2R.mR\omega = 2mR^2\omega$ $(\because v = R\omega)$

$\Rightarrow \dfrac{M}{L} = \dfrac{q}{2m}$

30. (d) According to gives information following figure can be drawn, which shows that direction of magnetic field is along the direction of motion of charge so net force on it is zero.

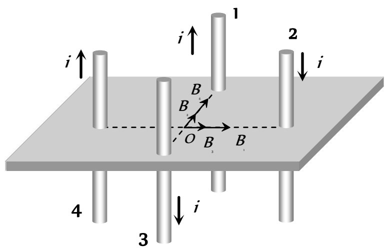


31. (b) $M = iA = i\times\pi R^2$ also $i = \dfrac{Q\omega}{2\pi} \Rightarrow M = \dfrac{1}{2}$

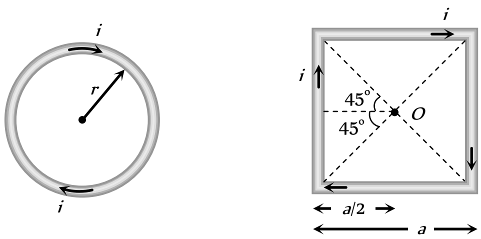
32. (c) Direction of magnetic field (B, B, B and B) at origin due to wires 1, 2, 3 and 4 are shown in the following figure.

$B_1 = B_2 = B_3 = B_4 = \dfrac{\mu_0}{4\pi}.\dfrac{2i}{x} = B$. So net magnetic field at origin O

$B_{net} = \sqrt{(B_1+B_3)^2+(B_2+B_4)^2} = \sqrt{(2B)^2+(2B)^2} = 2\sqrt{2}B$



33. (b) Circular coil Square coil



Length $L = 2\pi r$ Length $L = 4a$

Magnetic field at the centre of circular coil

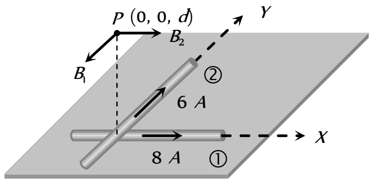
$$B_{circular} = \frac{\mu_0}{4\pi}.\frac{2\pi i}{r} = \frac{\mu_0}{4\pi}.\frac{4\pi^2 i}{L}$$

Magnetic field at the centre of square coil

$$B_{square} = \frac{\mu_0}{4\pi}.\frac{8\sqrt{2}\,i}{a} = \frac{\mu_0}{4\pi}.\frac{32\sqrt{2}\,i}{L}$$

Hence $\frac{B_{circular}}{B_{square}} = \frac{\pi^2}{8\sqrt{2}}$

34. (d) Magnetic field at P due to wire 1, $B_1 = \frac{\mu_0}{4\pi}.\frac{2(8)}{d}$



and due to wire 2, $B_2 = \frac{\mu_0}{4\pi}.\frac{2(6)}{d}$

$$\Rightarrow B_{net} = \sqrt{B_1^2 + B_2^2} = \sqrt{\left(\frac{\mu_0}{4\pi}.\frac{16}{d}\right)^2 + \left(\frac{\mu_0}{4\pi}.\frac{12}{d}\right)^2}$$

$$= \frac{\mu_0}{4\pi} \times \frac{2}{d} \times 10 = \frac{5\mu_0}{\pi d}$$

35. (b) According to question resistance of wire ADC is twice that of wire ABC. Hence current flows through ADC is half that of ABC *i.e.* $\frac{i_2}{i_1} = \frac{1}{2}$. Also $i_1 + i_2 = i \Rightarrow i_1 = \frac{2i}{3}$ and $i_2 = \frac{i}{3}$

Magnetic field at centre O due to wire AB and BC (part 1 and 2) $B_1 = B_2 = \frac{\mu_0}{4\pi}.\frac{2i_1 \sin 45^o}{a/2} \otimes = \frac{\mu_0}{4\pi}.\frac{2\sqrt{2}\,i_1}{a} \otimes$

and magnetic field at centre O due to wires AD and DC (*i.e.* part 3 and 4) $B_3 = B_4 = \frac{\mu_0}{4\pi}\frac{2\sqrt{2}\,i_2}{a} \odot$

Also $i_1 = 2i_2$. So $(B_1 = B_2) > (B_3 = B_4)$

Hence net magnetic field at centre O

$$B_{net} = (B_1 + B_2) - (B_3 + B_4)$$

$$= 2 \times \frac{\mu_0}{4\pi}.\frac{2\sqrt{2} \times \left(\frac{2}{3}i\right)}{a} - \frac{\mu_0}{4\pi}.\frac{2\sqrt{2}\left(\frac{i}{3}\right) \times 2}{a}$$

$$= \frac{\mu_0}{4\pi}.\frac{4\sqrt{2}\,i}{3a}(2-1)\otimes = \frac{\sqrt{2}\,\mu_0 i}{3\pi a}\otimes$$

36. (d) By using $B = \frac{\mu_0 i}{2\pi r}\left(\frac{r^2 - a^2}{b^2 - a^2}\right)$ here $r = \frac{3R}{2}$, $a = R$, $b = 2R$

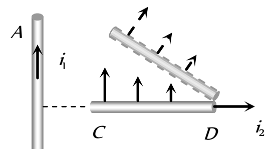
$$\Rightarrow B = \frac{\mu_0 i}{2\pi\left(\frac{3R}{2}\right)} \times \left\{\frac{\left(\frac{3R}{2}\right)^2 - R^2}{(2R^2) - R^2}\right\} = \frac{5.\mu_o i}{36\pi R}.$$

37. (a) Suppose in equilibrium wire PQ lies at a distance r above the wire AB

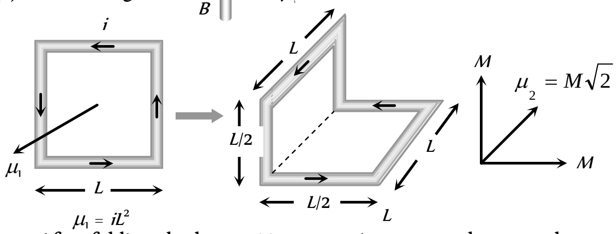
Hence in equilibrium $mg = Bil \Rightarrow mg = \frac{\mu_0}{4\pi}\left(\frac{2i}{r}\right) \times il$

$$\Rightarrow 10^{-3} \times 10 = 10^{-7} \times \frac{2 \times (50)^2}{r} \times 0.5 \Rightarrow r = 25\,mm$$

38. (c) Since the force on the rod CD is non-uniform it will experience force and torque. From the left hand side it can be seen that the force will be upward and torque is clockwise.



39. (c) Initial magnetic moment = $\mu_1 = iL^2$



After folding the loop, M = magnetic moment due to each part

$$= i\left(\frac{L}{2}\right) \times L = \frac{iL^2}{2} = \frac{\mu_1}{2}$$

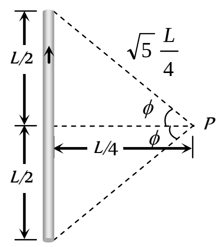
$$\Rightarrow \mu_2 = M\sqrt{2} = \frac{\mu_1}{2} \times \sqrt{2} = \frac{\mu_1}{\sqrt{2}}$$

40. (a) By using $B = \frac{\mu_0}{4\pi}.\frac{i}{a}(\sin\phi_1 + \sin\phi_2)$

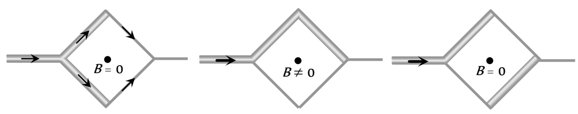
$$\Rightarrow B = \frac{\mu_0}{4\pi}.\frac{i}{(L/4)}(2\sin\phi)$$

Also $\sin\phi = \frac{L/2}{\sqrt{5}L/4} = \frac{2}{\sqrt{5}}$

$$\Rightarrow B = \frac{4\mu_0 i}{\sqrt{5}\pi L}$$



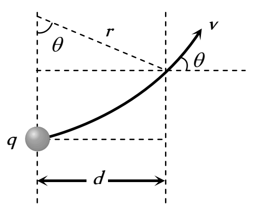
41. (d) In P and R loops, currents are divided in same proportion because the branches have equal resistance. Hence magnetic field produced at centre due to each segment is of equal magnitude but of opposite direction, so net field is zero.



42. (a) From figure it is clear that

$\sin\theta = \frac{d}{r}$ also $r = \frac{p}{qB}$

$$\therefore \sin\theta = \frac{Bqd}{p}$$

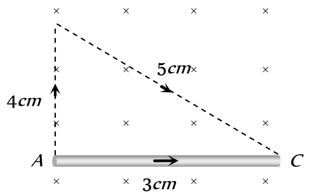


43. (a) $\vec{F}_{CAD} = \vec{F}_{CD} = \vec{F}_{CED}$

$\therefore$ Net force on frame $= 3\vec{F}_{CD} = (3)(2)(1)(4)$ ($F = ilB$)

$= 24\ N$

44. (b) The given curved wire can be treated as a straight wire as shown

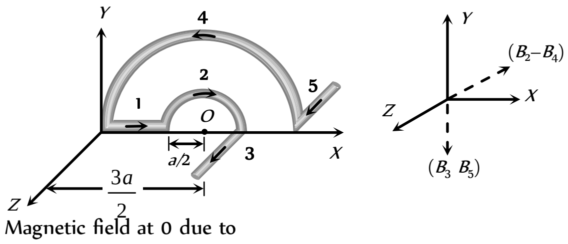


Force acting on the wire *AC*, $F = Bil = 2\times 2\times 3\times 10^{-2}$

$= 12\times 10^{-2} N$ along *y*-axis.

So acceleration of wire $= \frac{F}{m} = \frac{12\times 10^{-2}}{10\times 10^{-3}} = 12\,m/s^2$

45. (b)



Magnetic field at O due to

Part (1) : $B_1 = 0$

Part (2): $B_2 = \frac{\mu_0}{4\pi}.\frac{\pi i}{(a/2)} \otimes$ (along –*Z*-axis)

Part (3): $B_3 = \frac{\mu_0}{4\pi}.\frac{i}{(a/2)}(\downarrow)$ (along – *Y*-axis)

Part (4): $B_4 = \frac{\mu_0}{4\pi}.\frac{\pi i}{(3a/2)} \odot$ (along +*Z*-axis)

Part (5): $B_5 = \frac{\mu_0}{4\pi}.\frac{i}{(3a/2)}(\downarrow)$ (along – *Y*-axis)

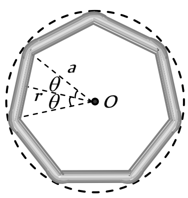
$$B_2 - B_4 = \frac{\mu_0}{4\pi}.\frac{\pi i}{a}\left(2 - \frac{2}{3}\right) = \frac{\mu_0 i}{3a} \otimes \text{ (along – Z-axis)}$$

$$B_3 + B_5 = \frac{\mu_0}{4\pi}.\frac{1}{a}\left(2 + \frac{2}{3}\right) = \frac{8\mu_0 i}{12\pi a}(\downarrow) \text{ (along – Y-axis)}$$

Hence net magnetic field

$$B_{net} = \sqrt{(B_2 - B_4)^2 + (B_3 + B_5)^2} = \frac{\mu_0 i}{3\pi a}\sqrt{\pi^2 + 4}$$

46. (b) Magnetic field at the centre due to one side



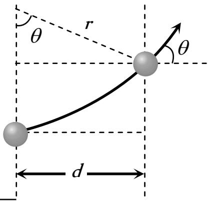
$B_1 = \frac{\mu_0}{4\pi}.\frac{2i\sin\theta}{r}$ where $r = a\cos\theta$

So $B_1 = \frac{\mu_0}{4\pi}.\frac{2i\sin\theta}{a\cos\theta} = \frac{\mu_0 i}{2\pi a}\tan\theta$

Hence net magnetic field

$$B_{net} = n\times\frac{\mu_0 i}{2\pi a}\tan\frac{\pi}{n}.$$

47. (b) According to following figure $\sin\theta = \frac{d}{r}$



also $r = \frac{\sqrt{2mk}}{qB} = \frac{1}{B}\sqrt{\frac{2mV}{q}}$

$\therefore \sin\theta = Bd\sqrt{\frac{q}{2mV}}$

$= 0.51\times 0.1\sqrt{\frac{1.6\times 10^{-19}}{2\times 1.67\times 10^{-27}\times 500\times 10^3}}$

$= \frac{1}{2} \Rightarrow \theta = 30^o$

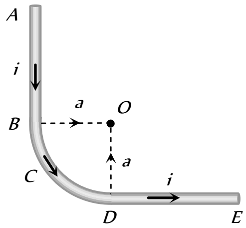
48. (b) The field at the midpoint of *BC* due to *AB* is $\left(-\frac{\mu_0}{4\pi}.\frac{i}{d/2}\hat{k}\right)$ and the same is due to *CD*. Therefore the total field is $\left[-\left(\frac{\mu_0 i}{\pi d}\right)\hat{k}\right]$

49. (a) The electron reverses it's direction. It can be done by covering semi-circular path in *x-z* or *x-y* plane.

50. (d) The field at O due to *AB* is $\frac{\mu_0}{4\pi}.\frac{i}{a}\hat{k}$ and that due to *DE* is also $\frac{\mu_0}{4\pi}.\frac{i}{a}\hat{k}$.

However the field due to *BCD* is $\frac{\mu_0}{4\pi}.\frac{i}{a}\left(\frac{\pi}{2}\right)\hat{k}$.

Thus the total field at *O* is $\frac{\mu_0}{4\pi}.\frac{i}{a}\left(2 + \frac{\pi}{2}\right)\hat{k}$



51. (d) The energy of a charged particle moving in magnetic field remains constant because the magnetic field does not do any work. Therefore kinetic energy is constant *i.e.* $u = v$.

The force on electron will act along negative *y*-axis initially. The electron will undergo circular motion in clockwise direction and emerge out the field. So $y < 0$.

Graphical Questions

1. (c) $|\vec{B}| = \frac{\mu_0}{4\pi}.\frac{2\pi i}{r} \Rightarrow |\vec{B}| \propto \frac{1}{r}$

2. (a) Every point on line *AB* will be equidistant from *X* and *Y*-axis. So magnetic field at every point on line *AB* due to wire 1 along *X*-axis is equal in magnitude but opposite in direction to the magnetic field due to wire along *Y*-axis. Hence B_{net} on $AB = 0$

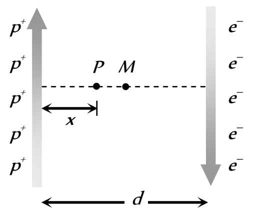
3. (b) If the current flows out of the paper, the magnetic field at points to the right of the wire will be upwards and to the left will be downward. Now magnetic field at *C*, is zero. The field in the region BX' will be upwards $(+ve)$ because all points lying in this region are to the right of both the wires. Similarly, magnetic field in the region *AX* will be downwards $(-\ ve)$. The field in the region *AC* will be upwards $(+ve)$ because points are closer to *A* compared to *B*. Similarly magnetic field in region *BC* will be downward $(-ve)$. Graph *(b)* satisfies all these conditions.

4. (a) Magnetic field inside the conductor $B_{in} \propto r$ and magnetic field outside the conductor $B_{out} \propto \frac{1}{r}$

(where *r* is the distance of observation point from axis)

5. (c) The magnetic field at points to the right of the proton beam acts perpendicular to the paper inwards (×). The magnetic field at points to the left of the electron beam acts perpendicular to the paper outwards (·).

Magnetic field at mid point *M* is zero.



Magnetic field at the points closer to proton beam acts perpendicular to the paper inwards (*i.e.* (×)) and at the points closer to electron beam it acts outwards *i.e.* (·). In the given options graph *(c)* satisfies all the conditions.

6. (a) Magnetic field inside the hollow metallic cylinder $B_{in} = 0$, and magnetic field outside it $B_{out} \propto \frac{1}{r}$

7. (a) Magnetic field in the middle of the solenoid's is maximum, magnetic field at the and $B_{end} = \frac{1}{2}B_{centre}$.

8. (b) The charge will not experience any force if $|\overrightarrow{F_e}| = |\overrightarrow{F_m}|$. This condition is satisfied in option (b) only.

9. (c) The given portion of the curved wire may be treated as a straight wire of length $2L$ which experiences a magnetic force $F_m = Bi(2L)$

10. (a) $\tau = NBiA\sin\theta$ so the graph between τ and θ is a sinusoidal graph.

11. (c) For undeviated motion $|\overrightarrow{F_e}| = |\overrightarrow{F_m}|$, which happened when $\vec{v}, \vec{E}$ and $\vec{B}$ are mutually perpendicular to each other.

12. (a) If at a place, magnetic induction is *B*, then energy density will be equal to $U = \frac{B^2}{2\mu_0}$. It means, graph between *U* and *B* will be a parabola passing through origin and symmetric about *U*-axis.

13. (b, c) Since length of the wire is equal to *l*, therefore, $2\pi Rn = l$ or $n = \frac{l}{2\pi R}$.

Magnetic induction at centre of a circular coil is given by

$$B = \frac{\mu_0}{4\pi} \cdot \frac{2\pi ni}{R} = \frac{\mu_0 l i}{4\pi R^2} \Rightarrow B \propto \frac{1}{R^2}$$

It means, when $R \to 0, B \to \infty$ and $R \to \infty, B \to 0$,

Hence (b) is correct and (d) is wrong.

Substituting $R = \frac{l}{2\pi n}$ in $B = \frac{\mu_0}{4\pi} \cdot \frac{2\pi ni}{R}$

$B \propto n^2$. It means graph between *B* and *n* will be a parabola having increasing slope and passing through origin. Hence (c) is correct and (a) is wrong.

14. (b) When a current flows through cylindrical shell, then according to Ampere circuital law, magnetic induction inside it will be equal to zero. Hence energy density at $r < R$ is equal to zero.

Therefore, (a), (c) and (d) are wrong.

When $r > R$, $B = \frac{\mu_0 i}{2\pi r}$.

Since $U = \frac{B^2}{2\mu_0}$, therefore, outside the shell, $U = \frac{\mu_0 i^2}{8\pi^2 r^2}$. It means, just outside the shell, $U = \frac{\mu_0 i^2}{8\pi^2 R^2}$ and when $r \to \infty, U \to 0$.

Hence (b) is correct.

15. (b) Energy density in previous objective, at $r = 2R$, will be equal to $U = \frac{\mu_0 i^2}{32\pi^2 R^2}$ or $U \propto i^2$. It means, graph-between *U* and *i* will be a parabola, passing through origin, symmetric about *U*-axis and having increasing slope. Hence (b) is correct.

16. (b) Direction of magnetic field at every point on axis of a current carrying coil remains same though magnitude varies. Hence magnetic induction for whole the *x*-axis will remain positive.

Therefore, (c) and (d) are wrong.

Magnitude of magnetic field will very with *x* according to law,

$$B = \frac{\mu_0 NIR^2}{2(R^2 + x^2)^{3/2}}.$$

Hence, at $x = 0, B = \frac{\mu_0 NI}{2R}$ and when $x \to \infty, B \to 0$.

Slope of the graph will be $\frac{dB}{dx} = -\frac{3\mu_0 NIR^2.x}{2(R^2+x^2)^{5/2}}$.

It means, at $x = 0$, slope is equal to zero or tangent to the graph at $x = 0$, must be parallel to x-axis.

Hence (b) is correct and (a) is wrong.

Assertion and Reason

1. (a) Cyclotron is suitable for accelerating heavy particles like protons, α-particles *etc*, and not for electrons because of low mass. Because electrons acquire very high velocities very near to velocity of light and appreciable variation in their mass, occurs.

2. (c) Cyclotron is utilised to accelerate the positive ion. And cyclotron frequency is given by $\nu = \frac{Be}{2\pi m}$. It means cyclotron frequency doesn't depends upon velocity. Therefore, assertion is true and reason false.

3. (a) A moving charge experiences a force in magnetic field. It is because of interaction of two magnetic fields, one which is produced due to the motion of charge and other in which charge is moving.

4. (e) In this case we can not be sure about the absence of the magnetic field because if the electron moving parallel to the direction of magnetic field, the angle between velocity and applied magnetic field is zero ($F = 0$). Then also electron passes without deflection. Also $F = evB\sin\theta \Rightarrow F \propto B$.

5. (a) In the absence of the electric current, the free electrons in a conductor are in a state of random motion, like molecules in a gas. Their average velocity is zero. *i.e.* they do not have any net velocity in a direction. As a result, there is no net magnetic force on the free electrons in the magnetic field. On passing the current, the free electrons acquire drift velocity in a definite direction, hence magnetic force acts on them, unless the field has no perpendicular component.

6. (c) Time taken is independent of velocity and radius of path. However, maximum velocity will be given by $v_{max} = \frac{qBR}{m}$ where R is radius of Dee's.

7. (a) Due to metallic frame the deflection is only due to current in a coil and magnetic field, not due to vibration in the strings. If string start oscillating, presence of metallic frame in the field make these oscillations damped.

8. (c) The direction of magnetic field due to current carrying conductor can be found by applying right hand thumb rule or right hand palm rule. When electric current is passed through a circular conductor, the magnetic field lines near the center of the conductor are almost straight lines. Magnetic flux direction is determined only by the direction of current.

9. (a) The force on a charged particle moving in a uniform magnetic field always acts in direction perpendicular to the direction of motion of the charge. As work done by magnetic field on the charge is zero, [$W = FS\cos\theta$], so the energy of the charged particle does not change.

10. (b) We know that the direction of the earth's magnetic field is toward north and the velocity of electron is vertically downward. Applying Fleming's left hand rule, the direction of force is towards west. Therefore, an electron coming from outer space will be deflected toward west.

11. (d) In the case of metallic rod, the charge carriers flow through whole of the cross section. Therefore, the magnetic field exists both inside as well as outside. However magnetic field inside the rod will go on decreasing as we go towards the axis.

12. (e) The force experienced by a charge particle in a magnetic field is given by, $\vec{F} = q(\vec{v} \times \vec{B})$

which is independent of mass. As q, v and B are same for both the electron and proton, hence both will experience same force.

13. (b) The torque on the coil in a magnetic field is given by $\tau = nIBA\cos\theta$

For radial field, the coil is set with its plane parallel to the direction of the magnetic field B, then $\theta = 0°$ and $\cos\theta = 1 \Rightarrow$ Torque $= nIBA\,(1) = nIBA$ (maximum).

14. (b) The winding of helix carry currents in the same direction therefore they experience an attractive force pulling the lower end out of mercury. As a result of this, the circuit breaks, current becomes zero and hence the force of attraction vanishes. Therefore helix comes back to its final position, completing the circuit again. In this way, the process is repeated and helix executes oscillatory motion.

15. (b) For a solenoid $B_{end} = \frac{1}{2}(B_{in})$. Also for a long solenoid, magnetic field is uniform within it but this reason is not explaining the assertion.

16. (d) When a charged particle is moving on a circular path in a magnetic field, the magnitude of velocity does not change but direction of velocity is changing every moment. Hence velocity is changing, so momentum $(m\vec{v})$ is also changing.

17. (b) Time period, $T = \frac{2\pi m}{Bq}$ as $\left(\frac{m}{q}\right)_\alpha = 2\left(\frac{m}{q}\right)_p \Rightarrow T_\alpha = 2T_p$

Also $T \propto m$, but then $T_\alpha = 4T_p$ which is not the case.

18. (d) When two long parallel wires, are connected to a battery in series. They carry currents in opposite directions, hence they repel each other.

19. (a) Here, both Assertion and Reason are correct and reason is the correct explanation of assertion.

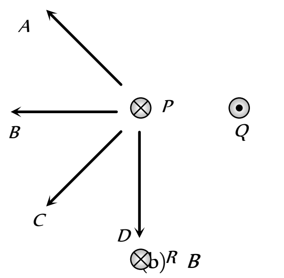
Magnetic Effect of Current — SET Self Evaluation Test - 21

1. In the hydrogen atom, the electron is making 6.6×10^{15} $r.p.s.$ If the radius of the orbit is 0.53×10^{-10} $metre$, then magnetic field produced at the centre of the orbit is
(a) 140 *Tesla* (b) 12.5 *Tesla*
(c) 1.4 *Tesla* (d) 0.14 *Tesla*

2. A coil carrying a heavy current and having large number of turns mounted in a *N-S* vertical plane and a current flows in clockwise direction. A small magnetic needle at its cente will have its north pole in
(a) East-north direction (b) West-north direction
(c) East-south direction (d) West-south direction

3. A charged particle is projected in a plane perpendicular to a uniform magnetic field. The area bounded by the path described by the particle is proportional to
(a) The velocity (b) The momentum
(c) The kinetic energy (d) None of these

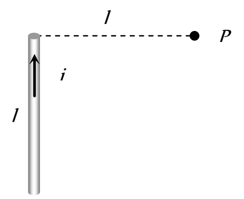
4. In figure shows three long straight wires *P, Q* and *R* carrying currents normal to the plane of the paper. All three currents have the same magnitude. Which arrow best shows the direction of the resultant force on the wire *P*



(a) *A* (b) *B*
(c) *C* (d) *D*

5. A moving coil galvanometer has 48 turns and area of coil is $4\times10^{-2}m^2$. If the magnetic field is 0.2 *T*, then to increase the current sensitivity by 25% without changing area (A) and field (B) the number of turns should become
(a) 24 (b) 36
(c) 60 (d) 54

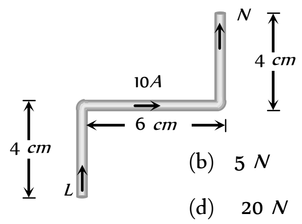
6. Figure shows a straight wire of length *l* current *i*. The magnitude of magnetic field produced by the current at point *P* is



(a) $\frac{\sqrt{2}\mu_0 i}{\pi l}$
(b) $\frac{\mu_0 i}{4\pi l}$
(c) $\frac{\sqrt{2}\mu_0 i}{8\pi l}$
(d) $\frac{\mu_0 i}{2\sqrt{2}\pi l}$

7. A winding wire which is used to frame a solenoid can bear a maximum 10 *A* current. If length of solenoid is 80*cm* and it's cross sectional radius is 3 *cm* then required length of winding wire is $(B=0.2\,T)$
(a) $1.2\times10^2\,m$ (b) $4.8\times10^2\,m$
(c) $2.4\times10^3\,m$ (d) $6\times10^3\,m$

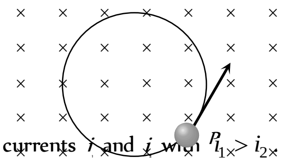
8. A current carrying wire *LN* is bent in the from shown below. If wire carries a current of 10 *A* and it is placed in a magnetic field of 5 *T* which acts perpendicular to the paper outwards then it will experience a force



(a) Zero (b) 5 *N*
(c) 30 *N* (d) 20 *N*

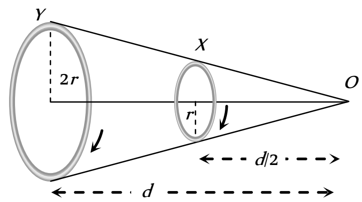
9. A wire of length *L* is bent in the form of a circular coil and current *i* is passed through it. If this coil is placed in a magnetic field then the torque acting on the coil will be maximum when the number of turns is
(a) As large as possible (b) Any number
(c) 2 (d) 1

10. A particle having a charge of $10.0\mu C$ and mass $1\mu g$ moves in a circle of radius 10 cm under the influence of a magnetic field of induction $0.1T$. When the particle is at a point P, a uniform electric field is switched on so that the particle starts moving along the tangent with a uniform velocity. The electric field is
(a) 0.1 *V/m*
(b) 1.0 *V/m*
(c) 10.0 *V/m*
(d) 100 *V/m*



11. Two parallel long wires carry currents i_1 and i_2 with $i_1 > i_2$. When the currents are in the same direction, the magnetic field midway between the wires is 10 μT. When the direction of i_2 is reversed, it becomes 40 μT. the ratio i_1/i_2 is
(a) 3 : 4 (b) 11 : 7
(c) 7 : 11 (d) 5 : 3

12. Two circular coils *X* and *Y*, having equal number of turns, carry equal currents in the same sense and subtend same solid angle at point *O*. If the smaller coil, *X* is midway between *O* and *Y*, then if we represent the magnetic induction due to bigger coil *Y* at *O* as B_Y and that due to smaller coil *X* at *O* as B_X, then
(a) $\frac{B_Y}{B_X}=1$
(b) $\frac{B_Y}{B_X}=2$
(c) $\frac{B_Y}{B_X}=\frac{1}{2}$



(d) $\frac{B_Y}{B_X} = \frac{1}{4}$

13. A fixed horizontal wire carries a current of 200 *A*. Another wire having a mass per unit length $10^{-2} kg/m$ is placed below the first wire at a distance of 2 *cm* and parallel to it. How much current must be passed through the second wire if it floats in air without any support? What should be the direction of current in it

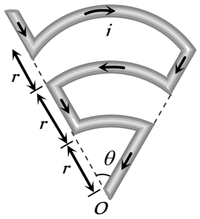
(a) 25A (direction of current is same to first wire)

(b) 25A (direction of current is opposite to first wire)

(c) 49 A (direction of current is same to first wire)

(d) 49 A (direction of current is opposite to first wire)

14. Find magnetic field at *O*



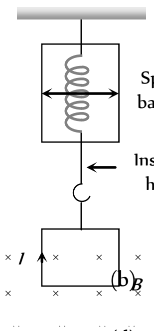
(a) $\frac{5\mu_0 i\theta}{24\pi r}$

(b) $\frac{\mu_0 i\theta}{24\pi r}$

(c) $\frac{11\mu_0 i\theta}{24\pi r}$

(d) Zero

15. A square loop of side a hangs from an insulating hanger of spring balance. The magnetic field of strength *B* occurs only at the lower edge. It carries a current *I*. Find the change in the reading of the spring balance if the direction of current is reversed



(a) *IaB*

(b) 2 *IaB*

(c) $\frac{IaB}{2}$

(d) $\frac{3}{2} IaB$

16. A charge of $2.0\,\mu C$ moves with a speed of $3.0 \times 10^6 ms^{-1}$ along + *ve X*-axis A magnetic field of strength $\vec{B} = -0.2\,\hat{k}$ *Tesla* exists in space. What is the magnetic force $(\vec{F}_m)$ on the charge

(a) $F_m = 1.2\,N$ along + $ve\ x-$ direction

(b) $F_m = 1.2\,N$ along – $ve\ x-$ direction

(c) $F_m = 1.2\,N$ along + $ve\ y-$ direction

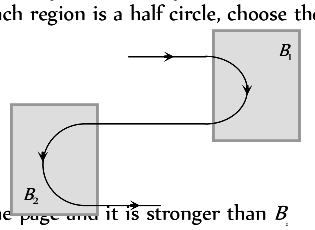
(d) $F_m = 1.2\,N$ along – $ve\ y-$ direction

17. Five very long, straight wires are bound together to form a small cable. Currents carried by the wires are $I_1 = 20A$, $I_2 = -6A$, $I_3 = 12A, I_4 = -7A, I_5 = 18A$. The magnetic induction at a distance of 10 *cm* from the cable is

(a) 34 μT (b) 74 mT

(c) 34 mT (d) 74 μT

18. Following figure shows the path of an electron that passes through two regions containing uniform magnetic fields of magnitudes B_1 and B_2. It's path in each region is a half circle, choose the correct option



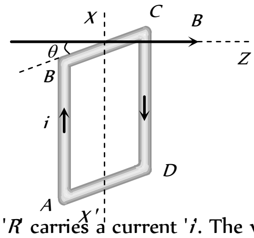
(a) B_1 is into the page and it is stronger than B_2

(b) B_1 is in to the page and it is weaker than B_2

(c) B_1 is out of the page and it is weaker than B_2

(d) B_1 is out of the page and it is stronger than B_2

19. The square loop *ABCD*, carrying a current *i*, is placed in uniform magnetic field *B*, as shown. The loop can rotate about the axis *XX'*. The plane of the loop makes and angle θ (θ < 90°) with the direction of *B*. Through what angle will the loop rotate by itself before the torque on it becomes zero



(a) θ

(b) 90°– θ

(c) 90° + θ

(d) 180°– θ

20. A cylindrical conductor of radius '*R*' carries a current '*i*'. The value of magnetic field at a point which is *R*/4 distance inside from the surface is 10 *T*. Find the value of magnetic field at point which is 4*R* distance outside from the surface

(a) $\frac{4}{3}T$ (b) $\frac{8}{3}T$

(c) $\frac{40}{3}T$ (d) $\frac{80}{3}T$

21. Three long straight wires are connected parallel to each other across a battery of negligible internal resistance. The ratio of their resistances are 3 : 4 : 5. What is the ratio of distances of middle wire from the others if the net force experienced by it is zero

(a) 4 : 3 (b) 3 : 1

(c) 5 : 3 (d) 2 : 3

Answers and Solutions

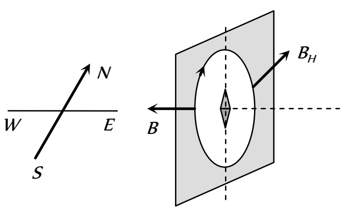
(SET -21)

1. (b) $i = qv$

$$B = \frac{\mu_0 i}{2r} = \frac{\mu_0 q v}{2r} = \frac{4\pi \times 10^{-7} \times 1.6 \times 10^{-19} \times 6.6 \times 10^{15}}{2 \times 0.53 \times 10^{-10}}$$

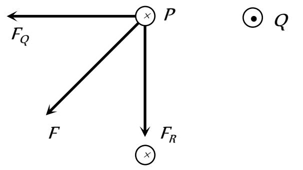
$$= \frac{2\pi \times 1.6 \times 6.6}{5.3} = 12.518 \ \textit{Tesla}$$

2. (b)



3. (c) $r = \frac{\sqrt{2mK}}{qB}$ and $A = \pi r^2 \Rightarrow A = \frac{\pi(2mK)}{q^2B^2} \Rightarrow A \propto K.$

4. (c) The forces F_Q and F_R are the forces applies by wires Q and R respectively on the wire P as shown in figure. Their resultant force F is best shown by C.

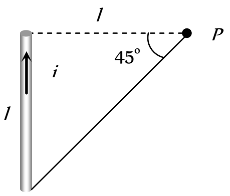


5. (c) As we know

Current sensitivity $S_i = \frac{NBA}{C}$

$\Rightarrow S_i \propto N \Rightarrow \frac{(S_i)_1}{(S_i)_2} = \frac{N_1}{N_2} \Rightarrow \frac{100}{125} = \frac{48}{N_2} \Rightarrow N_2 = 60.$

6. (c) The given situation can be redrawn as follow.



As we know the general formula for finding the magnetic field due to a finite length wire

$$B = \frac{\mu_0}{4\pi}.\frac{i}{r}(\sin\phi_1 + \sin\phi_2)$$

Here $\phi_1 = 0^o, \phi = 45^o$

$$\therefore B = \frac{\mu_0}{4\pi}.\frac{i}{r}(\sin 0^o + \sin 45^o) = \frac{\mu_0}{4\pi}.\frac{i}{\sqrt{2}l} \Rightarrow B = \frac{\sqrt{2}\mu_0 i}{8\pi l}$$

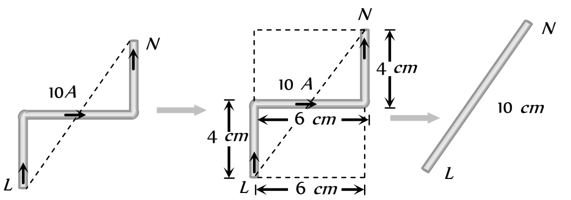
7. (c) $B = \frac{\mu_0 Ni}{l}$ where N = Total number of turns, l = length of the solenoid

$$\Rightarrow 0.2 = \frac{4\pi \times 10^{-7} \times N \times 10}{0.8} \Rightarrow N = \frac{4 \times 10^4}{\pi}$$

Since N turns are made from the winding wire so length of the wire $(L) = 2\pi r \times N$ [$2\pi r$ = length of each turns]

$$\Rightarrow L = 2\pi \times 3 \times 10^{-2} \times \frac{4 \times 10^4}{\pi} = 2.4 \times 10^3 m$$

8. (b) The given wire can be replaced by a straight wire as shown below



Hence force experienced by the wire

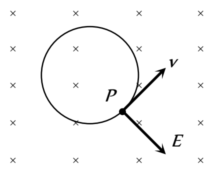
$F = Bil = 5 \times 10 \times 0.1 = 5N$

9. (d) $\tau_{max} = MB$ or $\tau_{max} = ni\pi r^2 B$. Let number of turns in length l is n so $l = n(2\pi r)$ or $\alpha = \frac{l}{2\pi n}$

$$\Rightarrow \tau_{max} = \frac{ni\pi Bl^2}{4\pi^2 n^2} = \frac{l^2 iB}{4\pi n_{min}} \Rightarrow \tau_{max} \propto \frac{1}{n_{min}} \Rightarrow n_{min} = 1$$

10. (c) When the particle moves along a circle in the magnetic field B, the magnetic force is radially inward. If an electric field of proper magnitude is switched on which is directed radially outwards, the particle may experience no force. It will then move along a straight line with uniform velocity. This will be the case when $qE = qvB \Rightarrow E = vB$

also $r = \frac{mv}{qB} \Rightarrow v = \frac{qBr}{m}$

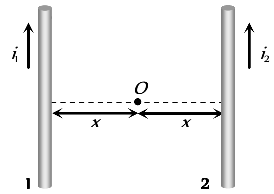


So $E = \frac{qB^2 r}{m}$

$$= \frac{(10 \times 10^{-6}) \times (0.1)^2 \times 10 \times 10^{-2}}{1 \times 10^{-3} \times 10^{-6}} = 10\ V/m$$

11. (d) Initially when wires carry currents in the same direction as shown.

Magnetic field at mid point O due to wires 1 and 2 are respectively



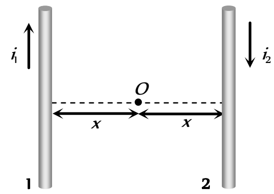
$B_1 = \frac{\mu_0}{4\pi}.\frac{2i_1}{x} \otimes$

and $B_2 = \frac{\mu_0}{4\pi}.\frac{2i_2}{x} \odot$

Hence net magnetic field at O $B_{net} = \frac{\mu_0}{4\pi} \times \frac{2}{x} \times (i_1 - i_2)$

$\Rightarrow 10 \times 10^{-6} = \frac{\mu_0}{4\pi}.\frac{2}{x}(i_1 - i_2)$ ..... (i)

If the direction of i_2 is reversed then



$B_1 = \frac{\mu_0}{4\pi}.\frac{2i_1}{x} \otimes$

and $B_2 = \frac{\mu_0}{4\pi}.\frac{2i_2}{x} \otimes$

So $B_{net} = \frac{\mu_0}{4\pi}.\frac{2}{x}(i_1 + i_2)$

$\Rightarrow 40 \times 10^{-6} = \frac{\mu_0}{4\pi}.\frac{2}{x}(i_1 + i_2)$ ..... (ii)

Dividing equation (ii) by (i) $\frac{i_1 + i_2}{i_1 - i_2} = \frac{4}{1} \Rightarrow \frac{i_1}{i_2} = \frac{5}{3}$

12. (c) Magnetic field at O due to bigger coil Y, is

$$B_Y = \frac{\mu_0}{4\pi}.\frac{2\pi i(2r)^2}{\{d^2 + (2r)^2\}^{3/2}} = \frac{\mu_0}{4\pi}.\frac{8\pi i r^2}{(d^2 + 4r^2)^{3/2}}$$

Magnetic field at O due to smaller coil X is

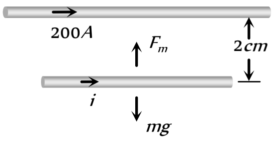
$$B_X = \frac{\mu_0}{4\pi}.\frac{2\pi i r^2}{\left\{\left(\frac{d}{2}\right)^2 + r^2\right\}^{3/2}} = \frac{\mu_0}{4\pi}.\frac{16\pi i r^2}{(d^2 + 4r^2)^{3/2}}$$

$\Rightarrow \frac{B_Y}{B_X} = \frac{1}{2}$

13. (c) For floating the second wire

$$\left|\begin{matrix}\text{Down ward weight} \\ \text{of second wire}\end{matrix}\right| = \left|\begin{matrix}\text{Magnetic force} \\ \text{on it}\end{matrix}\right|$$

$\Rightarrow mg = \frac{\mu_0}{4\pi} \cdot \frac{2i_1 i_2}{a} \times l$



$\Rightarrow \left(\frac{m}{l}\right) g = \frac{\mu_0}{4\pi} \cdot \frac{2i_1 i_2}{a}$

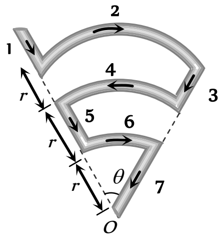
$\Rightarrow 10^{-2} \times 9.8 = 10^{-7} \times \frac{2 \times 200 \times i}{2 \times 10^{-2}} \Rightarrow i = 49A$

(Direction of current is same to first wire)

14. (a) $B_1 = B_3 = B_5 = 0$

$B_2 = \frac{\mu_0}{4\pi} \cdot \frac{\theta i}{3r} \otimes, \; B_4 = \frac{\mu_0}{4\pi} \cdot \frac{\theta i}{2r} \odot$

and $B_6 = \frac{\mu_0}{4\pi} \cdot \frac{\theta i}{r} \otimes$



$\therefore$ Net magnetic field at O,

$B_{net} = B_2 - B_4 + B_6 = \frac{\mu_0}{4\pi} \cdot \frac{\theta i}{r}\left(\frac{1}{3} - \frac{1}{2} + 1\right) = \frac{5\mu_0 \theta i}{24\pi r}$

***

15. (b) Initially $F_1 = mg + IaB$ (down wards)

when the direction of current is reversed

$F_2 = mg - IaB$ (down wards) $\Rightarrow \Delta F = 2IaB$

16. (c) By using $\vec{F}_m = q(\vec{v} \times \vec{B})$

$\Rightarrow \vec{F}_m = 2 \times 10^{-6}\{3 \times 10^6 \hat{i} \times (-0.2)\hat{k}\} = -1.2(\hat{i} \times \hat{k}) = +1.2\hat{j}$

i.e., 1.2 N in positive y direction.

17. (d) $i_{net} = 20 - 6 + 12 - 7 + 18 = 37A$ so $B = \frac{\mu_0}{4\pi} \cdot \frac{2i}{a}$

$= 10^{-7} \times \frac{2 \times 37}{10 \times 10^{-2}} = 74 \times 10^{-6} T = 74 \mu T$

18. (a) Direction of field can be find using Fleming left hand rule and $r \propto \frac{1}{B}$.

19. (c) In the position shown, AB is outside and CD is inside the plane of the paper. The Ampere force on AB acts into the paper. The torque on the loop will be clockwise, as seen from above. The loop must rotate through an angle $(90^o + \theta)$ before the plane of the loop becomes normal to the direction of the direction of B and the torque becomes zero.

20. (b) Magnetic field inside the cylindrical conductor

$B_{in} = \frac{\mu_0}{4\pi} \cdot \frac{2ir}{R^2}$ (R=Radius of cylinder, r = distance of observation point from axis of cylinder)

Magnetic field out side the cylinder at a distance r' from it's axis $B_{out} = \frac{\mu_0}{4\pi} \cdot \frac{2i}{r'}$

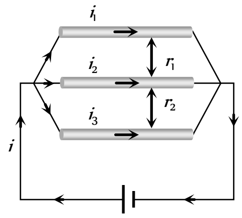
$\Rightarrow \frac{B_{in}}{B_{out}} = \frac{rr'}{R^2} \Rightarrow \frac{10}{B_{out}} = \frac{\left(R - \frac{R}{4}\right)(R + 4R)}{R^2} \Rightarrow B_{out} = \frac{8}{3} T$

21. (c) The wires are in parallel and ratio of their resistances are 3 : 4 : 5, Hence currents in wires are in the ratio $\frac{1}{3} : \frac{1}{4} : \frac{1}{5}$

$i_1 = \frac{k}{3}$

$i_2 = \frac{k}{4}$

$i_3 = \frac{k}{5}$



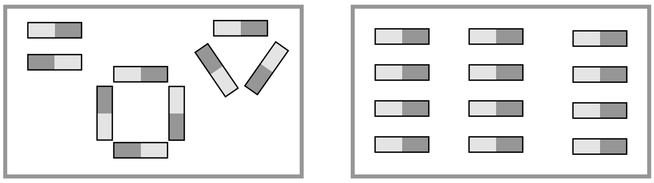
Force between top and middle wire $F_1 = \frac{\mu_0}{4\pi} \cdot \frac{2i_1 i_2}{r_1}$

$= \frac{\mu_0}{4\pi} \times \frac{2\left(\frac{1}{3}\right)\left(\frac{1}{4}\right)k^2}{r_1}$. Force between bottom and middle wire $F_2 = \frac{\mu_0}{4\pi} \frac{\left(\frac{1}{4}\right)\left(\frac{1}{5}\right)k^2}{r_2}$. As the forces are equal and opposite so $F_1 = F_2 \Rightarrow \frac{r_1}{r_2} = \frac{5}{3}$.

Chapter 22
Magnetism

The molecular theory of magnetism was given by Weber and modified later by Ewing. According to this theory.

Every molecule of a substance is a complete magnet in itself. However, in an **magnetic** substance the molecular magnets are randomly oriented to give net zero magnetic moment. On magnetising, the molecular magnets are realigned in a specific direction leading to a net magnetic moment.

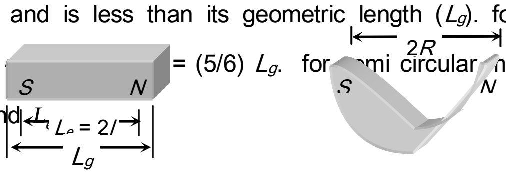


(A) Unmagnetised **(B)** Magnetised

Fig. 22.1

Bar Magnet

A bar magnet consist of two equal and opposite magnetic pole separated by a small distance. Poles are not exactly at the ends. The shortest distance between two poles is called effective length (L_e) and is less than its geometric length (L_g). for bar magnet L_e = (5/6) L_g. for semi circular magnet $L_g = \pi R$ and $L_e = 2R$



(A) Bar magnet **(B)** Semicircular magnet

Fig. 22.2

(1) **Directive properties** : When a magnet suspended freely it stays in the earth's *N-S* direction (in magnetic meridian).

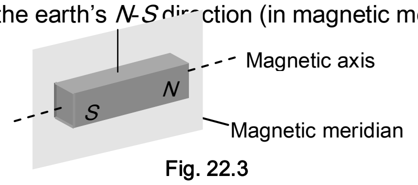


Fig. 22.3

(2) **Monopole concept** : If a magnet is Broken into number of pieces, each piece becomes a magnet. This in turn implies that monopoles do not exist. (*i.e.*, ultimate individual unit of magnetism in any magnet is called dipole).

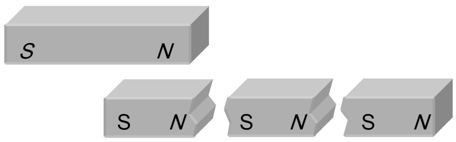

Fig. 22.4

(3) For two rods as shown, if both the rods attract in figure (A) and doesn't attract in figure (B) then, *Q* is a magnetic and *P* is simple iron rod. Repulsion is sure test of magnetism.

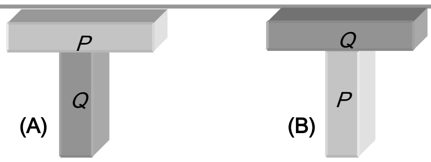

Fig. 22.5

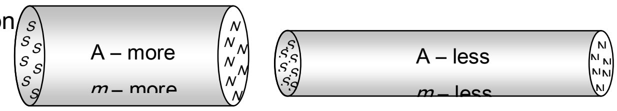
(4) **Pole strength (m) :** The strength of a magnetic pole to attract magnetic materials towards itself is known as pole strength.

(i) It is a scalar quantity.

(ii) Pole strength of N and S pole of a magnet is conventionally represented by $+m$ and $-m$ respectively.

(iii) It's SI unit is *amp* × *m* or *N*/*Tesla* and dimensions are [LA].

(iv) Pole strength of the magnet depends on the nature of material of magnet and area of cross section. It doesn't depends upon



(A) (B)

Fig. 22.6

(5) **Magnetic moment or magnetic dipole moment ($\vec{M}$) :** It represents the strength of magnet. Mathematically it is defined as the product of the strength of either pole and effective length. *i.e.* $\vec{M} = m(2\vec{l})$

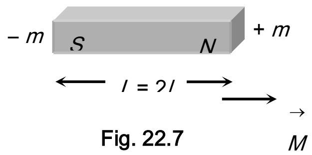


Fig. 22.7

(i) It is a vector quantity directed from south to north.

(ii) It's S.I. unit *amp*×*m*^{2} or *N*-*m* / *Tesla* and dimensions [AL^2]

(6) **Cutting of a rectangular bar magnet :** Suppose we have a rectangular bar magnet having length, breadth and mass are L, b and w respectively if it is cut in n equal parts along the length as well as perpendicular to the length simultaneously as shown in the figure then

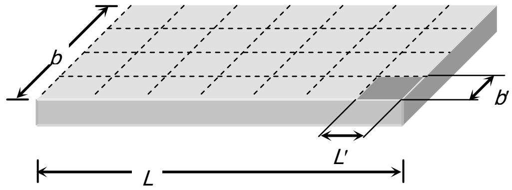

Fig. 22.8

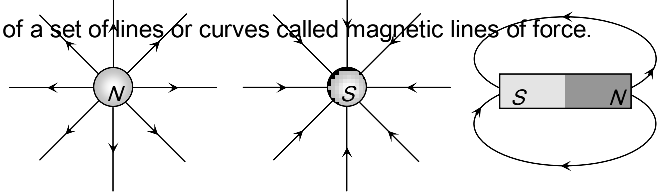
Length of each part $L' = \frac{L}{\sqrt{n}}$, breadth of each part $b' = \frac{b}{\sqrt{n}}$, Mass of each part $w' = \frac{w}{n}$, pole strength of each part $m' = \frac{m}{\sqrt{n}}$, Magnetic moment of each part $M' = m'L' = \frac{m}{\sqrt{n}} \times \frac{L}{\sqrt{n}} = \frac{M}{n}$

If initially moment of inertia of bar magnet about the axes passing from centre and perpendicular to it's length is $I = w\left(\frac{L^2+b^2}{12}\right)$ then moment of inertia of each part $I' = \frac{I}{n^2}$

(7) **Cutting of a thin bar magnet :** For thin magnet $b = 0$ so $L' = \frac{L}{n}$, $w' = \frac{w}{n}$, $m' = \frac{m}{n}$, $I' = \frac{I}{n^3}$

Various Terms Related to Magnetism

(1) **Magnetic field and magnetic lines of force :** Space around a magnetic pole or magnet or current carrying wire within which it's effect can be experienced is defined as magnetic field. Magnetic field can be represented with the help of a set of lines or curves called magnetic lines of force.



(A) Isolated north pole (B) Isolated south pole (C) Magnetic dipole

Fig. 22.9

(2) **Magnetic flux (ϕ) and flux density (B)**

(i) The number of magnetic lines of force passing normally through a surface is defined as magnetic flux (ϕ). It's S.I. unit is *weber* (*wb*) and CGS unit is *Maxwell*.

Remeber 1 *wb* = 10^8 *Maxwell*.

(ii) When a piece of a magnetic substance is placed in an external magnetic field the substance becomes magnetised. The number of magnetic lines of induction inside a magnetised substance crossing unit area normal to their direction is called magnetic induction or magnetic flux density ($\vec{B}$). It is a vector quantity.

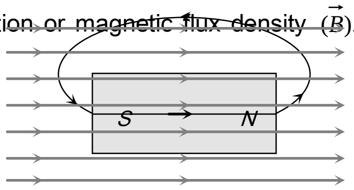


Fig. 22.10

It's SI unit is *Tesla* which is equal to $\frac{wb}{m^2}=\frac{N}{amp\times m}=\frac{J}{amp\times m^2}=\frac{volt\times\sec}{m^2}$

and CGS unit is *Gauss*. Remember 1 *Tesla* = 10^4 *Gauss*.

(3) **Magnetic permeability :** It is the degree or extent to which magnetic lines of force can enter a substance and is denoted by μ. Or characteristic of a medium which allows magnetic flux to pass through it is called it's permeability. *e.g.* permeability of soft iron is 1000 times greater than that of air.

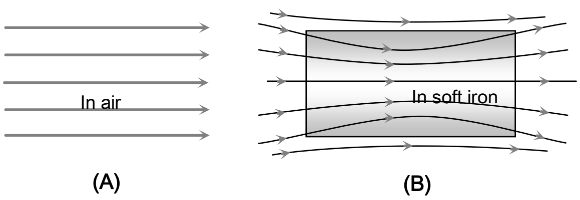

Fig. 22.11

Also μ = $\mu_0\ \mu_r$; where μ_0 = absolute permeability of air or free space = $4\pi\times10^{-7}\ tesla\times m/amp.$

and μ_r = Relative permeability of the medium = $\frac{B}{B_0}=\frac{\text{flux density in material}}{\text{flux density in vacuum}}$.

(4) **Intensity of magnetising field ($\vec{H}$) (magnetising field) :** It is the degree or extent to which a magnetic field can magnetise a substance. Also $H=\frac{B}{\mu}$.

It's SI unit is

$A/m.=\frac{N}{m^2\times Tesla}=\frac{N}{wb}=\frac{J}{m^3\times Tesla}=\frac{J}{m\times wb}$ It's CGS unit is *Oersted*. Also 1 *Oersted* = 80 *A*/*m*

(5) **Intensity of magnetisation (*I*) :** It is the degree to which a substance is magnetised when placed in a magnetic field.

It can also be defined as the pole strength per unit cross sectional area of the substance or the induced dipole moment per unit volume.

Hence *I* = $\frac{m}{A}=\frac{M}{V}$. It is a vector quantity, it's S.I. unit is *Amp*/*m*.

(6) **Magnetic susceptibility (χ_m) :** It is the property of the substance which shows how easily a substance can be magnetised. It can also be defined as the ratio of intensity of magnetisation (*I*) in a substance to the magnetic intensity (*H*) applied to the substance, *i.e.* $\chi_m=\frac{I}{H}$. It is a scalar quantity with no units and dimensions.

(7) **Relation between permeability and susceptibility :** Total magnetic flux density *B* in a material is the sum of magnetic flux density in vacuum B_0 produced by magnetising force and magnetic flux density due to magnetisation of material B_m. *i.e.* $B=B_0+B_m \Rightarrow B=\mu_0H+\mu_0I=\mu_0(H+I)=\mu_0H(1+\chi_m)$. Also $\mu_r=(1+\chi_m)$

Force and Field

(1) **Coulombs law in magnetism** : The force between two magnetic poles of strength m_1 and m_2 lying at a distance r is

given by $F = k.\frac{m_1 m_2}{r^2}$. In S.I. units $k = \frac{\mu_0}{4\pi} = 10^{-7} wb / Amp \times m$, In CGS units $k = 1$

(2) **Magnetic field**

(i) Magnetic field due to an imaginary magnetic pole (Pole strength *m*) : Is given by $B = \frac{F}{m_0}$ also $B = \frac{\mu_0}{4\pi}.\frac{m}{d^2}$

(ii) Magnetic field due to a bar magnet : At a distance *r* from the centre of magnet

(a) On axial position

$B_a = \frac{\mu_0}{4\pi}\frac{2Mr}{(r^2 - l^2)^2}$; If *l* << *r* then $B_a = \frac{\mu_0}{4\pi}\frac{2M}{r^3}$

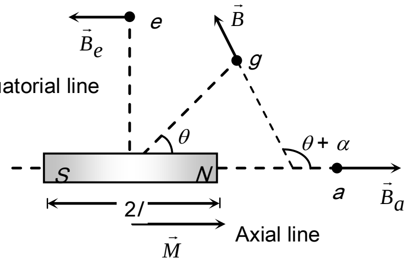

Fig. 22.12

(b) On equatorial position : $B_e = \frac{\mu_0}{4\pi}\frac{M}{(r^2 + l^2)^{3/2}}$; If *l* << *r* ; then $B_e = \frac{\mu_0}{4\pi}\frac{M}{r^3}$

(c) General position : In general position for a short bar magnet $B_g = \frac{\mu_0}{4\pi}\frac{M}{r^3}\sqrt{(3\cos^2\theta + 1)}$

(3) **Bar magnet in magnetic field** : When a bar magnet is left free in an uniform magnetic field, if align it self in the directional field.

(i) Torque : $\tau = MB\sin\theta \Rightarrow \vec{\tau} = \vec{M} \times \vec{B}$

(ii) Work : $W = MB(1 - \cos\theta)$

(iii) Potential energy : $U = -MB\cos\theta = -\vec{M}.\vec{B}$; (θ = Angle made by the dipole with the field)

(4) **Gauss's law in magnetism** : Net magnetic flux through any closed surface is always zero *i.e.* $\oint \vec{B}.\vec{ds} = 0$

Earth's Magnetic Field (Terrestrial Magnetism)

As per the most established theory it is due to the rotation of the earth where by the various charged ions present in the molten state in the core of the earth rotate and constitute a current.

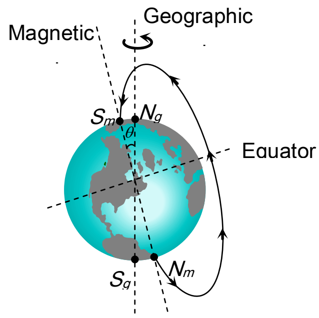

Fig. 22.13

(1) The magnetic field of earth is similar to one which would be obtained if a huge magnet is assumed to be buried deep inside the earth at it's centre.

(2) The axis of rotation of earth is called geographic axis and the points where it cuts the surface of earth are called geographical poles (N_g, S_g). The circle on the earth's surface perpendicular to the geographical axis is called equator.

(3) A vertical plane passing through the geographical axis is called geographical meridian.

(4) The axis of the huge magnet assumed to be lying inside the earth is called magnetic axis of the earth. The points where the magnetic axis cuts the surface of earth are called magnetic poles. The circle on the earth's surface perpendicular to the magnetic axis is called magnetic equator.

(5) Magnetic axis and Geographical axis don't coincide but they make an angle of 17.5° with each other.

(6) Magnetic equator divides the earth into two hemispheres. The hemisphere containing south polarity of

earth's magnetism is called northern hemisphere while the other, the southern hemisphere.

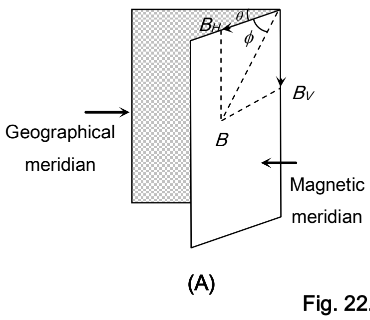
(7) The magnetic field of earth is not constant but changes irregularly from place to place on the surface of the earth and even at a given place it varies with time too.

(8) Direction of earth's magnetic field is from *S* (geographical south) to *N* (geographical north).

Elements of Earth's Magnetic Field

The magnitude and direction of the magnetic field of the earth at a place are completely given by certain. quantities known as magnetic elements.

(1) **Magnetic Declination (θ) :** It is the angle between geographic and the magnetic meridian planes.



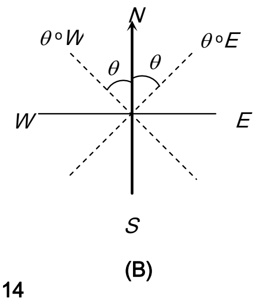


Fig. 22.14

Declination at a place is expressed at $\theta^o E$ or $\theta^o W$ depending upon whether the north pole of the compass needle lies to the east or to the west of the geographical axis.

(2) **Angle of inclination or Dip (ϕ) :** It is the angle between the direction of intensity of total magnetic field of earth and a horizontal line in the magnetic meridian.

(3) **Horizontal component of earth's magnetic field (B_H) :** Earth's magnetic field is horizontal only at the magnetic equator. At any other place, the total intensity can be resolved into horizontal component (B_H) and vertical component (B_V).

Also $B_H = B\cos\phi$ ...... (i) and $B_V = B\sin\phi$ ...... (ii)

By squaring and adding equation (i) and (ii)

$$B = \sqrt{B_{H^2} + B_{V^2}}$$

Dividing equation (ii) by equation (i) $\tan\phi = \frac{B_V}{B_H}$

Magnetic Maps and Neutral Points

(1) **Magnetic maps :** Magnetic maps (*i.e.* Declination, dip and horizontal component) over the earth vary in magnitude from place to place. It is found that many places have the same value of magnetic elements. The lines are drawn joining all place on the earth having same value of a magnetic element. These lines form magnetic map.

(i) Isogonic lines: These are the lines on the magnetic map joining the places of equal declination.

(ii) Agonic line: The line which passes through places having zero declination is called agonic line.

(iii) Isoclinic lines : These are the lines joining the points of equal dip or inclination.

(iv) Aclinic line : The line joining places of zero dip is called aclinic line (or magnetic equator)

(v) Isodynamic lines : The lines joining the points or places having the same value of horizontal component of earth's magnetic field are called isodynamic lines.

(2) **Neutral points :** A neutral point is a point at which the resultant magnetic field is zero. In general the neutral point is obtained when horizontal component of earth's field is balanced by the field produced by the magnet.

Tangent Law

When a small magnet is suspended in two uniform magnetic fields B and B_H which are at right angles to each other, the magnet comes to rest at an angle θ with respect to B_H .

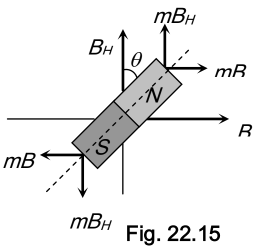

Fig. 22.15

In equilibrium

$$MB_H \sin\theta = MB\sin(90^o - \theta)$$

$\Rightarrow B = B_H \tan\theta.$ This is called tangent law.

Tangent Galvanometer

It consists of three circular coils of insulated copper wire wound on a vertical circular frame made of nonmagnetic material as ebonite or wood. A small magnetic compass needle is pivoted at the centre of the vertical circular frame. When the coil of the tangent galvanometer is kept in magnetic meridian and current passes through any of the coil then the needle at the centre gets deflected and comes to an equilibrium position under the action of two perpendicular field : one due to horizontal component of earth and the other due to field (*B*) set up by the coil due to current.

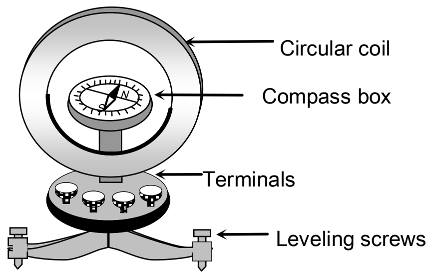

Fig. 22.16

In equilibrium $\boldsymbol{B} = \boldsymbol{B_H} \tan\theta$ where $B = \frac{\mu_0 ni}{2r}$; *n* = number of turns, *r* = radius of coil, *i* = the current to be measured, θ = angle made by needle from the direction of B_H in equilibrium.

Hence $\frac{\mu_0 Ni}{2r} = B_H \tan\theta \Rightarrow i = k \tan\theta$ where $k = \frac{2rB_H}{\mu_0 N}$ is called reduction factor.

Deflection Magnetometer

It's working is based on the principle of tangent law. It consists of a small compass needle, pivoted at the centre of a circular box. The box is kept in a wooden frame having two meter scale fitted on it's two arms. Reading of a scale at any point directly gives the distance of that point from the centre of compass needle.

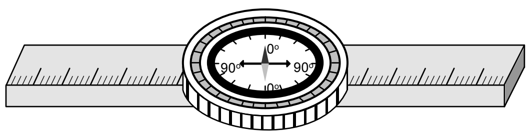

Fig. 22.17

(1) **Tan *A* position :** In this position the magnetometer is set perpendicular to magnetic meridian. So that, magnetic field due to magnet, is in axial position and perpendicular to earth's field. Hence $B_H \tan\theta = \frac{\mu_0}{4\pi} \cdot \frac{2Mr}{(r^2 - l^2)^2}$ or $B_H \tan\theta = \frac{\mu_0}{4\pi} \cdot \frac{2M}{r^3}$

(2) **Tan *B* position :** The arms of magnetometer are set in magnetic meridian, so that the magnetic field due to magnet is at it's equatorial position. Hence $B_H \tan\theta = \frac{\mu_0}{4\pi} \cdot \frac{M}{(r^2 + l^2)^{3/2}}$ or $B_H \tan\theta = \frac{\mu_0}{4\pi} \cdot \frac{M}{r^3}$

(3) **Comparison of magnetic moments :** According to deflection method $\frac{M_1}{M_2} = \frac{\tan\theta_1}{\tan\theta_2}$

According to null deflection method $\frac{M_1}{M_2} = \left(\frac{d_1}{d_2}\right)^3$

Vibration Magnetometer

Vibration magnetometer is used for comparison of magnetic moments and magnetic fields. This device works on the principle, that whenever a freely suspended magnet in a uniform magnetic field, is disturbed from it's equilibrium position, it starts vibrating about the mean position.

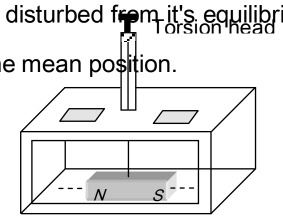

Fig. 22.18

Time period of oscillation of experimental bar magnet (magnetic moment *M*) in earth's magnetic field (B_H) is given by the formula. $T = 2\pi\sqrt{\frac{I}{MB_H}}$; where, $I =$ moment of inertia of short bar magnet $= \frac{wL^2}{12}$ (*w* = mass of bar magnet)

(1) **Determination of magnetic moment of a magnet :** The experimental (given) magnet is put into vibration magnetometer and it's time period *T* is determined. Now $T = 2\pi\sqrt{\frac{I}{MB_H}} \Rightarrow M = \frac{4\pi^2 I}{B_H . T^2}$

(2) **Comparison of horizontal components of earth's magnetic field at two places**

$T = 2\pi\sqrt{\dfrac{I}{MB_H}}$; since I and M of the magnet are constant,

So $T^2 \propto \dfrac{1}{B_H} \Rightarrow \dfrac{(B_H)_1}{(B_H)_2} = \dfrac{T_2^2}{T_1^2}$

(3) **Comparison of magnetic moment of two magnets of same size and mass**

$T = 2\pi\sqrt{\dfrac{I}{M.B_H}}$; Here I and B_H are constants.

So $M \propto \dfrac{1}{T^2} \Rightarrow \dfrac{M_1}{M_2} = \dfrac{T_2^2}{T_1^2}$

(4) **Comparison of magnetic moments by sum and difference method**

Sum position

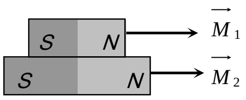

Fig. 22.19

Net magnetic moment $M_s = M_1 + M_2$

Net moment of inertia $I_s = I_1 + I_2$

Time period of oscillation of this pair in earth's magnetic field (B_H)

$$T_s = 2\pi\sqrt{\frac{I_s}{M_s B_H}} = 2\pi\sqrt{\frac{I_1 + I_2}{(M_1 + M_2)B_H}} \quad ....(i)$$

Frequency $\nu_s = \dfrac{1}{2\pi}\sqrt{\dfrac{(M_1 + M_2)B_H}{I_s}}$

Difference position

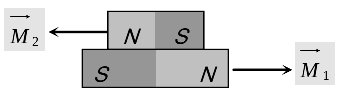

Fig. 22.20

Net magnetic moment

$M_d = M_1 + M_2$

Net moment of inertia $I_d = I_1 + I_2$

and $T_d = 2\pi\sqrt{\dfrac{I_d}{M_d B_H}} = 2\pi\sqrt{\dfrac{I_1 + I_2}{(M_1 - M_2)B_H}}$ ....(ii)

and $\nu_d = \dfrac{1}{2\pi}\sqrt{\dfrac{(M_1 + M_2)B_H}{(I_1 + I_2)}}$. From equation (i) and (ii) we get

$$\frac{T_s}{T_d} = \sqrt{\frac{M_1 - M_2}{M_1 + M_2}} \Rightarrow \frac{M_1}{M_2} = \frac{T_d^2 + T_s^2}{T_d^2 - T_s^2} = \frac{\nu_s^2 + \nu_d^2}{\nu_s^2 - \nu_d^2}$$

(5) **To find the ratio of magnetic field :** Suppose it is required to find the ratio $\dfrac{B}{B_H}$ where B is the field created by magnet and B_H is the horizontal component of earth's magnetic field.

To determine $\dfrac{B}{B_H}$ a primary (main) magnet is made to first oscillate in earth's magnetic field (B_H) alone and it's time period of oscillation (T) is noted.

$T = 2\pi\sqrt{\dfrac{I}{M\,B_H}}$

and frequency $\nu = \dfrac{1}{2\pi}\sqrt{\dfrac{M\,B_H}{I}}$

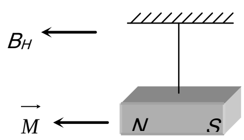

Fig. 22.21

Now a secondary magnet placed near the primary magnet so primary magnet oscillate in a new field with is the resultant of B and B_H and now time period, is noted again.

$T' = 2\pi\sqrt{\dfrac{I}{M(B + B_H)}}$

or $\nu' = \dfrac{1}{2\pi}\sqrt{\dfrac{M(B + B_H)}{I}}$

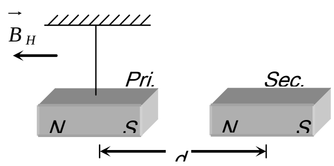

Fig. 22.22

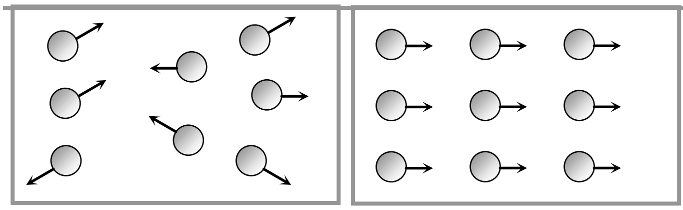
$\Rightarrow \dfrac{B}{B_H} = \left(\dfrac{\nu'}{\nu}\right)^2 - 1$

Magnetic Materials

On the basis of mutual interactions or behaviour of various materials in an external magnetic field, the materials are divided in three main categories.

(1) **Diamagnetic materials :** Diamagnetism is the intrinsic property of every material and it is generated due to mutual interaction between the applied magnetic field and orbital motion of electrons.

(2) **Paramagnetic materials :** In these substances the inner orbits of atoms are incomplete. The electron spins are uncoupled, consequently on applying a magnetic field the magnetic moment generated due to spin motion align in the direction of magnetic field and induces magnetic moment in its direction due to which the material gets feebly magnetised. In these materials the electron number is odd.



(A) When no field is applied

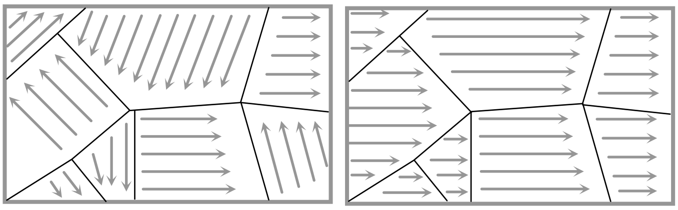
(B) On application of field $(\vec{B})$

Fig. 22.23

(3) **Ferromagnetic materials :** In some materials, the permanent atomic magnetic moments have strong tendency to align themselves even without any external field.

These materials are called ferromagnetic materials.

In every unmagnetised ferromagnetic material, the atoms form domains inside the material. Different domains, however, have different directions of magnetic moment and hence the materials remain unmagnetised. On applying an external magnetic field, these domains rotate and align in the direction of magnetic field.



(A) Unmagnetised

(B) Magnetised

Fig. 22.24

(4) **Curie Law :** The magnetic susceptibility of paramagnetic substances is inversely proportional to its absolute temperature *i.e.* $\chi \propto \frac{1}{T} \Rightarrow \chi \propto \frac{C}{T}$; where C = Curie constant, T = absolute temperature.

On increasing temperature, the magnetic susceptibility of paramagnetic materials decreases and vice versa.

The magnetic susceptibility of ferromagnetic substances does not change according to Curie law.

(5) **Curie temperature (T_c) :** The temperature above which a ferromagnetic material behaves like a paramagnetic material is defined as Curie temperature (T_c).

or

The minimum temperature at which a ferromagnetic substance is converted into paramagnetic substance is defined as Curie temperature. For various ferromagnetic materials its values are different, *e.g.* for *Ni*, $T_{C_{Ni}} = 358^o C$ for *Fe*, $T_{C_{Fe}} = 770^o C$

for *CO*, $T_{C_{CO}} = 1120^o C$

At this temperature the ferromagnetism of the substances suddenly vanishes.

(6) **Curie-weiss law :** At temperatures above Curie temperature the magnetic susceptibility of ferromagnetic materials is inversely proportional to ($T - T_c$)

i.e. $\chi \propto \frac{1}{T - T_c}$

$\Rightarrow \chi = \frac{C}{(T - T_c)}$

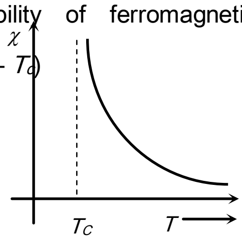


Fig. 22.25

Here T_c = Curie temperature

χ-T curve is shown (for Curie-Weiss Law)

Hysteresis Curve

For ferromagnetic materials, by removing external magnetic field *i.e.* H = 0. The magnetic moment of some domains remain aligned in the applied direction of previous magnetising field which results into a residual magnetism.

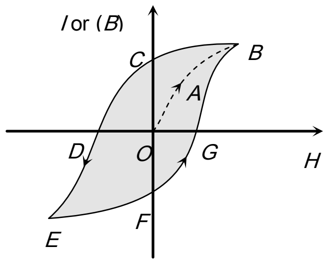

Fig. 22.26

The lack of retracibility as shown in figure is called hysteresis and the curve is known as hysteresis loop.

(1) **Retentivity :** When H is reduced, I reduces but is not zero when H = 0. The remainder value OC of magnetisation when H = 0 is called the residual magnetism or retentivity.

The property by virtue of which the magnetism (I) remains in a material even on the removal of magnetising field is called Retentivity or Residual magnetism.

(2) **Corecivity or corecive force** : When magnetic field H is reversed, the magnetisation decreases and for a particular value of H, denoted by H_c, it becomes zero *i.e.*, $H_c = OD$ when $I = 0$. This value of H is called the corecivity.

Magnetic hard substance (steel) $\rightarrow$ High corecvity

Magnetic soft substance (soft iron) $\rightarrow$ Low corecivity

(3) When field H is further increased in reverse direction, the intensity of magnetisation attains saturation value in reverse direction (*i.e.* point E)

(4) When H is decreased to zero and changed direction in steps, we get the part $EFGB$.

Thus complete cycle of magnetisation and demagnetisation is represented by $BCDEFGB$. This curve is known as hysteresis curve

Table 22.1 : Comparison between soft iron and steel

Soft iron	Steel
	The area of hysteresis loop is less (low energy loss)	The area of hysteresis loop is large (high energy loss)
Less relativity and corecive force	More retentivity and corecive force
Magnetic permeability is high	Magnetic permeability is less
I and χ both are high	I and χ both are low
It magnetised and demagnetised easily	Magnetisation and demagnetisation is not easy
Used in dynamo, transformer, electromagnet tape recorder and tapes *etc.*	Used for making permanent magnet.

Table 22.2 : Comparative study of magnetic materials

Property	Diamagnetic substances	Paramagnetic substances	Ferromagnetic substances
Cause of magnetism	Orbital motion of electrons	Spin motion of electrons	Formation of domains
Explanation of magnetism	On the basis of orbital motion of electrons	On the basis of spin and orbital motion of electrons	On the basis of domains formed
Behaviour In a non-uniform magnetic field	These are repelled in an external magnetic field *i.e.* have a tendency to move from high to low field region 	These are feebly attracted in an external magnetic field *i.e.*, have a tendency to move from low to high field region 	These are strongly attracted in an external magnetic field *i.e.* they easily move from low to high field region 
State of magnetisation	These are weekly magnetised in a direction opposite to that of applied magnetic field	These get weekly magnetised in the direction of applied magnetic field	These get strongly magnetised in the direction of applied magnetic field
When the material in the form of liquid is filled in the *U*-tube and placed between pole pieces.	Liquid level in that limb gets depressed 	Liquid level in that limb rises up 	Liquid level in that limb rises up very much On placing the gaseous materials between pole pieces	The gas expands at right angles to the magnetic field.	The gas expands in the direction of magnetic field.	The gas rapidly expands in the direction of magnetic field
The value of magnetic induction B	$B < B_0$ (where B_0 is the magnetic induction in vacuum)	$B > B_0$	$B >> B_0$
Magnetic susceptibility χ	Low and negative $\|\chi\| \approx 1$	Low but positive $\chi \approx 1$	Positive and high $\chi \approx 10^2$
Dependence of χ on temperature	Does not depend on temperature (except *Bi* at low temperature) 	On cooling, these get converted to ferromagnetic materials at Curie temperature 	These get converted into paramagnetic materials at Curie temperature Relative permeability (μ_r)	$\mu_r < 1$	$\mu_r > 1$	$\mu_r >> 1$ $\mu_r = 10^2$
Intensity of magnetisation (I)	I is in a direction opposite to that of H and its value is very low	I is in the direction of H but value is low	I is in the direction of H and value is very high.
I-H curves			
Magnetic moment (*M*)	Very low (≈ 0)	Very low	Very high
Examples	*Cu*, *Ag*, *Au*, *Zn*, *Bi*, *Sb*, *NaCl*, H_2O air and diamond *etc.*	*Al*, *Mn*, *Pt*, *Na*, $CuCl_2$, O_2 and crown glass	*Fe*, *Co*, *Ni*, *Cd*, Fe_3O_4 *etc.*

Tips & Tricks

✍ Bohr magneton $\mu_B = \frac{eh}{4\pi m} = 9.27\times10^{-24}\ A/m^2$. It serves as natural unit of magnetic moment. Bohr magneton can be defined as the orbital magnetic moment of an electron circulating in inner most orbit.

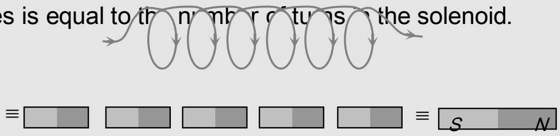
✍ Magnetic moment of straight current carrying wire is zero.

✍ Magnetic moment of toroid is zero

✍ Atoms which have paired electron have the magnetic moment zero.

✍ Magnetostriction : The length of an iron bar changes when it is magnetised, when an iron bar magnetised it's length increases due to alignment of spins parallel to the field. This increase is in the direction of magnetisation. This effect is known as magnetostriction.

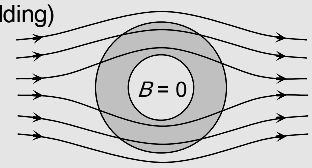
✍ A current carrying solenoid can be treated as the arrangement of small magnetic dipoles placed in line with each other as shown. The number of such small magnetic dipoles is equal to the number of turns in the solenoid.



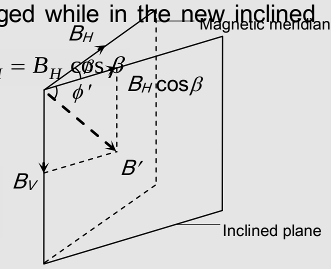
✍ When a magnetic dipole of moment *M* moves from unstable equilibrium to stable equilibrium position in a magnetic field B, the kinetic energy will decrease by 2 *MB*.

✍ Intensity of magnetisation (*I*) is produced in materials due to spin motion of electrons.

✍ For protecting a sensitive equipment from the external magnetic field it should be placed inside an iron cane. (magnetic shielding)



✍ **Apparent dip :** In a vertical plane inclined at an angle β to the magnetic meridian, vertical component of earth's magnetic field remains unchanged while in the new inclined plane horizontal component $B'_H = B_H \cos\beta$



ϕ' = apparent angle of dip

and $\tan\phi' = \frac{B_V}{B'_H} = \frac{B_V}{B_H\cos\beta}$

$\Rightarrow \tan\phi' = \frac{\tan\phi}{\cos\beta}$

✍ If at any place the angle of dip is θ and magnetic latitude is λ then tan θ = 2tanλ

✍ At the poles and equator of earth the values of total intensity are 0.66 and 0.33 *Oersted respectively.*

✍ Remember time period of oscillation in difference position is greater than that in sum position $T_d > T_s$.

✍ If a rectangular bar magnet is cut in n equal parts then time period of each part will be $\frac{1}{\sqrt{n}}$ times that of complete magnet (i.e. $T' = \frac{T}{\sqrt{n}}$) while for short magnet $T' = \frac{T}{n}$. If nothing is said then bar magnet is treated as short magnet.

✍ Suppose a magnetic needle is vibrating in earth's magnetic field. With temperature rise *M* decreases hence time period (*T*) increases but at 770°*C* (Curie temperature) it stops vibrating.

✍ An iron cored coil and a bulb are connected in series with an ac generator. If an iron rod is introduced inside a coil, then the intensity of bulb will decrease, because some energy lost in magnetising the rod.

✍ Hysteresis energy loss = Area bound by the hysteresis loop = *VAnt Joule*; Where , *V* = Volume of ferromagnetic sample, *A* = Area of *B* – *H* loop *P*, *n* = Frequency of alternating magnetic field and *t* = Time

Ordinary Thinking

Objective Questions

Magnet and it's Properties

1. An iron rod of length *L* and magnetic moment *M* is bent in the form of a semicircle. Now its magnetic moment will be

[CPMT 1984; MP Board 1986; NCERT 1975; MP PET/PMT 1988; EAMCET (Med.) 1995; Manipal MEE 1995;RPMT 1996; BHU 1995; MP PET 2002]

(a) M (b) $\frac{2M}{\pi}$

(c) $\frac{M}{\pi}$ (d) $M\pi$

2. Unit of magnetic flux density (or magnetic induction) is

[DPMT 1988;CPMT 1984, 78, 90; MP PMT 1992; MH CET 2004]

(a) *Tesla* (b) *Weber/metre*^{2}

(c) *Newton/ampere-metre* (d) All of the above

3. Magnetic intensity for an axial point due to a short bar magnet of magnetic moment *M* is given by

[MP PET 1984; CPMT 1974; Pb. PMT 1999]

(a) $\frac{\mu_0}{4\pi}\times\frac{M}{d^3}$ (b) $\frac{\mu_0}{4\pi}\times\frac{M}{d^2}$

(c) $\frac{\mu_0}{2\pi}\times\frac{M}{d^3}$ (d) $\frac{\mu_0}{2\pi}\times\frac{M}{d^2}$

4. A magnet is placed in iron powder and then taken out, then maximum iron powder is at

(a) Some away from north pole

(b) Some away from south pole

(c) The middle of the magnet

(d) The end of the magnet

5. A magnet of magnetic moment *M* and pole strength *m* is divided in two equal parts, then magnetic moment of each part will be **[MP Board 1985; MP PET 1984, 2000; NCERT 1974; AFMC 1996; MP PMT 2002; MH CET (Med.) 2001; CPMT 1983, 84; KCET 1994, 2001]**

(a) M (b) $M/2$

(c) $M/4$ (d) $2M$

6. Points *A* and *B* are situated along the extended axis of 2 *cm* long bar magnet at a distance *x* and 2*x cm* respectively. From the pole nearer to the points, the ratio of the magnetic field at A and B will be **[EAMCET 1984; CPMT 1986]**

(a) 4 : 1 exactly (b) 4 : 1 approx.

(c) 8 : 1 exactly (d) 8 : 1 approx.

7. If a magnet of pole strength *m* is divided into four parts such that the length and width of each part is half that of initial one, then the pole strength of each part will be

(a) $m/4$ (b) $m/2$

(c) $m/8$ (d) $4m$

8. The distance of two points on the axis of a magnet from its centre is 10 *cm* and 20 *cm* respectively. The ratio of magnetic intensity at these points is 12.5 : 1. The length of the magnet will be

(a) 5 *cm* (b) 25 *cm*

(c) 10 *cm* (d) 20 *cm*

9. Ratio of magnetic intensities for an axial point and a point on broad side-on position at equal distance *d* from the centre of magnet will be **or** The magnetic field at a

distance *d* from a short bar magnet in longitudinal and transverse positions are in the ratio **[CPMT 1978, 82; KCET 1998]**

(a) 1 : 1 (b) 2 : 3

(c) 2 : 1 (d) 3 : 2

10. The magnetism of magnet is due to [JIPMER 1997]

(a) The spin motion of electron
(b) Earth
(c) Pressure of big magnet inside the earth
(d) Cosmic rays

11. The pole strength of a bar magnet is 48 *ampere-metre* and the distance between its poles is 25 *cm*. The moment of the couple by which it can be placed at an angle of 30° with the uniform magnetic intensity of flux density 0.15 *Newton /ampere-metre* will be

(a) 12 *Newton × metre* (b) 18 *Newton × metre*
(c) 0.9 *Newton × metre* (d) None of the above

12. The magnetic field at a point x on the axis of a small bar magnet is equal to the field at a point y on the equator of the same magnet. The ratio of the distances of x and y from the centre of the magnet is [MP PMT 1990]

(a) 2^{-3} (b) $2^{-1/3}$
(c) 2^3 (d) $2^{1/3}$

13. A magnet of magnetic moment 20 C.G.S. units is freely suspended in a uniform magnetic field of intensity 0.3 C.G.S. units. The amount of work done in deflecting it by an angle of 30° in C.G.S. units is [MP PET 1991]

(a) 6 (b) $3\sqrt{3}$
(c) $3(2-\sqrt{3})$ (d) 3

14. A bar magnet having centre O has a length of 4 *cm*. Point P_1 is in the broad side-on and P_2 is in the end side-on position with OP_1 = OP_2 = 10 *metres*. The ratio of magnetic intensities H at P_1 and P_2 is [MP PET 1990]

(a) $H_1 : H_2 = 16 : 100$ (b) $H_1 : H_2 = 1 : 2$
(c) $H_1 : H_2 = 2 : 1$ (d) $H_1 : H_2 = 100 : 16$

15. The magnetic field due to a short magnet at a point on its axis at distance X *cm* from the middle point of the magnet is 200 *Gauss*. The magnetic field at a point on the neutral axis at a distance X *cm* from the middle of the magnet is

[CPMT 1971, 88; MP PET 1985]

(a) 100 *Gauss* (b) 400 *Gauss*
(c) 50 *Gauss* (d) 200 *Gauss*

16. Which of the following, the most suitable material for making permanent magnet is

(a) Steel (b) Soft iron
(c) Copper (d) Nickel

17. In the case of bar magnet, lines of magnetic induction

[CPMT 1975; CBSE PMT 1990]

(a) Start from the north pole and end at the south pole
(b) Run continuously through the bar and outside
(c) Emerge in circular paths from the middle of the bar
(d) Are produced only at the north pole like rays of light from a bulb

18. A sensitive magnetic instrument can be shielded very effectively from outside magnetic fields by placing it inside a box of [CPMT 1974]

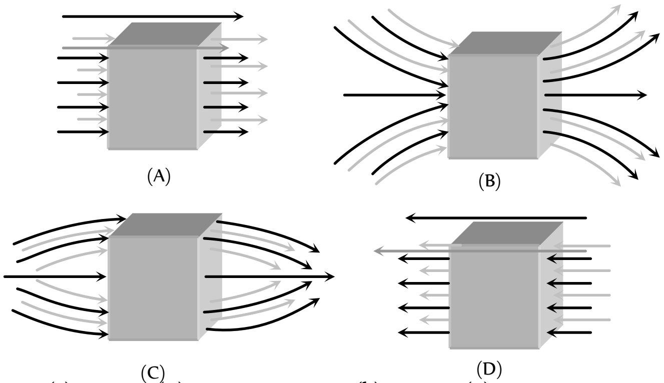
(a) Teak wood
(b) Plastic material
(c) Soft iron of high permeability
(d) A metal of high conductivity

19. The field due to a magnet at a distance R from the centre of the magnet is proportional to [MP PET 1996]

(a) R^2 (b) R^3
(c) $1/R^2$ (d) $1/R^3$

20. A uniform magnetic field, parallel to the plane of the paper existed in space initially directed from left to right. When a bar of soft iron is placed in the field parallel to it, the lines of force passing through it will be represented by

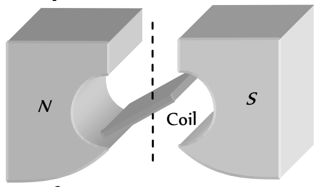
[CPMT 1986, 88]



(a) Figure (A) (b) Figure (B)
(c) Figure (C) (d) Figure (D)

21. The figure below shows the north and south poles of a permanent magnet in which n turn coil of area of cross-section A is resting, such that for a current i passed through the coil, the plane of the coil makes an angle θ with respect to the direction of magnetic field B. If the plane of the magnetic field and the coil are horizontal and vertical respectively, the torque on the coil will be

[CPMT 1986, 88; DPMT 2002]



(a) $\tau = niAB\cos\theta$
(b) $\tau = niAB\sin\theta$
(c) $\tau = niAB$
(d) None of the above, since the magnetic field is radial

22. Points A and B are situated perpendicular to the axis of a 2*cm* long bar magnet at large distances X and $3X$ from its centre on opposite sides. The ratio of the magnetic fields at A and B will be approximately equal to [CPMT 1988]

(a) 1 : 9 (b) 2 : 9
(c) 27 : 1 (d) 9 : 1

23. Two short magnets with their axes horizontal and perpendicular to the magnetic meridian are placed with their centres 40 *cm* east and 50 *cm* west of magnetic needle. If the needle remains undeflected, the ratio of their magnetic moments $M_1 : M_2$ is [MP PET 1990]

(a) 4 : 5 (b) 16 : 25
(c) 64 : 125 (d) $2:\sqrt{5}$

24. If a bar magnet of magnetic moment M is freely suspended in a uniform magnetic field of strength B, the work done in rotating the magnet through an angle θ is

[AFMC 1997; MNR 1998; RPET 1999; MP PMT 1989, 96, 99; MP PET 1984, 89, 2000; UPSEAT 1999, 2000, 05]

(a) $MB(1-\sin\theta)$ (b) $MB\sin\theta$
(c) $MB\cos\theta$ (d) $MB(1-\cos\theta)$

25. Two small bar magnets are placed in a line with like poles facing each other at a certain distance *d* apart. If the length of each magnet is negligible as compared to *d*, the force between them will be inversely proportional to

[CPMT 1971; NCERT 1971; MP PMT 1992]

(a) d (b) d^2

(c) $\frac{1}{d^2}$ (d) d^4

26. A magnet of magnetic moment *M* is situated with its axis along the direction of a magnetic field of strength B. The work done in rotating it by an angle of 180° will be

[MP PMT 1985; MP PET 1997]

(a) $-MB$ (b) $+MB$

(c) 0 (d) $+2MB$

27. A long magnet is cut in two parts in such a way that the ratio of their lengths is 2 : 1. The ratio of pole strengths of both the section is [CPMT 1986]

(a) Equal (b) In the ratio of 2 : 1

(c) In the ratio of 1 : 2 (d) In the ratio of 4 : 1

28. A bar magnet of length 10 *cm* and having the pole strength equal to 10^{-3} *weber* is kept in a magnetic field having magnetic induction (*B*) equal to $4\pi \times 10^{-3}$ *Tesla*. It makes an angle of 30° with the direction of magnetic induction. The value of the torque acting on the magnet is

[MP PMT 1993]

(a) $2\pi \times 10^{-7}\ N \times m$ (b) $2\pi \times 10^{-5}\ N \times m$

(c) $0.5 N \times m$ (d) $0.5 \times 10^2\ N \times m$

($\mu_0 = 4\pi \times 10^{-7}\ weber / amp \times m$)

29. Magnetic field intensity is defined as [MP PET 1993]

(a) Magnetic moment per unit volume

(b) Magnetic induction force acting on a unit magnetic pole

(c) Number of lines of force crossing per unit area

(d) Number of lines of force crossing per unit volume

30. If the magnetic flux is expressed in *weber*, then magnetic induction can be expressed in

[CPMT 1974, 77, 83, 86, 87; MP PET 1989]

(a) *Weber/m* (b) *Weber/m*

(c) *Weber-m* (d) *Weber-m*

31. A magnetic needle is kept in a non-uniform magnetic field. It experiences [MP PMT 1987; IIT 1982; Kerala PET 2002; AMU 1999; AIEEE 2005]

(a) A force and a torque

(b) A force but not a torque

(c) A torque but not a force

(d) Neither a torque nor a force

32. The magnetic induction in air at a distance *d* from an isolated point pole of strength *m* unit will be [MNR 1987; CPMT 1991; MP PET 1995; AMU 1999; J & K CET 2005]

(a) $\frac{m}{d}$ (b) $\frac{m}{d^2}$

(c) md (d) md^2

33. A magnetic needle lying parallel to a magnetic field requires *W* units of work to turn it through 60°. The torque required to maintain the needle in this position will be

[AIEEE 2003; UPSEAT 2000; BHU 2004; Pb PET 2004]

(a) $\sqrt{3}\,W$ (b) W

(c) $\frac{\sqrt{3}}{2}W$ (d) $2W$

34. A long magnetic needle of length $2L$, magnetic moment *M* and pole strength *m* units is broken into two pieces at the middle. The magnetic moment and pole strength of each piece will be

(a) $\frac{M}{2}, \frac{m}{2}$ (b) $M, \frac{m}{2}$

(c) $\frac{M}{2}, m$ (d) M, m

35. Two identical thin bar magnets each of length *l* and pole strength *m* are placed at right angle to each other with north pole of one touching south pole of the other. Magnetic moment of the system is

(a) *ml* (b) 2*ml*

(c) $\sqrt{2}ml$ (d) $\frac{1}{2}ml$

36. Magnetic induction is a [AFMC 1986]

(a) Scalar quantity (b) Vector quantity

(c) Both (a) and (b) (d) None of the above

37. What happens to the force between magnetic poles when their pole strength and the distance between them are both doubled[CPMT 1978, 80, 84, 8

(a) Force increases to two times the previous value

(b) No change

(c) Force decreases to half the previous value

(d) Force increases to four times the previous value

38. Force between two unit pole strength placed at a distance of one metre is [CPMT 1987]

(a) 1 *N* (b) $\frac{10^{-7}}{4\pi}N$

(c) $10^{-7}\ N$ (d) $4\pi \times 10^{-7} N$

39. A small bar magnet of moment *M* is placed in a uniform field *H*. If magnet makes an angle of 30° with field, the torque acting on the magnet is [CPMT 1989]

(a) *MH* (b) $\frac{MH}{2}$

(c) $\frac{MH}{3}$ (d) $\frac{MH}{4}$

40. If a hole is made at the centre of a bar magnet, then its magnetic moment will

(a) Increase (b) Decrease

(c) Not change (d) None of these

41. The small magnets each of magnetic moment 10 *A-m* are placed end-on position 0.1*m* apart from their centres. The force acting between them is [MNR 1994]

(a) $0.6 \times 10^7\ N$ (b) $0.06 \times 10^7\ N$

(c) $0.6N$ (d) $0.06N$

42. Magnetic lines of force [MP PET 1994]

(a) Always intersect

(b) Are always closed

(c) Tend to crowd far away from the poles of magnet

(d) Do not pass through vacuum

43. Rate of change of torque τ with deflection θ is maximum for a magnet suspended freely in a uniform magnetic field of induction *B*, when [MP PET 1994]

(a) $\theta = 0°$ (b) $\theta = 45°$

(c) $\theta = 60°$ (d) $\theta = 90°$

44. A magnet of magnetic moment *M* is rotated through 360° in a magnetic field *H*, the work done will be [KCET 1998; MP PMT 1994; Roorkee 2000]

(a) *MH* (b) 2*MH*

(c) $2\pi MH$ (d) Zero

45. The direction of line of magnetic field of bar magnet is [AFMC 1995]

(a) From south pole to north pole

(b) From north pole to south pole

(c) Across the bar magnet

(d) From south pole to north pole inside the magnet and from north pole to south pole outside the magnet

46. The work done in turning a magnet of magnetic moment '*M* by an angle of 90° from the meridian is '*n*' times the corresponding work done to turn it through an angle of 60°, where '*n*' is given by[CBSE PMT 1995; MP PET 2003]

(a) 1/2 (b) 2

(c) 1/4 (d) 1

47. Force between two identical bar magnets whose centres are *r metre* apart is 4.8 *N*, when their axes are in the same line. If separation is increased to 2*r*, the force between them is reduced to

(a) 2.4*N* (b) 1.2*N*

(c) 0.6*N* (d) 0.3*N*

48. A bar magnet of magnetic moment 10^4 *J/T* is free to rotate in a horizontal plane. The work done in rotating the magnet slowly from a direction parallel to a horizontal magnetic field of 4×10^{-5} *T* to a direction 60° from the field will be [MP PET 1995]

(a) 0.2 *J* (b) 2.0 *J*

(c) 4.18 *J* (d) 2×10^{2} *J*

49. Magnetic lines of force due to a bar magnet do not intersect because

(a) A point always has a single net magnetic field

(b) The lines have similar charges and so repel each other

(c) The lines always diverge from a single point

(d) The lines need magnetic lenses to be made to intersect

50. The unit of magnetic moment is [MP PET 1996; AMU 2000; MP PMT 1995, 2002]

(a) *Wb/m* (b) $Wb.m^2$

(c) *A.m* (d) $A.m^2$

51. The dipole moment of a short bar magnet is 1.25 *A-m*. The magnetic field on its axis at a distance of 0.5 *metre* from the centre of the magnet is

(a) $1.0\times10^{-4}\ Newton / amp - meter$

(b) $4\times10^{-2}\ Newton / amp - metre$

(c) $2\times10^{-6}\ Newton / amp - metre$

(d) $6.64\times10^{-8}\ Newton / amp - metre$

52. A permanent magnet [MP PET 1996]

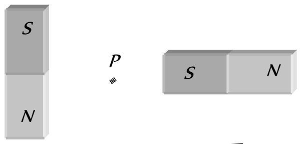
(a) Attracts all substances

(b) Attracts only magnetic substances

(c) Attracts magnetic substances and repels all non-magnetic substances

(d) Attracts non-magnetic substances and repels magnetic substances

53. Two equal bar magnets are kept as shown in the figure. The direction of resultant magnetic field, indicated by arrow head at the point *P* is (approximately)



(a) $\longrightarrow$ (b) $\nearrow$

(c) $\searrow$ (d) $\uparrow$

54. The S.I. unit of magnetic permeability is [MP PET 1997]

(a) Am^{-1}

(b) Am

(c) $Henry\,m^{-1}$

(d) No unit, it is a dimensionless number

55. A short bar magnet placed with its axis at 30° with a uniform external magnetic field of 0.16 *Tesla* experiences a torque of [AIIMS 1995] magnitude 0.032 *Joule*. The magnetic moment of the bar magnet will be [MP PMT 1997; UPSEAT 2004]

(a) 0.23 *Joule/Tesla* (b) 0.40 *Joule/Tesla*

(c) 0.80*Joule/Tesla* (d) Zero

56. The magnetic field to a small magnetic dipole of magnetic moment *M*, at distance *r* from the centre on the equatorial line is given by (in M.K.S. system) [MP PMT/PET 1998]

(a) $\frac{\mu_0}{4\pi}\times\frac{M}{r^2}$ (b) $\frac{\mu_0}{4\pi}\times\frac{M}{r^3}$

[MP PMT 1995]

(c) $\frac{\mu_0}{4\pi}\times\frac{2M}{r^2}$ (d) $\frac{\mu_0}{4\pi}\times\frac{2M}{r^3}$

57. The incorrect statement regarding the lines of force of the magnetic field *B* is [MP PET 1999]

(a) Magnetic intensity is a measure of lines of force passing through unit area held normal to it

(b) Magnetic lines of force form a close curve

(c) Inside a magnet, its magnetic lines of force move from north pole of a magnet towards its south pole

(d) Due to a magnet magnetic lines of force never cut each other

58. A straight wire carrying current *i* is turned into a circular loop. If the magnitude of magnetic moment associated with it in M.K.S. unit is *M*, the length of wire will be [MP PET 1999]

(a) $4\pi iM$ (b) $\sqrt{\frac{4\pi M}{i}}$

(c) $\sqrt{\frac{4\pi i}{M}}$ (d) $\frac{M\pi}{4i}$

59. A bar magnet of magnetic moment $\vec{M}$ is placed in a magnetic field of induction $\vec{B}$. The torque exerted on it is

[EAMCET (Engg.) 1995; CBSE PMT 1999; BHU 2003; CPMT 2004; MP PMT 2001, 05]

(a) $\vec{M}.\vec{B}$ (b) $-\vec{M}.\vec{B}$

(c) $\vec{M}\times\vec{B}$ (d) $\vec{B}\times\vec{M}$

60. For protecting a sensitive equipment from the external magnetic field, it should be

[KCET 1993; CBSE PMT 1998]

(a) Placed inside an aluminium cane
(b) Placed inside an iron cane
(c) Wrapped with insulation around it when passing current through it
(d) Surrounded with fine copper sheet

61. If a piece of metal was thought to be magnet, which one of the following observations would offer conclusive evidence

[KCET 1994]

(a) It attracts a known magnet
(b) It repels a known magnet
(c) Neither (a) nor (b)
(d) It attracts a steel screw driver

62. The magnet can be completely demagnetized by

[KCET 1994]

(a) Breaking the magnet into small pieces
(b) Heating it slightly
(c) Droping it into ice cold water
(d) A reverse field of appropriate strength

63. A current loop placed in a magnetic field behaves like a

[AFMC 1994]

(a) Magnetic dipole (b) Magnetic substance
(c) Magnetic pole (d) All are true

64. A magnet when placed perpendicular to a uniform field of strength $10^{-4}\,Wb/m^2$ experiences a maximum couple of moment $4\times10^{-5}\,N/m.$. What is its magnetic moment

[Bihar MEE 1995]

(a) $0.4A\times m^2$ (b) $0.2A\times m^2$
(c) $0.16A\times m^2$ (d) $0.04A\times m^2$
(e) $0.06A\times m^2$

65. *Weber/m* is equal to [CPMT 1985; AFMC 1997]

(a) *Volt* (b) *Henry*
(c) *Tesla* (d) All of these

66. Two magnets, each of magnetic moment '*M* are placed so as to form a cross at right angles to each other. The magnetic moment of the system will be

[AFMC 1999; Pb PET 2001]

(a) 2 *M* (b) $\sqrt{2}\,M$
(c) 0.5 *M* (d) *M*

67. Two like magnetic poles of strength 10 and 40 SI units are separated by a distance 30 *cm*. The intensity of magnetic field is zero on the line joining them [JIPMER 1999]

(a) At a point 10 *cm* from the stronger pole
(b) At a point 20 *cm* from the stronger pole
(c) At the mid-point
(d) At infinity

68. If a magnet of length 10 *cm* and pole strength 40 *A-m* is placed at an angle of 45° in an uniform induction field of intensity 2×10^{-4} *T*, the couple acting on it is

[Pb. PMT 1999; MH CET (Med.) 1999]

(a) 0.5656×10^{-4} *N-m* (b) 0.5656×10^{-3} *N-m*
(c) 0.656×10^{-4} *N-m* (d) 0.656×10^{-5} *N-m*

69. The intensity of magnetic field is *H* and moment of magnet is *M*. The maximum potential energy is

[Pb. PMT 1999; MH CET (Med.) 1999]

(a) *MH* (b) 2 *MH*
(c) 3 *MH* (d) 4 *MH*

70. A bar magnet of magnetic moment 200 *A-m* is suspended in a magnetic field of intensity 0.25 *N/A-m*. The couple required to deflect it through 30° is

[AFMC 1999; Pb. PET 2000]

(a) 50 *N-m* (b) 25 *N-m*
(c) 20 *N-m* (d) 15 *N-m*

71. Two similar bar magnets *P* and *Q*, each of magnetic moment *M*, are taken, If *P* is cut along its axial line and *Q* is cut along its equatorial line, all the four pieces obtained have [EAMCET (Engg.) 2000]

(a) Equal pole strength (b) Magnetic moment $\frac{M}{4}$

(c) Magnetic moment $\frac{M}{2}$ (d) Magnetic moment *M*

72. A magnet of magnetic moment $50\,\hat{i}\,A\text{-}m^2$ is placed along the *x*-axis in a magnetic field $\vec{B}=(0.5\,\hat{i}+3.0\,\hat{j})T$. The torque acting on the magnet is

[MP PMT 2000]

(a) $175\ \hat{k}\ N\text{-}m$ (b) $150\ \hat{k}\ N\text{-}m$

(c) $75\ \hat{k}\ N\text{-}m$ (d) $25\sqrt{37}\,\hat{k}\ N\text{-}m$

73. A bar magnet is held perpendicular to a uniform magnetic field. If the couple acting on the magnet is to be halved by rotating it, then the angle by which it is to be rotated is

[CBSE PMT 2000]

(a) 30° (b) 45°
(c) 60° (d) 90°

74. There is no couple acting when two bar magnets are placed coaxially separated by a distance because

[EAMCET (Engg.) 2000]

(a) There are no forces on the poles
(b) The forces are parallel and their lines of action do not coincide
(c) The forces are perpendicular to each other
(d) The forces act along the same line

75. A bar magnet of magnetic moment 3.0 *A-m* is placed in a uniform magnetic induction field of 2×10^{-5} *T*. If each pole of the

magnet experiences a force of 6×10^{-4} *N*, the length of the magnet is [EAMCET (Med.) 2000]

(a) 0.5 *m* (b) 0.3 *m*

(c) 0.2 *m* (d) 0.1 *m*

76. A bar magnet when placed at an angle of 30° to the direction of magnetic field induction of 5×10^{-2} *T*, experiences a moment of couple 25×10^{-6} *N-m*. If the length of the magnet is 5 *cm* its pole strength is

[EAMCET (Med.) 2000]

(a) 2×10^{-2} *A-m* (b) 5×10^{-2} *A-m*

(c) 2 *A-m* (d) 5 *A-m*

77. Two lines of force due to a bar magnet [MP PMT 2002]

(a) Intersect at the neutral point

(b) Intersect near the poles of the magnet

(c) Intersect on the equatorial axis of the magnet

(d) Do not intersect at all

78. The ultimate individual unit of magnetism in any magnet is called [MP PET 2002; J & K CET 2004]

(a) North pole (b) South pole

(c) Dipole (d) Quadrupole

79. The magnetic field lines due to a bar magnet are correctly shown in [IIT-JEE (Screening) 2002]

(a) 
(b) 
(c) 
(d) 
80. The magnetic lines of force inside a bar magnet

[AIEEE 2003]

(a) Are from south-pole to north-pole of the magnet

(b) Are from north-pole to south-pole of the magnet

(c) Do not exist

(d) Depend upon the area of cross-section of the bar magnet

81. If a magnet is hanged with its magnetic axis then it stops in

[AFMC 2003]

(a) Magnetic meridian (b) Geometric meridian

(c) Angle of dip (d) None of these

82. The work done in rotating a magnet of magnetic moment 2 *A-m* in a magnetic field of 5×10^{-3} *T* from the direction along the magnetic field to opposite direction to the magnetic field, is

(a) Zero (b) 2×10^{-2} *J*

(c) 10^{-2} *J* (d) 10 *J*

83. The torque on a bar magnet due to the earth's magnetic field is maximum when the axis of the magnet is

[MP PMT 2004]

(a) Perpendicular to the field of the earth

(b) Parallel to the vertical component of the earth's field

(c) At an angle of 33° with respect to the *N-S* direction

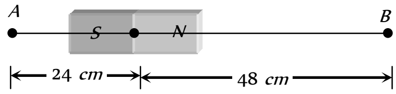
(d) Along the North-South (*N-S*) direction

84. Magnetic dipole moment is a [AFMC 2004]

(a) Scalar quantity (b) Vector quantity

(c) Constant quantity (d) None of these

85. A bar magnet of length 3 *cm* has points *A* and *B* along its axis at distances of 24 *cm* and 48 *cm* on the opposite sides. Ratio of magnetic fields at these points will be [DPMT 2004]



(a) 8 (b) $1/2\sqrt{2}$

(c) 3 (d) 4

86. A magnet of magnetic moment $2\,J\,T^{-1}$ is aligned in the direction of magnetic field of 0.1 T. What is the net work done to bring the magnet normal to the magnetic field

[DCE 2004]

(a) 0.1 *J* (b) 0.2 *J*

(c) 1 *J* (d) 2 *J*

87. The magnetic moment of a magnet of length 10 *cm* and pole strength 4.0 *Am* will be [DPMT 2003]

(a) $0.4\ Am^2$ (b) $1.6\ Am^2$

(c) $20\ Am^2$ (d) $8.0\ Am^2$

88. The effective length of a magnet is 31.4 *cm* and its pole strength is 0.5 *Am*. The magnetic moment, if it is bent in the form of a semicircle will be [DPMT 2003]

(a) $0.1\ Am^2$ (b) $0.01\ Am^2$

(c) $0.2\ Am^2$ (d) $1.2\ Am^2$

89. The magnetic potential at a point on the axial line of a bar magnet of dipole moment *M* is *V*. What is the magnetic potential due to a bar magnet of dipole moment $\frac{M}{4}$ at the same point

(a) $4\,V$ (b) $2\,V$

(c) $\frac{V}{2}$ (d) $\frac{V}{4}$

90. A small bar magnet has a magnetic moment 1.2 *A-m*. The magnetic field at a distance 0.1 *m* on its axis will be : ($\mu_0 = 4\pi \times 10^{-7}$ *T-m/A*) [MP PET 2003]

(a) 1.2×10^{-4} *T* (b) 2.4×10^{-4} *T*

(c) 2.4×10^{4} *T* (d) 1.2×10^{4} *T*

91. Two identical short bar magnets, each having magnetic moment of 10 *Am*, are arranged such that their axial lines are perpendicular to each other and their centres be along the same straight line in a horizontal plane. If the distance between their centres is 0.2 *m*, the resultant magnetic induction at a point midway between them is

$(\mu_0 = 4\pi \times 10^{-7}\, Hm^{-1})$ [EAMCET 2005]

(a) $\sqrt{2} \times 10^{-7}$ *Tesla* (b) $\sqrt{5} \times 10^{-7}$ *Tesla*

(c) $\sqrt{2} \times 10^{-3}$ *Tesla* (d) $\sqrt{5} \times 10^{-3}$ *Tesla*

92. A magnet of length 0.1 *m* and pole strength $10^{-4}\, A.m.$ is kept in a magnetic field of $30\, Wb/m^2$ at an angle 30°. The couple acting on it is .... $\times 10^{-4}\, Nm.$ [MP PET 2005]

(a) 7.5 (b) 3.0

(c) 1.5 (d) 6.0

Earth Magnetism

1. A very small magnet is placed in the magnetic meridian with its south pole pointing north. The null point is obtained 20 *cm* away from the centre of the magnet. If the earth's magnetic field (horizontal component) at this point be 0.3 *gauss*, the magnetic moment of the magnet is

[CPMT 1987; MNR 1978]

(a) $8.0 \times 10^2\, e.m.u.$ (b) $1.2 \times 10^3\, e.m.u.$

(c) $2.4 \times 10^3\, e.m.u.$ (d) $3.6 \times 10^3\, e.m.u.$

2. Intensity of magnetic field due to earth at a point inside a hollow steel box is [MP PET 1995]

(a) Less than outside (b) More than outside

(c) Same (d) Zero

3. Earth's magnetic field always has a horizontal component except at or Horizontal component of earth's magnetic field remains zero at

(a) Equator (b) Magnetic poles

(c) A latitude of 60° (d) An altitude of 60°

4. A dip needle in a plane perpendicular to magnetic meridian will remain [NCERT 1975; MP PMT 1984; MP PET 1995]

(a) Vertical

(b) Horizontal

(c) In any direction

(d) At an angle of dip to the horizontal

5. At magnetic poles of earth, angle of dip is

[CPMT 1977, 91; NCERT 1981; MP PET 1997; Pb PET 2002]

(a) Zero (b) 45°

(c) 90° (d) 180°

6. The correct relation is

[CPMT 1986; MP PET 1981; AFMC 1996]

(a) $\boldsymbol{B} = \dfrac{B_V}{B_H}$ (b) $\boldsymbol{B} = B_V \times B_H$

(c) $|\boldsymbol{B}| = \sqrt{B_H^2 + B_V^2}$ (d) $\boldsymbol{B} = B_H + B_V$

(Where B_H = Horizontal component of earth's magnetic field; B_V = Vertical component of earth's magnetic field and B = Total intensity of earth's magnetic field)

7. At a certain place, the horizontal component of earth's magnetic field is $\sqrt{3}$ times the vertical component. The angle of dip at that place is [MP PMT 1984, 85; AFMC 2000]

(a) 60° (b) 45°

(c) 90° (d) 30°

8. The vertical component of earth's magnetic field is zero at or The earth's magnetic field always has a vertical component except at the

[NCERT 1980, 88; CPMT 1983; MP PMT 1996]

(a) Magnetic poles (b) Geographical poles

(c) Every place (d) Magnetic equator

9. The angle between the magnetic meridian and geographical meridian is called

[MNR 1990; UPSEAT 1999, 2000; MP PMT 2000]

(a) Angle of dip (b) Angle of declination

(c) Magnetic moment (d) Power of magnetic field

10. The lines of forces due to earth's horizontal component of magnetic field are

[CPMT 1985; MP PMT 1980; AIIMS 1998]

(a) Parallel straight lines (b) Concentric circles

(c) Elliptical (d) Parabolic

11. At a place, if the earth's horizontal and vertical components of magnetic fields are equal, then the angle of dip will be

[SCRA 1994; DCE 2001; MP PMT 2002]

(a) 30° (b) 90°

(c) 45° (d) 0°

[CPMT 1971, 81, 83]

12. If the angles of dip at two places are 30° and 45° respectively, then the ratio of horizontal components of earth's magnetic field at the two places will be [MP PET 1989]

(a) $\sqrt{3} : \sqrt{2}$ (b) $1 : \sqrt{2}$

(c) $1 : \sqrt{3}$ (d) $1 : 2$

13. At a place the earth's horizontal component of magnetic field is $0.36 \times 10^{-4}\, weber/m^2$. If the angle of dip at that place is 60°, then the vertical component of earth's field at that place in *weber/m* will be approximately [MP PMT 1985]

(a) 0.12×10^{-4} (b) 0.24×10^{-4}

(c) 0.40×10^{-4} (d) 0.62×10^{-4}

14. The angle of dip at a place is 40.6° and the intensity of the vertical component of the earth's magnetic field $V = 6 \times 10^{-5}$ *Tesla*. The total intensity of the earth's magnetic field (*I*) at this place is

(a) $7 \times 10^{-5}\, tesla$ (b) $6 \times 10^{-5}\, tesla$

(c) $5 \times 10^{-5}\, tesla$ (d) $9.2 \times 10^{-5}\, tesla$

15. The angle of dip is the angle [CPMT 1978]

(a) Between the vertical component of earth's magnetic field and magnetic meridian

(b) Between the vertical component of earth's magnetic field and geographical meridian

(c) Between the earth's magnetic field direction and horizontal direction

(d) Between the magnetic meridian and the geographical meridian

16. At a certain place the angle of dip is 30° and the horizontal component of earth's magnetic field is 0.50 *Oersted*. The earth's total magnetic field is [CPMT 1990]

(a) $\sqrt{3}$ (b) 1

(c) $\frac{1}{\sqrt{3}}$ (d) $\frac{1}{2}$

17. The angle of dip at the magnetic equator is

[MP PET 1984; MP PMT 1987; CBSE PMT 1989, 90; MP Board 1980; CPMT 1977, 87, 90; Manipal MEE 1995]

(a) 0° (b) 45°

(c) 30° (d) 90°

18. The line on the earth's surface joining the points where the field is horizontal is

[MNR 1985; UPSEAT 1999; Pb PET 2004]

(a) Magnetic meridian (b) Magnetic axis

(c) Magnetic line (d) Magnetic equator

(e) Isogonic line

19. The angle between the earth's magnetic and the earth's geographical axes is [MNR 1979]

(a) Zero (b) 17°

(c) 23° (d) None of these

20. The lines joining the places of the same horizontal intensity are known as [MNR 1984]

(a) Isogonic lines (b) Aclinic lines

(c) Isoclinic lines (d) Agonic lines

(e) Isodynamic lines

21. Ratio between total intensity of magnetic field at equator to poles is

(a) 1 : 1 (b) 1 : 2

(c) 2 : 1 (d) 1 : 4

22. A line passing through places having zero value of magnetic dip is called [CPMT 1987]

(a) Isoclinic line (b) Agonic line

(c) Isogonic line (d) Aclinic line

23. At a place, the horizontal and vertical intensities of earth's magnetic field is 0.30 *Gauss* and 0.173 *Gauss* respectively. The angle of dip at this place is [MP PMT 1986]

(a) 30° (b) 90°

(c) 60° (d) 45°

24. The angle of dip at a place is 60°. At this place the total intensity of earth's magnetic field is 0.64 units. The horizontal intensity of earth's magnetic field at this place is

[MP PET 1984]

(a) 1.28 units (b) 0.64 units

(c) 0.16 units (d) 0.32 units

25. The magnetic compass is not useful for navigation near the magnetic poles because [BIT Ranchi 1982]

(a) The magnetic field near the poles is zero

(b) The magnetic field near the poles is almost vertical

(c) At low temperature, the compass needle looses its magnetic properties

(d) Neither of the above

26. The angle of dip at a place on the earth gives

[MP PET 1994]

(a) The horizontal component of the earth's magnetic field

(b) The location of the geographic meridian

(c) The vertical component of the earth's field

(d) The direction of the earth's magnetic field

27. At the magnetic north pole of the earth, the value of horizontal component of earth's magnetic field and angle of dip are, respectively [MP PMT 1994]

(a) Zero, maximum (b) Maximum, minimum

(c) Maximum, maximum (d) Minimum, minimum

28. At a place, the magnitudes of the horizontal component and total intensity of the magnetic field of the earth are 0.3 and 0.6 *Oersted* respectively. The value of the angle of dip at this place will be

(a) 60° (b) 45°

(c) 30° (d) 0°

29. A dip circle is at right angle to the magnetic meridian. What will be the apparent dip [AFMC 1995]

(a) 0° (b) 30°

(c) 60° (d) 90°

30. A bar magnet is placed north-south with its north pole due north. The points of zero magnetic field will be in which direction from the centre of the magnet

[MNR 1995; MP PMT 1995; UPSEAT 2000]

(a) North and south

(b) East and west

(c) North-east and south-west

(d) North-west and south-east [IIT 1979; CPMT 1986]

31. In two separate experiments the neutral points due to two small magnets are at a distance of r and $2r$ in broad side-on position. The ratio of their magnetic moments will be

(a) 4 : 1 (b) 1 : 2

(c) 2 : 1 (d) 1 : 8

32. The magnetic field due to the earth is closely equivalent to that due to [BIT Ranchi 1982]

(a) A large magnet of length equal to the diameter of the earth

(b) A magnetic dipole placed at the centre of the earth

(c) A large coil carrying current

(d) Neither of the above

33. The earth's magnetic field at a certain place has a horizontal component 0.3 *Gauss* and the total strength 0.5 *Gauss*. The angle of dip is [MP PMT 1995]

(a) $\tan^{-1}\frac{3}{4}$ (b) $\sin^{-1}\frac{3}{4}$

(c) $\tan^{-1}\frac{4}{3}$ (d) $\sin^{-1}\frac{3}{5}$

34. The value of the horizontal component of the earth's magnetic field and angle of dip are $1.8\times10^{-5}\,Weber/m^2$ and 30° respectively at some place. The total intensity of earth's magnetic field at that place will be [MP PET 1996]

(a) $2.08\times10^{-5}\,Weber/m^2$ (b) $3.67\times10^{-5}\,Weber/m^2$

(c) $3.18 \times 10^{-5} Weber/m^2$ (d) $5.0 \times 10^{-5} Weber/m^2$

35. When the *N*-pole of a bar magnet points towards the south and *S*-pole towards the north, the null points are at the [MP PMT 1996]

(a) Magnetic axis

(b) Magnetic centre

(c) Perpendicular divider of magnetic axis

(d) *N* and *S* poles

36. Lines which represent places of constant angle of dip are called

(a) Isobaric lines (b) Isogonic lines

(c) Isoclinic lines (d) Isodynamic lines

37. The vertical component of the earth's magnetic field is zero at a place where the angle of dip is [MP PMT/PET 1998]

(a) 0° (b) 45°

(c) 60° (d) 90°

38. At a certain place, the horizontal component B_0 and the vertical component V_0 of the earth's magnetic field are equal in magnitude. The total intensity at the place will be [MP PMT 1999, 2003]

(a) B_0 (b) B_0^2

(c) $2B_0$ (d) $\sqrt{2}B_0$

39. A compass needle will show which one of the following directions at the earth's magnetic pole [KCET 1993, 94]

(a) Vertical (b) No particular direction

(c) Bent at 45° to the vertical (d) Horizontal

40. The north pole of the earth's magnet is near the geographical

(a) South (b) East

(c) West (d) North

41. The magnetic field of earth is due to [JIPMER 1997]

(a) Motion and distribution of some material in and outside the earth

(b) Interaction of cosmic rays with the current of earth

(c) A magnetic dipole buried at the centre of the earth

(d) Induction effect of the sun

42. A short magnet of moment 6.75 *Am* produces a neutral point on its axis. If horizontal component of earth's magnetic field is $5 \times 10^{-5} Wb/m^2$, then the distance of the neutral point should be

(a) 10 *cm* (b) 20 *cm*

(c) 30 *cm* (d) 40 *cm*

43. Due to the earth's magnetic field, charged cosmic ray particles

(a) Require greater kinetic energy to reach the equator than the poles

(b) Require less kinetic energy to reach the equator than the poles

(c) Can never reach the equator

(d) Can never reach the poles

44. Two bar magnets with magnetic moments 2 *M* and *M* are fastened together at right angles to each other at their centres to form a crossed system, which can rotate freely about a vertical axis through the centre. The crossed system sets in earth's magnetic field with magnet having magnetic moment 2*M* making and angle θ with the magnetic meridian such that [AFMC 1999]

(a) $\theta = \tan^{-1}\left(\frac{1}{\sqrt{3}}\right)$ (b) $\theta = \tan^{-1}\left(\sqrt{3}\right)$

(c) $\theta = \tan^{-1}\left(\frac{1}{2}\right)$ (d) $\theta = \tan^{-1}\left(\frac{3}{4}\right)$

45. Angle of dip is 90° at [AIIMS 1999]

(a) Poles (b) Equator

(c) Both (a) and (b) (d) None of these

46. At a certain place the horizontal component of the earth's magnetic field is *B* and the angle of dip is 45°. The total intensity of the field at that place will be [MP PET 2000; Pb PET 2003]

(a) *B* (b) $\sqrt{2}\,B_0$

(c) 2 *B* (d) B_0^2

47. The value of angle of dip is zero at the magnetic equator because on it [MP PET 2001]

(a) *V* and *H* are equal

(b) The value of *V* and *H* is zero

(c) The value of *V* is zero

(d) The value of *H* is zero

48. Which of the following relation is correct in magnetism [KCET (Engg./Med.) 2001]

(a) $I^2 = V^2 + H^2$ (b) $I = V + H$

(c) $V = I^2 + H^2$ (d) $V^2 = I + H$

49. The direction of the null points is on the equatorial line of a bar magnet, when the north pole of the magnet is pointing [KCET 1994] [AFMC 1999; Pb. PMT 2000; CPMT 2001; MH CET 2003]

(a) North (b) South

(c) East (d) West

50. Magnetic meridian is a [Orissa JEE 2002]

(a) Point (b) Horizontal plane

(c) Vertical plane (d) Line along *N-S*

51. The angle of dip at a certain place is 30°. If the horizontal component of the earth's magnetic field is *H*, the intensity of the total magnetic field is [SCRA 1994] [UPSEAT 1993, 2000; MP PMT 2002]

(a) $\frac{H}{2}$ [CBSE PMT 1997] (b) $\frac{2H}{\sqrt{3}}$

(c) $H\sqrt{2}$ (d) $H\sqrt{3}$

52. The horizontal component of the earth's magnetic field is 0.22 *Gauss* and total magnetic field is 0.4 *Gauss*. The angle of dip. is

(a) $\tan^{-1}(1)$ (b) $\tan^{-1}(\infty)$

(c) $\tan^{-1}(1.518)$ (d) $\tan^{-1}(\pi)$

53. A bar magnet is situated on a table along east-west direction in the magnetic field of earth. The number of neutral points, where the magnetic field is zero, are [MP PMT 2004]

(a) 2 (b) 0

(c) 1 (d) 4

54. At which place, earth's magnetism become horizontal [AFMC 2004]

(a) Magnetic pole (b) Geographical pole

(c) Magnetic meridian (d) Magnetic equator

55. Isogonic lines on magnetic map will have [AFMC 2004]

(a) Zero angle of dip

(b) Zero angle of declination

(c) Same angle of declination

(d) Same angle of dip

56. A current carrying coil is placed with its axis perpendicular to *N-S* direction. Let horizontal component of earth's magnetic field be H_0 and magnetic field inside the loop is *H*. If a magnet is suspended inside the loop, it makes angle θ with *H*. Then θ =

(a) $\tan^{-1}\left(\frac{H_0}{H}\right)$ (b) $\tan^{-1}\left(\frac{H}{H_0}\right)$

(c) $\text{cosec}^{-1}\left(\frac{H}{H_0}\right)$ (d) $\cot^{-1}\left(\frac{H_0}{H}\right)$

57. Let *V* and *H* be the vertical and horizontal components of earth's magnetic field at any point on earth. Near the north pole

(a) $V >> H$ (b) $V << H$

(c) $V = H$ (d) $V = H = 0$

58. At the magnetic poles of the earth, a compass needle will be [DCE 2003]

(a) Vertical

(b) Bent slightly

(c) Horizontal

(d) Inclined at 45° to the horizontal

59. If magnetic lines of force are drawn by keeping magnet vertical, then number of neutral points will be [MP PMT 1985; CPMT 1985]

(a) One (b) Two

(c) Four (d) Five

Magnetic Equipments

1. Time period of a freely suspended magnet does not depend upon [NCERT 1980; CPMT 1986; MP PET 1997]

(a) Length of the magnet

(b) Pole strength of the magnet

(c) Horizontal component of earth's magnetic field

(d) Length of the suspension thread

2. Magnetic moments of two bar magnets may be compared with the help of [MP PET/PMT 1988]

(a) Deflection magnetometer

(b) Vibration magnetometer

(c) Both of the above

(d) None of the above

3. The time period of oscillation of a freely suspended bar magnet with usual notations is given by [CPMT 1973, 76, 87; MP PET 1994, 96]

(a) $T = 2\pi\sqrt{\frac{I}{MB_H}}$ (b) $T = 2\pi\sqrt{\frac{MB_H}{I}}$

(c) $T = \sqrt{\frac{I}{MB_H}}$ (d) $T = 2\pi\sqrt{\frac{B_H}{MI}}$

4. In sum and difference method in vibration magnetometer, the time period is more if [MP PMT 1989; MP PET/PMT 1988]

(a) Similar poles of both magnets are on same sides

(b) Opposite poles of both magnets are on same sides

(c) Both magnets are perpendicular to each other

(d) Nothing can be said

[Orissa PMT 2004]

5. At a certain place a magnet makes 30 oscillations per minute. At another place where the magnetic field is double, its time period will be [MP PMT 1989; MP PET/PMT 1988]

(a) 4 *sec* (b) 2 *sec*

(c) $\frac{1}{2}$ sec (d) $\sqrt{2}$ sec

[UPSEAT 2004]

6. Vibration magnetometer is used for comparing [MP PET/PMT 1988]

(a) Magnetic fields (b) Earth's field

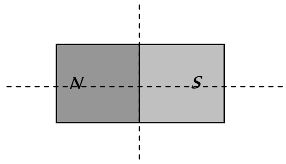
(c) Magnetic moments (d) All of the above

7. Two magnets of same size and mass make respectively 10 and 15 *oscillations per minute* at certain place. The ratio of their magnetic moments is [Bihar PET 1984; MP PET/PMT 1988; MP PET 1992]

(a) 4 : 9 (b) 9 : 4

(c) 2 : 3 (d) 3 : 2

8. Time period for a magnet is *T*. If it is divided in four equal parts along its axis and perpendicular to its axis as shown then time period for each part will be



(a) $4T$ (b) $T/4$

(c) $T/2$ (d) T

9. Keeping dissimilar poles of two magnets of equal pole strength and length same side, their time period will be [DPMT 2001]

(a) Zero (b) One second

(c) Infinity (d) Any value

10. Time period in vibration magnetometer will be infinity at

(a) Magnetic equator (b) Magnetic poles

(c) Equator (d) At all places

11. Twists of suspension fibre should be removed in vibration magnetometer so that

(a) Time period be less

(b) Time period be more

(c) Magnet may vibrate freely

(d) Cannot be said with certainty

12. The period of oscillation of a magnet in vibration magnetometer is 2 sec. The period of oscillation of a magnet whose magnetic moment is four times that of the first magnet is[CPMT 1975, 77, 79, 89, 90; MP PMT 1986]

(a) 1 *sec* (b) 4 *sec*

(c) 8 *sec* (d) 0.5 *sec*

13. Moment of inertia of a magnetic needle is 40 *gm-cm* has time period 3 *seconds* in earth's horizontal field = 3.6×10^{-5} *weber/m*. Its magnetic moment will be

(a) $0.5\, A \times m^2$ (b) $5\, A \times m^2$

(c) $0.250\, A \times m^2$ (d) $5 \times 10^2\, A \times m^2$

14. Vibration magnetometer before use, should be set

(a) In magnetic meridian

(b) In geographical meridian

(c) Perpendicular to magnetic meridian

(d) In any position

15. If a brass bar is placed on a vibrating magnet, then its time period

(a) Decreases

(b) Increases

(c) Remains unchanged

(d) First increases then decreases

16. A magnetic needle is made to vibrate in uniform field *H*, then its time period is *T*. If it vibrates in the field of intensity 4*H*, its time period will be

[MP Board 1988; MP PMT 1992; MH CET (Med.) 1999]

(a) $2T$ (b) $T/2$

(c) $2/T$ (d) T

17. Two bar magnets of the same mass, length and breadth but magnetic moments *M* and 2*M* respectively, when placed in same position, time period is 3 *sec*. What will be the time period when they are placed in different position

[NCERT 1977; DPMT 1999]

(a) $\sqrt{3}$ sec (b) $3\sqrt{3}$ sec

(c) 3 sec (d) 6 sec

18. To compare magnetic moments of two magnets by vibration magnetometer, 'sum and difference method' is better because

(a) Determination of moment of inertia is not needed which minimises the errors

(b) Less observations are required

(c) Comparatively less calculations

(d) All the above

19. A magnet is suspended in such a way that it oscillates in the horizontal plane. It makes 20 *oscillations per minute* at a place where dip angle is 30° and 15 *oscillations per minute* at a place where dip angle is 60°. The ratio of total earth's magnetic field at the two places is

[MP PMT 1991; BHU 1997]

(a) $3\sqrt{3}:8$ (b) $16:9\sqrt{3}$

(c) $4:9$ (d) $2\sqrt{3}:9$

20. The time period of oscillation of a magnet in a vibration magnetometer is 1.5 *seconds*. The time period of oscillation of another magnet similar in size, shape and mass but having one-fourth magnetic moment than that of first magnet, oscillating at same place will be

[MP PMT 1991; MP PMT 2002]

(a) 0.75 *sec* (b) 1.5 *sec*

(c) 3 *sec* (d) 6 *sec*

21. A bar magnet *A* of magnetic moment M_A is found to oscillate at a frequency twice that of magnet *B* of magnetic moment M_B when placed in a vibrating *magneto-meter*. We may say that

(a) $M_A = 2M_B$ (b) $M_A = 8M_B$

(c) $M_A = 4M_B$ (d) $M_B = 8M_A$

22. Two magnets *A* and *B* are identical in mass, length and breadth but have different magnetic moments. In a vibration magnetometer, if the time period of *B* is twice the time period of *A*. The ratio of the magnetic moments M_A / M_B of the magnets will be [MP PET 1990; MP PMT 19

(a) $1/2$ (b) 2

(c) 4 (d) $1/4$

23. A magnet of magnetic moment *M* oscillating freely in earth's horizontal magnetic field makes *n* oscillations per minute. If the magnetic moment is quadrupled and the earth's field is doubled, the number of oscillations made per minute would be

(a) $\frac{n}{2\sqrt{2}}$ (b) $\frac{n}{\sqrt{2}}$

(c) $2\sqrt{2}n$ (d) $\sqrt{2}n$

24. A magnetic needle suspended horizontally by an unspun silk fibre, oscillates in the horizontal plane because of the restoring force originating mainly from [CPMT 1980, 89]

(a) The torsion of the silk fibre

(b) The force of gravity

(c) The horizontal component of earth's magnetic field

(d) All the above factors

25. At two places *A* and *B* using vibration magnetometer, a magnet vibrates in a horizontal plane and its respective periodic time are 2 *sec* and 3 *sec* and at these places the earth's horizontal components are H_A and H_B respectively. Then the ratio between H_A and H_B will be

[MP PMT 1985, 89]

(a) 9 : 4 (b) 3 : 2

(c) 4 : 9 (d) 2 : 3

26. The time period of a bar magnet suspended horizontally in the earth's magnetic field and allowed to oscillate

[MP PET 1992]

(a) Is directly proportional to the square root of its mass

(b) Is directly proportional to its pole strength

(c) Is inversely proportional to its magnetic moment

(d) Decreases if the length increases but pole strength remains same

27. Magnets *A* and *B* are geometrically similar but the magnetic moment of *A* is twice that of *B*. If T_1 and T_2 be the time periods of the oscillation when their like poles and unlike poles are kept together respectively, then $\frac{T_1}{T_2}$ will be

[SCRA 1998]

(a) $\frac{1}{3}$ (b) $\frac{1}{2}$

(c) $\frac{1}{\sqrt{3}}$ (d) $\sqrt{3}$

28. A small bar magnet *A* oscillates in a horizontal plane with a period *T* at a place where the angle of dip is 60°. When the same needle is made to oscillate in a vertical plane coinciding with the magnetic meridian, its period will be

[MP PMT 1992]

(a) $\frac{T}{\sqrt{2}}$ (b) T

(c) $\sqrt{2}T$ (d) $2T$

29. Vibration magnetometer works on the principle of **[MP PET 1993]**

(a) Torque acting on the bar magnet
(b) Force acting on the bar magnet
(c) Both the force and the torque acting on the bar magnet
(d) None of these

30. Tangent galvanometer is used to measure **[MP PET 1993]**

(a) Steady currents
(b) Current impulses
(c) Magnetic moments of bar magnets
(d) Earth's magnetic field

31. A tangent galvanometer has a coil with 50 turns and radius equal to 4 *cm*. A current of 0.1 *A* is passing through it. The plane of the coil is set parallel to the earth's magnetic meridian. If the value of the earth's horizontal component of the magnetic field is 7×10^{-5} *tesla* and $\mu_0 = 4\pi\times10^{-7}\,weber/amp\times m$, then the deflection in the galvanometer needle will be **[MP PMT 1993]**

(a) 45° (b) 48.2°
(c) 50.7° (d) 52.7°

32. A bar magnet has a magnetic moment equal to $5\times10^{-5}\,weber\times m$. It is suspended in a magnetic field which has a magnetic induction (*B*) equal to $8\pi\times10^{-4}\,tesla$ The magnet vibrates with a period of vibration equal to 15 *sec*. The moment of inertia of the magnet is **[MP PMT 1993; CBSE PMT 2001]**

(a) $22.5 kg\times m^2$ (b) $11.25\times kg\times m^2$

(c) $5.62\times kg\times m^2$ (d) $7.16\times10^{-7}kg-m^2$

33. The time period of a freely suspended magnet is 4 *seconds*. If it is broken in length into two equal parts and one part is suspended in the same way, then its time period will be **[NCERT 1984; CPMT 1991; MP PMT 1994; MH CET 2004]**

(a) 4 *sec* (b) 2 *sec*

(c) 0.5 *sec* (d) 0.25 *sec*

34. Which of the following statement is true about magnetic moments of atoms of different elements **[CPMT 1977]**

(a) All have a magnetic moment
(b) None has a magnetic moment
(c) All acquire a magnetic moment under external magnetic field and in same direction as the field
(d) None of the above statements are accurate

35. The number of turns and radius of cross-section of the coil of a tangent galvanometer are doubled. The reduction factor *K* will be **[NCERT 1983; MP PMT 2002]**

(a) *K* (b) 2*K*

(c) 4*K* (d) *K*/4

36. A magnetic needle suspended by a silk thread is vibrating in the earth's magnetic field. If the temperature of the needle is increased by 500°*C*, then **[MNR 1994]**

(a) The time period decreases
(b) The time period remains unchanged
(c) The time period increases
(d) The needle stops vibrating

37. The sensitivity of a tangent galvanometer is increased if **[AFMC 1995]**

(a) Number of turn decreases (b) Number of turn increases

(c) Field increases (d) None of the above

38. Two tangent galvanometers having coils of the same radius are connected in series. A current flowing in them produces deflections of 60° and 45° respectively. The ratio of the number of turns in the coils is **[MP PET 1995; MP PMT 1999]**

(a) 4/3 (b) $(\sqrt{3}+1)/1$

(c) $(\sqrt{3}+1)/(\sqrt{3}-1)$ (d) $\sqrt{3}/1$

39. Using a bar magnet *P*, a vibration magnetometer has time period 2*seconds*. When a bar *Q* (identical to *P* in mass and size) is placed on top of *P*, the time period is unchanged. Which of the following statements is true **[MP PMT 1995]**

(a) *Q* is of non-magnetic material
(b) *Q* is a bar magnet identical to *P*, and its north pole placed on top of *P*s north pole
(c) *Q* is of unmagnetized ferromagnetic material
(d) Nothing can be said about *Q*s properties

40. The strength of the magnetic field in which the magnet of a vibration magnetometer is oscillating is increased 4 times its original value. The frequency of oscillation would then become

(a) Twice its original value
(b) Four times its original value
(c) Half its original value
(d) One-fourth its original value

41. A certain amount of current when flowing in a properly set tangent galvanometer, produces a deflection of 45°. If the current be reduced by a factor of $\sqrt{3}$, the deflection would **[MP PMT 1996; DPMT 2005]**

(a) Decrease by 30° (b) Decrease by 15°

(c) Increase by 15° (d) Increase by 30°

42. Two normal uniform magnetic field contain a magnetic needle making an angle 60° with *F*. Then the ratio of $\frac{F}{H}$ is **[CPMT 1987; DPMT 2001]**

(a) 1 : 2 (b) 2 : 1

(c) $\sqrt{3}:1$ (d) $1:\sqrt{3}$

43. A short magnetic needle is pivoted in a uniform magnetic field of strength 1 *T*. When another magnetic field of strength $\sqrt{3}\,T$ is applied to the needle in a perpendicular direction, the needle deflects through an angle θ, where θ is **[KCET 1999]**

(a) 30° (b) 45°

(c) 90° (d) 60°

44. Two magnets are held together in a vibration magnetometer and are allowed to oscillate in the earth's magnetic field with like poles together, 12 oscillations per minute are made but for unlike poles together only 4 oscillations per minute are executed. The ratio of their magnetic moments is

[MP PMT 1996; CPMT 2002]

(a) 3 : 1 (b) 1 : 3

(c) 3 : 5 (d) 5 : 4

45. To measure which of the following, is a tangent galvanometer used [MP PET 1997; CBSE PMT 2001]

(a) Charge (b) Angle

(c) Current (d) Magnetic intensity

46. When $\sqrt{3}$ *ampere* current is passed in a tangent galvanometer, there is a deflection of 30° in it. The deflection obtained when 3 *amperes* current is passed, is

[MP PMT 1997]

(a) 30° (b) 45°

(c) 60° (d) 75°

47. The period of oscillations of a magnetic needle in a magnetic field is 1.0 *sec*. If the length of the needle is halved by cutting it, the time period will be [MP PMT/PET 1998]

(a) 1.0 *sec* (b) 0.5 *sec*

(c) 0.25 *sec* (d) 2.0 *sec*

48. The time period of a freely suspended magnet is 2 *sec*. If it is broken in length into two equal parts and one part is suspended in the same way, then its time period will be

[MP PMT 1999]

(a) 4 *sec* (b) 2 *sec*

(c) $\sqrt{2}$ sec (d) 1 *sec*

49. The bob of a simple pendulum is replaced by a magnet. The oscillations are set along the length of the magnet. A copper coil is added so that one pole of the magnet passes in and out of the coil. The coil is short-circuited. Then which one of the following happens

[KCET 1994]

(a) Period decreases

(b) Period does not change

(c) Oscillations are damped

(d) Amplitude increases

50. The period of oscillation of a vibration magnetometer depends on which of the following factors [KCET 1994]

(a) *I* and *M* only (b) *M* and *H* only

(c) *I* and *H* only (d) *I*, M and *H* only

where *I* is the moment of inertia of the magnet about the axis of suspension, *M* is the magnetic moment of the magnet and *H* is the external magnetic field

51. The time period of oscillation of a bar magnet suspended horizontally along the magnetic meridian is T_0. If this magnet is replaced by another magnet of the same size and pole strength but with double the mass, the new time period will be

(a) $\frac{T_0}{2}$ (b) $\frac{T_0}{\sqrt{2}}$

(c) $\sqrt{2}T_0$ (d) $2T_0$

52. Two short magnets having magnetic moments in the ratio 27 : 8, when placed on opposite sides of a deflection magnetometer, produce no deflection. If the distance of the weaker magnet is 0.12 *m* from the centre of deflection magnetometer, the distance of the stronger magnet from the centre is

(a) 0.06 *m* (b) 0.08 *m*

(c) 0.12 *m* (d) 0.18 *m*

53. The magnet of a vibration magnetometer is heated so as to reduce its magnetic moment by 19%. By doing this the periodic time of the magnetometer will [MP PMT 2000, 01]

(a) Increase by 19% (b) Decrease by 19%

(c) Increase by 11% (d) Decrease by 21%

54. A magnet makes 40 oscillations per minute at a place having magnetic field intensity of 0.1×10^{-5} *T*. At another place, it takes 2.5 *sec* to complete one vibration. The value of earth's horizontal field at that place is

[AIIMS 2000; CPMT 2000; Pb PET 2002]

(a) 0.25×10^{-6} *T* (b) 0.36×10^{-6} *T*

(c) 0.66×10^{-8} *T* (d) 1.2×10^{-6} *T*

55. A tangent galvanometer has a coil of 25 turns and radius of 15 *cm*. The horizontal component of the earth's magnetic field is 3×10^{-5} *T*. The current required to produce a deflection of 45° in it, is

[MP PMT 2000]

(a) 0.29 *A* (b) 1.2 *A*

(c) 3.6×10^{-5} *A* (d) 0.14 *A*

56. The time period of a vibration magnetometer is T_0. Its magnet is replaced by another magnet whose moment of inertia is 3 times and magnetic moment is 1/3 of the initial magnet. The time period now will be [MP PMT 2000]

(a) $3T_0$ (b) T_0

(c) $T_0/\sqrt{3}$ (d) $T_0/3$

57. The error in measuring the current with a tangent galvanometer is minimum when the deflection is about

[MP PET 2001]

(a) 0° (b) 30°

(c) 45° (d) 60°

58. Before using the tangent galvanometer, its coil is set in

[MP PMT 2001; CPMT 2005]

(a) Magnetic meridian (or vertically north south)

(b) Perpendicular to magnetic meridian

(c) At angle of 45° to magnetic meridian

(d) It does not require any setting

59. The time period of a thin bar magnet in earth's magnetic field is *T*. If the magnet is cut into two equal parts perpendicular to its length, the time period of each part in the same field will be

(a) $\frac{T}{2}$ (b) *T*

(c) $\sqrt{2}\,T$ (d) 2*T*

60. A magnet freely suspended in a vibration magnetometer makes 10 oscillations per minute at a place *A* and 20 oscillations per minute at a place *B*. If the horizontal component of earth's magnetic field at *A* is $36 \times 10^{-6}\,T$, then its value at *B* is [SCRA 1994; JIPMER 2001, 02]

(a) 36×10^{-6} *T* (b) 72×10^{-6} *T*

(c) 144×10^{-6} *T* (d) 288×10^{-6} *T*

61. When 2 *amperes* current is passed through a tangent galvanometer, it gives a deflection of 30°. For 60° deflection, the current must be [EAMCET (Med.) 2000]

(a) 1 *amp* (b) $2\sqrt{3}$ *amp*

(c) 4 *amp* (d) 6 *amp*

62. Which of the following statement is not the true

[KCET (Engg./Med.) 2001]

(a) While taking reading of tangent galvanometer, the plane of the coil must be set at right angles to the earth's magnetic meridian

(b) A short magnet is used in a tangent galvanometer since a long magnet would be heavy and may not easily move

(c) Measurements with the tangent galvanometer will be more accurate when the deflection is around 45°

(d) A tangent galvanometer can not be used in the polar region

63. The period of oscillations of a magnet is 2 *sec*. When it is remagnetised so that the pole strength is 4 times its period will be

(a) 4 *sec* (b) 2 *sec*

(c) 1 *sec* (d) 1/2 *sec*

64. When two magnetic moments are compared using equal distance method the deflections produced are 45° and 30°. If the length of magnets are in the ratio 1 : 2, the ratio of their pole strengths is

(a) 3 : 1 (b) 3 : 2

(c) $\sqrt{3}:1$ (d) $2\sqrt{3}:1$

65. The magnetic needle of a tangent galvanometer is deflected at an angle 30° due to a magnet. The horizontal component of earth's magnetic field 0.34×10^{-4} *T* is along the plane of the coil. The magnetic intensity is

[AIIMS 2000, 2002; BHU 2000; AFMC 2000; KCET (Engg./Med.) 1999]

(a) 1.96×10^{-4} *T* (b) 1.96×10^{-5} *T*

(c) 1.96×10^{4} *T* (d) 1.96×10^{5} *T*

66. In a tangent galvanometer a current of 0.1 *A* produces a deflection of 30°. The current required to produce a deflection of 60° is

(a) 0.2 A (b) 0.3 A

(c) 0.4 A (c) 0.5 A

67. A bar magnet is oscillating in the Earth's magnetic field with a period *T*. What happens to its period and motion if its mass is quadrupled **[CBSE PMT 2003]**

(a) Motion remains S.H.M. with time period = $2T$

(b) Motion remains S.H.M. with time period = $4T$

(c) Motion remains S.H.M. and period remains nearly constant

(d) Motion remains S.H.M. with time period $=\dfrac{T}{2}$

68. A thin rectangular magnet suspended freely has a period of oscillation equal to *T*. Now it is broken into two equal halves (each having half of the original length) and one piece is made to oscillate freely in the same field. If its period of oscillation is T', then ratio $\dfrac{T'}{T}$ is **[AIEEE 2003]**

(a) $\dfrac{1}{4}$ (b) $\dfrac{1}{2\sqrt{2}}$

(c) $\dfrac{1}{2}$ (c) 2

69. A bar magnet is oscillating in the earth's magnetic field with time period *T*. If its mass is increased four times then its time period will be **[J & K CET 2004]**

(a) 4 *T* (b) 2 *T*

(c) *T* (d) *T*/2

70. The length of a magnet is large compared to its width and breadth. The time period of its oscillation in a vibration magnetometer is 2 *s*. The magnet is cut along its length into three equal parts and three parts are then placed on each other with their like poles together. The time period of this combination will be

(a) 2 *s* (b) 2/3 *s*

(c) $2\sqrt{3}\ s$ (d) $2/\sqrt{3}\ s$

[Kerala PMT 2002]

71. A magnet oscillating in a horizontal plane has a time period of 2 *second* at a place where the angle of dip is 30° and 3 *seconds* at another place where the angle of dip is 60°. The ratio of resultant magnetic fields at the two places is

[Pb. PET 2001]

(a) $\dfrac{4\sqrt{3}}{7}$ (b) $\dfrac{4}{9\sqrt{3}}$

[JIPMER 2002]

(c) $\dfrac{9}{4\sqrt{3}}$ (d) $\dfrac{9}{\sqrt{3}}$

72. Two identical bar magnets are placed on above the other such that they are mutually perpendicular and bisect each other. The time period of this combination in a horizontal magnetic field is *T*. The time period of each magnet in the same field is

(a) $\sqrt{2}\,T$ (b) $2^{\frac{1}{4}}T$

(c) $2^{-\frac{1}{4}}T$ (d) $2^{-\frac{1}{2}}T$

[MP PET 2003]

73. The radius of the coil of a Tangent galvanometer. which has 10 turns is 0.1*m*. The current required to produce a deflection of 60° $(B_H=4\times10^{-5}T)$ is **[MP PET 2005]**

(a) 3 *A* (b) 1.1 *A*

(c) 2.1 *A* (d) 1.5 *A*

Magnetic Materials

1. Magnets cannot be made from which of the following substances

(a) Iron (b) Nickel

(c) Copper (d) All of the above

2. The magnetic moment of atomic neon is

[NCERT 1984]

(a) Zero (b) $\mu B/2$

(c) μB (d) $3\mu B/2$

3. Which of the following is most suitable for the core of electromagnets **[AIIMS 1980; NCERT 1980; AFMC 1988; CBSE PMT 1990]**

(a) Soft iron (b) Steel

(c) Copper-nickel alloy (d) Air

4. Demagnetisation of magnets can be done by

[DPMT 1984; CBSE PMT 1988]

(a) Rough handling

(b) Heating

(c) Magnetising in the opposite direction

(d) All the above

5. A ferromagnetic material is heated above its curie temperature. Which one is a correct statement [MP PET 1995]
   (a) Ferromagnetic domains are perfectly arranged
   (b) Ferromagnetic domains becomes random
   (c) Ferromagnetic domains are not influenced
   (d) Ferromagnetic material changes itself into diamagnetic material

6. If a diamagnetic substance is brought near north or south pole of a bar magnet, it is [EAMCET (Engg.) 1995; CBSE PMT 1999; AFMC 2003]
   (a) Attracted by the poles
   (b) Repelled by the poles
   (c) Repelled by the north pole and attracted by the south pole
   (d) Attracted by the north pole and repelled by the south pole

7. The material of permanent magnet has [KCET 1994, 2003; AFMC 2004]
   (a) High retentivity, low coercivity
   (b) Low retentivity, high coercivity
   (c) Low retentivity, low coercivity
   (d) High retentivity, high coercivity

8. The permanent magnet is made from which one of the following substances [Bihar MEE 1995]
   (a) Diamagnetic (b) Paramagnetic
   (c) Ferromagnetic (d) Electromagnetic

9. Temperature above which a ferromagnetic substance becomes paramagnetic is called [SCRA 1994; J & K CET 2004]
   (a) Critical temperature (b) Boyle's temperature
   (c) Debye's temperature (d) Curie temperature

10. When a magnetic substance is heated, then it [AIIMS 1999]
   (a) Becomes a strong magnet
   (b) Losses its magnetism
   (c) Does not effect the magnetism
   (d) Either (a) or (c)

11. The only property possessed by ferromagnetic substance is [KCET 1999]
   (a) Hysteresis
   (b) Susceptibility
   (c) Directional property
   (d) Attracting magnetic substances

12. Substances in which the magnetic moment of a single atom is not zero, is known as [AFMC 1999]
   (a) Diamagnetism (b) Ferromagnetism
   (c) Paramagnetism (d) Ferrimagnetism

13. Diamagnetic substances are [AFMC 1999]
   (a) Feebly attracted by magnets
   (b) Strongly attracted by magnets
   (c) Feebly repelled by magnets
   (d) Strongly repelled by magnets

14. The magnetic susceptibility is [RPMT 1999]
   (a) $\chi = \frac{I}{H}$ (b) $\chi = \frac{B}{H}$
   (c) $\chi = \frac{M}{V}$ (d) $\chi = \frac{M}{H}$

15. Which of the following statements are true about the magnetic susceptibility χ_m of paramagnetic substance [Roorkee 1999]
   (a) Value of χ_m is inversely proportional to the absolute temperature of the sample
   (b) χ_m is positive at all temperature
   (c) χ_m is negative at all temperature
   (d) χ_m does not depend on the temperature of the sample

16. Relative permeability of iron is 5500, then its magnetic susceptibility will be [KCET 2000; Kerala PMT 2004]
   (a) 5500×10^{7} (b) 5500×10^{-7}
   (c) 5501 (d) 5499

17. An example of a diamagnetic substance is [KCET 2000]
   (a) Aluminium (b) Copper
   (c) Iron (d) Nickel

18. The use of study of hysteresis curve for a given material is to estimate the [KCET (Engg./Med.) 2000]
   (a) Voltage loss (b) Hysteresis loss
   (c) Current loss (d) All of these

19. Magnetic permeability is maximum for [AIIMS 2000; MH CET 2003; DPMT 2003]
   (a) Diamagnetic substance (b) Paramagnetic substance
   (c) Ferromagnetic substance (d) All of these

20. If a diamagnetic solution is poured into a *U*-tube and one arm of this *U*-tube placed between the poles of a strong magnet with the meniscus in a line with the field, then the level of the solution will
   (a) Rise (b) Fall
   (c) Oscillate slowly (d) Remain as such

21. The relative permeability is represented by μ_r and the susceptibility is denoted by χ for a magnetic substance. Then for a paramagnetic substance [KCET (Engg./Med.) 2001]
   (a) $\mu_r < 1, \chi < 0$ (b) $\mu_r < 1, \chi > 0$
   (c) $\mu_r > 1, \chi < 0$ (d) $\mu_r > 1, \chi > 0$

22. Which of the following is true [BHU 2001]
   (a) Diamagnetism is temperature dependent
   (b) Paramagnetism is temperature dependent
   (c) Paramagnetism is temperature independent
   (d) None of these

23. The magnetic susceptibility does not depend upon the temperature in [CBSE PMT 2001]
   (a) Ferrite substances (b) Ferromagnetic substances
   (c) Diamagnetic substances (d) Paramagnetic substances

24. Identify the paramagnetic substance [KCET 2001]
   (a) Iron (b) Aluminium
   (c) Nickel (d) Hydrogen

25. If a magnetic substance is kept in a magnetic field, then which of the following is thrown out [DCE 1999, 2001]

(a) Paramagnetic (b) Ferromagnetic
(c) Diamagnetic (d) Antiferromagnetic

26. If the angular momentum of an electron is $\vec{J}$ then the magnitude of the magnetic moment will be [MP PET 2002]

(a) $\frac{eJ}{m}$ (b) $\frac{eJ}{2m}$
(c) $eJ\,2m$ (d) $\frac{2m}{eJ}$

27. The magnetic susceptibility is negative for [AIEEE 2002]

(a) Paramagnetic materials
(b) Diamagnetic materials
(c) Ferromagnetic materials
(d) Paramagnetic and ferromagnetic materials

28. The universal property of all substances is [CPMT 2002]

(a) Diamagnetism (b) Ferromagnetism
(c) Paramagnetism (d) All of these

29. Which of the following statements is incorrect about hysteresis

(a) This effect is common to all ferromagnetic substances
(b) The hysteresis loop area is proportional to the thermal energy developed per unit volume of the material
(c) The hysteresis loop area is independent of the thermal energy developed per unit volume of the material
(d) The shape of the hysteresis loop is characteristic of the material

30. Curies law can be written as

[MH CET 2002; CBSE PMT 2003]

(a) $\chi \propto (T - T_c)$ (b) $\chi \propto \frac{1}{T - T_c}$
(c) $\chi \propto \frac{1}{T}$ (d) $\chi \propto T$

31. A superconductor exhibits perfect [KCET 2002]

(a) Ferrimagnetism (b) Ferromagnetism
(c) Paramagnetism (d) Diamagnetism

32. A small rod of bismuth is suspended freely between the poles of a strong electromagnet. It is found to arrange itself at right angles to the magnetic field. This observation establishes that bismuth is

(a) Diamagnetic (b) Paramagnetic
(c) Ferri-magnetic (d) Antiferro-magnetic

33. A diamagnetic material in a magnetic field moves

[Pb. PMT 1999; AIIMS 2000; MH CET 2000; CBSE PMT 2003]

(a) From weaker to the stronger parts of the field
(b) Perpendicular to the field
(c) From stronger to the weaker parts of the field
(d) In none of the above directions

34. Curie temperature is the temperature above which

[DCE 2002; AIEEE 2003]

(a) A paramagnetic material becomes ferromagnetic
(b) A ferromagnetic material becomes paramagnetic
(c) A paramagnetic material becomes diamagnetic
(d) A ferromagnetic material becomes diamagnetic

35. A frog can be deviated in a magnetic field produced by a current in a vertical solenoid placed below the frog. This is possible because the body of the frog behaves as

[AIIMS 2003]

(a) Paramagnetic (b) Diamagnetic
(c) Ferromagnetic (d) Antiferromagnetic

36. Which one of the following is a non-magnetic substance

[MP PET 2004]

(a) Iron (b) Nickel
(c) Cobalt (d) Brass

37. Liquid oxygen remains suspended between two pole faces of a magnet because it is [AIIMS 2004]

(a) Diamagnetic (b) Paramagnetic
(c) Ferromagnetic (d) Antiferromagnetic

38. Curie-Weiss law is obeyed by iron at a temperature ......

[KCET 2004]

(a) Below Curie temperature (b) Above Curie temperature
(c) At Curie temperature only (d) At all temperatures

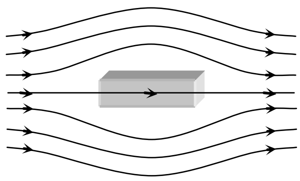
39. The materials suitable for making electromagnets should have

[UPSEAT 2002]

(a) High retentivity and high coercivity
(b) Low retentivity and low coercivity
(c) High retentivity and low coercivity
(d) Low retentivity and high coercivity

40. The given figure represents a material which is

[Orissa PMT 2004]



(a) Paramagnetic (b) Diamagnetic
(c) Ferromagnetic (d) None of these

41. For an isotropic medium B, μ, H and M are related as (where B, μ_0, H and M have their usual meaning in the context of magnetic material [Pb. PMT 2004]

[Kerala 2002]

(a) $(B - M) = \mu_0 H$ (b) $M = \mu_0(H + M)$
(c) $H = \mu_0(H + M)$ (d) $B = \mu_0(H + M)$

42. The magnetic susceptibility of any paramagnetic material changes with absolute temperature T as

[UPSEAT 2004; DCE 2005]

(a) Directly proportional to T
(b) Remains constant
(c) Inversely proportional to T
(d) Exponentially decaying with T

43. When a piece of a ferromagnetic substance is put in a uniform magnetic field, the flux density inside it is four times the flux density away from the piece. The magnetic permeability of the material is

(a) 1 (b) 2
(c) 3 (d) 4

44. Which of the following is diamagnetism [DCE 2002]

(a) Aluminium (b) Quartz

(c) Nickel (d) Bismuth

45. If a ferromagnetic material is inserted in a current carrying solenoid, the magnetic field of solenoid **[DCE 2004]**

(a) Largely increases (b) Slightly increases

(c) Largely decreases (d) Slightly decreases

46. In the hysteresis cycle, the value of H needed to make the intensity of magnetisation zero is called **[DCE 2004]**

(a) Retentivity (b) Coercive force

(c) Lorentz force (d) None of the above

47. If the magnetic dipole moment of an atom of diamagnetic material, paramagnetic material and ferromagnetic material denoted by μ_d, μ_p, μ_f respectively then **[CBSE PMT 2005]**

(a) $\mu_d \neq 0$ and $\mu_f \neq 0$ (b) $\mu_p = 0$ and $\mu_f \neq 0$

(c) $\mu_d = 0$ and $\mu_p \neq 0$ (d) $\mu_d \neq 0$ and $\mu_p = 0$

48. Among the following properties describing diamagnetism identify the property that is wrongly stated **[KCET 2005]**

(a) Diamagnetic material do not have permanent magnetic moment

(b) Diamagnetism is explained in terms of electromagnetic induction

(c) Diamagnetic materials have a small positive susceptibility

(d) The magnetic moment of individual electrons neutralize each other

49. Susceptibility of ferromagnetic substance is **[Orissa JEE 2005]**

(a) > 1 (b) < 1

(c) 0 (d) 1

50. When a ferromagnetic material is heated to temperature above its Curie temperature, the material **[UPSEAT 2005]**

(a) Is permanently magnetized

(b) Remains ferromagnetic

(c) Behaves like a diamagnetic material

(d) Behaves like a paramagnetic material

CT Critical Thinking

Objective Questions

1. Two identical magnetic dipoles of magnetic moments 1.0 A-m each, placed at a separation of $2m$ with their axis perpendicular to each other. The resultant magnetic field at a point midway between the dipoles is **[Roorkee 1995]**

(a) $5 \times 10^{-7} T$ (b) $\sqrt{5} \times 10^{-7} T$

(c) $10^{-7} T$ (d) None of these

2. Two short magnets placed along the same axis with their like poles facing each other repel each other with a force which varies inversely as

(a) Square of the distance

(b) Cube of the distance

(c) Distance

(d) Fourth power of the distance

3. Two identical short bar magnets, each having magnetic moment M, are placed a distance of $2d$ apart with axes perpendicular to each other in a horizontal plane. The magnetic induction at a point midway between them is **[IIT-JEE (Screening) 2000]**

(a) $\frac{\mu_0}{4\pi}(\sqrt{2})\frac{M}{d^3}$ (b) $\frac{\mu_0}{4\pi}(\sqrt{3})\frac{M}{d^3}$

(c) $\left(\frac{2\mu_0}{\pi}\right)\frac{M}{d^3}$ (d) $\frac{\mu_0}{4\pi}(\sqrt{5})\frac{M}{d^3}$

4. If a magnet is suspended at an angle 30° to the magnetic meridian, it makes an angle of 45° with the horizontal. The real dip is

(a) $\tan^{-1}(\sqrt{3}/2)$ (b) $\tan^{-1}(\sqrt{3})$

(c) $\tan^{-1}(\sqrt{3/2})$ (d) $\tan^{-1}(2/\sqrt{3})$

5. A short bar magnet with its north pole facing north forms a neutral point at P in the horizontal plane. If the magnet is rotated by 90° in the horizontal plane, the net magnetic induction at P is (Horizontal component of earth's magnetic field = B_H)

(a) 0 (b) $2B_H$

(c) $\frac{\sqrt{5}}{2}B_H$ (d) $\sqrt{5}B_H$

6. The true value of angle of dip at a place is 60°, the apparent dip in a plane inclined at an angle of 30° with magnetic meridian is

(a) $\tan^{-1}\frac{1}{2}$ (b) $\tan^{-1}(2)$

(c) $\tan^{-1}\left(\frac{2}{3}\right)$ (d) None of these

7. A vibration magnetometer consists of two identical bar magnets placed one over the other such that they are perpendicular and bisect each other. The time period of oscillation in a horizontal magnetic field is $2^{5/4}$ *seconds*. One of the magnets is removed and if the other magnet oscillates in the same field, then the time period in seconds is

(a) $2^{1/4}$ (b) $2^{1/2}$

(c) 2 (d) $2^{3/4}$

8. In a vibration magnetometer, the time period of a bar magnet oscillating in horizontal component of earth's magnetic field is 2 *sec*. When a magnet is brought near and parallel to it, the time period reduces to 1 *sec*. The ratio H/F of the horizontal component H and the field F due to magnet will be **[MP PMT 1990; Pb PET 2000]**

(a) 3 (b) $1/3$

(c) $\sqrt{3}$ (d) $1/\sqrt{3}$

9. A cylindrical rod magnet has a length of 5 cm and a diameter of 1 cm. It has a uniform magnetisation of 5.30 × 10^3 Amp/m. What its magnetic dipole moment

(a) $1 \times 10^{-2} J/T$ (b) $2.08 \times 10^{-2} J/T$

(c) $3.08 \times 10^{-2} J/T$ (d) $1.52 \times 10^{-2} J/T$

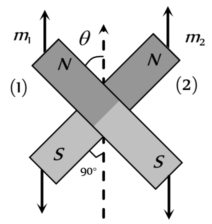
10. Two magnets of equal mass are joined at right angles to each other as shown the magnet 1 has a magnetic moment 3 times that of magnet 2. This arrangement is pivoted so that it is free to rotate in the horizontal plane. In equilibrium what angle will the magnet 1 subtend with the magnetic meridian

(a) $\tan^{-1}\left(\frac{1}{2}\right)$

(b) $\tan^{-1}\left(\frac{1}{3}\right)$

(c) $\tan^{-1}(1)$

(d) 0°



11. The dipole moment of each molecule of a paramagnetic gas is 1.5×10^{-23} *amp* × m^2. The temperature of gas is 27°*C* and the number of molecules per unit volume in it is 2×10^{26} m^{-3}. The maximum possible intensity of magnetisation in the gas will be

(a) 3×10^{3} *amp/m* (b) 4×10^{-3} *amp/m*

(c) 5×10^{5} *amp/m* (d) 6×10^{-4} *amp/m*

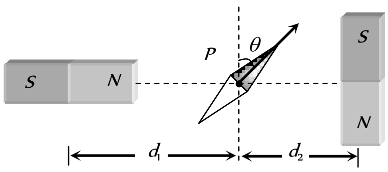
12. Two magnets *A* and *B* are identical and these are arranged as shown in the figure. Their length is negligible in comparison to the separation between them. A magnetic needle is placed between the magnets at point *P* which gets deflected through an angle θ under the influence of magnets. The ratio of distance d_1 and d_2 will be

(a) $(2\tan\theta)^{1/3}$

(b) $(2\tan\theta)^{-1/3}$

(c) $(2\cot\theta)^{1/3}$

(d) $(2\cot\theta)^{-1/3}$



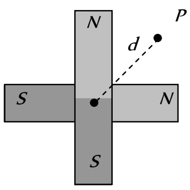
13. Two short magnets of equal dipole moments *M* are fastened perpendicularly at their centre (figure). The magnitude of the magnetic field at a distance *d* from the centre on the bisector of the right angle is

(a) $\frac{\mu_0}{4\pi}\frac{M}{d^3}$

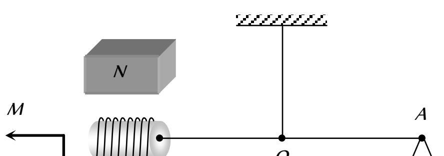
(b) $\frac{\mu_0}{4\pi}\frac{M\sqrt{2}}{d^3}$

(c) $\frac{\mu_0}{4\pi}\frac{2\sqrt{2}M}{d^3}$

(d) $\frac{\mu_0}{4\pi}\frac{2M}{d^3}$



14. A small coil C with *N* = 200 turns is mounted on one end of a balance beam and introduced between the poles of an electromagnet as shown in figure. The cross sectional area of coil is A= 1.0 *cm*, length of arm OA of the balance beam is $l = 30\,cm$. When there is no current in the coil the balance is in equilibrium. On passing a current *I* = 22 mA through the coil the equilibrium is restored by putting the additional counter weight of mass $\Delta m = 60\,mg$ on the balance pan. Find the magnetic induction at the spot where coil is located.



(a) 0.4 *T* (b) 0.3 *T*

(c) 0.2 *T* (d) 0.1 *T*

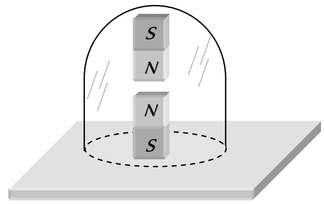
15. Two identical bar magnets with a length 10 *cm* and weight 50 *gm-weight* are arranged freely with their like poles facing in a inverted vertical glass tube. The upper magnet hangs in the air above the lower one so that the distance between the nearest pole of the magnet is 3*mm*. Pole strength of the poles of each magnet will be

(a) 6.64 *amp* × *m*

(b) 2 *amp* × *m*

(c) 10.25 *amp* × *m*

(d) None of these



16. If ϕ_1 and ϕ_2 be the angles of dip observed in two vertical planes at right angles to each other and ϕ be the true angle of dip, then

(a) $\cos^2\phi = \cos^2\phi_1 + \cos^2\phi_2$

(b) $\sec^2\phi = \sec^2\phi_1 + \sec^2\phi_2$

(c) $\tan^2\phi = \tan^2\phi_1 + \tan^2\phi_2$

(d) $\cot^2\phi = \cot^2\phi_1 + \cot^2\phi_2$

17. Each atom of an iron bar $(5\,cm \times 1\,cm \times 1\,cm)$ has a magnetic moment $1.8 \times 10^{-23}\ Am^2$. Knowing that the density of iron is $7.78 \times 10^3\ kg^{-3}m$, atomic weight is 56 and Avogadro's number is 6.02×10^{23} the magnetic moment of bar in the state of magnetic saturation will be

(a) $4.75\ Am^2$ (b) $5.74\ Am^2$

(c) $7.54\ Am^2$ (d) $75.4\ Am^2$

18. An iron rod of volume $10^{-4}\,m^3$ and relative permeability 1000 is placed inside a long solenoid wound with 5 *turns/cm*. If a current of 0.5 *A* is passed through the solenoid, then the magnetic moment of the rod is

(a) $10\ Am^2$ (b) $15\ Am^2$

(c) $20\ Am^2$ (d) $25\ Am^2$

19. A bar magnet has coercivity $4 \times 10^3\ Am^{-1}$. It is desired to demagnetise it by inserting it inside a solenoid 12 *cm* long and having 60 turns. The current that should be sent through the solenoid is

(a) 2 *A* (b) 4 *A*

(c) 6 *A* (d) 8 *A*

20. A magnet is suspended in the magnetic meridian with an untwisted wire. The upper end of wire is rotated through 180° to deflect the magnet by 30° from magnetic meridian. When this magnet is replaced by another magnet, the upper end of wire is rotated through 270° to deflect the magnet 30° from magnetic meridian. The ratio of magnetic moments of magnets is

(a) 1 : 5 (b) 1 : 8

(c) 5 : 8 (d) 8 : 5

21. A dip needle vibrates in the vertical plane perpendicular to the magnetic meridian. The time period of vibration is found to be 2 *seconds*. The same needle is then allowed to vibrate in the horizontal plane and the time period is again found to be 2 *seconds*. Then the angle of dip is

(a) 0° (b) 30°

(c) 45° (d) 90°

22. The unit for molar susceptibility is

(a) m^3 (b) $kg\text{-}m^3$

(c) $kg^{-1}\ m^3$ (d) No units

23. A short magnet oscillates with a time period 0.1 *s* at a place where horizontal magnetic field is $24\mu T$. A downward current of 18 *A* is established in a vertical wire 20 *cm* east of the magnet. The new time period of oscillator

(a) 0.1 *s* (b) 0.089 *s*

(c) 0.076 *s* (d) 0.057 *s*

24. A dip needle lies initially in the magnetic meridian when it shows an angle of dip θ at a place. The dip circle is rotated through an angle *x* in the horizontal plane and then it shows an angle of dip θ'. Then $\dfrac{\tan\theta'}{\tan\theta}$ is

(a) $\dfrac{1}{\cos x}$ (b) $\dfrac{1}{\sin x}$

(c) $\dfrac{1}{\tan x}$ (d) $\cos x$

25. A dip circle is adjusted so that its needle moves freely in the magnetic meridian. In this position, the angle of dip is 40°. Now the dip circle is rotated so that the plane in which the needle moves makes an angle of 30° with the magnetic meridian. In this position the needle will dip by an angle

[DCE 2005]

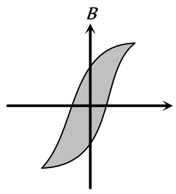
(a) 40° (b) 30°

(c) More than 40° (d) Less than 40°

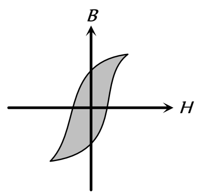
GQ Graphical Questions

1. For substances hysteresis (*B* - *H*) curves are given as shown in figure. For making temporary magnet which of the following is best.

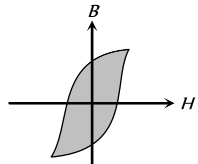
(a)



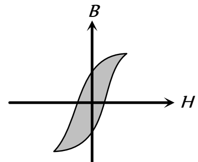
(b)



(c)

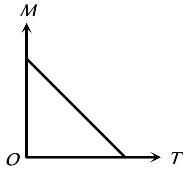


(d)

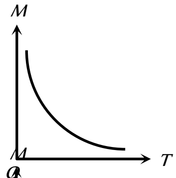


2. A curve between magnetic moment and temperature of magnet is

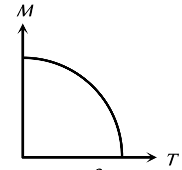
(a)



(b)



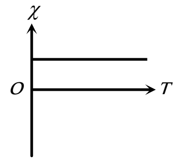
(c)



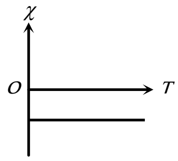
(d)

3. The variation of magnetic susceptibility (χ) with temperature for a diamagnetic substance is best represented by

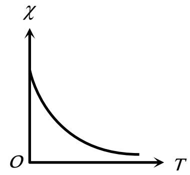
(a)



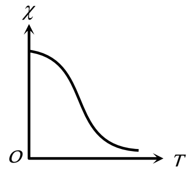
(b)



(c)

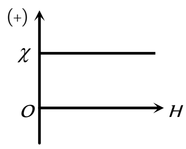


(d)

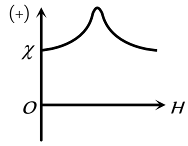


4. The variation of magnetic susceptibility (χ) with magnetising field for a paramagnetic substance is

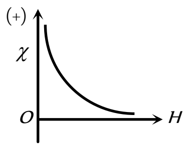
(a)



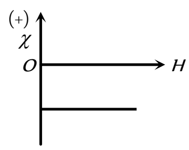
(b)



(c)

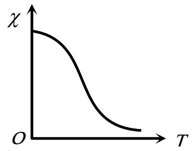


(d)

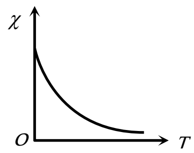


5. The variation of magnetic susceptibility (χ) with absolute temperature *T* for a ferromagnetic material is

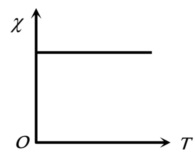
(a)



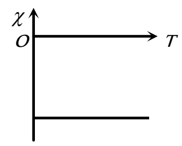
(b)



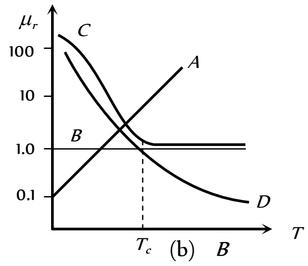
(c)



(d)



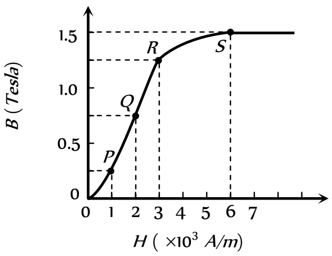
6. The relative permeability (μ_r) of a ferromagnetic substance varies with temperature *(T)* according to the curve



(a) *A* (b) *B*

(c) *C* (d) *D*

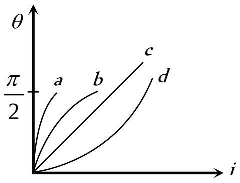
7. The basic magnetization curve for a ferromagnetic material is shown in figure. Then, the value of relative permeability is highest for the point



(a) *P* (b) *Q*

(c) *R* (d) *S*

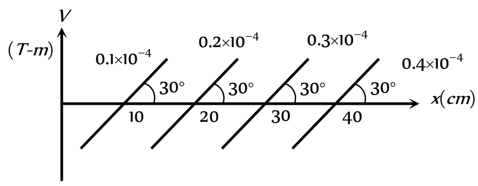
8. Which curve may best represent the current deflection in a tangent galvanometer



(a) *A* (b) *B*

(c) *C* (d) *D*

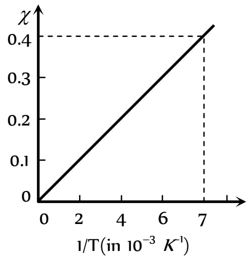
9. Some equipotential surfaces of the magnetic scalar potential are shown in the figure. Magnetic field at a point in the region is



(a) $10^{-4}T$ (b) $2\times10^{-4}T$

(c) $0.5\times10^{-4}T$ (d) None of these

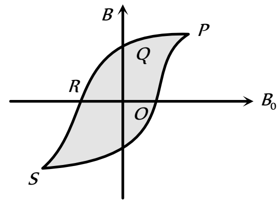
10. The $\chi - 1/T$ graph for an alloy of paramagnetic nature is shown in Fig. The curie constant is, then



(a) 57 *K* (b) $2.8\times10^{-3}K$

(c) 570 *K* (d) $17.5\times10^{-3}K$

11. The figure illustrate how *B*, the flux density inside a sample of unmagnetised ferromagnetic material varies with B_0, the magnetic flux density in which the sample is kept. For the sample to be suitable for making a permanent magnet **[AMU 2001]**



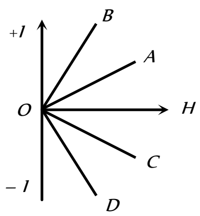
(a) *OQ* should be large, *OR* should be small

(b) *OQ* and *OR* should both be large

(c) *OQ* should be small and *OR* should be large

(d) *OQ* and *OR* should both be small

12. The variation of the intensity of magnetisation *(I)* with respect to the magnetising field *(H)* in a diamagnetic substance is described by the graph **[KCET 2002]**

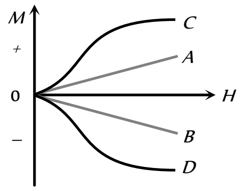


(a) *OD* (b) *OC*

(c) *OB* (d) *OA*

13. For ferromagnetic material, the relative permeability (μ_r), versus magnetic intensity *(H)* has the following shape

(a) 
(b) 
(c) 
(d) 
14. The most appropriate magnetization *M* versus magnetising field *H* curve for a paramagnetic substance is



(a) A (b) B

(c) C (d) D

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : We cannot think of magnetic field configuration with three poles.
Reason : A bar magnet does exert a torque on itself due to its own field. [AIIMS 2002]

2. Assertion : The poles of magnet cannot be separated by breaking into two pieces.
Reason : The magnetic moment will be reduced to half when a magnet is broken into two equal pieces.[SCRA 1994]

3. Assertion : Basic difference between an electric line and magnetic line of force is that former is discontinuous and the latter is continuous or endless.
Reason : No electric lines of forces exist inside a charged body but magnetic lines do exist inside a magnet.

4. Assertion : Magnetic moment of an atom is due to both, the orbital motion and spin motion of every electron.
Reason : A charged particle produces a magnetic field.

5. Assertion : When radius of circular loop carrying current is doubled, its magnetic moment becomes four times.
Reason : Magnetic moment depends on area of the loop.

6. Assertion : The earth's magnetic field is due to iron present in its core.
Reason : At a high temperature magnet losses its magnetic property or magnetism.

7. Assertion : A compass needle when placed on the magnetic north pole of the earth rotates in vertical direction.
Reason : The earth has only horizontal component of its magnetic field at the north poles.

8. Assertion : The tangent galvanometer can be made more sensitive by increasing the number of turns of its coil.
Reason : Current through galvanometer is proportional to the number of turns of coil.

9. Assertion : The ferromagnetic substance do not obey Curie's law.
Reason : At Curie point a ferromagnetic substance start behaving as a paramagnetic substance.

10. Assertion : The properties of paramagnetic and ferromagnetic substance are not effected by heating.
Reason : As temperature rises, the alignment of molecular magnets gradually decreases.

11. Assertion : Soft iron is used as transformer core.
Reason : Soft iron has narrow hysteresis loop.

12. Assertion : Magnetism is relativistic.
Reason : When we move along with the charge so that there is no motion relative to us, we find no magnetic field associated with the charge.

13. Assertion : The earth's magnetic field does not affect the working of a moving coil galvanometer.
Reason : Earth's magnetic field is very weak.

14. Assertion : A paramagnetic sample display greater magnetisation (for the same magnetising field) when cooled.
Reason : The magnetisation does not depend on temperature.

15. Assertion : Electromagnets are made of soft iron.
Reason : Coercivity of soft iron is small.

16. Assertion : To protect any instrument from external magnetic field, it is put inside an iron body.
Reason : Iron is a magnetic substance.

17. Assertion : When a magnet is brought near iron nails, only translatory force act on it.
Reason : The field due to a magnet is generally uniform.

18. Assertion : When a magnetic dipole is placed in a non uniform magnetic field, only a torque acts on the dipole.
Reason : Force would also acts on dipole if magnetic field were uniform.

19. Assertion : Reduction factor (K) of a tangent galvanometer helps in reducing deflection to current.
Reason : Reduction factor increases with increase of current.

20. Assertion : The susceptibility of diamagnetic materials does not depend upon temperature.
Reason : Every atom of a diamagnetic material is not a complete magnet in itself.

21. Assertion : The permeability of a ferromagnetic material is independent of the magnetic field.
Reason : Permeability of a material is a constant quantity.

22. Assertion : For a perfectly diamagnetic substance permeability is always one.
Reason : The ability of a material of permit the passage of magnetic lines of force through it is called magnetic permeability.

23. Assertion : Gauss theorem is not applicable in magnetism.
Reason : Mono magnetic pole does not exist.

24. Assertion : Magnetic moment of helium atom is zero.
Reason : All the electron are paired in helium atom orbitals.

25. Assertion : For making permanent magnets, steel is preferred over soft iron.
Reason : As retentivity of steel is smaller.

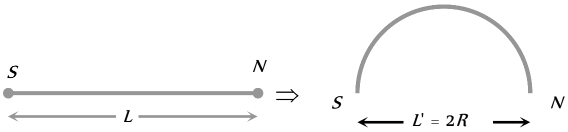
AS Answers and Solutions

Magnet and it's Properties

1. (b) On bending a rod it's pole strength remains unchanged where as its magnetic moment changes.

New magnetic moment $M' = m(2R) = m\left(\frac{2L}{\pi}\right) = \frac{2M}{\pi}$



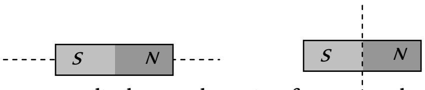
2. (d)

3. (c) $B_a = \frac{\mu_0}{4\pi}\frac{2M}{d^3} = \frac{\mu_0}{2\pi}\frac{M}{d^3}$

4. (d)

5. (b) If cut along the axis of magnet of length l, then new pole strength $m' = \frac{m}{2}$ and new length $l' = l$

$\therefore$ New magnetic moment $M' = \frac{m}{2} \times l = \frac{ml}{2} = \frac{M}{2}$



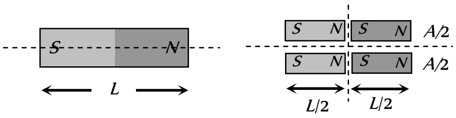
If cut perpendicular to the axis of magnet, then new pole strength $m' = m$ and new length, $l' = l/2$

$\therefore$ New magnetic moment $M' = m \times \frac{l}{2} = \frac{ml}{2} = \frac{M}{2}$

6. (d) For a magnet $B = \frac{\mu_0}{4\pi} \cdot \frac{2M}{x^3}$ (Nearly)

$\Rightarrow \frac{B_1}{B_2} = \left(\frac{x_1}{x_2}\right)^3 = \left(\frac{x}{2x}\right)^3 = \frac{1}{8}$ (Approx.)

7. (b) For each part $m' = \frac{m}{2}$



8. (c) $\frac{B_1}{B_2} = \frac{d_1}{d_2}\left(\frac{d_2^2 - l^2}{d_1^2 - l^2}\right)^2 \Rightarrow \frac{12.5}{1} = \frac{10}{20}\left(\frac{400 - l^2}{100 - l^2}\right)^2$

$\Rightarrow l = 5\ cm$

Hence length of magnet $= 2l = 10\ cm$

9. (c) $B_1 = \frac{2M}{d^3} . B_2 = \frac{M}{d^3}$; $\therefore \frac{B_1}{B_2} = 2:1$

10. (a)

11. (c) $\tau = MB\sin\theta = 48 \times 25 \times 10^{-2} \times 0.15 \times \frac{1}{2} = 0.9\ N \times m$

12. (d) $B_1 = \frac{2M}{x^3}$ *and* $B_2 = \frac{M}{y^3}$

As $B_1 = B_2$

Hence $\frac{2M}{x^3} = \frac{M}{y^3}$ or $\frac{x^3}{y^3} = 2$ or $\frac{x}{y} = 2^{1/3}$

13. (c) Work done $W = MB_H(1 - \cos\theta)$

$= 20 \times 0.3(1 - \cos 30°) = 6\left(1 - \frac{\sqrt{3}}{2}\right) = 3(2 - \sqrt{3})$

14. (b) Magnetic intensity on end side-on position is twice than broad side on position.

15. (a) Along the axis of magnet $B_a = \frac{2M}{X^3} = 200\ guass$

$\Rightarrow B_a = \frac{M}{X^3} = 100\ guass$

16. (a)

17. (b)

18. (c)

19. (d) Provided length of magnet is <<the distance.

20. (b) Permeability of soft iron is maximum, so maximum lines of force tries to pass through the soft iron.

21. (a) Plane of coil is having angle θ with the magnetic field.

$\therefore \tau = MB\sin(90 - \theta)$ or $\tau = niAB\cos\theta$ [As $M = niA$]

22. (c) $B \propto \frac{1}{x^3} \Rightarrow \frac{B_1}{B_2} = \left(\frac{x_2}{x_1}\right)^3 = \left(\frac{3x}{x}\right)^3 = \frac{27}{1}$

23. (c) For null deflection $\frac{M_1}{M_2} = \left(\frac{d_1}{d_2}\right)^3 = \left(\frac{40}{50}\right)^3 = \frac{64}{125}$

24. (d)

25. (d) $F = \frac{\mu_0}{4\pi}\left(\frac{6MM'}{d^4}\right)$ in end-on position.

26. (d) Work done $MB(\cos\theta_1 - \cos\theta_2)$

$\theta_1 = 0^o$ and $\theta_2 = 180^o$

$\Rightarrow W = MB(\cos 0 - \cos 180) = 2MB$

27. (a) Pole strength doesn't depend upon the length.

28. (a) Torque $\tau = MB_H\sin\theta$

$= 0.1 \times 10^{-3} \times 4\pi \times 10^{-3} \times \sin 30^o = 10^{-7} \times 4\pi \times \frac{1}{2}$

$= 2\pi \times 10^{-7}\ N \times m$

29. (b) Number of lines of force passing through per unit area normally is intensity of magnetic field, hence option (c) is incorrect. The correct option is (b).

30. (a) Flux $= B \times A$; $\therefore B = \frac{Flux}{A} = Weber/m^2$

31. (a)

32. (b) $B = \frac{m}{d^2}$ in C.G.S. system.

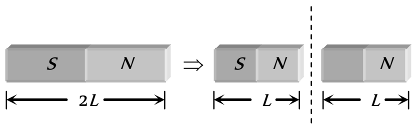
33. (a) $W = MB(\cos\theta_1 - \cos\theta_2) = MB(\cos 0^o - \cos 60^o)$

$= MB\left(1 - \frac{1}{2}\right) = \frac{MB}{2}$

and $\tau = MB\sin\theta = MB\sin 60^o = MB\frac{\sqrt{3}}{2}$

$\therefore \tau = \left(\frac{MB}{2}\right)\sqrt{3} \Rightarrow \tau = \sqrt{3}\ W$

34. (c)

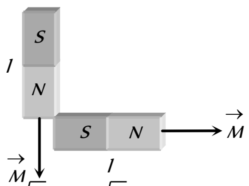


Pole strength of each part $= m$

Magnetic moment of each part

$= M' = m'L' = mL = \frac{M}{2}$

35. (c)



$M_{net} = \sqrt{2}M = \sqrt{2}ml.$

36. (b)

37. (b) $F \propto \frac{m_1 m_2}{r^2}$

38. (c) $F = 10^{-7} \times \frac{m^2}{r^2} = \frac{10^{-7}(1)^2}{(1)^2} = 10^{-7}\,N$

39. (b) $\tau = MH\sin\theta = MH\sin 30^o = \frac{MH}{2}$

40. (c)

41. (c) $F = \frac{\mu_0}{4\pi}\left(\frac{6MM'}{d^4}\right)$ in end-on position between two small magnets.

$\therefore F = 10^{-7}\left(\frac{6\times 10\times 10}{(0.1)^4}\right) = 0.6\,N$

42. (b)

43. (a) $\tau = MB_H\sin\theta$ or $\frac{d\tau}{d\theta} = MB_H\cos\theta$

This will be maximum. when $\theta = 0^o$.

44. (d) $W = MB(\cos\theta_1 - \cos\theta_2)$; $\theta_1 = 0^o$ and $\theta_2 = 360^o \Rightarrow W = 0$

45. (d)

46. (b) $W_1 = MB(\cos 0^o - \cos 90^o) = MB(1-0) = MB$

$W_2 = MB(\cos 0^o - \cos 60^o) = MB\left(1 - \frac{1}{2}\right) = \frac{MB}{2}$

$\therefore W_1 = 2W_2 \Rightarrow n = 2$

47. (d) In magnetic dipole, force $\propto \frac{1}{r^4}$

Hence new force $= \frac{4.8}{2^4} = \frac{4.8}{16} = 0.3\,N$

48. (a) Magnetic moment of bar $M = 10^4\,J/T$

$B = 4\times 10^{-5}\,T$

Hence work done $W = \vec{M}.\vec{B}$

$= 10^4 \times 4\times 10^{-5} \times \cos 60^o = 0.2\,J$

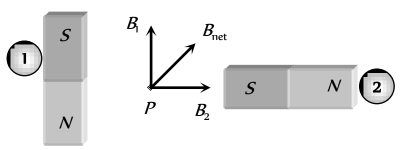
49. (a)

50. (d)

51. (c) $B = \frac{\mu_0}{4\pi}\frac{2M}{d^3} = 10^{-7}\times\frac{2\times 1.25}{(0.5)^3} = 2\times 10^{-6}\,N/A-m$

52. (b)

53. (b)



54. (c)

55. (b) $\tau = MB_H\sin\theta \Rightarrow 0.032 = M\times 0.16\times\sin 30^o$

$\Rightarrow M = 0.4\,J/tesla$

56. (b) $B_{equatorial} = \frac{\mu_0}{4\pi}\frac{M}{r^3}$

57. (c) Inside a magnet, magnetic lines of force move form south pole to north pole.

58. (b) Magnetic moment of circular loop carrying current

$M = IA = I(\pi R^2) = I\pi\left(\frac{L}{2\pi}\right)^2 = \frac{IL^2}{4\pi} \Rightarrow L = \sqrt{\frac{4\pi M}{I}}$

59. (c)

60. (b) Concept of magnetic screening.

61. (b) Repulsion is the sure test of magnetism.

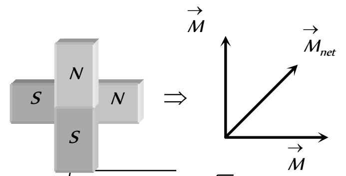
62. (d)

63. (a)

64. (a) $C_{max} = MB \Rightarrow 4\times 10^{-5} = M\times 10^{-4} \Rightarrow M = 0.4\,A\times m^2$

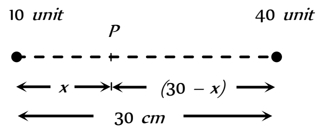
65. (c) Magnetic flux $\phi = BA \Rightarrow B = \frac{\phi}{A} = \frac{Weber}{m^2} = Tesla$

66. (b)



$\Rightarrow M_{net} = \sqrt{M^2 + M^2} = \sqrt{2}M$

67. (b) Suppose magnetic field is zero at point *P*. Which lies at a distance *x* from 10 unit pole. Hence at *P*



$\frac{\mu_0}{4\pi}\cdot\frac{10}{x^2} = \frac{\mu_0}{4\pi}\cdot\frac{40}{(30-x)^2} \Rightarrow x = 10cm$

So from stronger pole distance is 20 *cm*.

68. (b) $\tau = MB\sin\theta = (mL)B\sin\theta$

$= (40\times 10\times 10^{-2})\times 2\times 10^{-4}\times\sin 45°$

$= 0.565\times 10^{-3}\,N-m$

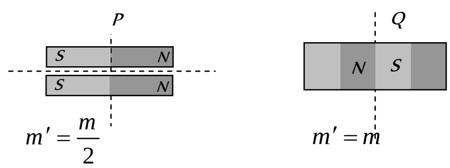
69. (a) Potential energy $U = -MB\cos\theta$

$\Rightarrow U_{max} = MH(\text{at}\,\theta = 180^o)$

70. (b) $\tau = MB\sin\theta$

$\tau = 200\times 0.25\times\sin 30° = 25\,N\times m.$

71. (c) If pole strength, magnetic moment and length of each part are m', M' and L' respectively then



$m' = \frac{m}{2}$ $\qquad$ $m' = m$

$L' = L$ $\qquad$ $L' = \frac{L}{2}$

$\Rightarrow M' = \frac{M}{2}$ $\qquad$ $\Rightarrow M' = \frac{M}{2}$

72. (b) $\vec{\tau} = \vec{M}\times\vec{B} \Rightarrow \vec{\tau} = 50\hat{i}\times(0.5\hat{i} + 3\hat{j})$

$= 150(\hat{i}\times\hat{j}) = 150\hat{k}\,N\times m.$

73. (c) $\tau = MB\sin\theta \Rightarrow \tau \propto \sin\theta$

$$\Rightarrow \frac{\tau_1}{\tau_2} = \frac{\sin\theta_1}{\sin\theta_2} \Rightarrow \frac{\tau}{\tau/2} = \frac{\sin 90}{\sin\theta_2}$$

$$\Rightarrow \sin\theta_2 = \frac{1}{2} \Rightarrow \theta_2 = 30^o$$

$\Rightarrow$ angle of rotation $= 0Å - 30 = 60°$

74. (d)

75. (d) $F = mB \Rightarrow F = \frac{M}{L} \times B$

$$\Rightarrow 6 \times 10^{-4} = \frac{3}{L} \times 2 \times 10^{-5} \Rightarrow L = 0.1\, m.$$

76. (a) $\tau = MB\sin\theta \Rightarrow \tau = (mL)B\sin\theta$

$$\Rightarrow 25 \times 10^{-6} = (m \times 5 \times 10^{-2}) \times 5 \times 10^{-2} \times \sin 30$$

$$\Rightarrow m = 2 \times 10^{-2}\, A - m.$$

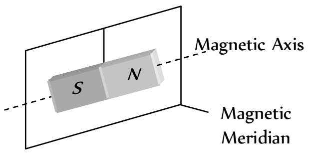
77. (d)

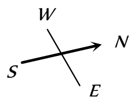
78. (c) Monopole do not exists.

79. (d)

80. (a)

81. (a)





82. (b) $W = MB(1 - \cos\theta)$; where $\theta = 180^o$

$$\Rightarrow W = 2MB \Rightarrow W = 2 \times 2 \times 5 \times 10^{-3} = 2 \times 10^{-2}\, J$$

83. (a) Torque on a bar magnet in earths magnetic field (B) is $\tau = MB_H \sin\theta$. τ will be maximum if sin θ = maximum *i.e.* θ = 90°. Hence axis of the magnet is perpendicular to the field of earth.

84. (b)

85. (a) Both points A and B lying on the axis of the magnet and on axial position

$$B \propto \frac{1}{d^3} \Rightarrow \frac{B_A}{B_B} = \left(\frac{d_B}{d_A}\right)^3 = \left(\frac{48}{24}\right)^3 = \frac{8}{1}$$

86. (b) $W = MB(1 - \cos\theta) = 2 \times 0.1 \times (1 - \cos 90^o) = 0.2 J$

87. (a) $M = mL = 4 \times 10 \times 10^{-2} = 0.4 A \times m^2$

88. (a) Similar to solution (1)

New magnetic moment

$$M' = \frac{2M}{\pi} = \frac{2mL}{\pi} = \frac{2 \times 0.5 \times 31.4 \times 10^{-2}}{3.14} = 0.1\, amp \times m^2$$

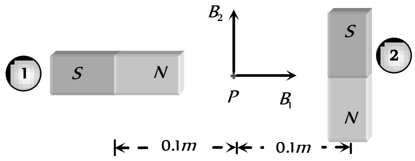
89. (d) Magnetic potential at a distance d from the bar magnet on it's axial line is given by

$$V = \frac{\mu_0}{4\pi} \cdot \frac{M}{d^2} \Rightarrow V \propto M \Rightarrow \frac{V_1}{V_2} = \frac{M_1}{M_2}$$

$$\Rightarrow \frac{V}{V_2} = \frac{M}{M/4} \Rightarrow V_2 = \frac{V}{4}$$

90. (b) $B = \frac{\mu_0}{4\pi} \cdot \frac{2M}{d^3} \Rightarrow B = 10^{-7} \times \frac{2 \times 1.2}{(0.1)^3} = 2.4 \times 10^{-4}\, T$

91. (d)



From figure $B_{net} = \sqrt{B_a^{\,2} + B_e^{\,2}}$

$$= \sqrt{\left(\frac{\mu_0}{4\pi} \cdot \frac{2M}{d^3}\right)^2 + \left(\frac{\mu_0}{4\pi} \cdot \frac{M}{d^3}\right)^2}$$

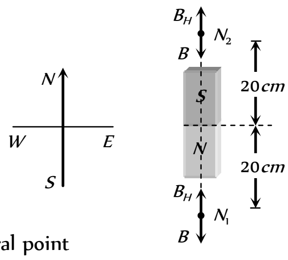
$$= \sqrt{5} \cdot \frac{\mu_0}{4\pi} \cdot \frac{M}{d^3} = \sqrt{5} \times 10^{-7} \times \frac{10}{(0.1)^3} = \sqrt{5} \times 10^{-3}\ \textit{Tesla.}$$

92. (c) $\tau = MB\sin\theta = m \times (2l) \times B\sin\theta$

$$= 10^{-4} \times 0.1 \times 30 \sin 30° = 1.5 \times 10^{-4}\, Nm$$

Earth Magnetism

1. (b)



At neutral point

$$|B| = |B_H| \Rightarrow \frac{2M}{(20)^3} = 0.3 \Rightarrow M = 1.2 \times 10^3\ emu.$$

2. (d) No magnetic lines of force passes through the steel box.

3. (b) At magnetic poles, the angle of dip is 90°. Hence the horizontal component $B_H = B\cos\theta = 0.$

4. (a)

5. (c)

6. (c)

7. (d) $B_H = \sqrt{3}\, B_V$, also $\tan\theta = \frac{B_V}{B_H} = \frac{1}{\sqrt{3}} \Rightarrow \theta = 30^o$

8. (d) At magnetic equator, the angle of dip is 0°. Hence the vertical component $V = I\sin\phi = 0.$

9. (b)

10. (a)

11. (c) $B_V = H_H \tan\phi$; If $B_V = B_H$, then $\tan\phi = 1$ or $\phi = 45^o$

12. (a) The horizontal components are $(B_H)_1 = B\cos\phi_1$ and $(B_H)_2 = B\cos\phi_2$

$$\therefore \frac{(B_H)_1}{(B_H)_2} = \frac{\cos\phi_1}{\cos\phi_2} = \frac{\cos 30^o}{\cos 45^o} = \frac{\sqrt{3}}{2} \times \sqrt{2} = \frac{\sqrt{3}}{\sqrt{2}}$$

13. (d) From the relation $B_H = B\cos\phi$ and $B_V = B\sin\phi$

$\frac{B_V}{B_H} = \tan\phi$ or $B_V = B_H \tan\phi$

$= 0.36 \times 10^{-4} \times \tan 60^o = 0.623 \times 10^{-4}\ Wb/m^2$

14. (d) From the relation $B_V = I\sin\phi$

$I = \frac{V}{\sin\phi} = \frac{6\times10^{-5}}{\sin 40.6^o} = \frac{6\times10^{-5}}{0.65} = 9.2\times10^{-5}$ *tesla*

15. (c)

16. (c) $B_H = B\cos\phi; \therefore B = \frac{B_H}{\cos\phi} = \frac{0.5}{\cos 30^o} = \frac{0.5}{\sqrt{3}/2} = \frac{1}{\sqrt{3}}$

17. (a)

18. (d)

19. (b)

20. (e)

21. (b)

22. (d)

23. (a) $\tan\phi = \frac{B_V}{B_H} = \frac{0.173}{0.30} = \frac{1.73}{3.0} = \frac{\sqrt{3}}{3} = \frac{1}{\sqrt{3}} \Rightarrow \phi = 30^o$

24. (d) $B_H = B\cos\phi = 0.64\times\cos 60^o = 0.64\times\frac{1}{2} = 0.32$ units

25. (b)

26. (d)

27. (a)

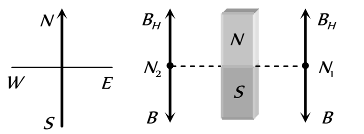
28. (a) $B_H = 0.3\ Oersted,\ I = 0.6\ Oersted$

We have $B_H = I\cos\phi \Rightarrow \cos\phi = \frac{B_H}{I} = \frac{0.3}{0.6} = \frac{1}{2}$

$\therefore \phi = 60^o$

29. (d)

30. (b)



31. (d) At broad side-on position $B = \frac{M}{d^3}$

$\therefore \frac{M_1}{d_1^3} = \frac{M_2}{d_2^3}$ or $\frac{M_1}{r^3} = \frac{M_2}{8r^3}$ or $\frac{M_1}{M_2} = \frac{r^3}{8r^3} = \frac{1}{8}$

32. (a)

33. (c) $B^2 = B_V^2 + B_H^2 \Rightarrow B_V = \sqrt{B^2 - B_H^2} = \sqrt{(0.5)^2 - (0.3)^2} = 0.4$

Now $\tan\phi = \frac{B_V}{B_H} = \frac{0.4}{0.3} = \frac{4}{3} \Rightarrow \phi = \tan^{-1}\left(\frac{4}{3}\right)$.

34. (a) Horizontal component $B_H = B\cos\phi$

Total intensity of earth magnetic field $B = \frac{B_H}{\cos\phi}$

$= \frac{1.8\times10^5}{\cos 30^o} = \frac{1.8\times10^{-5}}{\sqrt{3}/2} = 2.08\times10^{-5}\ Wb/m^2$

35. (a)

36. (c)

37. (a) The vertical component of earth's magnetic field is zero at equator where angle of dip is also zero.

38. (d) $B_0 = V_0$ also total intensity $B = \sqrt{B_0^2 + V_0^2} \Rightarrow B = \sqrt{2}B_0$

39. (a) At poles magnetic field is perpendicular to the surface of earth.

40. (a)

41. (a)

42. (c) At neutral point

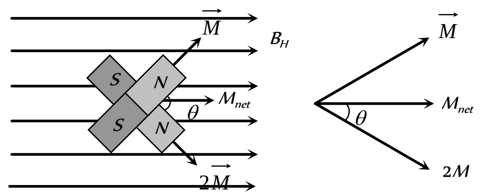
$\left|\text{Magnetic field due to magnet}\right| = \left|\text{Magnetic field due to earth}\right|$

$\frac{\mu_0}{4\pi}\cdot\frac{2M}{d^3} = 5\times10^{-5} \Rightarrow 10^{-7}\times\frac{2\times6.75}{d^3} = 5\times10^{-5}$

$\Rightarrow d = 0.3\ m = 30\ cm$

43. (c) As they enter the magnetic field of the earth, they are deflected away from the equator.

44. (c)



$\Rightarrow \tan\theta = \frac{M}{2M} = \frac{1}{2} \Rightarrow \theta = \tan^{-1} = \frac{1}{2}$

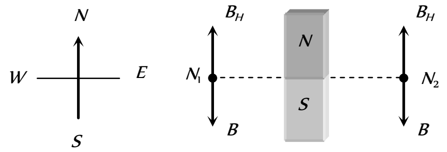
45. (a)

46. (b) $B_H = B\sin\phi \Rightarrow B = \frac{B_H}{\sin\phi} \Rightarrow B = \frac{B_o}{\sin 45^o} = \sqrt{2}B_0$

47. (c)

48. (a)

49. (a)



N_1 and N_2 are two null points. And

B_H = Horizontal component of earth's magnetic field

B = Magnetic field due to bar magnet.

50. (c)

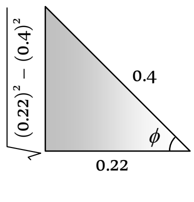
51. (b) $B_H = B\cos\phi \Rightarrow B = \frac{B_H}{\cos\phi} \Rightarrow B = \frac{B_H}{\cos 30^o} = \frac{2B_H}{\sqrt{3}}$

52. (c) By using $B_H = B\cos\phi$

$\Rightarrow \cos\phi = \frac{B_H}{B} = \frac{0.22}{0.4}$

$\Rightarrow \tan\phi = \frac{\sqrt{(0.4)^2 - (0.22)^2}}{0.22}$

$\Rightarrow \phi = \tan^{-1}(1.518)$



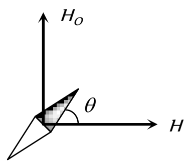
53. (b)

54. (d) At equator angle of dip is zero.

55. (c)

56. (a) In given case H and H_0 are perpendicular to each other.

From figure $\tan\theta = \frac{H_0}{H}$



$\Rightarrow \theta = \tan^{-1}\left(\frac{H_0}{H}\right)$

57. (a)
58. (b)
59. (a)

Magnetic Equipments

1. (d)
2. (c)
3. (a)

4. (b) In sum position : $T_S = 2\pi\sqrt{\frac{I_s}{(M_1+M_2)B_H}}$

In difference position : $T_d = 2\pi\sqrt{\frac{I_d}{(M_1-M_2)B_H}}$

It is clear that $T_d > T_s$

5. (d) $T = 2\pi\sqrt{\frac{I}{MB_H}}; \therefore \frac{T_1}{T_2} = \sqrt{\frac{(B_H)_2}{(B_H)_1}} \Rightarrow T_2 = T_1\sqrt{\frac{(B_H)_1}{(B_H)_2}}$

Here n=30 *oscillation / min* $= \frac{1}{2}$ *oscillation/sec*

$\therefore T_1 = \frac{1}{n_1} = 2\sec$

$\therefore T_2 = 2\sqrt{\frac{B_H}{2B_H}} = 2\times\frac{1}{\sqrt{2}} = \sqrt{2}\sec$

6. (d)

7. (a) $T = 2\pi\sqrt{\frac{1}{MB_H}} \Rightarrow \frac{T_1}{T_2} = \sqrt{\frac{M_2}{M_1}}$

$\Rightarrow \frac{M_1}{M_2} = \frac{T_2^2}{T_1^2} = \frac{(60/15)^2}{(60/10)^2} = \frac{4}{9}$

8. (c) When magnet of length l is cut into four equal parts. then $m' = \frac{m}{2}$ and $l' = \frac{l}{2}$; $\therefore M' = \frac{m}{2}\times\frac{l}{2} = \frac{ml}{4} = \frac{M}{4}$

New moment of inertia $I' = \frac{wl^2}{12} = \frac{\frac{w}{4}.\left(\frac{1}{2}\right)^2}{12} = \frac{1}{16}.\frac{wl^2}{12}$

Here w is the mass of magnet.

$\therefore I' = \frac{1}{16}I$; Time period of each part $T' = 2\pi\sqrt{\frac{I'}{M'B_H}}$

$= 2\pi\sqrt{\frac{I/16}{(M/4)B_H}} = 2\pi\sqrt{\frac{I}{4MB_H}} = \frac{T}{2}$

9. (c) $T = 2\pi\sqrt{\frac{I_1+I_2}{(M_1-M_2)B_H}}$

Here $M_1 = M_2 = M, \therefore T = \infty$

10. (b) Time period in vibration magnetometer

$T = 2\pi\sqrt{\frac{I}{MB_H}}$, At poles $B_H = 0$ *so* $T = \infty$

11. (c)

12. (a) $\frac{T_1}{T_2} = \sqrt{\frac{M_2}{M_1}} = \sqrt{\frac{4M}{M}} = 2 \Rightarrow \frac{2}{T_2} = 2 \Rightarrow T_2 = 1\sec$

13. (a) $T = 2\pi\sqrt{\frac{I}{MB_H}}$

$I = 40gm - cm^2 = 400\times10^{-8}kg - m^2$

$\therefore 3 = 2\pi\sqrt{\frac{400\times10^{-8}}{36\times10^{-6}\times M}}$

$\Rightarrow \frac{1}{M} = \frac{9}{4\pi^2}\times\frac{36}{4} \Rightarrow M = 0.5\ A\times m^2$

14. (a)

15. (b) Because moment of inertia increases i.e. $T \propto \sqrt{I}$

16. (b) $T = 2\pi\sqrt{\frac{I}{MB_H}} \Rightarrow \frac{T_1}{T_2} = \sqrt{\frac{(B_H)_2}{(B_H)_1}}$

$\Rightarrow T_2 = T\sqrt{\frac{(BH)_1}{(BH)_2}} = \frac{T}{2}$ $\left(\because (B_H)_2 = 4(B_H)_1\right)$

17. (b) In sum position $T \propto \frac{1}{\sqrt{M_1+M_2}}$ and in difference position $T \propto \frac{1}{\sqrt{M_1-M_2}}$

$\Rightarrow \frac{3^2}{T^2} = \frac{2M-M}{2M+M} \Rightarrow T^2 = 9\times3\sec^2$

$\therefore T = 3\sqrt{3}\sec$

18. (d)

19. (b) Given $\nu_1 = \frac{20}{60} = \frac{1}{3}\sec^{-1}$ and $\nu_2 = \frac{15}{60} = \frac{1}{4}\sec^{-1}$

Now $\nu = \frac{1}{2\pi}\sqrt{\frac{MB_H}{I}} = \frac{1}{2\pi}\sqrt{\frac{MB\cos\phi}{I}}$ $(\because B_H = B\cos\phi)$

$\therefore \frac{\nu_1}{\nu_2} = \sqrt{\frac{B_1\cos\phi_1}{B_2\cos\phi_2}} \Rightarrow \frac{B_1}{B_2} = \left(\frac{\nu_1}{\nu_2}\right)^2\left(\frac{\cos\phi_2}{\cos\phi_1}\right)^2$

$\Rightarrow \frac{B_1}{B_2} = \left(\frac{1/3}{1/4}\right)^2\frac{\cos60^\circ}{\cos30^\circ} = \frac{16}{9}\times\frac{1/2}{\sqrt{3}/2} = \frac{16}{9\sqrt{3}}$.

20. (c) $T \propto \frac{1}{\sqrt{M}} \Rightarrow \frac{T_1}{T_2} = \sqrt{\frac{M_2}{M_1}} \Rightarrow \frac{1.5}{T_2} = \sqrt{\frac{M_1/4}{M_1}} = \frac{1}{2}$

$\Rightarrow T_2 = 3\sec$

21. (c) $\nu = \frac{1}{2\pi}\sqrt{\frac{MB_H}{I}} \Rightarrow \nu \propto \sqrt{M}$

$\Rightarrow \frac{\nu_A}{\nu_B} = \sqrt{\frac{M_A}{M_B}} \Rightarrow \frac{2}{1} = \sqrt{\frac{M_A}{M_B}} \Rightarrow M_A = 4M_B$

22. (c) $T = 2\pi\sqrt{\frac{I}{MB_H}} \Rightarrow T \propto \frac{1}{\sqrt{M}} \Rightarrow \frac{M_A}{M_B} = \left(\frac{T_B}{T_A}\right)^2 = \frac{4}{1}$

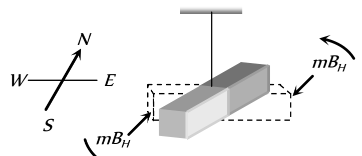
23. (c) No. of oscillation per minute $= \frac{1}{2\pi}\sqrt{\frac{MB_H}{I}}$

$\Rightarrow n \propto \sqrt{MB_H};\ M \to 4\ times$

$B_H \to 2\ times$

So $\nu \to \sqrt{8}\ times\ i.e.\ \nu' = \sqrt{8}\nu = 2\sqrt{2}n$

24. (c)



25. (a) $T = 2\pi\sqrt{\frac{I}{MH}} \Rightarrow T \propto \frac{1}{\sqrt{H}} \Rightarrow \frac{T_A}{T_B} = \sqrt{\frac{H_B}{H_A}}$

$\Rightarrow \frac{H_A}{H_B} = \left(\frac{T_B}{T_A}\right)^2 = \left(\frac{3}{2}\right)^2 = \frac{9}{4}$.

26. (a) $T = 2\pi\sqrt{\frac{I}{MB_H}}$ and $I = \frac{w(l^2+b^2)}{12}$; $\therefore T \propto \sqrt{w}$

(w = Mass of the magnet)

27. (c) $T_{Sum} = 2\pi\sqrt{\frac{(I_1+I_2)}{(M_1+M_2)B_H}}$

$T_{diff} = 2\pi\sqrt{\frac{I_1+I_2}{(M_1-M_2)B_H}}$

$\Rightarrow \frac{T_s}{T_d} = \frac{T_1}{T_2} = \sqrt{\frac{M_1-M_2}{M_1+M_2}} = \sqrt{\frac{2M-M}{2M+M}} = \frac{1}{\sqrt{3}}$

28. (a) $T = 2\pi\sqrt{\frac{I}{MB}} \Rightarrow \frac{T}{T'} = \sqrt{\frac{B'}{B}} = \sqrt{\frac{B}{B_H}}$

$\Rightarrow \frac{T}{T'} = \sqrt{\frac{1}{\cos\phi}} = \sqrt{\frac{1}{\cos 60^o}} = \sqrt{2} \Rightarrow T' = \frac{T}{\sqrt{2}}$

29. (a)

30. (a)

31. (b) For tangent galvanometer $I = \frac{2rB}{\mu_0 n}\tan\theta$

$\therefore \tan\theta = \frac{I\mu_0 n}{2rB} = \frac{0.1\times 4\pi\times 10^{-7}\times 50}{0.04\times 7\times 10^{-5}\times 2} = 1.12$

or $\theta = \tan^{-1}(1.12) = 48.2^o$

32. (d) Time period of a magnet $T = 2\pi\sqrt{\frac{I}{MB}}$

or $I = \frac{T^2 MB}{4\pi^2} = \frac{225\times 5\times 10^{-5}\times 8\pi\times 10^{-4}}{4\pi^2}$

$\therefore I = 7.16\times 10^{-7}\,kg - m^2$

33. (b) $T = 2\pi\sqrt{\frac{I}{MB_H}} = 4\sec$

When magnet is cut into two equal halves, then New magnetic moment $M' = \frac{M}{2}$

New moment of inertia $I' = \frac{(w/2)(l/2)^2}{12} = \frac{1}{8}\cdot\frac{wl^2}{12}$

Where w is the initial mass of the magnet

But $I = \frac{wl^2}{12}$; $\therefore I' = \frac{I}{8}$

$\therefore$ New time period $T' = 2\pi\sqrt{\frac{I'}{M'B_H}}$

$= 2\pi\sqrt{\frac{I/8}{(M/2)B_H}} = \frac{1}{2}2\pi\sqrt{\frac{I}{M_H}} = \frac{1}{2}\times T = \frac{1}{2}\times 4 = 2\sec$

34. (d)

35. (a) $K = \frac{2RB_H}{\mu_0 N}$ (R = radius, N= number of turns)

36. (c) $T \propto \frac{1}{\sqrt{M}}$. Since magnetic moment decreases with increase in temperature hence time period T increases.

37. (b) Sensitivity $S = \frac{\theta}{i} = \frac{\theta}{K\tan\theta}$ where $K = \frac{2RB_H}{\mu_0 N}$

For increasing sensitivity K should be decreased and hence number of turns should be increased.

38. (d) In the first galvanometer

$i_1 = K_1\tan\theta_1 = K_1\tan 60^o = K_1\sqrt{3}$

In the second galvanometer

$i_2 = K_2\tan\theta_2 = K_2\tan 45^o = K_2$

In series $i_1 = i_2 \Rightarrow K_1\sqrt{3} = K_2 \Rightarrow \frac{K_1}{K_2} = \frac{1}{\sqrt{3}}$

But $K \propto \frac{1}{n} \Rightarrow \frac{K_1}{K_2} = \frac{n_2}{n_1}$ $\therefore \frac{n_1}{n_2} = \frac{\sqrt{3}}{1}$.

39. (b) $T = 2\pi\sqrt{\frac{I}{MB_H}}$. If Q is an identical bar magnet then time period of system will be $T' = 2\pi\sqrt{\frac{2I}{(2M)B_H}} = T$

40. (a) Frequency $\nu \propto \sqrt{B_H}$

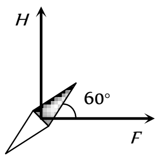
41. (b) In tangent galvanometer, $I \propto \tan\theta$

$$\therefore \frac{I_1}{I_2} = \frac{\tan\theta_1}{\tan\theta_2} \Rightarrow \frac{I_1}{I_1/\sqrt{3}} = \frac{\tan 45^0}{\tan\theta_2}$$

$$\Rightarrow \sqrt{3}\tan\theta_2 = 1 \Rightarrow \tan\theta_2 = \frac{1}{\sqrt{3}} \Rightarrow \theta_2 = 30^o$$

So deflection will decrease by $45^\circ - 30^\circ = 15^\circ$.

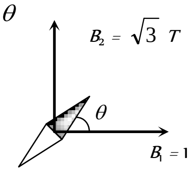
42. (d) From figure at equilibrium



$$\tan 60° = \frac{H}{F}$$

$$\Rightarrow \sqrt{3} = \frac{H}{F} \Rightarrow \frac{F}{H} = \frac{1}{\sqrt{3}}$$

43. (d) In balance condition $B_2 = B_1 \tan\theta$



$$\Rightarrow \tan\theta = \frac{\sqrt{3}}{1}$$

$$\Rightarrow \theta = 60^o$$

44. (d) In the sum and difference method of vibration magnetometer

$$\frac{M_1}{M_2} = \frac{T_2^2 + T_1^2}{T_2^2 - T_1^2}$$

Here $T_1 = \frac{1}{n_1} = \frac{60}{12} = 5\,\text{sec}$. $T_2 = \frac{1}{n_2} = \frac{60}{4} = 15\,\text{sec}$

$$\therefore \frac{M_1}{M_2} = \frac{15^2 + 5^2}{15^2 - 5^2} = \frac{225+25}{225-25} = \frac{5}{4}$$

45. (c)

46. (b) $i \propto \tan\theta \Rightarrow \frac{i_1}{i_2} = \frac{\tan\theta_1}{\tan\theta_2} \Rightarrow \frac{\sqrt{3}}{3} = \frac{\tan 30^o}{\tan\theta_2} \Rightarrow \theta = 45^o$

47. (b) $T = 2\pi\sqrt{\frac{I}{MB}} = 2\pi\sqrt{\frac{wl^2/12}{\text{Pole strength} \times 2l \times B}}$

$$\therefore T \propto \sqrt{Wl}$$

$$\therefore \frac{T_2}{T_1} = \sqrt{\frac{w_2}{w_1} \times \frac{l_2}{l_1}} = \sqrt{\frac{w_1/2}{w_1} \times \frac{l_1/2}{l_1}} = \frac{1}{2}$$

$$\Rightarrow T_2 = \frac{T_1}{2} = 0.5\ sec$$

48. (d) $T' = \frac{T}{n} \Rightarrow T' = \frac{2}{2} = 1 sec$

49. (c) It is due to the magnetic field produced by coil.

50. (d)

51. (c) $T = 2\pi\sqrt{\frac{I}{MB_H}} \Rightarrow T \propto \sqrt{I} \propto \sqrt{w} \Rightarrow T' = \sqrt{2}\ T_0$

52. (d) $\frac{M_1}{M_2} = \left(\frac{d_1}{d_2}\right)^3 \Rightarrow \frac{27}{8} = \left(\frac{d_1}{0.12}\right)^3$

$$\Rightarrow \frac{3}{2} = \frac{d_1}{0.12} \Rightarrow 0.18\ m$$

53. (c) $T = 2\pi\sqrt{\frac{I}{MB_H}} \Rightarrow T \propto \frac{1}{\sqrt{M}} \Rightarrow \frac{T_1}{T_2} = \sqrt{\frac{M_2}{M_1}}$

If $M_1 = 100$ than M_2 $(100 - 19) = 81$

So $\frac{T_1}{T_2} = \sqrt{\frac{81}{100}} = \frac{9}{10} \Rightarrow T_2 = \frac{10}{9}T_1 = 1.11\,T_1$

$\Rightarrow$ Time period increases by 11%

54. (b) $T = 2\pi\sqrt{\frac{I}{M \times B_H}} \Rightarrow T \propto \frac{1}{\sqrt{B_H}}$

$$\Rightarrow \frac{T_1}{T_2} = \sqrt{\frac{(B_H)_2}{(B_H)_1}} \Rightarrow \frac{60/40}{2.5} = \sqrt{\frac{(B_H)_2}{0.1\times10^{-5}}}$$

$$\Rightarrow (B_H)_2 = 0.36\times10^{-6}\,T$$

55. (a) $i = \frac{2rB_H}{\mu_0 N}\tan\theta$

$$\Rightarrow i = \frac{2\times15\times10^{-2}\times3\times10^{-5}}{4\pi\times10^{-7}\times25}\times\tan 45^o \Rightarrow i = 0.29\ A$$

56. (a) $T = 2\pi\sqrt{\frac{I}{MB_H}}$; $I \to 3$ times and $M \to \frac{1}{3}$ times

So $T \to 3$ times *i.e.* $T' = 3T_0$

57. (c) In case of tangent galvanometer as

$$i = k\tan\phi$$

Differentiating both side *w.r.t.* ϕ

$$\frac{di}{d\phi} = k\sec^2\phi \Rightarrow di = k\sec^2 d\phi$$

$$\Rightarrow \frac{di}{i} = \frac{d\phi}{\sin\phi\cos\phi} = \frac{2d\phi}{\sin2\phi}$$

Hence the error in the measurement will be least when

$$\sin2\phi = \text{max} = 1 \Rightarrow 2\phi = 90^o \Rightarrow \phi = 45^o$$

58. (a)

59. (a) $T' = \frac{T}{n}$

60. (c) $\frac{T_A}{T_B} = \sqrt{\frac{(B_H)_B}{(B_H)_A}} \Rightarrow \frac{60/10}{60/20} = \sqrt{\frac{(B_H)_B}{36\times10^{-6}}}$

$$\Rightarrow (B_H)_B = 144\times10^{-6}\,T$$

61. (d) $i \propto \tan\phi \Rightarrow \frac{i_1}{i_2} = \frac{\tan\phi_1}{\tan\phi_2}$

$$\Rightarrow \frac{2}{i_2} = \frac{\tan 30}{\tan 60} \Rightarrow i_2 = 6\ amp$$

62. (a) In tangent galvanometer experiment. The plane of the coil firstly set in the magnetic meridian.

63. (c) $T \propto \frac{1}{\sqrt{M}} \Rightarrow T \propto \frac{1}{\sqrt{m}}$; If $m \to 4$ times.

$T \to \frac{1}{2}$ times i.e. $T' = \frac{T}{2} = \frac{2}{2} = 1\,\text{sec}$

64. (d) $\frac{M_1}{M_2} = \frac{\tan\theta_1}{\tan\theta_2} \Rightarrow \frac{m_1 L_1}{m_2 L_2} = \frac{\tan\theta_1}{\tan\theta_2}$

$\Rightarrow \frac{m_1}{m_2} = \frac{2}{1} \times \frac{\tan 45°}{\tan 30°} = \frac{2\sqrt{3}}{1}$

65. (b) $B = B_H \tan\theta = 0.34 \times 10^{-4} \tan 30° = 1.96 \times 10^{-5} T$

66. (b) $i \propto \tan\phi \Rightarrow \frac{i_1}{i_2} = \frac{\tan\phi_1}{\tan\phi_2}$

$\Rightarrow \frac{0.1}{i_2} = \frac{\tan 30°}{\tan 60°} = \frac{1}{3} \Rightarrow i_2 = 0.3A$

67. (a) As $T \propto \sqrt{I}$; where I = moment of inertia

$= \frac{wL^2}{12} \Rightarrow T \propto \sqrt{w}$ (w = Mass of magnet. If w $\to$ quadrupled, then $T \to$ doubled *i.e.* $T' = 2T$

68. (c) Oscillation of *n* part of magnet $T' = \frac{T}{n}$

$\Rightarrow \frac{T'}{T} = \frac{1}{n}$; here *n* = 2 so $\frac{T'}{T} = \frac{1}{2}$.

69. (b) $T = 2\pi\sqrt{\frac{I}{M B_H}}$; where $I = \frac{w(L^2 + b^2)}{12}$

(w =Mass of magnet)

$\Rightarrow T \propto \sqrt{w}$, If w $\to$ four times then $T \to$ Two times

70. (b) Initially, the time period of the magnet

$T = 2 = 2\pi\sqrt{\frac{I}{MB}}$ ..... (i)

For each part, it's moment of inertia $= \frac{I}{27}$ and magnetic moment $= \frac{M}{3}$

$\therefore$ Moment of inertia of system $I_s = \frac{I}{27} \times 3 = \frac{I}{9}$

Magnetic moment of system $M_s = \frac{M}{3} \times 3 = M$

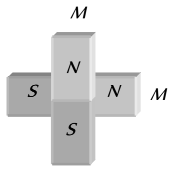
Time period of system

$T_s = 2\pi\sqrt{\frac{I_s}{M_s B}} = \frac{1}{3} \times 2\pi\sqrt{\frac{I}{MB}} = \frac{T}{3} = \frac{2}{3}\,\text{sec}$

71. (c) $T \propto \frac{1}{\sqrt{B_H}} = \frac{1}{\sqrt{B\cos\phi}} \Rightarrow \frac{T_1}{T_2} = \sqrt{\frac{B_2\cos\phi_2}{B_1\cos\phi_1}}$

$\Rightarrow \frac{B_1}{B_2} = \frac{T_2^2}{T_1^2} \times \frac{\cos\phi_2}{\cos\phi_1} = \left(\frac{3}{2}\right)^2 \times \frac{\cos 60°}{\cos 30°} \Rightarrow \frac{B_1}{B_2} = \frac{9}{4\sqrt{3}}$

72. (c) Time period of combination



$T = 2\pi\sqrt{\frac{2I}{\sqrt{2}\,M.H}}$ .....(i)

and time period of each magnet

$T' = 2\pi\sqrt{\frac{I}{MH}}$ ......(ii)

from (i) and (ii) we get

$T' = \frac{T}{2^{1/4}} = 2^{-1/4}T$

73. (b) $B = B_H \tan\theta \Rightarrow \frac{\mu_0 ni}{2r} = B_H \tan\theta$

$\Rightarrow i = \frac{2r.\,B_H \tan\theta}{\mu_0 n} = \frac{2 \times 0.1 \times 4 \times 10^{-5}}{10 \times 4\pi \times 10^{-7}} = 1.1A$

Magnetic Materials

1. (c)

2. (a) Neon atom is diamagnetic, hence it's net magnetic moment is zero.

3. (a) Soft iron is highly ferromagnetic.

4. (d)

5. (b) On heating, different domains have net magnetisation in them which are randomly distributes. Thus the net magnetisastion of the substance due to various domains decreases to minimum.

6. (b) Repelled due to induction of similar poles.

7. (d) From the characteristic of *B-H* curve.

8. (c)

9. (d)

10. (b)

11. (a)

12. (c) The property of paramagnetism is found in these substances whose atoms have an excess of electrons spinning in the same direction. Hence atoms of paramagnetic substances have a net non-zero magnetic moment of their own.

13. (c)

14. (a)

15. (a, b)

16. (d) $\chi_m = (\mu_r - 1) \Rightarrow \chi_m = (5500 - 1) = 5499$

17. (b)

18. (b)

19. (c)

20. (b) Because, diamagnetic substance, moves from stronger magnetic field to weaker field.

21. (d)

22. (b) With rise in temperature their magnetic susceptibility decreases *i.e.* $\chi_m \propto \frac{1}{T}$

23. (c)

24. (b)

25. (c) Diamagnetic substances are repelled by magnetic field.

26. (b) As we know for circulating electron magnetic moment

$M = \frac{1}{2}evr$ ...... (i)

and angular momentum $J = mvr$ ...... (ii)

From equation (i) and (ii) $M = \frac{eJ}{2m}$

27. (b)

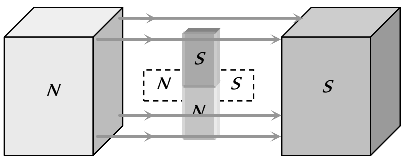
28. (a)

29. (c) The energy lost per unit volume of a substance in a complete cycle of magnetisation is equal to the area of the hysteresis loop.

30. (c)

31. (d)

32. (a) A diamagnetic rod set itself perpendicular to the field if free to rotate between the poles of a magnet as in this situation the field is strongest near the poles.



33. (c)

34. (b)

35. (b) Diamagnetic substances are repelled by the magnetic field.

36. (d)

37. (b)

38. (b)

39. (c)

40. (b)

41. (d) Net magnetic induction $B = B_0 + B_m = \mu_0 H + \mu_0 M$

42. (c)

43. (d) $\mu_r = \frac{B}{B_0} = 4$

46. (b)

47. (c)

48. (c) Susceptibility of diamagnetic substance is negative and it does not change with temperature.

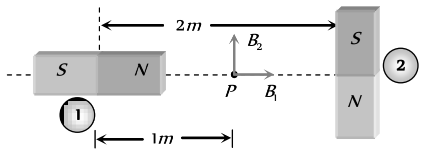
49. (a)

50. (d) When a ferromagnetic material in heated above its curie temperature then it behaves like paramagnetic material.

Critical Thinking Questions

1. (b) With respect to 1st magnet, *P* lies in end side-on position

$\therefore B_1 = \frac{\mu_0}{4\pi}\left(\frac{2M}{d^3}\right)$ (RHS)



With respect to 2nd magnet. *P* lies in broad side on position.

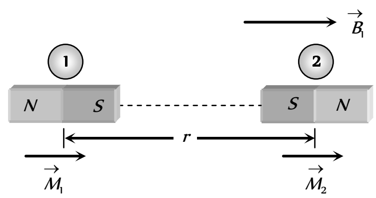
$\therefore B_2 = \frac{\mu_0}{4\pi}\left(\frac{M}{d^3}\right)$ (Upward)

$B_1 = 10^{-7} \times \frac{2\times 1}{1} = 2\times 10^{-7}\,T,\ B_2 = \frac{B_1}{2} = 10^{-7}\,T$

As B_1 and B_2 are mutually perpendicular, hence the resultant magnetic field

$B_R = \sqrt{B_1^2 + B_2^2} = \sqrt{(2\times 10^{-7})^2 + (10^{-7})^2} = \sqrt{5}\times 10^{-7}\,T$

2. (d)



Both the magnets are placed in the field of one another, hence potential energy of dipole (2) is

$U_2 = -M_2 B_1 \cos 0 = -M_2 B_1 = M_2 \times \frac{\mu_0}{4\pi}.\frac{2M_1}{r^3}$

By using $F = -\frac{dU}{dr}$, Force on magnet (2) is

$F_2 = -\frac{dU_2}{dr} = -\frac{d}{dr}\left(\frac{\mu_0}{4\pi}.\frac{2M_1M_2}{r^3}\right) = -\frac{\mu_0}{4\pi}.6\frac{M_1M_2}{r^4}$

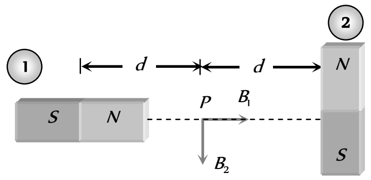
It can be proved $|F_1| = |F_2| = F = \frac{\mu_0}{4\pi}.\frac{6M_1M_2}{r^4}$

$\Rightarrow F \propto \frac{1}{r^4}$

3. (d) At point *P* net magnetic field $B_{net} = \sqrt{B_1^2 + B_2^2}$

where $B_1 = \frac{\mu_0}{4\pi}.\frac{2M}{d^3}$ and $B_2 = \frac{\mu_0}{4\pi}.\frac{M}{d^3}$

$\Rightarrow B_{net} = \frac{\mu_0}{4\pi}.\frac{\sqrt{5}M}{d^3}$



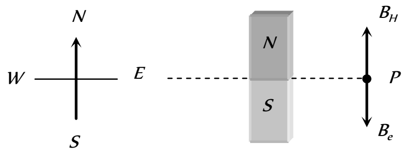
4. (a) Let the real dip be ϕ, then $\tan\phi = \frac{B_V}{B_H}$

For apparent dip,

$$\tan\phi' = \frac{B_V}{B_H\cos\beta} = \frac{B_V}{B_H\cos 30^o} = \frac{2B_V}{\sqrt{3}B_H}$$

or $\tan 45^o = \frac{2}{\sqrt{3}}.\tan\phi$ or $\phi = \tan^{-1}\left(\frac{\sqrt{3}}{2}\right)$

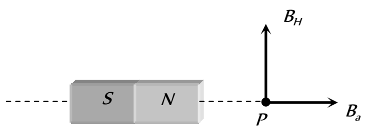
5. (d) Initially



Neutral point obtained on equatorial line and at neutral point $|B_H| = |B_e|$

where B_H = Horizontal component of earth's magnetic field, B_e = Magnetic field due to bar magnet on it's equatorial line

Finally



Point P comes on axial line of the magnet and at P, net magnetic field $B = \sqrt{B_a^2 + B_H^2}$

$$= \sqrt{(2B_e)^2 + (B_H)^2} = \sqrt{(2B_H)^2 + B_H^2} = \sqrt{5}\ B_H$$

6. (b) $\tan\phi' = \frac{\tan\phi}{\cos\beta}$; where ϕ' =Apparent angle of dip,

ϕ = True angle of dip, β =Angle made by vertical plane with magnetic meridian.

$$\Rightarrow \tan\phi' = \frac{\tan 60^o}{\cos 30^o} = 2 \Rightarrow \phi' = \tan^{-1}(2)$$

7. (c) Initially magnetic moment of system

$M_1 = \sqrt{M^2 + M^2} = 2M$ and moment of inertia

$I_1 = I + I = 2I.$

Finally when one of the magnet is removed then

$M_2 = M$ and $I_2 = I$

So $T = 2\pi\sqrt{\frac{I}{M\ B_H}}$

$$\frac{T_1}{T_2} = \sqrt{\frac{I_1}{I_2} \times \frac{M_2}{M_1}} = \sqrt{\frac{2I}{I} \times \frac{M}{\sqrt{2}M}} \Rightarrow T_2 = \frac{2^{5/4}}{2^{1/4}} = 2\ \text{sec}.$$

8. (b) $T \propto \frac{1}{\sqrt{H}} \Rightarrow \frac{T_1}{T_2} = \sqrt{\frac{H_2}{H_1}} \Rightarrow \frac{2}{1} = \sqrt{\frac{H+F}{H}} \Rightarrow F = 3H$

or $\frac{H}{F} = \frac{1}{3}$

9. (b) Relation for dipole moment is, $M = I \times V$. Volume of the cylinder $V = \pi r^2 l$, Where r is the radius and l is the length of the cylinder, then dipole moment,

$$M = I\pi r^2 l = (5.30 \times 10^3) \times \frac{22}{7} \times (0.5 \times 10^{-2})^2 (5 \times 10^{-2})$$

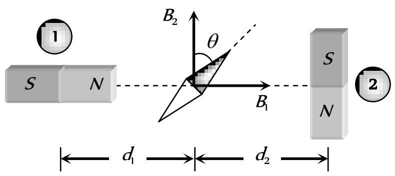
$$= 2.08 \times 10^{-2}\ J/T$$

10. (b) For equilibrium of the system torques on M_1 and M_2 due to B_H must counter balance each other *i.e.* $M_1 \times B_H = M_2 \times B_H$. If θ is the angle between M_1 and B_H will be $(90-\theta)$; so $M_1 B_H \sin\theta = M_2 B_H \sin(90-\theta)$

$$\Rightarrow \tan\theta = \frac{M_2}{M_1} = \frac{M}{3M} = \frac{1}{3} \Rightarrow \theta = \tan^{-1}\left(\frac{1}{3}\right)$$

11. (a) $I = \frac{M}{V} = \frac{\mu N}{V} = \frac{1.5 \times 10^{-23} \times 2 \times 10^{26}}{1} = 3 \times 10^3\ Amp/m$

12. (c) In equilibrium $B_1 = B_2\tan\theta$

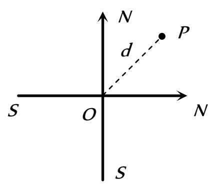


$$\Rightarrow \frac{\mu_0}{4\pi}.\frac{2M}{d_1^3} = \frac{\mu_0}{4\pi}.\frac{M}{d_2^3}\tan\theta$$

$$\Rightarrow \frac{d_1}{d_2} = (2\cot\theta)^{1/3}$$

13. (c) Resultant magnetic moment of the two magnets is

$$M_{net} = \sqrt{M^2 + M^2} = \sqrt{2}M$$



Imagine a short magnet lying along OP with magnetic moment equal to $M\sqrt{2}$. Thus point P lies on the axial line of the magnet.

$\therefore$ Magnitude of magnetic field at P is given by

$$B = \frac{\mu_0}{4\pi}.\frac{2\sqrt{2}M}{d^3}$$

14. (a) On passing current through the coil, it acts as a magnetic dipole. Torque acting on magnetic dipole is counter balanced by the moment of additional weight about position O. Torque acting on a magnetic dipole

$$\tau = MB\sin\theta = (NiA)B\sin 90^o = NiAB.$$

Again $\tau = Force \times Lever\ arm = \Delta mg \times l$

$\Rightarrow NiAB = \Delta mgl$

$\Rightarrow B = \frac{\Delta mgl}{NiA} = \frac{60\times10^{-3}\times9.8\times30\times10^{-2}}{200\times22\times10^{-3}\times1\times10^{-4}} = 0.4\ T$

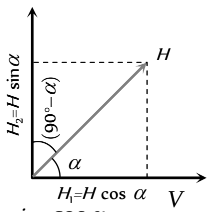
15. (a) The weight of upper magnet should be balanced by the repulsion between the two magnet

$\therefore \frac{\mu}{4\pi}.\frac{m^2}{r^2} = 50gm - wt$

$\Rightarrow 10^{-7}\times\frac{m^2}{(9\times10^{-6})} = 50\times10^{-3}\times9.8$

$\Rightarrow m = 6.64 amp\times m$

16. (d) Let α be the angle which one of the planes make with the magnetic meridian the other plane makes an angle $(90^o - \alpha)$ with it. The components of H in these planes will be $H\cos\alpha$ and $H\sin\alpha$ respectively. If ϕ_1 and ϕ_2 are the apparent dips in these two planes, then



$\tan\phi_1 = \frac{V}{H\cos\alpha}$ *i.e.* $\cos\alpha = \frac{V}{H\tan\phi_1}$ ..... (i)

$\tan\phi_2 = \frac{V}{H\sin\alpha}$ *i.e.* $\sin\alpha = \frac{V}{H\tan\phi_2}$ ..... (ii)

Squaring and adding (i) and (ii), we get

$\cos^2\alpha + \sin^2\alpha = \left(\frac{V}{H}\right)^2\left(\frac{1}{\tan^2\phi_1} + \frac{1}{\tan^2\phi_2}\right)$

i.e. $1 = \frac{V^2}{H^2}\left(\cot^2\phi_1 + \cot^2\phi_2\right)$

or $\frac{H^2}{V^2} = \cot^2\phi_1 + \cot^2\phi_2$ *i.e.* $\cot^2\phi = \cot^2\phi_1 + \cot^2\phi_2$

This is the required result.

17. (c) The number of atoms per unit volume in a specimen,

$n = \frac{\rho N_A}{A}$

For iron, $\rho = 7.8\times10^{-3} kgm^{-3}$,

$N_A = 6.02\times10^{26} / kgmol$, A=56

$\Rightarrow n = \frac{7.8\times10^3\times6.02\times10^{26}}{56} = 8.38\times10^{28} m^{-3}$

Total number of atoms in the bar is

$N_0 = nV = 8.38\times10^{28}\times(5\times10^{-2}\times1\times10^{-2}\times1\times10^{-2})$

$N_0 = 4.19\times10^{23}$

The saturated magnetic moment of bar

$= 4.19\times10^{23}\times1.8\times10^{-23} = 7.54\ Am^2$

18. (d) We have, $B = \mu_0 H + \mu_0 I$

or $I = \frac{B - \mu_0 H}{\mu_0}$ or $I = \frac{\mu H - \mu_0 H}{\mu_0} = \left(\frac{\mu}{\mu_0} - 1\right)H$

$I = (\mu_r - 1)H$

For a solenoid of n-turns per unit length and current i

$H = ni$

$\therefore I = (\mu_r - 1)ni = (1000-1)\times500\times0.5$

$I = 2.5\times10^5\ Am^{-1}$

$\therefore$ Magnetic moment $M=IV$

$M = 2.5\times10^5\times10^{-4} = 25\ Am$

19. (d) The bar magnet coercivity $4\times10^3 Am^{-1}$ *i.e.*, it requires a magnetic intensity $H = 4\times10^3 Am^{-1}$ to get demagnetised. Let i be the current carried by solenoid having n number of turns per metre length, then by definition $H = ni$. Here $H = 4\times10^3$ *Amp turn metre*

$n = \frac{N}{l} = \frac{60}{0.12} = 500$ *turn metre*

$\Rightarrow i = \frac{H}{n} = \frac{4\times10^3}{500} = 8.0\ A$

20. (c) Let M and $M_{,}$ be the magnetic moments of magnets and H the horizontal component of earth's field.

We have $\tau = MH\sin\theta$. If ϕ is the twist of wire, then $\tau = C\phi$, C being restoring couple per unit twist of wire

$\Rightarrow C\phi = MH\sin\theta$

Here $\phi_1 = (180^o - 30^o) = 150^o = 150\times\frac{\pi}{180}$ *rad*

$\phi_2 = (270^o - 30^o) = 240^o = 240\times\frac{\pi}{180}$ *rad*

So, $C\phi_1 = M_1 H\sin\theta$ (For deflection $\theta = 30^o$ of I magnet)

$C\phi_2 = M_2 H\sin\theta$ (For deflection $\theta = 30^o$ of II magnet)

Dividing $\frac{\phi_1}{\phi_2} = \frac{M_1}{M_2}$

$\Rightarrow \frac{M_1}{M_2} = \frac{\phi_1}{\phi_2} = \frac{150\times\left(\frac{\pi}{180}\right)}{240\times\left(\frac{\pi}{180}\right)} = \frac{15}{24} = \frac{5}{8}$

$\Rightarrow M_1 : M_2 = 5:8$

21. (c) In vertical plane perpendicular to magnetic meridian.

$T = 2\pi\sqrt{\frac{I}{MB_V}}$ ..... (i)

In horizontal plane $T = 2\pi\sqrt{\dfrac{I}{MB_H}}$ ..... (ii)

Equation (i) and (ii) gives $B_V = B_H$

Hence by using $\tan\phi = \dfrac{B_V}{B_H} \Rightarrow \tan\phi = 1 \Rightarrow \phi = 45^o$

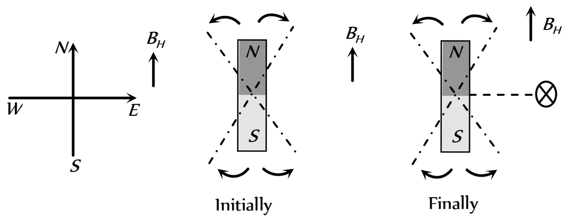
22. (a) Molar susceptiblity

$$= \frac{\text{Volume susceptiblity}}{\text{Density of material}} \times \text{molecular weight}$$

$$= \frac{I/H}{\rho} \times M = \frac{I/H}{M/V} \times M$$

So it's unit is m.

23. (c)



Initially $T = 2\pi\sqrt{\dfrac{I}{mB_H}}$, Finally $T' = 2\pi\sqrt{\dfrac{I}{m(B+B_H)}}$

Where B = Magnetic field due to down ward conductor

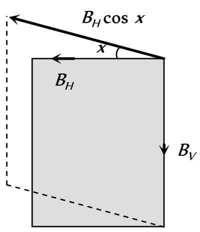
$$= \frac{\mu_0}{4\pi}.\frac{2i}{a} = 18\mu T$$

$$\therefore \frac{T'}{T} = \sqrt{\frac{B_H}{B+B_H}} \Rightarrow \frac{T'}{0.1} = \frac{24}{18+24} \Rightarrow T' = 0.076\,s.$$

24. (a) In first case $\tan\theta = \dfrac{B_V}{B_H}$ ..... (i)

Second case $\tan\theta' = \dfrac{B_V}{B_H\cos x}$ ..... (ii)

From equation (i) and (ii), $\dfrac{\tan\theta'}{\tan\theta} = \dfrac{1}{\cos x}$



25. (c) $\tan\theta = \dfrac{B_V}{B_H}$ ... (i)

If apparent dip is θ' then

$$\tan\theta' = \frac{B'_V}{B'_H} = \frac{B_V}{B_H\cos 30^\circ} = \frac{B_V}{B_H \times \frac{\sqrt{3}}{2}}$$

$$\Rightarrow \tan\theta' = \left(\frac{2}{\sqrt{3}}\right)\tan\theta \Rightarrow \tan\theta' > \tan\theta \Rightarrow \theta' > \theta$$

Graphical Questions

1. (d) For a temporary magnet the hysteresis loop should be long and narrow.

2. (c) Magnetism of a magnet falls with rise of temperature and becomes practically zero above curie temperature.

3. (b) For a diamagnetic substance χ is small, negative and independent of temperature.

4. (a) Susceptibility of a paramagnetic substance is independent of magnetising field.

5. (a) Susceptibility of a ferromagnetic substance falls with rise of temperature $\left(\chi = \dfrac{c}{T - T_c}\right)$ and the substance becomes paramagnetic above curie temperature, so magnetic susceptibility becomes very small above curie temperature.

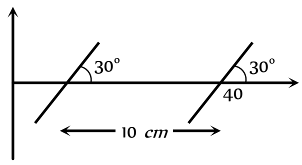
6. (c)

7. (b) $B = \mu_0\mu_r H \Rightarrow \mu_r \propto \dfrac{B}{H}$ = slope of *B- H* curve

According to the given graph, slope of the graph is highest point *Q*.

8. (b) $i \propto \tan\theta$

9. (b) $|B| = \dfrac{\Delta V}{\Delta x} = \dfrac{0.1 \times 10^{-4}}{0.1\sin 30^o} = 2 \times 10^{-4}T$



10. (a) $X = C \times \dfrac{1}{T} = \dfrac{0.4}{7 \times 10^{-3}} = 57K$

11. (b) In the given figure *OQ* refers to retentivity while *OR* refers to corecivity, for permanents both retentivity and corecivity should be high.

12. (b) Intensity of magnetisation of diamagnetic substance is very small and negative.

13. (d) $\mu_r = 1 + \dfrac{I}{H}$; as we know *I* dependent on *H*, initially value of $\dfrac{I}{H}$ is smaller so value of μ increases with *H* but slowly but with further increases of *H* value of $\dfrac{I}{H}$ also increases *i.e.* μ increases speedily. When material fully magnetised *I* becomes constant then with the increase of *H* $\left(\dfrac{I}{H}\text{ decreases}\right)$ μ decreases. This is confirm with the option (d).

14. (a) For paramagnetic substance magnetization *M* proportional to magnetising field *H*, and *M* is positive.

Assertion and Reason

1. (d) It is quite clear that magnetic poles always exists in pairs. Since, one can imagine magnetic field configuration with three poles. When north poles or south poles of two magnets are glued together. They provide a three pole field configuration. It is also known that a bar magnet does not exert a torque on itself due to own its field.

2. (b) As we know every atom of a magnet acts as a dipole, So poles cannot be separated. When magnet is broken into two equal pieces, magnetic moment of each part will be half of the original magnet.

3. (a) In case of the electric field of an electric dipole, the electric lines of force originate from positive charge and end at negative charge. Since isolated magnetic lines are closed continuous loops extending through out the body of the magnet.

4. (c) In an atom, electrons revolve around the nucleus and as such the circular orbits of electrons may be considered as the small current loops. In addition to orbital motion, an electron has got spin motion also. So the total magnetic moment of electron is the vector sum of its magnetic moments due to orbital and spin motion. Charge particles at rest do not produce electric field.

5. (b) Magnetic dipole moment of the current loop

= Ampere turns × Area of the coil

Initially magnetic moment $M = i\pi r$, new magnetic moment $M' = i\pi(2r)^2 = 4i(\pi r^2) = 4M.$

So magnetic moment becomes four times when radius is doubled.

6. (e) The temperature inside the earth is so high that it is impossible for iron core to behave as magnet and act as a source of magnetic field. The magnetic field of earth is considered to be due to circulating electric current in the iron (In molten state) and other conducting materials inside the earth.

7. (d) The earth has only vertical component of its magnetic field at the magnetic poles. Since compass needle is only free to rotate in horizontal plane. At north pole the vertical component of earth's field will exert torque on the magnetic needle so as to align it along its direction. As the compass needle can not rotate in vertical plane, it will rest horizontally, when placed on the magnetic pole of the earth.

8. (b) In tangent galvanometer the current through the coil is given by $I = \frac{2r}{n\mu_0}.B_H \tan\theta \Rightarrow \tan\theta \propto n/r$

i.e. by reducing its radius or by increasing number of turns of coil we can increase the sensitivity of tangent galvanometer.

9. (b) The susceptibility of ferromagnetic substance decreases with the rise of temperature in a complicated manner. After Curies point the susceptibility of ferromagnetic substance varies inversely with its absolute temperature. Ferromagnetic substance obey's Curies law only above its Curie point.

10. (e) The properties of substance is due to alignment of molecules in it. When these substance are heated, molecules acquire some kinetic energy. Some of molecules may get back to the closed chain arrangement (produce zero resultant). So they lose their magnetic property or magnetism. Therefor the properties of both ferromagnetic and paramagnetic are effected by heating.

11. (a) The core of a transformer undergoes cycles of magnetisation again and again. During each cycle of magnetisation, energy numerically equal to the area of the hysteresis loop is spent per unit volume of the core. Therefore, for high efficiency of transformer, the energy loss will be lesser if the hystersis loop is of lesser area, i.e. narrow. That's why the soft iron is used as core, which has narrow hysteresis loop (or area of $B-H$ curve is very small). Also soft iron (ferromegnetic substance) has high permeability, high retentivity, low coercivity and low hystersis loss.

12. (a) A magnetic field is produced by the motion of electric charge. Since motion is relative, the magnetic field is also relative.

13. (a) In a moving coil galvanometer, the coil is suspended in a very strong uniform magnetic field created by two magnetic pole pieces. The earth's magnetic field is quite weak as compared to that field, therefore, it does not effect the working of magnetic field.

14. (c) A paramagnetic sample display greater magnetisation when cooled, this is because at lower temperature, the tendency to disrupt the alignment of dipoles (due to magnetising field) decreases on account of reduced random thermal motion.

15. (a) Electromagnets are magnets, which can be turned on and off by switching the current on and off. As the material in electromagnets is subjected to cyclic change (magnification and demagentisation), the hysteresis loss of the material must be small. The material should attain high value of I and B with low value of magnetising field intensity H. As soft iron has small coercivity, so it is a best choice for this purpose.

16. (a) Since iron is ferromagnetic in nature, therefore, lines of force due to external magnetic field prefer to pass through iron.

17. (d) In general, the field due to a magnet is non-uniform. Therefore, it exerts both, a net force and a torque on the nails which will translate and also rotate the nails before striking to north pole of magnet with their induced south poles and vice-versa.

18. (d) In a non-uniform magnetic field, both a torque and a net force acts on the dipole. If magnetic field were uniform, net force on dipole would be zero.

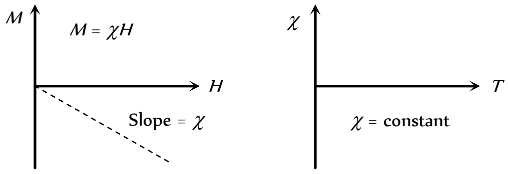
19. (c) The reduction factor of tangent galvanometer is

$$K = \frac{B_H}{G} = B_H \times \frac{2r}{n\mu_0}$$

Thus reduction factor of a tangent galvanometer depends upon the geometry of its coil. It increases with increase of radius and decreases with increase in number of turn of the coil of the galvanometer.

20. (c) Diamagnetism is non-cooperative behaviour of orbiting electrons when exposed to an applied magnetic field. Diamagnetic substance are composed of atom which have no net magnetic moment (*i.e.*, all the orbital shells are filled and there are no unpaired electrons). When exposed to a field, a negative magnetization is produced and thus the susceptibility is negative.

Behaviour of diamagnetic material is that the susceptibility is temperature independent.



21. (d) The permeability of a ferromagnetic material is not independent of magnetic field, $\vec{B} = K_m \vec{B}_0$.

B_0 is applied field. The total magnetic field $\vec{B}$ inside a ferromagnet may be 10^3 or 10^4 times the applied field B_0. The permeability K_m of a ferromagnetic material is not constant, neither the field $\vec{B}$ nor the magnetization $\vec{M}$ increases linearly with $\vec{B}$. Even at small value of B_0. From the hysteresis curve, magnetic permeability is greater for lower field.

22. (e) For a perfectly diamagnetic substance,

$B = \mu_0(H + I) = 0 \qquad \therefore I = -H.$

Therefore, $\chi_m = \dfrac{I}{H} = -1$

Therefore relative permeability

$\mu_r = 1 + \chi_m = 1 - 1 = 0. \quad \therefore \mu = \mu_0 \mu_r =$ zero.

i.e. for a perfectly diamagnetic material permeability is zero.

23. (a)

24. (a) Helium atom has paired electrons so their electron spin are opposite to each other and hence it's net magnetic moment is zero.

25. (b) Steel is preferred over soft iron for making permanent magnets, because coercivity of steel is larger.

Magnetism

Self Evaluation Test - 22

1. A compass needle whose magnetic moment is 60 *amp* × *m* pointing geographical north at a certain place, where the horizontal component of earth's magnetic field is 40 μ *Wb/m*, experiences a torque $1.2 \times 10^{-3}\ N \times m$. What is the declination at this place

(a) 30° (b) 45°

(c) 60° (d) 25°

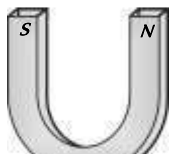
2. The distance between the poles of a horse shoe magnet is 0.1 *m* and its pole strength is 0.01 *amp-m*. The induction of magnetic field at a point midway between the poles will be

(a) $2 \times 10^{-5}\ T$

(b) $4 \times 10^{-6}\ T$

(c) $8 \times 10^{-7}\ T$

(d) Zero



3. Due to a small magnet intensity at a distance *x* in the end on position is 9 Gauss. What will be the intensity at a distance $\frac{x}{2}$ on broad side on position

(a) 9 *Gauss* (b) 4 *Gauss*

(c) 36 *Gauss* (d) 4.5 *Gauss*

4. The magnetic moment produced in a substance of $1 gm$ is $6 \times 10^{-7}\ ampere-metre^2$. If its density is $5\ gm/cm^3$, then the intensity of magnetisation in *A/m* will be

(a) 8.3×10^6 (b) 3.0

(c) 1.2×10^{-7} (d) 3×10^{-6}

5. The needle of a deflection galvanometer shows a deflection of 60° due to a short bar magnet at a certain distance in $\tan A$ position. If the distance is doubled, the deflection is

(a) $\sin^{-1}\left(\frac{\sqrt{3}}{8}\right)$ (b) $\cos^{-1}\left(\frac{\sqrt{3}}{8}\right)$

(c) $\tan^{-1}\left(\frac{\sqrt{3}}{8}\right)$ (d) $\cot^{-1}\left(\frac{\sqrt{3}}{8}\right)$

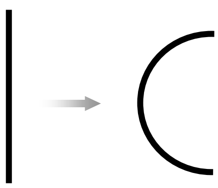
6. The area of hysteresis loop of a material is equivalent to 250 *joule*. When 10 *kg* material is magnetised by an alternating field of 50 *Hz* then energy lost in one *hour* will be if the density of material is $7.5\ gm/cm^3$

(a) $6 \times 10^4\ J$ (b) $6 \times 10^4\ erg$

(c) $3 \times 10^2\ J$ (d) $3 \times 10^2\ erg$

7. A magnetised wire of moment *M* is bent into an arc of a circle subtending an angle of 60° at the centre; then the new magnetic moment is

(a) $(2M/\pi)$



(b) (M/π)

(c) $(3\sqrt{3}M/\pi)$

(d) $(3M/\pi)$ **[EAMCET (Engg.) 1996]**

8. A tangent galvanometer shows a deflection 45° when 10 *mA* current pass through it. If the horizontal component of the earth's field is $3.6 \times 10^{-5}\ T$ and radius of the coil is 10 *cm*. The number of turns in the coil is

(a) 5700 turns (b) 57 turns

(c) 570 turns (d) 5.7 turns

9. A magnet is parallel to a uniform magnetic field. If it is rotated by 60°, the work done is 0.8 *J*. How much work is done in moving it 30° further

(a) 0.8×10^7 *ergs* (b) 0.4 *J*

(c) 8 *J* (d) 0.8 *ergs*

10. Susceptibility of *Mg* at 300 *K* is 1.2×10^{-5}. The temperature at which susceptibility will be 1.8×10^{-5} is **[Roorkee 1999]**

(a) 450 *K* (b) 200 *K*

(c) 375 *K* (d) None of these

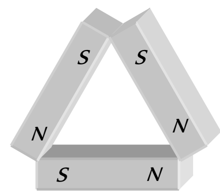
11. Three identical bar magnets each of magnetic moment *M* are placed in the form of an equilateral triangle as shown. The net magnetic moment of the system is

(a) Zero

(b) 2 *M*

(c) $M\sqrt{3}$

(d) $\frac{3M}{2}$



12. A magnetic needle is placed on a cork floating in a still lake in the northern hemisphere. Does the needle together with the cork move towards the north of the lake

(a) Yes

(b) No

(c) May be or may not be move

(d) Nothing can be said

13. The magnet of vibration magnetometer is heated so as to reduce its magnetic moment by 36%. By doing this the periodic time of the magnetometer will

(a) Increases by 36% (b) Increases by 25%

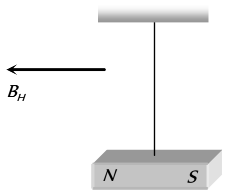
(c) Decreases by 25% (d) Decreases by 64%

14. The ratio of magnetic moments of two bar magnet is 13 : 5. These magnets are held together in a vibration magnetometer are allowed to oscillate in earth's magnetic field with like poles together 15 oscillation per minute are made. What will be the frequency of oscillation of system if unlike poles are together

(a) 10 *oscillations/min* (b) 15 *oscillations/min*

(c) 12 *oscillations/min* (d) $\frac{75}{13}$ *oscillations/min*

15. A magnet is suspended horizontally in the earth's magnetic field. When it is displaced and then released it oscillates in a horizontal plane with a period *T*. If a place of wood of the same moment of inertia (about the axis of rotation) as the magnet is attached to the magnet what would the new period of oscillation of the system become



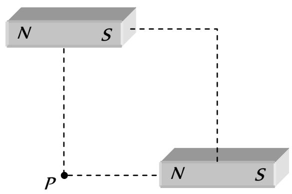
(a) $\frac{T}{3}$

(b) $\frac{T}{2}$

(c) $\frac{T}{\sqrt{2}}$

(d) $T\sqrt{2}$

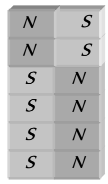
16. Two short magnets of magnetic moment 1000 Am^2 are placed as shown at the corn ers of a square of side 10 *cm*. The net magnetic induction at *P* is



(a) 0.1 *T* (b) 0.2 *T*

(c) 0.3 *T* (d) 0.4 *T*

17. The length of *a* magnet is large compared to it's width and breadth. The time period of its oscillation in a vibration magnetometer is *T*. The magnet is cut along it's length into six parts and these parts are then placed together as shown in the figure. The time period of this combination will be



(a) *T*

(b) $\frac{T}{\sqrt{3}}$

(c) $\frac{T}{2\sqrt{3}}$

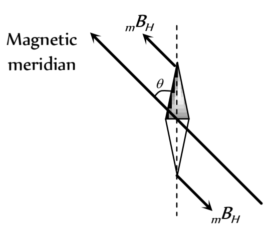
(d) Zero

Answers and Solutions

(SET -22)

1. (a) As the compass needle is free to rotate in a horizontal plane and points along the magnetic meridian,

so when it is pointing along the geographic meridian, it will experience a torque due



to the horizontal component of earth's magnetic field *i.e.* $\tau = MB_H \sin\theta$

where θ = angle between geographical

and magnetic meridians called angle of declination

So, $\sin\theta = \frac{1.2\times10^{-3}}{60\times40\times10^{-6}} = \frac{1}{2} \Rightarrow \theta = 30^o$

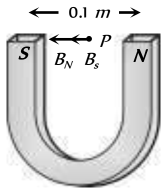
2. (c) Net magnetic field at mid point P, $B = B_N + B_S$

where B_N = magnetic field due to N- pole

B_S = magnetic field due to S- pole

$B_N = B_S = \frac{\mu_0}{4\pi}\frac{m}{r^2}$

$= 10^{-7}\times\frac{0.01}{\left(\frac{0.1}{2}\right)^2} = 4\times10^{-7}\,T$



$\therefore B_{net} = 8\times10^{-7}\,T.$

3. (c) In C.G.S. $B_{axial} = 9 = \frac{2M}{x^3}$ .....(i)

$B_{\text{equaterial}} = \frac{M}{\left(\frac{x}{2}\right)^3} = \frac{8M}{x^3}$ .....(ii)

From equation (i) and (ii) $B_{\text{equaterial}} = 36$ *Gauss.*

4. (b) $I = \frac{M}{V} = \frac{M}{\text{mass/density}}$,

given mass = $1gm$ = $10^{-3}\,kg$,

and density $= 5gm/cm^3 = \frac{5\times10^{-3}\,kg}{(10^{-2})^3\,m^3} = 5\times10^3\,kg/m^3$

Hence $I = \frac{6\times10^{-7}\times5\times10^3}{10^{-3}} = 3$

5. (c) For short bar magnet in tan A-position

$\frac{\mu_0}{4\pi}\frac{2M}{d^3} = H\tan\theta$ .....(i)

When distance is doubled, then new deflection θ' is given by

$\frac{\mu_0}{4\pi}\frac{2M}{(2d)^3} = H\tan\theta'$ .....(ii)

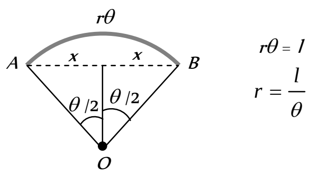
$\therefore \frac{\tan\theta'}{\tan\theta} = \frac{1}{8} \Rightarrow \tan\theta' = \frac{\tan\theta}{8} = \frac{\tan 60^\circ}{8} = \frac{\sqrt{3}}{8}$

$\Rightarrow \theta' = \tan^{-1}\left(\frac{\sqrt{3}}{8}\right)$

6. (a) $E = nAVt = nA\frac{m}{d}t = \frac{50\times250\times10\times3600}{7.5\times10^3} = 6\times10^4\,J$

7. (d) From figure

$\sin\frac{\theta}{2} = \frac{x}{r}$



$\Rightarrow x = r\sin\frac{\theta}{2}$

Hence new magnetic moment $M' = m(2x) = m.2r\sin\frac{\theta}{2}$

$= m.\frac{2l}{\theta}\sin\frac{\theta}{2} = \frac{2ml\sin\theta/2}{\theta} = \frac{2M\sin(\pi/6)}{\pi/3} = \frac{3M}{\pi}$

8. (c) $K = \frac{2rB_H}{\mu_0 n}$

or $n = \frac{2rB_H}{\mu_0 K} = \frac{2\times0.1\times3.6\times10^{-5}}{4\pi\times10^{-7}\times10\times10^{-3}} = \frac{1.8\times10^3}{3.14} = 570$

9. (a) $W = MB(\cos\theta_1 - \cos\theta_2)$

When the magnet is rotated from 0° to 60°, then work done is 0.8 J

$0.8 = MB(\cos0^\circ - \cos60^\circ) = \frac{MB}{2}$

$\Rightarrow MB = 1.6\,N-m$

In order to rotate the magnet through an angle of 30°, *i.e.*, from 60° to 90°, the work done is

$W' = MB(\cos60^\circ - \cos90^\circ) = MB\left(\frac{1}{2} - 0\right)$

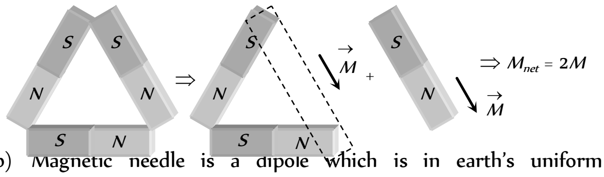
$= \frac{MB}{2} = \frac{1.6}{2} = 0.8\,J = 0.8\times10^7\,ergs$

10. (b) $\chi \propto \frac{1}{T}$

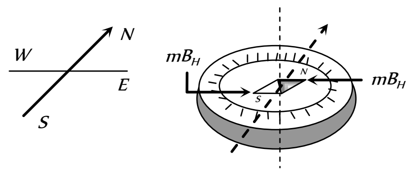
$\therefore \chi_1 T_1 = \chi_2 T_2$

Hence $T_2 = \frac{1.2\times10^{-5}\times300}{1.8\times10^{-5}} = 200\,K$

11. (b) The resultant magnetic moment can be calculated as follows.



12. (b) Magnetic needle is a dipole which is in earth's uniform magnetic field and as a dipole in a uniform field does not experience any net force but may experience a couple as shown in figure, so the needle together with the cork will not translate *i.e.* move towards the north of the lake, but will rotate and set itself parallel to the field with it's north pole pointing north.



13. (b) $T = 2\pi\sqrt{\frac{I}{MB_H}} \Rightarrow T \propto \frac{1}{\sqrt{M}} \Rightarrow \frac{T_1}{T_2} = \sqrt{\frac{M_2}{M_1}}$

If $M_1 = 100$ then $M_2 = (100-36) = 64$

So $\frac{T_1}{T_2} = \sqrt{\frac{64}{100}} = \frac{8}{10} \Rightarrow T_2 = \frac{10}{8}T_1 = 1.25\,T_1$

So % increase in time period = 25%

14. (a) $\frac{M_1}{M_2} = \frac{\nu_s^2 + \nu_d^2}{\nu_s^2 - \nu_d^2} \Rightarrow \frac{13}{5} = \frac{(15)^2 + \nu_d^2}{(15)^2 - \nu_d^2}$

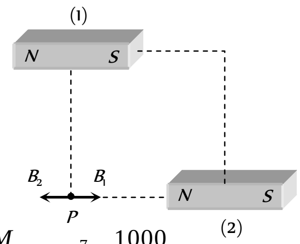
$\Rightarrow \nu_d = 10$ *oscillations/min*

***

15. (d) Due to wood moment of inertia of the system becomes twice but there is no change in magnetic moment of the system.

Hence by using $T = 2\pi\sqrt{\frac{I}{MB_H}} \Rightarrow T \propto \sqrt{I} \Rightarrow T' = \sqrt{2}\,T$

16. (a) Point P lies on equatorial line of magnet (1) and axial line of magnet (2) as shown



$B_1 = \frac{\mu_0}{4\pi}\cdot\frac{M}{d^3} = 10^{-7}\times\frac{1000}{(0.1)^3} = 0.1\,T$

$B_2 = \frac{\mu_0}{4\pi}\cdot\frac{2M}{d^3} = 10^{-7}\times\frac{2\times 1000}{(0.1)^3} = 0.2\,T$

$\therefore\ B_{net} = B_2 - B_1 = 0.1\,T$

17. (c) $T = 2\pi\sqrt{\frac{I}{MH}}$; MI of each part $= \frac{I}{6^3}$

and magnetic moment of each part $= \frac{M}{6}$

so net *MI* of system $= \frac{I}{6^3}\times 6 = \frac{I}{6^2}$

and net magnetic moment $= \frac{4M}{6} - \frac{2M}{6} = \frac{M}{3}$

$\therefore$ time period of the system

$T' = 2\pi\sqrt{\frac{I/36}{(M/3)H}} = \frac{1}{2\sqrt{3}}2\pi\sqrt{\frac{I}{MH}} = \frac{T}{2\sqrt{3}}$

Electromagnetic Induction

Magnetic Flux

(1) The total number of magnetic lines of force passing normally through an area placed in a magnetic field is equal to the magnetic flux linked with that area.

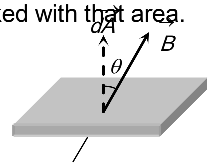

Fig. 23.1

(2) Net flux through the surface $\phi = \oint \vec{B} \cdot d\vec{A} = BA\cos\theta$

(θ is the angle between area vector and magnetic field vector)

If $\theta = 0^o$ then $\phi = BA$, If $\theta = 90^o$ then $\phi = 0$

(3) **Unit and Dimension :** Magnetic flux is a scalar quantity. It's S.I. unit is *weber* (*wb*), CGS unit is *Maxwell* or *Gauss* × *cm*^{2}; ($1 wb = 10^8$ *Maxwell*).

(4) Other units : *Tesla* × *m*^{2} $= \frac{N \times m}{Amp} = \frac{Joule}{Amp} = \frac{Volt \times \text{Coulomb}}{Amp}$

$= Volt \times sec$ = *Ohm* × *Coulomb* = *Henry* × *Amp*. It's dimensional formula [ϕ] = [$ML^2T^{-2}A^{-1}$]

Faraday's Laws of Electromagnetic Induction

(1) **First law :** Whenever the number of magnetic lines of force (magnetic flux) passing through a circuit changes an emf is produced in the circuit called induced emf. The induced emf persists only as long as there is change or cutting of flux.

(2) **Second law :** The induced emf is given by rate of change of magnetic flux linked with the circuit *i.e.* $e = -\frac{d\phi}{dt}$. For *N* turns $e = -\frac{N\,d\phi}{dt}$; Negative sign indicates that induced emf (*e*) opposes the change of flux.

(3) **Other formulae :** $\phi = BA\cos\theta$; Hence ϕ will change if either, *B*, *A* or θ will change

So $e = -N\frac{d\phi}{dt} = -\frac{N(\phi_2 - \phi_1)}{\Delta t} = -\frac{NA(B_2 - B_1)\cos\theta}{\Delta t}$

$= -\frac{NBA(\cos\theta_2 - \cos\theta_1)}{\Delta t}$

Table 23.1 : Induced *i*, *q* and *P*

Induced current (*i*)	Induced charge (*q*)	Induced power (*P*)
$i = \frac{e}{R} = -\frac{N}{R}\cdot\frac{d\phi}{dt}$	$dq = i\,dt = -\frac{N}{R}\cdot d\phi$ Induced charge is time independent.	$P = \frac{e^2}{R} = \frac{N^2}{R}\left(\frac{d\phi}{dt}\right)^2$ It depends on time and resistance

Lenz's Law

This law gives the direction of induced emf/induced current. According to this law, the direction of induced emf or current in a circuit is such as to oppose the cause that produces it. This law is based upon law of conservation of energy.

(1) When *N*-pole of a bar magnet moves towards the coil, the flux associated with loop increases and an emf is induced in it. Since the circuit of loop is closed, induced current also flows in it.

(2) Cause of this induced current, is approach of north pole and therefore to oppose the cause, *i.e.*, to repel the approaching north pole, the induced current in loop is in such a direction so that the front face of loop behaves as north pole. Therefore induced current as seen by observer *O* is in anticlockwise direction. (figure)

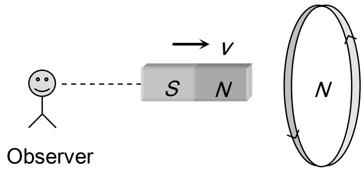

Fig. 23.2

Table 23.2 : The various positions of relative motion between the magnet and the coil

Position of magnet	 Observer	 Observer	 Observer	 Observer
Direction of induced current	Anticlockwise direction	Clockwise direction	Clockwise direction	Anticlockwise direction
Behaviour of face of the coil	As a north pole	As a south pole	As a south pole	As a north pole
Type of magnetic force opposed	Repulsive force	Attractive force	Repulsive force	Attractive force
Magnetic field linked with the coil and it's progress as viewed from left	Cross (×), Increases	Cross (×), Decreases	Dots (·) Increases	Dots (·) Decreases

(3) If the loop is free to move the cause of induced emf in the coil can also be termed as relative motion. Therefore to oppose the cause, the relative motion between the approaching magnet and the loop should be opposed. For this, the loop will itself start moving in the direction of motion of the magnet.

(4) It is important to remember that whenever cause of induced emf is relative motion, the new motion is always in the direction of motion of the cause.

Induced Electric Field

It is non-conservative and non-electrostatic in nature. Its field lines are concentric circular closed curves.

A time varying magnetic field $\frac{dB}{dt}$ always produced induced electric field in all space surrounding it.

Induced electric field (E_{in}) is directly proportional to induced emf so $e = \oint \vec{E}_{in} \cdot d\vec{l}$ .....(i)

From Faraday's second laws $e = -\frac{d\phi}{dt}$ .....(ii)

From (i) and (ii) $e = \oint \vec{E}_{in} . d\vec{l} = -\frac{d\phi}{dt}$ This is known as integral form of Faraday's laws of EMI.

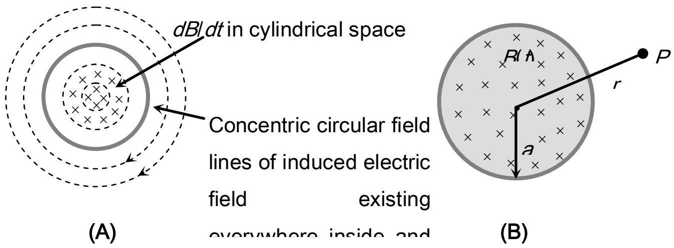

Fig. 23.3

A uniform but time varying magnetic field $B(t)$ exists in a circular region of radius 'a' and is directed into the plane of the paper as shown, the magnitude of the induced electric field (E_{in}) at point P lies at a distance r from the centre of the circular region is calculated as follows.

So $\oint \vec{E}_{in} d\vec{l} = e = \frac{d\phi}{dt} = A\frac{dB}{dt}$ *i.e.* $E(2\pi r) = \pi a^2 \frac{dB}{dt}$

where $r \geq a$ or $E = \frac{a^2}{2r}\frac{dB}{dt}$; $\boldsymbol{E_{in} \propto \frac{1}{r}}$

Dynamic (Motional) EMI Due to Translatory Motion

(1) Consider a conducting rod of length l moving with a uniform velocity $\vec{v}$ perpendicular to a uniform magnetic field $\vec{B}$, directed into the plane of the paper. Let the rod be moving to the right as shown in figure. The conducting electrons also move to the right as they are trapped within the rod.

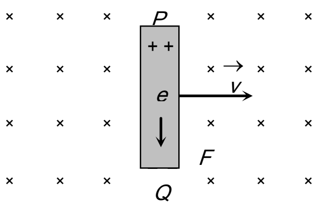

Fig. 23.4

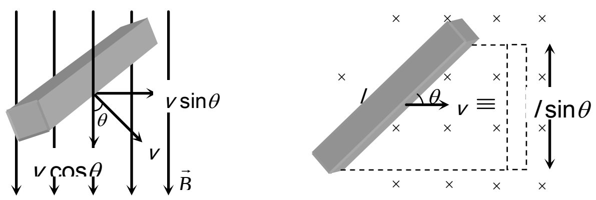
Conducting electrons experiences a magnetic force $F_m = evB$. So they move from P to Q within the rod. The end P of the rod becomes positively charged while end Q becomes negatively charged, hence an electric field is set up within the rod which opposes the further downward movement of electrons *i.e.* an equilibrium is reached and in equilibrium $F_e = F_m$ *i.e.* $eE = evB$ or $E = vB \Rightarrow$ Induced emf $\boldsymbol{e = El = Bvl}$ $[E = \frac{V}{l}]$

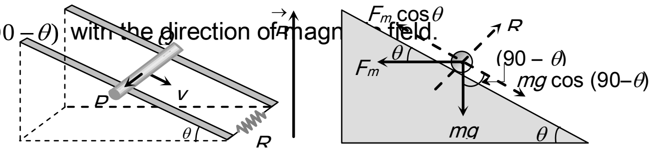
(2) If rod is moving by making an angle θ with the direction of magnetic field or length. Induced emf $e = Bvl\sin\theta$



(A) (B)

Fig. 23.5

(3) **Motion of conducting rod on an inclined plane :** When conductor start sliding from the top of an inclined plane as shown, it moves perpendicular to it's length but at an angle $(90 - \theta)$ with the direction of magnetic field.



(A) (B)

Fig. 23.6

Hence induced emf across the ends of conductor $e = Bv\sin(90-\theta)l = Bvl\cos\theta$

So induced current $i = \frac{Bvl\cos\theta}{R}$ (Directed from Q to P).

The forces acting on the bar are shown in following figure. The rod will move down with constant velocity only if

$$F_m\cos\theta = mg\cos(90-\theta) = mg\sin\theta \Rightarrow Bil\cos\theta = mg\sin\theta$$

$$B\left(\frac{Bv_T l\cos\theta}{R}\right)l\cos\theta = mg\sin\theta \Rightarrow v_T = \frac{mgR\sin\theta}{B^2l^2\cos^2\theta}$$

Motional Emi in Loop by Generated Area

If conducting rod moves on two parallel conducting rails as shown in following figure then phenomenon of induced emf can also be understand by the concept of generated area (The area swept of conductor in magnetic field, during it's motion)

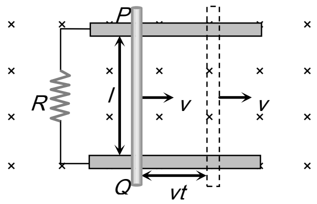


Fig. 23.7

As shown in figure in time t distance travelled by conductor = vt

Area generated $A = lvt$. Flux linked with this area $\phi = BA = Blvt$. Hence induced emf $|e| = \frac{d\phi}{dt} = Bvl$

(1) **Induced current :** $i = \frac{e}{R} = \frac{Bvl}{R}$

(2) **Magnetic force :** Conductor *PQ* experiences a magnetic force in opposite direction of it's motion and $F_m = Bil = B\left(\frac{Bvl}{R}\right)l = \frac{B^2vl^2}{R}$

(3) **Power dissipated in moving the conductor :** For uniform motion of rod *PQ*, the rate of doing mechanical work by external agent or mech. Power delivered by external source is given as

$$P_{mech} = P_{ext} = \frac{dW}{dt} = F_{ext}.v = \frac{B^2vl^2}{R} \times v = \frac{B^2v^2l^2}{R}$$

(4) **Electrical power :** Also electrical power dissipated in resistance or rate of heat dissipation across resistance is given as

$$P_{thermal} = \frac{H}{t} = i^2R = \left(\frac{Bvl}{R}\right)^2.R \; ; \quad P_{thermal} = \frac{B^2v^2l^2}{R}$$

(It is clear that $P_{mech.}$ = $P_{thermal}$ which is consistent with the principle of conservation of energy.)

(5) **Motion of conductor rod in a vertical plane :** If conducting rod released from rest (at *t* = 0) as shown in figure then with rise in it's speed (*v*), induces emf (*e*), induced current (*i*), magnetic force (F_m) increases but it's weight remains constant.

Rod will achieve a constant maximum (terminal) velocity v_T if $F_m = mg$

So $\frac{B^2v_T^2l^2}{R} = mg$

$\Rightarrow \quad v_T = \frac{mgR}{B^2l^2}$

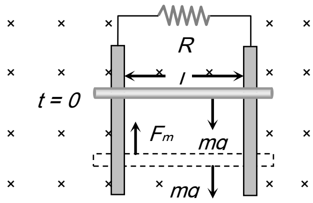

Fig. 23.8

Special cases

Motion of train and aeroplane in earth's magnetic field

(A) Fig. 23.9 (B)

Induced emf across the axle of the wheels of the train and it is across the tips of the wing of the aeroplane is given by *e* = $B_v lv$ where *l* = length of the axle or distance between the tips of the wings of plane, B_v = vertical component of earth's magnetic field and *v* = speed of train or plane.

Motional EMI Due to Rotational Motion

(1) **Conducting rod :** A conducting rod of length *l* whose one end is fixed, is rotated about the axis passing through it's fixed end and perpendicular to it's length with constant angular velocity ω. Magnetic field (*B*) is perpendicular to the plane of the paper.

emf induces across the ends of the rod

where ν = frequency (revolution per sec) and *T* = Time period.

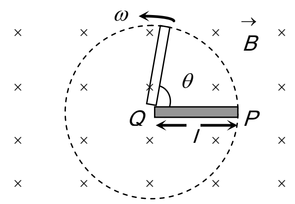

Fig. 23.10

(2) **Cycle wheel** : A conducting wheel each spoke of length *l* is rotating with angular velocity ω in a given magnetic field as shown below in fig.

Due to flux cutting each metal spoke becomes identical cell of emf *e* (say), all such identical cells connected in parallel fashion $e_{net} = e$ (emf of single cell). Let *N* be the number of spokes hence $e_{net} = \frac{1}{2}Bwl^2; \omega = 2\pi\nu$

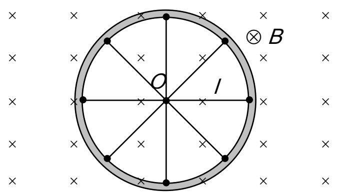

Fig. 23.11

Here $e_{net} \propto N^o$ *i.e.* total emf does not depends on number of spokes '*N*.

(3) **Faraday copper disc generator :** A metal disc can be assumed to made of uncountable radial conductors when metal disc rotates in transverse magnetic field these radial conductors cuts away magnetic field lines and because of this flux cutting all becomes identical cells each of emf 'e' where $e = \frac{1}{2}B\omega r^2$,

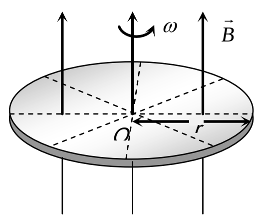

Fig. 23.12

(4) **Semicircular conducting loop** : If a semi-circular conducting loop (*ACD*) of radius '*r*' with centre at *O*, the plane of loop being in the plane of paper. The loop is now made to rotate with a constant angular velocity ω, about an axis passing through *O* and perpendicular to the plane of paper. The effective resistance of the loop is *R*.

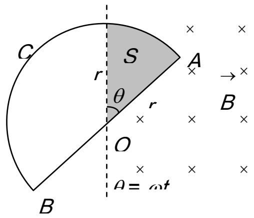

Fig. 23.13

In time *t* the area swept by the loop in the field *i.e.* region II

$A = \frac{1}{2} r(r\theta) = \frac{1}{2} r^2 \omega t$; $\frac{dA}{dt} = \frac{r^2 \omega}{2}$

Flux link with the rotating loop at time t $\phi = BA$

Hence induced emf in the loop in magnitude $|e| = \frac{d\phi}{dt} = B\frac{dA}{dt} = \frac{B\omega r^2}{2}$ and induced current $i = \frac{|e|}{R} = \frac{B\omega r^2}{2R}$

Periodic EMI

Suppose a rectangular coil having *N* turns placed initially in a magnetic field such that magnetic field is perpendicular to it's plane as shown.

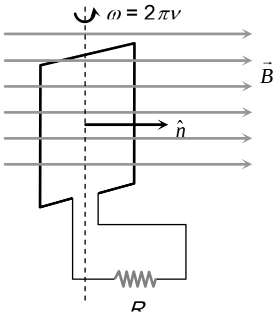

Fig. 23.14

ω – Angular speed

ν – Frequency of rotation of coil

R – Resistance of coil

For uniform rotational motion with ω, the flux linked with coil at any time t

$\phi = NBA \cos\theta = NBA \cos\omega t$

$\phi = \phi_0 \cos\omega t$ where ϕ_0 = *NBA* = maximum flux

(1) **Induced emf in coil :** Induced emf also changes in periodic manner that's why this phenomenon called periodic EMI

$e = -\frac{d\phi}{dt} = NBA\omega \sin\omega t \Rightarrow e = e_0 \sin\omega t$ where e_0 = emf amplitude or max. emf $= NBA\omega = \phi_0 \omega$

(2) **Induced current :** At any time *t*, $i = \frac{e}{R} = \frac{e_0}{R} \sin\omega t = i_0 \sin\omega t$ where i_0 = current amplitude or max. current $i_0 = \frac{e_0}{R} = \frac{NBA\omega}{R} = \frac{\phi_0 \omega}{R}$

Inductance

(1) Inductance is that property of electrical circuits which opposes any change in the current in the circuit.

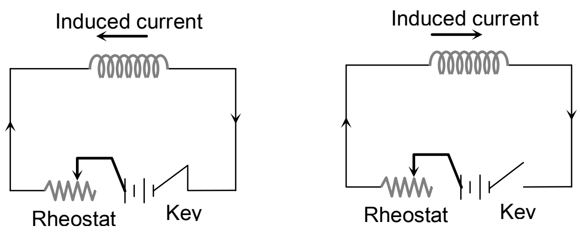
(2) Inductance is inherent property of electrical circuits. It will always be found in an electrical circuit whether we want it or not.

(3) A straight wire carrying current with no iron part in the circuit will have lesser value of inductance.

(4) Inductance is analogous to inertia in mechanics, because inductance of an electrical circuit opposes any change of current in the circuit.

Self Induction

Whenever the electric current passing through a coil or circuit changes, the magnetic flux linked with it will also change. As a result of this, in accordance with Faraday's laws of electromagnetic induction, an emf is induced in the coil or the circuit which opposes the change that causes it. This phenomenon is called 'self induction' and the emf induced is called back emf, current so produced in the coil is called induced current.



(A) Main current **(B)** Main current decreasing

Fig. 23.15

(1) **Coefficient of self-induction :** Number of flux linkages with the coil is proportional to the current *i*. *i.e.* $N\phi \propto i$ or $N\phi = Li$ (*N* is the number of turns in coil and $N\phi$ – total flux linkage). Hence $\boldsymbol{L = \frac{N\phi}{i}}$ = coefficient of self-induction.

(2) If i = 1*amp*, N = 1 then, $L = \phi$ *i.e.* the coefficient of self induction of a coil is equal to the flux linked with the coil when the current in it is 1 *amp*.

(3) By Faraday's second law induced emf $e = -N\dfrac{d\phi}{dt}$. Which gives $\boldsymbol{e = -L\dfrac{di}{dt}}$; If $\dfrac{di}{dt} = 1\, amp/sec$ then $|e| = L$.

Hence coefficient of self induction is equal to the emf induced in the coil when the rate of change of current in the coil is unity.

(4) **Units and dimensional formula of 'L' :** It's S.I. unit

$$\frac{weber}{Amp} = \frac{Tesla \times m^2}{Amp} = \frac{N \times m}{Amp^2} = \frac{Joule}{Amp^2} = \frac{Coulomb \times volt}{Amp^2}$$

$= \dfrac{volt \times \sec}{amp} = ohm \times \sec$. But practical unit is henry (H). It's dimensional formula $[L] = [ML^2T^{-2}A^{-2}]$

(5) **Dependence of self inductance (L) :** 'L' does not depend upon current flowing or change in current flowing but it depends upon number of turns (N), Area of cross section (A) and permeability of medium (μ).

'L' does not play any role till there is a constant current flowing in the circuit. 'L' comes in to the picture only when there is a change in current.

(6) **Magnetic potential energy of inductor :** In building a steady current in the circuit, the source emf has to do work against of self inductance of coil and whatever energy consumed for this work stored in magnetic field of coil this energy called as magnetic potential energy (U) of coil

$U = \int_0^i Li\,di = \dfrac{1}{2}Li^2$; Also $U = \dfrac{1}{2}(Li)i = \dfrac{N\phi i}{2}$

(7) **The various formulae for L**

Condition	Figure
Circular coil $L = \dfrac{\mu_0 \pi N^2 r}{2}$	Solenoid $L = \dfrac{\mu_0\mu_r N^2 A}{l} = \dfrac{\mu N^2 A}{l} (\mu = \mu_0\mu_r)$	Toroid $L = \dfrac{\mu_0 N^2 r}{2}$	Square coil $L = \dfrac{2\sqrt{2}\mu_0 N^2 a}{\pi}$	Coaxial cylinders $L = \dfrac{\mu_0}{2\pi r}\log_e\dfrac{r_2}{r_1}$ $\dfrac{2.303}{2\pi r}\mu_0 \log_{10}\dfrac{r_2}{r_1}$	
Mutual Induction

Whenever the current passing through a coil or circuit changes, the magnetic flux linked with a neighbouring coil or circuit will also change. Hence an emf will be induced in the neighbouring coil or circuit. This phenomenon is called 'mutual induction'.

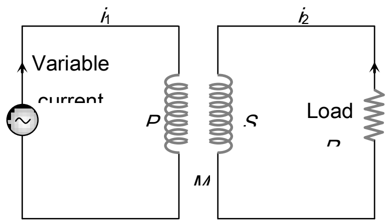

Fig. 23.16

(1) **Coefficient of mutual induction :** Total flux linked with the secondary due to current in the primary is $N_2\phi_2$ and $N_2\phi_2 \propto i_1 \Rightarrow N_2\phi_2 = Mi_1$ where N_1 - Number of turns in primary; N_2 - Number of turns in secondary; ϕ_2 - Flux linked with each turn of secondary; i_1 - Current flowing through primary; M-Coefficient of mutual induction or mutual inductance.

(2) According to Faraday's second law emf induces in secondary $e_2 = -N_2\dfrac{d\phi_2}{dt}$; $e_2 = -M\dfrac{di_1}{dt}$

(3) If $\dfrac{di_1}{dt} = \dfrac{1Amp}{sec}$ then $|e_2| = M$. Hence coefficient of mutual induction is equal to the emf induced in the secondary coil when rate of change of current in primary coil is unity.

(4) **Units and dimensional formula of M :** Similar to self-inductance (L)

(5) **Dependence of mutual inductance**

(i) Number of turns (N_1, N_2) of both coils

(ii) Coefficient of self inductances (L_1, L_2) of both the coils

(iii) Area of cross-section of coils

(iv) Magnetic permeability of medium between the coils (μ_r) or nature of material on which two coils are wound

(v) Distance between two coils (As d increases so M decreases)

(vi) Orientation between primary and secondary coil (for 90° orientation no flux relation $M = 0$)

(vii) Coupling factor 'K' between primary and secondary coil

(6) **Relation between M, L_1 and L_2 :** For two magnetically coupled coils $M = k\sqrt{L_1L_2}$; where k – coefficient of coupling or coupling factor which is defined as

$$k = \frac{\text{Magnetic flux linked in secondary}}{\text{Magnetic flux linked in primary}}; \quad 0 \le k \le 1$$

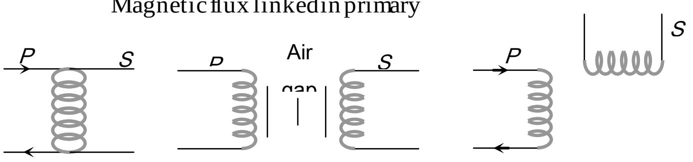

Fig. 23.17

(A) $k = 1$ (B) $0 < k < 1$ (C) $k = 0$

(7) **The various formulae for M :**

Condition	Figure
Two concentric coplaner circular coils $M = \dfrac{\pi\mu_0 N_1 N_2 r^2}{2R}$	Two Solenoids $M = \dfrac{\mu_0 N_1 N_2 A}{l}$	Two concentric coplaner square coils $M = \dfrac{\mu_0 2\sqrt{2}\, N_1 N_2 l^2}{\pi L}$	
Combination of Inductance

(1) **Series :** If two coils of self-inductances L_1 and L_2 having mutual inductance are in series and are far from each other, so that the mutual induction between them is negligible, then net self inductance $L_S = L_1 + L_2$

When they are situated close to each other, then net inductance $L_S = L_1 + L_2 \pm 2M$

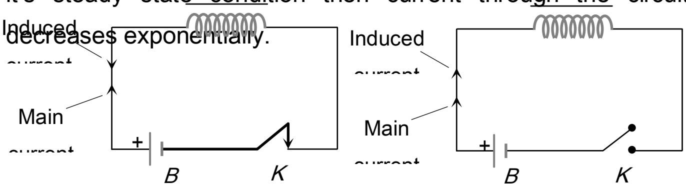
(2) **Parallel :** If two coils of self-inductances L_1 and L_2 having mutual inductance are connected in parallel and are far from each other, then net inductance L is $\dfrac{1}{L_P} = \dfrac{1}{L_1} + \dfrac{1}{L_2} \Rightarrow$ $L_P = \dfrac{L_1L_2}{L_1 + L_2}$

When they are situated close to each other, then

$$L_P = \frac{L_1 L_2 - M^2}{L_1 + L_2 \pm 2M}$$

Growth and Decay of Current In *LR*- Circuit

If a circuit containing a pure inductor *L* and a resistor *R* in series with a battery and a key then on closing the circuit current through the circuit rises exponentially and reaches up to a certain maximum value (steady state). If circuit is opened from it's steady state condition then current through the circuit decreases exponentially.



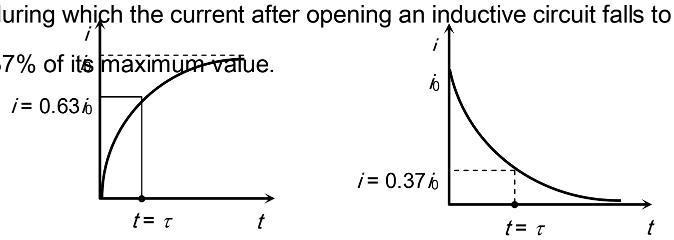
(A) Growth of current **(B)** Decay of current

Fig. 23.18

(1) The value of current at any instant of time *t* after closing the circuit (*i.e.* during the rising of current) is given by $i = i_0\left[1 - e^{-\frac{R}{L}t}\right]$; where $i_0 = i_{max} = \frac{E}{R}$ = steady state current.

(2) The value of current at any instant of time *t* after opening from the steady state condition (*i.e.* during the decaying of current) is given by $i = i_0 e^{-\frac{R}{L}t}$

(3) **Time constant (τ) :** It is given as $\tau = \frac{L}{R}$; It's unit is *second*. In other words the time interval, during which the current in an inductive circuit rises to 63% of its maximum value at make, is defined as time constant or it is the time interval, during which the current after opening an inductive circuit falls to 37% of its maximum value.



(A) (B)

Fig. 23.19

LC- Oscillation

When a charged capacitor *C* having an initial charge q_0 is discharged through an inductance *L*, the charge and current in the circuit start oscillating simple harmonically. If the resistance of the circuit is zero, no energy is dissipated as heat. We also assume an idealized situation in which energy is not radiated away from the circuit. The total energy associated with the circuit is constant.

Frequency of oscillation is given by

$$\omega = \frac{1}{\sqrt{LC}} \frac{rad}{sec}$$

or $\nu = \frac{1}{2\pi\sqrt{LC}} Hz$

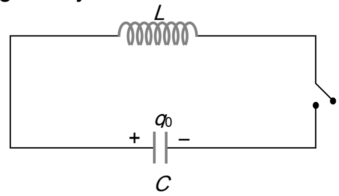


Fig. 23.20

Eddy Current

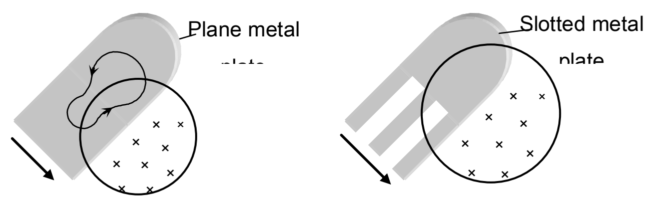
When a changing magnetic flux is applied to a bulk piece of conducting material then circulating currents called eddy currents are induced in the material. Because the resistance of the bulk conductor is usually low, eddy currents often have large magnitudes and heat up the conductor.

(1) These are circulating currents like eddies in water.

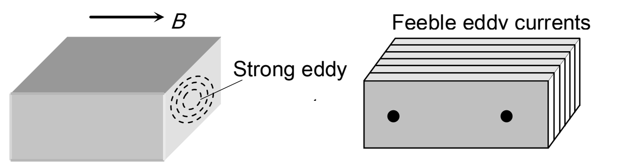
(2) Experimental concept given by Focault hence also named as "Focault current".

(3) The production of eddy currents in a metallic block leads to the loss of electric energy in the form of heat.

(4) By Lamination, slotting processes the resistance path for circulation of eddy current increases, resulting in to weakening them and also reducing losses causes by them



(A) Strong eddies produced **(B)** Feeble eddies Gradual damping



(C) Solid metallic core (D) Laminated core

(5) **Application of eddy currents :** Though most of the times eddy currents are undesirable but they find some useful applications as enumerated below

(i) **Dead-beat galvanometer :** A dead beat galvanometer means one whose pointer comes to rest in the final equilibrium position immediately without any oscillation about the equilibrium position when a current is passed in its coil.

This is achieved by winding the coil on a metallic frame the large eddy currents induced in the frame provide electromagnetic damping.

(ii) **Electric-brakes :** When the train is running its wheel is moving in air and when the train is to be stopped by electric breaks the wheel is made to move in a field created by electromagnet. Eddy currents induced in the wheels due to the changing flux oppose the cause and stop the train.

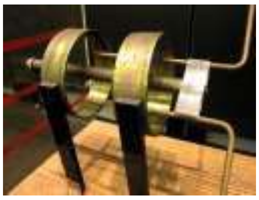
(iii) **Induction furnace :** Joule's heat causes the melting of a metal piece placed in a rapidly changing magnetic field.

(iv) **Speedometer :** In the speedometer of an automobile, a magnet is geared to the main shaft of the vehicle and it rotates according to the speed of the vehicle. The magnet is mounted in an aluminium cylinder with the help of hair springs. When the magnet rotates, it produces eddy currents in the drum and drags it through an angle, which indicates the speed of the vehicle on a calibrated scale.

(v) **Energy meter :** In energy meters, the armature coil carries a metallic aluminium disc which rotates between the poles of a pair of permanent horse shoe magnets. As the armature rotates, the current induced in the disc tends to oppose the motion of the armature coil. Due to this braking effect, deflection is proportional to the energy consumed.

dc Motor

It is an electrical machine which converts electrical energy into mechanical energy.



(1) **Principle :** It is based on the fact that a current carrying coil placed in the magnetic field experiences a torque. This torque rotates the coil.

(2) **Construction :** It consists of the following components figure.

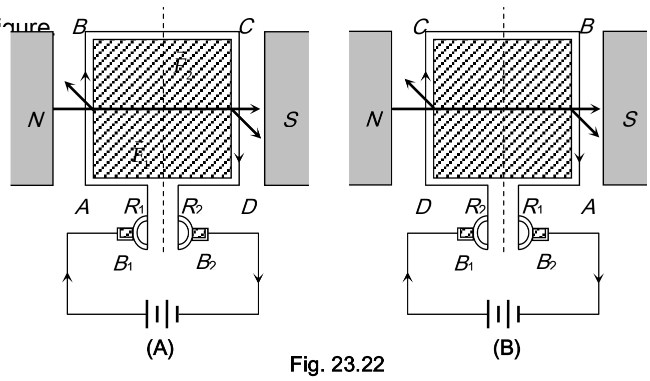


Fig. 23.22

ABCD = Armature coil, S_1, S_2 = split ring comutators

B_1, B_2 = Carbon brushes, *N*, *S* = Strong magnetic poles

(3) **Working :** Force on any arm of the coil is given by $\vec{F} = i(\vec{l} \times \vec{B})$ in fig., force on *AB* will be perpendicular to plane of the paper and pointing inwards. Force on *CD* will be equal and opposite. So coil rotates in clockwise sense when viewed from top in fig. The current in *AB* reverses due to commutation keeping the force on *AB* and *CD* in such a direction that the coil continues to rotate in the same direction.

(4) **Back emf in motor :** Due to the rotation of armature coil in magnetic field a back emf is induced in the circuit. Which is given by $e = E - iR$.

Back emf directly depends upon the angular velocity ω of armature and magnetic field *B*. But for constant magnetic field *B*, value of back emf *e* is given by $e \propto \omega$ or $e = k\omega$ ($e = NBA\omega \sin\omega t$)

(5) **Current in the motor :** $i = \frac{E-e}{R} = \frac{E-k\omega}{R}$; When motor is just switched on *i.e.* $\omega = 0$ so $e = 0$ hence $i = \frac{E}{R} = \text{maximum}$ and at full speed, ω is maximum so back emf *e* is maximum and *i* is minimum. Thus, maximum current is drawn when the motor is just switched on which decreases when motor attains the speed.

(6) **Motor starter :** At the time of start a large current flows through the motor which may burn out it. Hence a starter is used for starting a dc motor safely. Its function is to introduce a suitable resistance in the circuit at the time of starting of the motor. This resistance decreases gradually and reduces to zero when the motor runs at full sped.

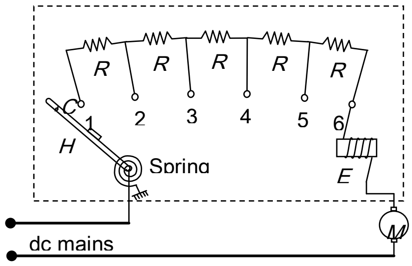

Fig. 23.23

The value of starting resistance is maximum at time $t = 0$ and its value is controlled by spring and electromagnetic system and is made to zero when the motor attains its safe speed.

(7) **Mechanical power and Efficiency of dc motor :**

Efficiency $\eta = \frac{P_{mechanical}}{P_{supplied}} = \frac{P_{out}}{P_{in}} = \frac{e}{E} = \frac{\text{Back e.m.f.}}{\text{Supply voltage}}$

(8) **Uses of dc motors :** They are used in electric locomotives, electric ears, rolling mills, electric cranes, electric lifts, dc drills, fans and blowers, centrifugal pumps and air compressors, *etc.*

ac Generator/Alternator/Dynamo

An electrical machine used to convert mechanical energy into electrical energy is known as ac generator/alternator.

(1) **Principle :** It works on the principle of electromagnetic induction *i.e.*, when a coil is rotated in uniform magnetic field, an induced emf is produced in it.

(2) **Construction :** The main components of ac generator are

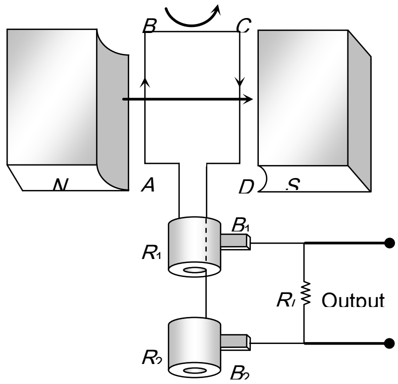

Fig. 23.24

(i) **Armature :** Armature coil (*ABCD*) consists of large number of turns of insulated copper wire wound over a soft iron core.

(ii) **Strong field magnet :** A strong permanent magnet or an electromagnet whose poles (*N* and *S*) are cylindrical in shape in a field magnet. The armature coil rotates between the pole pieces of the field magnet. The uniform magnetic field provided by the field magnet is perpendicular to the axis of rotation of the coil.

(iii) **Slip rings :** The two ends of the armature coil are connected to two brass slip rings R_1 and R_2. These rings rotate along with the armature coil.

(iv) **Brushes :** Two carbon brushes (B_1 and B_2), are pressed against the slip rings. The brushes are fixed while slip rings rotate along with the armature. These brushes are connected to the load through which the output is obtained.

(3) **Working :** When the armature coil *ABCD* rotates in the magnetic field provided by the strong field magnet, it cuts the magnetic lines of force. Thus the magnetic flux linked with the coil changes and hence induced emf is set up in the coil. The direction of the induced emf or the current in the coil is determined by the Fleming's right hand rule.

The current flows out through the brush B_1 in one direction of half of the revolution and through the brush B_2 in the next half revolution in the reverse direction. This process is repeated. Therefore, emf produced is of alternating nature.

$e = -\frac{Nd\phi}{dt} = NBA\omega \sin\omega t = e_0 \sin\omega t$ where $e_0 = NBA\omega$

$i = \frac{e}{R} = \frac{e_0}{R}\sin\omega t = i_0 \sin\omega t$ $R \rightarrow$ Resistance of the circuit

dc Generator

If the current produced by the generator is direct current, then the generator is called dc generator.

dc generator consists of (i) Armature (coil) (ii) Magnet (iii) Commutator (iv) Brushes

In dc generator commutator is used in place of slip rings. The commutator rotates along with the coil so that in every cycle when direction of '*e*' reverses, the commutator also reverses or makes contact with the other brush so that in the external load the current remains in the some direction giving dc

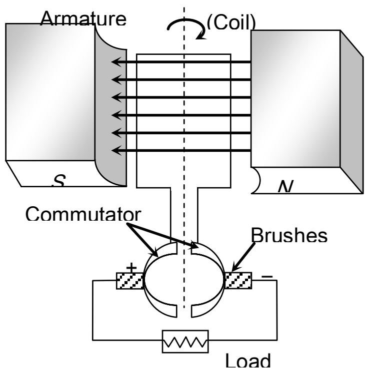

Fig. 23.25

Transformer

It is a device which raises or lowers the voltage in ac circuits through mutual induction.

It consists of two coils wound on the same core. The alternating current passing through the primary creates a continuously changing flux through the core. This changing flux induces an alternating emf in the secondary.

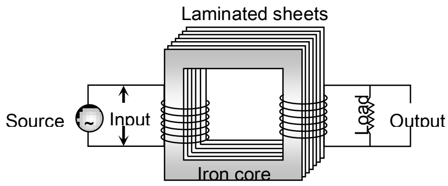

Fig. 23.26

(1) Transformer works on ac only and never on dc.

(2) It can increase or decrease either voltage or current but not both simultaneously.

(3) Transformer does not change the frequency of input ac.

(4) There is no electrical connection between the winding but they are linked magnetically.

(5) Effective resistance between primary and secondary winding is infinite.

(6) The flux per turn of each coil must be same *i.e.* $\phi_S = \phi_P$; $-\frac{d\phi_S}{dt} = -\frac{d\phi_P}{dt}$.

(7) If N_P = number of turns in primary, N_S = number of turns in secondary, V_P = applied (input) voltage to primary, V_S = Voltage across secondary (load voltage or output), e_P = induced emf in primary ; e_S = induced emf in secondary, ϕ = flux linked with primary as well as secondary, i_P = current in primary; i_S = current in secondary (or load current)

As in an ideal transformer there is no loss of power *i.e.* $P_{out} = P_{in}$ so $V_S i_S = V_P i_P$ and $V_P \approx e_P$, $V_S \approx e_S$. Hence $\frac{e_S}{e_P} = \frac{N_S}{N_P} = \frac{V_S}{V_P} = \frac{i_P}{i_S} = k$; k = Transformation ratio (or turn ratio)

Table 23.3 : Types of transformer

Step up transformer	Step down transformer
It increases voltage and decreases current 	It decreases voltage and increases current 
$V_S > V_P$	$V_S < V_P$
$N_S > N_P$	$N_S < N_P$
$E_S > E_P$	$E_S < E_P$
$i_S < i_P$	$i_S > i_P$
$R_S > R_P$	$R_S < R_P$
$t_S > t_P$	$t_S > t_P$
$k > 1$	$k < 1$

(8) **Efficiency of transformer (η) :** Efficiency is defined as the ratio of output power and input power

i.e. $\eta\% = \frac{P_{out}}{P_{in}} \times 100 = \frac{V_S i_S}{V_P i_P} \times 100$

For an ideal transformer $P_{out} = P_{in}$ so $\eta = 100\%$ (But efficiency of practical transformer lies between 70% – 90%)

For practical transformer $P_{in} = P_{out} + P_{losses}$

so $\eta = \frac{P_{out}}{P_{in}} \times 100 = \frac{P_{out}}{(P_{out} + P_L)} \times 100 = \frac{(P_{in} - P_L)}{P_{in}} \times 100$

(9) **Losses in transformer :** In transformers some power is always lost due to, heating effect, flux leakage eddy currents, hysteresis and humming.

(i) ***Cu* loss (i^2R) :** When current flows through the transformer windings some power is wasted in the form of heat $(H = i^2 Rt)$. To minimize this loss windings are made of thick *Cu* wires (To reduce resistance)

(ii) **Eddy current loss :** Some electrical power is wasted in the form of heat due to eddy currents, induced in core, to minimize this loss transformers core are laminated and silicon is added to the core material as it increases the resistivity. The material of the core is then called silicon-iron (steel).

(iii) **Hystersis loss :** The alternating current flowing through the coils magnetises and demagnetises the iron core again and again. Therefore, during each cycle of magnetisation, some energy is lost due to hysteresis. However, the loss of energy can be minimised by selecting the material of core, which has a narrow hysterisis loop. Therefore core of transformer is made of soft iron. Now a days it is made of "Permalloy" (*Fe*-22%, *Ni*-78%).

(iv) **Magnetic flux leakage :** Magnetic flux produced in the primary winding is not completely linked with secondary because few magnetic lines of force complete their path in air only. To minimize this loss secondary winding is kept inside the primary winding.

(v) **Humming losses :** Due to the passage of alternating current, the core of the transformer starts vibrating and produces humming sound. Thus, some part (may be very small) of the electrical energy is wasted in the form of humming sounds produced by the vibrating core of the transformer.

(10) **Uses of transformer :** A transformer is used in almost all ac operations *e.g.*

(i) In voltage regulators for TV, refrigerator, computer, air conditioner etc.

(ii) In the induction furnaces.

(iii) Step down transformer is used for welding purposes.

(iv) In the transmission of ac over long distance.

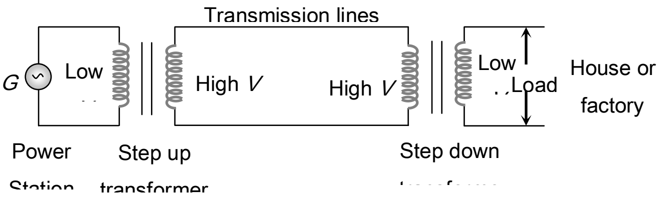

Fig. 23.27

(v) Step down and step up transformers are used in electrical power distribution.

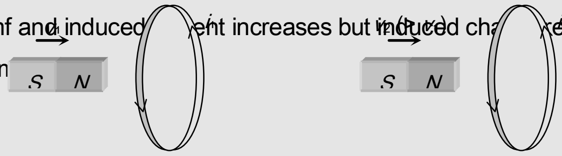
(vi) Audio frequency transformers are used in radiography, television, radio, telephone *etc.*

(vii) Radio frequency transformers are used in radio communication.

(viii) Transformers are also used in impedance matching.

Tips & Tricks

✍ If a bar magnet moves towards a fixed conducting coil, then due to the flux changes an emf, current and charge induces in the coil. If speed of magnet increases then induced emf and induced current increases but induced charge remains same.



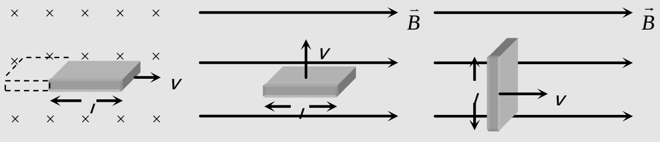
Induced parameter : e_1, i_1, q_1 $\quad$ e_2 (> e_1), i_2(> i_1), q_2 (= q_1)

✍ Can ever electric lines of force be closed curve ? Yes, when produced by a changing magnetic field.

✍ No flux cutting ⟶ No EMI

✍ Vector form of motional emf : $e = (\vec{v} \times \vec{B}).\vec{l}$

✍ In motional emf $\vec{B}, \vec{v}$ and $\vec{l}$ are three vectors. If any two vector are parallel – No flux cutting.



$\vec{v} \,||\, \vec{l}$ so $e = 0$ $\quad$ $\vec{B} \,||\, \vec{l}$ so $e = 0$ $\quad$ $\vec{v} \,||\, \vec{B}$ so $e = 0$

✍ A piece of metal and a piece of non-metal are dropped from the same height near the surface of the earth. The non-metallic piece will reach the ground first because there will be no induced current in it.

✍ If an aeroplane is landing down or taking off and its wings are in the east-west direction, then the potential difference or emf will be induced across the wings. If an aeroplane is landing down or taking off and its wings are in the north-south direction, then no potential difference or emf will be induced.

✍ When a conducting rod moving horizontally on equator of earth no emf induces because there is no vertical component of earth's magnetic field. But at poles B_V is maximum so maximum flux cutting hence emf induces.

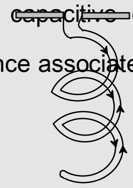
✍ When a conducting rod falling freely in earth's magnetic field such that it's length lies along East - West direction then induced emf continuously increases w.r.t. time and induced current flows from West - East.

✍ 1 *henry* = 10^9 *emu* of inductance or 10^9 *ab-henry*.

✍ Inductance at the ends of a solenoid is half of it's the inductance at the centre. $\left(L_{end} = \frac{1}{2} L_{centre}\right)$.

✍ A thin long wire made up of material of high resistivity behaves predominantly as a resistance. But it has some amount of inductance as well as capacitance in it. It is thus difficult to obtain pure resistor. Similarly it is difficult to obtain pure capacitor as well as pure inductor.

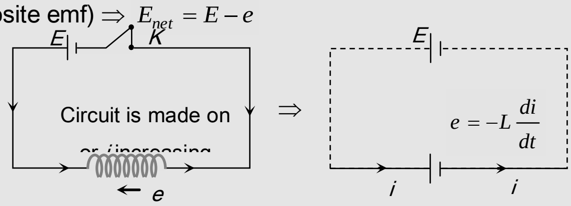
✍ Due to inherent presence of self inductance in all electrical circuits, a resistive circuit with no capacitive or inductive element in it, also has some inductance associated with it.



The effect of self-inductance can be eliminated as in the coils of a resistance box by doubling back the coil on itself.

✍ It is not possible to have mutual inductance without self inductance but it may or may not be possible self inductance without mutual inductance.

✍ If main current through a coil increases (i↑) so $\frac{di}{dt}$ will be positive (+*ve*), hence induced emf *e* will be negative (*i.e.* opposite emf) ⇒ $E_{net} = E - e$

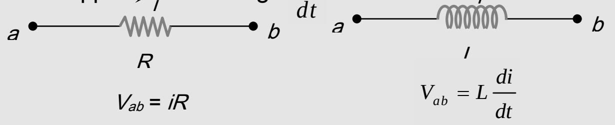


✍ Sometimes at sudden opening of key, because of high inductance of circuit a high momentarily induced emf produced and a sparking occurs at key position. To avoid sparking a capacitor is connected across the key.

✍ Sometimes at sudden opening of key, because of high inductance of circuit a high momentarily induced emf produced and a sparking occurs at key position. To avoid sparking a capacitor is connected across the key.

✍ One can have resistance with or without inductance but one can't have inductance without having resistance.

✍ The circuit behaviour of an inductor is quite different from that of a resistor. while a resistor opposes the current *i,* an inductor opposes the change $\frac{di}{dt}$ in the circuit.



✍ In *RL*-circuit with dc source the time taken by the current to reach half of the maximum value is called half life time and it is given by $T = 0.693\ \frac{L}{R}$.

✍ dc motor is a highly versatile energy conversion device. It can meet the demand of loads requiring high starting torque, high accelerating and decelerating torque.

✍ When a source of emf is connected across the two ends of the primary winding alone or across the two ends of secondary winding alone, ohm's law can be applied. But in the transformer as a whole, ohm's law should not be applied because primary winding and secondary winding are not connected electrically.

✍ Even when secondary circuit of the transformer is open it also draws some current called no load primary current for supplying no load *Cu* and iron loses.

✍ Transformer has highest possible efficiency out of all the electrical machines.

Ordinary Thinking

Objective Questions

Faraday's and Lenz's Law

1. In electromagnetic induction, the induced e.m.f. in a coil is independent of [CPMT 1984]
   (a) Change in the flux (b) Time
   (c) Resistance of the circuit (d) None of the above

2. Lenz's law is consequence of the law of conservation of [JIPMER 1997; CPMT 1990; RPMT 1997; MP PET 1999; MP PMT 2000, 03; RPET 2003; AFMC 2004]
   (a) Charge (b) Momentum
   (c) Mass (d) Energy

3. In electromagnetic induction, the induced charge in a coil is independent of
   (a) Change in the flux (b) Time
   (c) Resistance in the circuit (d) None of the above

4. The magnetic flux through a circuit of resistance R changes by an amount $\Delta\phi$ in time Δt, Then the total quantity of electric charge Q, which passing during this time through any point of the circuit is given by [Haryana CEE 1996; CBSE PMT 2004]
   (a) $Q = \frac{\Delta\phi}{\Delta t}$ (b) $Q = \frac{\Delta\phi}{\Delta t} \times R$
   (c) $Q = -\frac{\Delta\phi}{\Delta t} + R$ (d) $Q = \frac{\Delta\phi}{R}$

5. A cylindrical bar magnet is kept along the axis of a circular coil. If the magnet is rotated about its axis, then [CPMT 1983; BCECE 2004]
   (a) A current will be induced in a coil
   (b) No current will be induced in a coil
   (c) Only an e.m.f. will be induced in the coil
   (d) An e.m.f. and a current both will be induced in the coil

6. A metallic ring is attached with the wall of a room. When the north pole of a magnet is brought near to it, the induced current in the ring will be [AFMC 1993; MP PMT/PET 1998; Pb PET 2003]

   (a) First clockwise then anticlockwise
   (b) In clockwise direction
   (c) In anticlockwise direction
   (d) First anticlockwise then clockwise

7. A coil having an area A_0 is placed in a magnetic field which changes from B_0 to $4B_0$ in a time interval *t*. The e.m.f. induced in the coil will be [MP PET 1990]
   (a) $\frac{3A_0B_0}{t}$ (b) $\frac{4A_0B_0}{t}$
   (c) $\frac{3B_0}{A_0 t}$ (d) $\frac{4B_0}{A_0 t}$

8. The magnetic flux linked with a coil is given by an equation ϕ (in *webers*) = $8t^2 + 3t + 5$. The induced e.m.f. in the coil at the fourth second will be [MP PET 1990]
   (a) 16 *units* (b) 39 *units*
   (c) 67 *units* (d) 145 *units*

9. The current flowing in two coaxial coils in the same direction. On increasing the distance between the two, the electric current will
   (a) Increase
   (b) Decrease
   (c) Remain unchanged
   (d) The information is incomplete

10. A copper ring is held horizontally and a bar magnet is dropped through the ring with its length along the axis of the ring. The acceleration of the falling magnet while it is passing through the ring is [CBSE PMT 1996; MP PET 1990, 99; CPMT 1991, 99; JIPMER 1997; CPMT 2003; MP PET/PMT 2001; KCET 2001; Kerala (Engg.) 2001]
    (a) Equal to that due to gravity
    (b) Less than that due to gravity
    (c) More than that due to gravity
    (d) Depends on the diameter of the ring and the length of the magnet

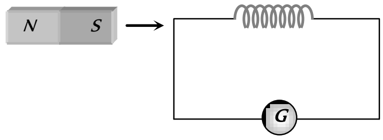
11. A square coil $10^{-2} m^2$ area is placed perpendicular to a uniform magnetic field of intensity $10^3 Wb/m^2$. The magnetic flux through the coil is [MP PMT 1990, 2001]
    (a) 10 *weber* (b) 10^{-5} *weber*
    (c) 10^5 *weber* (d) 100 *weber*

12. A magnet is brought towards a coil (i) speedly (ii) slowly then the induced e.m.f./induced charge will be respectively [RPMT 1997; MP PMT 2003]
    (a) More in first case / More in first case
    (b) More in first case/Equal in both case
    (c) Less in first case/More in second case
    (d) Less in first case/Equal in both case

13. The direction of induced e.m.f. during electromagnetic induction is given by [MP PET 1994, 96]
    (a) Faraday's law (b) Lenz's law
    (c) Maxwell's law (d) Ampere's law

14. In a coil of area $10\ cm^2$ and 10 turns with a magnetic field directed perpendicular to the plane and is changing at the rate of 10^8 *gauss/second*. The resistance of the coil is 20 *ohm*. The current in the coil will be [CPMT 1976]
    (a) 5 *amp* (b) 0.5 *amp*
    (c) 0.05 *amp* (d) 5×10^8 *amp*

15. As shown in the figure, a magnet is moved with a fast speed towards a coil at rest. Due to this induced electromotive force, induced current and induced charge in the coil is E, I and Q respectively. If the speed of the magnet is doubled, the incorrect statement is [MP PET 1995]



(a) E increases (b) I increases

(c) Q remains same (d) Q increases

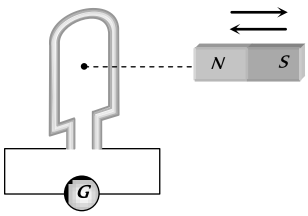
16. A coil having 500 square loops each of side 10 *cm* is placed normal to a magnetic flux which increases at the rate of 1.0 *tesla/second*. The induced e.m.f. in volts is

[CPMT 1989, 90; DCE 2002]

(a) 0.1 (b) 0.5

(c) 1 (d) 5

17. When a magnet is pushed in and out of a circular coil C connected to a very sensitive galvanometer G as shown in the adjoining diagram with a frequency ν, then



(a) Constant deflection is observed in the galvanometer

(b) Visible small oscillations will be observed in the galvanometer if ν is about 50 *Hz*

(c) Oscillations in the deflection will be observed clearly if $\nu = 1$ or 2 *Hz*

(d) No variation in the deflection will be seen if $\nu = 1$ or 2 *Hz*

18. A coil of area $100 cm^2$ has 500 turns. Magnetic field of $0.1\ weber/metre^2$ is perpendicular to the coil. The field is reduced to zero in 0.1 *second*. The induced e.m.f. in the coil is

(a) 1 *V* (b) 5 *V*

(c) 50 *V* (d) Zero

19. A 50 turns circular coil has a radius of $3\ cm$, it is kept in a magnetic field acting normal to the area of the coil. The magnetic field B increased from 0.10 *tesla* to 0.35 *tesla* in 2 *milliseconds*. The average induced e.m.f. in the coil is

[MP PET 1994]

(a) $1.77\ volts$ (b) $17.7\ volts$

(c) $177\ volts$ (d) $0.177\ volts$

20. A coil having an area $2m^2$ is placed in a magnetic field which changes from $1Wb/m^2$ to $4Wb/m^2$ in a interval of 2 *second*. The e.m.f. induced in the coil will be

[DPMT 1999; MP PET 2002]

(a) 4 *V* (b) 3 *V*

(c) 1.5 *V* (d) 2 *V*

21. A coil has 2000 turns and area of $70 cm^2$. The magnetic field perpendicular to the plane of the coil is $0.3 Wb/m^2$ and takes 0.1*sec* to rotate through 180^o. The value of the induced e.m.f. will be

[MP PET 1993; Similar to AIIMS 1997]

(a) $8.4V$ (b) $84V$

(c) $42V$ (d) $4.2V$

22. Two different loops are concentric and lie in the same plane. The current in the outer loop is clockwise and increasing with time. The induced current in the inner loop then, is

[MP PET 1993]

(a) Clockwise

(b) Zero

(c) Counter clockwise

(d) In a direction that depends on the ratio of the loop radii

23. According to Faraday's law of electromagnetic induction

[MP PET 1994]

(a) The direction of induced current is such that it opposes the cause producing it

(b) The magnitude of induced e.m.f. produced in a coil is directly proportional to the rate of change of magnetic flux

(c) The direction of induced e.m.f. is such that it opposes the cause producing it

(d) None of the above

24. The unit of magnetic flux is

[MP PMT 1994; MP PET 1995; AFMC 1998]

(a) $Weber/m^2$ (b) *Weber*

(c) *Henry* (d) *Ampere/m*

25. The north pole of a long horizontal bar magnet is being brought closer to a vertical conducting plane along the perpendicular direction. The direction of the induced current in the conducting plane will be [MP PMT 1994]

(a) Horizontal (b) Vertical

(c) Clockwise (d) Anticlockwise

26. The magnetic field in a coil of 100 turns and 40 *square cm* area is increased from 1 *Tesla* to 6 *Tesla* in 2 *second*. The magnetic field is perpendicular to the coil. The e.m.f. generated in it is [MP PMT 1991; MH CET (Med.) 1999]

(a) $10^4\ V$ (b) 1.2 *V*

(c) 1.0 *V* (d) $10^{-2}\ V$

27. The dimensions of magnetic flux are

[MP PMT 1994; CBSE PMT 1999]

(a) $MLT^{-2}A^{-2}$ (b) $ML^2T^{-2}A^{-2}$

(c) $ML^2T^{-1}A^{-2}$ (d) $ML^2T^{-2}A^{-1}$

28. Lenz's law gives [MP PMT 1994]

(a) The magnitude of the induced e.m.f.

(b) The direction of the induced current

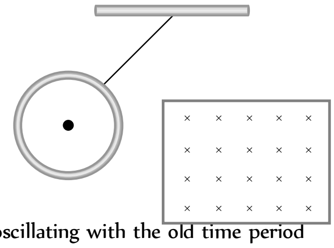
(c) Both the magnitude and direction of the induced current

(d) The magnitude of the induced current

29. The north pole of a bar magnet is moved swiftly downward towards a closed coil and then second time it is raised upwards slowly. The magnitude and direction of the induced currents in the two cases will be of [MP PET 1996]

	First case	*Second case*
(a)	Low value clockwise	Higher value anticlockwise
(b)	Low value clockwise	Equal value anticlockwise
(c)	Higher value clockwise	Low value clockwise
(d)	Higher value anticlockwise	Low value clockwise

30. A metallic ring connected to a rod oscillates freely like a pendulum. If now a magnetic field is applied in horizontal direction so that the pendulum now swings through the field, the pendulum will



(a) Keep oscillating with the old time period

(b) Keep oscillating with a smaller time period

(c) Keep oscillating with a larger time period

(d) Come to rest very soon

31. A circular coil of 500 turns of wire has an enclosed area of $0.1 m^2$ per turn. It is kept perpendicular to a magnetic field of induction 0.2 *T* and rotated by 180° about a diameter perpendicular to the field in 0.1 *sec*. How much charge will pass when the coil is connected to a galvanometer with a combined resistance of 50 *ohms*

(a) 0.2 *C* (b) 0.4 *C*

(c) 2 *C* (d) 4 *C*

32. A coil of 100 *turns* and area 5 *square centimetre* is placed in a magnetic field B = 0.2 *T*. The normal to the plane of the coil makes an angle of 60° with the direction of the magnetic field. The magnetic flux linked with the coil is

[MP PMT 1997]

(a) $5 \times 10^{-3} Wb$ (b) $5 \times 10^{-5} Wb$

(c) $10^{-2} Wb$ (d) $10^{-4} Wb$

33. In a circuit with a coil of resistance 2 *ohms*, the magnetic flux changes from 2.0 *Wb* to 10.0 *Wb* in 0.2 second. The charge that flows in the coil during this time is

[MP PMT 1997]

(a) 5.0 *coulomb* (b) 4.0 *coulomb*

(c) 1.0 *coulomb* (d) 0.8 *coulomb*

34. The direction of induced current is such that it opposes the very cause that has produced it. This is the law of

[MP PMT/PET 1998]

(a) Lenz (b) Faraday

(c) Kirchhoff (d) Fleming

35. To induce an e.m.f. in a coil, the linking magnetic flux

[KCET 1994]

(a) Must decrease

(b) Can either increase or decrease

(c) Must remain constant

(d) Must increase

36. A solenoid is 1.5 *m* long and its inner diameter is 4.0 *cm*. It has three layers of windings of 1000 turns each and carries a current of 2.0 *amperes*. The magnetic flux for a cross-section of the solenoid is nearly [AMU 1995]

(a) 2.5×10^{-7} *weber* (b) 6.31×10^{-6} *weber*

(c) 5.2×10^{-5} *weber* (d) 4.1×10^{-5} *weber*

37. A coil of 40 Ω resistance has 100 turns and radius 6 *mm* is connected to ammeter of resistance of 160 *ohms*. Coil is placed perpendicular to the magnetic field. When coil is taken out of the field, 32 μ C charge flows through it. The intensity of magnetic field will be [RPET 1997]

(a) 6.55 *T* (b) 5.66 *T*

(c) 0.655 *T* (d) 0.566 *T*

38. Faraday's laws are consequence of conservation of

[CBSE PMT 1993; BHU 2002]

(a) Energy

(b) Energy and magnetic field

(c) Charge

(d) Magnetic field

39. A magnetic field of 2×10^{-2} *T* acts at right angles to a coil of area 100 *cm* with 50 turns. The average emf induced in the coil is 0.1 *V*, when it is removed from the field in time *t*. The value of *t* is[CBSE PMT 1992; CI

(a) 0.1 *sec* (b) 0.01 *sec*

(c) 1 *sec* (d) 20 *sec*

40. The total charge induced in a conducting loop when it is moved in magnetic field depends on
[MP PET 1997]

[CBSE PMT 1992; ISM Dhanbad 1994]

(a) The rate of change of magnetic flux

(b) Initial magnetic flux only

(c) The total change in magnetic flux

(d) Final magnetic flux only

41. A rectangular coil of 20 turns and area of cross- section 25 *sq* cm has a resistance of 100 *ohm*. If a magnetic field which is perpendicular to the plane of the coil changes at the rate of 1000 *Tesla* per second, the current in the coil is

[CBSE PMT 1992;
Very Similar to MHCET 2002; DPMT 2004]

(a) 1.0 *ampere* (b) 50 *ampere*

(c) 0.5 *ampere* (d) 5.0 *ampere*

42. The north pole of a magnet is brought near a metallic ring. The direction of the induced current in the ring will be

[AIIMS 1999]

(a) Clockwise (b) Anticlockwise

(c) Towards north (d) Towards south

43. Lenz's law applies to [DCE 1999]

(a) Electrostatics

(b) Lenses

(c) Electro-magnetic induction

(d) Cinema slides

44. If a coil of metal wire is kept stationary in a non-uniform magnetic field, then [BHU 2000]

(a) An e.m.f. is induced in the coil

(b) A current is induced in the coil

(c) Neither e.m.f. nor current is induced

(d) Both e.m.f. and current is induced

45. The magnetic flux linked with a coil, in *webers*, is given by the equations $\phi = 3t^2 + 4t + 9$. Then the magnitude of induced e.m.f. at t = 2 *second* will be

[KCET 2000; CPMT 2003; MP PET 2005]

(a) 2 *volt* (b) 4 *volt*
(c) 8 *volt* (d) 16 *volt*

46. A coil has an area of 0.05 *m* and it has 800 turns. It is placed perpendicularly in a magnetic field of strength $4 \times 10^{-5}\ Wb/m^2$, it is rotated through 90^o in 0.1 *sec*. The average e.m.f. induced in the coil is **[CPMT 2001]**

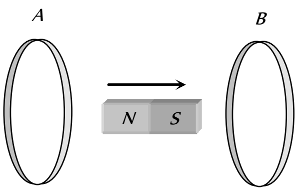
(a) 0.056 *V* (b) 0.046 *V*
(c) 0.026 *V* (d) 0.016 *V*

47. A moving conductor coil in a magnetic field produces an induced e.m.f. This is in accordance with

[AFMC 1993; MH CET 2001, 03]

(a) Amperes law (b) Coulomb law
(c) Lenz's law (d) Faraday's law

48. In the diagram shown if a bar magnet is moved along the common axis of two single turn coils *A* and *B* in the direction of arrow



(a) Current is induced only in *A* & not in *B*
(b) Induced currents in *A* & *B* are in the same direction
(c) Current is induced only in *B* and not in *A*
(d) Induced currents in *A* & *B* are in opposite directions

49. Magnetic flux ϕ (in *weber*) linked with a closed circuit of resistance 10 *ohm* varies with time *t* (in seconds) as

$$\phi = 5t^2 - 4t + 1$$

The induced electromotive force in the circuit at t = 0.2 *sec.* is

(a) 0.4 *volts* (b) – 0.4 *volts*
(c) – 2.0 *volts* (d) 2.0 *volts*

50. The formula for induced e.m.f. in a coil due to change in magnetic flux through the coil is (here *A* = area of the coil, *B* = magnetic field) **[MP PET 2002]**

(a) $e = -A.\dfrac{dB}{dt}$ (b) $e = -B.\dfrac{dA}{dt}$

(c) $e = -\dfrac{d}{dt}(A.B)$ (d) $e = -\dfrac{d}{dt}(A \times B)$

51. Lenz's law is expressed by the following formula (here *e* = induced e.m.f., ϕ = magnetic flux in one turn and *N* = number of turns)

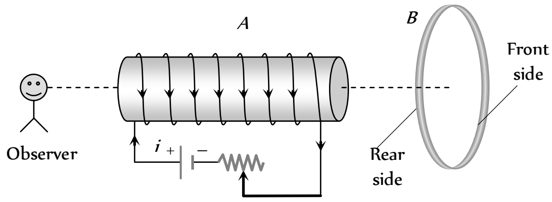
(a) $e = -\phi\dfrac{dN}{dt}$ (b) $e = -N\dfrac{d\phi}{dt}$

(c) $e = -\dfrac{d}{dt}\left(\dfrac{\phi}{N}\right)$ (d) $e = N\dfrac{d\phi}{dt}$

52. A magnet is dropped down an infinitely long vertical copper tube

(a) The magnet moves with continuously increasing velocity and ultimately acquires a constant terminal velocity
(b) The magnet moves with continuously decreasing velocity and ultimately comes to rest
(c) The magnet moves with continuously increasing velocity but constant acceleration
(d) The magnet moves with continuously increasing velocity and acceleration

53. An aluminium ring *B* faces an electromagnet *A*. The current *I* through *A* can be altered **[Kerala PET 2002]**



(a) Whether *I* increases or decreases, *B* will not experience any force
(b) If *I* decreases, *A* will repel *B* **[Kerala (Engg.) 2001]**
(c) If *I* increases, *A* will attract *B*
(d) If *I* increases, *A* will repel *B*

54. The magnetic flux linked with a coil at any instant '*t*' is given by ϕ = 5*t* – 100*t* + 300, the e.m.f. induced in the coil at *t* = 2 *second* is

(a) – 40 *V* (b) 40 *V*
(c) 140 *V* (d) 300 *V*

55. A coil has 1,000 turns and 500 *cm* as its area. The plane of the coil is placed at right angles to a magnetic induction field of $2 \times 10^{-5}\ Wb/m^2$. The coil is rotated through 180^o in 0.2 *seconds*. The average e.m.f. induced in the coil, in *milli-volts*, is

(a) 5 (b) 10
(c) 15 (d) 20

56. When a bar magnet falls through a long hollow metal cylinder fixed with its axis vertical, the final acceleration of the magnet is **[MP PMT 2001]**

(a) Equal to zero
(b) Less than *g*
(c) Equal to *g*
(d) Equal to *g* in to beginning and then more than *g*

57. The magnetic flux linked with a vector area $\vec{A}$ in a uniform magnetic field $\vec{B}$ is **[MP PET 2003]**

(a) $\vec{B} \times \vec{A}$ (b) AB

(c) $\vec{B}.\vec{A}$ **[MP PET 2002]** (d) $\dfrac{B}{A}$

58. The magnetic flux linked with a circuit of resistance 100 *ohm* increases from 10 to 60 *webers*. The amount of induced charge that flows in the circuit is (in *coulomb*)

[MP PET 2003]

(a) 0.5 (b) 5

(c) 50 (d) 100

59. A magnet *NS* is suspended from a spring and while it oscillates, the magnet moves in and out of the coil *C*. The coil is connected to a galvanometer *G*. Then as the magnet oscillates,

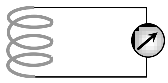
(a) *G* shows deflection to the left and right with constant amplitude

(b) *G* shows deflection on one side

(c) *G* shows no deflection.

(d) *G* shows deflection to the left and right but the amplitude steadily decreases.

60. A coil having n turns and resistance $R\,\Omega$ is connected with a galvanometer of resistance $4R\Omega$. This combination is moved in time t *seconds* from a magnetic field W_1 *weber* to W_2 *weber*. The induced current in the circuit is



(a) $-\dfrac{W_2 - W_1}{5\,Rnt}$ (b) $-\dfrac{n(W_2 - W_1)}{5\,Rt}$

(c) $-\dfrac{(W_2 - W_1)}{Rnt}$ (d) $-\dfrac{n(W_2 - W_1)}{Rt}$

61. If a copper ring is moved quickly towards south pole of a powerful stationary bar magnet, then [Pb. PMT 2004]

(a) Current flows through the copper ring

(b) Voltage in the magnet increase

(c) Current flows in the magnet

(d) Copper ring will get magnetised

62. The magnetic flux linked with coil, in weber is given by the equation, $\phi = 5t^2 + 3t + 16$. The induced emf in the coil in the fourth second is [Pb. PMT 2004]

(a) 10 *V* (b) 30 *V*

(c) 45 *V* (d) 90 *V*

63. The coil of area 0.1 m^2 has 500 turns. After placing the coil in a magnetic field of strength $4\times10^{-4}\,Wb/m^2$, if rotated through 90° in 0.1 s, the average emf induced in the coil is

[Pb. PET 2002]

(a) 0.012 *V* (b) 0.05 *V*

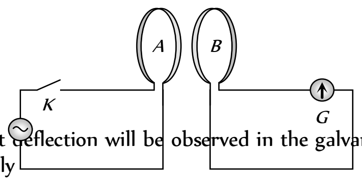
(c) 0.1 *V* (d) 0.2 *V*

64. Magnetic flux in a circuit containing a coil of resistance 2Ω changes from 2.0 *Wb* to 10 *Wb* in 0.2 *sec*. The charge passed through the coil in this time is [DPMT 2003]

(a) 0.8 *C* (b) 1.0 *C*

(c) 5.0 *C* (d) 4.0 *C*

65. The diagram below shows two coils *A* and *B* placed parallel to each other at a very small distance. Coil *A* is connected to an ac supply. *G* is a very sensitive galvanometer. When the key is closed



(a) Constant deflection will be observed in the galvanometer for 50 *Hz* supply

(b) Visible small variations will be observed in the galvanometer for 50 *Hz* input

(c) Oscillations in the galvanometer may be observed when the input ac voltage has a frequency of 1 to 2 *Hz*

(d) No variation will be observed in the galvanometer even when the input ac voltage is 1 or 2 *Hz*

66. An infinitely long cylinder is kept parallel to an uniform magnetic field B directed along positive *z* axis. The direction of induced current as seen from the *z* axis will be

[IIT-JEE (Screening) 2005]

(a) Clockwise of the +*ve z* axis

(b) Anticlockwise of the +*ve z* axis

(c) Zero

(d) Along the magnetic field

67. In a magnetic field of 0.05 *T*, area of a coil changes from $101\,cm^2$ to $100\,cm^2$ without changing the resistance which is 2Ω. The amount of charge that flow during this period is [KCET 2004]

[Orissa PMT 2005]

(a) 2.5×10^{-6} *coulomb* (b) 2×10^{-6} *coulomb*

(c) 10^{-6} *coulomb* (d) 8×10^{-6} *coulomb*

68. If a coil of 40 turns and area 4.0 cm^2 is suddenly removed from a magnetic field, it is observed that a charge of $2.0\times10^{-4}\,C$ flows into the coil. If the resistance of the coil is 80Ω, the magnetic flux density in Wb/m^2 is [AIEEE 2004] [MP PET 2005]

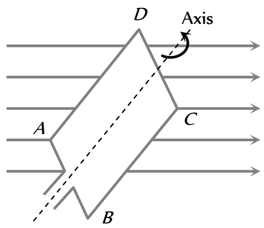
(a) 0.5 (b) 1.0

(c) 1.5 (d) 2.0

Motional EMI

1. A rectangular coil ABCD is rotated anticlockwise with a uniform angular velocity about the axis shown in diagram below. The axis of rotation of the coil as well as the magnetic field *B* are horizontal. The induced e.m.f. in the coil would be maximum when

[Haryana CEE 1996; MP PMT 1992, 94, 99]



(a) The plane of the coil is horizontal

(b) The plane of the coil makes an angle of 45° with the magnetic field

(c) The plane of the coil is at right angles to the magnetic field

(d) The plane of the coil makes an angle of 30° with the magnetic field

[CPMT 1986]

2. A 10 *metre* wire kept in east-west falling with velocity 5 *m/sec* perpendicular to the field $0.3\times10^{-4}\,Wb/m^2$. The induced e.m.f. across the terminal will be [MP PET 2000]

(a) 0.15 *V* (b) 1.5 *mV*

(c) 1.5 *V* (d) 15.0 *V*

3. An electric potential difference will be induced between the ends of the conductor shown in the diagram, when the conductor moves in the direction

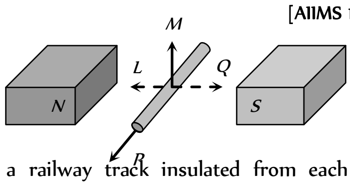
[AIIMS 1982; DPMT 2001]

(a) *P*

(b) *Q*

(c) *L*

(d) *M*



4. Two rails of a railway track insulated from each other and the ground are connected to a milli voltmeter. What is the reading of voltmeter, when a train travels with a speed of 180 *km/hr* along the track. Given that the vertical component of earth's magnetic field is $0.2 \times 10^{-4}\, weber/m^2$ and the rails are separated by 1 *metre*

[IIT 1981; KCET 2001]

(a) 10^{-2} *volt* (b) 10^{-4} *volt*

(c) 10^{-3} *volt* (d) 1 *volt*

5. A conductor of 3 *m* in length is moving perpendicularly to magnetic field of 10^{-3} *tesla* with the speed of $10^2\, m/s$, then the e.m.f. produced across the ends of conductor will be

(a) 0.03 *volt* (b) 0.3 *volt*

(c) 3×10^{-3} *volt* (d) 3 *volt*

6. When a wire loop is rotated in a magnetic field, the direction of induced e.m.f. changes once in each

[MP PMT 1991, 04]

(a) $\frac{1}{4}$ revolution (b) $\frac{1}{2}$ revolution

(c) 1 revolution (d) 2 revolution

7. An aeroplane in which the distance between the tips of wings is 50 *m* is flying horizontally with a speed of 360 *km/hr* over a place where the vertical components of earth magnetic field is $2.0 \times 10^{-4}\, weber/m^2$. The potential difference between the tips of wings would be

[CPMT 1990; MP PET 1991]

(a) 0.1 *V* (b) 1.0 *V*

(c) 0.2 *V* (d) 0.01 *V*

8. A copper disc of radius 0.1 *m* is rotated about its centre with 10 revolutions per second in a uniform magnetic field of 0.1 *Tesla* with its plane perpendicular to the field. The e.m.f. induced across the radius of disc is [MH CET (Med) 2001]

(a) $\frac{\pi}{10} V$ (b) $\frac{2\pi}{10} V$

(c) $\pi \times 10^{-2} V$ (d) $2\pi \times 10^{-2} V$

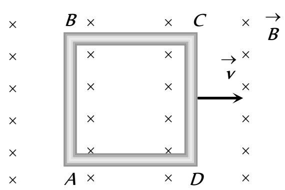
9. A metal conductor of length 1*m* rotates vertically about one of its ends at angular velocity 5 *radians per second*. If the horizontal component of earth's magnetic field is $0.2 \times 10^{-4} T$, then the e.m.f. developed between the two ends of the conductor is[MP PMT 1992; AIEEE 2004]

(a) 5 mV (b) $5 \times 10^{-4} V$

(c) 50 mV (d) 50 μV

10. A conducting square loop of side *L* and resistance *R* moves in its plane with a uniform velocity *v* perpendicular to one of its sides. A magnetic induction *B* constant in time and space, pointing perpendicular and into the plane of the loop exists everywhere. The current induced in the loop is

[IIT 1989; MP PET 1997; MP PMT 1996, 99; MP PMT 2002]



(a) $\frac{Blv}{R}$ clockwise

(b) $\frac{Blv}{R}$ anticlockwise

(c) $\frac{2Blv}{R}$ anticlockwise

(d) Zero

11. A player with 3 *m* long iron rod runs towards east with a speed of 30 *km/hr*. Horizontal component of earth's magnetic field is $4 \times 10^{-5}\, Wb/m^2$. If he is running with rod in horizontal and vertical positions, then the potential difference induced between the two ends of the rod in two cases will be

(a) Zero in vertical position and $1 \times 10^{-3} V$ in horizontal position

(b) $1 \times 10^{-3} V$ in vertical position and zero is horizontal position

(c) Zero in both cases

(d) $1 \times 10^{-3} V$ in both cases

12. A coil of area 80 *square cm* and 50 turns is rotating with 2000 *revolutions per minute* about an axis perpendicular to a magnetic field of 0.05 *Tesla*. The maximum value of the e.m.f. developed in it is [MP PET 1996] [MP PMT 1994]

(a) 200π *volt* (b) $\frac{10\pi}{3}$ *volt*

(c) $\frac{4\pi}{3}$ *volt* (d) $\frac{2}{3}$ *volt*

13. A conducting rod of length *l* is falling with a velocity *v* perpendicular to a uniform horizontal magnetic field *B*. The potential difference between its two ends will be

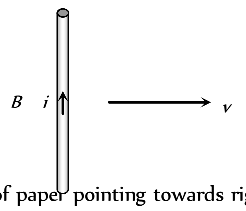
[MP PMT 1994]

(a) 2*Blv* (b) *Blv*

(c) $\frac{1}{2} Blv$ (d) $B^2 l^2 v^2$

14. A conducting wire is moving towards right in a magnetic field *B*. The direction of induced current in the wire is shown in the figure. The direction of magnetic field will be

[MP PET 1995]



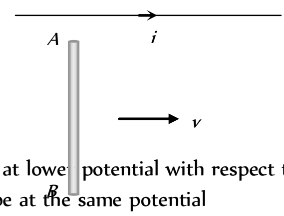
(a) In the plane of paper pointing towards right

(b) In the plane of paper pointing towards left

(c) Perpendicular to the plane of paper and down-wards

(d) Perpendicular to the plane of paper and upwards

15. The current carrying wire and the rod *AB* are in the same plane. The rod moves parallel to the wire with a velocity *v*. Which one of the following statements is true about induced emf in the rod



(a) End *A* will be at lower potential with respect to *B*

(b) *A* and *B* will be at the same potential

(c) There will be no induced e.m.f. in the rod

(d) Potential at *A* will be higher than that at *B*

16. A long horizontal metallic rod with length along the east-west direction is falling under gravity. The potential difference between its two ends will [MP PMT 1997]

(a) Be zero (b) Be constant

(c) Increase with time (d) Decrease with time

17. A two metre wire is moving with a velocity of 1 m/*sec* perpendicular to a magnetic field of 0.5 *weber*/*m*. The e.m.f. induced in it will be

[MP PMT/PET 1998; Pb PET 2003]

(a) 0.5 *volt* (b) 0.1 *volt*

(c) 1 *volt* (d) 2 *volt*

18. A metal rod moves at a constant velocity in a direction perpendicular to its length. A constant uniform magnetic field exists in space in a direction perpendicular to the rod as well as its velocity. Select the correct statement(s) from the following

(a) The entire rod is at the same electric potential

(b) There is an electric field in the rod

(c) The electric potential is highest at the centre of the rod and decreases towards its ends

(d) The electric potential is lowest at the centre of the rod and increases towards its ends

19. A conducting wire is dropped along east-west direction, then [RPMT 1997]

(a) No emf is induced

(b) No induced current flows

(c) Induced current flows from west to east

(d) Induced current flows from east to west

20. The magnetic induction in the region between the pole faces of an electromagnet is 0.7 *weber/m*. The induced e.m.f. in a straight conductor 10 *cm* long, perpendicular to *B* and moving perpendicular both to magnetic induction and its own length with a velocity 2 *m/sec* is [AMU (Med.) 1999]

(a) 0.08 *V* (b) 0.14 *V*

(c) 0.35 *V* (d) 0.07 *V*

21. A straight conductor of length 0.4 *m* is moved with a speed of 7 *m/s* perpendicular to the magnetic field of intensity of 0.9 *Wb/m*. The induced e.m.f. across the conductor will be [MH CET (Med.) 1999]

(a) 7.25 *V* (b) 3.75 *V*

(c) 1.25 *V* (d) 2.52 *V*

22. A coil of *N* turns and mean cross-sectional area *A* is rotating with uniform angular velocity ω about an axis at right angle to uniform magnetic field *B*. The induced e.m.f. *E* in the coil will be

(a) $NBA \sin\omega t$ (b) $NB\,\omega \sin\omega t$

(c) $NB/A \sin\omega t$ (d) $NBA\,\omega \sin\omega t$

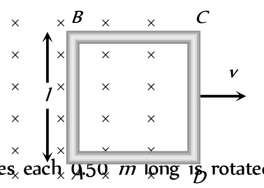
23. A conducting square loop of side *l* and resistance *R* moves in its plane with a uniform velocity *v* perpendicular to one of its sides. A magnetic induction *B* constant in time and space, pointing perpendicular and into the plane at the loop exists everywhere with half the loop outside the field, as shown in figure. The induced e.m.f. is [AIEEE 2002]

(a) Zero

(b) *RvB*

(c) *VBl/R*

(d) *VBl*



24. A wheel with ten metallic spokes each 0.50 *m* long is rotated with a speed of 120 *rev/min* in a plane normal to the earth's magnetic field at the place. If the magnitude of the field is 0.4 Gauss, the induced e.m.f. between the axle and the rim of the wheel is equal to

(a) $1.256 \times 10^{-3}\ V$ (b) $6.28 \times 10^{-4}\ V$

(c) $1.256 \times 10^{-4}\ V$ (d) $6.28 \times 10^{-5}\ V$

25. A metal rod of length 2 *m* is rotating with an angular velocity of 100 *rad/sec* in a plane perpendicular to a uniform magnetic field of 0.3 *T*. The potential difference between the ends of the rod is

(a) 30 *V* (b) 40 *V*

(c) 60 *V* (d) 600 *V*

26. The wing span of an aeroplane is 20 *metre*. It is flying in a field, where the vertical component of magnetic field of earth is 5 × 10 *tesla*, with velocity 360 *km/h*. The potential difference produced between the blades will be [CPMT 2003]

(a) 0.10 *V* (b) 0.15 *V*

(c) 0.20 *V* (d) 0.30 *V*

27. A horizontal straight conductor kept in north-south direction falls under gravity, then [MP PMT 2003]

(a) A current will be induced from South to North

(b) A current will be induced from North to South

(c) No induce e.m.f. along the length of conductor

(d) An induced e.m.f. is generated along the length of conductor

28. A rectangular coil of 300 turns has an average area of average area of $25\,cm \times 10\,cm$. The coil rotates with a speed of 50 *cps* in a uniform magnetic field of strength $4 \times 10^{-2}\,T$ about an axis perpendicular of the field. The peak value of the induced e.m.f. is (in volt) [KCET 2004]

(a) 3000π (b) 300π

(c) 30π (d) 3π

29. A rod of length 20 *cm* is rotating with angular speed of 100 rps in a magnetic field of strength 0.5 *T* about it's one end. What is the potential difference between two ends of the rod [Orissa PMT 2004]

(a) 2.28 *V* (b) 4.28 *V*

(c) 6.28 *V* (d) 2.5 *V*

30. A circular metal plate of radius *R* is rotating with a uniform angular velocity ω with its plane perpendicular to a uniform magnetic field *B*. Then the emf developed between the centre and the rim of the plate is [UPSEAT 2004]

(a) $\pi\omega BR^2$ (b) ωBR^2

(c) $\pi\omega BR^2/2$ [MP PMT 2002] (d) $\omega BR^2/2$

31. A circular coil of mean radius of 7 *cm* and having 4000 turns is rotated at the rate of 1800 revolutions per minute in the earth's magnetic field (*B* = 0.5 gauss), the maximum e.m.f. induced in coil will be [Pb. PMT 2003]

(a) 1.158 *V* (b) 0.58 *V*

(c) 0.29 *V* (d) 5.8 *V*

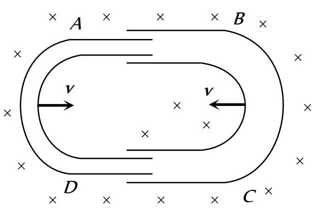
32. One conducting *U* tube can slide inside another as shown in figure, maintaining electrical contacts between the tubes. The magnetic field *B* is perpendicular to the plane of the figure. If each tube moves towards the other at a constant sped *v* then the emf induced in the circuit in terms of *B, l* and *v* where *l* is the width of each tube, will be [AIEEE 2005]

(a) Zero

(b) $2\,Blv$

(c) Blv [AMU (Med.) 2002]

(d) $-Blv$



33. The magnitude of the earth's magnetic field at a place is B_0 and the angle of dip is δ. A horizontal conductor of length *l* lying along the magnetic north-south moves eastwards with a velocity *v*. The emf induced across the conductor is [MP PET 2003] [Kerala PET 2005]

(a) Zero (b) $B_0 l v \sin\delta$

(c) $B_0 l v$ (d) $B_0 l v \cos\delta$

Static EMI

1. The back e.m.f. induced in a coil, when current changes from 1 ampere to zero in one *milli-second*, is 4 *volts*, the self inductance of the coil is [MP PET/PMT 1988]

(a) 1 *H* (b) 4 *H*

(c) 10^{-3} *H* (d) 4×10^{-3} *H*

2. An e.m.f. of 5 *volt* is produced by a self inductance, when the current changes at a steady rate from 3 *A* to 2 *A* in 1 millisecond. The value of self inductance is

[CPMT 1982; MP PMT 1991; CBSE PMT 1993; AFMC 2002]

(a) Zero (b) 5 *H*

(c) 5000 *H* (d) 5 *mH*

3. A 50 *mH* coil carries a current of 2 *ampere*. The energy stored in joules is [MP PET/PMT 1988; MP PET 2005]

(a) 1 (b) 0.1

(c) 0.05 (d) 0.5

4. The current passing through a choke coil of 5 henry is decreasing at the rate of 2 *ampere/sec*. The e.m.f. developing across the coil is

[CPMT 1982; MP PMT 1990; AIIMS 1997; MP PET 1999]

(a) 10 *V* (b) – 10 *V*

(c) 2.5 *V* (d) – 2.5 *V*

5. Average energy stored in a pure inductance *L* when a current *i* flows through it, is [MP PET/PMT 1988]

(a) Li^2 (b) $2Li^2$

(c) $\frac{Li^2}{4}$ (d) $\frac{Li^2}{2}$

6. A solenoid has 2000 turns wound over a length of 0.30 *metre*. The area of its cross-section is $1.2\times10^{-3}m^2$. Around its central section, a coil of 300 turns is wound. If an initial current of 2 A in the solenoid is reversed in 0.25 *sec*, then the e.m.f. induced in the coil is

[NCERT 1982; MP PMT 2003]

(a) $6\times10^{-4}V$ (b) $4.8\times10^{-3}V$

(c) $6\times10^{-2}V$ (d) 48 *mV*

7. A coil is wound as a transformer of rectangular cross-section. If all the linear dimensions of the transformer are increased by a factor 2 and the number of turns per unit length of the coil remain the same, the self inductance increased by a factor of

(a) 16 (b) 12

(c) 8 (d) 4

8. Two coils of self inductance L_1 and L_2 are placed closer to each other so that total flux in one coil is completely linked with other. If M is mutual inductance between them, then

[DCE 2002]

(a) $M = L_1L_2$ (b) $M = L_1/L_2$

(c) $M=\sqrt{L_1L_2}$ (d) $M=(L_1L_2)^2$

9. The equivalent quantity of mass in electricity is

(a) Charge (b) Potential

(c) Inductance (d) Current

10. The momentum in mechanics is expressed as $m\times v$. The analogous expression in electricity is [MP PMT 2003]

(a) $I\times Q$ (b) $I\times V$

(c) $L\times I$ (d) $L\times Q$

11. In what form is the energy stored in an inductor or

A coil of inductance *L* is carrying a steady current *i*. What is the nature of its stored energy [CBSE PMT 1990, 92;

MP PMT 1996, 2000, 02; Kerala PMT 2002]

(a) Magnetic

(b) Electrical

(c) Both magnetic and electrical

(d) Heat

12. The coefficient of self inductance of a solenoid is 0.18 *mH*. If a crode of soft iron of relative permeability 900 is inserted, then the coefficient of self inductance will become nearly

(a) 5.4 *mH* (b) 162 *mH*

(c) 0.006 *mH* (d) 0.0002 *mH*

13. In a transformer, the coefficient of mutual inductance between the primary and the secondary coil is 0.2 *henry*. When the current changes by 5 *ampere/second* in the primary, the induced e.m.f. in the secondary will be

[MP PMT 1989]

(a) 5 *V* (b) 1 *V*

(c) 25 *V* (d) 10 *V*

14. When the current in a coil changes from 8 *ampere* to 2 *ampere* in 3×10^{-2} *second*, the e.m.f. induced in the coil is $2\ volt$. The self inductance of the coil (in *millihenry*) is

[MNR 1991; UP SEAT 2000; Pb PET 2004]

(a) 1 (b) 5

(c) 20 (d) 10

15. The mutual inductance between two coils is 1.25 *henry*. If the current in the primary changes at the rate of 80 *ampere/second*, then the induced e.m.f. in the secondary is

[MP PET 1990]

(a) 12.5 *V* (b) 64.0 *V*

(c) 0.016 *V* (d) 100.0 *V*

16. A coil of wire of a certain radius has 600 turns and a self inductance of 108 *mH*. The self inductance of a 2nd similar coil of 500 turns will be [MP PMT 1990]

(a) 74 *mH* (b) 75 *mH*

(c) 76 *mH* (d) 77 *mH*

[AIIMS 1980]

17. When the number of turns in a coil is doubled without any change in the length of the coil, its self inductance becomes

[MP PMT 1986; CBSE PMT 1992; Pb PET 2000]

(a) Four times (b) Doubled

(c) Halved (d) Unchanged

18. The average e.m.f. induced in a coil in which the current changes from 2 *ampere* to 4 *ampere* in 0.05 *second* is 8 *volt*. What is the self inductance of the coil ?

[NCERT 1984; CPMT 1997; MP PMT 1999, 2003;

UPSEAT 2000; RPMT 2000; Pb. PMT 2002; RPET 2003;

DPMT 2005]

(a) 0.1 *H* (b) 0.2 *H*

(c) 0.4 *H* (d) 0.8 *H*

19. If a current of 3.0 *amperes* flowing in the primary coil is reduced to zero in 0.001 *second*, then the induced e.m.f. in the secondary coil is 15000 *volts*. The mutual inductance between the two coils is

(a) 0.5 *henry* (b) 5 *henry*

(c) 1.5 *henry* (d) 10 *henry*

20. An e.m.f. of 12 *volts* is induced in a given coil when the current in it changes at the rate of 48 *amperes per minute*. The self inductance of the coil is [MP PMT 2000]

(a) 0.25 *henry* (b) 15 *henry*
(c) 1.5 *henry* (d) 9.6 *henry*

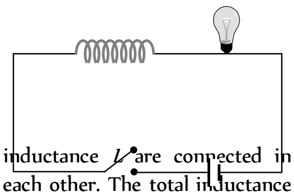
21. A closely wound coil of 100 turns and area of cross-section $1\ cm^2$ has a coefficient of self-induction 1 *mH*. The magnetic induction in the centre of the core of the coil when a current of $2A$ flows in it, will be [MP PET 1992]

(a) $0.022\ Wbm^{-2}$ (b) $0.4\ Wb\,m^{-2}$
(c) $0.8\ Wb\,m^{-2}$ (d) $1\ Wb\,m^{-2}$

22. Two circuits have coefficient of mutual induction of 0.09 *henry*. Average e.m.f. induced in the secondary by a change of current from 0 to 20 *ampere* in 0.006 *second* in the primary will be

(a) 120 *V* (b) 80 *V*
(c) 200 *V* (d) 300 *V*

23. In the following circuit, the bulb will become suddenly bright if



(a) Contact is made or broken
(b) Contact is made
(c) Contact is broken
(d) Won't become bright at all

24. Two pure inductors each of self inductance *L* are connected in parallel but are well separated from each other. The total inductance is

[MP PET 1991; Pb. PMT 1999; BHU 1998, 05]

(a) $2L$ (b) L
(c) $\frac{L}{2}$ (d) $\frac{L}{4}$

25. A coil and a bulb are connected in series with a dc source, a soft iron core is then inserted in the coil. Then

[MP PMT 1990; RPET 2001]

(a) Intensity of the bulb remains the same
(b) Intensity of the bulb decreases
(c) Intensity of the bulb increases
(d) The bulb ceases to glow

26. Self induction of a solenoid is [MP PMT 1993]

(a) Directly proportional to current flowing through the coil
(b) Directly proportional to its length
(c) Directly proportional to area of cross-section
(d) Inversely proportional to area of cross-section

27. Mutual inductance of two coils can be increased by

[MP PET 1994]

(a) Decreasing the number of turns in the coils
(b) Increasing the number of turns in the coils
(c) Winding the coils on wooden core
(d) None of the above

28. The self inductance of a coil is 5 *henry*, a current of 1 *amp* change to 2 *amp* within 5 *second* through the coil. The value of induced e.m.f. will be [MP PET 1994;

Similar MP PET/PMT 1998; CBSE PMT 1990]

(a) 10 *volt* (b) 0.10 *volt*
(c) 1.0 *volt* (d) 100 *volt*

29. The unit of inductance is [MP PMT 1994, 95;

MP PET 1997; MP PMT/PET 1998; RPET 2001]

(a) *Volt/ampere* (b) *Joule/ampere*
(c) *Volt-sec/ampere* (d) *Volt-ampere/sec*

30. The current flowing in a coil of self inductance 0.4 *mH* is increased by 250 *mA* in 0.1 *sec*. The e.m.f. induced will be

[MP PMT 1994]

(a) + 1 *V* (b) – 1 *V*
(c) + 1 *mV* (d) – 1 *mV*

31. 5 *cm* long solenoid having 10 *ohm* resistance and 5 *mH* inductance is joined to a 10 *volt* battery. At steady state the current through the solenoid in *ampere* will be

[MP PET 1995]

(a) 5 (b) 1
(c) 2 (d) Zero

32. When current in a coil changes to 2 *ampere* from 8 *ampere* in [MP PET 1992] $3\times10^{-3}\ second$, the e.m.f. induced in the coil is 2 *volt*. The self inductance of the coil in *millihenry* is

[MP PET 1995]

[CBSE PMT 1989]

(a) 1 (b) 5
(c) 20 (d) 10

33. An ideal coil of 10 *henry* is joined in series with a resistance of 5 *ohm* and a battery of 5 *volt*. 2 second after joining, the current flowing in *ampere* in the circuit will be

[MP PET 1995]

(a) e^{-1} (b) $(1-e^{-1})$
(c) $(1-e)$ (d) e

34. The number of turns of primary and secondary coils of a transformer are 5 and 10 respectively and the mutual inductance of the transformer is 25 *henry*. Now the number of turns in the primary and secondary of the transformer are made 10 and 5 respectively. The mutual inductance of the transformer in *henry* will be [MP PET 1995]

(a) 6.25 (b) 12.5
(c) 25 (d) 50

35. The inductance of a coil is $60\ \mu H$. A current in this coil increases from 1.0 *A* to 1.5 *A* in 0.1 *second*. The magnitude of the induced e.m.f. is [MP PMT 1995]

(a) $60\times10^{-6}\ V$ (b) $300\times10^{-4}\ V$
(c) $30\times10^{-4}\ V$ (d) $3\times10^{-4}\ V$

36. A circular coil of radius 5 *cm* has 500 turns of a wire. The approximate value of the coefficient of self induction of the coil will be [MP PET 1996; Pb PET 2000]

(a) 25 *millihenry* (b) 25×10^{-3} *millihenry*
(c) 50×10^{-3} *millihenry* (d) 50×10^{-3} *henry*

37. An e.m.f. of 100 *millivolts* is induced in a coil when the current in another nearby coil becomes 10 *ampere* from zero in 0.1 *second*. The coefficient of mutual induction between the two coils will be

[MP PET 1996; Kerala PMT 2004]

(a) 1 *millihenry* (b) 10 *millihenry*
(c) 100 *millihenry* (d) 1000 *millihenry*

38. In a coil of self inductance 0.5 *henry*, the current varies at a constant rate from zero to 10 *amperes* in 2 *seconds*. The e.m.f. generated in the coil is [MP PMT 1996]

(a) 10 *volts* (b) 5 *volts*
(c) 2.5 *volts* (d) 1.25 *volts*

39. A coil of self inductance 50 *henry* is joined to the terminals of a battery of e.m.f. 2 *volts* through a resistance of 10 *ohm* and a steady current is flowing through the circuit. If the battery is now disconnected, the time in which the current will decay to 1/*e* of its steady value is [MP PMT 1996]

(a) 500 *seconds* (b) 50 *seconds*

(c) 5 *seconds* (d) 0.5 *seconds*

40. The self inductance of a solenoid of length *L*, area of cross-section *A* and having *N* turns is [MP PET 1997; MP PET 2003]

(a) $\frac{\mu_0 N^2 A}{L}$ (b) $\frac{\mu_0 NA}{L}$

(c) $\mu_0 N^2 LA$ (d) $\mu_0 NAL$

41. The self inductance of a coil is *L*. Keeping the length and area same, the number of turns in the coil is increased to four times. The self inductance of the coil will now be [MP PMT 1997]

(a) $\frac{1}{4}L$ (b) *L*

(c) 4 *L* (d) 16 *L*

42. The mutual inductance between a primary and secondary circuits is 0.5 *H*. The resistances of the primary and the secondary circuits are 20 *ohms* and 5 *ohms* respectively. To generate a current of 0.4 *A* in the secondary, current in the primary must be changed at the rate of [MP PMT 1997]

(a) 4.0 *A/s* (b) 16.0 *A/s*

(c) 1.6 *A/s* (d) 8.0 *A/s*

43. The energy stored in a 50 *mH* inductor carrying a current of 4 *A* will be [MP PET 1999]

(a) 0.4 *J* (b) 4.0 *J*

(c) 0.8 *J* (d) 0.04 *J*

44. The average e.m.f. induced in a coil in which a current changes from 0 to 2 *A* in 0.05 *s* is 8 *V*. The self inductance of the coil is

(a) 0.1 *H* (b) 0.2 *H*

(c) 0.4 *H* (d) 0.8 *H*

45. If the current is halved in a coil, then the energy stored is how much times the previous value [CPMT 1999]

(a) $\frac{1}{2}$ (b) $\frac{1}{4}$

(c) 2 (d) 4

46. The SI unit of inductance, the henry, can be written as [IIT JEE 1998]

(a) *Weber/ampere* (b) *Volt-second/ampere*

(c) *Joule/(ampere)* (d) *Ohm-second*

47. A varying current in a coil changes from 10 *amp* to zero in 0.5 *sec*. If average EMF is induced in the coil is 220 *volts*, the self inductance of coil is [EAMCET 1994; MH CET (Med.) 1999]

(a) 5 *H* (b) 10 *H*

(c) 11 *H* (d) 12 *H*

48. Which of the following is wrong statement [AMU 1995]

(a) An emf can be induced between the ends of a straight conductor by moving it through a uniform magnetic field

(b) The self induced emf produced by changing current in a coil always tends to decrease the current

(c) Inserting an iron core in a coil increases its coefficient of self induction

(d) According to Lenz's law, the direction of the induced current is such that it opposes the flux change that causes it

49. A coil has an inductance of 2.5 *H* and a resistance of 0.5 *r*. If the coil is suddenly connected across a 6.0 *volt* battery, then the time required for the current to rise 0.63 of its final value is

(a) 3.5 *sec* (b) 4.0 *sec*

(c) 4.5 *sec* (d) 5.0 *sec*

50. When the number of turns and the length of the solenoid are doubled keeping the area of cross-section same, the inductance [CBSE PMT 1993

(a) Remains the same (b) Is halved

(c) Is doubled (d) Becomes four times

51. A 100 *mH* coil carries a current of 1 *ampere*. Energy stored in its magnetic field is [CBSE PMT 1992; KCET 1998]

(a) 0.5 *J* (b) 1 *J*

(c) 0.05 *J* (d) 0.1 *J*

52. The mutual inductance of an induction coil is $5H$. In the primary coil, the current reduces from $5A$ to zero in $10^{-3}s$. What is the induced emf in the secondary coil [RPET 1996]

(a) $2500V$ (b) 25000 *V*

(c) 2510 *V* (d) Zero

53. The self inductance of a straight conductor is [KCET 1998]

(a) Zero (b) Very large

(c) Infinity (d) Very small

54. What is the coefficient of mutual inductance when the magnetic flux changes by $2\times10^{-2}Wb$ and change in current is 0.01*A*[BHU 1998; AIIMS 2002]

(a) 2 *henry* (b) 3 *henry*

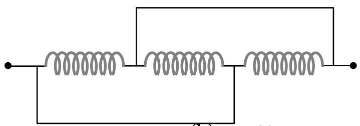
(c) $\frac{1}{2}$ *henry* (d) Zero

55. The current in a coil changes from 4 *ampere* to zero in 0.1 *s*. If the average e.m.f. induced is 100 *volt*, what is the self inductance of the coil [CPMT 1999] [MNR 1998]

(a) 2.5 *H* (b) 25 *H*

(c) 400 *H* (d) 40 *H*

56. Pure inductance of 3.0 *H* is connected as shown below. The equivalent inductance of the circuit is [MNR 1998; AIEEE 2002]



(a) 1 *H* (b) 2 *H*

(c) 3 *H* (d) 9 *H*

57. A varying current at the rate of 3 *A/s* in a coil generates an e.m.f. of 8 *mV* in a nearby coil. The mutual inductance of the two coils is

(a) 2.66 *mH* (b) $2.66\times10^{-3}\,mH$

(c) 2.66 *H* (d) 0.266 *H*

58. If a current of 10 *A* flows in one second through a coil, and the induced e.m.f. is 10 *V*, then the self-inductance of the coil is [CPMT 2000; Pb. PM

(a) $\frac{2}{5}H$ (b) $\frac{4}{5}H$

(c) $\frac{5}{4}H$ (d) 1 *H*

59. The inductance of a closed-packed coil of 400 turns is 8 *mH*. A current of 5 *mA* is passed through it. The magnetic flux through each turn of the coil is [Roorkee 2000]

(a) $\frac{1}{4\pi}\mu_0 Wb$ (b) $\frac{1}{2\pi}\mu Wb$

(c) $\frac{1}{3\pi}\mu_0 Wb$ [AMU 1995] (d) $0.4\,\mu_0 Wb$

60. When the current through a solenoid increases at a constant rate, the induced current [UPSEAT 2000]

(a) Is constant and is in the direction of the inducing current

(b) Is a constant and is opposite to the direction of the inducing current

(c) Increases with time and is in the direction of the inducing current

(d) Increases with time and opposite to the direction of the inducing current

61. If in a coil rate of change of area is 5 *m/milli second* and current become 1 *amp* from 2 *amp* in 2×10^{-3} *sec*. If magnitude of field is 1 *tesla* then self inductance of the coil is [RPET 2000]

(a) 2 *H* (b) 5 *H*

(c) 20 *H* (d) 10 *H*

62. The inductance of a solenoid 0.5 *m* long of cross-sectional area 20 *cm* and with 500 turns is [AMU (Med.) 2000]

(a) 12.5 *mH* (b) 1.25 *mH*

(c) 15.0 *mH* (d) 0.12 *mH*

63. The equivalent inductance of two inductances is 2.4 *henry* when connected in parallel and 10 *henry* when connected in series. The difference between the two inductances is [MP PMT 2000]

(a) 2 *henry* (b) 3 *henry*

(c) 4 *henry* (d) 5 *henry*

64. An e.m.f. of 12 *volt* is produced in a coil when the current in it changes at the rate of 45 *amp/minute*. The inductance of the coil is

(a) 0.25 *henry* (b) 1.5 *henry*

(c) 9.6 *henry* (d) 16.0 *henry*

65. An average induced e.m.f. of 1*V* appears in a coil when the current in it is changed from 10*A* in one direction to 10 *A* in opposite direction in 0.5 *sec*. Self-inductance of the coil is [CPMT 2001]

(a) 25 *mH* (b) 50 *mH*

(c) 75 *mH* (d) 100 *mH*

66. A coil of resistance 10 Ω and an inductance 5*H* is connected to a 100 *volt* battery. Then energy stored in the coil is [Pb. PMT 2001; CPMT 2002]

(a) 125 *erg* (b) 125 *J*

(c) 250 *erg* (d) 250 *J*

67. If a change in current of 0.01 *A* in one coil produces a change in magnetic flux of $1.2\times10^{-2}Wb$ in the other coil, then the mutual inductance of the two coils in henries is [EAMCET 2001]

(a) 0 (b) 0.5

(c) 1.2 (d) 3

68. Energy stored in a coil of self inductance 40*mH* carrying a steady current of 2 *A* is [Kerala (Engg.) 2001]

(a) 0.8 *J* (b) 8 *J*

(c) 0.08 *J* (d) 80 *J*

69. A solenoid of length *l metre* has self-inductance *L* henry. If number of turns are doubled, its self inductance [MP PMT 2001]

(a) Remains same (b) Becomes 2*L* henry

(c) Becomes 4*L henry* (d) Becomes $\frac{L}{\sqrt{2}}$ *henry*

70. Two coils *A* and *B* having turns 300 and 600 respectively are placed near each other, on passing a current of 3.0 *ampere* in *A*, the flux linked with *A* is 1.2×10^{-4} *weber* and with *B* it is 9.0×10^{-5} *weber*. The mutual inductance of the system is

(a) 2×10^{-5} *henry* (b) 3×10^{-5} *henry*

(c) 4×10^{-5} *henry* (d) 6×10^{-5} *henry*

71. In a circular conducting coil, when current increases from 2 *A* to 18 *A* in 0.05 *sec*., the induced e.m.f. is 20 *V*. The self inductance of the coil is [MP PET 2001]

(a) 62.5 *mH* (b) 6.25 *mH*

(c) 50 *mH* (d) None of these

72. Find out the e.m.f. produced when the current changes from 0 to 1 *A* in 10 *second*, given *L* = 10 *μH* [DCE 2001]

(a) 1 *V* (b) 1 *μV*

(c) 1 *mV* (d) 0.1 *V*

73. Which of the following is not the unit of self inductance [AMU (Med.) 2001]

(a) *Weber/Ampere* (b) *Ohm-Second*

(c) *Joule-Ampere* (d) *Joule Ampere*$^{-2}$

74. A coil of 100 turns carries a current of 5 *mA* and creates a magnetic flux of 10^{-5} *weber*. the inductance is [Orissa JEE 2002]

(a) 0.2 *mH* (b) 2.0 *mH*

(c) 0.02 *mH* [MP PET 2000] (d) None of these

75. In circular coil, when no. of turns is doubled and resistance becomes $\frac{1}{4}th$ of initial, then inductance becomes [AIEEE 2002]

(a) 4 *times* (b) 2 *times*

(c) 8 *times* (d) No change

76. The current in a coil of inductance 5 *H* decreases at the rate of 2 *A/s*. The induced e.m.f. is [MH CET 2002]

(a) 2 *V* (b) 5 *V*

(c) 10 *V* (d) – 10 *V*

77. The self-induced e.m.f. in a 0.1 *H* coil when the current in it is changing at the rate of 200 *ampere/second* is [DPMT 2002]

(a) 8×10^{-4} *V* (b) 8×10^{-5} *V*

(c) 20 *V* (d) 125 *V*

78. Two circuits have mutual inductance of 0.1 *H*. What average e.m.f. is induced in one circuit when the current in the other circuit changes from 0 to 20 *A* in 0.02 *s* [Kerala PET 2002]

(a) 240 *V* (b) 230 *V*

(c) 100 *V* (d) 300 *V*

79. An air core solenoid has 1000 turns and is one *metre* long. Its cross-sectional area is 10 *cm*. Its self inductance is [JIPMER 2002]

(a) 0.1256 *mH* (b) 12.56 *mH*

(c) 1.256 *mH* (d) 125.6 *mH*

80. The coefficient of mutual inductance of two coils is 6 *mH*. If the current flowing in one is 2 *ampere*, then the induced e.m.f. in the second coil will be [BVP 2003]

(a) 3 *mV* (b) 2 *mV*

(c) 3 *V* (d) Zero

81. An L-R circuit has a cell of e.m.f. E, which is switched on at time t = 0. The current in the circuit after a long time will be [MP PET 2003]

(a) Zero (b) $\frac{E}{R}$

(c) $\frac{E}{L}$ (d) $\frac{E}{\sqrt{L^2+R^2}}$

82. Two coils are placed close to each other. The mutual inductance of the pair of coils depends upon [AIEEE 2003]

(a) The currents in the two coils

(b) The rates at which currents are changing in the two coils

(c) Relative position and orientation of the two coils

(d) The materials of the wires of the coils

83. When the current change from + 2A to – 2A in 0.05 *second*, an e.m.f. of 8 V is induced in a coil. The coefficient of self-induction of the coil is [AIEEE 2003]

(a) 0.1 H (b) 0.2 H

(c) 0.4 H (d) 0.8 H

84. A coil resistance 20Ω and inductance 5H is connected with a 100 V battery. Energy stored in the coil will be [MP PMT 2003]

(a) 41.5 J (b) 62.50 J

(c) 125 J (d) 250 J

85. Why the current does not rise immediately in a circuit containing inductance [EAMCET 1994]

(a) Because of induced emf

(b) Because of high voltage drop

(c) Because of low power consumption

(d) Because of Joule heating

86. Two circular coils have their centres at the same point. The mutual inductance between them will be maximum when their axes

(a) Are parallel to each other

(b) Are at 60° to each other

(c) Are at 45° to each other

(d) Are perpendicular to each other

87. The current in a coil decreases from 1 A to 0.2 A. In 10*sec*. Calculate the coefficient of self inductance. If induced emf is 0.4 *volt*.

(a) 5 H (b) 3 H

(c) 4 H (d) 2 H

88. The current through choke coil increases form zero to 6A in 0.3 *seconds* and an induced e.m.f. of 30 V is produced. The inductance of the coil of choke is [MP PMT 2004]

(a) 5 H (b) 2.5 H

(c) 1.5 H (d) 2 H

89. The resistance and inductance of series circuit are 5Ω and 20H respectively. At the instant of closing the switch, the current is increasing at the rate 4A-*s*. The supply voltage is [MP PMT 2004]

(a) 20 V (b) 80 V

(c) 120 V (d) 100 V

90. A coil of N = 100 turns carries a current I = 5 A and creates a magnetic flux $\phi = 10^{-5} Tm^{-2}$ per turn. The value of its inductance L will be [UPSEAT 2004]

(a) 0.05 *mH* (b) 0.10 *mH*

(c) 0.15 *mH* (d) 0.20 *mH*

91. Two identical induction coils each of inductance L joined in series are placed very close to each other such that the winding direction of one is exactly opposite to that of the other, what is the net inductance [DCE 2003]

(a) L (b) 2L

(c) L/2 (d) Zero

92. If the current 30 A flowing in the primary coil is made zero in 0.1 *sec*. The emf induced in the secondary coil is 1.5 *volt*. The mutual inductance between the coil is [Pb PMT 2003]

(a) 0.05 H (b) 1.05 H

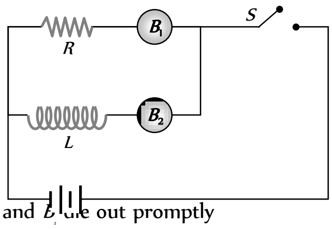
(c) 0.1 H (d) 0.2 H

93. Eddy currents are used in [AFMC 2004]

(a) Induction furnace (b) Electromagnetic brakes

(c) Speedometers (d) All of these

94. The adjoining figure shows two bulbs B and B resistor R and an inductor L. When the switch S is turned off [CPMT 1989]



(a) Both B and B die out promptly

(b) Both B and B die out with some delay

(c) B dies out promptly but B with some delay

(d) B dies out promptly but B with some delay

95. In L-R circuit, for the case of increasing current, the magnitude of current can be calculated by using the formula [MP PET 1994]

(a) $I = I_0 e^{-Rt/L}$ (b) $I = I_0(1-e^{-Rt/L})$

(c) $I = I_0(1-e^{Rt/L})$ (d) $I = I_0 e^{Rt/L}$

96. An ind[MP PMT 2004]a resistance R are first connected to a battery. After some time the battery is disconnected but L and R remain connected in a closed circuit. Then the current reduces to 37% of its initial value in [MP PMT 1994]

(a) *RL sec* (b) $\frac{R}{L}$ *sec*

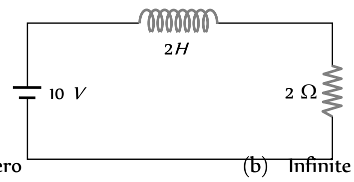
(c) $\frac{L}{R}$ *sec* [BCECE 2004] (d) $\frac{1}{LR}$ *sec*

97. In an LR-circuit, time constant is that time in which current grows from zero to the value (where I_0 is the steady state current) [MP PMT/PET 199

(a) $0.63\, I_0$ (b) $0.50\, I_0$

(c) $0.37\, I_0$ (d) I_0

98. In the figure magnetic energy stored in the coil is [RPET 2000]



(a) Zero (b) Infinite

(c) 25 *joules* (d) None of the above

99. A capacitor is fully charged with a battery. Then the battery is removed and coil is connected with the capacitor in parallel, current varies as [RPET 2000; DCE 2000]

(a) Increases monotonically (b) Decreases monotonically

(c) Zero (d) Oscillates indefinitely

100. A coil of inductance 40 *henry* is connected in 0series with a resistance of 8 *ohm* and the combination is joined to the terminals of a 2 *volt* battery. The time constant of the circuit is

(a) 40 *seconds* (b) 20 *seconds*

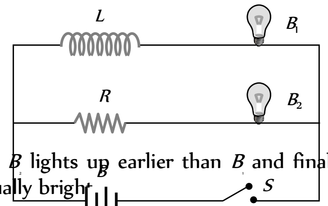
(c) 8 *seconds* (d) 5 *seconds*

101. A solenoid has an inductance of 60 *henrys* and a resistance of 30 *ohms*. If it is connected to a 100 volt battery, how long will it take for the current to reach $\frac{e-1}{e} \approx 63.2\%$ of its final value

(a) 1 *second* (b) 2 *seconds*

(c) *e seconds* (d) 2*e seconds*

102. An inductor, *L* a resistance *R* and two identical bulbs, B_1 and B_2 are connected to a battery through a switch *S* as shown in the figure. The resistance *R* is the same as that of the coil that makes *L*. Which of the following statements gives the correct description of the happenings when the switch *S* is closed



(a) The bulb B_2 lights up earlier than B_1 and finally both the bulbs shine equally bright

(b) B_1 light up earlier and finally both the bulbs acquire equal brightness

(c) B_2 lights up earlier and finally B_1 shines brighter than B_2

(d) B_1 and B_2 light up together with equal brightness all the time

103. The time constant of an *LR* circuit represents the time in which the current in the circuit [MP PMT 2002]

(a) Reaches a value equal to about 37% of its final value

(b) Reaches a value equal to about 63% of its final value

(c) Attains a constant value

(d) Attains 50% of the constant value

104. A *LC* circuit is in the state of resonance. If $C = 0.1 \mu F$ and $L = 0.25$ *henry*. Neglecting ohmic resistance of circuit what is the frequency of oscillations [BHU 2003; MP PMT 2005]

(a) 1007 *Hz* (b) 100 *Hz*

(c) 109 *Hz* (d) 500 *Hz*

105. An oscillator circuit consists of an inductance of 0.5 *mH* and a capacitor of 20 μF. The resonant frequency of the circuit is nearly

(a) 15.92 *Hz* (b) 159.2 *Hz*

(c) 1592 *Hz* (d) 15910 *Hz*

106. A coil of inductance 300 *mH* and resistance 2Ω is connected to a source of voltage $2V$. The current reaches half of its steady state value in [AIEEE 2005]

(a) 0.15 *s* (b) 0.3 *s*

(c) 0.05 *s* (d) 0.1 *s*

107. A coil having an inductance of 0.5 *H* carries a current which is uniformly varying from zero to 10 ampere in 2 second. The e.m.f. (in volts) generated in the coil is

[Kerala PET 2005]

(a) 10 (b) 5

(c) 2.5 (d) 1.25

108. The square root of the product of inductance and capacitance has the dimension of [KCET 2005]

(a) Length (b) Mass

(c) Time (d) No dimension

[MP PET 2000]

Application of EMI (Motor, Dynamo, Transformer...)

1. Which of the following does not depend upon the magnetic effect of some sort

(a) Moving coil galvanometer

(b) Hot wire ammeter [MP PET 2000]

(c) Dynamo

(d) Electric motor

2. Use of eddy currents is done in the following except

(a) Moving coil galvanometer

(b) Electric brakes

(c) Induction motor [AMU (Med.) 2002]

(d) Dynamo

3. Plane of eddy currents makes an angle with the plane of magnetic lines of force equal to

(a) 40^o (b) 0^o

(c) 90^o (d) 180^o

4. Which of the following is constructed on the principle of electromagnetic induction [MP PMT 2002]

(a) Galvanometer (b) Electric motor

(c) Generator (d) Voltmeter

5. A transformer is based on the principle of

[AIIMS 1998; AFMC 2005]

(a) Mutual inductance (b) Self inductance

(c) Ampere's law (d) Lenz's law

6. Which of the following is not an application of eddy currents

[CBSE PMT 1989]

(a) Induction furnace

(b) Galvanometer damping

(c) Speedometer of automobiles

(d) *X*-ray crystallography

7. The core of a transformer is laminated to reduce energy losses due to

[Kerala PET 2002] [CBSE PMT 1990; Karnataka CET (Med.) 2001]

(a) Eddy currents (b) Hysteresis

(c) Resistance in winding (d) None of these

8. The pointer of a dead-beat galvanometer gives a steady deflection because [MP PMT 1994]

(a) Eddy currents are produced in the conducting frame over which the coil is wound

(b) Its magnet is very strong

(c) Its pointer is very light

(d) Its frame is made of abonite

9. The device that does not work on the principle of mutual induction is [KCET 1994]

(a) Induction coil (b) Motor

(c) Tesla coil (d) Transformer

10. Eddy currents are produced when

[CBSE PMT 1993; AFMC 2002]

(a) A metal is kept in varying magnetic field

(b) A metal is kept in the steady magnetic field

(c) A circular coil is placed in a magnetic field

(d) Through a circular coil, current is passed

11. If rotational velocity of a dynamo armature is doubled, then induced e.m.f. will become [MP PMT 1991; AIIMS 2000]

(a) Half (b) Two times

(c) Four times (d) Unchanged

12. Dynamo is a device for converting

(a) Electrical energy into mechanical energy

(b) Mechanical energy into electrical energy

(c) Chemical energy into mechanical energy

(d) Mechanical energy into chemical energy

13. The working of dynamo is based on principle of [CPMT 1984]

(a) Electromagnetic induction

(b) Conversion of energy into electricity

(c) Magnetic effects of current

(d) Heating effects of current

14. Choke coil works on the principle of [MP PET/PMT 1988]

(a) Transient current (b) Self induction

(c) Mutual induction (d) Wattless current

15. When the speed of a dc motor increases the armature current [CPMT 1984, 85; MP PMT 2004]

(a) Increases

(b) Decreases

(c) Does not change

(d) Increases and decreases continuously

16. The output of a dynamo using a splitting commutator is

(a) dc

(b) ac

(c) Fluctuating dc

(d) Half-wave rectified voltage

17. Which of the following statement is incorrect

(a) Both ac and dc dynamo have a field magnet

(b) Both ac and dc dynamo have an armature

(c) Both ac and dc dynamo convert mechanical energy into electrical energy

(d) Both ac and dc dynamo have slip rings

18. The coil of dynamo is rotating in a magnetic field. The developed induced e.m.f. changes and the number of magnetic lines of force also changes. Which of the following condition is correct

(a) Lines of force minimum but induced e.m.f. is zero

(b) Lines of force maximum but induced e.m.f. is zero

(c) Lines of force maximum but induced e.m.f. is not zero

(d) Lines of force maximum but induced e.m.f. is also maximum

19. Dynamo core is laminated because [MP PET 1995]

(a) Magnetic field increases

(b) Magnetic saturation level in core increases

(c) Residual magnetism in core decreases

(d) Loss of energy in core due to eddy currents decreases

20. Armature current in dc motor will be maximum when [CPMT 1986, 88; MP PET 1995]

(a) Motor has acquired maximum speed

(b) Motor has acquired intermediate speed

(c) Motor has just started moving

(d) Motor is switched off

21. The armature of dc motor has $20\,\Omega$ resistance. It draws current of 1.5 ampere when run by 220 *volts* dc supply. The value of back e.m.f. induced in it will be [MP PMT 1999]

(a) 150 *V* (b) 170 *V*

(c) 180 *V* (d) 190 *V*

22. In an induction coil, the secondary e.m.f. is [KCET 1994]

(a) Zero during break of the circuit

(b) Very high during make of the circuit

(c) Zero during make of the circuit

(d) Very high during break of the circuit

23. The number of turns in the coil of an ac generator is 5000 and the area of the coil is $0.25\,m^2$. The coil is rotated at the rate of 100 *cycles/sec* in a magnetic field of $0.2\,W/m^2$. The peak value of the emf generated is nearly [AMU 1995]

(a) 786 *kV* (b) 440 *kV*

(c) 220 *kV* (d) 157.1 *kV*

24. In a dc motor, induced e.m.f. will be maximum [RPMT 1997]

(a) When motor takes maximum speed

(b) When motor starts rotating

(c) When speed of motor increases

(d) When motor is switched off

25. Work of electric motor is [RPMT 1997]

(a) To convert ac into dc

(b) To convert dc into ac

(c) Both (a) and (b)

(d) To convert ac into mechanical work

26. In an induction coil with resistance, the induced emf will be maximum when [RPMT 1996]

(a) The switch is put on due to high resistance

(b) The switch is put off due to high resistance

(c) The switch is put on due to low resistance

(d) The switch is put off due to low resistance

27. An electric motor operating on a 60 *V* dc supply draws a current of 10 *A*. If the efficiency of the motor is 50%, the resistance of its winding is [MP PET 1993] [AMU (Engg.) 2001]

(a) 3Ω (b) 6Ω

(c) 15Ω (d) 30Ω

28. A device which converts electrical energy into mechanical energy is

(a) Dynamo (b) generator

(c) Electric motor (d) Induction coil

29. An electric motor operates on a 50 *volt* supply and a current of 12*A*. If the efficiency of the motor is 30%, what is the resistance of the winding of the motor [Kerala PET 2002]

(a) 6Ω (b) 4Ω

(c) $2.9\,\Omega$ (d) 3.1Ω

30. A motor having an armature of resistance 2Ω is designed to operate at 220 *V* mains. At full speed, it develops a back e.m.f. of 210 *V*. When the motor is running at full speed, the current in the armature is [UPSEAT 2002]

(a) 5*A* (b) 105*A*

(c) 110*A* (d) 215*A*

31. Fan is based on [AFMC 2003]

(a) Electric Motor (b) Electric dynamo

(c) Both (d) None of these

32. A transformer is employed to [MP PET 1985; MP PMT 1993; RPET 1999]

(a) Obtain a suitable dc voltage

(b) Convert dc into ac

(c) Obtain a suitable ac voltage

(d) Convert ac into dc

33. What is increased in step-down transformer [MP PMT/PET 1998; CPMT 1999]

(a) Voltage (b) Current

(c) Power (d) Current density

34. The core of a transformer is laminated so that [CPMT 1985; MP PMT 1994, 2000, 02, 03; BHU 1999]

(a) Ratio of voltage in the primary and secondary may be increased

(b) Rusting of the core may be stopped

(c) Energy losses due to eddy currents may be reduced

(d) Change in flux is increased

35. In transformer, core is made of soft iron to reduce [AIIMS 1998; UPSEAT 2001; AFMC 2005]

(a) Hysteresis losses

(b) Eddy current losses

(c) Force opposing electric current

(d) None of the above

36. The transformation ratio in the step-up transformer is

(a) 1

(b) Greater than one

(c) Less than one

(d) The ratio greater or less than one depends on the other factors

37. In a transformer 220 ac voltage is increased to 2200 *volts*. If the number of turns in the secondary are 2000, then the number of turns in the primary will be [MP PET/PMT 1988]

(a) 200 (b) 100

(c) 50 (d) 20

38. The ratio of secondary to the primary turns in a transformer is 3 : 2. If the power output be *P*, then the input power neglecting all loses must be equal to [MP PMT 1984; KCET 2003]

(a) 5 *P* (b) 1.5 *P*

(c) *P* (d) $\frac{2}{5}P$

39. The primary winding of a transformer has 100 turns and its secondary winding has 200 turns. The primary is connected to an ac supply of 120 *V* and the current flowing in it is 10 A. The voltage and the current in the secondary are [MP PMT 1991; DPMT 2004]

(a) 240 *V*, 5 *A* (b) 240 *V*, 10 *A*

(c) 60 *V*, 20 *A* (d) 120 *V*, 20 *A*

40. A step-down transformer is connected to 2400 *volts* line and 80 amperes of current is found to flow in output load. The ratio of the turns in primary and secondary coil is 20 : 1. If transformer efficiency is 100%, then the current flowing in primary coil will be

(a) 1600 *A* (b) 20 *A*

(c) 4 *A* (d) 1.5 *A*

41. A loss free transformer has 500 turns on its primary winding and 2500 in secondary. The meters of the secondary indicate 200 *volts* at 8 *amperes* under these conditions. The voltage and current in the primary is [MP PMT 1996]

(a) 100 *V*, 16 *A* (b) 40 *V*, 40 *A*

(c) 160 *V*, 10 *A* (d) 80 *V*, 20 *A*

42. An ideal transformer has 100 turns in the primary and 250 turns in the secondary. The peak value of the ac is 28 *V*. The *r.m.s.* secondary voltage is nearest to [MP PMT 1992]

(a) 50 *V* (b) 70 *V*

(c) 100 *V* (d) 40 *V*

43. A transformer is employed to reduce 220 *V* to 11 *V*. The primary draws a current of 5 *A* and the secondary 90 *A*. The efficiency of the transformer is [MP PMT 1992, 2001, 04]

(a) 20% (b) 40%

(c) 70% (d) 90%

44. In a step-up transformer, the turn ratio is 1 : 2. A Leclanche cell (e.m.f. 1.5V) is connected across the primary. The voltage developed in the secondary would be [MP PET 1992, 99; AIIMS 2000; MP PMT 2000; RPET 2001]

(a) 3.0 *V* (b) 0.75 *V*

(c) 1.5 *V* (d) Zero

45. The alternating voltage induced in the secondary coil of a transformer is mainly due to [MP PET 1992; MP PMT 1996]

(a) A varying electric field

(b) A varying magnetic field

(c) The vibrations of the primary coil

(d) The iron core of the transformer

46. We can reduce eddy currents in the core of transformer [MP PET 1993]

(a) By increasing the number of turns in secondary coil

(b) By taking laminated core

(c) By making step-down transformer

(d) By using a weak ac at high potential

47. A 100% efficient transformer has 100 turns in the primary and 25 turns in its secondary coil. If the current in the secondary coil is 4 amp, then the current in the primary coil is

(a) 1 *amp* (b) 4 *amp*

(c) 8 *amp* (d) 16 *amp*

48. The efficiency of transformer is very high because [MP PET 1994]

(a) There is no moving part in a transformer

(b) It produces very high voltage

(c) It produces very low voltage

(d) None of the above

49. In a lossless transformer an alternating current of 2 *amp* is flowing in the primary coil. The number of turns in the primary and secondary coils are 100 and 20 respectively. The value of the current in the secondary coil is [MP PMT 1994]

(a) 0.08 *A* (b) 0.4 *A*

(c) 5 *A* (d) 10 *A*

50. A transformer connected to 220 *volt* line shows an output of 2 *A* at 11000 *volt*. The efficiency is 100%. The current drawn from the line is

(a) 100 *A* (b) 200 *A*

(c) 22 *A* (d) 11 *A*

51. The coils of a step down transformer have 500 and 5000 turns. In the primary coil an ac of 4 *ampere* at 2200 *volts* is sent. The value of the current and potential difference in the secondary coil will be

(a) 20 *A*, 220 *V* (b) 0.4 *A*, 22000 *V*

(c) 40 *A*, 220 *V* (d) 40 *A*, 22000 *V*

52. A power transformer is used to step up an alternating e.m.f. of 220 *V* to 11 *kV* to transmit 4.4 *kW* of power. If the primary coil has 1000 turns, what is the current rating of the secondary ? Assume 100% efficiency for the transformer [MP PET 1997]

(a) 4 *A* (b) 0.4 *A*

(c) 0.04 *A* (d) 0.2 *A*

53. A step up transformer connected to a 220 *V AC* line is to supply 22 *kV* for a neon sign in secondary circuit. In primary circuit a fuse wire is connected which is to blow when the current in the secondary circuit exceeds 10 *mA*. The turn ratio of the transformer is [MP PET 1997]

(a) 50 (b) 100

(c) 150 (d) 200

54. In a transformer the primary has 500 *turns* and secondary has 50 *turns*. 100 *volts* are applied to the primary coil, the voltage developed in the secondary will be [MP PMT 1997]

(a) 1 *V* (b) 10 *V*

(c) 1000 *V* (d) 10000 *V*

55. A transformer is used to [MP PET 1999]

(a) Change the alternating potential

(b) Change the alternating current

(c) To prevent the power loss in alternating current flow

(d) To increase the power of current source

56. A step-up transformer operates on a 230 *V* line and supplies a load of 2 *ampere*. The ratio of the primary and secondary windings is 1 : 25. The current in the primary is [CBSE PMT 1998]

(a) 15 *A* (b) 50 *A*

(c) 25 *A* (d) 12.5 *A*

57. The number of turns in the primary coil of a transformer is 200 and the number of turns in the secondary coil is 10. If 240 *volt AC* is applied to the primary, the output from the secondary will be [BHU 1997; JIPMER

(a) 48 *V* (b) 24 *V*

(c) 12 *V* (d) 6 *V*

58. The primary winding of transformer has 500 turns whereas its secondary has 5000 turns. The primary is connected to an ac supply of 20 *V*, 50 *Hz*. The secondary will have an output of [CBSE PMT 1997; AIIMS 19

(a) 200 *V*, 50 *Hz* (b) 2 *V*, 50 *Hz*

(c) 200 *V*, 500 *Hz* (d) 2 *V*, 5 *Hz*

59. A step-up transformer has transformation ratio of 3 : 2. What is the voltage in secondary if voltage in primary is 30 *V*

(a) 45 *V* (b) 15 *V*

(c) 90 *V* [MP PMT 1995] (d) 300 *V*

60. In a transformer, the number of turns in primary coil and secondary coil are 5 and 4 respectively. If 240 *V* is applied on the primary coil, then the ratio of current in primary and secondary coil is [AFMC 1998; CPMT 20

(a) 4 : 5 (b) 5 : 4

(c) 5 : 9 [MP PET 1996] (d) 9 : 5

61. A step-down transformer is connected to main supply 200 *V* to operate a 6 *V*, 30 *W* bulb. The current in primary is [AMU (Engg.) 1999]

(a) 3 *A* (b) 1.5 *A*

(c) 0.3 *A* (d) 0.15 *A*

62. The number of turns in primary and secondary coils of a transformer are 100 and 20 respectively. If an alternating potential of 200 *volt* is applied to the primary, the induced potential in secondary will be [RPET 1999]

(a) 10 *V* (b) 40 *V*

(c) 1000 *V* (d) 20,000 *V*

63. The ratio of secondary to primary turns is 9 : 4. If power input is *P*, what will be the ratio of power output (neglect all losses) to power input [DCE 1999]

(a) 4 : 9 (b) 9 : 4

(c) 5 : 4 (d) 1 : 1

64. Voltage in the secondary coil of a transformer does not depend upon. [BHU 2000]

(a) Voltage in the primary coil

(b) Ratio of number of turns in the two coils

(c) Frequency of the source

(d) Both (a) and (b)

65. A transformer has turn ratio 100/1. If secondary coil has 4 *amp* current then current in primary coil is [RPET 2000]

(a) 4 *A* (b) 0.04 *A*

(c) 0.4 *A* (d) 400 *A*

66. In a step-up transformer the turn ratio is 1:10. A resistance of 200 *ohm* connected across the secondary is drawing a current of 0.5 *A*. What is the primary voltage and current [MP PET 2000]

(a) 50 *V*, 1 *amp* (b) 10 *V*, 5 *amp*

(c) 25 *V*, 4 *amp* (d) 20 *V*, 2 *amp*

67. Large transformers, when used for some time, become hot and are cooled by circulating oil. The heating of transformer is due to

(a) Heating effect of current alone
(b) Hysteresis loss alone
(c) Both the hysteresis loss and heating effect of current
(d) None of the above

68. In a step-up transformer the voltage in the primary is 220 V and the current is 5A. The secondary voltage is found to be 22000 V. The current in the secondary (neglect losses) is [Kerala PMT 2002]

(a) 5 A (b) 50 A
(c) 500 A (d) 0.05 A

69. In a transformer, number of turns in the primary are 140 and that in the secondary are 280. If current in primary is 4A then that in the secondary is [AIEEE 2002]

(a) 4 A (b) 2 A
(c) 6 A (d) 10 A

70. A transformer has 100 turns in the primary coil and carries 8 A current. If input power is one kilowatt, the number of turns required in the secondary coil to have 500 V output will be [MP PET 2002]

(a) 100 (b) 200
(c) 400 (d) 300

71. An ideal transformer has 500 and 5000 turn in primary and secondary windings respectively. If the primary voltage is connected to a 6V battery then the secondary voltage is [Orissa JEE 2003]

(a) 0 (b) 60 V
(c) 0.6 V (d) 6.0 V

72. In a primary coil 5A current is flowing on 220 volts. In the secondary coil 2200 V voltage produces. Then ratio of number of turns in secondary coil and primary coil will be [RPET 2003]

(a) 1 : 10 (b) 10 : 1
(c) 1 : 1 (d) 11 : 1

73. A step up transformer has transformation ration 5 : 3. What is voltage in secondary if voltage in primary is 60 V [Pb. PET 2000]

(a) 20 V (b) 60 V
(c) 100 V (d) 180 V

74. In a step up transformer, 220 V is converted into 200 V. The number of turns in primary coil is 600. What is the number of turns in the secondary coil [DCE 2004]

(a) 60 (b) 600
(c) 6000 (d) 100

75. The output voltage of a transformer connected to 220 *volt* line is 1100 *volt* at 1 *amp* current. Its efficiency is 100%. The current coming from the line is [Pb. PET 2003]

(a) 20 A (b) 10 A
(c) 11 A (d) 22 A

76. Quantity that remains unchanged in a transformer is [MP PMT/PET 1998; AIIMS 1999; J & K CET 2005]

(a) Voltage (b) Current
(c) Frequency (d) None of the above

77. In a region of uniform magnetic induction $B = 10^{-2}\, tesla$, a circular coil of radius 30 *cm* and resistance π *ohm* is rotated about an axis which is perpendicular to the direction of B and which forms a diameter of the coil. If the coil rotates at 200 *rpm* the amplitude of the alternating current induced in the coil is [MP PET 2001]

(a) 4π *mA* (b) 30 *mA*
(c) 6 *mA* (d) 200 *mA*

78. In a transformer, the number of turns in primary and secondary are 500 and 2000 respectively. If current in primary is 48 A, the current in the secondary is [Orissa PMT 2004]

(a) 12 A (b) 24 A
(c) 48 A (d) 144 A

79. In an inductor of inductance L = 100 *mH*, a current of $I = 10A$ is flowing. The energy stored in the inductor is [Orissa PMT 2004]

(a) 5 J (b) 10 J
(c) 100 J (d) 1000 J

80. The turn ratio of a transformers is given as 2 : 3. If the current through the primary coil is 3 A, thus calculate the current through load resistance [BHU 2005]

(a) 1 A (b) 4.5 A
(c) 2 A (d) 1. 5 A

81. Core of transformer is made up of [AFMC 2005]

(a) Soft iron (b) Steel
(c) Iron (d) Alnico

82. The induction coil works on the principle of [KCET 2005]

(a) Self-induction (b) Mutual induction
(c) Ampere's rule (d) Fleming's right hand rule

83. A transformer with efficiency 80% works at 4 *kW* and 100 V. If the secondary voltage is 200 V, then the primary and secondary currents are respectively [Kerala PMT 2005]

(a) 40 A, 16 A (b) 16 A, 40 A
(c) 20 A, 40 A (d) 40 A, 20 A

84. In a step up transformer, if ratio of turns of primary to secondary is 1 : 10 and primary voltage is 230 V. If the load current is 2A, then the current in primary is [Orissa PMT 2005]

(a) 20 A (b) 10 A
(c) 2 A (d) 1 A

85. If a coil made of conducting wires is rotated between poles pieces of the permanent magnet. The motion will generate a current and this device is called [CPMT 2005]

(a) An electric motor (b) An electric generator
(c) An electromagnet (d) All of above

86. A step-down transformer is used on a 1000 V line to deliver 20 A at 120 V at the secondary coil. If the efficiency of the transformer is 80% the current drawn from the line is . [Kerala PET 2005]

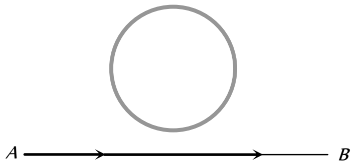
(a) 3 A (b) 30 A
(c) 0.3 A (d) 2.4 A

Critical Thinking

Objective Questions

1. An electron moves along the line *AB*, which lies in the same plane as a circular loop of conducting wires as shown in the diagram. What will be the direction of current induced if any, in the loop

[MP PET 1989; AIIMS 1982, 2001; KCET 2003; UPSEAT 2005]



(a) No current will be induced
(b) The current will be clockwise
(c) The current will be anticlockwise
(d) The current will change direction as the electron passes by

2. A copper rod of length *l* is rotated about one end perpendicular to the magnetic field *B* with constant angular velocity ω. The induced e.m.f. between the two ends is

[MP PMT 1992; Orissa JEE 2003]

(a) $\frac{1}{2}B\omega l^2$ (b) $\frac{3}{4}B\omega l^2$

(c) $B\omega l^2$ (d) $2B\omega l^2$

3. Two different coils have self-inductance $L_1 = 8\ mH$, $L_2 = 2mH$. The current in one coil is increased at a constant rate. The current in the second coil is also increased at the same rate. At a certain instant of time, the power given to the two coils is the same. At that time the current, the induced voltage and the energy stored in the first coil are i_1, V_1 and W_1 respectively. Corresponding values for the second coil at the same instant are i_2, V_2 and W_2 respectively. Then [IIT JEE 1994]

(a) $\frac{i_1}{i_2} = \frac{1}{4}$ (b) $\frac{i_1}{i_2} = 4\ 8$

(c) $\frac{W_2}{W_1} = 4$ (d) $\frac{V_2}{V_1} = \frac{1}{4}$

4. An e.m.f. of 15 *volt* is applied in a circuit containing 5 *henry* inductance and 10 *ohm* resistance. The ratio of the currents at time $t = \infty$ and at $t = 1$ *second* is [MP PMT 1994]

(a) $\frac{e^{1/2}}{e^{1/2}-1}$ (b) $\frac{e^2}{e^2-1}$

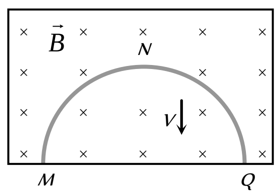
(c) $1-e^{-1}$ (d) e^{-1}

5. Two conducting circular loops of radii R_1 and R_2 are placed in the same plane with their centres coinciding. If $R_1 >> R_2$, the mutual inductance *M* between them will be directly proportional to [MP PMT 1994; MP PET 2001]

(a) R_1/R_2 (b) R_2/R_1

(c) R_1^2/R_2 (d) R_2^2/R_1

6. A thin semicircular conducting ring of radius *R* is falling with its plane vertical in a horizontal magnetic induction *B*. At the position *MNQ*, the speed of the ring is *V* and the potential difference developed across the ring is [IIT JEE 1996]



(a) Zero
(b) $Bv\pi R^2/2$ and *M* is at higher potential
(c) πRBV and *Q* is at higher potential
(d) $2RBV$ and *Q* is at higher potential

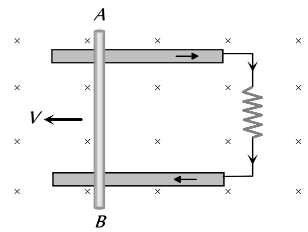
7. At a place the value of horizontal component of the earth's magnetic field *H* is $3\times10^{-5}\ Weber/m^2$. A metallic rod *AB* of length 2 *m* placed in east-west direction, having the end *A* towards east, falls vertically downward with a constant velocity of 50 *m/s*. Which end of the rod becomes positively charged and what is the value of induced potential difference between the two ends

(a) End *A*, $3\times10^{-3}\ mV$ (b) End *A*, 3 *mV*

(c) End *B*, $3\times10^{-3}\ mV$ (d) End *B*, 3 *mV*

8. Consider the situation shown in the figure. The wire *AB* is sliding on the fixed rails with a constant velocity. If the wire *AB* is replaced by semicircular wire, the magnitude of the induced current will

(a) Increase
(b) Remain the same
(c) Decrease
(d) Increase or decrease depending on whether the semicircle bulges towards the resistance or away from it



9. A circular loop of radius *R* carrying current *I* lies in *x-y* plane with its centre at origin. The total magnetic flux through *x-y* plane is [IIT-JEE 1999]

(a) Directly proportional to *I*
(b) Directly proportional to *R*
(c) Directly proportional to R^2
(d) Zero

10. Two identical circular loops of metal wire are lying on a table without touching each other. Loop-*A* carries a current which increases with time. In response, the loop-*B*

[IIT JEE 1999; UPSEAT 2003]

(a) Remains stationary
(b) Is attracted by the loop-*A*
(c) Is repelled by the loop-*A*
(d) Rotates about its CM, with CM fixed

(CM is the centre of mass)

11. Two coils have a mutual inductance 0.005 *H*. The current changes in the first coil according to equation $I = I_0 \sin\omega t$, where $I_0 = 10A$ and ω = 100 π *radian/sec*. The maximum value of e.m.f. in the second coil is

[CBSE PMT 1998; Pb. PMT 2000]

(a) 2π (b) 5π

(c) π (d) 4π

12. A small square loop of wire of side *l* is placed inside a large square loop of wire of side *L* (*L* > *l*). The loop are coplanar and their centre coincide. The mutual inductance of the system is proportional to

(a) l/L (b) l^2/L

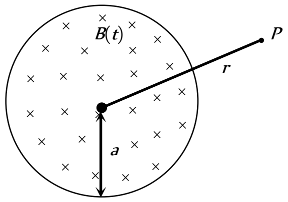
(c) L/l (d) L^2/l

13. A wire of length 1 *m* is moving at a speed of 2 *ms* perpendicular to its length and a homogeneous magnetic field of 0.5 *T*. The ends of the wire are joined to a circuit of resistance 6 Ω. The rate at which work is being done to keep the wire moving at constant speed is [Roorkee 1999]

(a) $\frac{1}{12}W$ (b) $\frac{1}{6}W$

(c) $\frac{1}{3}W$ (d) 1*W*

14. A uniform but time-varying magnetic field *B*(*t*) exists in a circular region of radius *a* and is directed into the plane of the paper, as shown. The magnitude of the induced electric field at point *P* at a distance *r* from the centre of the circular region



(a) Is zero

(b) Decreases as $\frac{1}{r}$

(c) Increases as *r*

(d) Decreases as $\frac{1}{r^2}$

15. A coil of wire having finite inductance and resistance has a conducting ring placed coaxially within it. The coil is connected to a battery at time *t* = 0, so that a time-dependent current $I_1(t)$ starts flowing through the coil. If $I_2(t)$ is the current induced in the ring. and $B(t)$ is the magnetic field at the axis of the coil due to $I_1(t)$, then as a function of time (*t* > 0), the product $I_2(t)\,B(t)$

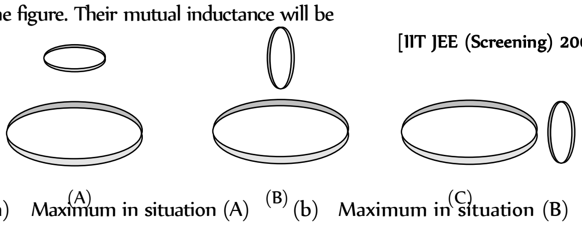
[IIT-JEE (Screening) 2000]

(a) Increases with time (b) Decreases with time

(c) Does not vary with time (d) Passes through a maximum

16. Two circular coils can be arranged in any of the three situations shown in the figure. Their mutual inductance will be

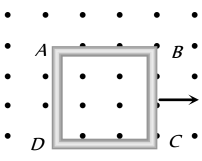
[IIT JEE (Screening) 2001]



(a) Maximum in situation (A) (b) Maximum in situation (B)

(c) Maximum in situation (C) (d) The same in all situations

17. A metallic square loop *ABCD* is moving in its own plane with velocity *v* in a uniform magnetic field perpendicular to its plane as shown in the figure. An electric field is induced



(a) In *AD*, but not in *BC*

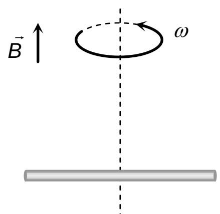
(b) In *BC*, but not in *AD*

(c) Neither in *AD* nor in *BC*

(d) In both *AD* and *BC*

18. A conducting rod of length 2*l* is rotating with constant angular speed *ω* about its perpendicular bisector. A uniform magnetic field $\vec{B}$ exists parallel to the axis of rotation. The e.m.f. induced between two ends of the rod is

[MP PET 2001]



(a) $B\omega l$

(b) $\frac{1}{2}B\omega l^2$

(c) $\frac{1}{8}B\omega l^2$

(d) Zero

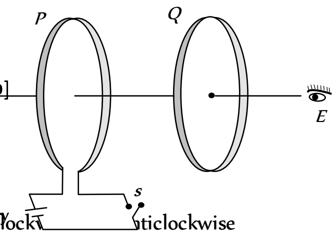
19. An inductor of 2 *henry* and a resistance of 10 *ohms* are connected in series with a battery of 5 *volts*. The initial rate of change of current is [MP PMT 2001]

(a) 0.5 *amp/sec* (b) 2.0 *amp/sec*

(c) 2.5 *amp/sec* (d) 0.25 *amp/sec*

20. As shown in the figure, *P* and *Q* are two coaxial conducting loops separated by some distance. When the switch *S* is closed, a clockwise current I_P flows in *P* (as seen by *E*) and an induced current I_{Q_1} flows in *Q*. The switch remains closed for a long time. When *S* is opened, a current I_{Q_2} flows in *Q*. Then the directions of I_{Q_1} and I_{Q_2} (as seen by *E*) are [IIT JEE (Screening) 2002]

[IIT-JEE (Screening) 2000]



(a) Respectively clockwise and anticlockwise

(b) Both clockwise

(c) Both anticlockwise

(d) Respectively anticlockwise and clockwise

21. A short-circuited coil is placed in a time-varying magnetic field. Electrical power is dissipated due to the current induced in the coil. If the number of turns were to be quadrupled and the wire radius halved, the electrical power dissipated would be

(a) Halved (b) The same

(c) Doubled (d) Quadrupled

22. A physicist works in a laboratory where the magnetic field is 2 *T*. She wears a necklace enclosing area 0.01 *m* in such a way that the plane of the necklace is normal to the field and is having a resistance *R* = 0.01 Ω. Because of power failure, the field decays to 1 *T* in time 10^{-3} *seconds*. Then what is the total heat produced in her necklace ? (*T* = *Tesla*)

[Orissa JEE 2002]

(a) 10 *J* (b) 20 *J*

(c) 30 *J* (d) 40 *J*

23. A coil of inductance 8.4 *mH* and resistance 6 Ω is connected to a 12 *V* battery. The current in the coil is 1.0 *A* at approximately the time

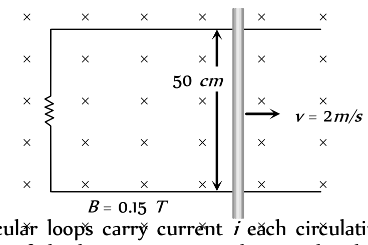
[IIT-JEE (Screening) 1999; UPSEAT 2003]

[IIT JEE (Screening) 2001]

(a) 500 *sec* (b) 20 *sec*

(c) 35 *milli sec* (d) 1 *milli sec*

24. As shown in the figure a metal rod makes contact and complete the circuit. The circuit is perpendicular to the magnetic field with $B = 0.15\,tesla$ If the resistance is $3\,\Omega$, force needed to move the rod as indicated with a constant speed of $2m/sec$ is



(a) $3.75\times10^{-3}\,N$

(b) $3.75\times10^{-2}\,N$

(c) $3.75\times10^{2}\,N$

(d) $3.75\times10^{-4}\,N$

25. Two identical coaxial circular loops carry current *i* each circulating in the clockwise direction. If the loops are approaching each other, then [MP PMT 1995, 96]

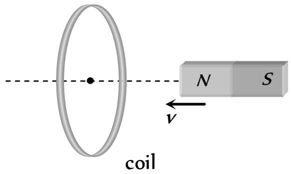
(a) Current in each loop increases

(b) Current in each loop remains the same

(c) Current in each loop decreases

(d) Current in one-loop increases and in the other it decreases

26. In the following figure, the magnet is moved towards the coil with a speed v and induced *emf* is e. If magnet and coil recede away from one another each moving with speed v, the induced *emf* in the coil will be



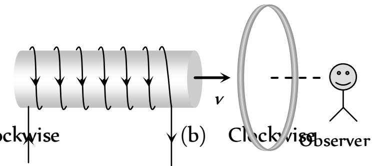
(a) e

(b) $2e$

(c) $e/2$

(d) $4e$

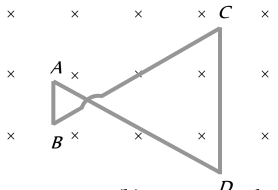
27. A current carrying solenoid is approaching a conducting loop as shown in the figure. The direction of induced current as observed by an observer on the other side of the loop will be



(a) Anticlockwise (b) Clockwise

(c) East (d) West

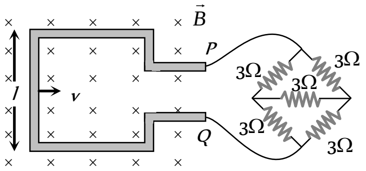
28. A conducting wire frame is placed in a magnetic field which is directed into the paper. The magnetic field is increasing at a constant rate. The directions of induced current in wires *AB* and *CD* are



(a) *B* to *A* and *D* to *C* (b) *A* to *B* and *C* to *D*

(c) *A* to *B* and *D* to *C* (d) *B* to *A* and *C* to *D*

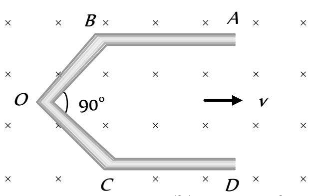
29. A square metallic wire loop of side 0.1 m and resistance of 1Ω is moved with a constant velocity in a magnetic field of 2 wb/m as shown in figure. The magnetic field is perpendicular to the plane of the loop, loop is connected to a network of resistances. What should be the velocity of loop so as to have a steady current of $1 mA$ in loop



(a) 1 cm/sec (b) 2 cm/sec

(c) 3 cm/sec (d) 4 cm/sec

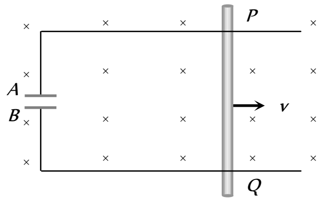
30. A conductor *ABOCD* moves along its bisector with a velocity of 1 m/s through a perpendicular magnetic field of 1 wb/m, as shown in fig. If all the four sides are of $1m$ length each, then the induced emf between points *A* and *D* is



(a) 0 (b) 1.41 *volt*

(c) 0.71 *volt* (d) None of the above

31. A conducting rod *PQ* of length L = 1.0 m is moving with a uniform speed v = 2 m/s in a uniform magnetic field $B = 4.0\,T$ directed into the paper. A capacitor of capacity C = 10 μF is connected as shown in figure. Then



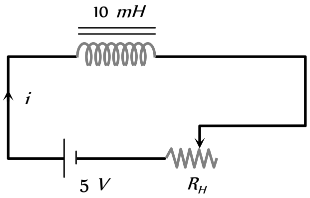
(a) $q_A = +80\ \mu C$ and $q_B = -80\ \mu C$

(b) $q_A = -80\ \mu C$ and $q_B = +80\ \mu C$

(c) $q_A = 0 = q_B$

(d) Charge stored in the capacitor increases exponentially with time

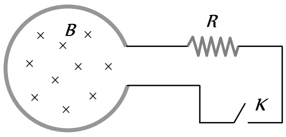
32. The resistance in the following circuit is increased at a particular instant. At this instant the value of resistance is 10Ω. The current in the circuit will be now



(a) i = 0.5 A (b) i > 0.5 A

(c) i < 0.5 A (d) i = 0

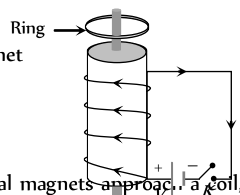
33. Shown in the figure is a circular loop of radius r and resistance R. A variable magnetic field of induction $B = B_0 e^{-t}$ is established inside the coil. If the key (K) is closed, the electrical power developed right after closing the switch is equal to



(a) $\dfrac{B_0^2 \pi r^2}{R}$ (b) $\dfrac{B_0 10 r^3}{R}$

(c) $\dfrac{B_0^2 \pi^2 r^4 R}{5}$ (d) $\dfrac{B_0^2 \pi^2 r^4}{R}$

34. A conducting ring is placed around the core of an electromagnet as shown in fig. When key K is pressed, the ring



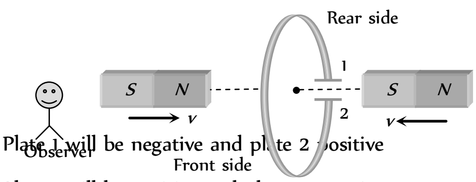
(a) Remain stationary

(b) Is attracted towards the electromagnet

(c) Jumps out of the core

(d) None of the above

35. The north and south poles of two identical magnets approach a coil, containing a condenser, with equal speeds from opposite sides. Then



(a) Plate 1 will be negative and plate 2 positive

(b) Plate 1 will be positive and plate 2 negative

(c) Both the plates will be positive

(d) Both the plates will be negative

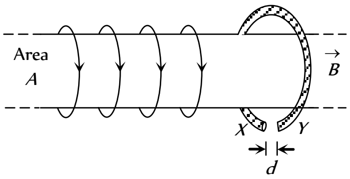
36. A highly conducting ring of radius R is perpendicular to and concentric with the axis of a long solenoid as shown in fig. The ring has a narrow gap of width d in its circumference. The solenoid has cross sectional area A and a uniform internal field of magnitude B_0. Now beginning at $t = 0$, the solenoid current is steadily increased to so that the field magnitude at any time t is given by $B(t) = B_0 + \alpha t$ where $\alpha > 0$. Assuming that no charge can flow across the gap, the end of ring which has excess of positive charge and the magnitude of induced e.m.f. in the ring are respectively

(a) X, $A\alpha$

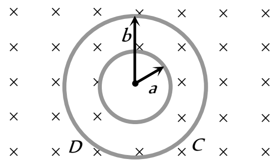
(b) X $\pi R\alpha$

(c) Y, $\pi A\alpha$

(d) Y, $\pi R\alpha$



37. Plane figures made of thin wires of resistance R = 50 *milli ohm/metre* are located in a uniform magnetic field perpendicular into the plane of the figures and which decrease at the rate dB/dt = 0.1 *m T/s*. Then currents in the inner and outer boundary are. (The inner radius a = 10 *cm* and outer radius b = 20 *cm*)



(a) 10· A (Clockwise), 2 × 10· A (Clockwise)

(b) 10· A (Anticlockwise), 2 × 10· A (Clockwise)

(c) 2 × 10· A (clockwise), 10· A (Anticlockwise)

(d) 2 × 10· A (Anticlockwise), 10· A (Anticlockwise)

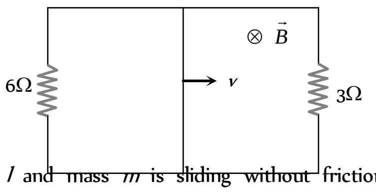
38. A rectangular loop with a sliding connector of length l = 1.0 m is situated in a uniform magnetic field B = 2T perpendicular to the plane of loop. Resistance of connector is r = 2Ω. Two resistance of 6Ω and 3Ω are connected as shown in figure. The external force required to keep the connector moving with a constant velocity v = 2m/s is

(a) 6 N

(b) 4 N

(c) 2 N

(d) 1 N



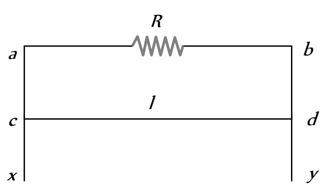
39. A wire cd of length l and mass m is sliding without friction on conducting rails ax and by as shown. The vertical rails are connected to each other with a resistance R between a and b. A uniform magnetic field B is applied perpendicular to the plane $abcd$ such that cd moves with a constant velocity of

(a) $\dfrac{mgR}{Bl}$

(b) $\dfrac{mgR}{B^2l^2}$

(c) $\dfrac{mgR}{B^3l^3}$

(d) $\dfrac{mgR}{B^2l}$



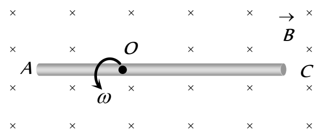
40. A conducting rod AC of length $4l$ is rotated about a point O in a uniform magnetic field $\vec{B}$ directed into the paper. $AO = l$ and $OC = 3l$. Then

(a) $V_A - V_O = \dfrac{B\omega l^2}{2}$

(b) $V_O - V_C = \dfrac{7}{2}B\omega l^2$

(c) $V_A - V_C = 4B\omega l^2$

(d) $V_C - V_O = \dfrac{9}{2}B\omega l^2$



41. How much length of a very thin wire is required to obtain a solenoid of length l_0 and inductance L

(a) $\sqrt{\dfrac{2\pi L l_0}{\mu_0}}$

(b) $\sqrt{\dfrac{4\pi L l_0}{\mu_0^2}}$

(c) $\sqrt{\dfrac{4\pi L l_0}{\mu_0}}$

(d) $\sqrt{\dfrac{8\pi L l_0}{\mu_0}}$

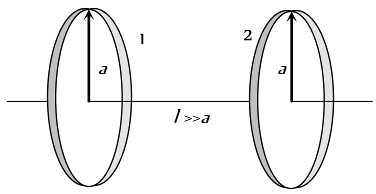
42. What is the mutual inductance of a two-loop system as shown with centre separation l

(a) $\dfrac{\mu_0 \pi a^4}{8l^3}$

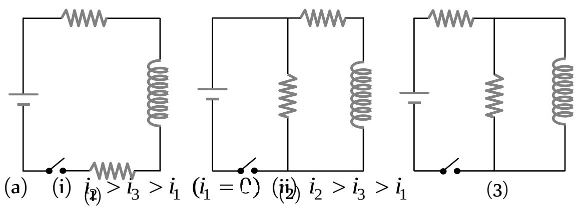
(b) $\dfrac{\mu_0 \pi a^4}{4l^3}$

(c) $\dfrac{\mu_0 \pi a^4}{6l^3}$

(d) $\dfrac{\mu_0 \pi a^4}{2l^3}$



43. The figure shows three circuits with identical batteries, inductors, and resistors. Rank the circuits according to the current through the battery (i) just after the switch is closed and (ii) a long time later, greatest first



(a) (i) $i_2 > i_3 > i_1$ $(i_1 = 0)$ (ii) $i_2 > i_3 > i_1$

(b) (i) $i_2 < i_3 < i_1$ $(i_1 \neq 0)$ (ii) $i_2 > i_3 > i_1$

(c) (i) $i_2 = i_3 = i_1$ $(i_1 = 0)$ (ii) $i_2 < i_3 < i_1$

(d) (i) $i_2 = i_3 > i_1$ $(i_1 \neq 0)$ (ii) $i_2 > i_3 > i_1$

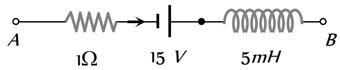
44. The network shown in the figure is a part of a complete circuit. If at a certain instant the current i is 5 A and is decreasing at the rate of $10^3\,A/s$ then $V_A - V_B$ is

(a) 5 V

(b) 10 V

(c) 15 V

(d) 20 V



45. A 50 *volt* potential difference is suddenly applied to a coil with $L = 5 \times 10^{-3}$ *henry* and $R = 180\,ohm$. The rate of increase of current after 0.001 *second* is [MP PET 1994]

(a) 27.3 *amp/sec*

(b) 27.8 *amp/sec*

(c) 2.73 *amp/sec*

(d) None of the above

46. The current in a LR circuit builds up to $\dfrac{3}{4}th$ of its steady state value in $4s$. The time constant of this circuit is

[Roorkee 2000]

(a) $\frac{1}{\ln 2}s$ (b) $\frac{2}{\ln 2}s$

(c) $\frac{3}{\ln 2}s$ (d) $\frac{4}{\ln 2}s$

47. A conducting ring of radius 1 *meter* is placed in an uniform magnetic field B of 0.01 *Telsa* oscillating with frequency 100 *Hz* with its plane at right angles to B. What will be the induced electric field [AIIMS 2005]

(a) $\pi\, volt/m$ (b) $2\, volt/m$

(c) $10\, volt/m$ (d) $62\, volt/m$

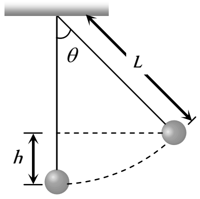
48. A simple pendulum with bob of mass m and conducting wire of length L swings under gravity through an angle 2θ. The earth's magnetic field component in the direction perpendicular to swing is B. Maximum potential difference induced across the pendulum is [MP PET 2005]

(a) $2BL\sin\left(\frac{\theta}{2}\right)(gL)^{1/2}$

(b) $BL\sin\left(\frac{\theta}{2}\right)(gL)$

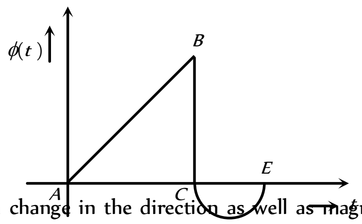
(c) $BL\sin\left(\frac{\theta}{2}\right)(gL)^{3/2}$

(d) $BL\sin\left(\frac{\theta}{2}\right)(gL)^{2}$



Graphical Questions

1. The graph Shows the variation in magnetic flux $\phi(t)$ with time through a coil. Which of the statements given below is not correct



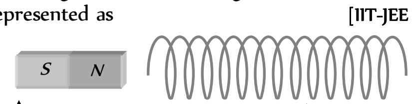
(a) There is a change in the direction as well as magnitude of the induced emf between B and D

(b) The magnitude of the induced emf is maximum between B and C

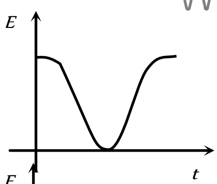
(b) There is a change in the direction as well as magnitude of induced emf between A and C

(d) The induced emf is zero at B

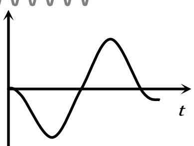
2. The variation of induced emf (E) with time (t) in a coil if a short bar magnet is moved along its axis with a constant velocity is best represented as [IIT-JEE (Screening) 2004]



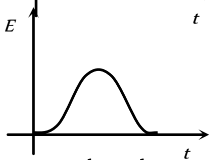
(a)



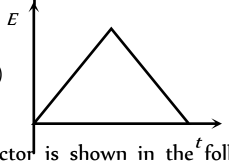
(b)



(c)



(d)



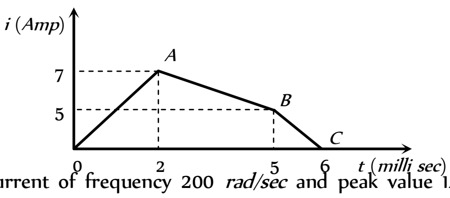
3. The current through a 4.6 H inductor is shown in the following graph. The induced emf during the time interval $t = 5$ *milli-sec* to 6 *milli-sec* will be

(a) 10^3 V

(b) -23×10^3 V

(c) 23×10^3 V

(d) Zero



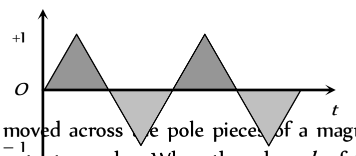
4. An alternating current of frequency 200 *rad/sec* and peak value 1A as shown in the figure, is applied to the primary of a transformer. If the coefficient of mutual induction between the primary and the secondary is 1.5 H, the voltage induced in the secondary will be

(a) 300 V

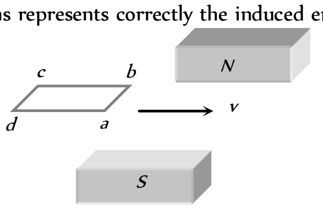
(b) 191 V

(c) 220 V

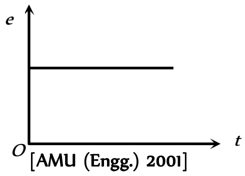
(d) 471 V



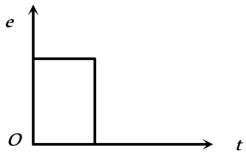
5. A horizontal loop $abcd$ is moved across the pole pieces of a magnet as shown in fig. with a constant speed v. When the edge ab of the loop enters the pole pieces at time $t = 0$ *sec.* Which one of the following graphs represents correctly the induced emf in the coil



(a)

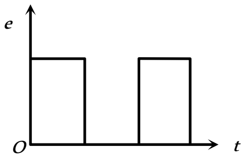


(b)

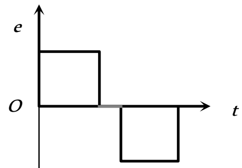


[AMU (Engg.) 2001]

(c)



(d)



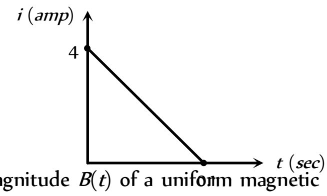
6. Some magnetic flux is changed from a coil of resistance 10 *ohm*. As a result an induced current is developed in it, which varies with time as shown in figure. The magnitude of change in flux through the coil in *webers* is

(a) 2

(b) 4

(c) 6

(d) None of these



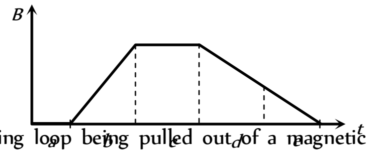
7. The graph gives the magnitude $B(t)$ of a uniform magnetic field that exists throughout a conducting loop, perpendicular to the plane of the loop. Rank the five regions of the graph according to the magnitude of the emf induced in the loop, greatest first

(a) $b > (d = e) < (a = c)$

(b) $b > (d = e) > (a = c)$

(c) $b < d < e < c < a$

(d) $b > (a = c) > (d = e)$



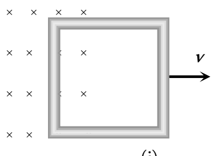
8. Figure (i) shows a conducting loop being pulled out of a magnetic field with a speed v. Which of the four plots shown in figure (ii) may represent the power delivered by the pulling agent as a function of the speed v

(a) a

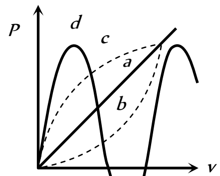
(b) b

(c) c

(d) d

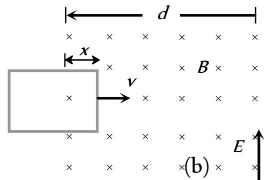


(i)

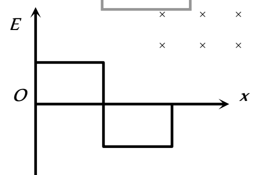


(ii)

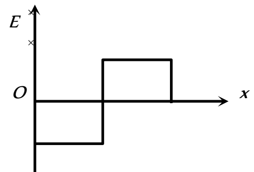
9. A rectangular loop is being pulled at a constant speed v, through a region of certain thickness d, in which a uniform magnetic field B is set up. The graph between position x of the right hand edge of the loop and the induced emf E will be



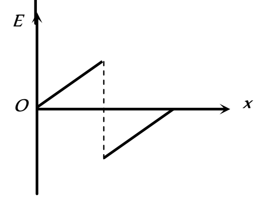
(a)



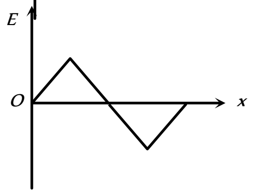
(b)



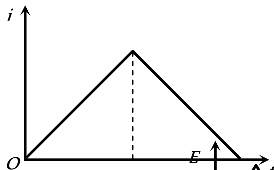
(c)

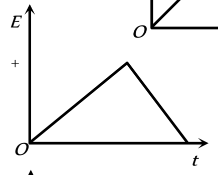


(d)

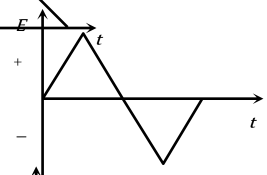


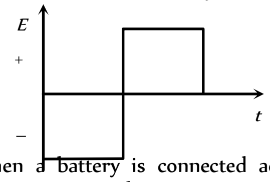
10. The current i in an inductance coil varies with time, t according to the graph shown in fig. Which one of the following plots shows the variation of voltage in the coil with time



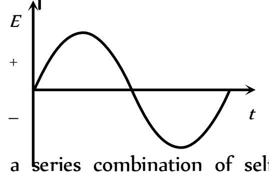
(a)


(b)

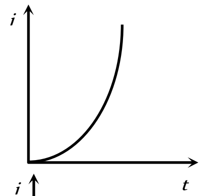


(c)


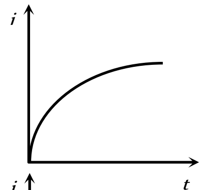
(d)

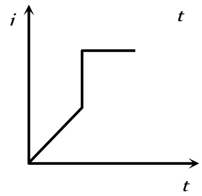


11. When a battery is connected across a series combination of self inductance L and resistance R, the variation in the current i with time t is best represented by [MP PET 2004]

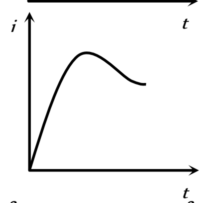
(a)


(b)



(c)


(d)



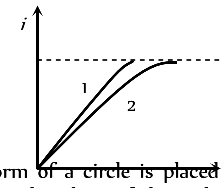
12. When a certain circuit consisting of a constant e.m.f. E an inductance L and a resistance R is closed, the current in, it increases with time according to curve 1. After one parameter (E, L or R) is changed, the increase in current follows curve 2 when the circuit is closed second time. Which parameter was changed and in what direction

(a) L is increased

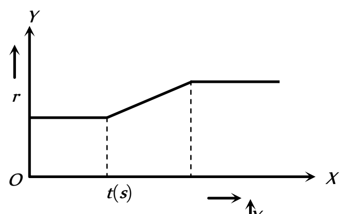
(b) L is decreased

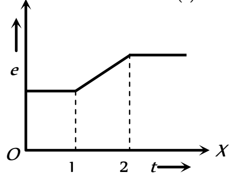
(c) R is increased

(d) R is decreased

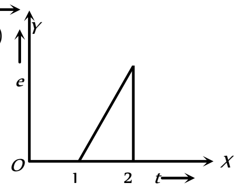


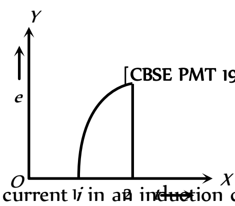
13. A flexible wire bent in the form of a circle is placed in a uniform magnetic field perpendicular to the plane of the coil. The radius of the coil changes as shown in figure. The graph of induced emf in the coil is represented by



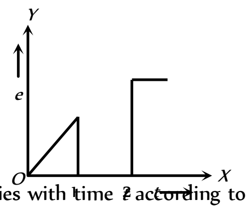
(a)


(b)



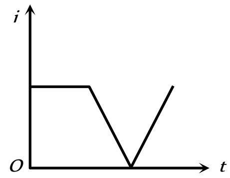
(c)


(d)

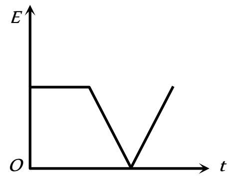


[CBSE PMT 1994]

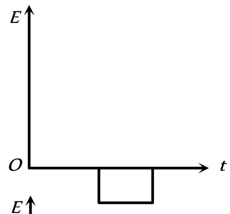
14. The current i in an induction coil varies with time t according to the graph shown

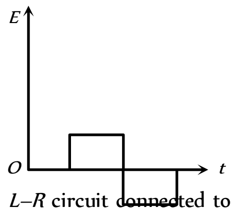


in figure. Which of the following graphs shows the induced emf (e) in the coil with time

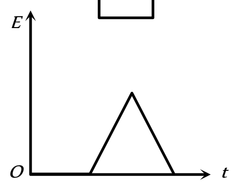
(a)


(b)

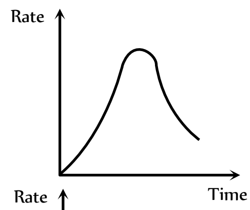


(c)


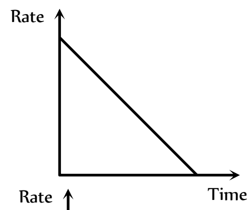
(d)

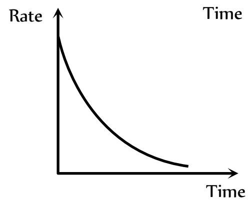


15. In an L–R circuit connected to a battery the rate at which energy is stored in the inductor is plotted against time during the growth of the current in the circuit. Which of the following best represents the resulting curve

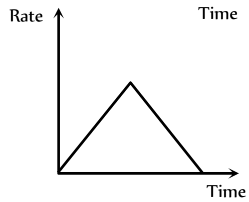
(a)


(b)

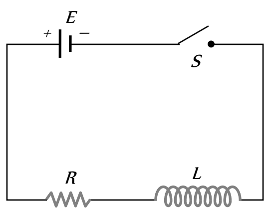


(c)


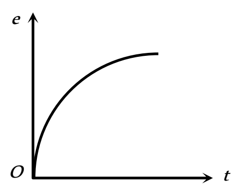
(d)

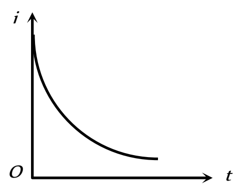


16. Switch S of the circuit shown in figure. is closed at t = 0. If e denotes the induced



emf in L and i, the current flowing through the circuit at time t, which of the following graphs is correct





(a) (b) IV.

(c) (d) 
17. For previous objective, which of the following graphs is correct

(a) (b) (c) (d) 
18. A square loop of side 5 *cm* enters a magnetic field with 1 *cm/s*. The front edge enters the magnetic field at $t = 0$ then which graph best depicts *emf*

(a) (b) (c) (d) 
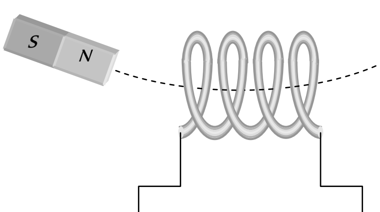
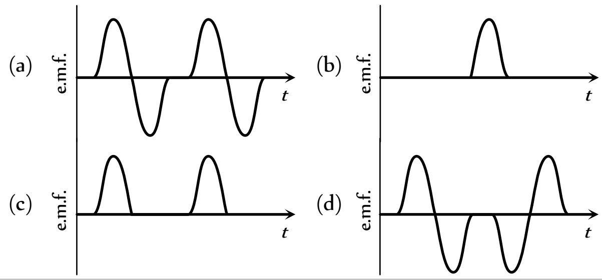
19. A magnet is made to oscillate with a particular frequency, passing through a coil as shown in figure. The time variation of the magnitude of e.m.f. generated across the coil during one cycle is





Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : Eddy currents is produced in any metallic conductor when magnetic flux is changed around it.
Reason : Electric potential determines the flow of charge. **[AIIMS 1995]**

2. Assertion : The quantity *L/R* possesses dimensions of time.
Reason : To reduce the rate of increases of current through a solenoid should increase the time constant (*L/R*). **[AIIMS 2002]**

3. Assertion : Faraday's laws are consequences of conservation of energy.
Reason : In a purely resistive ac circuit, the current lags behind the e.m.f. in phase. **[AIIMS 2002]**

4. Assertion : Only a change in magnetic flux will maintain an induced current the coil.
Reason : The presence of large magnetic flux through a coil maintains a current in the coil if the circuit is continuous. **[AIIMS 1999]**

5. Assertion : Magnetic flux can produce induced e.m.f.
Reason : Faraday established induced e.m.f. experimentally.

6. Assertion : The induced e.m.f. and current will be same in two identical loops of copper and aluminium, when rotated with same speed in the same magnetic field.
Reason : Induced e.m.f. is proportional to rate of change of magnetic field while induced current depends on resistance of wire.

7. Assertion : Inductance coil are made of copper.
Reason : Induced current is more in wire having less resistance.

8. Assertion : Self-inductance is called the inertia of electricity.
Reason : Self-inductance is the phenomenon, according to which an opposing induced e.m.f. is produced in a coil as a result of change in current or magnetic flux linked in the coil.

9. Assertion : When two coils are wound on each other, the mutual induction between the coils is maximum.
Reason : Mutual induction does not depend on the orientation of the coils. **[AIIMS 2005]**

10. Assertion : Acceleration of a magnet falling through a long solenoid decreases.
Reason : The induced current produced in a circuit always flow in such direction that it opposes the change or the cause the produced it.

11. Assertion : An aircraft flies along the meridian, the potential at the ends of its wings will be the same.
Reason : Whenever there is change in the magnetic flux e.m.f. induces.

12. Assertion : A spark occur between the poles of a switch when the switch is opened.
Reason : Current flowing in the conductor produces magnetic field.

13. Assertion : In the phenomenon of mutual induction, self induction of each of the coils persists.
Reason : Self induction arises when strength of current in same coil changes. In mutual induction, current is changing in both the individual coils.

14. Assertion : Lenz's law violates the principle of conservation of energy.
Reason : Induced e.m.f., opposes always the change in magnetic flux responsible for its production.

15. Assertion : The induced emf in a conducting loop of wire will be non zero when it rotates in a uniform magnetic field.
Reason : The emf is induced due to change in magnetic flux.

16. Assertion : An induced emf is generated when magnet is withdrawn from the solenoid.
Reason : The relative motion between magnet and solenoid induces emf.

17. Assertion : An artificial satellite with a metal surface is moving above the earth in a circular orbit. A current will be induced in satellite if the plane of the orbit is inclined to the plane of the equator.
Reason : The current will be induced only when the speed of satellite is more than 8 km/sec.

18. Assertion : A bar magnet is dropped into a long vertical copper tube. Even taking air resistance as negligible, the magnet attains a constant terminal velocity. If the tube is heated, the terminal velocity gets increased.
Reason : The terminal velocity depends on eddy current produced in bar magnet.

19. Assertion : A metal piece and a non-metal (stone) piece are dropped from the same height near earth's surface. Both will reach the earth's surface simultaneously.
Reason : There is no effect of earth's magnetic field on freely falling body.

20. Assertion : A transformer cannot work on dc supply.
Reason : dc changes neither in magnitude nor in direction.

21. Assertion : Soft iron is used as a core of transformer.
Reason : Area of hysteresis is loop for soft iron is small.

22. Assertion : An ac generator is based on the phenomenon of self-induction.
Reason : In single coil, we consider self-induction only.

23. Assertion : An electric motor will maximum efficient when back e.m.f. is equal to applied e.m.f.
Reason : Efficiency of electric motor is depends only on magnitude of back e.m.f..

24. Assertion : The back emf in a dc motor is maximum when the motor has just been switched on.
Reason : When motor is switched on it has maximum speed.

AS Answers and Solutions

Faraday's and Lenz's Law

1. (c) Because induced e.m.f. is given by $E = -N\frac{d\phi}{dt}$.

2. (d) The energy of the field increases with the magnitude of the field. Lenz's law infers that there is an opposite field created due to increase or decrease of magnetic flux around a conductor so as to hold the law of conservation of energy.

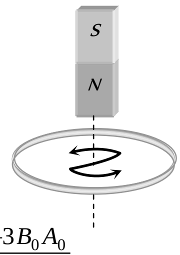
3. (b) We know that $e = \frac{d\phi}{dt}$

But $e = iR$ and $i = \frac{dq}{dt} \Rightarrow \frac{dq}{dt}R = \frac{d\phi}{dt} \Rightarrow dq = \frac{d\phi}{R}$

4. (d) Similar to Q.3

5. (b) Because there is no change in flux linked with coil

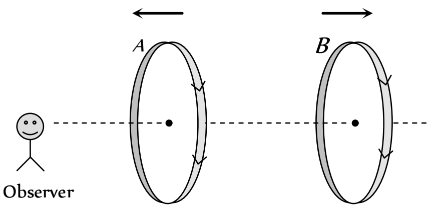
6. (c) As it is seen from the magnet side induced current will be anticlockwise.



7. (a) $e = -\frac{d\phi}{dt} = \frac{-3B_0A_0}{t}$

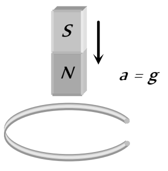
8. (c) $e = -\frac{d\phi}{dt} = -(16t + 3) = -67 units$

9. (a) Induced current in both the coils assist the main current so current through each coil increases.



10. (b) When the magnet is allowed to fall vertically along the axis of loop with its north pole towards the ring. The upper face of the ring will become north pole in an attempt to oppose the approaching north pole of the magnet. Therefore the acceleration in the magnet is less than *g.*

Note : If coil is broken at any point then induced *emf* will be generated in it but no induced current will flow. In this condition the coil will not oppose the motion of magnet and the magnet will fall freely with acceleration *g.* (*i.e. a = g*)



11. (a) $\phi = BA = 10\ weber$

12. (b) The magnitude of induced e.m.f. is directly proportional to the rate of change of magnetic flux. Induced charge doesn't depend upon time.

13. (b)

14. (a) $I = \frac{e}{R} = \frac{-N(d\phi/dt)}{R} = \frac{10\times10^8\times10^{-4}\times10^{-4}\times10}{20} = 5\ A$

15. (d) Induced charge doesn't depend upon the speed of magnet.

16. (d) $|e| = N\left(\frac{\Delta B}{\Delta t}\right).A\cos\theta = 500\times1\times(10\times10^{-2})^2\cos 0 = 5V.$

17. (c) When frequency is high, the galvanometer will not show deflection.

18. (b) $e = -\frac{N(B_2 - B_1)A\cos\theta}{\Delta t}$

$= -\frac{500\times(0-0.1)\times100\times10^{-4}\cos 0}{0.1} = 5V$

19. (b) $e = -\frac{N(B_2 - B_1)A\cos\theta}{\Delta t}$

$= -\frac{50(0.35-0.10)\times\pi(3\times10^{-2})^2\times\cos 0^o}{2\times10^{-3}} = 17.7\ V.$

20. (b) $|e| = A.\frac{\Delta B}{\Delta t} = 2\times\frac{(4-1)}{2} = 3\ V.$

21. (b) $e = -\frac{NBA(\cos\theta_2 - \cos\theta_1)}{\Delta t}$

$= -2000\times0.3\times70\times10^{-4}\frac{(\cos 180 - \cos 0)}{0.1}$

$\Rightarrow e = 84\ V$

22. (c) The induced current will be in such a direction so that it opposes the change due to which it is produced.

23. (b)

24. (b)

25. (d) According to Lenz's law.

26. (c) $e = -N\left(\frac{\Delta B}{\Delta t}\right).A\cos\theta = -100\times\frac{(6-1)}{2}\times(40\times10^{-4})\cos 0$

$\Rightarrow |e| = 1\ V$

27. (d)

28. (b)

29. (d)

30. (d) Emf induces in ring and it will opposes the motion. Hence due to the resistance of the ring all energy dissipates.

31. (b) $\Delta Q = \frac{NBA}{R}(\cos\theta_1 - \cos\theta_2)$

$= \frac{500\times0.2\times0.1(\cos 0 - \cos 180)}{50} = 0.4\ C$

32. (a) $\phi = NBA\cos\theta = 100\times0.2\times5\times10^{-4}\cos 60^o$

$= 5\times10^{-3} Wb$

33. (b) $\Delta Q = \frac{\Delta\phi}{R} = \frac{(10-2)}{2} = 4C$

34. (a)

35. (b)

36. (b) $\phi = \mu_0 niA = 4\pi\times10^{-7}\times\frac{3000}{1.5}\times2\times\pi(2\times10^{-2})^2$

$= 6.31\times10^{-6}\,Wb$

37. (d) $q = -\frac{N}{R}(B_2 - B_1)A\cos\theta$

$32\times10^{-6} = -\frac{100}{(160+40)}(0-B)\times\pi\times(6\times10^{-3})^2\times\cos 0^o$

$\Rightarrow B = 0.565\ T$

38. (a) Faraday's laws involve conversion of mechanical energy into electric energy. This is in accordance with the law of conservation of energy.

39. (a) $e = -\frac{N(B_2 - B_1)A\cos\theta}{\Delta t}$

$\Rightarrow 0.1 = \frac{-50\times(0-2\times10^{-2})\times100\times10^{-4}\times\cos 0^o}{t}$

$\Rightarrow t = 0.1 sec$.

40. (c) $q = \frac{N}{R}d\phi\ \ \therefore q \propto d\phi$

41. (c) $i = \frac{|e|}{R} = \frac{N}{R}.\frac{\Delta B}{\Delta t}A\cos\theta = \frac{20}{100}\times1000\times(25\times10^{-4})\cos 0^o$

$\Rightarrow i = 0.5\ A$

42. (b) According to Lenz's law.

43. (c)

44. (c) E.m.f. or current induces, only when flux linked with the coil changes.

45. (d) $e = -\frac{d\phi}{dt} = -\frac{d}{dt}(3t^2 + 4t + 9) = -(6t+4)$

$e = -[6(2)+4] = -16 \Rightarrow |e| = 16\ volt$

46. (d) $e = -\frac{NBA(\cos\theta_2 - \cos\theta_1)}{\Delta t}$

$= -\frac{800\times4\times10^{-5}\times0.05\,(\cos 90^o - \cos 0^o)}{0.1} = 0.016\ V$

47. (d)

48. (d)

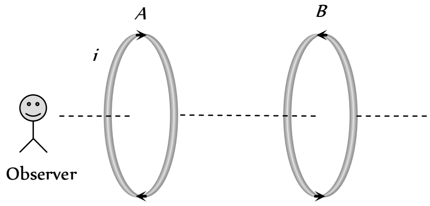
49. (d) $e = -\frac{d\phi}{dt} = -(10t-4) \Rightarrow (e)_{t=2} = -(10\times0.2-4) = 2\ volt$

50. (c)

51. (b)

52. (a) If bar magnet is falling vertically through the hollow region of long vertical copper tube then the magnetic flux linked with the copper tube (due to 'non-uniform' magnetic field of magnet) changes and eddy currents are generated in the body of the tube by Lenz's law the eddy currents opposes the falling of the magnet which therefore experience a retarding force. The retarding force increases with increasing velocity of the magnet and finally equals the weight of the magnet. The magnet then attains a constant final terminal velocity *i.e.* magnet ultimately falls with zero acceleration in the tube.

53. (d)



If current through A increases, crosses (X) linked with coil *B* increases, hence anticlockwise current induces in coil *B.* As shown in figure both the current produces repulsive effect.

54. (b) $e = -\frac{d\phi}{dt} = -\frac{d}{dt}(5t^3 - 100t + 300)$

$= -(15t^2 - 100)$ at $t = 2 sec$; $e = 40\ V$

55. (b) By using $e = -\frac{NBA(\cos\theta_2 - \cos\theta_1)}{\Delta t}$

$e = -\frac{1000\times2\times10^{-5}\times500\times10^{-4}(\cos 180^o - \cos 0^o)}{0.2}$

$= 10^{-2} volt = 10 mV$

56. (a) Similar to Q. 52

57. (c)

58. (a) Induced charge $Q = -\frac{N}{R}(\phi_2 - \phi_1) = \frac{1}{100}(60-10) = 0.5C$

59. (d)

60. (b) $i = \frac{e}{R} = \frac{-N}{R}\frac{(\phi_2 - \phi_1)}{\Delta t} = \frac{-n(W_2 - W_1)}{5Rt}$

61. (a) Magnetic flux linked with the ring changes so current flows through it.

62. (a) $|e| = \frac{d\phi}{dt} = \frac{d}{dt}(5t^2 + 3t + 16) = (10t + 3)$

when $t = 3$ sec, $e_3 = (10\times3+3) = 33\ V$

when $t = 4$ sec, $e_4 = (10\times4+3) = 43\ V$

Hence emf induced in fourth second

$= e_4 - e_3 = 43 - 33 = 10\ V$

63. (d) $e = \frac{-NBA(\cos\theta_2 - \cos\theta_1)}{\Delta t}$

$= -\frac{500\times4\times10^{-4}\times0.1(\cos 90 - \cos 0)}{0.1} = 0.2\ V$

64. (d) $q = \frac{N}{R}(\Delta\phi) = \frac{1}{2}\times(10-2) = 4C$

65. (c) At low frequency of 1 to 2 *Hz,* oscillations may be observed as our eyes will be able to detect it.

66. (c) Since the magnetic field is uniform therefore there will be no change in flux hence no current will be induced.

67. (a) $\phi = BA$

$\Rightarrow$ change in flux $d\phi = B.dA = 0.05\,(101-100)\,10^{-4}$

$= 5.10^{-6}$ Wb.

Now, charge $dQ = \frac{d\phi}{R} = \frac{5\times10^{-6}}{2} = 2.5\times10^{-6}\,C$.

68. (b) $\Delta Q = \frac{\Delta\phi}{R} = \frac{n\times BA}{R}$

$\Rightarrow B = \frac{\Delta Q.R}{nA} = \frac{2\times10^{-4}\times80}{40\times4\times10^{-4}} = 1\,Wb/m^2$

Motional EMI

1. (a) Emf = $e = e_0\sin\theta$; e will be maximum when θ is 90° *i.e.* plane of the coil will be horizontal.

2. (b) Induced e.m.f. $= Blv = 0.3\times10^{-4}\times10\times5$

$= 1.5\times10^{-3}\,V = 1.5\,mV$

3. (d) Conductor cuts the flux only when, if it moves in the direction of *M*.

4. (c) $e = B_v.vl = 0.2\times10^{-4}\times\left(\frac{180\times1000}{3600}\right)\times1 = 10^{-3}\,V$

5. (b) $e = Bvl = 3\times10^{-3}\times10^2 = 0.3\,volt$

6. (b) This is the case of periodic EMI

7. (b) $e = B_v.v.l = 2\times10^{-4}\times\left(\frac{360\times1000}{3600}\right)\times50 \Rightarrow e = 1\,V$

8. (c) $e = \frac{1}{2}B\omega r^2 = \frac{1}{2}\times0.1\times2\pi\times10\times(0.1)^2 = \pi\times10^{-2}\,V$

9. (d) $e = \frac{1}{2}B\omega r^2 = \frac{1}{2}\times0.2\times10^{-4}\times5\times(1)^2 = 50\,\mu V$

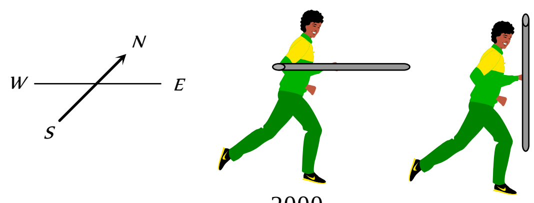
10. (d) No flux change is taking place because magnetic field exists everywhere and is constant in time and space.

11. (b) If player is running with rod in vertical position towards east, then rod cuts the magnetic field of earth perpendicularly (magnetic field of earth is south to north).

Hence Maximum emf induced is

$e = Bvl = 4\times10^{-5}\times\frac{30\times1000}{3600}\times3 = 1\times10^{-3}\,volt$

When he is running with rod in horizontal position, no field is cut by the rod, so $e = 0$.



12. (c) $e = NBA\omega;\ \omega = 2\pi f = 2\pi\times\frac{2000}{60}$

$\therefore e = 50\times0.05\times80\times10^{-4}\times2\pi\times\frac{2000}{60} = \frac{4\pi}{3}$

13. (b)

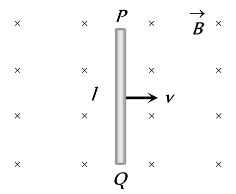
14. (c) According to Fleming right hand rule, the direction of *B* will be perpendicular to the plane of paper and act downward.

15. (d) By Fleming's right hand rule.

16. (c) $e = Bvl \Rightarrow e \propto v \propto gt$

17. (c) $e = Bvl = 0.5\times2\times1 = 1\,V$

18. (b) A motional emf $e = Bvl$ is induced in the rod, or we can say, a potential difference is induced between the two ends of the rod *AB*, with *P* at higher potential and *Q* at lower potential. Due to this potential difference, there is an electric field in the rod.



19. (c)

20. (b) $e = Bvl \Rightarrow e = 0.7\times2\times(10\times10^{-2}) = 0.14\,V$

21. (d) $e = Bvl \Rightarrow e = 0.9\times7\times0.4 = 2.52\,V$

22. (d)

23. (d)

24. (d) $e = Bl^2\pi\nu = 0.4\times10^{-4}\times(0.5)^2\times(3.14)\times\frac{120}{60}$

$= 6.28\times10^{-5}\,V$

25. (c) $e = \frac{1}{2}Bl^2\omega = \frac{1}{2}\times0.3\times(2)^2\times100 = 60V$

26. (a) $e = Bvl = 5\times10^{-5}\times\frac{360\times1000}{3600}\times20 = 0.1V$

27. (c)

28. (c) Peak value of $emf = e_0 = \omega NBA = 2\pi\nu NBA$

$= 2\pi\times50\times300\times4\times10^{-2}\times(25\times10^{-2}\times10\times10^{-2})$

$= 30\,\pi\,volt$

29. (c) $e = \frac{1}{2}Bl^2\omega = Bl^2\pi\nu$

$\Rightarrow e = 0.5(20\times10^{-2})^2\times3.14\times100 = 6.28\,V$

30. (d)

31. (b) $e_0 = \omega NBA = (2\pi\nu)NB(\pi r^2) = 2\times\pi^2\nu\,NBr^2$

$= 2\times(3.14)^2\times\frac{1800}{60}\times4000\times0.5\times10^{-4}\times(7\times10^{-2})^2$

$= 0.58\,V$

32. (b) Two emf's induces in the closed circuit each of value $Bl\,v$. These two emf's are additive. So $E_{net} = 2Bl\,v$.

33. (b) When a conductor lying along the magnetic north-south, moves eastwards it will cut vertical component of B_0. So induced *emf*

$e = vB_Vl = v(B_0\sin\delta\,l) = B_0lv\sin\delta$.

Static EMI

1. (d) $e = -L\frac{di}{dt}$ but $e = 4V$ and $\frac{di}{dt} = \frac{0-1}{10^{-3}} = -1/10^{-3}$

$\therefore \frac{-1}{10^{-3}}(-L) = 4 \Rightarrow L = 4\times 10^{-3}\, henry$

2. (d) $L = \frac{e}{di/dt} = \frac{5}{(3-2)/10^{-3}} = \frac{5}{1}\times 10^{-3} = 5 millihenry$

3. (b) Energy stored $E = \frac{1}{2}Li^2 = \frac{1}{2}\times 50\times 10^{-3}\times 4 = 0.1\ J$

4. (a) Given $\frac{di}{dt} = 2A/sec.,\ L = 5\ H\ \therefore e = L\frac{di}{dt} = 5\times 2 = 10\ V$

5. (d) As we know $e = -\frac{d\phi}{dt} = -L\frac{di}{dt}$

Work done against back e.m.f. e in time dt and current i is

$dW = -eidt = L\frac{di}{dt}idt = Li\,di \Rightarrow W = L\int_0^i i\,di = \frac{1}{2}Li^2$

6. (d) Induced emf $e = M\frac{di}{dt} = \frac{\mu_0 N_1 N_2 A}{l}.\frac{di}{dt}$

$= \frac{4\pi\times 10^{-7}\times 2000\times 300\times 1.2\times 10^{-3}}{0.30}\times\frac{|2-(-2)|}{0.25}$

$= 48.2\times 10^{-3}\ V = 48\ mV$

7. (c) Self inductance $L = \mu_0 N^2 A/l = \mu_0 n^2 lA$

Where n is the number of turns per unit length and N is the total number of turns and $N = nl$

In the given question n is same. A is increased 4 times and l is increased 2 times and hence L will be increased 8 times.

8. (c) $M = -\frac{e_2}{di_1/dt} = -\frac{e_1}{di_2/dt}$

Also $e_1 = -L_1\frac{di_1}{dt}.e_2 = -L_2\frac{di_2}{dt}$

$M^2 = \frac{e_1 e_2}{\left(\frac{di_1}{dt}\right)\left(\frac{di_2}{dt}\right)} = L_1 L_2 \Rightarrow M = \sqrt{L_1 L_2}$

9. (c) Inductance is inherent property of electrical circuits. It will always be found in an electrical circuit whether we want it or not. The circuit in which a large emf is induced when the current in the circuit changes is said to have greater inductance. A straight wire carrying current with no iron part in the circuit will have lesser value of inductance while if the circuit contains a circular coil having many number of turns, the induced emf to oppose the cause will be greater and the circuit is therefore said to have greater value of inductance.

10. (c) Magnetic flux $\phi = LI$

By analogy, since physical quantities mass *(m)* and linear velocity *(v)* are equivalent to electrical quantities inductance *(L)* and current *(I)* respectively. Thus magnetic flux $\phi = LI$ is equivalent to momentum $\mathbf{p} = m\times \mathbf{v}$.

11. (a) Energy stored $= \frac{1}{2}Li^2$, where Li is a magnetic flux.

12. (b) $L = \mu ni \Rightarrow \frac{L_2}{L_1} = \frac{\mu}{\mu_0}$ (n and i are same)

$\Rightarrow L_2 = \mu_r L_1 = 900\times 0.18 = 162\, mH$

13. (b) $e = M\frac{di}{dt} = 0.2\times 5 = 1\ V$

14. (d) $e = -L\frac{di}{dt} \Rightarrow 2 = -L\left(\frac{8-2}{3\times 10^{-2}}\right) \Rightarrow L = 0.01\ H = 10\ mH$

15. (d) $e = M\frac{di}{dt} = 1.25\times 80 = 100\ V$

16. (b) $\frac{L_B}{L_A} = \left(\frac{n_B}{n_A}\right)^2 \Rightarrow L_B = \left(\frac{500}{600}\right)^2\times 108 = 75\ mH$

17. (a) $L \propto N^2$ *i.e.* $\frac{L_1}{L_2} = \left(\frac{N_1}{N_2}\right)^2 \Rightarrow L_2 = L_1\left(\frac{N_2}{N_1}\right)^2 = 4L_1$

18. (b) $e = -L\frac{di}{dt} \Rightarrow 8 = L\frac{(4-2)}{0.05} \Rightarrow L = 0.2\ H$

19. (b) $e = M\frac{di}{dt} \Rightarrow M = \frac{15000}{3}\times 0.001 = 5\ H$

20. (b) $L = \frac{e}{di/dt} = \frac{12}{48/60} = 15\ H$

21. (a) $B = \frac{\mu_0 Ni}{2r} = \frac{4\pi\times 10^{-7}\times 100\times 2\times\sqrt{\pi}}{2\times 10^{-2}} = 0.022\ wb/m^2$

22. (d) $e = M\frac{di}{dt} = 0.09\times\frac{20}{0.006} = 300\ V$

23. (c)

24. (c) Inductors obey the laws of parallel and series combination of resistors.

25. (b) There will be self induction effect when soft iron core is inserted.

26. (c) $L = \mu_0 N^2 A/l$

27. (b)

28. (c) $e = -L\frac{di}{dt} \Rightarrow e = 5\times\frac{1}{5} = 1\ volt$

29. (c) $e = L\frac{di}{dt} \Rightarrow L = \frac{Volt-\sec}{Ampere}$

30. (d) $e = -L\frac{di}{dt} = -0.4\times 10^{-3}\times\frac{250\times 10^{-3}}{0.1} = -1\ mV$

31. (b) In steady state current passing through solenoid

$i = \frac{E}{R} = \frac{10}{10} = 1\ A$

32. (a) $e = L\frac{di}{dt} \Rightarrow 2 = L\times\frac{6}{3\times 10^{-3}} \Rightarrow L = 1\ mH$

33. (b) From $i = i_0[1 - e^{-Rt/L}]$, where $i_0 = \frac{5}{5} = 1\ amp$

$\therefore i = 1\left(1 - e^{\frac{-5\times 2}{10}}\right) = (1 - e^{-1})amp$

34. (c) $M = \frac{\mu_0 N_1 N_2 A}{l}$

35. (d) $e = L\frac{di}{dt} = 60\times 10^{-6}.\frac{(1.5-1.0)}{0.1} = 3\times 10^{-4}\,volt$

36. (a) $\phi = Li \Rightarrow NBA = Li$

Since magnetic field at the centre of circular coil carrying current is given by $B = \frac{\mu_0}{4\pi}.\frac{2\pi Ni}{r}$

$\therefore N.\frac{\mu_0}{4\pi}.\frac{2\pi Ni}{r}.\pi r^2 = Li \Rightarrow L = \frac{\mu_0 N^2 \pi r}{2}$

Hence self inductance of a coil

$= \frac{4\pi\times 10^{-7}\times 500\times 500\times \pi\times 0.05}{2} = 25\ mH$

37. (a) Induced $e.m.f.$ $e = M\frac{di}{dt} \Rightarrow 100\times 10^{-3} = M\left(\frac{10}{0.1}\right)$

$\therefore M = 10^{-3}H = 1\,mH$

38. (c) $\frac{\Delta i}{\Delta t} = \frac{10}{2} = 5\ A/\sec \Rightarrow e = L\frac{\Delta i}{\Delta t} = 0.5\times 5 = 2.5\ volts$

39. (c) Time in which the current will decay to $\frac{1}{e}$ of its steady value is $t = \tau = \frac{L}{R} = \frac{50}{10} = 5$ *seconds*

40. (a)

41. (d) $L \propto N^2$

42. (a) $e_2 = M\frac{di_1}{dt} \Rightarrow i_2 R_2 = M\frac{di_1}{dt} \Rightarrow 0.4\times 5 = 0.5\times\frac{di_1}{dt}$

$\Rightarrow \frac{di_1}{dt} = 4\ A/\sec.$

43. (a) $U = \frac{1}{2}Li^2 = \frac{1}{2}\times(50\times 10^{-3})\times(4)^2 = 400\times 10^{-3} = 0.4\,J$

44. (b) $e = -L\left(\frac{di}{dt}\right) \Rightarrow 8 = -L\times\left(-\frac{2}{0.05}\right) \Rightarrow L = 0.2H$

45. (b) $U = \frac{1}{2}Li^2$ i.e. $\frac{U_2}{U_1} = \left(\frac{i_2}{i_1}\right)^2 = \left(\frac{1}{2}\right)^2 = \frac{1}{4} \Rightarrow U_2 = \frac{1}{4}U_1$

46. (a, b, c, d)

47. (c) $|e| = L\frac{di}{dt} \Rightarrow 220 = L\times\frac{10}{0.5} \Rightarrow L = 11\ H$

48. (b)

49. (d) $t = \tau = \frac{L}{R} = \frac{2.5}{0.5} = 5$ sec

50. (c) $L = \mu_0\frac{N^2}{l}A$. When N and l are doubled. L is also doubled.

51. (c) Energy $= \frac{1}{2}LI^2 = \frac{1}{2}\times 100\times 10^{-3}\times 1^2 = 0.05J$

52. (b) $e = -M\frac{di}{dt} = -5\times\frac{(-5)}{10^{-3}} = 25000\ V$

53. (a) $L \propto n$ (Number of turns), For straight conductor $n = 0$, hence $L = 0$.

54. (a) $\Delta\phi = L\Delta I \Rightarrow L = \frac{\Delta\phi}{\Delta I} = \frac{2\times 10^{-2}}{0.01} = 2H$

55. (a) $e = L\frac{di}{dt} \Rightarrow 100 = L\times\frac{4}{0.1} \Rightarrow L = 2.5\ H$

56. (a) The inductances are in parallel $\Rightarrow L_{eq} = \frac{L}{3} = \frac{3}{3} = 1\ H$

57. (a) $|e| = M\frac{di}{dt} \Rightarrow 8\times 10^{-3} = M\times 3 \Rightarrow A_1 = 2.66mH$

58. (d) $|e| = L\frac{di}{dt} \Rightarrow 10 = L\times\frac{10}{1} \Rightarrow L = 1H$

59. (a) $N\phi = Li \Rightarrow \phi = \frac{Li}{N} = \frac{8\times 10^{-3}\times 5\times 10^{-3}}{400} = 10^{-7} = \frac{\mu_0}{4\pi}wb$

60. (b) According to Lenz's law.

61. (d) $N\phi = Li \Rightarrow \frac{Nd\phi}{dt} = \frac{Ldi}{dt} \Rightarrow NB\frac{dA}{dt} = \frac{Ldi}{dt}$

$\Rightarrow \frac{1\times 1\times 5}{10^{-3}} = L\times\left(\frac{2-1}{2\times 10^{-3}}\right) \Rightarrow L = 10H$

62. (b) $L = \frac{\mu_0 N^2 A}{l} = \frac{4\pi\times 10^{-7}\times(500)^2\times 20\times 10^{-4}}{0.5} = 1.25mH$

63. (a) $L_S = L_1 + L_2 = 10H$ ..... (i)

$L_P = \frac{L_1 L_2}{L_1 + L_2} = 2.4H$ ..... (ii)

On solving (i) and (ii) $L_1 L_2 = 24$ ..... (iii)

Also $(L_1 - L_2)^2 = (L_1 + L_2)^2 - 4L_1 L_2$

$\Rightarrow (L_1 - L_2)^2 = (10)^2 - 4\times 24 = 4 \Rightarrow L_1 - L_2 = 2H$

64. (d) $e = L\frac{di}{dt} \Rightarrow 12 = L\times\frac{45}{60} \Rightarrow L = 16H$

65. (a) $|e| = L\frac{di}{dt} \Rightarrow 1 = \frac{L\times\{10-(-10)\}}{0.5} \Rightarrow L = 25mH$

66. (d) $U = \frac{1}{2}Li^2 \Rightarrow U = \frac{1}{2}\times 5\times\left(\frac{100}{10}\right)^2 = 250J$

67. (c) $\phi = Mi \Rightarrow M = \frac{1.2\times 10^{-2}}{0.01} = 1.2H$

68. (c) $U = \frac{1}{2}Li^2 \Rightarrow U = \frac{1}{2}\times 40\times 10^{-3}\times(2)^2 = 0.08J$

69. (c) $L \propto N^2$

70. (b) $N_2\phi_2 = Mi_1 \Rightarrow 9\times10^{-5} = M\times3 \Rightarrow M = 3\times10^{-5}H$

71. (a) $|e| = L\frac{di}{dt} \Rightarrow 20 = L\times\frac{(18-2)}{0.05} \Rightarrow L = 62.5\ mH$

72. (b) $|e| = L\frac{di}{dt} \Rightarrow |e| = 10\times10^{-6}\times\frac{1}{10} = 1\mu V$

73. (c)

74. (b) $\phi_T = Li \Rightarrow L = \frac{10^{-5}}{5\times10^{-3}} = 2mH$

75. (a) $L \propto N^2$

76. (c) $e = -L\frac{di}{dt}$, since current decreases so $\frac{di}{dt}$ is negative, hence $e = -5\times(-2) = +10V$

77. (c) $e = L\frac{di}{dt} \Rightarrow e = 0.1\times200 = 20V$

78. (c) $e = M\frac{di}{dt} \Rightarrow e = 0.1\times\frac{(20-0)}{0.02} = 100V$

79. (c) $L = \frac{\mu_0 N^2 A}{l} = \frac{4\pi\times10^{-7}\times(1000)^2\times10\times10^{-4}}{1}$

$=1.256\ mH$

80. (d) In secondary e.m.f. induces only when current through primary changes.

81. (b)

82. (c)

83. (a) $e = L\frac{di}{dt} \Rightarrow 8 = L\times\frac{(2-(-2))}{0.05} \Rightarrow L = 0.1H$

84. (b) $U = \frac{1}{2}Li^2 = \frac{1}{2}L\left(\frac{E}{R}\right)^2 = \frac{1}{2}\times5\times\left(\frac{100}{20}\right)^2 = 62.50J$

85. (a)

86. (a)

87. (a) $e = -L\frac{di}{dt} \Rightarrow 0.4 = -\frac{L(0.2-1)}{10} \Rightarrow L = 5\ H$

88. (c) $|e| = L\frac{di}{dt} \Rightarrow 30 = L\times\frac{(6-0)}{0.3} \Rightarrow L = 1.5\ H$

89. (b) $i = i_0\left(1-e^{-\frac{Rt}{L}}\right) \Rightarrow \frac{di}{dt} = -i_0\left(-\frac{R}{L}\right)e^{-\frac{Rt}{L}} = \frac{i_0R}{L}.e^{-\frac{Rt}{L}}$

At $t = 0$; $\frac{di}{dt} = \frac{i_0R}{L} = \frac{E}{L} \Rightarrow 4 = \frac{E}{20} \Rightarrow E = 80\ V$

90. (d) $N\phi = Li \Rightarrow 100\times10^{-5} = L\times5 \Rightarrow L = 0.2\ mH.$

91. (d) When the two coils are joined in series such that the winding of one is opposite to the other, then the emf produced in first coil is 180° out of phase of the emf produced in second coil.

Thus, emf produced in first coil is negative and the emf produced in second coil is positive so, net inductance is

$L = L_1 + L_2 = L + L \Rightarrow L = -\frac{\phi}{i} + \frac{\phi}{i} = 0$

92. (a) $e = M\frac{di}{dt} \Rightarrow 1.5 = M\times\frac{30}{0.1} \Rightarrow M = 0.05\ H$

93. (d)

94. (c) Current in B_1 will promptly become zero while current in B_2 will slowly tend to zero.

95. (b)

96. (c) When battery disconnected current through the circuit start decreasing exponentially according to $i = i_0e^{-Rt/L}$

$\Rightarrow 0.37i_0 = i_0e^{-Rt/L} \Rightarrow 0.37 = \frac{1}{e} = e^{-Rt/L} \Rightarrow t = \frac{L}{R}$

97. (a) Current at any instant of time t after closing an L-R circuit is given by $I = I_0\left[1-e^{\frac{-R}{L}t}\right]$

Time constant $t = \frac{L}{R}$

$\therefore I = I_0\left[1-e^{\frac{-R}{L}\times\frac{L}{R}}\right] = I_0(1-e^{-1}) = I_0\left(1-\frac{1}{e}\right)$

$= I_0\left(1-\frac{1}{2.718}\right) = 0.63I_0 = 63\%$ of I_0

98. (c) $i = \frac{V}{R} = \frac{10}{2} = 5A$

$U = \frac{1}{2}Li^2 = \frac{1}{2}\times2\times25 = 25\ J$

99. (d)

100. (d) Time constant $= \frac{L}{R} = \frac{40}{8} = 5$ sec.

101. (b) $t = \tau = \frac{L}{R} = \frac{60}{30} = 2\,\text{sec}.$

102. (c)

103. (b)

104. (a) $\nu_0 = \frac{1}{2\pi\sqrt{(0.25)\times(0.1\times10^{-6})}} = \frac{10^4}{9.93} = 1007\,Hz$

105. (c) $\nu_0 = \frac{1}{2\pi\sqrt{LC}} = \frac{1}{2\times3.14\sqrt{5\times10^{-4}\times20\times10^{-6}}}$

$\nu_0 = \frac{10^4}{6.28} = 1592\ Hz$

106. (d) $i = i_0\left(1-e^{\frac{-Rt}{L}}\right) \Rightarrow$ For $i = \frac{i_0}{2}$, $t = 0.693\frac{L}{R}$

$\Rightarrow t = 0.693\times\frac{300\times10^{-3}}{2} = 0.1\,sec$

107. (c) $|e| = L\left|\frac{di}{dt}\right| = 0.5 \times \frac{10}{2} = 2.5V$

108. (c) Time period of LC circuit oscillations

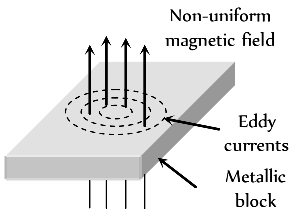
$T = 2\pi\sqrt{LC} \Rightarrow$ dimensions of $\sqrt{LC}$ is Time.

Application of EMI (Motor, Dynamo, Transformer...)

1. (b) Hot wire ammeter is not based on the phenomenon of electromagnetic induction.

2. (d)

3. (c) Direction of eddy currents is given by Lenz's rule.



4. (c) In a generator. e.m.f. is induced according as Lenz's rule.

5. (a)

6. (d)

7. (a) Circulation of eddy currents is prevented by use of laminated core.

8. (a)

9. (c)

10. (a)

11. (b) $e \propto \omega$

12. (b)

13. (a) Rotation of magnet in the dynamo creates the variable flux which in turn produces the induced current.

14. (b)

15. (b) With the increasing speed, ω increases. Thus current reduces due to increase in the back e.m.f.

Moreover $i = \frac{V - K\omega}{R}$. More ω will lead to the lesser current.

16. (c) Commutator converts ac into fluctuating dc.

17. (d) Only ac dynamo have slip rings.

18. (b) $e \propto \frac{d\phi}{dt}$; if $\phi \to$ maximum then $e \to$ minimum.

19. (d)

20. (c) Motor e.m.f. equation $E_b = V - I_a R_a$

At starting $E_b = 0$, so I_a will be maximum.

21. (d) $i = \frac{E-e}{R} \Rightarrow 1.5 = \frac{220 - e}{20} \Rightarrow e = 190\ V$

22. (d)

23. (d) $e_0 = \omega NBA = (2\pi\nu)\ NBA$

$= 2 \times 3.14 \times 1000 \times 5000 \times 0.2 \times 0.25 = 157\ kV$

24. (a) Back emf $\propto$ speed of motor.

25. (d)

26. (b)

27. (a) Efficiency $\eta = 50\%$ So $e = E/2$

and $i = \frac{E-e}{R} \Rightarrow i = \frac{E - E/2}{R} = \frac{E}{2R}$

$\Rightarrow R = \frac{E}{2i} = \frac{60}{2 \times 10} = 3\Omega$

28. (c)

29. (c) $\eta = \frac{e}{E} \times 100 \Rightarrow e = 0.3\ E$

Now, $i = \frac{E-e}{R} \Rightarrow 12 = \frac{50 - (0.3 \times 50)}{R} \Rightarrow R = 2.9\Omega$

30. (a) $i = \frac{E-e}{R} = \frac{220 - 210}{2} = \frac{10}{2} = 5A$

31. (a)

32. (c) A transformer is a device to convert alternating current at high voltage into low voltage and *vice-versa.*

33. (b) We know that for step down transformer

$V_p > V_s$ but $\frac{V_p}{V_s} = \frac{i_s}{i_p}$; $\therefore i_s > i_p$

Current in the secondary coil is greater than the primary.

34. (c)

35. (a)

36. (b) Transformation ratio $k = \frac{N_s}{N_p} = \frac{V_s}{V_p}$

For step-up transformers, $N_s > N_p$ *i.e.* $V_s > V_p$, hence $k > 1$.

37. (a) $\frac{V_p}{V_s} = \frac{N_p}{N_s} \Rightarrow N_p = \left(\frac{220}{2200}\right) 2000 = 200$

38. (c) Provided no power looses, being assumed.

39. (a) $\frac{N_s}{N_p} = \frac{V_s}{V_p} \Rightarrow \frac{200}{100} = \frac{V_s}{120} \Rightarrow V_s = 240\ V$

also $\frac{V_s}{V_p} = \frac{i_p}{i_s} \Rightarrow \frac{240}{120} = \frac{10}{i_s} \Rightarrow i_s = 5\ A$

40. (c) $\frac{N_s}{N_p} = \frac{V_s}{V_p} \Rightarrow \frac{1}{20} = \frac{V_s}{2400} \Rightarrow V_s = 120\ V$

For 100% efficiency $V_s i_s = V_p i_p$

$\Rightarrow 120 \times 80 = 2400\ i_p \Rightarrow i_p = 4\ A$

41. (b) $\frac{V_p}{V_s} = \frac{N_p}{N_s} = \frac{500}{2500} = \frac{1}{5} \Rightarrow V_p = \frac{200}{5} = 40\ V$

Also $i_p V_p = i_s V_s \Rightarrow i_p = i_s \frac{V_s}{V_p} = 8 \times 5 = 40\ A$

42. (a) $\frac{N_s}{N_p} = \frac{V_s}{V_p} \Rightarrow \frac{250}{100} = \frac{V_s}{28/\sqrt{2}} \Rightarrow V_s = 50\ V$

43. (d) $\eta = \frac{V_s i_s}{V_p i_p} \times 100 = \frac{11 \times 90}{220 \times 5} \times 100 = 90\ \%$

44. (d) Transformer doesn't work on dc

45. (b)

46. (b)

47. (a) For 100% efficient transformer

$V_s i_s = V_p i_p \Rightarrow \frac{V_s}{V_p} = \frac{i_p}{i_s} = \frac{N_s}{N_p} \Rightarrow \frac{i_p}{4} = \frac{25}{100} \Rightarrow i_p = 1\ A$

48. (a)

49. (d) $\frac{N_s}{N_p} = \frac{i_p}{i_s} \Rightarrow i_s = i_p \times \frac{N_p}{N_s} = 2 \times \frac{100}{20} = 10\ A$

50. (a) $\frac{V_s}{V_p} = \frac{i_p}{i_s} \Rightarrow i_p = \frac{11000 \times 2}{220} = 100\ A$

51. (c) $\frac{N_p}{N_s} = \frac{V_p}{V_s} = \frac{i_s}{i_p}$. The transformer is step-down type, so primary coil will have more turns. Hence

$\frac{5000}{500} = \frac{2200}{V_s} = \frac{i_s}{4} \Rightarrow V_s = 220\ V, i_s = 40\ amp$

52. (b) $i_s = \frac{P_s}{V_s} = \frac{4.4 \times 10^3}{11 \times 10^3} = 0.4\ A$

53. (b) $\frac{N_s}{N_p} = \frac{V_s}{V_p} = \frac{22000}{220} = 100$

54. (b)

55. (a)

56. (b) $\frac{N_s}{N_p} = \frac{i_p}{i_s}$ or $\frac{25}{1} = \frac{i_p}{2} \Rightarrow i_p = 50A$

57. (c) $\frac{V_s}{V_p} = \frac{N_s}{N_p} \Rightarrow V_s = \frac{N_s}{N_p} \times V_p = \frac{10}{200} \times 240 = 12\ volts$

58. (a) $\frac{V_s}{V_p} = \frac{N_s}{N_p} \Rightarrow \frac{V_s}{20} = \frac{5000}{500} \Rightarrow V_s = 200\ V$

Frequency remains unchanged.

59. (a) $\frac{V_s}{V_p} = \frac{N_s}{N_p} = k \Rightarrow \frac{V_s}{30} = \frac{3}{2} \Rightarrow V_s = 45\ V$

60. (a) $\frac{N_s}{N_p} = \frac{i_p}{i_s} \Rightarrow \frac{i_p}{i_s} = \frac{4}{5}$

61. (d) $V_p = 200\ V,\ V_s = 6V$

$P_{out} = V_s i_s \Rightarrow 30 = 6 \times i_s \Rightarrow i_s = 5\ A$

From $\frac{V_s}{V_p} = \frac{i_p}{i_s} \Rightarrow \frac{6}{200} = \frac{i_p}{5} \Rightarrow i_p = 0.15\ A$

62. (b) $\frac{E_p}{E_s} = \frac{N_p}{N_s} \Rightarrow \frac{200}{E_s} = \frac{100}{20} \Rightarrow E_s = 40\ V$

63. (d) Since all the losses are neglected.

So $P_{out} = P_{in}$

64. (c)

65. (b) $\frac{i_p}{i_s} = \frac{N_s}{N_p} \Rightarrow \frac{i_p}{4} = \frac{1}{100} \Rightarrow i_p = 0.04\ A$

66. (b) $N_p : N_s = 1:10$ and $V_s = 0.5 \times 200 = 100\ V$

$\frac{V_s}{V_p} = \frac{N_s}{N_p} \Rightarrow \frac{100}{V_p} = \frac{10}{1} \Rightarrow V_p = 10\ V$

$\frac{i_p}{i_s} = \frac{N_s}{N_p} \Rightarrow \frac{i_p}{0.5} = \frac{10}{1}, i_p = 5\ amp$

67. (c)

68. (d) $\frac{V_p}{V_s} = \frac{i_s}{i_p} \Rightarrow \frac{220}{22000} = \frac{i_s}{5} \Rightarrow i_s = 0.05\ amp$

69. (b) $\frac{V_p}{V_s} = \frac{i_s}{i_p} \Rightarrow i_s = 4 \times \frac{140}{280} = 2A$

70. (c) $P_s = V_s i_s \Rightarrow 1000 = V_s \times 8 \Rightarrow V_s = \frac{1000}{8}$

$\frac{V_p}{V_s} = \frac{N_p}{N_s} \Rightarrow \frac{(1000/8)}{500} = \frac{100}{N_s} \Rightarrow N_s = 400$

71. (a) Transformer works on ac only.

72. (b) $\frac{N_s}{N_p} = \frac{V_s}{V_p} = \frac{2200}{220} = \frac{10}{1}$

73. (c) Transformation ratio $k = \frac{V_s}{V_p} \Rightarrow \frac{5}{3} = \frac{V_s}{60} \Rightarrow V_s = 100\ V$

74. (c) $\frac{N_s}{N_p} = \frac{V_s}{V_p} \Rightarrow \frac{N_s}{600} = \frac{2200}{220} \Rightarrow N_s = 6000$

75. (b) For 100% efficiency $V_s i_s = V_p i_p$

$\Rightarrow 1100 \times 2 = 220 \times i_p \Rightarrow i_p = 10A$

76. (c)

77. (c) Amplitude of the current $i_0 = \frac{e_0}{R} = \frac{\omega NBA}{R} = \frac{2\pi\nu NB(\pi r^2)}{R}$

$i_0 = \frac{2\pi \times 1 \times 10^{-2} \times \pi(0.3)^2}{\pi^2} = 6 \times 10^{-3} A = 6mA$

78. (a) $\frac{N_s}{N_p} = \frac{i_p}{i_s} \Rightarrow \frac{2000}{500} = \frac{48}{i_s} \Rightarrow i_s = 12A$

79. (a) $U = \frac{1}{2}Li^2 = \frac{1}{2} \times 100 \times 10^{-3} \times (10)^2 = 5J$

80. (c) As $\frac{I_P}{I_s} = \frac{n_p}{n_s}$; *i.e.* $\frac{3}{I_s} = \frac{3}{2} \Rightarrow I_s = 2A$.

81. (a)

82. (b)

83. (a) $\eta = \frac{\text{outputpower}}{\text{inputpower}} = \frac{E_s I_s}{E_p I_p} \Rightarrow \frac{80}{100} = \frac{200 \times I_s}{4 \times 10^3}$

$\Rightarrow I_S = \frac{80}{100} \times \frac{4 \times 1000}{200} = 16A$

Also, $E_p I_p = 4KW \Rightarrow I_p = \frac{4\times10^3}{100} = 40A$

84. (a) $\frac{N_P}{N_S} = \frac{I_S}{I_P} \Rightarrow I_P = \frac{N_S}{N_P} I_S = \frac{10}{1}\times 2 = 20\ A$.

85. (b)

86. (a) $\eta = \frac{\text{Output}}{\text{Input}} \Rightarrow \frac{80}{100} = \frac{20\times20}{1000\times i_l}$

$\Rightarrow i_l = \frac{20\times120\times100}{1000\times80} = 3A$.

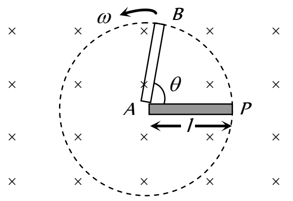
Critical Thinking Questions

1. (d) If electron is moving from left to right, the flux linked with the loop (which is into the page) will first increase and then decrease as the electron passes by. So the induced current in the loop will be first anticlockwise and will change direction as the electron passes by.

2. (a) If in time t the rod turns by an angle θ, the area generated by the rotation of rod will be

$= \frac{1}{2} l \times l\theta = \frac{1}{2} l^2\theta$

So the flux linked with the area generated by the rotation of rod



$$\phi = B\left(\frac{1}{2}l^2\theta\right)\cos 0 = \frac{1}{2}Bl^2\theta = \frac{1}{2}Bl^2\omega t$$

And so $e = \frac{d\phi}{dt} = \frac{d}{dt}\left(\frac{1}{2}Bl^2\omega t\right) = \frac{1}{2}Bl^2\omega$

3. (a, c, d) From Faraday's Law, the induced voltage $V \propto L$

rate of change of current is constant $\left(V = -L\frac{di}{dt}\right)$

$\therefore \frac{V_2}{V_1} = \frac{L_2}{L_1} = \frac{2}{8} = \frac{1}{4} \Rightarrow \frac{V_1}{V_2} = 4$

Power given to the two coils is same, *i.e.*,

$V_1 i_1 = V_2 i_2 \Rightarrow \frac{i_1}{i_2} = \frac{V_2}{V_1} = \frac{1}{4}$

Energy stored $W = \frac{1}{2}Li^2$

$\Rightarrow \frac{W_2}{W_1} = \left(\frac{L_2}{L_1}\right)\left(\frac{i_2}{i_1}\right)^2 = \left(\frac{1}{4}\right)(4)^2 = 4 \Rightarrow \frac{W_1}{W_2} = \frac{1}{4}$

4. (b) $i = i_0(1 - e^{-Rt/L})$

$i_0 = \frac{E}{R}$ (Steady current) when $t = \infty$

$i_\infty = \frac{E}{R}(1 - e^{-\infty}) = \frac{5}{10} = 1.5$

$i_1 = 1.5(1 - e^{-R/L}) = 1.5(1 - e^{-2}) \Rightarrow \frac{i_\infty}{i_1} = \frac{1}{1 - e^{-2}} = \frac{e^2}{e^2 - 1}$

5. (d) Mutual inductance between two coil in the same plane with their centers coinciding is given by

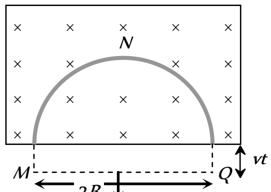
$M = \frac{\mu_0}{4\pi}\left(\frac{2\pi^2 R_2^2 N_1 N_2}{R_1}\right)$ *henry*.

6. (d) Rate of decrease of area of the semicircular ring

$-\frac{dA}{dt} = (2R)\ V$

According to Faraday's law of induction induced emf

$e = -\frac{d\phi}{dt} = -B\frac{dA}{dt} = -B(2RV)$



The induced current in the ring must generate magnetic field in the upward direction. Thus Q is at higher potential.

7. (b) Induced potential difference between two ends $= Blv = B_H lv$

$= 3\times10^{-5}\times2\times50 = 30\times10^{-3} volt = 3\,millivolt$

By Fleming's right hand rule, end A becomes positively charged.

8. (b) Effective length between A and B remains same.

9. (d) Circular loop behaves as a magnetic dipole whose one surface will be N-pole and another will be S-pole. Therefore magnetic lines a force emerges from N will meet at S. Hence total magnetic flux through x-y plane is zero.

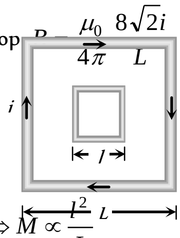
10. (c) If the current increases with time in loop A, then magnetic flux in B will increase. According to Lenz's law, loop $-B$ is repelled by loop $-A$.

11. (b) $e = M\frac{di}{dt} = 0.005\times\frac{d}{dt}(i_0 \sin\omega t) = 0.005\times i_0\omega\cos\omega t$

$\therefore e_{max} = 0.005\times10\times100\pi = 5\pi$

12. (b) Magnetic field produced due to large loop $B = \frac{\mu_0}{4\pi}\frac{8\sqrt{2}i}{L}$

Flux linked with smaller loop



$\phi = B(l^2) = \frac{\mu_0}{4\pi}\frac{8\sqrt{2}il^2}{L}$

$\therefore \phi = Mi \Rightarrow M = \frac{\phi}{i} = \frac{\mu_0}{4\pi}\cdot\frac{8\sqrt{2}l^2}{L} \Rightarrow M \propto \frac{l^2}{L}$

13. (b) Rate of work $= \frac{W}{t} = P = Fv$; also $F = Bil = B\left(\frac{Bvl}{R}\right)l$

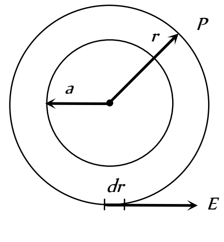
$\Rightarrow P = \frac{B^2v^2l^2}{R} = \frac{(0.5)^2\times(2)^2\times(1)^2}{6} = \frac{1}{6}W$

14. (b) Construct a concentric circle of radius r. The induced electric field (E) at any point on the circle is equal to that at P. For this circle

$\oint \vec{E}.d\vec{l} = \left|\frac{d\phi}{dt}\right| = A\left|\frac{dB}{dt}\right|$

or $E\times(2\pi r) = \pi a^2.\left|\frac{dB}{dt}\right|$

$\Rightarrow E = \frac{a^2}{2r}\left|\frac{dB}{dt}\right| \Rightarrow E \propto \frac{1}{r}$



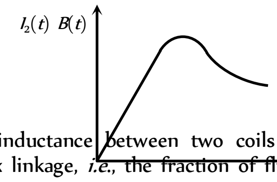
15. (d) Using k, k' etc, as different constants.

$I_1(t) = k_1[1 - e^{-t/\tau}]$, $B(t) = k_2 I_1(t)$

$I_2(t) = k_3 \dfrac{dB(t)}{dt} = k_4 e^{-t/\tau}$

$\therefore I_2(t)\, B(t) = k_5[1 - e^{-t/\tau}][e^{-t/\tau}]$

This quantity is zero for $t = 0$ and $t = \infty$ and positive for other value of *t*. It must, therefore, pass through a maximum.

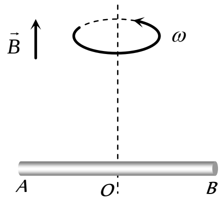


16. (a) The mutual inductance between two coils depends on their degree of flux linkage, *i.e.*, the fraction of flux linked with one coil which is also linked to the other coil. Here, the two coils in arrangement (a) are placed with their planes parallel. This will allow maximum flux linkage.

17. (d) Both *AD* and *BC* are straight conductors moving in a uniform magnetic field and emf will be induced in both. This will cause electric fields in both, but no net current flows in the circuit.

18. (d) Potential difference between

O and *A* is $V_0 - V_A = \dfrac{1}{2} Bl^2\omega$



O and *B* is $V_0 - V_B = \dfrac{1}{2} Bl^2\omega$

so $V_A - V_B = 0$

19. (c) $i = i_0\left(1 - e^{\frac{-Rt}{L}}\right) \Rightarrow \dfrac{di}{dt} = \dfrac{d}{dt} i_0 - \dfrac{d}{dt} i_0 e^{\frac{-Rt}{L}}$

$\Rightarrow \dfrac{di}{dt} = 0 - i_0\left(-\dfrac{R}{L}\right)e^{-\frac{Rt}{L}} = \dfrac{i_0 R}{L} e^{-\frac{Rt}{L}}$

Initially, $t = 0 \Rightarrow \dfrac{di}{dt} = \dfrac{i_0 \times R}{L} = \dfrac{E}{L} = \dfrac{5}{2} = 2.5\ amp/sec.$

20. (d) When switch *S* is closed magnetic field lines passing through *Q* increases in the direction from right to left. So, according to Lenz's law induced current in *Q i.e.* I_{Q_1} will flow in such a direction so that the magnetic field lines due to I_{Q_2} passes from left to right through *Q*. This is possible when I_{Q_1} flows in anticlockwise direction as seen by *E*. Opposite is the case when switch *S* is opened *i.e.* I_{Q_2} will be clockwise as seen by *E*.

21. (b) Power $P = \dfrac{e^2}{R}$; hence $e = -\left(\dfrac{d\phi}{dt}\right)$ where $\phi = NBA$

$\therefore e = -NA\left(\dfrac{dB}{dt}\right)$ Also $R \propto \dfrac{l}{r^2}$

Where *R* = resistance, *r* = radius, *l* = Length

$\therefore P \propto \dfrac{N^2 r^2}{l} \Rightarrow \dfrac{P_1}{P_2} = 1$

22. (a) $H = \dfrac{V^2 t}{R}$ *and* $V = \dfrac{N(B_2 - B_1)A\cos\theta}{t}$

$V = \dfrac{1 \times (1-2) \times 0.01 \times \cos 0^o}{10^{-3}} = 10\ V$

So, $H = \dfrac{(10)^2 \times 10^{-3}}{0.01} = 10\ J$

23. (d) Peak current in the circuits $i_0 = \dfrac{12}{6} = 2A$

Current decreases from 2*A* to 1*A i.e.,* becomes half in time $t = 0.693\dfrac{L}{R} = 0.693 \times \dfrac{8.4 \times 10^{-3}}{6} = 1 millisec.$

24. (a) Induced current in the circuit $i = \dfrac{Bvl}{R}$

Magnetic force acting on the wire $F_m = Bil = B\left(\dfrac{Bvl}{R}\right)l$

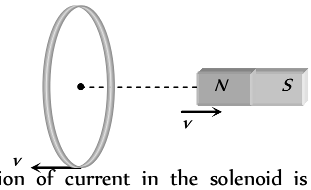
$\Rightarrow F_m = \dfrac{B^2 vl^2}{R}$ External force needed to move the rod with constant velocity

$(F_m) = \dfrac{B^2 vl^2}{R} = \dfrac{(0.15)^2 \times (2) \times (0.5)^2}{3} = 3.75 \times 10^{-3}\ N$

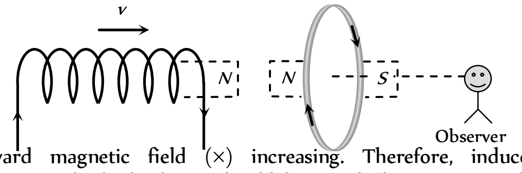
25. (c) According to Lenz's Law

26. (b) $\left(\dfrac{d\phi}{dt}\right)_{\text{In first case}} = e$

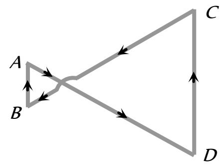
$\left(\dfrac{d\phi}{dt}\right)_{\text{relative velocity}\, 2v} = 2\left(\dfrac{d\phi}{dt}\right)_{\text{I case}} = 2e$



27. (b) The direction of current in the solenoid is anti-clockwise as seen by observer. On displacing it towards the loop a current in the loop will be induced in a direction so as to oppose the approach of solenoid. Therefore the direction of induced current as observed by the observer will be clockwise.



28. (a) Inward magnetic field (×) increasing. Therefore, induced current in both the loops should be anticlockwise. But as the area of loop on right side is more, induced *emf* in this will be more compared to the left side loop $\left(e = -\dfrac{d\phi}{dt} = -A.\dfrac{dB}{dt}\right)$. Therefore net current in the complete loop will be in a direction shown below. Hence only option (a) is correct.

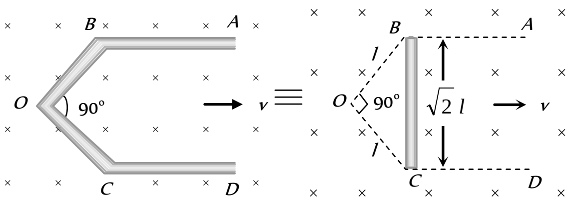


29. (b) Equivalent resistance of the given Wheatstone bridge circuit (balanced) is 3Ω so total resistance in circuit is $R = 3 + 1 = 4\Omega$. The emf induced in the loop $e = Bvl$.

So induced current $i = \dfrac{e}{R} = \dfrac{Bvl}{R}$

$\Rightarrow 10^{-3} = \dfrac{2 \times v \times (10 \times 10^{-2})}{4} \Rightarrow v = 2cm / sec.$

30. (b) There is no induced emf in the part AB and CD because they are moving along their length while emf induced between B and C *i.e.* between A and D can be calculated as follows

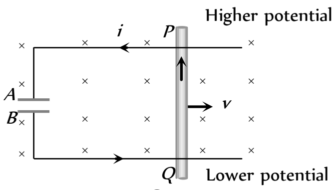


Induced emf between B and C = Induced emf between A and B

$= Bv(\sqrt{2}\,l) = 1 \times 1 \times 1 \times \sqrt{2} = 1.41 volt.$

31. (a) $Q = CV = C(Bvl) = 10 \times 10^{\cdot} \times 4 \times 2 \times 1 = 80\ \mu C$

According to Fleming's right hand rule induced current flows from Q to P. Hence P is at higher potential and Q is at lower potential. Therefore A is positively charged and B is negatively charged.



32. (b) If resistance is constant (10Ω) then steady current in the circuit $i = \dfrac{5}{10} = 0.5\ A$. But resistance is increasing it means current through the circuit start decreasing. Hence inductance comes in picture which induces a current in the circuit in the same direction of main current. So $i > 0.5\ A$.

33. (d) $P = \dfrac{e^2}{R}$; $e = -\dfrac{d}{dt}(BA) = A\dfrac{d}{dt}(B_o e^{-t}) = AB_o e^{-t}$

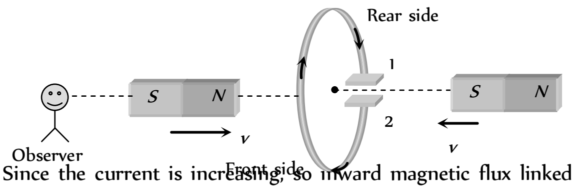
$\Rightarrow P = \dfrac{1}{R}(AB_o e^{-t})^2 = \dfrac{A^2 B_o^2 e^{-2t}}{R}$

At the time of starting $t = 0$ so $P = \dfrac{A^2 B_o^2}{R}$

$\Rightarrow P = \dfrac{(\pi r^2)^2 B_o^2}{R} = \dfrac{B_o^2 \pi^2 r^4}{R}$

34. (c) When key k is pressed, current through the electromagnet start increasing *i.e.* flux linked with ring increases which produces repulsion effect.

35. (b) By the movement of both the magnets, current will be anticlockwise, as seen from left side *i.e.* plate 1 will be positive and 2 will be negative.



36. (a) Since the current is increasing, so inward magnetic flux linked with the ring also increasing (as viewed from left side). Hence induced current in the ring is anticlockwise, so end x will be positive.

Induced emf $|e| = A\dfrac{dB}{dt} = A\dfrac{d}{dt}(B_o + \alpha t) \Rightarrow |e| = A\alpha$

37. (a) Current in the inner coil $i = \dfrac{e}{R} = \dfrac{A_1}{R_1}\dfrac{dB}{dt}$

length of the inner coil $= 2\pi a$

so it's resistance $R_1 = 50 \times 10^{-3} \times 2\pi\,(a)$

$\therefore i_1 = \dfrac{\pi a^2}{50 \times 10^{-3} \times 2\pi\,(a)} \times 0.1 \times 10^{-3} = 10^{-4}\,A$

According to lenz's law direction of i is clockwise.

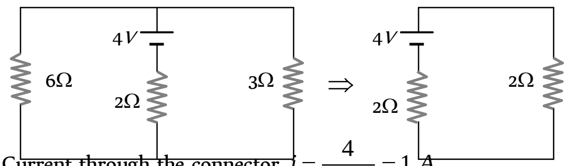
Induced current in outer coil $i_2 = \dfrac{e_2}{R_2} = \dfrac{A_2}{R_2}\dfrac{dB}{dt}$

$\Rightarrow i_2 = \dfrac{\pi b^2}{50 \times 10^{-3} \times (2\pi b)} \times 0.1 \times 10^{-3} = 2 \times 10^{-4}\,A\,(CW)$

38. (c) Motional emf $e = Bvl \Rightarrow e = 2 \times 2 \times 1 = 4\ V$

This acts as a cell of emf $E = 4\ V$ and internal resistance $r = 2\Omega$.

This simple circuit can be drawn as follows



Current through the connector $i = \dfrac{4}{2+2} = 1\ A$

$\therefore$ magnetic force on connector $F_m = Bil = 2 \times 1 \times 1 = 2\ N$

(Towards left)

39. (b) Due to magnetic field, wire will experience an upward force $F = Bil = B\left(\dfrac{Bvl}{R}\right)l \Rightarrow F = \dfrac{B^2 v l^2}{R}$

If wire slides down with constant velocity then

$F = mg \Rightarrow \dfrac{B^2 v l^2}{R} = mg \Rightarrow v = \dfrac{mgR}{B^2 l^2}$

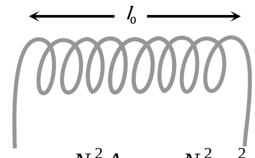
40. (c) By using $e = \dfrac{1}{2}Bl^2\omega$

For part AO; $e_{OA} = e_O - e_A = \dfrac{1}{2}Bl^2\omega$

For part OC; $e_{OC} = e_O - e_C = \dfrac{1}{2}B(3l)^2\omega$

$\therefore e_A - e_C = 4\,Bl^2\omega$

41. (c) Suppose solenoid has N turns, each of radius r and length of wire is l.



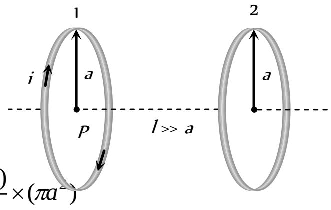
It's self inductance $L = \dfrac{\mu_0 N^2 A}{l_0} = \dfrac{\mu_0 N^2 \pi r^2}{l_0}$ .... (i)

Also length of the wire $l = N \times 2\pi r$

$\Rightarrow N^2 r^2 = \dfrac{l^2}{4\pi^2}$ .... (ii)

From equation (i) and (ii) $l=\sqrt{\dfrac{4\pi L l_o}{\mu_o}}$

42. (d) Magnetic field at the location of coil (2) produced due to coil (1)



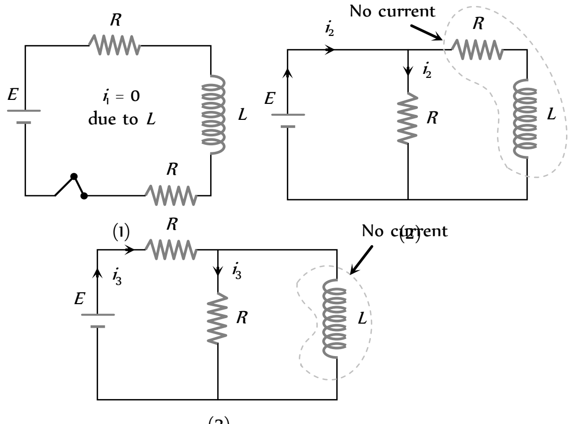
$B_1=\dfrac{\mu_o}{4\pi}\cdot\dfrac{2M}{l^3}$

Flux linked with coil (2)

$\phi_2=B_1A_2=\dfrac{\mu_o}{4\pi}\dfrac{2i\,(\pi a^2)}{l^3}\times(\pi a^2)$

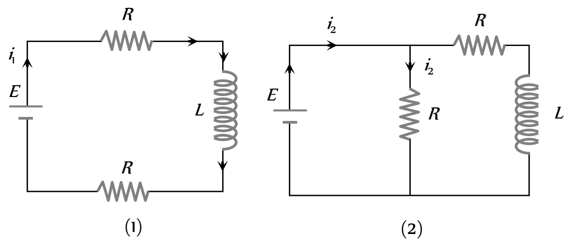
Also $\phi_2=Mi\Rightarrow M=\dfrac{\mu_o\pi a^4}{2l^3}$

43. (a) Just before closing the switch.

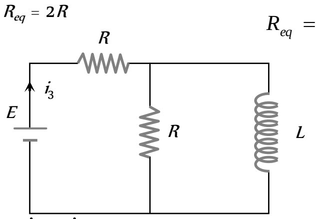


$i_1=0,\ i_2=\dfrac{E}{R},\ i_3=\dfrac{E}{2R}$ so $i_2>i_3>i_1$ $(i_1=0)$

After a long time closing the switch



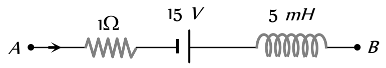
$R_{eq}=2R$ $\qquad R_{eq}=\dfrac{R}{2}$



Hence $i_2>i_3>i_1$ (3)

44. (c) By using Kirchoff's voltage law

$$V_A-iR+E-L\frac{di}{dt}=V_B\Rightarrow V_B-V_A=15\ volt.$$



45. (d) The rate of increase of current

$$=\frac{di}{dt}=\frac{d}{dt}i_0\left(1-e^{-Rt/L}\right)=\frac{d}{dt}i_0-\frac{d}{dt}i_0e^{-Rt/L}$$

$$=0-i_0e^{-Rt/L}\cdot\frac{d}{dt}\left(-\frac{Rt}{L}\right)=i_0\frac{R}{L}e^{-Rt/L}$$

$$=\frac{50}{180}\times\frac{180}{5\times10^{-3}}\times e^{-(180\times0.001)/(5\times10^{-3})}=10^4\times e^{-36}\,A/\sec$$

46. (b) We know that $i=i_o\left[1-e^{\frac{-Rt}{L}}\right]$ or $\dfrac{3}{4}i_o=i_o\left[1-e^{-t/\tau}\right]$

(where $\tau=\dfrac{L}{R}=$ time constant)

$\dfrac{3}{4}=1-e^{-t/\tau}$ or $e^{-t/\tau}=1-\dfrac{3}{4}=\dfrac{1}{4}$

$e^{t/\tau}=4$ or $\dfrac{t}{\tau}=\ln 4$

$\Rightarrow\tau=\dfrac{t}{\ln4}=\dfrac{4}{2\ln2}\Rightarrow\tau=\dfrac{2}{\ln2}\,sec.$

47. (b) In a constant magnetic field conducting ring oscillates with a frequency of 100 *Hz*.

i.e. $T=\dfrac{1}{100}$ s, in time $\dfrac{T}{2}$ flux links with coil changes from BA to zero. ⇒ Induced emf = $\dfrac{\text{change in flux}}{\text{time}}$

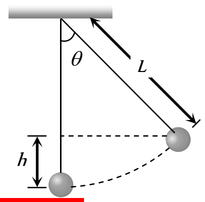
$$=\frac{BA}{T/2}=\frac{2BA}{T}=\frac{2B\times\pi r^2}{T}=\frac{2\times0.01\times\pi\times1^2}{1/100}=4\pi V$$

Induced electric field along the circle, using Maxwell equation

$$\oint E.dl=-\frac{d\phi}{dt}=A\frac{dB}{dt}=e$$

$$\Rightarrow E=\frac{1}{2\pi r}\times\left(\pi r^2\times\frac{dB}{dt}\right)=\frac{e}{2\pi r}=\frac{4\pi}{2\pi r}=2\,V/m$$

48. (a)



$\Rightarrow h=L(1-\cos\theta)$ ....(i)

Maximum velocity at equilibrium is given by

$\therefore\ v^2=2gh=2g\,L(1-\cos\theta)=2g\,L\left(2\sin^2\dfrac{\theta}{2}\right)$

$\Rightarrow v=2\sqrt{gL}\sin\dfrac{\theta}{2}$

Thus, max. potential difference

$$V_{\max}=BvL=B\times2\sqrt{gL}\sin\frac{\theta}{2}L=2BL\sin\frac{\theta}{2}(gL)^{1/2}.$$

Graphical Questions

1. (d) At B, flux is maximum, so from $|e| = \frac{d\phi}{dt}$ at B $|e| = 0$

2. (b) As the magnet moves towards the coil, the magnetic flux increases (nonlinearly). Also there is a change in polarity of induced emf when the magnet passes on to the other side of the coil.

3. (c) Rate of decay of current between t = 5 ms to 6 ms

$= \frac{di}{dt} = -(\text{Slope of the line} BC)$

$= -\left(\frac{5}{1\times 10^{-3}}\right) = -5\times 10^{3} A/s.$ Hence induced emf

$e = -L\frac{di}{dt} = -4.6\times(-5\times 10^{3}) = 23\times 10^{3} V.$

4. (b) $e = -M\frac{di}{dt} = -1.5\frac{(1-0)}{(T/4)} = -\frac{6}{T}$, $T = \frac{2\pi}{\omega} = \frac{2\pi}{200} = \frac{\pi}{100}$

$\Rightarrow |e| = \frac{600}{\pi} = 190.9\, V \simeq 191 V$

5. (d) When loop enters in field between the pole pieces, flux linked with the coil first increases (constantly) so a constant emf induces, when coil entered completely within the field, no flux change so $e = 0$.

When coil exit out, flux linked with the coil decreases, hence again emf induces, but in opposite direction.

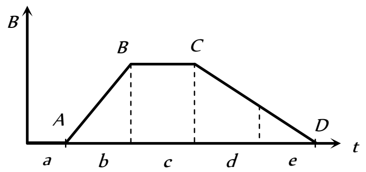
6. (a) $|dq| = \frac{d\phi}{R} = i\, dt$ = Area under $i - t$ graph

$\therefore d\phi =$ (Area under $i - t$ graph) R

$= \frac{1}{2}\times 4\times 0.1\times(10) = 2\, wb.$

7. (b) Induced emf $e = A\frac{dB}{dt}$

i.e. $e \propto \frac{dB}{dt}$ (= slope of $B - t$ graph)



In the given graph slope of AB > slope of CD, slope in the 'a' region = slope in the 'c' region = 0, slope in the 'd' region = slope in the 'e' region $\neq 0$. That's why $b > (d = e) > (a = c)$

8. (b) $P = Fv = Bil\times v = B\left(\frac{Bvl}{R}\right)l\times v = \frac{B^2v^2l^2}{R} \Rightarrow P \propto v^2$

9. (b) As x increases so $\frac{dB}{dt}$ increases *i.e.* induced emf (e) is negative.

When loop completely entered in the magnetic field, emf = 0

When it exit out x increases but $\frac{dB}{dt}$ decreases *i.e.* e is positive.

10. (c) According to $i - t$ graph, in the first half current is in-creasing uniformly so a constant negative emf induces in the circuit.

In the second half current is decreasing uniformly so a constant positive emf induces

Hence graph (c) is correct

11. (b) $i = i_0\left(1 - e^{-\frac{R}{L}t}\right)$

12. (a) $\frac{di}{dt}$ = slope of $i - t$ graph slope of graph (2) < slope of graph (1) so $\left(\frac{di}{dt}\right)_2 < \left(\frac{di}{dt}\right)_1$

Also $L \propto \frac{1}{(di/dt)} \Rightarrow L_2 > L_1$

13. (b) $\phi = BA = B\times\pi r^2$

$\therefore \phi \propto r^2 \Rightarrow \phi = kr^2$ (k = constant)

$\therefore e = \frac{d\phi}{dt} = k.2r\frac{dr}{dt}$

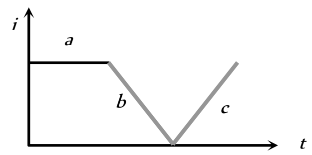
From 0 – 1, r is constant, $\therefore \frac{dr}{dt} = 0$ hence, e = 0

From 1 – 2, $r = \alpha t$, $\therefore \frac{dr}{dt} = \alpha$ hence $e \propto r \Rightarrow e \propto t$

From 2 – 3, again r is constant, $\therefore \frac{dr}{dt} = 0$ hence e = 0

14. (c) Emf induces during 'a' = 0

emf induced during 'b' is constant throughout emf induced during 'c' is constant throughout magnitude of emf induced during 'b' is equal to the magnitude of emf induced during 'c'. But the direction opposite.



15. (a) $U = \frac{1}{2}Li^2$

$\therefore$ Rate $= \frac{dU}{dt} = Li\left(\frac{di}{dt}\right)$

At $t = 0, i = 0$ $\therefore$ rate $= 0$

At $t = \infty, i = i_0$ but $\frac{di}{dt} = 0$, therefore rate = 0

16. (c) At the time t = 0, e is max and is equal to E, but current i is zero.

As the time passes, current through the circuit increases but induced emf decreases.

17. (d) If at any instant, current through the circuit is i then applying Kirchoffs voltage law, $iR+e=E \Rightarrow e=E-iR$. Therefore, graph between e and i will be a straight line having negative slope and having a positive intercept.

18. (c) When loop is entering in the field, magnetic flux (*i.e.* $\times$) linked with the loop increases so induced emf in it $e=Bvl=0.6\times10^{-2}\times5\times10^{-2}=3\times10^{-4}V$ (Negative) .

When loop completely entered in the field (after 5 *sec*) flux linked with the loop remains constant so $e = 0$.

After 15 *sec*, loop begins to exit out, linked magnetic flux decreases so induced emf $e=3\times10^{-4}V$ (Positive).

19. (a)

Assertion and Reason

1. (b) When a metallic conductor is moved in a magnetic field; magnetic flux is varied. It disturbs the free electrons of the metal and set up an induced emf in it. As there are no free ends of the metal *i.e.* it will be closed in itself so there will be induced current.

2. (b) The relation of induced emf is $e=\frac{Ldi}{dt}$ and current i is given by $i=\frac{e}{R}=\frac{1}{R}.\frac{L.di}{dt} \Rightarrow \frac{di}{dt}=i\frac{R}{L}=\frac{i}{L/R}$.

In order to decreases the rate of increase of current through solenoid. We have to increase the time constant $\frac{L}{R}$.

3. (c) According to Faraday's laws, the conversion of mechanical energy into electrical energy. This is in accordance with the law of conservation of energy. It is also clearly known that in pure resistance, the emf is in phase with the current.

4. (c) Presence of magnetic flux cannot produce current.

5. (e) E.M.F. induces, when there is change in magnetic flux. Faraday did experiment in which, there is relative motion between the coil and magnet, the flux linked with the coil changes and e.m.f. induces.

6. (e) Since both the loops are identical (same area and number of turns) and moving with a same speed in same magnetic field. Therefore same emf is induced in both the coils. But the induced current will be more in the copper loop as its resistance will be lesser as compared to that of the aluminium loop.

7. (a) The inductance coils made of copper will have very small ohmic resistance. Due to change in magnetic flux a large induced current will be produced in such an inductance, which will offer appreciable opposition to the flow of current.

8. (b) Self-inductance of a coil is its property virtue of which the coil opposes any change in the current flowing through it.

9. (c) The manner in which the two coils are oriented, determines the coefficient of coupling between them.

$M=K^2.L_1L_2$

When the two coils are wound on each other, the coefficient of coupling is maximum and hence mutual inductance between the coil is maximum.

10. (a) The induced current in the ring opposes the motion of falling magnet. Therefore, the acceleration of the falling magnet will be less than that due to gravity.

11. (e) As the aircraft flies, magnetic flux changes through its wings due to the vertical component of the earth's magnetic field. Due to this, induced emf is produced across the wings of the aircraft. Therefore, the wings of the aircraft will not be at the same potential.

12. (b) According to Lenz's law, induced emf are in a direction such as to attempt to maintain the original magnetic flux when a change occurs. When the switch is opened, the sudden drop in the magnetic field in the circuit induces an emf in a direction that attempts to keep the original current flowing. This can cause a spark as the current bridges the air gap between the poles of the switch. (The spark is more likely in circuits with large inductance).

13. (b) Mutual inductance is the phenomenon according to which an opposing e.m.f. produce flux in a coil as a result of change in current or magnetic flux linked with a neighboring coil. But when two coils are inductively coupled, in addition to induced e.m.f. produced due to mutual induction, also induced e.m.f. is produced in each of the two coils due to self-induction.

14. (e) Lenz's Law is based on conservation of energy and induced emf always opposes the cause of it *i.e.*, change in magnetic flux.

15. (a) As the coil rotates, the magnetic flux linked with the coil (being $\vec{B}\,.\,\vec{A}$) will change and emf will be induced in the loop.

16. (a)

17. (c) When the satellite moves in inclined plane with equatorial plane (including orbit around the poles), the value of magnetic field will change both in magnitude and direction. Due to this, the magnetic flux through the satellite will change and hence induced currents will be produced in the metal of the satellite. But no current will induced if satellite orbits in the equatorial plane because the magnetic flux does not change through the metal of the satellite in this plane.

18. (b) When the tube is heated its resistance gets increased due to which eddy currents produced in copper tube becomes weak. Hence opposing force also gets reduced and the terminal velocity of magnet gets increased.

19. (d) When a metal piece falls from a certain height then eddy currents are produced in it due to earth's magnetic field. Eddy current oppose the motion of piece. Hence metal piece falls with a smaller acceleration (as compared to g). But no eddy current are produced in non-metal piece, hence it drops with acceleration due to gravity. Therefore non-metal piece will reach the earth's surface earlier.

20. (a) Transformer works on *ac* only, *ac* changes in magnitude as well as in direction.

21. (a) Hysteresis loss in the core of transformer directly proportional to the hysteresis loop area of the core material. Since soft iron has narrow hysteresis loop area, that is why soft iron core is used in the transformer.

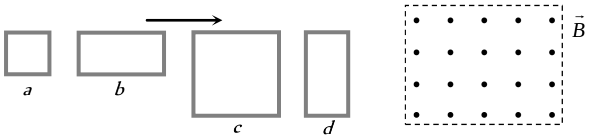
22. (e) *ac* generator is based on the principle of the electromagnetic induction. When a coil is rotated about an axis perpendicular to the direction of uniform magnetic field, an induced emf is produced across it.

23. (d) Efficiency of electric motor is maximum when the back emf set up in the armature is half the value of the applied battery *emf.*

24. (d) Backs *emf.* $e \propto \omega$. At start $\omega = 0$ so $e = 0$

Electromagnetic Induction — SET Self Evaluation Test - 23

1. The figure shows four wire loops, with edge lengths of either L or $2L$. All four loops will move through a region of uniform magnetic field $\vec{B}$ (directed out of the page) at the same constant velocity. Rank the four loops according to the maximum magnitude of the e.m.f. induced as they move through the field, greatest first



(a) $(e_c = e_d) < (e_a = e_b)$ (b) $(e_c = e_d) > (e_a = e_b)$

(c) $e_c > e_d > e_b > e_a$ (d) $e_c < e_d < e_b < e_a$

2. A circular coil and a bar magnet placed near by are made to move in the same direction. The coil covers a distance of 1 m in 0.5 sec and the magnet a distance of 2 m in 1 sec. The induced emf produced in the coil

(a) Zero

(b) 1 V

(c) 0.5 V

(d) Cannot be determined from the given information

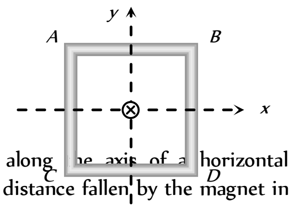
3. A square coil $ABCD$ lying in x-y plane with it's centre at origin. A long straight wire passing through origin carries a current $i = 2t$ in negative z-direction. The induced current in the coil is

(a) Clockwise

(b) Anticlockwise

(c) Alternating

(d) Zero



4. A short magnet is allowed to fall along the axis of a horizontal metallic ring. Starting from rest, the distance fallen by the magnet in one second may be

(a) 4 m (b) 5 m

(c) 6 m (d) 7 m

5. The horizontal component of the earth's magnetic field at a place is 3×10^{-4} T and the dip is $\tan^{-1}\left(\frac{4}{3}\right)$. A metal rod of length 0.25 m placed in the north-south position and is moved at a constant speed of 10 cm/s towards the east. The emf induced in the rod will be

(a) Zero (b) 1 μV

(c) 5 μV (d) 10 μV

6. A copper disc of radius 0.1 m rotates about its centre with 10 revolutions per second in a uniform magnetic field of 0.1 $Tesla$. The emf induced across the radius of the disc is

(a) $\frac{\pi}{10}V$ (b) $\frac{2\pi}{10}V$

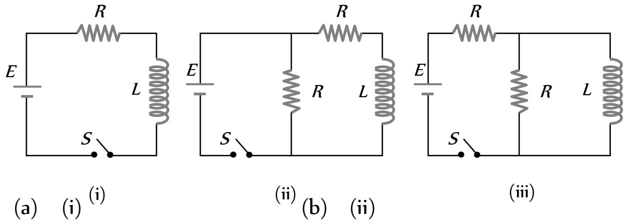
(c) 10 π mV (d) 20 π mV

7. A coil of Cu wire (radius-r, self inductance-L) is bent in two concentric turns each having radius $\frac{r}{2}$. The self inductance now

(a) $2L$ (b) L

(c) 4 L (d) $L/2$

8. In which of the following circuit is the current maximum just after the switch S is closed



(a) (i) (b) (ii)

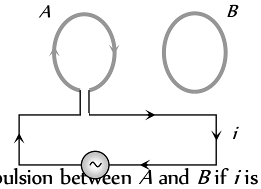
(c) (iii) (d) Both (ii) and (iii)

9. A small coil is introduced between the poles of an electromagnet so that its axis coincides with the magnetic field direction. The number of turns is n and the cross sectional area of the coil is A. When the coil turns through 180° about its diameter, the charge flowing through the coil is Q. The total resistance of the circuit is R. What is the magnitude of the magnetic induction

(a) $\frac{QR}{nA}$ (b) $\frac{2QR}{nA}$

(c) $\frac{Qn}{2RA}$ (d) $\frac{QR}{2nA}$

10. Two circular coils A and B are facing each other as shown in figure. The current i through A can be altered



(a) There will be repulsion between A and B if i is increased

(b) There will be attraction between A and B if i is increased

(c) There will be neither attraction nor repulsion when i is changed

(d) Attraction or repulsion between A and B depends on the direction of current. If does not depend whether the current is increased or decreased

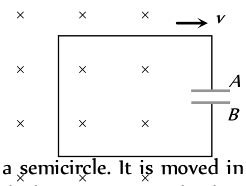
11. A conducting loop having a capacitor is moving outward from the magnetic field then which plate of the capacitor will be positive

(a) Plate – A

(b) Plate – B

(c) Plate – A and Plate – B both

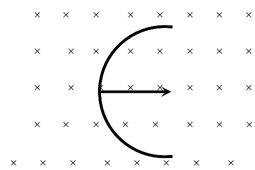
(d) None



12. A straight wire of length L is bent into a semicircle. It is moved in a uniform magnetic field with speed v with diameter perpendicular to the field. The induced emf between the ends of the wire is

(a) BLv

(b) $2BLv$



(c) $2\pi BLv$

(d) $\frac{2BvL}{\pi}$

13. If in a coil rate of change of area is $\frac{5\, metre^2}{millisecond}$ and current become 1 *amp* form 2 *amp* in 2×10^{-3} *sec*. If magnetic field is 1 *Tesla* then self inductance of the coil is

(a) 2 *H* (b) 5 *H*

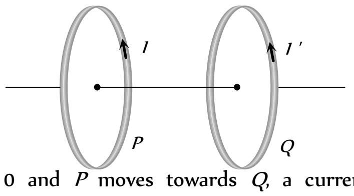
(c) 20 *H* (d) 10 *H*

14. In series with 20 *ohm* resistor a 5 *henry* inductor is placed. To the combination an e.m.f. of 5 *volt* is applied. What will be the rate of increase of current at $t = 0.25$ *sec*

(a) e (b) e^{-2}

(c) e^{-1} (d) None of these

15. Two coils P and Q are placed co-axially and carry current I and I' respectively



(a) If $I = 0$ and P moves towards Q, a current in the same direction as I is induced in Q

(b) If $I = 0$ and Q moves towards P, a current opposite in direction to that of I' is induced in P

(c) When $I \neq 0$ and $I' \neq 0$ are in the same direction, then two coil tend to move apart

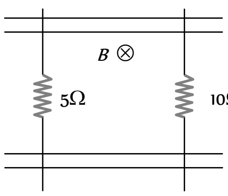
(d) None of these

16. The phase difference between the flux linkage and the induced e.m.f. in a rotating coil in a uniform magnetic field

(a) π (b) $\pi/2$

(c) $\pi/4$ (d) $\pi/6$

17. A pair of parallel conducting rails lie at right angle to a uniform magnetic field of 2.0 *T* as shown in the fig. Two resistors 10 Ω and 5 Ω are to slide without friction along the rail. The distance between the conducting rails is 0.1 *m*. Then



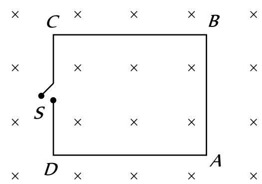
(a) Induced current $= \frac{1}{150} A$ directed clockwise if 10 Ω resistor is pulled to the right with speed 0.5 ms^{-1} and 5Ω resistor is held fixed

(b) Induced current $= \frac{1}{300} A$ directed anti-clockwise if 10 Ω resistor is pulled to the right with speed 0.5 ms^{-1} and 5Ω resistor is held fixed

(c) Induced current $= \frac{1}{300} A$ directed clockwise if 5 Ω resistor is pulled to the left at 0.5 ms^{-1} and 10 Ω resistor is held at rest

(d) Induced current $= \frac{1}{150} A$ directed anti-clockwise if 5 Ω resistor is pulled to the left at 0.5 ms^{-1} and 10 Ω resistor is held at rest

18. The magnetic field in the cylindrical region shown in figure increases at a constant rate of 20 *mT/sec*. Each side of the square loop *ABCD* has a length of 1 *cm* and resistance of 4Ω. Find the current in the wire *AB* if the switch *S* is closed



(a) $1.25 \times 10^{-7} A$, (anti-clockwise)

(b) $1.25 \times 10^{-7} A$ (clockwise)

(c) $2.5 \times 10^{-7} A$ (anti clockwise)

(d) $2.5 \times 10^{-7} A$ (clockwise)

19. An aircraft with a wing-span of 40 *m* flies with a speed of 1080 $km\, h^{-1}$ in the eastward direction at a constant altitude in the northern hemisphere, where the vertical component of earth's magnetic field is 1.75×10^{-5} *T*. Then the emf that develops between the tips of the wings is

(a) 0.5 *V* (b) 0.35 *V*

(c) 0.21 *V* (d) 2.1 *V*

20. A hundred turns of insulated copper wire are wrapped around an iron cylinder of area $1 \times 10^{-3}\, m^2$ and are connected to a resistor. The total resistance in the circuit is 10 *ohms*. If the longitudinal magnetic induction in the iron changes from 1 $weber\, m^{-2}$, in one direction to 1 $Weber\, m^{-2}$ in the opposite direction, how much charge flows through the circuit

(a) 2×10^{-2} *C* (b) 2×10^{-3} *C*

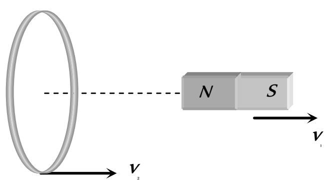
(c) 2×10^{-4} *C* (d) 2×10^{-5} *C*

Answers and Solutions

(SET -23)

1. (b) Emf induces across the length of the wire which cuts the magnetic field. (Length of c = Length d) > (Length of a = b). So $(e_c = e_d) > (e_a = e_b)$

2. (a) Speed of the magnet



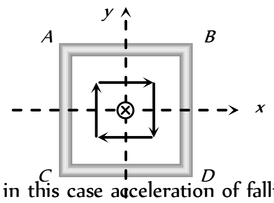
$v_1 = \frac{2}{1} = 2\, m/s$

Speed of the coil

$v_2 = \frac{1}{0.5} = 2\, m/s$

Relative speed between coil and magnet is zero, so there is no induced emf in the coil.

3. (d) Magnetic lines are tangential to the coil as shown in figure. Thus net magnetic flux passing through the coil is always zero or the induced current will be zero.



4. (a) We know that in this case acceleration of falling magnet will be lesser than *g*. If '*g*' would have been acceleration, then distance covered $= \frac{1}{2}gt^2 = 5m$.

Now the distance covered will be less than 5 *m*. hence only option (a) is correct.

5. (d) Rod is moving towards east, so induced emf across it's end will be $e = B_v vl = (B_H \tan\phi)vl$

$$\therefore e = 3\times10^{-4}\times\frac{4}{3}\times(10\times10^{-2})\times0.25 = 10^{-5}\,V = 10\,\mu V$$

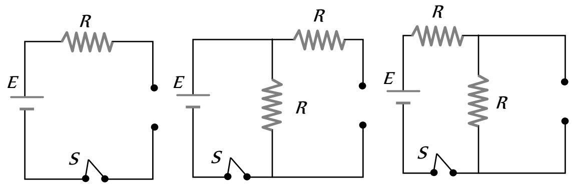
6. (c) The induced emf between centre and rim of the rotating disc is

$$E = \frac{1}{2}B\omega R^2 = \frac{1}{2}\times0.1\times2\pi\times10\times(0.1)^2 = 10\pi\times10^{-3}\,volt$$

7. (a) $\because\ L \propto N^2 r$; $\frac{L_1}{L_2} = \left(\frac{N_1}{N_2}\right)^2 \times \frac{r_1}{r_2}$

$$\Rightarrow \frac{L}{L_2} = \left(\frac{1}{2}\right)^2 \times \left(\frac{r}{r/2}\right) = \frac{1}{2};\quad L_2 = 2L$$

8. (b) At $t = 0$ current through *L* is zero so it acts as open circuit. The given figures can be redrawn as follow.



$i_1 = 0$ (i) $\quad i_2 = \frac{E}{R}$ (ii) $\quad i_3 = \frac{E}{2R}$ (iii)

Hence $i_2 > i_3 > i_1$.

***

9. (d) Induced charge $Q = -\frac{NBA}{R}(\cos\theta_2 - \cos\theta_1)$

$$= -\frac{NBA}{R}(\cos180^o - \cos0^o) \Rightarrow B = \frac{QR}{2NA}$$

10. (a) With rise in current in coil *A* flux through *B* increases. According to Lenz's law repulsion occurs between *A* and *B*.

11. (a) Crosses (×) linked with the loop are decreasing, so induced current in it is clockwise *i.e.* from $B \to A$. Hence electrons flow from plate *A* to *B* so plate *A* becomes positively charged.

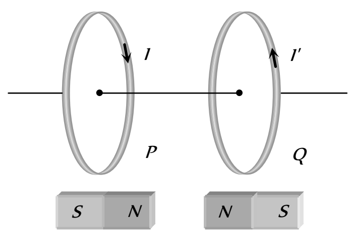
12. (d) Induced emf $e = Bvl \Rightarrow e = Bv(2R) = \frac{2BvL}{\pi}$

13. (d) $e = B.\frac{dA}{dt} = L\frac{di}{dt} \Rightarrow 1\times\frac{5}{10^{-3}} = L\times\frac{(2-1)}{2\times10^{-3}} \Rightarrow L = 10H$

14. (c) $i = i_0(1-e^{-Rt/L}) \Rightarrow \frac{di}{dt} = i_0\left(\frac{R}{L}\right)e^{-Rt/L} = \frac{E}{L}e^{-Rt/L}$

On putting values $\frac{di}{dt} = \frac{1}{e} = e^{-1}$.

15. (b)



16. (b) $\phi = BA\cos\theta$ where θ is the angle between area and field

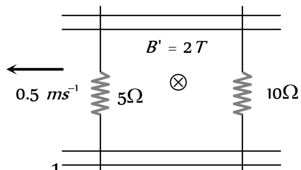
$$e = \frac{-d\phi}{dt} = -BA\sin\theta.\frac{d\theta}{dt} = BA\left(\frac{d\theta}{dt}\right)\cos(90+\theta)$$

Here phase difference = 90°.

17. (d) When 5Ω resistor is pulled left at 0.5 *m/sec* induced *emf*, in the said resistor $= e = vBl = 0.5\times2\times0.1 = 0.1\,V$

Resistor 10Ω is at rest so induced *emf* in it $(e = vBl)$ be zero.

Now net *emf*, in the circuit $= 0.1V$ and equivalent resistance of the circuit $R = 15\,\Omega$



Hence current $i = \frac{0.1}{15}amp = \frac{1}{150}amp$

And its direction will be anti-clockwise (according to Lenz's law)

18. (a) $i = \frac{e}{R} = \frac{A}{R}.\frac{dB}{dt} = \frac{(1\times10^{-2})^2}{16}\times20\times10^{-3} = 1.25\times10^{-7}A$

(Anti-clockwise).

19. (c) $L = 40\ m$, $v = 1080\,km\ h^{-1} = 300\,m\ sec^{-1}$ and $B = 1.75\times10^{-5}\ T \Rightarrow$

$$e = Blv = 1.75\times10^{-5}\times40\times300 = 0.21\,V$$

20. (a) $dQ = \frac{d\phi}{R} = \frac{nAdB}{R} = \frac{100\times1\times10^{-3}\times2}{10} = 2\times10^{-2}C$

Alternating Current

Alternating Quantities (*i* or *V*)

(1) An alternating quantity (current *i* or voltage *V*) is one whose magnitude changes continuously with time between zero and a maximum value and whose direction reverses periodically.

(2) Some graphical representation for alternating quantities

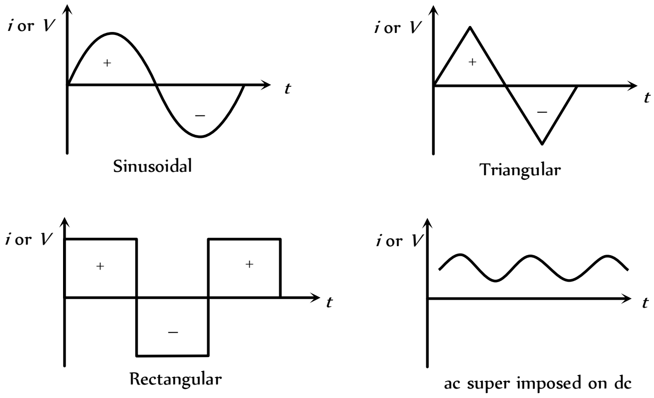

Fig. 24.1

(3) **Equation for *i* and *V* :** Alternating current or voltage varying as sine function can be written as

$$i = i_0 \sin\omega t = i_0 \sin 2\pi\nu t = i_0 \sin\frac{2\pi}{T}t$$

and $V = V_0 \sin\omega t = V_0 \sin 2\pi\nu t = V_0 \sin\frac{2\pi}{T}t$

where *i* and *V* are Instantaneous values of current and voltage,

i_0 and V_0 are peak values of current and voltage

ω = Angular frequency in *rad/sec*, ν = Frequency in *Hz* and *T* = time period

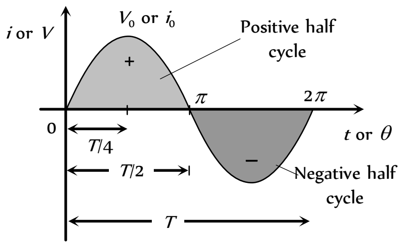

Fig. 24.2

(i) The time taken to complete one cycle of variations is called the periodic time or time period.

(ii) Alternating quantity is positive for half the cycle and negative for the rest half. Hence average value of alternating quantity (*i* or *V*) over a complete cycle is zero.

(iii) The value of alternating quantity is zero or maximum 2ν times every second. The direction also changes 2ν times every second.

(iv) Generally sinusoidal waveform is used as alternating current/voltage.

(v) At $t = \frac{T}{4}$ from the beginning, *i* or *V* reaches to their maximum value.

Important Values of Alternating Quantities

(1) **Peak value (i_0 or V_0) :** The maximum value of alternating quantity (i_0 or V_0) is defined as peak value or amplitude.

(2) **Mean square value ($\overline{V^2}$ or $\overline{i^2}$) :** The average of square of instantaneous values in one cycle is called mean square value. It is always positive for one complete cycle. *e.g.* $\overline{V^2} = \frac{1}{T}\int_0^T V^2 dt = \frac{V_0^2}{2}$ or $\overline{i^2} = \frac{i_0^2}{2}$

(3) **Root mean square (r.m.s.) value :** Root of mean of square of voltage or current in an *ac* circuit for one complete cycle is called *r.m.s.* value. It is denoted by V_{rms} or i_{rms}

$$i_{rms} = \sqrt{\frac{i_1^2 + i_2^2 + ...}{n}} = \sqrt{\overline{i^2}} = \sqrt{\frac{\int_0^T i^2 dt}{\int_0^T dt}} = \frac{i_0}{\sqrt{2}} = 0.707\, i_0 = 70.7\%\, i_0$$

Similarly $V_{rms} = \frac{V_0}{\sqrt{2}} = 0.707\, V_0 = 70.7\%$ of V_0

$$\left[\langle \sin^2(\omega t)\rangle = \langle \cos^2(\omega t)\rangle = \frac{1}{2}\right]$$

(i) The *r.m.s.* value of alternating current is also called virtual value or effective value.

(ii) In general when values of voltage or current for alternating circuits are given, these are *r.m.s.* value.

(iii) ac ammeter and voltmeter are always measure *r.m.s.* value. Values printed on *ac* circuits are *r.m.s.* values.

(iv) In our houses *ac* is supplied at 220 *V*, which is the *r.m.s.* value of voltage. It's peak value is $\sqrt{2} \times 200 = 311V$.

(v) *r.m.s.* value of *ac* is equal to that value of *dc*, which when passed through a resistance for a given time will produce the same amount of heat as produced by the alternating current when passed through the same resistance for same time.

(4) **Mean or Average value (i_{av} or V_{av}) :** The average value of alternating quantity for one complete cycle is zero.

The average value of *ac* over half cycle (t = 0 to $T/2$)

$$i_{av} = \frac{\int_0^{T/2} i\,dt}{\int_0^{T/2} dt} = \frac{2i_0}{\pi} = 0.637 i_0 = 63.7\% \text{ of } i_0$$

Similarly $V_{av} = \frac{2V_0}{\pi} = 0.637 V_0 = 63.7\%$ of V_0

(5) **Peak to peak value :** It is equal to the sum of the magnitudes of positive and negative peak values

$\therefore$ Peak to peak value = $V_0 + V_0 = 2V_0$

$$= 2\sqrt{2}\,V_{rms} = 2.828\,V_{rms}$$

(6) **Form factor and peak factor :** The ratio of *r.m.s.* value of *ac* to it's average during half cycle is defined as form factor. The ratio of peak value and *r.m.s.* value is called peak factor

Phase

Physical quantity which represents both the instantaneous value and direction of alternating quantity at any instant is called it's phase. It's a dimensionless quantity and it's unit is radian.

If an alternating quantity is expressed as $X = X_0 \sin(\omega t \pm \phi_0)$ then the argument of $\sin(\omega t + \phi)$ is called it's phase. Where ωt = instantaneous phase (changes with time) and ϕ_0 = initial phase (constant *w.r.t.* time)

Table 24.1 : Some important values

Nature of wave form	Wave form	*r.m.s.* value	average value	Form factor $R_f = \frac{\text{r.m.s. value}}{\text{Average value}}$	Peak factor $R_p = \frac{\text{Peak value}}{\text{r.m.s. value}}$
Sinusoidal		$\frac{i_0}{\sqrt{2}}$	$\frac{2}{\pi} i_0$	$\frac{\pi}{2\sqrt{2}} = 1.11$	$\sqrt{2} = 1.41$
Half wave rectified		$\frac{i_0}{2}$	$\frac{i_0}{\pi}$	$\frac{\pi}{2} = 1.57$	2
Full wave rectified		$\frac{i_0}{\sqrt{2}}$	$\frac{2i_0}{\pi}$	$\frac{\pi}{2\sqrt{2}}$	$\sqrt{2}$
Square or Rectangular		i_0	i_0	1	1

(1) **Phase difference** (Phase constant) : The difference between the phases of currents and voltage is called phase difference. If alternating voltage and current are given by $V = V_0 \sin(\omega t + \phi_1)$ and $i = i_0 \sin(\omega t + \phi_2)$ then phase difference $\phi = \phi_1 - \phi_2$ (relative to current) or $\phi = \phi_2 - \phi_1$ (relative to voltage)

(2) **Time difference :** If phase difference between alternating current and voltage is ϕ then time difference between them is given as

$$\text{T.D.} = \frac{T}{2\pi} \times \phi$$

(3) **Phasor diagram :** A diagram representing alternating current and alternating voltage (of same frequency) as vectors (phasors) with the phase angle between them is called a phasor diagram.

While drawing phasor diagram for a pure element (*e.g.* *R*, *L* or *C*) either of the current or voltage can be plotted along *X*-axis.

But when phasor diagram for a combination of elements is drawn then quantity which remains constant for the combination must be plotted along *X*-axis so we observe that

(i) In series circuits current has to be plotted along *X*-axis.

(ii) In parallel circuits voltage has to be plotted along *X*-axis.

Measurement of Alternating Quantities

Alternating current shows heating effect only, hence meters used for measuring ac are based on heating effect and are called hot wire meters (Hot wire ammeter and hot wire voltmeter)

Table 24.2 : Measurement of ac and dc

ac measurement	*dc* measurement
(1) All ac meters read *r.m.s.* value.	(1) All dc meters read average value
(2) All ac meters are based on heating effect of current.	(2) All dc meters are based on magnetic effect of current
(3) Deflection in hot wire meters $\theta \propto i_{rms}^2$  (non-linear scale)	(3) Deflection in *dc* meters $\theta \propto i$  (Linear scale)

Impedance, Reactance, Admittance and Susceptance

(1) **Impedance (*Z*) :** The opposition offered by ac circuits to the flow of ac through it is defined it's impedance. It's unit is *ohm*(Ω).

(2) **Reactance (*X*) :** The opposition offered by inductor or capacitor or both to the flow of ac through it is defined as reactance. It is of following two type

(i) **Inductive reactance (*X*)** : Offered by inductive circuit $X_L = \omega L = 2\pi\nu L$ $\nu_{dc} = 0$ so for dc, $X_L = 0$.

Capacitive reactance (*X*) : Offered by capacitive circuit $X_C = \dfrac{1}{\omega C} = \dfrac{1}{2\pi\nu C}$ for dc $X_C = \infty$.

(3) **Admittance (*Y*) :** $Z = \dfrac{V_0}{i_0} = \dfrac{V_{rms}}{i_{rms}}$ Reciprocal of impedance is known as admittance $\left(Y = \dfrac{1}{Z}\right)$. It's unit is *mho*

(4) **Susceptance (*S*) :** the reciprocal of reactance is defined as susceptance $\left(S = \dfrac{1}{X}\right)$. It is of two type

(i) inductive susceptance $S_L = \dfrac{1}{X_L} = \dfrac{1}{2\pi\nu L}$ and

(ii) Capacitive susceptance, $S_C = \dfrac{1}{X_C} = \omega C = 2\pi\nu C$.

Power in ac Circuits

In dc circuits power is given by $P = Vi$. But in ac circuits, since there is some phase angle between voltage and current, therefore power is defined as the product of voltage and that component of the current which is in phase with the voltage.

Thus $\boldsymbol{P = V\,i\cos\phi}$; where *V* and *i* are *r.m.s.* value of voltage and current.

(1) **Instantaneous power :** Suppose in a circuit $V = V_0 \sin\omega t$ and $i = i_0 \sin(\omega t + \phi)$ then $P_{\text{instantaneous}} = Vi = V_0 i_0 \sin\omega t \sin(\omega t + \phi)$

(2) **Average power (True power) :** The average of instantaneous power in an ac circuit over a full cycle is called average power. It's unit is *watt i.e.*

$$P_{av} = V_{rms} i_{rms} \cos\phi = \frac{V_0}{\sqrt{2}} \cdot \frac{i_0}{\sqrt{2}} \cos\phi = \frac{1}{2} V_0 i_0 \cos\phi = i_{rms}^2 R = \frac{V_{rms}^2 R}{Z^2}$$

(3) **Apparent or virtual power :** The product of apparent voltage and apparent current in an electric circuit is called apparent power. This is always positive $P_{app} = V_{rms} i_{rms} = \dfrac{V_0 i_0}{2}$

Power Factor

(1) It may be defined as cosine of the angle of lag or lead (*i.e.* $\cos\phi$)

(2) It is also defined as the ratio of resistance and impedance (*i.e.* $\dfrac{R}{Z}$)

(3) The ratio $\dfrac{\text{True power}}{\text{Apparent power}} = \dfrac{W}{VA} = \dfrac{kW}{kVA} = \cos\phi$

Resistive Circuit (*R*-Circuit)

(1) Current : $i = i_0 \sin\omega t$

(2) Peak current : $i_0 = \dfrac{V_0}{R}$

(3) Phase difference between voltage and current : $\phi = 0$

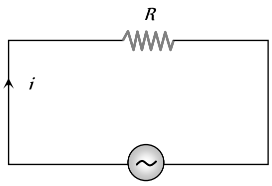
(4) Power factor : $\cos\phi = 1$

(5) Power : $P = V_{rms} i_{rms} = \dfrac{V_0 i_0}{2}$

(6) Time difference : T.D. = 0

(7) Phasor diagram : Both are in same phase

Fig. 24.4



$V = V_0 \sin\omega t$

Fig. 24.3

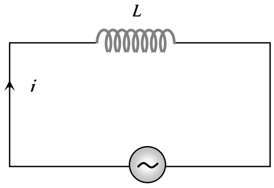
Inductive Circuit (*L*-Circuit)

(1) Current : $i = i_0 \sin\left(\omega t - \dfrac{\pi}{2}\right)$

(2) Peak current :

$$i_0 = \frac{V_0}{X_L} = \frac{V_0}{\omega_L} = \frac{V_0}{2\pi\nu L}$$

(3) Phase difference between



$V = V_0 \sin\omega t$

Fig. 24.5

voltage and current $\phi = 90^o$ (or $+\dfrac{\pi}{2}$)

(4) Power factor : $\cos\phi = 0$

(5) Power : $P = 0$

(6) Time difference : $\text{T.D.} = \dfrac{T}{4}$

(7) Phasor diagram : Voltage leads the current by $\dfrac{\pi}{2}$

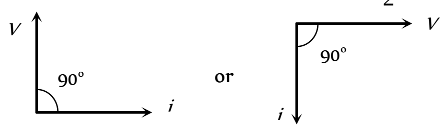


Fig. 24.6

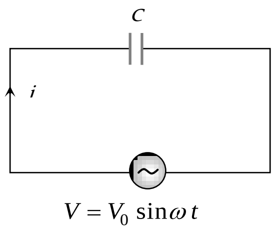
Capacitive Circuit (*C*-Circuit)

(1) Current : $i = i_0 \sin\left(\omega t + \dfrac{\pi}{2}\right)$



$V = V_0 \sin\omega t$

Fig. 24.7

(2) Peak current :

$$i_0 = \frac{V_0}{X_C} = V_0\omega C = V_0(2\pi\nu C)$$

(3) Phase difference between voltage and current : $\phi = 90^o$ (or $-\dfrac{\pi}{2}$)

(4) Power factor : $\cos\phi = 0$

(5) Power : $P = 0$

(6) Time difference : $\text{TD} = \dfrac{T}{4}$

(7) Phasor diagram : Current leads the voltage by $\pi/2$

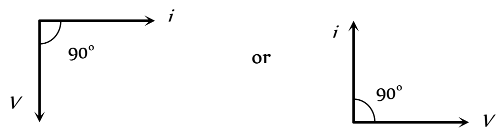


Fig. 24.8

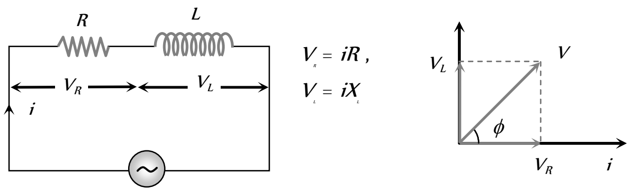
Resistive, Inductive Circuit (*RL*-Circuit)



$V = V_0 \sin\omega t$

Fig. 24.9

(1) Applied voltage : $V = \sqrt{V_R^2 + V_L^2}$

(2) Impedance : $Z = \sqrt{R^2 + X_L^2} = \sqrt{R^2 + \omega^2 L^2} = \sqrt{R^2 + 4\pi^2\nu^2 L^2}$

(3) Current : $i = i_0 \sin(\omega t - \phi)$

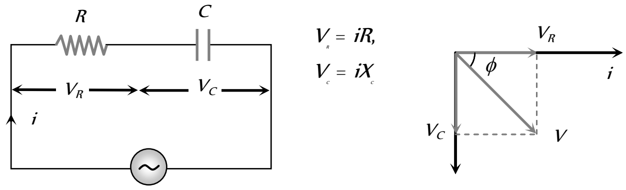
(4) Peak current $i_0 = \dfrac{V_0}{Z} = \dfrac{V_0}{\sqrt{R^2 + X_L^2}} = \dfrac{V_0}{\sqrt{R^2 + 4\pi^2\nu^2 L^2}}$

(5) Phase difference : $\phi = \tan^{-1}\dfrac{X_L}{R} = \tan^{-1}\dfrac{\omega L}{R}$

(6) Power factor : $\cos\phi = \dfrac{R}{\sqrt{R^2 + X_L^2}}$

(7) Leading quantity : Voltage

Resistive, Capacitive Circuit (*RC*-Circuit)



$V = V_0 \sin\omega t$

Fig. 24.10

(1) Applied voltage : $V = \sqrt{V_R^2 + V_C^2}$

(2) Impedance : $Z = \sqrt{R^2 + X_C^2} = \sqrt{R^2 + \left(\dfrac{1}{\omega C}\right)^2}$

(3) Current : $i = i_0 \sin(\omega t + \phi)$

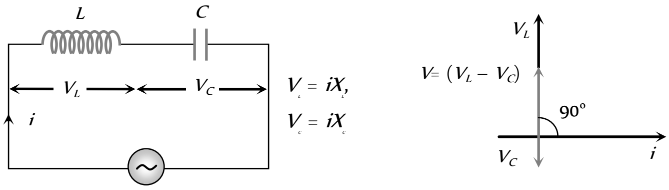
(4) Peak current : $i_0 = \dfrac{V_0}{Z} = \dfrac{V_0}{\sqrt{R^2 + X_C^2}} = \dfrac{V_0}{\sqrt{R^2 + \dfrac{1}{4\pi^2\nu^2 C^2}}}$

(5) Phase difference : $\phi = \tan^{-1}\dfrac{X_C}{R} = \tan^{-1}\dfrac{1}{\omega CR}$

(6) Power factor : $\cos\phi = \dfrac{R}{\sqrt{R^2 + X_C^2}}$

(7) Leading quantity : Current

Inductive, Capacitive Circuit (*LC*-Circuit)



$V = V_0 \sin\omega t$

Fig. 24.11

(1) Applied voltage : $V = V_L - V_C$

(2) Impedance : $Z = X_L - X_C = X$

(3) Current : $i = i_0 \sin\left(\omega t \pm \dfrac{\pi}{2}\right)$

(4) Peak current : $i_0 = \dfrac{V_0}{Z} = \dfrac{V_0}{X_L - X_C} = \dfrac{V_0}{\omega L - \dfrac{1}{\omega C}}$

(5) Phase difference : $\phi = 90^\circ$

(6) Power factor : $\cos\phi = 0$

(7) Leading quantity : Either voltage or current

Series *RLC*-Circuit

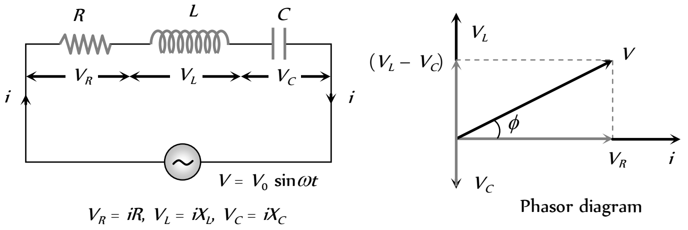


Fig. 24.12

(1) **Equation of current :** $i = i_0 \sin(\omega t \pm \phi)$; where $i_0 = \dfrac{V_0}{Z}$

(2) **Equation of voltage :** From phasor diagram

$$V = \sqrt{V_R^2 + (V_L - V_C)^2}$$

(3) **Impedance of the circuit :**

$$Z = \sqrt{R^2 + (X_L - X_C)^2} = \sqrt{R^2 + \left(\omega L - \frac{1}{\omega C}\right)^2}$$

(4) **Phase difference :** From phasor diagram

$$\tan\phi = \frac{V_L - V_C}{V_R} = \frac{X_L - X_C}{R} = \frac{\omega L - \dfrac{1}{\omega C}}{R} = \frac{2\pi\nu L - \dfrac{1}{2\pi\nu C}}{R}$$

(5) **If net reactance is inductive :** Circuit behaves as *LR* circuit

(6) **If net reactance is capacitive :** Circuit behave as *CR* circuit

(7) **If net reactance is zero :** Means $X = X_L - X_C = 0$

$\Rightarrow X_L = X_C$. This is the condition of resonance

(8) **At resonance** (series resonant circuit)

(i) $X_L = X_C \Rightarrow Z_{min} = R$ *i.e.* circuit behaves as resistive circuit

(ii) $V_L = V_C \Rightarrow V = V_R$ *i.e.* whole applied voltage appeared across the resistance

(iii) Phase difference : $\phi = 0° \Rightarrow$ p.f. = $\cos\phi = 1$

(iv) Power consumption $P = V_{rms} i_{rms} = \dfrac{1}{2} V_0 i_0$

(v) Current in the circuit is maximum and it is $i_0 = \dfrac{V_0}{R}$

(vi) These circuit are used for voltage amplification and as selector circuits in wireless telegraphy.

(9) **Resonant frequency** (Natural frequency)

At resonance $X_L = X_C \;\Rightarrow\; \omega_0 L = \dfrac{1}{\omega_0 C} \;\Rightarrow\; \omega_0 = \dfrac{1}{\sqrt{LC}} \dfrac{rad}{sec}$

$$\Rightarrow \nu_0 = \frac{1}{2\pi\sqrt{LC}} Hz \text{ (or } cps)$$

(Resonant frequency doesn't depend upon the resistance of the circuit)

(10) **Half power frequencies and band width :** The frequencies at which the power in the circuit is half of the maximum power (The power at resonance), are called half power frequencies.

(i) The current in the circuit at half power frequencies (HPF) is $\dfrac{1}{\sqrt{2}}$ or 0.707 or 70.7% of maximum current (current at resonance).

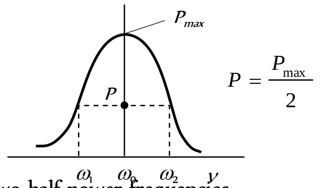

Fig. 24.13

(ii) There are two half power frequencies

(a) $\omega_1 \rightarrow$ called lower half power frequency. At this frequency the circuit is capacitive.

(b) $\omega_2 \rightarrow$ called upper half power frequency. It is greater than ω_0. At this frequency the circuit is inductive.

(iii) Band width $(\Delta\omega)$: The difference of half power frequencies ω_1 and ω_2 is called band width $(\Delta\omega)$ and $\Delta\omega = \omega_2 - \omega_1$. For series resonant circuit it can be proved $\Delta\omega = \left(\dfrac{R}{L}\right)$

(11) **Quality factor (*Q*-factor) of series resonant circuit**

(i) The characteristic of a series resonant circuit is determined by the quality factor (Q - factor) of the circuit.

(ii) It defines sharpness of i - ν curve at resonance when Q - factor is large, the sharpness of resonance curve is more and vice-versa.

(iii) Q - factor also defined as follows

$$Q\text{ - factor } = 2\pi \times \frac{\text{Max. energy stored}}{\text{Energy dissipation}}$$

$$= \frac{2\pi}{T} \times \frac{\text{Max. energy stored}}{\text{Mean power dissipated}} = \frac{\text{Resonant frequency}}{\text{Band width}} = \frac{\omega_0}{\Delta\omega}$$

(iv) Q - factor $= \dfrac{V_L}{V_R}$ or $\dfrac{V_C}{V_R} = \dfrac{\omega_0 L}{R}$ or $\dfrac{1}{\omega_0 CR}$

$$\Rightarrow Q\text{ - factor} = \frac{1}{R}\sqrt{\frac{L}{C}}$$

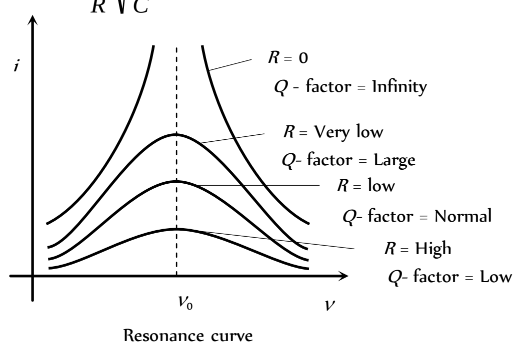

Fig. 24.14

Parallel *RLC* Circuits

$$i_R = \frac{V_0}{R} = V_0 G$$

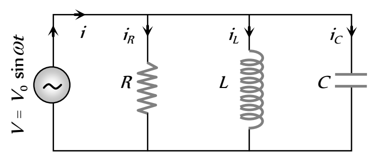

Fig. 24.15

$$i_L = \frac{V_0}{X_L} = V_0 S_L$$

$$i_C = \frac{V_0}{X_C} = V_0 S_C$$

(1) **Current and phase difference :** From phasor diagram current $i = \sqrt{i_R^2 + (i_C - i_L)^2}$ and phase difference $\phi = \tan^{-1}\frac{(i_C - i_L)}{i_R} = \tan^{-1}\frac{(S_C - S_L)}{G}$

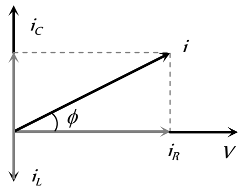

Fig. 24.16

(2) **Admittance (Y) of the circuit :** From equation of current

$$\frac{V_0}{Z} = \sqrt{\left(\frac{V_0}{R}\right)^2 + \left(\frac{V_0}{X_L} - \frac{V_0}{X_C}\right)^2}$$

$$\Rightarrow \frac{1}{Z} = Y = \sqrt{\left(\frac{1}{R}\right)^2 + \left(\frac{1}{X_L} - \frac{1}{X_C}\right)^2} = \sqrt{G^2 + (S_L - S_C)^2}$$

(3) **Resonance :** At resonance (i) $i_C = i_L \Rightarrow i_{\min} = i_R$

(ii) $\frac{V}{X_C} = \frac{V}{X_L} \Rightarrow S_C = S_L \Rightarrow \Sigma S = 0$

(iii) $Z_{\max} = \frac{V}{i_R} = R$

(iv) $\phi = 0 \Rightarrow$ p.f. $= \cos\phi = 1 =$ maximum

(v) Resonant frequency $\Rightarrow \nu = \frac{1}{2\pi\sqrt{LC}}$

(4) **Parallel LC circuits :** If inductor has resistance (R) and it is connected in parallel with capacitor as shown

(i) **At resonance**

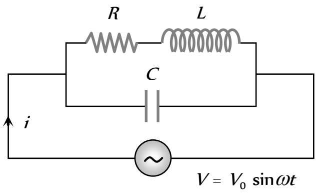

Fig. 24.17

(a) $Z_{\max} = \frac{1}{Y_{\min}} = \frac{L}{CR}$

(b) Current through the circuit is minimum and $i_{\min} = \frac{V_0 CR}{L}$

(c) $S_L = S_C \Rightarrow \frac{1}{X_L} = \frac{1}{X_C} \Rightarrow X = \infty$

(d) Resonant frequency $\omega_0 = \sqrt{\frac{1}{LC} - \frac{R^2}{L^2}}\ \frac{rad}{sec}$ or

$\nu_0 = \frac{1}{2\pi}\sqrt{\frac{1}{LC} - \frac{R^2}{L^2}}\ Hz$ (Condition for parallel resonance is $R < \sqrt{\frac{L}{C}}$)

(e) Quality factor of the circuit $= \frac{1}{CR} \cdot \frac{1}{\sqrt{\frac{1}{LC} - \frac{R^2}{L^2}}}$. In the state of resonance the quality factor of the circuit is equivalent to the current amplification of the circuit.

(ii) **If inductance has no resistance :** If $R = 0$ then circuit becomes parallel LC circuit as shown

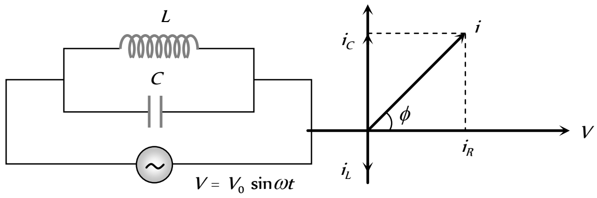

Fig. 24.18

Condition of resonance : $i_C = i_L \Rightarrow \frac{V}{X_C} = \frac{V}{X_L}$

$\Rightarrow X_C = X_L$. At resonance current i in the circuit is zero and impedance is infinite. Resonant frequency : $\nu_0 = \frac{1}{2\pi\sqrt{LC}}\ Hz$

Wattless Current

In an ac circuit $R = 0 \Rightarrow \cos\phi = 0$ so $P = 0$ *i.e.* in resistance less circuit the power consumed is zero. Such a circuit is called the wattless circuit and the current flowing is called the wattless current.

or

The component of current which does not contribute to the average power dissipation is called wattless current

(i) The average of wattless component over one cycle is zero

(ii) Amplitude of wattless current $= i\sin\phi$

and *r.m.s.* value of wattless current $= i_{rms}\sin\phi = \frac{i_0}{\sqrt{2}}\sin\phi$.

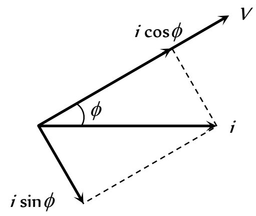

Fig. 24.19

It is quadrature (90) with voltage.

Choke Coil

Choke coil (or ballast) is a device having high inductance and negligible resistance. It is used to control current in ac circuits and is used in fluorescent tubes. The power loss in a circuit containing choke coil is least.

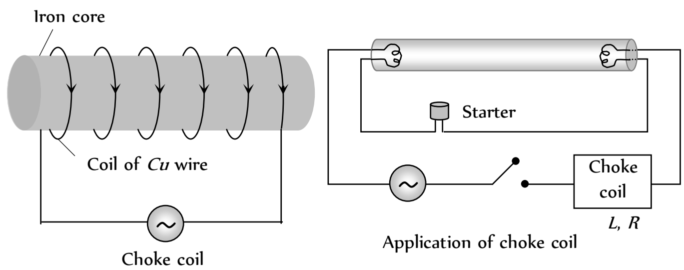

Fig. 24.20

(1) It consist of a Cu coil wound over a soft iron laminated core.

(2) Thick Cu wire is used to reduce the resistance (R) of the circuit.

(3) Soft iron is used to improve inductance (L) of the circuit.

(4) The inductive reactance or effective opposition of the choke coil is given by $X_L = \omega L = 2\pi\nu L$

(5) For an ideal choke coil $r = 0$, no electric energy is wasted *i.e.* average power $P = 0$.

(6) In actual practice choke coil is equivalent to a $R - L$ circuit.

(7) Choke coil for different frequencies are made by using different substances in their core.

For low frequency L should be large thus iron core choke coil is used. For high frequency ac circuit, L should be small, so air cored choke coil is used.

Tips & Tricks

☞ If ac is produced by a generator having a large number of poles then it's frequency

$$\nu = \frac{\text{Number of poles} \times \text{rotation per second}}{2} = \frac{P \times n}{2}$$

Where P is the number of poles; n is the rotational frequency of the coil.

✍ Alternating current in electric wires, bulbs etc. flows 50 times in one direction and 50 times in the opposite direction in 1 *second*. Since in one cycle the current becomes zero twice, hence a bulb lights up 100 times and is off 100 times in one second (50 cycles) but due to persistence of vision, it appears lighted continuously.

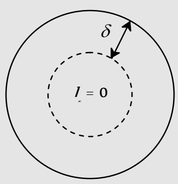
✍ ac is more dangerous than dc.

✍ The rate of change of ac is minimum at that instant when they are near their peak values.

✍ ac equipments such as electric motors, are more durable and convenient compared to dc equipments.

✍ **Skin Effect**

A direct current flows uniformly throughout the cross-section of the conductor. An alternating current, on the other hand, flows mainly along the surface of the conductor. This effect is known as skin effect. the reason is that when alternating current flows through a conductor, the flux changes in the inner part of the conductor are higher. Therefore the inductance of the inner part is higher than that of the outer part. Higher the frequency of alternating current, more is the skin effect.



The depth upto which ac current flows through a wire is called skin depth (δ).

Ordinary Thinking

Objective Questions

Alternating Current, Voltage and Power

1. The power is transmitted from a power house on high voltage ac because **[CPMT 1984, 85]**

(a) Electric current travels faster at higher *volts*

(b) It is more economical due to less power wastage

(c) It is difficult to generate power at low voltage

(d) Chances of stealing transmission lines are minimized

2. The potential difference V and the current i flowing through an instrument in an ac circuit of frequency f are given by $V = 5\cos\omega t$ *volts* and $I = 2\sin\omega t$ *amperes* (where $\omega = 2\pi f$). The power dissipated in the instrument is

[CPMT 1977, 80; MP PET 1999]

(a) Zero (b) 10 W

(c) 5 W (d) 2.5 W

3. In an ac circuit, V and I are given by

$V = 100\sin(100\,t)$ *volts*, $I = 100\sin\left(100t + \frac{\pi}{3}\right) mA$. The power dissipated in circuit is

[MP PET 1989; RPET 1999; MP PMT 1999, 2002]

(a) 10^4 *watt* (b) 10 *watt*

(c) 2.5 *watt* (d) 5 *watt*

4. Alternating current can not be measured by dc ammeter because

(a) ac cannot pass through dc ammeter

(b) Average value of complete cycle is zero

(c) ac is virtual

(d) ac changes its direction

5. The resistance of a coil for dc is in ohms. In ac, the resistance

(a) Will remain same (b) Will increase

(c) Will decrease (d) Will be zero

6. If instantaneous current is given by $i = 4\cos(\omega t + \phi)$ *amperes*, then the *r.m.s.* value of current is [RPET 2000]

(a) 4 amperes (b) $2\sqrt{2}$ amperes

(c) $4\sqrt{2}$ amperes (d) Zero amperes

7. In an ac circuit, peak value of voltage is 423 *volts*. Its effective voltage is [JIPMER 1997]

(a) 400 *volts* (b) 323 *volts*

(c) 300 *volts* (d) 340 *volts*

8. In an ac circuit $I = 100\sin 200\pi t$. The time required for the current to achieve its peak value will be [DPMT 2003]

(a) $\frac{1}{100}\,sec$ (b) $\frac{1}{200}\,sec$

(c) $\frac{1}{300}\,sec$ (d) $\frac{1}{400}\,sec$

9. The peak value of an Alternating current is 6 *amp*, then *r.m.s.* value of current will be

(a) 3 A (b) $3\sqrt{3}\,A$

(c) $3\sqrt{2}\,A$ (d) $2\sqrt{3}\,A$

10. A generator produces a voltage that is given by $V = 240\sin 120\,t$, where t is in seconds. The frequency and *r.m.s.* voltage are [MP PET 1993; MP PMT 1990]

(a) 60 *Hz* and 240 V (b) 19 *Hz* and 120 V

(c) 19 *Hz* and 170 V (d) 754 *Hz* and 70 V

11. If E_0 represents the peak value of the voltage in an ac circuit, the *r.m.s.* value of the voltage will be

[CPMT 1972; MP PMT 1996]

(a) $\frac{E_0}{\pi}$ (b) $\frac{E_0}{2}$

(c) $\frac{E_0}{\sqrt{\pi}}$ (d) $\frac{E_0}{\sqrt{2}}$

12. The peak value of 220 *volts* of ac mains is

[CPMT 1990; MP PMT 1999; MP PET 2000; RPET2001]

(a) 155.6 *volts* (b) 220.0 *volts*

(c) 311.0 *volts* (d) 440 *volts*

13. A sinusoidal ac current flows through a resistor of resistance R. If the peak current is I_p, then the power dissipated is

[MP PMT 1991]

(a) $I_p^2 R\cos\theta$ (b) $\frac{1}{2}I_p^2 R$

(c) $\frac{4}{\pi}I_p^2 R$ (d) $\frac{1}{\pi}I_p^2 R$

[AIEEE 2004]

14. A 40 Ω electric heater is connected to a 200 V, 50 Hz mains supply. The peak value of electric current flowing in the circuit is approximately [MP PET 1992]

(a) 2.5 A (b) 5.0 A

(c) 7 A (d) 10 A

15. The frequency of ac mains in India is

[CPMT 1987]

[NCERT 1974; MP PMT/PET 1988; RPMT 1997; RPET 2000]

(a) 30 *c/s* or *Hz* (b) 50 *c/s* or *Hz*

(c) 60 *c/s* or *Hz* (d) 120 *c/s* or *Hz*

16. The *r.m.s.* value of an ac of 50 *Hz* is 10 *amp*. The time taken by the alternating current in reaching from zero to maximum value and the peak value of current will be

[MP PET 1993; KCET 2003]

(a) 2×10^{-2} *sec* and 14.14 *amp*

(b) 1×10^{-2} *sec* and 7.07 *amp*

(c) 5×10^{-3} *sec* and 7.07 *amp*

(d) 5×10^{-3} *sec* and 14.14 *amp*

17. The root mean square value of the alternating current is equal to

(a) Twice the peak value

(b) Half the peak value

(c) $\frac{1}{\sqrt{2}}$ times the peak value

(d) Equal to the peak value

18. The peak value of an alternating e.m.f. E is given by $E = E_0\cos\omega t$ is 10 *volts* and its frequency is 50 *Hz*. At time $t = \frac{1}{600}\,sec$, the instantaneous e.m.f. is

[MP PMT 1990; MP PET 2004]

(a) 10 V (b) $5\sqrt{3}\,V$

(c) 5 V (d) 1 V

19. If a current I given by $I_0\sin\left(\omega t - \frac{\pi}{2}\right)$ flows in an ac circuit across which an ac potential of $E = E_0\sin\omega t$ has been applied, then the power consumption P in the circuit will be

[CPMT 1986; Roorkee 1992; SCRA 1996; MP PMT 1994; RPET 2001; MP PET 2001, 02]

(a) $P = \frac{E_0 I_0}{\sqrt{2}}$ (b) $P = \sqrt{2}E_0 I_0$

(c) $P = \frac{E_0 I_0}{2}$ (d) $P = 0$

20. In an ac circuit, the instantaneous values of e.m.f. and current are $e = 200 \sin 314\, t$ *volt* and $i = \sin\left(314t + \frac{\pi}{3}\right)$ *ampere*. The average power consumed in *watt* is [NCERT 1990; RPMT 1997]

(a) 200 (b) 100

(c) 50 (d) 25

21. An ac generator produced an output voltage $E = 170 \sin 377\, t\, volts$, where t is in seconds. The frequency of ac voltage is [MP PET 1994]

(a) 50 *Hz* (b) 110 *Hz*

(c) 60 *Hz* (d) 230 *Hz*

22. In general in an alternating current circuit [MP PMT 1994]

(a) The average value of current is zero

(b) The average value of square of the current is zero

(c) Average power dissipation is zero

(d) The phase difference between voltage and current is zero

23. An alternating current is given by the equation $i = i_1 \cos \omega t + i_2 \sin \omega t$. The *r.m.s.* current is given by [MP PMT 1994]

(a) $\frac{1}{\sqrt{2}}(i_1 + i_2)$ (b) $\frac{1}{\sqrt{2}}(i_i + i_2)^2$

(c) $\frac{1}{\sqrt{2}}(i_1^2 + i_2^2)^{1/2}$ (d) $\frac{1}{2}(i_1^2 + i_2^2)^{1/2}$

24. In an ac circuit, the current is given by $i = 5 \sin\left(100\, t - \frac{\pi}{2}\right)$ and the ac potential is $V = 200 \sin(100)\, volt$. Then the power consumption is [CBSE PMT 1995; MH CET 1999; CPMT 2002]

(a) 20 *watts* (b) 40 *watts*

(c) 1000 *watts* (d) 0 *watt*

25. An electric lamp is connected to 220 *V*, 50 *Hz* supply. Then the peak value of voltage is [AFMC 1996]

(a) 210 V (b) 211 *V*

(c) 311 V (d) 320 *V*

26. In a circuit, the value of the alternating current is measured by hot wire ammeter as 10 *ampere*. Its peak value will be [MP PET 1996; AMU (Med.) 1999; KCET (Engg./Med.) 2000; CPMT 2003]

(a) 10 *A* (b) 20 *A*

(c) 14.14 *A* (d) 7.07 *A*

27. The voltage of domestic ac is 220 *volt*. What does this represent

(a) Mean voltage

(b) Peak voltage

(c) Root mean voltage

(d) Root mean square voltage

28. The *r.m.s.* voltage of domestic electricity supply is 220 *volt*. Electrical appliances should be designed to withstand an instantaneous voltage of

(a) 220 *V* (b) 310 *V*

(c) 330 *V* (d) 440 *V*

29. The process by which ac is converted into dc is known as

(b) Purification (b) Amplification

(c) Rectification (d) Current amplification

30. In an ac circuit with voltage *V* and current *I*, the power dissipated is [CBSE PMT 1997]

(a) *VI*

(b) $\frac{1}{2} VI$

(c) $\frac{1}{\sqrt{2}} VI$

(d) Depends on the phase between *V* and *I*

31. For an ac circuit $V = 15 \sin \omega t$ and $I = 20 \cos \omega t$ the average power consumed in this circuit is [RPET 1999]

(a) 300 *Watt* (b) 150 *Watt*

(c) 75 *Watt* (d) zero

32. A bulb is connected first with dc and then ac of same voltage then it will shine brightly with [RPET 2000]

(a) AC

(b) DC

(c) Brightness will be in ratio 1/1.4

(d) Equally with both

33. An ac supply gives 30 *V r.m.s.* which passes through a 10 Ω resistance. The power dissipated in it is [AMU (Med.) 2001]

(a) $90\sqrt{2}\, W$ (b) $90\, W$

(c) $45\sqrt{2}\, W$ (d) $45\, W$

34. The frequency of an alternating voltage is 50 *cycles/sec* and its amplitude is 120 *V*. Then the *r.m.s.* value of voltage is [BHU 1999; MH CET (Med.) 2001; KCET (Med.) 2001; MH CET 2003]

(a) 101.3 *V* (b) 84.8 *V*

(c) 70.7 *V* (d) 56.5 *V*

35. A resistance of 20 *ohms* is connected to a source of an alternating potential $V = 220 \sin(100\pi t)$. The time taken by the current to change from its peak value to *r.m.s* value is [MP PET 2001]

(a) 0.2 *sec* (b) 0.25 *sec*

(c) 25×10^{-3} *sec* (d) 2.5×10^{-3} *sec*

36. Voltage and current in an ac circuit are given by $V = 5 \sin\left(100\pi t - \frac{\pi}{6}\right)$ and $I = 4 \sin\left(100\pi t + \frac{\pi}{6}\right)$ [Kerala PET 2001] [MP PMT 1996]

(a) Voltage leads the current by 30^o

(b) Current leads the voltage by 30^o

(c) Current leads the voltage by 60^o

(d) Voltage leads the current by 60^o

37. If an ac main supply is given to be 220 *V*. What would be the average e.m.f. during a positive half cycle [MH CET 2002]

(a) 198 *V* (b) 386 *V*

(c) 256 *V* (d) None of these

38. In an ac circuit, the *r.m.s.* value of current, I_{rms} is related to the peak current, I_0 by the relation [AFMC 2002]

(a) $I_{rms} = \frac{1}{\pi} I_0$ (b) $I_{rms} = \frac{1}{\sqrt{2}} I_0$

(c) $I_{rms} = \sqrt{2} I_0$ (d) $I_{rms} = \pi I_0$

39. An alternating voltage is represented as $E = 20\sin 300t$. The average value of voltage over one cycle will be

[MP PMT 2002]

(a) Zero (b) 10 *volt*

(c) $20\sqrt{2}$ *volt* (d) $\frac{20}{\sqrt{2}}$ *volt*

40. The ratio of peak value and *r.m.s* value of an alternating current is

(a) 1 (b) $\frac{1}{2}$

(c) $\sqrt{2}$ (d) $1/\sqrt{2}$

41. A 280 *ohm* electric bulb is connected to 200 *V* electric line. The peak value of current in the bulb will be

[MP PET 2002]

(a) About one ampere (b) Zero

(c) About two ampere (d) About four ampere

42. An ac source is rated at 220 *V*, 50 *Hz*. The time taken for voltage to change from its peak value to zero is

[Orissa JEE 2003]

(a) 50 *sec* (b) 0.02 *sec*

(c) 5 *sec* (d) 5×10^{-3} *sec*

43. If the value of potential in an ac, circuit is 10 *V*, then the peak value of potential is [CPMT 2003]

(a) $\frac{10}{\sqrt{2}}$ (b) $10\sqrt{2}$

(c) $20\sqrt{2}$ (d) $\frac{20}{\sqrt{2}}$

44. A lamp consumes only 50% of peak power in an a.c. circuit. What is the phase difference between the applied voltage and the circuit current [MP PMT 2004]

(a) $\frac{\pi}{6}$ (b) $\frac{\pi}{3}$

(c) $\frac{\pi}{4}$ (d) $\frac{\pi}{2}$

45. If an alternating voltage is represented as

$E = 141\sin(628\,t)$, then the *rms* value of the voltage and the frequency are respectively [Kerala PET 2005]

(a) $141V, 628Hz$ (b) $100V, 50Hz$

(c) $100V, 100Hz$ (d) $141V,\ 100Hz$

46. The maximum value of a.c. voltage in a circuit is 707 *V*. Its *rms* value is [MP PET 2005]

(a) 70.7 *V* (b) 100 *V*

(c) 500 *V* (d) 707 *V*

ac Circuits

1. Choke coil works on the principle of [MP PET/PMT 1988]

(a) Transient current (b) Self induction

(c) Mutual induction (d) Wattless current

2. A choke coil has [RPET 1999; AIIMS 1999]

(a) High inductance and low resistance

(b) Low inductance and high resistance

(c) High inductance and high resistance

(d) Low inductance and low resistance

3. Choke coil is used to control [CPMT 1984]

(a) ac (b) dc

(c) Both ac and dc (d) Neither ac nor dc

4. Current in the circuit is wattless, if

(a) Inductance in the circuit is zero

(b) Resistance in the circuit is zero

[MP PMT 2002]

(c) Current is alternating

(d) Resistance and inductance both are zero

5. The phase angle between e.m.f. and current in *LCR* series ac circuit is [MP PMT/PET 1998]

(a) 0 to $\pi/2$ (b) $\pi/4$

(c) $\pi/2$ (d) π

6. A choke coil is preferred to a rheostat in ac circuit as

(a) It consumes almost zero power

(b) It increases current

(c) It increases power

(d) It increases voltage

7. An alternating e.m.f. is applied to purely capacitive circuit. The phase relation between e.m.f. and current flowing in the circuit is **or**

In a circuit containing capacitance only

[MP PET 1996; AIIMS 1997]

(a) e.m.f. is ahead of current by $\pi/2$

(b) Current is ahead of e.m.f. by $\pi/2$

(c) Current lags behind e.m.f. by π

(d) Current is ahead of e.m.f. by π

8. An ac source is connected to a resistive circuits. Which of the following is true [CPMT 1985]

(a) Current leads the voltage and both are in same phase

(b) Current lags behind the voltage and both are in same phase

(c) Current and voltage are in same phase

(d) Any of the above may be true depending upon the value of resistance

9. The average power dissipated in a pure inductor of inductance *L* when an ac current is passing through it, is

[CPMT 1974; RPMT 1997; MP PET 1999]

(a) $\frac{1}{2}LI^2$ (b) $\frac{1}{4}LI^2$

(c) $2\,Li^2$ (d) Zero

(Inductance of the coil *L* and current *I*)

10. An alternating current of frequency $'f'$ is flowing in a circuit containing a resistance R and a choke L in series. The impedance of this circuit is

[CPMT 1978; MP PMT 1993; MP PET 1999; AIIMS 2000; Pb. PET 2004; RPET 2001, 03]

(a) $R + 2\pi fL$ (b) $\sqrt{R^2 + 4\pi^2 f^2 L^2}$

(c) $\sqrt{R^2 + L^2}$ (d) $\sqrt{R^2 + 2\pi fL}$

11. A resonant ac circuit contains a capacitor of capacitance $10^{-6} F$ and an inductor of $10^{-4} H$. The frequency of electrical oscillations will be

(a) $10^5\ Hz$ (b) 10 Hz

(c) $\frac{10^5}{2\pi} Hz$ (d) $\frac{10}{2\pi} Hz$

12. Power delivered by the source of the circuit becomes maximum, when [DCE 2004]

(a) $\omega L = \omega C$ (b) $\omega L = \frac{1}{\omega C}$

(c) $\omega L = -\left(\frac{1}{\omega C}\right)^2$ (d) $\omega L = \sqrt{\omega C}$

13. An alternating voltage is connected in series with a resistance R and an inductance L If the potential drop across the resistance is 200 V and across the inductance is 150 V, then the applied voltage is

(a) 350 V (b) 250 V

(c) 500 V (d) 300 V

14. An inductive circuit contains resistance of 10 Ω and an inductance of 20 H. If an ac voltage of 120 V and frequency 60 Hz is applied to this circuit, the current would be nearly

(a) 0.32 *amp* (b) 0.016 *amp*

(c) 0.48 *amp* (d) 0.80 *amp*

15. Same current is flowing in two alternating circuits. The first circuit contains only inductance and the other contains only a capacitor. If the frequency of the e.m.f. of ac is increased, the effect on the value of the current will be [MP PET 1993]

(a) Increases in the first circuit and decreases in the other

(b) Increases in both the circuits

(c) Decreases in both the circuits

(d) Decreases in the first circuit and increases in the other

16. A capacitor is a perfect insulator for

(a) Alternating currents (b) Direct currents

(c) Both ac and dc (d) None of these

17. In a circuit containing an inductance of zero resistance, the e.m.f. of the applied ac voltage leads the current by

[CPMT 1990]

(a) 90 (b) 45

(c) 30 (d) 0

18. In a pure inductive circuit or In an ac circuit containing inductance only, the current

[MP PMT 1993; CPMT 1996; Kerala PET 2002]

(a) Leads the e.m.f. by 90

(b) Lags behind the e.m.f. by 90

(c) Sometimes leads and sometime lags behind the e.m.f.

(d) Is in phase with the e.m.f.

19. A 20 *volts* ac is applied to a circuit consisting of a resistance and a coil with negligible resistance. If the voltage across the resistance is 12 V, the voltage across the coil is

[MP PMT 1989; RPMT 1997]

(a) 16 *volts* (b) 10 *volts*

(c) 8 *volts* (d) 6 *volts*

20. A resistance of 300 Ω and an inductance of $\frac{1}{\pi}$ henry are connected in series to a ac voltage of 20 *volts* and 200 Hz frequency. The phase angle between the voltage and current is

(a) $\tan^{-1}\frac{4}{3}$ (b) $\tan^{-1}\frac{3}{4}$

(c) $\tan^{-1}\frac{3}{2}$ (d) $\tan^{-1}\frac{2}{5}$

21. The power factor of LCR circuit at resonance is

[MP PMT 1991; RPMT 1999; RPET 2001; UPSEAT 1999]

(a) 0.707 (b) 1

(c) Zero (d) 0.5

22. An inductance of 1 mH a condenser of 10 μF and a resistance of 50 Ω are connected in series. The reactances of inductor and condensers are same. The reactance of either of them will be [CPMT 1990]

(a) 100 Ω (b) 30 Ω

(c) 3.2 Ω (d) 10 Ω

23. The natural frequency of a L-C circuit is equal to

[CPMT 1978, 97]

(a) $\frac{1}{2\pi}\sqrt{LC}$ (b) $\frac{1}{2\pi\sqrt{LC}}$

(c) $\frac{1}{2\pi}\sqrt{\frac{L}{C}}$ (d) $\frac{1}{2\pi}\sqrt{\frac{C}{L}}$

24. An alternating voltage $E = 200\sqrt{2}\sin(100\,t)$ is connected to a 1 *microfarad* capacitor through an ac ammeter. The reading of the ammeter shall be [NCERT 1984; MNR 1995; MP PET 1999; RPET 1999; UPSEAT 2000]

(a) 10 mA (b) 20 mA

(c) 40 mA (d) 80 mA

25. An ac circuit consists of an inductor of inductance 0.5 H and a capacitor of capacitance 8 μF in series. The current in the circuit is maximum when the angular frequency of ac source is

(a) 500 *rad/sec* (b) 2 × 10 *rad/sec*

(c) 4000 *rad/sec* (d) 5000 *rad/sec*

26. The average power dissipation in a pure capacitance in ac circuit is [DPMT 198

(a) $\frac{1}{2}CV^2$ (b) CV^2

(c) $\frac{1}{4}CV^2$ (d) Zero

27. In a region of uniform magnetic induction $B = 10^{-2}\ tesla$, a circular coil of radius 30 cm and resistance π *ohm* is rotated about an axis which is perpendicular to the direction of B and which forms

a diameter of the coil. If the coil rotates at 200 *rpm* the amplitude of the alternating current induced in the coil is

(a) 4π *mA* (b) 30 *mA*

(c) 6 *mA* (d) 200 *mA*

28. An inductive circuit contains a resistance of 10 *ohm* and an inductance of 2.0 *henry*. If an ac voltage of 120 *volt* and frequency of 60 *Hz* is applied to this circuit, the current in the circuit would be nearly [CPMT 1990; MP PET 2002]

(a) 0.32 *amp* (b) 0.16 *amp*

(c) 048 *amp* (d) 0.80 *amp*

29. In a *LCR* circuit having *L* = 8.0 *henry*, *C* = 0.5 μF and *R* = 100 *ohm* in series. The resonance frequency in *per second* is

(a) 600 *radian* (b) 600 *Hz*

(c) 500 *radian* (d) 500 *Hz*

30. In *LCR* circuit, the capacitance is changed from *C* to 4*C*. For the same resonant frequency, the inductance should be changed from *L* to [MP PMT 1986; BHU 1998]

(a) 2*L* (b) *L* / 2

(c) *L* / 4 (d) 4 *L*

31. A 120 *volt* ac source is connected across a pure inductor of inductance 0.70 henry. If the frequency of the source is 60 *Hz*, the current passing through the inductor is

[MP PET 1994]

(a) 4.55 *amps* (b) 0.355 *amps*

(c) 0.455 amps (d) 3.55 amps

32. The impedance of a circuit consists of 3 *ohm* resistance and 4 *ohm* reactance. The power factor of the circuit is

[MP PMT 1994]

(a) 0.4 (b) 0.6

(c) 0.8 (d) 1.0

33. *L*, *C* and *R* denote inductance, capacitance and resistance respectively. Pick out the combination which does not have the dimensions of frequency [MP PMT 1994]

(a) $\frac{1}{RC}$ (b) $\frac{R}{L}$

(c) $\frac{1}{\sqrt{LC}}$ (d) $\frac{C}{L}$

34. The power factor of a good choke coil is [MP PMT 1994]

(a) Nearly zero (b) Exactly zero

(c) Nearly one (d) Exactly one

35. If resistance of 100 Ω , inductance of 0.5 *henry* and capacitance of $10\times10^{-6}F$ are connected in series through 50 *Hz* ac supply, then impedance is [BHU 1995]

(a) 1.876 (b) 18.76

(c) 189.72 (d) 101.3

36. An alternating current source of frequency 100 *Hz* is joined to a combination of a resistance, a capacitance and a coil in series. The potential difference across the coil, the resistance and the capacitor is 46, 8 and 40 *volt* respectively. The electromotive force of alternating current source in *volt* is

[MP PET 1995]

(a) 94 (b) 14

(c) 10 [CBSE PMT 1990] (d) 76

37. A 10 *ohm* resistance, 5 *mH* coil and 10 μF capacitor are joined in series. When a suitable frequency alternating current source is joined to this combination, the circuit resonates. If the resistance is halved, the resonance frequency [MP PET 1995]

(a) Is halved (b) Is doubled

(c) Remains unchanged (d) In quadrupled

38. *L*, *C* and *R* represent physical quantities inductance, capacitance and resistance respectively. The combination representing dimension of frequency is
[CPMT 1990] [MP PET 1995; DCE 2001]

(a) *LC* (b) $(LC)^{-1/2}$

(c) $\left(\frac{L}{C}\right)^{-1/2}$ (d) $\frac{C}{L}$

39. In a series circuit $R = 300\ \Omega$, $L = 0.9\ H$, $C = 2.0\ \mu F$ and $\omega = 1000\ rad/sec$. The impedance of the circuit is

(a) 1300 Ω (b) 900 Ω

(c) 500 Ω (d) 400 Ω

40. In a *L-R* circuit, the value of *L* is $\left(\frac{0.4}{\pi}\right) henry$ and the value of *R* is 30 *ohm*. If in the circuit, an alternating *e.m.f.* of 200 *volt* at 50 cycles per sec is connected, the impedance of the circuit and current will be [MP PET 1996; DPMT 2003]

(a) $11.4\,\Omega, 17.5\,A$ (b) $30.7\,\Omega, 6.5A$

(c) $40.4\,\Omega, 5\,A$ (d) $50\,\Omega, 4A$

41. The reactance of a coil when used in the domestic ac power supply (220 *volt*, 50 *cycles*) is 100 *ohm*. The self inductance of the coil is nearly [MP PMT 1996]

(a) 3.2 *henry* (b) 0.32 *henry*

(c) 2.2 *henry* (d) 0.22 *henry*

42. In a series *LCR* circuit, operated with an ac of angular frequency ω , the total impedance is [MP PET 1996]

(a) $[R^2+(L\omega-C\omega)^2]^{1/2}$

(b) $\left[R^2+\left(L\omega-\frac{1}{C\omega}\right)^2\right]^{1/2}$

(c) $\left[R^2+\left(L\omega-\frac{1}{C\omega}\right)^2\right]^{-1/2}$

(d) $\left[(R\omega)^2+\left(L\omega-\frac{1}{C\omega}\right)^2\right]^{1/2}$

43. The reactance of a $25\,\mu F$ capacitor at the ac frequency of 4000 *Hz* is

(a) $\frac{5}{\pi}$ *ohm* (b) $\sqrt{\frac{5}{\pi}}$ *ohm*

(c) 10 *ohm* (d) $\sqrt{10}$ *ohm*

44. The frequency for which a $5\,\mu F$ capacitor has a reactance of $\frac{1}{1000}$ *ohm* is given by [MP PET 1997]

(a) $\frac{100}{\pi}\,MHz$ (b) $\frac{1000}{\pi}\,Hz$

(c) $\frac{1}{1000}\,Hz$ (d) 1000 *Hz*

45. An e.m.f. $E = 4\cos(1000t)$ *volt* is applied to an LR-circuit of inductance 3 *mH* and resistance 4 *ohms*. The amplitude of current in the circuit is [MP PMT 1997]

(a) $\frac{4}{\sqrt{7}}\,A$ (b) 1.0 *A*

(c) $\frac{4}{7}\,A$ (d) 0.8 *A*

46. In an ac circuit, a resistance of R *ohm* is connected in series with an inductance *L*. If phase angle between voltage and current be 45°, the value of inductive reactance will be

[MP PMT/PET 1998]

(a) $\frac{R}{4}$

(b) $\frac{R}{2}$

(c) R

(d) Cannot be found with the given data

47. A coil of inductance L has an inductive reactance of X_L in an AC circuit in which the effective current is *I*. The coil is made from a super-conducting material and has no resistance. The rate at which power is dissipated in the coil is

[MP PMT 1999]

(a) 0 (b) IX_L

(c) I^2X_L (d) IX_L^2

48. The phase difference between the current and voltage of *LCR* circuit in series combination at resonance is

[CPMT 1999; Pb. PET 2001]

(a) 0 (b) $\pi/2$

(c) π (d) $-\pi$

49. In a series resonant circuit, the ac voltage across resistance *R*, inductance *L* and capacitance *C* are 5 *V*, 10 *V* and 10 *V* respectively. The ac voltage applied to the circuit will be

[KCET 1994]

(a) 20 *V* (b) 10 *V*

(c) 5 *V* (d) 25 *V*

50. When 100 *volt* dc is applied across a coil, a current of 1 *amp* flows through it. When 100 volt ac at 50 cycle s^{-1} is applied to the same coil, only 0.5 ampere current flows. The impedance of the coil is

(a) $100\,\Omega$ (b) $200\,\Omega$

(c) $300\,\Omega$ (d) $400\,\Omega$

51. The coefficient of induction of a choke coil is 0.1*H* and resistance is $12\,\Omega$. If it is connected to an alternating current source of frequency 60 *Hz*, then power factor will be

[RPET 1997]

(a) 0.32 (b) 0.30

(c) 0.28 (d) 0.24

52. For series *LCR* circuit, wrong statement is [RPMT 1997]

(a) Applied e.m.f. and potential difference across resistance are in same phase

(b) Applied e.m.f. and potential difference at inductor coil have phase difference of $\pi/2$

(c) Potential difference at capacitor and inductor have phase difference of $\pi/2$

(d) Potential difference across resistance and capacitor have phase difference of $\pi/2$

53. In a purely resistive *ac* circuit, the current [Roorkee 1992]

(a) Lags behind the e.m.f. in phase

(b) Is in phase with the e.m.f.

(c) Leads the e.m.f. in phase

(d) Leads the e.m.f. in half the cycle and lags behind it in the other half

54. If an $8\,\Omega$ resistance and $6\,\Omega$ reactance are present in an ac series circuit then the impedance of the circuit will be

[MP PMT 2003]

(a) 20 *ohm* (b) 5 *ohm*

(c) 10 *ohm* (d) $14\sqrt{2}$ *ohm*

55. A 12 *ohm* resistor and a 0.21 henry inductor are connected in series to an ac source operating at 20 *volts*, 50 cycle/second. The phase angle between the current and the source voltage is

(a) 30° (b) 40°

(c) 80° (d) 90°

56. What will be the phase difference between virtual voltage and virtual current, when the current in the circuit is wattless

[RPET 1996]

(a) 90° (b) 45°

(c) 180° (d) 60°

57. The resonant frequency of a circuit is *f*. If the capacitance is made 4 times the initial values, then the resonant frequency will become

(a) $f/2$ (b) $2f$

(c) f (d) $f/4$

58. In the non-resonant circuit, what will be the nature of the circuit for frequencies higher than the resonant frequency

[RPET 1996]

(a) Resistive (b) Capacitive

(c) Inductive (d) None of the above

59. In an ac circuit, the potential difference across an inductance and resistance joined in series are respectively 16 *V* and 20 *V*. The total potential difference across the circuit is

[Bihar MEE 1995] [AFMC 1998; BHU 1999]

(a) 20.0 *V* (b) 25.6 *V*

(c) 31.9 *V* (d) 53.5 *V*

60. A 220 *V*, 50 *Hz* ac source is connected to an inductance of 0.2 *H* and a resistance of 20 *ohm* in series. What is the current in the circuit [MNR 1998; JIPMER 2001, 02]

(a) 10 *A* (b) 5 *A*

(c) 33.3 A (d) 3.33 A

61. An LCR circuit contains R = 50 Ω , L = 1 mH and C = 0.1 μF. The impedance of the circuit will be minimum for a frequency of [Bihar MEE 1995]

(a) $\frac{10^5}{2\pi} s^{-1}$ (b) $\frac{10^6}{2\pi} s^{-1}$

(c) $2\pi \times 10^5 s^{-1}$ (d) $2\pi \times 10^6 s^{-1}$

62. In a series LCR circuit, resistance $R = 10\Omega$ and the impedance $Z = 20\Omega$. The phase difference between the current and the voltage is [KCET (Engg./Med.) 1999]

(a) 30^o (b) 45^o

(c) 60^o (d) 90^o

63. A series ac circuit consist of an inductor and a capacitor. The inductance and capacitance is respectively 1 *henry* and $25\mu F$. If the current is maximum in circuit then angular frequency will be

(a) 200 (b) 100

(c) 50 (d) 200/2 π

64. An alternating e.m.f. of frequency $\nu \left(= \frac{1}{2\pi\sqrt{LC}} \right)$ is applied to a series LCR circuit. For this frequency of the applied e.m.f.

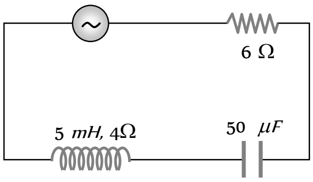
(a) The circuit is at resonance and its impedance is made up only of a reactive part

(b) The current in the circuit is in phase with the applied e.m.f. and the voltage across R equals this applied emf

(c) The sum of the p.d.'s across the inductance and capacitance equals the applied e.m.f. which is 180^o ahead of phase of the current in the circuit

(d) The quality factor of the circuit is $\omega L / R$ or $1/\omega CR$ and this is a measure of the voltage magnification (produced by the circuit at resonance) as well as the sharpness of resonance of the circuit

65. In the circuit shown below, the ac source has voltage $V = 20\cos(\omega t)$ volts with ω = 2000 *rad/sec*. the amplitude of the current will be nearest to [AMU (Engg.) 2000]



(a) $2A$

(b) $3.3A$

(c) $2/\sqrt{5}A$

(d) $\sqrt{5}A$

66. The value of the current through an inductance of $1H$ and of negligible resistance, when connected through an ac source of 200 V and 50 Hz, is [AFMC 2000]

(a) 0.637 A (b) 1.637 A

(c) 2.637A (d) 3.637 A

67. The quality factor of LCR circuit having resistance (R) and inductance (L) at resonance frequency (ω) is given by [AFMC 2000; CBSE PMT 2000]

(a) $\frac{\omega L}{R}$ (b) $\frac{R}{\omega L}$

(c) $\left(\frac{\omega L}{R}\right)^{1/2}$ (d) $\left(\frac{\omega L}{R}\right)^2$

68. Power factor is maximum in an LCR circuit when [RPET 2000]

(a) $X_L = X_C$ (b) $R = 0$

(c) $X_L = 0$ (d) $X_C = 0$

69. In an ac circuit the reactance of a coil is $\sqrt{3}$ times its resistance, the phase difference between the voltage across the coil to the current through the coil will be [KCET (Engg.) 2000]

(a) $\pi/3$ (b) $\pi/2$

(c) $\pi/4$ (d) $\pi/6$

70. The capacity of a pure capacitor is 1 *farad*. In dc circuits, its effective resistance will be [MP PMT 2000]

(a) Zero (b) Infinite

(c) 1 *ohm* (d) 1/2 *ohm*

71. In an ac circuit, the current lags behind the voltage by $\pi/3$. The components in the circuit are [RPMT 1999] [MP PMT 2000]

(a) R and L (b) R and C

(c) L and C (d) Only R

72. The reactance of a coil when used in the domestic ac power supply (220 *volts*, 50 cycles per second) is 50 *ohms*. The inductance of the coil is nearly [Roorkee 1999] [MP PMT 2000]

(a) 2.2 *henry* (b) 0.22 *henry*

(c) 1.6 *henry* (d) 0.16 *henry*

73. In an ac circuit, the power factor [Roorkee 2000]

(a) Is zero when the circuit contains an ideal resistance only

(b) Is unity when the circuit contains an ideal resistance only

(c) Is zero when the circuit contains an ideal inductance only

(d) Is unity when the circuit contains an ideal inductance only

74. A resistance of 40 *ohm* and an inductance of 95.5 *millihenry* are connected in series in a 50 *cycles/second* ac circuit. The impedance of this combination is very nearly [MP PET 2000]

(a) 30 *ohm* (b) 40 *ohm*

(c) 50 *ohm* (d) 60 *ohm*

75. For high frequency, a capacitor offers [CPMT 1999; CBSE PMT 1999; AFMC 2001; Pb. PET 2001; J & K CET 2004]

(a) More reactance (b) Less reactance

(c) Zero reactance (d) Infinite reactance

76. The coil of choke in a circuit [AIIMS 2001]

(a) Increases the current

(b) Decreases the current

(c) Does not change the current

(d) Has high resistance to dc circuit

77. In a circuit, the current lags behind the voltage by a phase difference of $\pi/2$. The circuit contains which of the following

(a) Only R (b) Only L

(c) Only C (d) R and C

78. The inductive reactance of an inductor of $\frac{1}{\pi}$ *henry* at 50 Hz frequency is [MP PET 2001, 02]

(a) $\frac{50}{\pi}$ *ohm* (b) $\frac{\pi}{50}$ *ohm*
(c) 100 *ohm* (d) 50 *ohm*

79. An oscillator circuit consists of an inductance of 0.5mH and a capacitor of 20 μF. The resonant frequency of the circuit is nearly
(a) 15.92 *Hz* (b) 159.2 *Hz*
(c) 1592 *Hz* (d) 15910 *Hz*

80. Reactance of a capacitor of capacitance $C\mu F$ for ac frequency $\frac{400}{\pi}$ *Hz* is 25Ω. The value *C* is [MH CET 2002]
(a) $50\mu F$ (b) $25\mu F$
(c) $100\mu F$ (d) $75\mu F$

81. The power factor of an ac circuit having resistance (*R*) and inductance (*L*) connected in series and an angular velocity ω is
(a) $R/\omega L$ (b) $R/(R^2+\omega^2L^2)^{1/2}$
(c) $\omega L/R$ (d) $R/(R^2-\omega^2L^2)^{1/2}$

82. A circuit has a resistance of 11Ω, an inductive reactance of 25Ω and a capacitative resistance of 18Ω. It is connected to an ac source of 260 *V* and 50*Hz*. The current through the circuit (in amperes) is
(a) 11 (b) 15
(c) 18 (d) 20

83. A 0.7 *henry* inductor is connected across a 120 *V* – 60 *Hz* ac source. The current in the inductor will be very nearly [MP PMT 2002]
(a) 4.55 *amp* (b) 0.355 *amp*
(c) 0.455 *amp* (d) 3.55 *amp*

84. There is a 5Ω resistance in an ac, circuit. Inductance of 0.1*H* is connected with it in series. If equation of ac e.m.f. is $5\sin 50t$ then the phase difference between current and e.m.f. is
(a) $\frac{\pi}{2}$ (b) $\frac{\pi}{6}$
(c) $\frac{\pi}{4}$ (d) 0

85. An inductor of inductance *L* and resistor of resistance *R* are joined in series and connected by a source of frequency ω. Power dissipated in the circuit is [AIEEE 2002; RPET 2003]
(a) $\frac{(R^2+\omega^2L^2)}{V}$ (b) $\frac{V^2R}{(R^2+\omega^2L^2)}$
(c) $\frac{V}{(R^2+\omega^2L^2)}$ (d) $\frac{\sqrt{R^2+\omega^2L^2}}{V^2}$

86. In a ac circuit of capacitance the current from potential is [CPMT 2003]
(a) Forward
(b) Backward
(c) Both are in the same phase
(d) None of these

87. A coil of 200Ω resistance and 1.0 *H* inductance is connected to an ac source of frequency $200/2\pi\ Hz$. Phase angle between potential and current will be [MP PMT 2003]
(a) 30° (b) 90°
(c) 45° (d) 0°

88. In a *LCR* circuit the pd between the terminals of the inductance is 60 *V*, between the terminals of the capacitor is 30 *V* and that between the terminals of resistance is 40 *V*. the supply voltage will be equal to ...... [KCET 2004]
(a) 50 *V* (b) 70 *V*
[Kerala PET 2002]
(c) 130 *V* (d) 10 *V*

89. Radio frequency choke uses core of [AFMC 2004]
(a) Air (b) Iron
(c) Air and iron (d) None of these

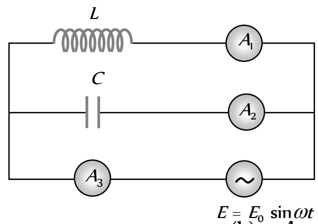
90. In a *LCR* circuit capacitance is changed from *C* to 2*C*. For the resonant frequency to remain unchanged, the inductance should be change from *L* to [AIEEE 2004]
(a) 4*L* (b) 2*L*
(c) *L*/2 (d) *L*/4

91. [AIEEE 2002; MP PET 2000] In an *LCR* series ac circuit, the voltage across each of the components, *L*, *C* and *R* is 50*V*. the voltage across the *LC* combination will be [AIEEE 2004]
(a) 50*V* (b) $50\sqrt{2}\ V$
(c) 100*V* (d) 0 *V* (zero)

92. A coil has *L* = 0.04 *H* and $R = 12\,\Omega$. When it is connected to 220*V*, 50*Hz* supply the current flowing through the coil, in amperes is [Kerala PMT 2002] [Kerala PMT 2004]
(a) 10.7 (b) 11.7
(c) 14.7 (d) 12.7

93. The current in series *LCR* circuit will be maximum when ω is [Kerala PMT 2004]
(a) As large as possible
(b) Equal o natural frequency of *LCR* system
(c) $\sqrt{LC}$
(d) $\sqrt{1/LC}$
[RPET 2003]

94. An inductor *L* and a capacitor *C* are connected in the circuit as shown in the figure. The frequency of the power supply is equal to the resonant frequency of the circuit. Which ammeter will read zero ampere [DCE 2002]



(a) A_1 (b) A_2
(c) A_3 (d) None of these

95. Which of the following components of a *LCR* circuit, with ac supply, dissipates energy [DCE 2004]
(a) *L* (b) *R*
(c) *C* (d) All of these

96. In a circuit L, C and R are connected in series with an alternating voltage source of frequency f. The current leads the voltage by 45°. The value of C is [CBSE PMT 2005]
(a) $\frac{1}{2\pi f(2\pi fL+R)}$

(b) $\dfrac{1}{\pi f(2\pi fL + R)}$

(c) $\dfrac{1}{2\pi f(2\pi fL - R)}$

(d) $\dfrac{1}{\pi f(2\pi fL - R)}$

97. In an *A.C.* circuit the current [CPMT 2005]

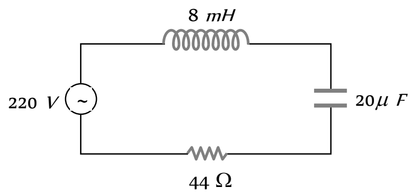
(a) Always leads the voltage

(b) Always lags behind the voltage

(c) Is always in phase with the voltage

(d) May lead or lag behind or be in phase with the voltage

98. For the series LCR circuit shown in the figure, what is the resonance frequency and the amplitude of the current at the resonating frequency [Kerala PET 2005]



(a) $2500\,rad - s^{-1}$ and $5\sqrt{2}\,A$

(b) $2500\,rad - s^{-1}$ and $5A$

(c) $2500\,rad - s^{-1}$ and $\dfrac{5}{\sqrt{2}}A$

(d) $25\,rad - s^{-1}$ and $5\sqrt{2}\,A$

Critical Thinking

Objective Questions

1. When 100 *volts* dc is supplied across a solenoid, a current of 1.0 amperes flows in it. When 100 *volts* ac is applied across the same coil, the current drops to 0.5 ampere. If the frequency of ac source is 50 *Hz*, then the impedance and inductance of the solenoid are

(a) 200 Ω and 0.55 *henry* (b) 100 Ω and 0.86 *henry*

(c) 200 Ω and 1.0 *henry* (d) 100 Ω and 0.93 *henry*

2. In an *LR*-circuit, the inductive reactance is equal to the resistance R of the circuit. An e.m.f. $E = E_0\cos(\omega t)$ applied to the circuit. The power consumed in the circuit is

[MP PMT 1997]

(a) $\dfrac{E_0^2}{R}$ (b) $\dfrac{E_0^2}{2R}$

(c) $\dfrac{E_0^2}{4R}$ (d) $\dfrac{E_0^2}{8R}$

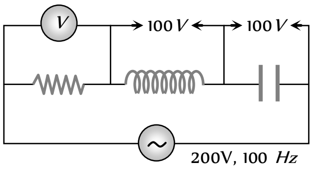
3. One 10 *V*, 60 *W* bulb is to be connected to 100 *V* line. The required induction coil has self inductance of value $(f = 50\,Hz)$

(a) 0.052 *H* (b) 2.42 *H*

(c) 16.2 *mH* (d) 1.62 *mH*

4. In the circuit given below, what will be the reading of the voltmeter

(a) 300 *V*

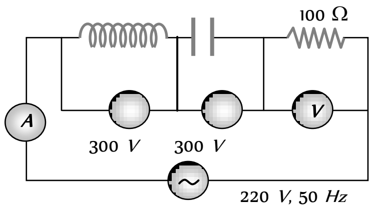


(b) 900 *V*

(c) 200 *V*

(d) 400 *V*

5. In the circuit shown below, what will be the readings of the voltmeter and ammeter [RPMT 1996]



(a) 800 *V*, 2*A* (b) 300 *V*, 2*A*

(c) 220 *V*, 2.2 *A* (d) 100 *V*, 2*A*

6. A bulb and a capacitor are connected in series to a source of alternating current. If its frequency is increased, while keeping the voltage of the source constant, then

[Roorkee 1999]

(a) Bulb will give more intense light

(b) Bulb will give less intense light

(c) Bulb will give light of same intensity as before

(d) Bulb will stop radiating light

7. An alternating e.m.f. of angular frequency ω is applied across an inductance. The instantaneous power developed in the circuit has an angular frequency [Roorkee 1999]

(a) $\dfrac{\omega}{4}$ (b) $\dfrac{\omega}{2}$

(c) ω (d) 2ω

8. The voltage of an ac source varies with time according to the equation $V = 100\sin 100\pi t\cos 100\pi t$ where t is in seconds and V is in volts. Then [MP PMT 1996; 2000]

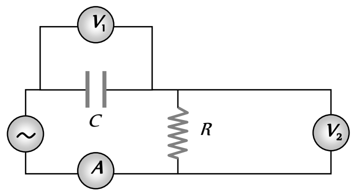
(a) The peak voltage of the source is 100 *volts*

(b) The peak voltage of the source is 50 *volts*

(c) The peak voltage of the source is $100/\sqrt{2}$ *volts*

(d) The frequency of the source is 50 *Hz* [CPMT 1990]

9. The diagram shows a capacitor C and a resistor R connected in series to an ac source. V_1 and V_2 are voltmeters and A is an ammeter



Consider now the following statements

I. Readings in A and V_2 are always in phase

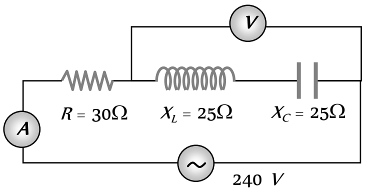
II. Reading in V is ahead in phase with reading in V_2 [RPET 1997]

III. Readings in A and V_1 are always in phase which of these statements are/is correct [AMU (Med.) 2001]

(a) I only (b) II only

(c) I and II only [RPET 1996] (d) II and III only

10. In the circuit shown in figure neglecting source resistance the voltmeter and ammeter reading will respectively, will be [KCET (Engg.) 2001]

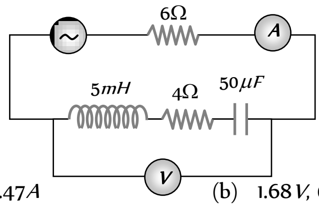


(a) 0 *V*, 3*A* (b) 150 *V*, 3*A*
(c) 150 *V*, 6*A* (d) 0 *V*, 8*A*

11. The voltage of an ac supply varies with time (t) as $V = 120 \sin 100\pi t \cos 100\pi t$. The maximum voltage and frequency respectively are [MP PMT 2001; MP PET 2002]

(a) 120 *volts*, 100 *Hz* (b) $\frac{120}{\sqrt{2}}$ *volts*, 100 *Hz*
(c) 60 *volts*, 200 *Hz* (d) 60 *volts*, 100 *Hz*

12. In the circuit shown in the figure, the ac source gives a voltage $V = 20\cos(2000\,t)$. Neglecting source resistance, the voltmeter and ammeter reading will be [KCET (Engg.) 2002]



(a) 0 *V*, 0.47*A* (b) 1.68 *V*, 0.47*A*
(c) 0 *V*, 1.4 *A* (d) 5.6 *V*, 1.4 *A*

13. A telephone wire of length 200 *km* has a capacitance of 0.014 μF per *km*. If it carries an ac of frequency 5 *kHz*, what should be the value of an inductor required to be connected in series so that the impedance of the circuit is minimum

(a) 0.35 *mH* (b) 35 *mH*
(c) 3.5 *mH* (d) Zero

14. In a certain circuit current changes with time according to $i = 2\sqrt{t}$. *r.m.s.* value of current between $t = 2$ to $t = 4s$ will be

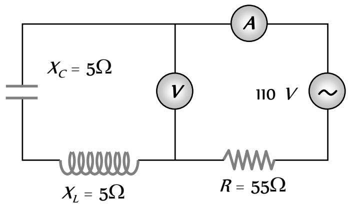
(a) $3A$ (b) $3\sqrt{3}A$
(c) $2\sqrt{3}A$ (d) $(2-\sqrt{2})A$

15. Match the following

Currents	*r.m.s.* values
(1) $x_0 \sin\omega t$	(i) x_0
(2) $x_0 \sin\omega t \cos\omega t$	(ii) $\frac{x_0}{\sqrt{2}}$
(3) $x_0 \sin\omega t + x_0 \cos\omega t$	(iii) $\frac{x_0}{(2\sqrt{2})}$

(a) 1. (i), 2. (ii), 3. (iii) (b) 1. (ii), 2. (iii), 3. (i)
(c) 1. (i), 2. (iii), 3. (ii) (d) None of these

16. The reading of ammeter in the circuit shown will be



(a) 2*A*
(b) 2.4 *A*
(c) Zero
(d) 1.7 *A*

17. An ac source of angular frequency ω is fed across a resistor *r* and a capacitor *C* in series. The current registered is *I*. If now the frequency of source is changed to $\omega/3$ (but maintaining the same voltage), the current in then circuit is found to be halved. Calculate the ratio of reactance to resistance at the original frequency ω [Roorkee 1996]

(a) $\sqrt{\frac{3}{5}}$ (b) $\sqrt{\frac{2}{5}}$
(c) $\sqrt{\frac{1}{5}}$ (d) $\sqrt{\frac{4}{5}}$

18. An *LCR* series circuit with a resistance of 100 *ohm* is connected to an ac source of 200 *V* (*r.m.s.*) and angular frequency 300 *rad/s*. When only the capacitor is removed, the current lags behind the voltage by 60^o. When only the inductor is removed the current leads the voltage by 60^o. The average power dissipated is

(a) 50 *W* (b) 100 *W*
(c) 200 *W* (d) 400 *W*

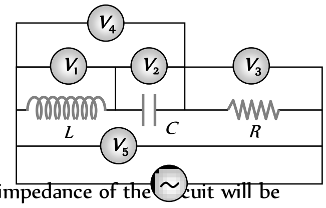
19. A virtual current of 4*A* and 50 *Hz* flows in an ac circuit containing a coil. The power consumed in the coil is 240 *W*. If the virtual voltage across the coil is 100 *V* its inductance will be

(a) $\frac{1}{3\pi}H$ (b) $\frac{1}{5\pi}H$
(c) $\frac{1}{7\pi}H$ (d) $\frac{1}{9\pi}H$

20. For a series *RLC* circuit $R = X_L = 2X_C$. The impedance of the circuit and phase difference (between) *V* and *i* will be

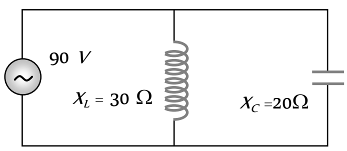
(a) $\frac{\sqrt{5}R}{2}, \tan^{-1}(2)$ (b) $\frac{\sqrt{5}R}{2}, \tan^{-1}\left(\frac{1}{2}\right)$
(c) $\sqrt{5}X_C, \tan^{-1}(2)$ (d) $\sqrt{5}R, \tan^{-1}\left(\frac{1}{2}\right)$

21. In the adjoining ac circuit the voltmeter whose reading will be zero at resonance is



(a) V
(b) V
(c) V
(d) V

22. In the adjoining figure the impedance of the circuit will be

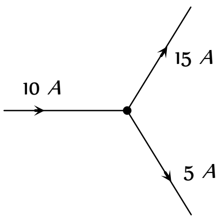


(a) 120 *ohm*
(b) 50 *ohm*
(c) 60 *ohm*
(d) 90 *ohm*

23. If $i = t^2$ $0 < t < T$ then *r.m.s.* value of current is

(a) $\frac{T^2}{\sqrt{2}}$ (b) $\frac{T^2}{2}$
(c) $\frac{T^2}{\sqrt{5}}$ (d) None of these

24. Is it possible



(a) Yes
(b) No

(c) Cannot be predicted

(d) Insufficient data to reply

25. In a series circuit $C = 2\mu F, L = 1mH$ and $R = 10\,\Omega$, when the current in the circuit is maximum, at that time the ratio of the energies stored in the capacitor and the inductor will be

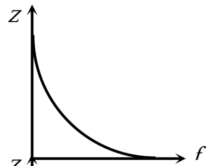
(a) 1 : 1 (b) 1 : 2

(c) 2 : 1 (d) 1 : 5

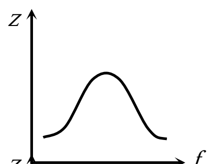
Graphical Questions

1. Which one of the following curves represents the variation of impedance (Z) with frequency f in series LCR circuit

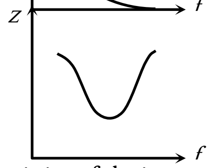
(a)



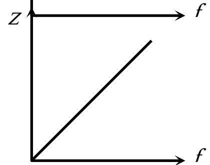
(b)



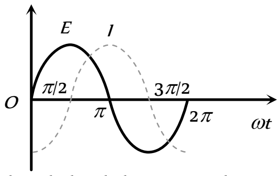
(c)



(d)



2. The variation of the instantaneous current (I) and the instantaneous emf (E) in a circuit is as shown in fig. Which of the following statements is correct



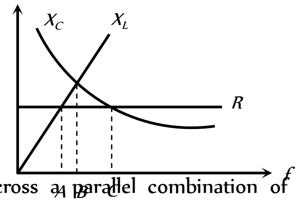
(a) The voltage lags behind the current by $\pi / 2$

(b) The voltage leads the current by $\pi / 2$

(c) The voltage and the current are in phase

(d) The voltage leads the current by π

3. The figure shows variation of R, X_L and X_C with frequency f in a series L, C, R circuit. Then for what frequency point, the circuit is inductive



(a) A

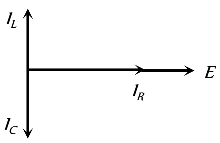
(b) B

(c) C

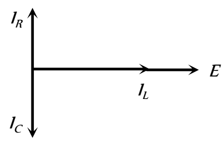
(d) All points

4. An alternating emf is applied across a parallel combination of a resistance R, capacitance C and an inductance L. If I_R, I_L, I_C are the currents through R, L and C respectively, then the diagram which correctly represents, the phase relationship among I_R, I_L, I_C and source emf E, is given by

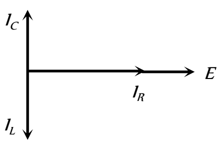
(a)



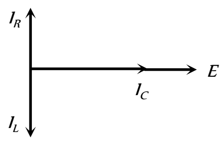
(b)



(c)

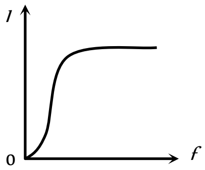


(d)

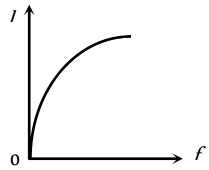


5. An ac source of variable frequency f is connected to an LCR series circuit. Which one of the graphs in figure. represents the variation of current of current I in the circuit with frequency f

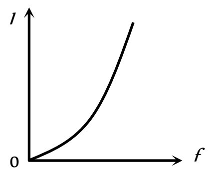
(a)



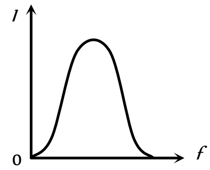
(b)



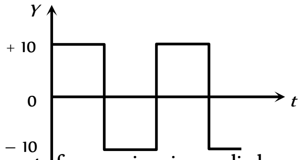
(c)



(d)



6. The $r.m.s.$ voltage of the wave form shown is



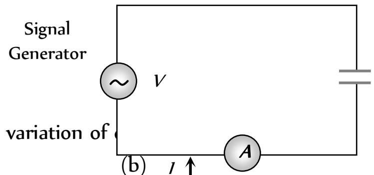
(a) 10 V

(b) 7 V

(c) 6.37 V

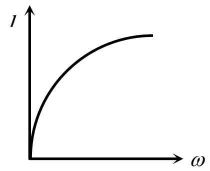
(d) None of these

7. A constant voltage at different frequencies is applied across a capacitance C as shown in the figure. Which of the following graphs

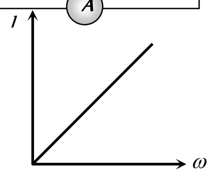


Correctly depicts the variation of current with frequency

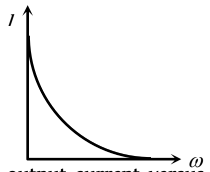
(a)



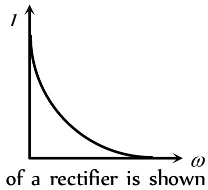
(b)



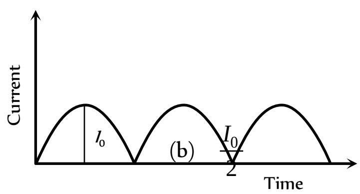
(c)



(d)



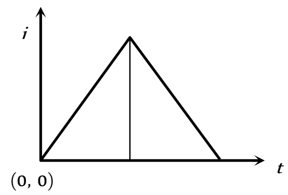
8. The output current versus time curve of a rectifier is shown in the figure. The average value of output current in this case is



(a) 0 (b) $\frac{I_0}{2}$

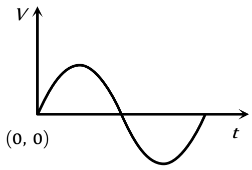
(c) $\frac{2I_0}{\pi}$ (d) I_0

9. The current 'i' in an inductance coil varies with time 't' according to following graph

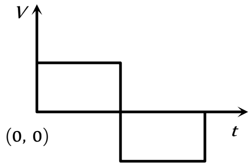


Which one of the following plots shows the variations of voltage in the coil [CBSE PMT 1994]

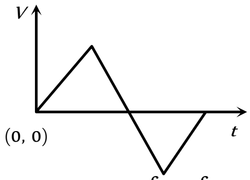
(a)



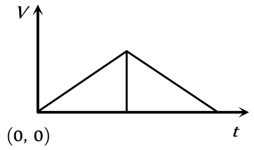
(b)



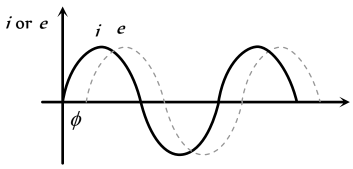
(c)



(d)

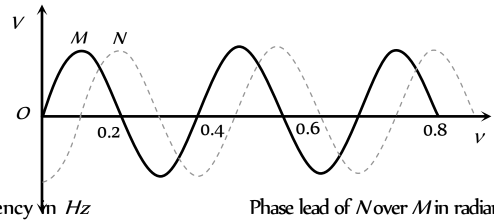


10. When an ac source of e.m.f. $e = E_0 \sin(100\,t)$ is connected across a circuit, the phase difference between the e.m.f. e and the current i in the circuit is observed to be $\pi/4$, as shown in the diagram. If the circuit consists possibly only of RC or LC in series, find the relationship between the two elements



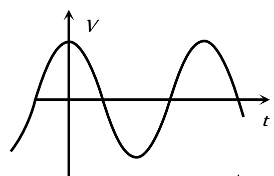
(a) $R = 1k\Omega, C = 10\mu F$
(b) $R = 1k\Omega, C = 1\mu F$
(c) $R = 1k\Omega, L = 10H$
(d) $R = 1k\Omega, L = 1H$

11. Two sinusoidal voltages of the same frequency are shown in the diagram. What is the frequency, and the phase relationship between the voltages

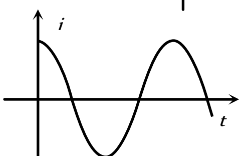


Frequency in Hz	Phase lead of N over M in radians
(a) 0.4	$-\pi/4$
(b) 2.5	$-\pi/2$
(c) 2.5	$+\pi/2$
(d) 2.5	$-\pi/4$

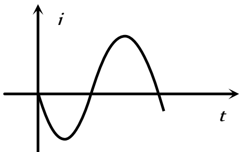
12. The voltage across a pure inductor is represented by the following diagram. Which one of the following diagrams will represent the current [MP PMT 1995]



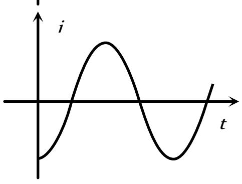
(a)



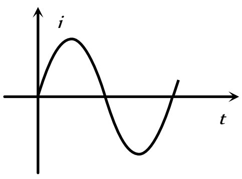
(b)



(c)

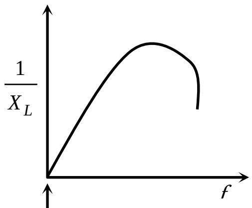


(d)

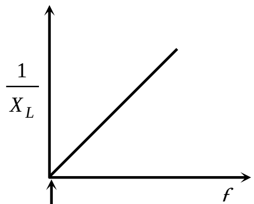


13. In pure inductive circuit, the curves between frequency f and reciprocal of inductive reactance $1/X_L$ is

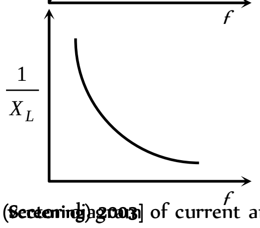
(a)



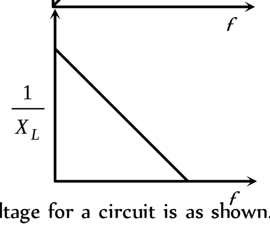
(b)



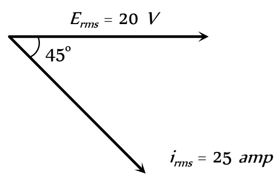
(c)



(d)

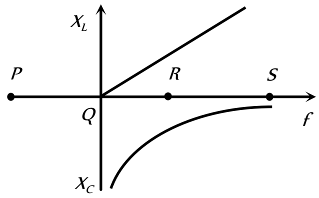


14. [IIT-JEE (Screening) 2003] The (vector) diagram of current and voltage for a circuit is as shown. The components of the circuit will be



(a) LCR
(b) LR
(c) LCR or LR
(d) None of these

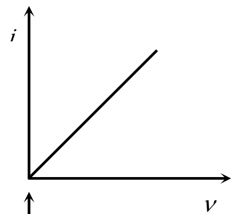
15. The resonance point in $X_L - f$ and $X_C - f$ curves is



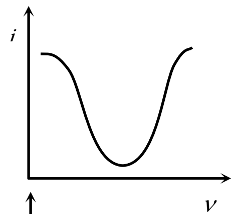
(a) P
(b) Q
(c) R
(d) S

16. The i - V curve for anti-resonant circuit is

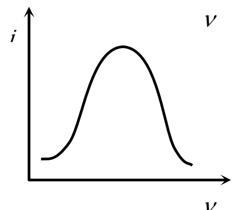
(a)



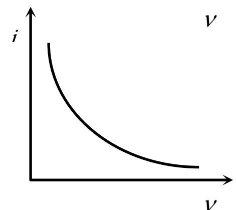
(b)



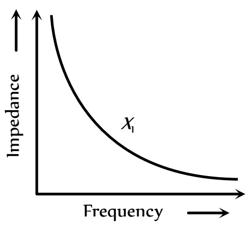
(c)

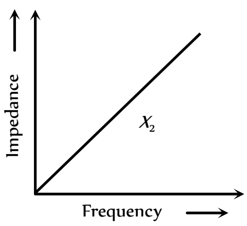


(d)



17. The graphs given below depict the dependence of two reactive impedances X_1 and X_2 on the frequency of the alternating e.m.f. applied individually to them. We can then say that [Haryana CEE 1996; RPMT 2004]





(a) X_1 is an inductor and X_2 is a capacitor

(b) X_1 is a resistor and X_2 is a capacitor

(c) X_1 is a capacitor and X_2 is an inductor

(d) X_1 is an inductor and X_2 is a resistor

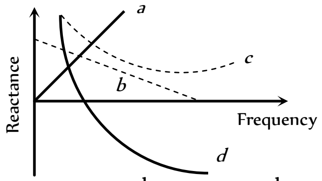
18. Which of the following plots may represent the reactance of a series LC combination [MP PMT 1999]

(a) a

(b) b

(c) c

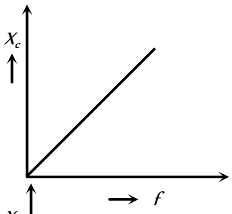
(d) d



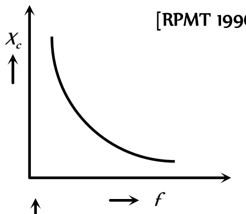
19. Which of the following curves correctly represents the variation of capacitive reactance X_c with frequency f

[RPMT 1996]

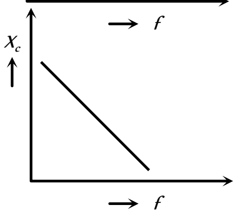
(a)



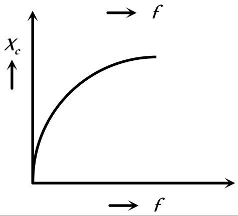
(b)



(c)



(d)



Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) If both assertion and reason are true and the reason is the correct explanation of the assertion.

(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.

(c) If assertion is true but reason is false.

(d) If the assertion and reason both are false.

(e) If assertion is false but reason is true.

1. Assertion : In series LCR circuit resonance can take place.

Reason : Resonance takes place if inductance and capacitive reactances are equal and opposite.

[AIIMS 1998]

2. Assertion : The alternating current lags behind the e.m.f. by a phase angle of $\pi / 2$, when ac flows through an inductor.

Reason : The inductive reactance increases as the frequency of ac source decreases.

3. Assertion : Capacitor serves as a block for dc and offers an easy path to ac.

Reason : Capacitive reactance is inversely proportional to frequency.

4. Assertion : When capacitive reactance is smaller than the inductive reactance in LCR current, e.m.f. leads the current .

Reason : The phase angle is the angle between the alternating e.m.f. and alternating current of the circuit.

5. Assertion : Chock coil is preferred over a resistor to adjust current in an ac circuit.

Reason : Power factor for inductance is zero.

6. Assertion : If the frequency of alternating current in an ac circuit consisting of an inductance coil is increased then current gets decreased.

Reason : The current is inversely proportional to frequency of alternating current.

7. Assertion : A bulb connected in series with a solenoid is connected to ac source. If a soft iron core is introduced in the solenoid, the bulb will glow brighter.

Reason : On introducing soft iron core in the solenoid, the inductance increases.

8. Assertion : An alternating current does not show any magnetic effect.

Reason : Alternating current varies with time.

9. Assertion : The dc and ac both can be measured by a hot wire instrument.

Reason : The hot wire instrument is based on the principle of magnetic effect of current.

10. Assertion : ac is more dangerous than dc

Reason : Frequency of ac is dangerous for human body.

11. Assertion : Average value of ac over a complete cycle is always zero.

Reason : Average value of ac is always defined over half cycle.

12. Assertion : The division are equally marked on the scale of ac ammeter.

Reason : Heat produced is directly proportional to the current.

13. Assertion : When ac circuit contain resistor only, its power is minimum.

Reason : Power of a circuit is independent of phase angle.

14. Assertion : An electric lamp connected in series with a variable capacitor and ac source, its brightness increases with increase in capacitance.

Reason : Capacitive reactance decrease with increase in capacitance of capacitor.

15. Assertion : An inductance and a resistance are connected in series with an ac circuit. In this circuit the current and the potential difference across the resistance lag behind potential difference across the inductance by an angle $\pi/2$.

Reason : In LR circuit voltage leads the current by phase angle which depends on the value of inductance and resistance both.

16. Assertion : A capacitor of suitable capacitance can be used in an ac circuit in place of the choke coil.

Reason : A capacitor blocks dc and allows ac only.

AS Answers and Solutions

Alternating Current, Voltage and Power

1. (b) Power loss $\propto \dfrac{1}{(\text{Voltage})^2}$

2. (a) $V = 5\cos\omega t = 5\sin\left(\omega t + \dfrac{\pi}{2}\right)$ and $i = 2\sin\omega t$

Power $= V_{r.m.s.} \times i_{r.m.s.} \times \cos\phi = 0$

(Since $\phi = \dfrac{\pi}{2}$, therefore $\cos\phi = \cos\dfrac{\pi}{2} = 0$)

3. (c) $P = V_{r.m.s.} \times i_{r.m.s.} \times \cos\phi = \dfrac{100}{\sqrt{2}} \times \dfrac{100 \times 10^{-3}}{\sqrt{2}} \times \cos\dfrac{\pi}{3}$

$= \dfrac{10^4 \times 10^{-3}}{2} \times \dfrac{1}{2} = \dfrac{10}{4} = 2.5\ watt$

4. (b) In dc ammeter, a coil is free to rotate in the magnetic field of a fixed magnet.

If an alternating current is passed through such a coil, the torque will reverse it's direction each time the current changes direction and the average value of the torque will be zero.

5. (b) The coil having inductance L besides the resistance R. Hence for ac it's effective resistance $\sqrt{R^2 + X_L^2}$ will be larger than it's resistance R for dc.

6. (b) $i_{r.m.s.} = \dfrac{i_o}{\sqrt{2}} = \dfrac{4}{\sqrt{2}} = 2\sqrt{2}\ ampere$

7. (c) Effective voltage $V_{r.m.s.} = \dfrac{V_o}{\sqrt{2}} = \dfrac{423}{\sqrt{2}} = 300\ V$

8. (d) The current takes $\frac{T}{4}$ *sec* to reach the peak value.

In the given question $\frac{2\pi}{T} = 200\pi \Rightarrow T = \frac{1}{100} sec$

$\therefore$ Time to reach the peak value $= \frac{1}{400} sec$

9. (c) $i_{r.m.s} = \frac{6}{\sqrt{2}} = 3\sqrt{2}\ A$

10. (c) $\nu = \frac{\omega}{2\pi} = \frac{120 \times 7}{2 \times 22} = 19\ Hz$

$V_{r.m.s.} = \frac{240}{\sqrt{2}} = 120\sqrt{2} \approx 170\ V$

11. (d)

12. (c) Peak value = $220\sqrt{2} = 311\ V$

13. (b) Power $= I^2R = \left(\frac{I_p}{\sqrt{2}}\right)^2 R = \frac{I_p^2 R}{2}$

14. (c) $i_{r.m.s.} = \frac{V_{r.m.s.}}{R} = \frac{200}{40} = 5\ A \Rightarrow i_0 = i_{r.m.s.}\sqrt{2} = 7.07\ A$

15. (b)

16. (d) Time taken by the current to reach the maximum value $t = \frac{T}{4} = \frac{1}{4\nu} = \frac{1}{4 \times 50} = 5 \times 10^{-3} sec$

and $i_o = i_{rms}\sqrt{2} = 10\sqrt{2} = 14.14\ amp$

17. (c)

18. (b) $E = E_0 \cos \omega t = E_0 \cos \frac{2\pi t}{T}$

$= 10 \cos \frac{2\pi \times 50 \times 1}{600} = 10 \cos \frac{\pi}{6} = 5\sqrt{3}\ volt.$

19. (d) Phase angle $\phi = 90^o$, so power $P = Vi \cos \phi = 0$

20. (c) $V_{rms} = \frac{200}{\sqrt{2}},\ i_{rms} = \frac{1}{\sqrt{2}}$

$\therefore P = V_{rms}\ i_{rms} \cos \phi = \frac{200}{\sqrt{2}} \frac{1}{\sqrt{2}} \cos \frac{\pi}{3} = 50\ watt$

21. (c) $2\pi\nu = 377 \Rightarrow \nu = 60.03\ Hz$

22. (a)

23. (c) $i_{rms} = \sqrt{\frac{i_1^2 + i_2^2}{2}} = \frac{1}{\sqrt{2}}(i_1^2 + i_2^2)^{1/2}$

24. (d) $P = Vi \cos \phi$

Phase difference $\phi = \frac{\pi}{2} \Rightarrow P = zero$

25. (c) $V_0 = V_{rms} \times \sqrt{2} = 220 \times \sqrt{2} = 310$

26. (c) Hot wire ammeter reads *rms* value of current. Hence its peak value $= i_{rms} \times \sqrt{2} = 14.14\ amp$

27. (d)

28. (b) Peak voltage $= \sqrt{2} \times 220 = 311\ V$

29. (c)

30. (d) $\because P = Vi \cos \phi,\ \therefore P \propto \cos \phi$

31. (d) $P = V_{rms} I_{rms} \cos \phi$; since $\phi = 90^o$. So $P = 0$

32. (d) Brightness $\propto P_{consumed} \propto \frac{1}{R}$ for Bulb, $R_{ac} = R_{dc}$, so brightness will be equal in both the cases.

33. (b) $P = \frac{V_{rms}^2}{R} = \frac{(30)^2}{10} = 90\ W$

34. (b) $V_{rms} = \frac{V_0}{\sqrt{2}} = \frac{120}{1.414} = 84.8\ V$

35. (d) Peak value to *r.m.s.* value means, current becomes $\frac{1}{\sqrt{2}}$ times.

So from $i = i_0 \sin 100\pi t \Rightarrow \frac{1}{\sqrt{2}} \times i_0 = i_0 \sin 100\pi t$

$\Rightarrow \sin \frac{\pi}{4} = \sin 100\pi t \Rightarrow t = \frac{1}{400} sec = 2.5 \times 10^{-3} sec.$

36. (c) Phase difference $\Delta\phi = \phi_2 - \phi_1 = \frac{\pi}{6} - \left(\frac{-\pi}{6}\right) = \frac{\pi}{3}$

37. (a) $V_{av} = \frac{2}{\pi} V_0 = \frac{2}{\pi} \times (V_{rms} \times \sqrt{2}) = \frac{2\sqrt{2}}{\pi}.V_{rms}$

$= \frac{2\sqrt{2}}{\pi} \times 220 = 198\ V$

38. (b)

39. (a)

40. (c)

41. (a) $i_{rms} = \frac{200}{280} = \frac{5}{7} A$. So $i_0 = i_{rms} \times \sqrt{2} = \frac{5}{7} \times \sqrt{2} \approx 1A.$

42. (d) Required time $t = T/4 = \frac{1}{4 \times 50} = 5 \times 10^{-3} sec$

43. (b) $V_0 = \sqrt{2}\ V_{rms} = 10\sqrt{2}$

44. (b) $P = \frac{1}{2} V_o i_o \cos \phi \Rightarrow P = P_{Peak}.\cos \phi$

$\Rightarrow \frac{1}{2}(P_{peak}) = P_{peak} \cos \phi \Rightarrow \cos \phi = \frac{1}{2} \Rightarrow \phi = \frac{\pi}{3}$

45. (c) $E = 141 \sin(628\, t)$,

$E_{rms} = \frac{E_0}{\sqrt{2}} = \frac{141}{1.41} = 100V$ and $2\pi f = 628$

$\Rightarrow f = 100 Hz$

46. (c) $E_{rms} = \frac{E_0}{\sqrt{2}} = \frac{707}{1.41} = 500V$

ac Circuits

1. (b)

2. (a)

3. (a) The choke coil can be used only in ac circuits, not in *dc* circuits, because for dc ($\omega = 0$) the inductive reactance $X_L = \omega L$ of the coil is zero, only the resistance of the coil remains effective which too is almost zero.

4. (b) Because power $= i^2R$, if $R = 0$, then $P = 0$.

5. (a)

6. (a) A choke coil contains high inductance but negligible resistance, due to which power loss becomes appreciably small.

7. (b) For purely capacitive circuit $e = e_0 \sin\omega t$

$i = i_o \sin\left(\omega t + \frac{\pi}{2}\right)$ *i.e.* current is ahead of emf by $\frac{\pi}{2}$

8. (c)

9. (d)

10. (b) $Z = \sqrt{R^2 + X_L^2}$, $X_L = \omega L$ and $\omega = 2\pi f$

$\therefore Z = \sqrt{R^2 + 4\pi^2 f^2 L^2}$

11. (c) $\nu = \frac{1}{2\pi\sqrt{LC}} = \frac{1}{2\pi\sqrt{10^{-6} \times 10^{-4}}} = \frac{10^5}{2\pi} Hz$

12. (b)

13. (b) The applied voltage is given by $V = \sqrt{V_R^2 + V_L^2}$

$V = \sqrt{(200)^2 + (150)^2} = 250\ volt$

14. (b) $i = \frac{V}{\sqrt{R^2 + \omega^2 L^2}} = \frac{120}{\sqrt{100 + 4\pi^2 \times 60^2 \times 20^2}}$ =0.016 A

15. (d) For the first circuit $i = \frac{V}{Z} = \frac{V}{\sqrt{R^2 + \omega^2 L^2}}$

$\therefore$ Increase in ω will cause a decrease in *i*.

For the second circuit $i = \frac{V}{\sqrt{R^2 + \frac{1}{\omega^2 C^2}}}$

$\therefore$ Increase in ω will cause an increase in *i*.

16. (b) $X_C = \frac{1}{\omega C} = \frac{1}{2\pi\nu C}$; For dc $\nu = 0$, $\therefore X_C = \infty$

17. (a) In a pure inductor (zero resistance), voltage leads the current by 90^o *i.e.* $\pi/2$.

18. (b)

19. (a) The voltage across a *L–R* combination is given by

$V^2 = V_R^2 + V_L^2$

$V_L = \sqrt{V^2 - V_R^2} = \sqrt{400 - 144} = \sqrt{256} = 16\ volt.$

20. (a) Phase angle $\tan\phi = \frac{\omega L}{R} = \frac{2\pi \times 200}{300} \times \frac{1}{\pi} = \frac{4}{3}$

$\therefore \phi = \tan^{-1}\frac{4}{3}$

21. (b) At resonance, *LCR* circuit behaves as purely resistive circuit, for purely resistive circuit power factor = 1

22. (d) Given $\omega L = \frac{1}{\omega C} \Rightarrow \omega^2 = \frac{1}{LC}$

or $\omega = \frac{1}{\sqrt{10^{-3} \times 10 \times 10^{-6}}} = \frac{1}{\sqrt{10^{-8}}} = 10^4$

$X_L = \omega L = 10^4 \times 10^{-3} = 10\,\Omega$

23. (b)

24. (b) Reading of ammeter $= i_{rms} = \frac{V_{rms}}{X_C} = \frac{V_0 \omega C}{\sqrt{2}}$

$= \frac{200\sqrt{2} \times 100 \times (1 \times 10^{-6})}{\sqrt{2}} = 2 \times 10^{-2} A = 20\ mA$

25. (a) Current will be maximum at the condition of resonance. So resonant frequency $\omega_0 = \frac{1}{\sqrt{LC}} = \frac{1}{\sqrt{0.5 \times 8 \times 10^{-6}}}$

= 500 *rad/s*

26. (d) Average power in ac circuits is given by $P = V_{rms} i_{rms} \cos\phi$

For pure capacitive circuit $\phi = 90^o$ so $P = 0$

27. (c) Amplitude of $ac = i_0 = \frac{V_0}{R} = \frac{\omega NBA}{R} = \frac{(2\pi\nu)NB(\pi r^2)}{R}$

$\Rightarrow i_0 = \frac{2\pi \times \frac{200}{60} \times 1 \times 10^{-2} \times \pi \times (0.3)^2}{\pi^2} = 6\ mA$

28. (b) $Z = \sqrt{R^2 + X_L^2} = \sqrt{10^2 + (2\pi \times 60 \times 2)^2} = 753.7$

$\therefore i = \frac{120}{753.7} = 0.159\ A$

29. (c) Resonance frequency in *radian/second* is

$\omega = \frac{1}{\sqrt{LC}} = \frac{1}{\sqrt{8 \times 0.5 \times 10^{-6}}} = 500\ rad/sec$

30. (c) $\omega = \frac{1}{\sqrt{L_1 C_1}} = \frac{1}{\sqrt{L_2 C_2}} \Rightarrow L_2 = \frac{L_1}{4}$

31. (c) $Z = X_L = 2\pi \times 60 \times 0.7$

$\therefore i = \frac{120}{Z} = \frac{120}{2\pi \times 60 \times 0.7} = 0.455\ ampere$

32. (b) $Z = \sqrt{R^2 + X^2} = \sqrt{4^2 + 3^2} = 5$

$\therefore \cos\phi = \frac{R}{Z} = \frac{3}{5} = 0.6$

33. (d)

34. (a) $\cos\phi = \frac{R}{Z}$. In choke coil $\phi \approx 90°$ so $\cos\phi \approx 0$

35. (c) $Z = \sqrt{R^2 + (X_L - X_C)^2}$

$= \sqrt{100^2 + \left(0.5 \times 100\pi - \frac{1}{10 \times 10^{-6} \times 100\pi}\right)^2} = 189.72\Omega$

36. (c) $V_L = 46\,volts$, $V_C = 40\,volts$, $V_R = 8\,volts$

E.M.F. of source $V = \sqrt{8^2 + (46 - 40)^2} = 10\,volts$

37. (c) Resonant frequency $= \frac{1}{2\pi\sqrt{LC}}$ does not depend on resistance.

38. (b) Frequency $= \frac{1}{2\pi\sqrt{LC}}$

So the combination which represents dimension of frequency is $\frac{1}{\sqrt{LC}} = (LC)^{-1/2}$

39. (c) For series *R-L-C* circuit, $Z = \sqrt{R^2 + (X_L - X_C)^2}$

$= \sqrt{(300)^2 + \left(1000 \times 0.9 - \frac{10^6}{1000 \times 2}\right)^2} = 500\Omega$

40. (d) $Z = \sqrt{R^2 + X^2} = \sqrt{R^2 + (2\pi f L)^2}$

$= \sqrt{(30)^2 + \left(2\pi \times 50 \times \frac{0.4}{\pi}\right)^2} = \sqrt{900 + 1600} = 50\Omega$

$i = \frac{V}{Z} = \frac{200}{50} = 4\, ampere$

41. (b) Reactance $= 2\pi \nu L \Rightarrow 100\,\Omega = 2 \times \frac{22}{7} \times 50 \times L$

$\therefore\ L = 0.32\ henry$

42. (b)

43. (a) $X_C = \frac{1}{2\pi \nu C} = \frac{1}{2\pi \times 4000 \times 25 \times 10^{-6}} = \frac{5}{\pi}\Omega$

44. (a) $X_C = \frac{1}{2\pi \nu C} \Rightarrow \frac{1}{1000} = \frac{1}{2\pi \times \nu \times 5 \times 10^{-6}}$

$\Rightarrow \nu = \frac{100}{\pi} MHz$

45. (d) $i = \frac{V}{Z} = \frac{4}{\sqrt{4^2 + (1000 \times 3 \times 10^{-3})^2}} = 0.8\ A$

46. (c) $\tan\phi = \frac{X_L}{R} \Rightarrow \tan 45^o = \frac{X_L}{R} = 1 \Rightarrow X_L = R$

47. (a) For purely L-circuit $P = 0$

48. (a) At resonance LCR series circuit behaves as pure resistive circuit. For resistive circuit $\phi = 0^o$

49. (c) $V = \sqrt{V_R^2 + (V_L - V_C)^2} = \sqrt{(5)^2 + (10 - 10)^2} = 5\ Volt$

50. (b) When dc is supplied $R = \frac{V}{i} = \frac{100}{1} = 100\,\Omega$

When ac is supplied $Z = \frac{V}{i} = \frac{100}{0.5} = 200\,\Omega$

51. (b) $\cos\phi = \frac{R}{Z} = \frac{R}{\sqrt{R^2 + \omega^2 L^2}}$

$= \frac{12}{\sqrt{(12)^2 + 4 \times \pi^2 \times (60)^2 \times (0.1)^2}} \Rightarrow \cos\phi = 0.30$

52. (c)

53. (b)

54. (c) Impedance $Z = \sqrt{R^2 + X^2} = \sqrt{(8)^2 + (6)^2} = 10\Omega$

55. (c) $\tan\phi = \frac{\omega L}{R} = \frac{2\pi \times 50 \times 0.21}{12} = 5.5 \Rightarrow \phi = 80^o$

56. (a) If the current is wattless then power is zero. Hence phase difference $\phi = 90^o$

57. (a) $f = \frac{1}{2\pi\sqrt{LC}} \Rightarrow f \propto \frac{1}{\sqrt{C}}$

58. (b) In non resonant circuits impedance $Z = \frac{1}{\sqrt{\frac{1}{R^2} + \left(\omega C - \frac{1}{\omega L}\right)^2}}$, with rise in frequency Z decreases *i.e.* current increases so circuit behaves as capacitive circuit.

59. (b) $V = \sqrt{V_R^2 + V_L^2} = \sqrt{(20)^2 + (16)^2} = \sqrt{656} = 25.6\ V$

60. (d) $i = \frac{220}{\sqrt{(20)^2 + (2 \times \pi \times 50 \times 0.2)^2}} = \frac{220}{66} = 3.33\ A$

61. (a) Impedance of LCR circuit will be minimum at resonant frequency so $\nu_0 = \frac{1}{2\pi\sqrt{LC}} = \frac{1}{2\pi\sqrt{1 \times 10^{-3} \times 0.1 \times 10^{-6}}}$

$= \frac{10^5}{2\pi} Hz$

62. (c) $\cos\phi = \frac{R}{Z} = \frac{10}{20} = \frac{1}{2} \Rightarrow \phi = 60^o$

63. (a) Current in LC circuit becomes maximum when resonance occurs. So

$\omega = \frac{1}{\sqrt{LC}} = \frac{1}{\sqrt{1 \times 25 \times 10^{-6}}} = \frac{1000}{5} = 200\, rad/\sec$

64. (b, d)

65. (a) $R = 6 + 4 = 10\,\Omega$

$X_L = \omega L = 2000 \times 5 \times 10^{-3} = 10\,\Omega$

$X_C = \frac{1}{\omega C} = \frac{1}{2000 \times 50 \times 10^{-6}} = 10\,\Omega$

$\therefore Z = \sqrt{R^2 + (X_L - X_C)^2} = 10\,\Omega$

Amplitude of current $= i_0 = \frac{V_0}{Z} = \frac{20}{10} = 2A$

66. (a) $i = \frac{V}{X_L} = \frac{200}{\omega L} = \frac{200}{2\pi \times 50 \times 1} = 0.637\ A$

67. (a)

68. (a) In LCR circuit; in the condition of resonance $X_L = X_C$ *i.e.* circuit behaves as resistive circuit. In resistive circuit power factor is maximum.

69. (a) $\tan\phi = \frac{X_L}{R} = \frac{\sqrt{3}\,R}{R} = \sqrt{3} \Rightarrow \phi = 60^o = \pi/3$

70. (b) $X_C = \frac{1}{2\pi\nu C} = \frac{1}{0} = \infty$

71. (a)

72. (d) $X_L = 2\pi\nu L \Rightarrow L = \frac{X_L}{2\pi\nu} = \frac{50}{2 \times 3.14 \times 50} = 0.16\ H$

73. (b, c)

74. (c) $Z = \sqrt{R^2 + (2\pi\nu L)^2}$

$= \sqrt{(40)^2 + 4\pi^2 \times (50)^2 \times (95.5 \times 10^{-3})^2} = 50\ ohm$

75. (b) $X_C = \frac{1}{2\pi\nu C} \Rightarrow X_C \propto \frac{1}{\nu}$

76. (b)

77. (b)

78. (c) $X_L = 2\pi\nu L = 2\times\pi\times 50\times\frac{1}{\pi} = 100\,\Omega$

79. (c) $\nu_0 = \frac{1}{2\pi\sqrt{LC}} = \frac{1}{2\times 3.14\sqrt{5\times 10^{-4}\times 20\times 10^{-6}}}$

$\nu_0 = \frac{10^4}{6.28} = 1592\,Hz$

80. (a) $X_C = \frac{1}{2\pi\nu C} \Rightarrow C = \frac{1}{2\pi\nu X_C} = \frac{1}{2\times\pi\times\frac{400}{\pi}\times 25} = 50\,\mu F$

81. (b) $\cos\phi = \frac{R}{Z} = \frac{R}{(R^2+\omega L^2)^{1/2}}$

82. (d) $Z = \sqrt{R^2+(X_L-X_C)^2} = \sqrt{(11)^2+(25-18)^2} = 13\,\Omega$

Current $i = \frac{260}{13} = 20\,A$

83. (c) $i = \frac{V}{X_L} = \frac{120}{2\times 3.14\times 60\times 0.7} = 0.455\,A$

84. (c) $\cos\phi = \frac{R}{Z} = \frac{R}{\sqrt{R^2+\omega^2L^2}} = \frac{5}{\sqrt{25+(50)^2\times(0.1)^2}}$

$= \frac{5}{\sqrt{25+25}} = \frac{1}{\sqrt{2}} \Rightarrow \phi = \pi/4$

85. (b) $P = Vi\cos\phi = V\left(\frac{V}{Z}\right)\left(\frac{R}{Z}\right) = \frac{V^2R}{Z^2} = \frac{V^2R}{(R^2+\omega^2L^2)}$

86. (a)

87. (c) $\tan\phi = \frac{X_L}{R} = \frac{2\pi\nu L}{R} = \frac{2\pi\times\frac{200}{2\pi}\times 1}{200} = 1 \Rightarrow \phi = 45^o$

88. (a) $V = \sqrt{V_R^2+(V_L-V_C)^2} = \sqrt{(40)^2+(60-30)^2} = 50V$

89. (a)

90. (c) $\nu_0 = \frac{1}{2\pi\sqrt{LC}}$

If C changes to $2C$ then for keeping ν constant L must change to $L/2$.

91. (d) Net voltage across LC combination $= V_L - V_C = 0\ V$

92. (d) Impedance $Z = \sqrt{R^2+4\pi^2\nu^2L^2}$

$= \sqrt{(12)^2+4\times(3.14)^2\times(50)^2\times(0.04)} = 17.37\ A$

Now current $i = \frac{V}{Z} = \frac{220}{17.37} = 12.7\Omega$

93. (d) At resonant frequency current in series LCR circuit is maximum.

94. (c)

95. (b)

96. (a) $\tan\phi = \frac{X_C - X_L}{R} \Rightarrow \tan 45^o = \frac{\frac{1}{2\pi fC} - 2\pi fL}{R}$

$\Rightarrow C = \frac{1}{2\pi f(2\pi fL + R)}$

97. (d)

98. (b) Resonance frequency

$\omega = \frac{1}{\sqrt{LC}} = \frac{1}{\sqrt{8\times 10^{-3}\times 20\times 10^{-6}}} = 2500\ rad/\sec$

Resonance current $= \frac{V}{R} = \frac{220}{44} = 5A$

Critical Thinking Questions

1. (a) For dc, $R = \frac{V}{i} = \frac{100}{1} = 100\ \Omega$

For ac, $Z = \frac{V}{i} = \frac{100}{0.5} = 200\ \Omega$

$\because\ Z = \sqrt{R^2 + (\omega L)^2} \Rightarrow 200 = \sqrt{(100)^2 + 4\pi^2(50)^2 L^2}$

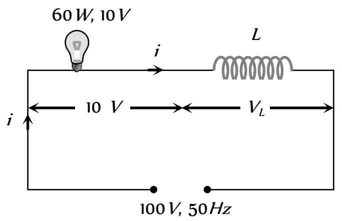
$\therefore\ L = 0.55\ H$

2. (c) $P = E_{rms}\, i_{rms} \cos\phi = \frac{E_0}{\sqrt{2}} \times \frac{i_0}{\sqrt{2}} \times \frac{R}{Z}$

$\Rightarrow \frac{E_0}{\sqrt{2}} \times \frac{E_0}{Z\sqrt{2}} \times \frac{R}{Z} \Rightarrow P = \frac{E_0^2 R}{2Z^2}$

Given $X_L = R$ so, $Z = \sqrt{2}R \Rightarrow P = \frac{E_0^2}{4R}$

3. (a) Current through the bulb $i = \frac{P}{V} = \frac{60}{10} = 6A$



$V = \sqrt{V_R^2 + V_L^2}$

$(100)^2 = (10)^2 + V_L^2 \Rightarrow V_L = 99.5\ Volt$

Also $V_L = iX_L = i \times (2\pi\nu L)$

$\Rightarrow 99.5 = 6 \times 2 \times 3.14 \times 50 \times L \Rightarrow L = 0.052\ H$

4. (c) $V^2 = V_R^2 + (V_L - V_C)^2$

Since $V_L = V_C$ hence $V = V_R = 200\ V$

5. (c) $V^2 = V_R^2 + (V_L - V_C)^2 \Rightarrow V_R = V = 220\ V$

Also $i = \frac{220}{100} = 2.2\ A$

6. (a) When a bulb and a capacitor are connected in series to an ac source, then on increasing the frequency the current in the circuit is increased, because the impedance of the circuit is decreased. So the bulb will give more intense light.

7. (d) The instantaneous values of emf and current in inductive circuit are given by $E = E_0 \sin\omega t$ and $i = i_0 \sin\left(\omega t - \frac{\pi}{2}\right)$ respectively.

So, $P_{inst} = Ei = E_0 \sin\omega t \times i_0 \sin\left(\omega t - \frac{\pi}{2}\right)$

$= E_0 i_0 \sin\omega t\left(\sin\omega t \cos\frac{\pi}{2} - \cos\omega t \sin\frac{\pi}{2}\right)$

$= E_0 i_0 \sin\omega t \cos\omega t$

$= \frac{1}{2} E_0 i_0 \sin 2\omega t$ $\quad (\sin 2\omega t = 2\sin\omega t \cos\omega t)$

Hence, angular frequency of instantaneous power is 2ω.

8. (b) $V = 50 \times 2 \sin 100\pi t \cos 100\pi t = 50 \sin 200\pi t$

$\Rightarrow V_0 = 50\ Volts$ and $\nu = 100 Hz$

9. (b) In RC series circuit voltage across the capacitor leads the voltage across the resistance by $\frac{\pi}{2}$

10. (d) The voltage V_L and V_C are equal and opposite so voltmeter reading will be zero.

Also $R = 30\,\Omega$, $X_L = X_C = 25\Omega$

So $i = \frac{V}{\sqrt{R^2 + (X_L - X_C)^2}} = \frac{V}{R} = \frac{240}{30} = 8\ A$

11. (d) $V = 120 \sin 100\pi t \cos 100\pi t \Rightarrow V = 60 \sin 200\pi t$

$V_{max} = 60V$ and $\nu = 100 Hz$

12. (d) $Z = \sqrt{(R)^2 + (X_L - X_C)^2}$;

$R = 10\,\Omega$, $X_L = \omega L = 2000 \times 5 \times 10^{-3} = 10\,\Omega$

$X_C = \frac{1}{\omega C} = \frac{1}{2000 \times 50 \times 10^{-6}} = 10\,\Omega$ *i.e.* $Z = 10\,\Omega$

Maximum current $i_0 = \frac{V_0}{Z} = \frac{20}{10} = 2A$

Hence $i_{rms} = \frac{2}{\sqrt{2}} = 1.4\ A$

and $V_{rms} = 4 \times 1.41 = 5.64\ V$

13. (a) Capacitance of wire

$C = 0.014 \times 10^{-6} \times 200 = 2.8 \times 10^{-6} F = 2.8 \mu F$

For impedance of the circuit to be minimum $X_L = X_C \Rightarrow$

$2\pi\nu L = \frac{1}{2\pi\nu C}$

$\Rightarrow L = \frac{1}{4\pi^2\nu^2 C} = \frac{1}{4(3.14)^2 \times (5 \times 10^3)^2 \times 2.8 \times 10^{-6}}$

$= 0.35 \times 10^{-3} H = 0.35\, mH$

14. (c) $\overline{i^2} = \frac{\int i^2 dt}{\int dt} = \frac{\int_2^4 (4t)dt}{\int_2^4 dt} = \frac{4\int_2^4 t\, dt}{2} = 2\left[\frac{t^2}{2}\right]_2^4 = \left[t^2\right]_2^4 = 12$

$\Rightarrow i_{rms} = \sqrt{\bar{i^2}} = \sqrt{12} = 2\sqrt{3}\ A$

15. (b) 1. *rms* value $= \frac{x_0}{\sqrt{2}}$

2. $x_0 \sin\omega t \cos\omega t = \frac{x_0}{2}\sin 2\omega t \Rightarrow rms$ value $= \frac{x_0}{2\sqrt{2}}$

3. $x_0 \sin\omega t + x_0 \cos\omega t \Rightarrow rms$ value $= \sqrt{\left(\frac{x_0}{\sqrt{2}}\right)^2 + \left(\frac{x_0}{\sqrt{2}}\right)^2}$

$= \sqrt{x_0^2} = x_0$

16. (c) Given $X_L = X_C = 5\Omega$, this is the condition of resonance. So $V_L = V_C$, so net voltage across L and C combination will be zero.

17. (a) At angular frequency ω, the current in RC circuit is given by

$$i_{rms} = \frac{V_{rms}}{\sqrt{R^2 + \left(\frac{1}{\omega C}\right)^2}} \quad ......(i)$$

Also $\frac{i_{rms}}{2} = \frac{V_{rms}}{\sqrt{R^2 + \left(\frac{1}{\frac{\omega}{3}C}\right)^2}} = \frac{V_{rms}}{\sqrt{R^2 + \frac{9}{\omega^2 C^2}}}$ ......(ii)

From equation (i) and (ii) we get

$$3R^2 = \frac{5}{\omega^2 C^2} \Rightarrow \frac{\frac{1}{\omega C}}{R} = \sqrt{\frac{3}{5}} \Rightarrow \frac{X_C}{R} = \sqrt{\frac{3}{5}}$$

18. (d) $\tan\phi = \frac{X_L}{R} = \frac{X_C}{R} \Rightarrow \tan 60^o = \frac{X_L}{R} = \frac{X_C}{R}$

$\Rightarrow X_L = X_C = \sqrt{3}\ R$

i.e. $Z = \sqrt{R^2 + (X_L - X_C)^2} = R$

So average power $P = \frac{V^2}{R} = \frac{200 \times 200}{100} = 400\ W$

19. (b) $R = \frac{P}{i_{rms}^2} = \frac{240}{16} = 15\Omega$

$Z = \frac{V}{i} = \frac{100}{4} = 25\Omega$

Now $X_L = \sqrt{Z^2 - R^2} = \sqrt{(25)^2 - (15)^2} = 20\Omega$

$\therefore 2\pi\nu L = 20 \Rightarrow L = \frac{20}{2\pi \times 50} = \frac{1}{5\pi}\ Hz$

20. (b) $X_L = R,\ X_C = R/2$

$\therefore \tan\phi = \frac{X_L - X_C}{R} = \frac{R - \frac{R}{2}}{R} = \frac{1}{2}$

$\Rightarrow \phi = \tan^{-1}(1/2)$

Also $Z = \sqrt{R^2 + (X_L - X_C)^2} = \sqrt{R^2 + \frac{R^2}{4}} = \frac{\sqrt{5}}{2}R$

21. (d) At resonance net voltage across L and C is zero.

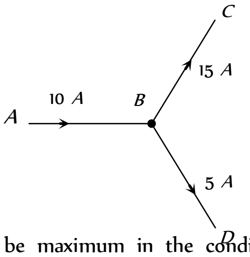
22. (c) $i_L = \frac{90}{30} = 3\ A,\quad i_C = \frac{90}{20} = 4.5\ A$

Net current through circuit $i = i_C - i_L = 1.5\ A$

$\therefore Z = \frac{V}{i} = \frac{90}{1.5} = 60\Omega$

23. (c) $i_{rms} = \sqrt{\frac{1}{T}\int_0^T i^2 dt} = \frac{T^2}{\sqrt{5}}$

24. (a) Yes, in AC if branch AB has R, BC has a capacitor C, and BD has a pure inductance L



25. (d) Current will be maximum in the condition of resonance so $i_{max} = \frac{V}{R} = \frac{V}{10}A$

Energy stored in the coil $W_L = \frac{1}{2}Li_{max}^2 = \frac{1}{2}L\left(\frac{E}{10}\right)^2$

$= \frac{1}{2} \times 10^{-3}\left(\frac{E^2}{100}\right) = \frac{1}{2} \times 10^{-5}E^2\ joule$

$\therefore$ Energy stored in the capacitor

$W_C = \frac{1}{2}CE^2 = \frac{1}{2} \times 2 \times 10^{-6}E^2 = 10^{-6}E^2\ joule$

$\therefore \frac{W_C}{W_L} = \frac{1}{5}$

Graphical Questions

1. (c) $Z = \sqrt{R^2 + \left(2\pi f L - \frac{1}{2\pi f C}\right)^2}$

From above equation at $f = 0 \Rightarrow z = \infty$

When $f = \frac{1}{2\pi\sqrt{LC}}$ (resonant frequency) $\Rightarrow Z = R$

For $f > \frac{1}{2\pi\sqrt{LC}} \Rightarrow Z$ starts increasing.

i.e., for frequency 0 – f, Z decreases

and for f to ∞, Z increases. This is justified by graph c.

2. (b) At $t = 0$, phase of the voltage is zero, while phase of the current is $-\frac{\pi}{2}$ i.e., voltage leads by $\frac{\pi}{2}$

3. (c) At $A : X_C > X_L$

At $B : X_C = X_L$

At $C : X_C < X_L$

4. (c) I_L lags behind I_R by a phase of $\frac{\pi}{2}$, while I_C leads by a phase of $\frac{\pi}{2}$.

5. (d) As explained in solution (1) for frequency $0 - f_r$, Z decreases hence $(i = V/Z)$, increases and for frequency $f_r - \infty$, Z increases hence i decrees.

6. (a) $V_{rms} = \sqrt{\frac{1}{T}\int_0^T 10^2\,dt} = 10\ V$

7. (b) For capacitive circuits $X_C = \frac{1}{\omega C}$

$\therefore i = \frac{V}{X_C} = V\omega C \Rightarrow i \propto \omega$

8. (c) $I_{av} = \frac{\int_0^{T/2} i\,dt}{\int_0^{T/2} dt} = \frac{\int_0^{T/2} I_0 \sin(\omega t)dt}{T/2}$

$$= \frac{2I_0}{T}\left[\frac{-\cos\omega t}{\omega}\right]_0^{T/2} = \frac{2I_0}{T}\left[-\frac{\cos\left(\frac{\omega T}{2}\right)}{\omega} + \frac{\cos 0^o}{\omega}\right]$$

$$= \frac{2I_0}{\omega T}[-\cos\pi + \cos 0^o] = \frac{2I_0}{2\pi}[1+1] = \frac{2I_0}{\pi}$$

9. (b) (1) For time interval $0 < t < T/2$

$I = kt$, where k is the slope

For inductor as we know, induced voltage $V = -L\frac{di}{dt}$

$\Rightarrow V_1 = -KL$

(2) For time interval $\frac{T}{2} < t < T$

$I = -Kt \Rightarrow V_2 = KL$

10. (a) As the current i leads the voltage by $\frac{\pi}{4}$, it is an RC circuit, hence

$\tan\phi = \frac{X_C}{R} \Rightarrow \tan\frac{\pi}{4} = \frac{1}{\omega CR}$

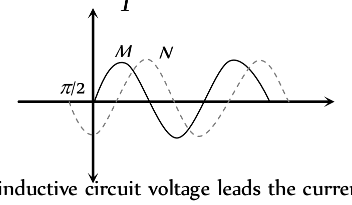
$\Rightarrow \omega CR = 1$ as $\omega = 100$ *rad/sec*

$\Rightarrow CR = \frac{1}{100} sec^{-1}$.

From all the given options only option (a) is correct.

11. (b) From the graph shown below. It is clear that phase lead of N over M is $-\frac{\pi}{2}$. Since time period (*i.e.* taken to complete one cycle) = 0.4 *sec*.

Hence frequency $\nu = \frac{1}{T} = 2.5\ Hz$



12. (d) In purely inductive circuit voltage leads the current by 90°.

13. (c) $X_L = 2\pi fL \Rightarrow X_L \propto f \Rightarrow \frac{1}{X_L} \propto \frac{1}{f}$

i.e., graph between $\frac{1}{X_L}$ and f will be a hyperbola.

14. (c) From phasor diagram it is clear that current is lagging with respect to E_-. This may be happen in LCR or LR circuit.

15. (c) At resonance $X_L = X_C$

16. (b) For anti-resonant circuit current is minimum at resonant frequency and at frequencies other than resonant frequency current rises with frequency.

17. (c) We have $X_C = \frac{1}{C \times 2\pi f}$ and $X_L = L \times 2\pi f$

18. (d) Reactance $X = X_L - X_C = 2\pi fL - \frac{1}{2\pi fC}$

19. (b) $X_C = \frac{1}{\omega C} = \frac{1}{2\pi fC}$ *i.e.* $X_C \propto \frac{1}{f}$

Assertion and Reason

1. (a) At resonant frequency, $X_L = X_C$ $\therefore$ $Z = R$ (minimum) there for current in the circuit is maximum.

2. (c) When ac flows through an inductor current lags behind the *emf.*, by phase of $\pi/2$, inductive reactance, $X_L = \omega L = \pi.2f.L$, so when frequency increases correspondingly inductive reactance also increases.

3. (a) The capacitive reactance of capacitor is given by

$$X_C = \frac{1}{\omega C} = \frac{1}{2\pi fC}$$

So this is infinite for dc ($f = 0$) and has a very small value for ac. Therefore a capacitor blocks dc.

4. (b) The phase angle for the LCR circuit is given by

$$\tan\phi = \frac{X_L - X_C}{R} = \frac{\omega L - 1/\omega C}{R}$$

Where X_L, X_C are inductive reactance and capacitive reactance respectively when $X_L > X_C$ then $\tan\phi$ is positive *i.e.* ϕ is positive (between 0 and $\pi/2$). Hence emf leads the current.

5. (a) If resistor is used in controlling ac supply, electrical energy will be wasted in the form of heat energy across the resistance wire. However, ac supply can be controlled with choke without any wastage of energy. This is because, power factor ($\cos\phi$) for resistance is unity and is zero for an inductance. [$P = EI\cos\phi$].

6. (a) When frequency of alternating current is increased, the effective resistance of the inductive coil increases. Current $(X_L = \omega L = 2\pi f L)$ in the circuit containing inductor is given by $I = \frac{V}{X_L} = \frac{V}{2\pi f L}$. As inductive resistance of the inductor increases, current in the circuit decreases.

7. (e) On introducing soft iron core, the bulb will glow dimmer. This is because on introducing soft iron core in the solenoid, its inductance L increases, the inductive reactance, $X_L = \omega L$ increases and hence the current through the bulb decreases.

8. (b) Like direct current, an alternating current also produces magnetic field. But the magnitude and direction of the field goes on changing continuously with time.

9. (c) Both ac and dc produce heat, which is proportional to square of the current. The reversal of direction of current in ac is immaterial so far as production of heat is concerned.

10. (a) The effect of ac on the body depends largely on the frequency. Low frequency currents of 50 to 60 *Hz* (*cycles/sec*), which are commonly used, are usually more dangerous than high frequency currents and are 3 to 5 times more dangerous than dc of same voltage and amperage (current). The usual frequency of 50 *cps* (or 60 *cps*) is extremely dangerous as it corresponds to the fibrillation frequency of the myocardium. This results in ventricular fibrillation and instant death.

11. (b) The mean average value of alternating current (or emf) during a half, cycle is given by $I_m = 0.636\, I_0$ (or $E_m = 0.636 E_0$)

During the next half cycle, the mean value of ac will be equal in magnitude but opposite in direction.

For this reason the average value of ac over a complete cycle is always zero. So the average value is always defined over a half cycle of ac.

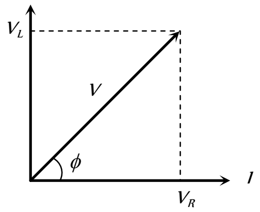
12. (d) An ac ammeter is constructed on the basics of heating effect of the electric current. Since heat produced varies as square of current $(H = I^2 R)$. Therefore the division marked on the scale of ac ammeter are not equally spaced.

13. (d) The power of a ac circuit is given by $P = EI\cos\phi$

where $\cos\phi$ is power factor and ϕ is phase angle. In case of circuit containing resistance only, phase angle is zero and power factor is equal to one. Therefore power is maximum in case of circuit containing resistor only.

14. (a) Capacitive reactance $X_C = \frac{1}{\omega C}$. When capacitance (C) increases, the capacitive reactance decreases. Due to decrease in its values, the current in the circuit will increases $\left(I = \frac{E}{\sqrt{R^2 + X_C^2}} \right)$ and hence brightness of source (or electric lamp) will also increases.

15. (b) As both the inductance and resistance are joined in series, hence current through both will be same. But in case of resistance, both the current and potential vary simultaneously, hence they are in same phase. In case of an inductance when current is zero, potential difference across it is maximum and when current reaches maximum (at $\omega t = \pi/2$), potential difference across it becomes zero *i.e.* potential difference leads the current by $\pi/2$ or current lags behind the potential difference by $\pi/2$, Phase angle in case of *LR* circuit is given as $\phi = \tan^{-1}\left(\frac{\omega L}{R}\right)$.



16. (b) We can use a capacitor of suitable capacitance as a chock coil, because average power consumed per cycle in an ideal capacitor is zero. Therefore, like a choke coil, a condenser can reduce ac without power dissipation.

Alternating Current

SET Self Evaluation Test - 24

1. A bulb and a capacitor are in series with an ac source. On increasing frequency how will glow of the bulb change

(a) The glow decreases (b) The glow increases

(c) The glow remain the same (d) The bulb quenches

2. The *r.m.s.* current in an ac circuit is 2 *A*. If the wattless current be $\sqrt{3}A$, what is the power factor

(a) $\frac{1}{\sqrt{3}}$ (b) $\frac{1}{\sqrt{2}}$

(c) $\frac{1}{2}$ (d) $\frac{1}{3}$

3. $\frac{2.5}{\pi}\mu F$ capacitor and 3000-*ohm* resistance are joined in series to an ac source of 200 *volt* and $50 sec^{-1}$ frequency. The power factor of the circuit and the power dissipated in it will respectively

(a) 0.6, 0.06 *W* (b) 0.06, 0.6 *W*

(c) 0.6, 4.8 *W* (d) 4.8, 0.6 *W*

4. The self inductance of a choke coil is 10 *mH*. When it is connected with a 10 *V* dc source, then the loss of power is 20 *watt*. When it is connected with 10 *volt* ac source loss of power is 10 *watt*. The frequency of ac source will be

(a) 50 *Hz* (b) 60 *Hz*

(c) 80 *Hz* (d) 100 *Hz*

5. In an *LCR* circuit $R = 100$ *ohm*. When capacitance *C* is removed, the current lags behind the voltage by $\pi/3$. When inductance *L* is removed, the current leads the voltage by $\pi/3$. The impedance of the circuit is

(a) 50 *ohm* (b) 100 *ohm*

(c) 200 *ohm* (d) 400 *ohm*

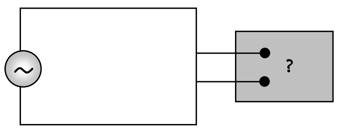
6. A group of electric lamps having a total power rating of 1000 *watt* is supplied by an ac voltage $E = 200\sin(310t + 60°)$. Then the *r.m.s.* value o the circuit current is

(a) 10 *A* (b) $10\sqrt{2}\ A$

(c) 20 *A* (d) $20\sqrt{2}\ A$

7. Following figure shows an ac generator connected to a "block box" through a pair of terminals. The box contains possible *R, L, C* or their combination, whose elements and arrangements are not known to us. Measurements outside the box reveals that

e = 75 sin (sin ωt) *volt*, i = 1.5 sin (ωt + 45°) *amp* then, the wrong statement is



(a) There must be a capacitor in the box

(b) There must be an inductor in the box

(c) There must be a resistance in the box

(d) The power factor is 0.707

8. A resistor *R*, an inductor *L* and a capacitor *C* are connected in series to an oscillator of frequency *n*. if the resonant frequency is n_r, then the current lags behind voltage, when

(a) $n = 0$ (b) $n < n_r$

(c) $n = n_r$ (d) $n > n_r$

9. If power factor is 1/2 in a series *RL* circuit $R = 100\,\Omega$. ac mains is used then *L* is

(a) $\frac{\sqrt{3}}{\pi}$ *Henry* (b) π *Henry*

(c) $\frac{\pi}{\sqrt{3}}$ *Henry* (d) None of these

10. What will be the self inductance of a coil, to be connected in a series with a resistance of $\pi\sqrt{3}\,\Omega$ such that the phase difference between the emf and the current at 50 *Hz* frequency is 30°

(a) 0.5 *Henry* (b) 0.03 *Henry*

(c) 0.05 *Henry* (d) 0.01 *Henry*

11. The phase difference between the voltage and the current in an ac circuit is $\pi/4$. If the frequency is 50 *Hz* then this phase difference will be equivalent to a time of

(a) 0.02 *s* (b) 0.25 *s*

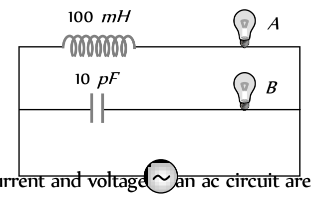
(c) 2.5 *ms* (d) 25 *ms*

12. The instantaneous values of current and emf in an ac circuit are $I = 1/\sqrt{2}\sin 314\,t\ amp$ and $E = \sqrt{2}\sin(314\,t - \pi/6)V$ respectively. The phase difference between *E* and *I* will be

(a) $-\pi/6\ rad$ (b) $-\pi/3\ rad$

(c) $\pi/6\ rad$ (d) $\pi/3\ rad$

13. If *A* and *B* are identical bulbs which bulbs glows brighter



(a) *A*

(b) *B*

(c) Both equally bright

(d) Cannot say

14. The instantaneous values of current and voltage in an ac circuit are $i = 100\sin 314\,t\,amp$ and $e = 200\sin(314\,t + \pi/3)V$ respectively. If the resistance is 1Ω then the reactance of the circuit will be

(a) $-200\sqrt{3}\,\Omega$ (b) $\sqrt{3}\,\Omega$

(c) $-200/\sqrt{3}\,\Omega$ (d) $100\sqrt{3}\,\Omega$

15. What is the *r.m.s.* value of an alternating current which when passed through a resistor produces heat which is thrice of that produced by a direct current of 2 amperes in the same resistor

(a) 6 *amp* (b) 2 *amp*

(c) 3.46 *amp* (d) 0.66 *amp*

AS Answers and Solutions

(SET -24)

1. (b) This is because, when frequency ν is increased, the capacitive reactance $X_C = \frac{1}{2\pi\nu C}$ decreases and hence the current through the bulb increases.

2. (c) $i_{WL} = i_{rms} \sin\phi \Rightarrow \sqrt{3} = 2\sin\phi \Rightarrow \sin\phi = \frac{\sqrt{3}}{2}$

$\Rightarrow \phi = 60^o$ so p.f. $= \cos\phi = \cos 60^o = \frac{1}{2}$.

3. (c) $Z = \sqrt{R^2 + \left(\frac{1}{2\pi\nu C}\right)^2} = \sqrt{(3000)^2 + \frac{1}{\left(2\pi \times 50 \times \frac{2.5}{\pi} \times 10^{-6}\right)^2}}$

$\Rightarrow Z = \sqrt{(3000)^2 + (4000)^2} = 5 \times 10^3 \Omega$

So power factor $\cos\phi = \frac{R}{Z} = \frac{3000}{5 \times 10^3} = 0.6$ and power

$P = V_{rms} i_{rms} \cos\phi = \frac{V_{rms}^2 \cos\phi}{Z} \Rightarrow P = \frac{(200)^2 \times 0.6}{5 \times 10^3} = 4.8W$

4. (c) With dc : $P = \frac{V^2}{R} \Rightarrow R = \frac{(10)^2}{20} = 5\,\Omega$;

With ac : $P = \frac{V_{rms}^2 R}{Z^2} \Rightarrow Z^2 = \frac{(10)^2 \times 5}{10} = 50\,\Omega^2$

Also $Z^2 = R^2 + 4\pi^2\nu^2 L^2$

$\Rightarrow 50 = (5)^2 + 4(3.14)^2 \nu^2 (10 \times 10^{-3})^2 \Rightarrow \nu = 80\,Hz.$

5. (b) When C is removed circuit becomes RL circuit hence

$\tan\frac{\pi}{3} = \frac{X_L}{R}$ .....(i)

When L is removed circuit becomes RC circuit hence

$\tan\frac{\pi}{3} = \frac{X_C}{R}$ .....(ii)

From equation (i) and (ii) we obtain $X_L = X_C$. This is the condition of resonance and in resonance $Z = R = 100\Omega$.

6. (b) $P = \frac{1}{2} V_0 i_0 \cos\phi \Rightarrow 1000 = \frac{1}{2} \times 200 \times i_0 \cos 60^o$

$\Rightarrow i_0 = 20A \Rightarrow i_{rms} = \frac{i_0}{\sqrt{2}} = \frac{20}{\sqrt{2}} = 10\sqrt{2}A.$

7. (b) Since voltage is lagging behind the current, so there must be no inductor in the box.

8. (d) The current will lag behind the voltage when reactance of inductance is more than the reactance of condenser. Thus,

$\omega L > \frac{1}{\omega C}$ or $\omega > \frac{1}{\sqrt{LC}}$

or $n > \frac{1}{2\pi\sqrt{LC}}$ or $n > n_r$ where n_r = resonant frequency.

9. (a) $\cos\phi = \frac{1}{2} \Rightarrow \phi = 60^o$ $\tan 60^o = \frac{\omega L}{R} \Rightarrow L = \frac{\sqrt{3}}{\pi} H$

10. (d) $\tan\phi = \frac{X_L}{R} = \frac{2\pi\nu L}{R} \Rightarrow \tan 30^o = \frac{2\pi \times 50 \times L}{\pi\sqrt{3}}$ = 0.01 H.

11. (c) Time difference $= \frac{T}{2\pi} \times \phi = \frac{(1/50)}{2\pi} \times \frac{\pi}{4} = \frac{1}{400} s = 2.5\,m\text{-}s$

12. (a) Phase difference relative to the current

$\phi = (314\,t - \frac{\pi}{6}) - (314\,t) = -\frac{\pi}{6}$

13. (a) $\because (X_C) >> (X_L)$

14. (b) $V_0 = i_0 Z \Rightarrow 200 = 100\,Z \Rightarrow Z = 2\Omega$

Also $Z^2 = R^2 + X_L^2 \Rightarrow (2)^2 = (1)^2 + X_L^2 \Rightarrow X_L = \sqrt{3}\Omega$

15. (c) Heat produced by ac = 3 × Heat produced by dc

$\therefore i_{rms}^2 Rt = 3 \times i^2 Rt \Rightarrow i_{rms}^2 = 3 \times 2^2$

$\Rightarrow i_{rms} = 2\sqrt{3} = 3.46\,A$

Chapter 25

Electron, Photon, Photoelectric Effect and X-rays

Electric Discharge Through Gases

At normal atmospheric pressure, the gases are poor conductor of electricity. If we establish a potential difference (of the order of 30 *kV*) between two electrodes placed in air at a distance of few *cm* from each other, electric conduction starts in the form of sparks.

The discharge of electricity through gases can be systematically studied with the help of discharge tube shown below

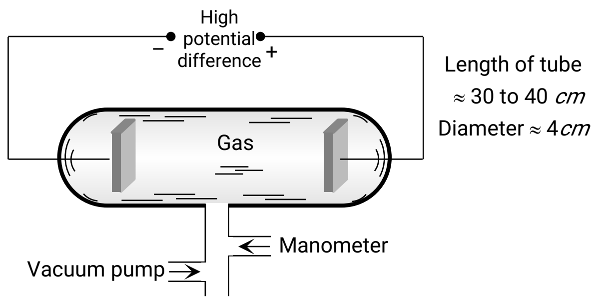

Fig. 25.1

As the pressure inside the discharge tube is gradually reduced, the following is the sequence of phenomenon that are observed.

(1) At normal pressure no discharge takes place.

(2) At the pressure 10 *mm* of *Hg*, a zig-zag thin red spark runs from one electrode to other and cracking sound is heard.

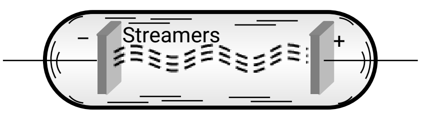

Fig. 25.2

(3) At the pressure 4 *mm.* of *Hg*, an illumination is observed at the electrodes and the rest of the tube appears dark. This type of discharge is called dark discharge.

(4) When the pressure falls below 4 *mm* of *Hg* then the whole tube is filled with bright light called positive column and colour of light depends upon the nature of gas in the tube as shown in the following table.

Table 25.1 : Colour for different gases

Gas	Air	H_2	N_2	Cl_2	CO_2	Neon
Colour	Purple red	Blue	Red	Green	Bluish white	Dark red

(5) At a pressure of 1.65 *mm* of *Hg* :

Sky colour light is produced at the cathode it is called as negative glow. Positive column shrinks towards the anode and the dark space between positive column and negative glow is called Faradays dark space (*FDS*).

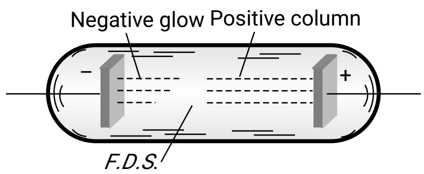

Fig. 25.3

(6) At a pressure of 0.8 *mm Hg* : At this pressure, negative glow is detached from the cathode and moves towards the anode. The dark space created between cathode and negative glow is called as Crook's dark space. Length of positive column further reduced. A glow appear at cathode called cathode glow.

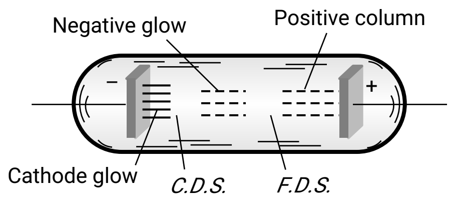

Fig. 25.4

(7) At a pressure of 0.05 *mm* of *Hg* : The positive column splits into dark and bright disc of light called striations.

(8) At the pressure of 0.01 or 10^{-2} *mm* of *Hg* some invisible

particles move from cathode which on striking with the glass tube on the opposite side of cathode cause the tube to glow. These invisible rays emerging from cathode are called cathode rays.

(9) Finally when pressure drops to nearly 10^{-4} *mm* of *Hg*, there is no discharge in tube.

Cathode Rays

(1) Cathode rays, discovered by Sir William Crooke

(2) They are streams of fast moving electrons.

(3) They can be produced by using a discharge tube containing gas at a low pressure of the order of 10^{-2} *mm* of *Hg*.

(4) The cathode rays in the discharge tube are the electrons produced due to ionisation of gas and that emitted by cathode due to collision of positive ions.

(5) Cathode rays travel in straight lines.

(6) Cathode rays are emitted normally from the cathode surface. Their direction is independent of the position of the anode.

(7) Cathode rays exert mechanical force on the objects they strike.

(8) Cathode rays produce heat when they strikes a metal surface.

(9) Cathode rays produce fluorescence.

(10) When cathode rays strike a solid object, specially a metal of high atomic weight and high melting point *X*-rays are emitted from the objects.

(11) Cathode rays are deflected by an electric field and also by a magnetic field.

(12) Cathode rays ionise the gases through which they are passed.

(13) Cathode rays can penetrate through thin foils of metal.

(14) Cathode rays are found to have velocity ranging $\frac{1}{30}th$ to $\frac{1}{10}th$ of velocity of light.

J.J. Thomson's Experiment

(1) It's working is based on the fact that if a beam of electron is subjected to the crossed electric field $\vec{E}$ and magnetic field $\vec{B}$, it experiences a force due to each field. In case the forces on the electrons in the electron beam due to these fields are equal and opposite, the beam remains undeflected.

(2) When no field is applied, the electron beam produces illuminations at point *P*.

(3) In the presence of any field (electric and magnetic) electron beam deflected up or down (illumination at P' or P'')

(4) If both the fields are applied simultaneously and adjusted such that electron beam passes undeflected and produces illumination at point *P*.

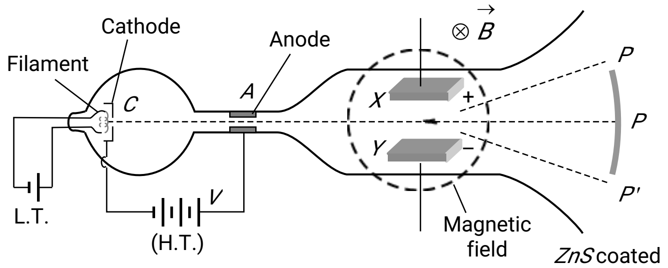

Fig. 25.5

In this case; Electric force = Magnetic force $\Rightarrow eE = evB$

$\Rightarrow v = \frac{E}{B}$; v = velocity of electron

(5) As electron beam accelerated from cathode to anode its loss in potential energy appears as gain in the K.E. at the anode. If suppose V is the potential difference between cathode and anode then, loss in potential energy = eV

And gain in kinetic energy at anode will be K.E. $= \frac{1}{2}mv^2$

i.e. $eV = \frac{1}{2}mv^2 \Rightarrow \frac{e}{m} = \frac{v^2}{2V} \Rightarrow \frac{e}{m} = \frac{E^2}{2VB^2}$

Thomson found, $\frac{e}{m} = 1.77 \times 10^{11}\ C/kg$.

If one includes the relativistic variation of mass with speed $(m = m_0/\sqrt{1 - v^2/c^2})$, then specific charge of an electron decreases with the increase in its velocity.

(6) The deflection of an electron in a purely electric field is given by $y = \frac{1}{2}\left(\frac{eE}{m}\right)\cdot\frac{l^2}{v^2}$; where l = Length of each plate, y = deflection of electron in the field region, v = speed of the electron.

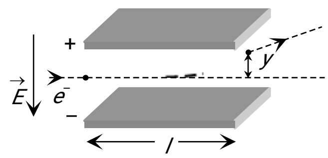

Fig. 25.6

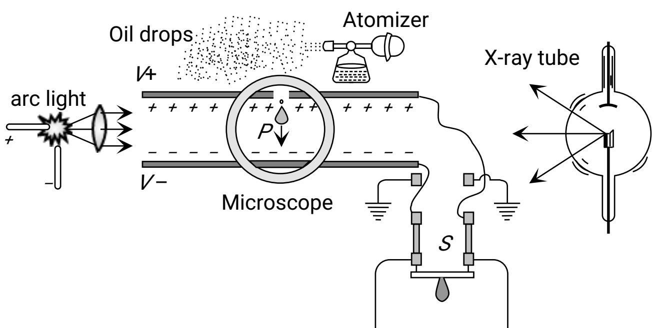
Millikans Oil Drop Experiment

(1) Millikan performed the pioneering oil drop experiment for the precise measurement of the charge on the electron.

(2) By applying suitable electric field across two metal plates, the charged oil droplets could be caused to rise or fall or even held stationary in the field of view for sufficiently long time. He found that the charge on an oil droplet was always an integral multiple of an elementary charge $1.602 \times 10^{-19}\ C$.

(3) In this experiment charge on the drop is given by

$$q = \frac{6\pi\eta(v_1 + v_2)d}{V}\left[\frac{9\eta v_1}{2g(\rho - \sigma)}\right]^{1/2}$$



where η = Coefficient of viscosity of air, v_1 = Terminal velocity of drop when no electric field is applied between the plates, v_2 = Terminal velocity of drop when electric field is applied between the plates.

V = Potential difference between the plates, d = Separation between plates, ρ = density of oil, σ = Density of air.

Positive Rays

When potential difference is applied across the electrodes of a discharge tube (10^{-3} *mm* of *Hg*), electrons are emitted from the perforated cathode. As they move towards anode, they gain energy. These energetic electrons when collide with the atoms of the gas in the discharge tube, they ionize the atoms. The positive ions so formed at various places between cathode and anode, travel towards the cathode. Since during their motion, the positive ions when reach the cathode, some pass through the holes in the cathode and a faint luminous glow comes out from each hole on the backside of the cathode. It is called positive rays, which are coming out from the holes.

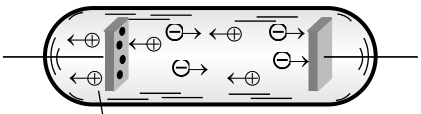


Fig. 25.8

(1) Positive rays are positive ions having same mass if the experimental gas does not have isotopes. However if the gas has isotopes then positive rays are group of positive ions having different masses.

(2) They travel in straight lines and cast shadows of objects placed in their path. But the speed of the positive rays is much smaller than that of cathode rays.

(3) They are deflected by electric and magnetic fields but the deflections are small as compared to that for cathode rays.

(4) They show a spectrum of velocities. Different positive ions move with different velocities. Being heavy, their velocity is much less than that of cathode rays.

(5) q/m ratio of these rays depends on the nature of the gas in the tube (while in case of the cathode rays q/m is constant and doesn't depend on the nature of gas in the tube). q/m for hydrogen is maximum.

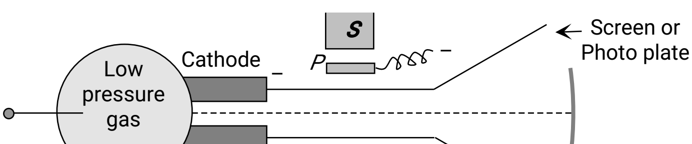
(6) They carry energy and momentum. The kinetic energy of positive rays is more than that of cathode rays.

(7) The value of charge on positive rays is an integral multiple of electronic charge.

(8) They cause ionisation (which is much more than that produced by cathode rays).

Thomson's Mass Spectrograph

It is used to measure atomic masses of various isotopes in gas. This is done by measuring q/m of singly ionised positive ion of the gas.



(1) The positive ions are produced in the bulb at the left hand side. These ions are accelerated towards cathode. Some of the positive ions pass through the fine hole in the cathode. This fine ray of positive ions is subjected to electric field E and magnetic field B and then allowed to strike a fluorescent screen ($\vec{E} \parallel \vec{B}$ but $\vec{E}$ or $\vec{B} \perp \vec{v}$).

(2) If the initial motion of the ions is in $+x$ direction and electric and magnetic fields are applied along $+y$ axis then force due to electric field is in the direction of y-axis and due to magnetic field it is along z-direction.

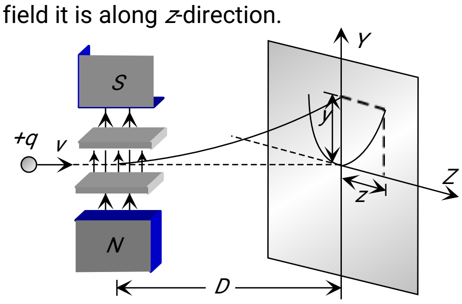


Fig. 25.10

The deflection due to electric field alone $y = \frac{qELD}{mv^2}$ .....(i)

The deflection due to magnetic field alone $z = \frac{qBLD}{mv}$ .....(ii)

From equation (i) and (ii), $z^2 = k\left(\frac{q}{m}\right)y$

where $k = \frac{B^2LD}{E}$; This is the equation of parabola. It means all the charged particles moving with different velocities but of same q/m value will strike the screen placed in yz plane on a parabolic track as shown in the above figure.

(3) All the positive ions of same. q/m moving with different velocity lie on the same parabola. Higher is the velocity lower is the value of y and z. The ions of different specific charge will lie on different parabola.

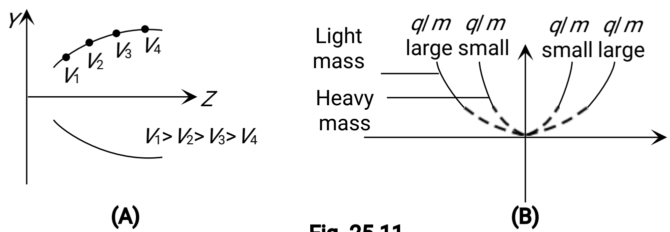

Fig. 25.11

(4) The number of parabola tells the number of isotopes present in the given ionic beam.

Bainbridge Mass Spectrograph

In Bainbridge mass spectrograph, field particles of same velocity are selected by using a velocity selector and then they are subjected to a uniform magnetic field perpendicular to the velocity of the particles. The particles corresponding to different isotopes follow different circular paths as shown in the figure.

(1) **Velocity selector :** The positive ions having a certain velocity v gets isolated from all other velocity particles. In this chamber the electric and magnetic fields are so balanced that the particle moves undeflected. For this the necessary condition is $v = \frac{E}{B}$ and E, B and v should be mutually perpendicular to each other.

(2) **Analysing chamber :** In this chamber magnetic field B is applied perpendicular to the direction of motion of the particle. As a result the particles move along a circular path of radius

$$r = \frac{mE}{qBB'} \Rightarrow \frac{q}{m} = \frac{E}{BB'r} \quad \text{also} \quad \frac{r_1}{r_2} = \frac{m_1}{m_2}$$

In this way the particles of different masses gets deflected on circles of different radii and reach on different points on the photo plate.

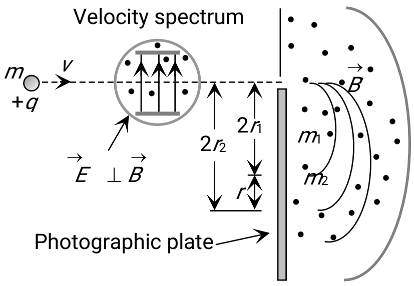

Fig. 25.12

Separation between two traces $= d = 2r_2 - 2r_1 = \frac{2v(m_2 - m_1)}{qB'}$.

Matter Waves (de-Broglie Waves)

According to de-Broglie a moving material particle sometimes acts as a wave and sometimes as a particle.

The wave associated with moving particle is called matter wave or de-Broglie wave and it propagates in the form of wave packets with group velocity.

(1) **de-Broglie wavelength :** According to de-Broglie theory, the wavelength of de-Broglie wave is given by

$$\lambda = \frac{h}{p} = \frac{h}{mv} = \frac{h}{\sqrt{2mE}} \Rightarrow \lambda \propto \frac{1}{p} \propto \frac{1}{v} \propto \frac{1}{\sqrt{E}}$$

Where h = Plank's constant, m = Mass of the particle, v = Speed of the particle, E = Energy of the particle.

The smallest wavelength whose measurement is possible is that of γ-rays.

The wavelength of matter waves associated with the microscopic particles like electron, proton, neutron, α-particle *etc.* is of the order of 10^{-10} *m.*

(2) **de-Broglie wavelength associated with the charged particles :** The energy of a charged particle accelerated through potential difference V is $E = \frac{1}{2}mv^2 = qV$

Hence de-Broglie wavelength $\lambda = \frac{h}{p} = \frac{h}{\sqrt{2mE}} = \frac{h}{\sqrt{2mqV}}$

$$\lambda_{Electron} = \frac{12.27}{\sqrt{V}} Å, \quad \lambda_{Proton} = \frac{0.286}{\sqrt{V}} Å,$$

$$\lambda_{Deutron} = \frac{0.202}{\sqrt{V}} Å, \quad \lambda_{\alpha-particle} = \frac{0.101}{\sqrt{V}} Å$$

(3) **de-Broglie wavelength associated with uncharged particles :** For *Neutron* de-Broglie wavelength is given as

$$\lambda_{Neutron} = \frac{0.286 \times 10^{-10}}{\sqrt{E \text{ (in } eV)}} m = \frac{0.286}{\sqrt{E \text{ (in } eV)}} Å$$

Energy of thermal neutrons at ordinary temperature

$\because$ $E = kT \Rightarrow \lambda = \frac{h}{\sqrt{2mkT}}$; where T = Absolute temperature, k = Boltzman's constant = 1.38×10^{-23} *Joule/kelvin*, So,

$$\lambda_{Thermal \quad neutron} = \frac{6.62 \times 10^{-34}}{\sqrt{2 \times 1.67 \times 10^{-27} \times 1.38 \times 10^{-23} T}} = \frac{30.83}{\sqrt{T}} Å$$

(4) **Ratio of wavelength of photon and electron :** The wavelength of a photon of energy E is given by $\lambda_{ph} = \frac{hc}{E}$

While the wavelength of an electron of kinetic energy K is given by $\lambda_e = \frac{h}{\sqrt{2mK}}$. Therefore, for the same energy,

the ratio $\frac{\lambda_{ph}}{\lambda_e} = \frac{c}{E}\sqrt{2mK} = \sqrt{\frac{2mc^2 K}{E^2}}$

Characteristics of Matter Waves

(1) Matter wave represents the probability of finding a particle in space.

(2) Matter waves are not electromagnetic in nature.

(3) de-Brogile or matter wave is independent of the charge on the material particle. It means, matter wave of de-Broglie wave is associated with every moving particle (whether charged or uncharged).

(4) Practical observation of matter waves is possible only when the de-Broglie wavelength is of the order of the size of the particles.

(5) Electron microscope works on the basis of de-Broglie waves.

(6) The phase velocity of the matter waves can be greater than the speed of the light.

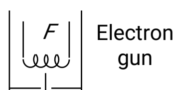
(7) Matter waves can propagate in vacuum, hence they are not mechanical waves.

(8) The number of de-Broglie waves associated with n^{th} orbital electron is n.

(9) Only those circular orbits around the nucleus are stable whose circumference is integral multiple of de-Broglie wavelength associated with the orbital electron.

Davision and Germer Experiment

(1) It is used to study the scattering of electron from a solid or to verify the wave nature of electron. A beam of electrons



emitted by electron gun is made to fall on nickel crystal cut along cubical axis at a particular angle. *Ni* crystal behaves like a three dimensional diffraction grating and it diffracts the electron beam obtained from electron gun.

(2) The diffracted beam of electrons is received by the detector which can be positioned at any angle by rotating it about the point of incidence. The energy of the incident beam of electrons can also be varied by changing the applied voltage to the electron gun.

(3) According to classical physics, the intensity of scattered beam of electrons at all scattering angle will be same but Davisson and Germer, found that the intensity of scattered beam of electrons was not the same but different at different angles of scattering. It is maximum for diffracting angle 50° at 54 *volt* potential difference.

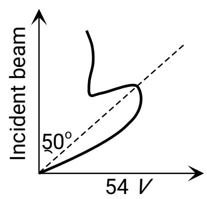


Fig. 25.14

(4) If the de-Broglie waves exist for electrons then these should be diffracted as *X*-rays. Using the Bragg's formula $2d\sin\theta = n\lambda$, we can determine the wavelength of these waves.

where d = distance between diffracting planes, $\theta = \frac{(180-\phi)}{2}$ = glancing angle for incident beam = Bragg's angle.

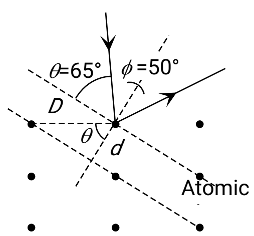

Fig. 25.15

The distance between diffracting planes in *Ni*-crystal for this experiment is $d = 0.91 \mathring{A}$ and the Bragg's angle = 65°. This gives for $n = 1$, $\lambda = 2 \times 0.91 \times 10^{-10} \sin 65^{\circ} = 1.65\ \mathring{A}$

Now the de-Broglie wavelength can also be determined by using the formula $\lambda = \frac{12.27}{\sqrt{V}} = \frac{12.27}{\sqrt{54}} = 1.67\ \mathring{A}$. Thus the de-Broglie hypothesis is verified.

(5) The Bragg's formula can be rewritten in the form containing interatomic distance D and angle ϕ

$$\because\ \theta = 90 - \frac{\phi}{2} \text{ and } d = D\cos\theta = D\sin\frac{\phi}{2}$$

Using $\sin\theta = \cos\frac{\phi}{2}$

$$2d\sin\theta = \lambda \Rightarrow 2(D\sin\frac{\phi}{2}).\cos\frac{\phi}{2} = \lambda \Rightarrow D\sin\phi = \lambda$$

Heisenberg Uncertainty Principle

(1) According to Heisenberg's uncertainty principle, it is impossible to measure simultaneously both the position and the momentum of the particle.

(2) Let Δx and Δp be the uncertainty in the simultaneous measurement of the position and momentum of the particle, then $\Delta x \Delta p = \hbar$; where $\hbar = \frac{h}{2\pi}$ and $h = 6.63 \times 10^{-34}$ *J-s* is the Planck's constant. $(\frac{h}{2\pi} = 1.05 \times 10^{-34}\ J\cdot sec)$

A more rigorous treatment gives $\Delta x..\Delta p \geq \frac{\hbar}{2}\left(\text{or } \frac{h}{4\pi}\right)$.

(3) If $\Delta x = 0$ then $\Delta p = \infty$ and if $\Delta p = 0$ then $\Delta x = \infty$

i.e., if we are able to measure the exact position of the particle (say an electron) then the uncertainty in the measurement of the linear momentum of the particle is infinite. Similarly, if we are able to measure the exact linear momentum of the particle *i.e.*, $\Delta p = 0$, then we can not measure the exact position of the particle at that time.

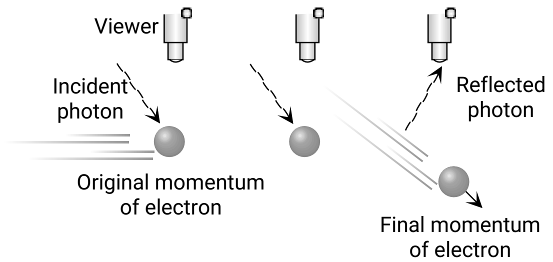

Fig. 25.16

An electron cannot be observed without changing it's momentum

(4) Uncertainty principle successfully explains

(i) Non-existence of electrons in the nucleus

(ii) Finite size of spectral lines.

(5) The Heisenberg uncertainty principle is also applicable to energy and time, angular momentum and angular displacement. Hence $\Delta E.\Delta t \geq \frac{h}{2\pi}$ and $\Delta L.\Delta\theta \geq \frac{h}{2\pi}$

(6) If the radius of the nucleus is r then the probability of finding the electron inside the nucleus is $\Delta x = 2r$ and uncertainty in momentum is $\Delta p = \frac{h}{4\pi r}$

Photon

According to Eienstein's quantum theory light propagates in the bundles (packets or quanta) of energy, each bundle being called a photon and possessing energy.

(1) **Energy of photon :** Energy of photon is given by

$E = h\nu = \frac{hc}{\lambda}$; where c = Speed of light, h = Plank's constant = 6.6×10^{-34} *J-sec*, ν = Frequency in *Hz*, λ = Wavelength of light.

In electron volt $E(eV) = \frac{hc}{e\lambda} = \frac{12375}{\lambda(Å)} \approx \frac{12400}{\lambda(Å)}$

(2) **Mass of photon :** Actually rest mass of the photon is zero. But it's effective mass is given as

$E = mc^2 = h\nu \Rightarrow m = \frac{E}{c^2} = \frac{h\nu}{c^2} = \frac{h}{c\lambda}$. This mass is also known as kinetic mass of the photon

(3) **Momentum of the photon**

Momentum $p = m \times c = \frac{E}{c} = \frac{h\nu}{c} = \frac{h}{\lambda}$

(4) **Number of emitted photons :** The number of photons emitted per second from a source of monochromatic radiation of wavelength λ and power P is given as $(n) = \frac{P}{E} = \frac{P}{h\nu} = \frac{P\lambda}{hc}$; where E = energy of each photon

(5) **Intensity of light (I) :** Energy crossing per unit area normally per second is called intensity or energy flux

i.e. $I = \frac{E}{At} = \frac{P}{A}$ $\left(\frac{E}{t} = P = \text{radiation power}\right)$

At a distance r from a point source of power P intensity is given by $I = \frac{P}{4\pi r^2} \Rightarrow I \propto \frac{1}{r^2}$

(6) **Number of photons falling per second (n) :** If P is the power of radiation and E is the energy of a photon then $n = \frac{P}{E}$

Photo-Electric Effect

The photo-electric effect is the emission of electrons (called photo-electrons when light strikes a surface. To escape from the surface, the electron must absorb enough energy from the incident radiation to overcome the attraction of positive ions in the material of the surface.

The photoelectric effect was first observed by Heinrich Hertz and it was investigated in detail by Whilelm Hallwachs and Philipp Lenard.

The photoelectric effect is based on the principle of conservation of energy.

(1) **Work function (or threshold energy) (W_0) :** The minimum energy of incident radiation, required to eject the electrons from metallic surface is defined as work function of that surface.

$W_0 = h\nu_0 = \frac{hc}{\lambda_0}$ *Joules* ; ν_0 = Threshold frequency;

λ_0 = Threshold wavelength

Work function in electron volt $W_0(eV) = \frac{hc}{e\lambda_0} = \frac{12375}{\lambda_0(Å)}$

Table 25.2 : Work function of several elements

Element	Work function (eV)	Element	Work function (eV)
Platinum	6.4	Aluminum	4.3
Gold	5.1	Silver	4.3
Nickel	5.1	Sodium	2.7
Carbon	5.0	Lithium	2.5
Silicon	4.8	Potassium	2.2
Copper	4.7	Cesium	1.9

(2) **Threshold frequency (ν_0) :** The minimum frequency of incident radiations required to eject the electron from metal surface is defined as threshold frequency.

If incident frequency $\nu < \nu_0 \Rightarrow$ No photoelectron emission

For most metals the threshold frequency is in the ultraviolet (corresponding to wavelengths between 200 and 300 *nm*), but for potassium and cesium oxides it is in the visible spectrum (λ between 400 and 700 *nm*)

(3) **Threshold wavelength (λ_0) :** The maximum wavelength of incident radiations required to eject the electrons from a metallic surface is defined as threshold wavelength.

If incident wavelength $\lambda > \lambda_0 \Rightarrow$ No photoelectron emission

(4) **Einstein's photoelectric equation :** According to Einstein, photoelectric effect is the result of one to one inelastic collision between photon and electron in which photon is completely absorbed

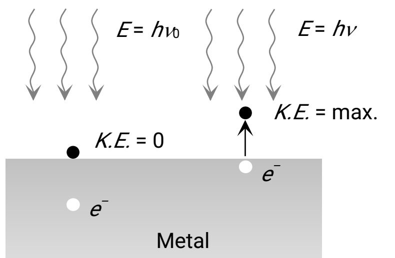

Fig. 25.17

Einstein's photoelectric equation is $E = W_0 + K_{max}$

where $K_{max} = \frac{1}{2}mv^2_{max}$ = maximum kinetic energy of emitted electrons.

Experimental Setup for Photoelectric Effect

(1) Two conducting electrodes, the anode (Q) and cathode (P) are enclosed in an evacuated glass tube as shown

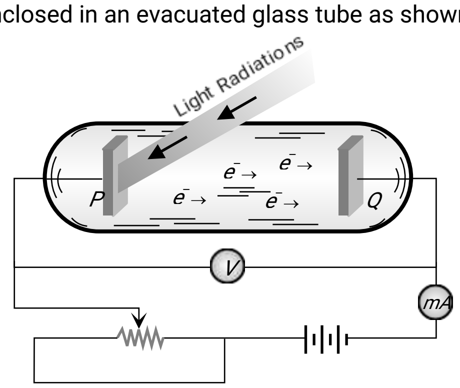

Fig. 25.18

(2) The battery or other source of potential difference creates an electric field in the direction from anode to cathode.

(3) Light of certain wavelength or frequency falling on the surface of cathode causes a current in the external circuit called photoelectric current.

(4) As potential difference increases, photo electric current also increases till saturation is reached.

(5) When polarity of battery is reversed (*i.e.* plate Q is at negative potential *w.r.t.* plate P) electrons start moving back towards the cathode.

(6) At a particular negative potential of plate Q no electron will reach the plate Q and the current will become zero, this negative potential is called **stopping potential** denoted by V_0. Maximum kinetic energy of photo electrons in terms of stopping potential will therefore be $K_{max} = (|V_0|)\ eV$

Effect of Intensity and Frequency of Light

(1) **Effect of intensity :** If the intensity of light is increased (while it's frequency is kept the same) the current levels off at a higher value, showing that more electrons are being emitted per unit time. But the stopping potential V_0 doesn't change *i.e.*

Intensity $\propto$ no. of incident photon $\propto$ no. of emitted photoelectron per time $\propto$ photo current

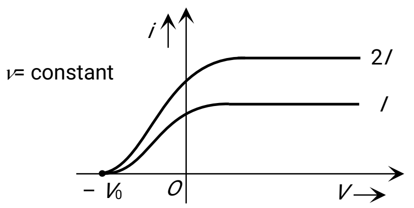

Fig. 25.19

(2) **Effect of frequency :** If frequency of incident light increases, (keeping intensity is constant) stopping potential increases but their is no change in photoelectric current

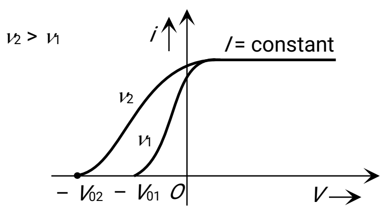

Fig. 25.20

Important Formulae for Photoelectric Effect

(1) $h\nu = h\nu_0 + K_{max}$ and $K_{max} = eV_0$

(2) $K_{max} = eV_0 = h(\nu - \nu_0) \Rightarrow \frac{1}{2}mv_{max}^2 = h(\nu - \nu_0)$

(3) $v_{max} = \sqrt{\frac{2h(\nu - \nu_0)}{m}}$

(4) $K_{max} = \frac{1}{2}mv_{max}^2 = eV_0 = hc\left(\frac{1}{\lambda} - \frac{1}{\lambda_0}\right) = hc\left(\frac{\lambda_0 - \lambda}{\lambda\lambda_0}\right)$

(5) $v_{max} = \sqrt{\frac{2hc}{m}\frac{(\lambda_0 - \lambda)}{\lambda\lambda_0}}$

(6) $V_0 = \frac{h}{e}(\nu - \nu_0) = \frac{hc}{e}\left(\frac{1}{\lambda} - \frac{1}{\lambda_0}\right) = 12375\left(\frac{1}{\lambda} - \frac{1}{\lambda_0}\right)$

Compton Effect

(1) The scattering of a photon by an electron is called Compton effect.

(2) The energy and momentum is conserved.

(3) Scattered photon will have less energy (more wavelength) as compare to incident photon (less wavelength).

(4) The energy lost by the photon is taken by electron as kinetic energy.

(5) The change in wavelength due to Compton effect is called Compton shift. Compton shift $\lambda_f - \lambda_i = \Delta\lambda = \frac{h}{m_0 c}(1 - \cos\phi)$

If $\phi = 0^\circ$, $\Delta\lambda = 0$

$\phi = 90^\circ$, $\Delta\lambda = \frac{h}{m_0 c} = 0.24\ nm$

$\phi = 180^\circ$, $\Delta\lambda = \frac{2h}{m_0 c} = 0.48\ nm$ (called Compton wave length)

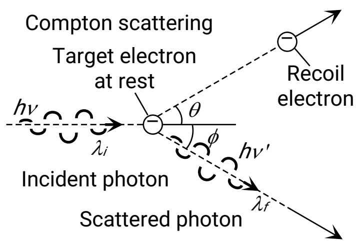

Fig. 25.21

X-Rays

(1) X-rays were discovered by scientist Rontgen thats why they are also called Rontgen rays.

(2) Rontgen discovered that when pressure inside a discharge tube is kept 10^{-3} *mm* of *Hg* and potential difference is kept 25 *kV*, then some unknown radiations (X-rays) are emitted by anode.

(3) There are three essential requirements for the production of X-rays.

(i) A source of electron

(ii) An arrangement to accelerate the electrons

(iii) A target of suitable material of high atomic weight and high melting point on which these high speed electrons strike.

Coolidge X-Ray Tube

(1) It consists of a highly evacuated glass tube containing cathode and target (also known as filament type X-ray tube). The cathode consist of a tungsten filament. The filament is coated with oxides of barium or strontium to have an emission of electrons even at low temperature. The filament is surrounded by a molybdenum cylinder kept at negative potential *w.r.t.* the target.

(2) The target (It is a material of high atomic weight, high melting point and high thermal conductivity) made of tungsten or molybdenum is embedded in a copper block.

(3) The face of the target is set at 45° to the incident electron stream.

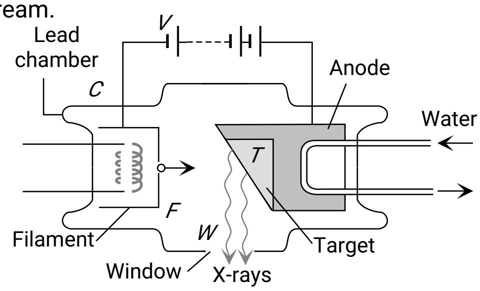

Fig. 25.22

(4) The filament is heated by passing the current through it. A high potential difference (≈ 10 *kV* to 80 *kV*) is applied between the target and cathode to accelerate the electrons which are emitted by filament. The stream of highly energetic electrons are focussed on the target.

(5) Most of the energy of the electrons is converted into heat (above 98%) and only a fraction of the energy of the electrons (about 2%) is used to produce X-rays.

(6) During the operation of the tube, a huge quantity of heat is produced in this target, this heat is conducted through the copper anode to the cooling fins from where it is dissipated by radiation and convection.

(7) **Control of intensity of X-rays** : Intensity implies the number of X-ray photons produced from the target. The intensity of X-rays emitted is directly proportional to the electrons emitted per second from the filament and this can be increased by increasing the filament current. So *intensity of X-rays* $\propto$ *Filament current*

(8) **Control of quality or penetration power of *X*-rays :** Quality of X-rays implies the penetrating power of X-rays, which can be controlled by varying the potential difference between the cathode and the target.

For large potential difference, energy of bombarding electrons will be large and hence larger is the penetration power of X-rays.

Table 25.3 : Types of X-rays

Hard X-rays	Soft X-rays
More penetration power	Less penetration power
More frequency of the order of ≈ 10^{19} *Hz*	Less frequency of the order of ≈ 10^{16} *Hz*
Lesser wavelength range (0.1Å – 4Å)	More wavelength range (4Å – 100Å)

Properties of X-Rays

(1) X-rays are electromagnetic waves with wavelength range 0.1Å – 100Å.

(2) The wavelength of X-rays is very small in comparison to the wavelength of light. Hence they carry much more energy (This is the only difference between X-rays and light)

(3) X-rays are invisible.

(4) They travel in a straight line with speed of light.

(5) X-rays are measured in Rontgen (measure of ionization power).

(6) X-rays carry no charge so they are not deflected in magnetic field and electric field.

(7) $\lambda_{Gama\ \ rays} < \lambda_{X\text{-}rays} < \lambda_{UV\ \ rays}$

(8) They used in the study of crystal structure.

(9) They ionise gases

(10) X-rays do not pass through heavy metals and bones.

(11) They affect photographic plates.

(12) Long exposure to X-rays is injurious for human body.

(13) Lead is the best absorber of X-rays.

(14) For X-ray photography of human body parts, $BaSO_4$ is the best absorber.

(15) They produce photoelectric effect and Compton effect

(16) X-rays are not emitted by hydrogen atom.

(17) These cannot be used in Radar because they are not reflected by the target.

(18) They show all the important properties of light rays like; reflection, refraction, interference, diffraction and polarization *etc*.

Absorption of X-Rays

X-rays are absorbed when they incident on substance.

Intensity of emergent *X*-rays $I = I_0 e^{-\mu x}$

So intensity of absorbed X-rays

$I' = I_0 - I = I_0(1 - e^{-\mu x})$

where x = thickness of absorbing medium, μ = absorption coefficient

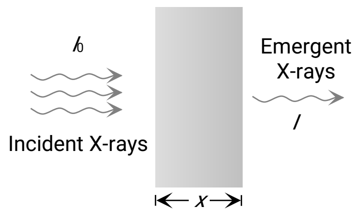

Fig. 25.23

$\mu \propto \lambda^3$; (λ = Wavelength of X-ray)

$\mu \propto \overline{\nu}^3$ (ν = Frequency of X-ray)

$\mu \propto Z^4$ (Z = Atomic number of target)

Classification of X-Rays

In X-ray tube, when high speed electrons strikes the target, they penetrate the target. They loses their kinetic energy and comes to rest inside the metal. The electron before finally being stopped makes several collisions with the atoms in the target. At each collision one of the following two types of X-rays may get formed.

(1) Continuous X-rays

(2) Characteristic X-rays

Continuous X-Rays

As an electron passes close to the positive nucleus of atom of the target, the electron is deflected from it's path as shown in figure. This results in deceleration of the electron. The loss in energy of the electron during deceleration is emitted in the form of X-rays.

The X-ray photons so emitted form the continuous X-ray spectrum.

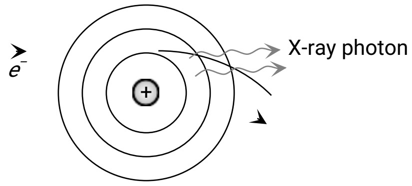

Fig. 25.24

(1) **Minimum wavelength :** When the electron looses whole of it's energy in a single collision with the atom, an X-ray photon of maximum energy $h\nu_{max}$ is emitted *i.e.*

$$\frac{1}{2}mv^2 = eV = h\nu_{max} = \frac{hc}{\lambda_{min}}$$

where v = velocity of electron before collision with target atom, V = potential difference through which electron is accelerated, c = speed of light = 3×10^8 *m/s*

Maximum frequency of radiations (X-rays) $\nu_{max} = \frac{eV}{h}$

Minimum wavelength = cut off wavelength of X-ray

$$\lambda_{min} = \frac{hc}{eV} = \frac{12375}{V}\ Å$$

(2) **Intensity wavelength graph :** The continuous X-ray spectra consist of all the wavelengths over a given range. These wavelength are of different intensities. Following figure shows the intensity variation of different wavelengths for various accelerating voltages applied to X-ray tube.

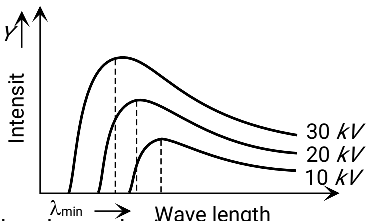

Fig. 25.25

For each voltage, the intensity curve starts at a particular minimum wavelength (λ_{min}). Rises rapidly to a maximum and then drops gradually.

The wavelength at which the intensity is maximum depends on the accelerating voltage, being shorter for higher voltage and vice-versa.

Characteristic X-Rays

Few of the fast moving electrons having high velocity penetrate the surface atoms of the target material and knock out the tightly bound electrons even from the inner most shells of the atom. Now when the electron is knocked out, a vacancy is created at that place.

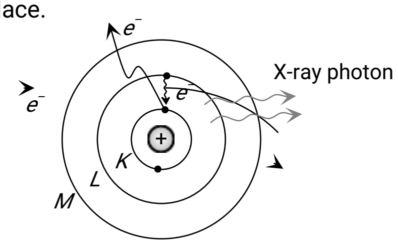

Fig. 25.26

To fill this vacancy electrons from higher shells jump to fill the created vacancies, we know that when an electron jumps from a higher energy orbit E_1 to lower energy orbit E_2, it radiates energy ($E_1 - E_2$). Thus this energy difference is radiated in the form of X-rays of very small but definite wavelength which depends upon the target material. The X-ray spectrum consists of sharp lines and is called characteristic X-ray spectrum.

(1) ***K, L, M, …… series* :** If the electron striking the target eject an electron from the *K*-shell of the atom, a vacancy is created in the *K*-shell. Immediately an electron from one of the outer shell, say *L*-shell jumps to the *K*-shell, emitting an X-ray photon of energy equal to the energy difference between the two shells. Similarly, if an electron from the *M*-shell jumps to the *K*-shell, X-ray photon of higher energy is emitted. The X-ray photons emitted due to the jump of electron from the *L*, *M*, *N* shells to the K-shells gives K_α, K_β, K_γ lines of the *K*-series of the spectrum.

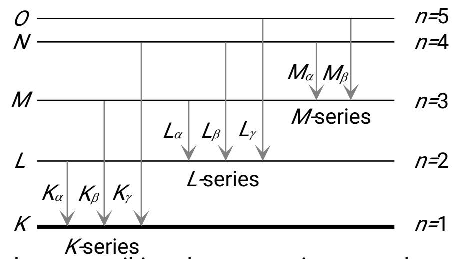

Fig. 25.27

If the electron striking the target ejects an electron from the *L*-shell of the target atom, an electron from the *M*, *N* ….. shells jumps to the *L*-shell so that X-rays photons of lesser energy are emitted.

These photons form the *L*-series of the spectrum. In a similar way the formation of *M* series, *N* series *etc*. may be explained.

(2) **Intensity-wavelength graph :** At certain sharply defined wavelengths, the intensity of X-rays is very large as marked K_α, K_β …. as shown in figure. These X-rays are known as characteristic X-rays. At other wavelengths the intensity varies gradually and these X-rays are called continuous X-rays.

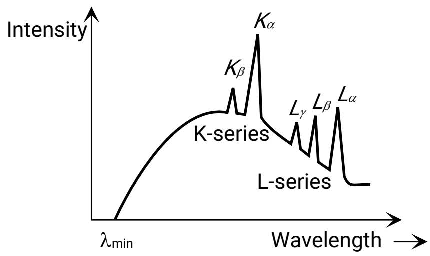

Fig. 25.28

Mosley's Law

Mosley studied the characteristic *X*-ray spectrum of a number of a heavy elements and concluded that the spectra of different elements are very similar and with increasing atomic number, the spectral lines merely shift towards higher frequencies.

He also gave the following relation $\sqrt{\nu} = a(Z - b)$

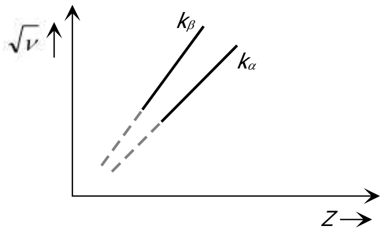

Fig. 25.29

where ν = Frequency of emitted line, Z = Atomic number of target, a = Proportionality constant, b = Screening constant or Shielding constant.

$(Z - b)$ = Effective atomic number

a and b doesn't depend on the nature of target. Different values of b are as follows

$b = 1$	for	K-series
$b = 7.4$	for	L-series
$b = 19.2$	for	M-series

(1) Mosley's law supported Bohr's theory

(2) It experimentally determined the atomic number (Z) of elements.

(3) This law established the importance of ordering of elements in periodic table by atomic number and not by atomic weight.

(4) Gaps in Moseley's data for A = 43, 61, 72, 75 suggested existence of new elements which were later discovered.

(5) The atomic numbers of Cu, Ag and Pt were established to be 29, 47 and 78 respectively.

(6) When a vacancy occurs in the K-shell, there is still one electron remaining in the K-shell. An electron in the L-shell will feel an effective charge of $(Z - 1)e$ due to $+Ze$ from the nucleus and $-e$ from the remaining K-shell electron, because L-shell orbit is well outside the K-shell orbit.

(7) Wave length of characteristic spectrum $\frac{1}{\lambda} = R(Z-b)^2\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$ and energy of X-ray radiations.

$$\Delta E = h\nu = \frac{hc}{\lambda} = Rhc\,(Z-b)^2\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$$

(8) If transition takes place from $n_2 = 2$ to $n_1 = 1$ (K_α - line)

(i) $a = \sqrt{\frac{3RC}{4}} = 2.47 \times 10^{15}\ Hz$

(ii) $\nu_{K\alpha} = RC\,(Z-1)^2\left(1 - \frac{1}{2^2}\right) = \frac{3RC}{4}(Z-1)^2$

$$= 2.47 \times 10^{15}(Z-1)^2\ Hz$$

(iii) In general the wavelength of all the K-lines are given by

$\frac{1}{\lambda_K} = R(Z-1)^2\left(1 - \frac{1}{n^2}\right)$ where n = 2, 3, 4, ….

While for K_α line $\lambda_{K\alpha} = \frac{1216}{(Z-1)^2}\ Å$

(iv) $E_{K\alpha} = 10.2(Z-1)^2\ eV$

Uses of X-Rays

(i) In study of crystal structure : Structure of DNA was also determined using X-ray diffraction.

(ii) In medical science

(iii) In radiography

(iv) In radio therapy

(v) In engineering

(vi) In laboratories

(vii) In detective department

(viii) In art the change occurring in old oil paintings can be examined by X-rays.

Tips & Tricks

✍ Discovery of positive rays helps in discovering of isotopes.

✍ The de-Broglie wavelength of electrons in first Bohr orbit of an atom is equal to circumference of orbit.

✍ A particle having zero rest mass and non zero energy and momentum must travels with a speed equal to speed of light.

✍ **de-Broglie wave length associates with gas molecules** is given as $\lambda = \frac{h}{mv_{rms}} = \frac{h}{\sqrt{3\ mkT}}$ (Energy of gas molecules at temperature T is $E = \frac{3}{2}kT$)

✍ A photon is not a material particle. It is a quanta of energy.

✍ When a particle exhibits wave nature, it is associated with a wave packet, rather then a wave.

✍ By coating the metal surface with a layer of barium oxide or strontium oxide it's work function is lowered.

✍ We must remember that intensity of incident light radiation is inversely proportional to the square of distance between source of light and photosensitive plate P *i.e.*, $I \propto \frac{1}{d^2}$ so $I \propto i \propto \frac{1}{d^2}$)

✍ The photoelectric current can be increased by filling some inert gas like Argon into the bulb. The photoelectrons emitted by cathode ionise the gas by collision and hence the current is increased.

✍ Compton effect shows that photon have momentum.

✍ Production of X-ray is the reverse phenomenon of photoelectric effect.

✍ The thickness of medium at which intensity of emergent X-rays becomes half *i.e.* $I' = \frac{I_0}{2}$ is called half value thickness ($x_{1/2}$) and it is given as $x_{1/2} = \frac{0.693}{\mu}$.

✍ Continuos X-rays are produced due to the phenomenon called "Bremsstrahlung". It means slowing down or braking radiation.

✍ The wavelength of characteristic X-ray doesn't depend on accelerating voltage. It depends on the atomic number (Z) of the target material.

✍ In characteristic X-ray spectrum $\lambda_{K\alpha} < \lambda_{L\alpha} < \lambda_{M\alpha}$ and $\nu_{K\alpha} > \nu_{L\alpha} > \nu_{M\alpha}$ also $\lambda_{K\alpha} > \lambda_{K\beta} > \lambda_{K\gamma}$

✍ Nearly all metals emits photoelectrons when exposed to UV light. But alkali metals like lithium, sodium, potassium, rubidium and cesium emit photoelectrons even when exposed to visible light.

✍ Oxide coated filament in vacuum tubes is used to emit electrons at relatively lower temperature.

✍ Conduction of electricity in gases at low pressure takes because colliding electrons acquire higher kinetic energy due to increase in mean free path.

✍ Kinetic energy of cathode rays depends on both voltage and work function of cathode.

✍ Photoelectric effect is due to the particle nature of light.

✍ Hydrogen atom does not emit X-rays because it's energy levels are too close to each other.

✍ The essential difference between X-rays and of γ-rays is that, γ-rays emits from nucleus while X-rays from outer part of atom.

✍ There is no time delay between emission of electron and incidence of photon *i.e.* the electrons are emitted out as soon as the light falls on metal surface.

✍ If light were wave (not photons) it will take about an year to eject a photoelectron out of the metal surface.

✍ Doze of X-ray are measured in terms of produced ions or free energy via ionisaiton.

✍ Safe doze for human body per week is one Rontgen (One Rontgon is the amount of X-rays which emits 2.5×10^4 *J* free energy through ionization of 1 *gm* air at NTP

✍ The photoelectrons emitted from the metallic surface have different kinetic energies even when the incident photons have same energy. This happens because all the electrons do not exist in the surface layer.

Those coming from below the surface loose more energy in getting themselves free.

✍ Einstein was awarded Nobel prize for explaining the photoelectric effect.

✍ Uncertainty in the measurement of momentum of photon within the nucleus is $\Delta p = \frac{h}{2\pi d}$

where d = diameter of the nucleus and Δx = d = uncertainty in the measurement of position of proton.

Ordinary Thinking

Objective Questions

Cathode Rays and Positive Rays

1. In the Millikan's experiment, the distance between two horizontal plates is 2.5 *cm* and the potential difference applied is 250 *V*. The electric field between the plates will be

(a) 900 *V/m* **(b)** 10000 *V/m*

(c) 625 *V/m* (d) 6250 *V/m*

2. The cathode rays have particle nature because of the fact that **[CPMT 1986; MNR 1986]**

(a) They can propagate in vacuum

(b) They are deflected by electric and magnetic fields

(c) They produced fluorescence

(d) They cast shadows

3. In Millikan's experiment for the determination of the charge on the electron, the reason for using the oil is

(a) It is a lubricant (b) Its density is higher

(c) It vapourises easily **(d)** It does not vapourise

4. The mass of a particle is 400 times than that of an electron and the charge is double. The particle is accelerated by 5 *V*. Initially the particle remained in rest, then its final kinetic energy will be **[MP PMT 1990]**

(a) 5 *eV* (b) 10 *eV*

(c) 100 *eV* (d) 2000 *eV*

5. An electron (charge = 1.6×10^{-19} C) is accelerated through a potential of 100,000 *V*. The energy acquired by the electron is **[MP PET 1989]**

(a) 1.6×10^{-24} J (b) 1.6×10^{-14} erg

(c) 0.53×10^{-17} J **(d)** 1.6×10^{-14} J

6. While doing his experiment, Millikan one day observed the following charges on a single drop

(i) 6.563×10^{-19} C (ii) 8.204×10^{-19} C

(iii) 11.50×10^{-19} C (iv) 13.13×10^{-19} C

(v) 16.48×10^{-19} C (vi) 18.09×10^{-19} C

From this data the value of the elementary charge (e) was found to be **[MP PMT 1993]**

(a) $1.641 \times 10^{-19}\ C$ (b) $1.630 \times 10^{-19}\ C$

(c) $1.648 \times 10^{-19}\ C$ (d) $1.602 \times 10^{-19}\ C$

7. When electron beam passes through an electric field, they gain kinetic energy. If the same beam passes through magnetic field, then

(a) Their energy increases

(b) Their momentum increases

(c) Their potential energy increases

(d) Energy and momentum both remains unchanged

8. Which of the following law is used in the Millikan's method for the determination of charge **[DPMT 2002]**

(a) Ampere's law **(b)** Stoke's law

(c) Fleming's left hand rule (d) Fleming's right hand rule

9. The mass of the electron varies with

(a) The size of the cathode ray tube

(b) The variation of *'g'*

(c) Velocity

(d) Size of the electron

10. When the speed of electrons increases, then the value of its specific charge **[MP PMT 1994]**

(a) Increases

(b) Decreases

(c) Remains unchanged

(d) Increases upto some velocity and then begins to decrease

11. An electron is accelerated through a potential difference of 1000 *volts*. Its velocity is nearly

[MP PMT 1985; Pb. PET 2003]

(a) $3.8 \times 10^{7}\ m/s$ (b) $1.9 \times 10^{6}\ m/s$

(c) $1.9 \times 10^{7}\ m/s$ (d) $5.7 \times 10^{7}\ m/s$

12. In an electron gun the control grid is given a negative potential relative to cathode in order to **[NCERT 1988]**

(a) Decelerate electrons

(b) Repel electrons and thus to control the number of electrons passing through it

(c) To select electrons of same velocity and to converge them along the axis

(d) To decrease the kinetic energy of electrons

13. The ratio of momenta of an electron and an $\alpha-$particle which are accelerated from rest by a potential difference of 100 V is

(a) 1 (b) $\sqrt{\frac{2m_e}{m_\alpha}}$

(c) $\sqrt{\frac{m_e}{m_\alpha}}$ (d) $\sqrt{\frac{m_e}{2m_\alpha}}$

14. When subjected to a transverse electric field, cathode rays move

(a) Down the potential gradient

(b) Up the potential gradient

(c) Along a hyperbolic path

(d) Along a circular path

15. The fact that electric charges are integral multiples of the fundamental electronic charge was proved experimentally by

(a) Planck (b) J.J. Thomson

(c) Einstein (d) Millikan

16. In Millikan oil drop experiment, a charged drop of mass $1.8\times10^{-14}\,kg$ is stationary between its plates. The distance between its plates is 0.90 *cm* and potential difference is 2.0 *kilo volts*. The number of electrons on the drop is

[MP PMT 1994, 2003; MP PET 1997]

(a) 500 (b) 50

(c) 5 (d) 0

17. The charge on electron was discovered by

[BHU 1995; RPMT 1999; DCE 2004]

(a) J.J. Thomson (b) Neil Bohr

(c) Millikan (d) Chadwick

18. From the following, what charges can be present on oil drops in Millikan's experiment [MP PET 1995]

(a) Zero, equal to the magnitude of charge on $\alpha-$particle

(b) $2e, 1.6\times10^{-18}\,C,$

(c) $1.6\times10^{-19}\,C, 2.5e$

(d) $1.5e, e$

(Here *e* is the electronic charge)

19. A narrow electron beam passes undeviated through an electric field $E=3\times10^4\,volt/m$ and an overlapping magnetic field $B=2\times10^{-3}\,Weber/m^2$. If electric field and magnetic field are mutually perpendicular. The speed of the electrons is

(a) 60 *m/s* (b) $10.3\times10^7\,m/s$

(c) $1.5\times10^7\,m/s$ (d) $0.67\times10^{-7}\,m/s$

20. In Thomson's method of determining *e/m* of electrons

[MP PMT 1997]

(a) Electric and magnetic fields are parallel to electrons beam

(b) Electric and magnetic fields are perpendicular to each other and perpendicular to electrons beam

(c) Magnetic field is parallel to the electrons beam

(d) Electric field is parallel to the electrons beam

[MNR 1994; RPET 1997]

21. Cathode rays enter into a uniform magnetic field perpendicular to the direction of the field. In the magnetic field their path will be

(a) Straight line (b) Circle

(c) Parabolic (d) Ellipse

22. The specific charge of an electron is [MP PMT/PET 1998; J&K CET 2004; Pb. PET 2002; MH CET 1999]

[MP PET 1994]

(a) $1.6\times10^{-19}\,coulomb$

(b) $4.8\times10^{-10}\,statcoulomb$

(c) $1.76\times10^{11}\,coulomb/kg$

(d) $1.76\times10^{-11}\,coulomb/kg$

[MP PET 1994]

23. An electron is moving with constant velocity along $x-$axis. If a uniform electric field is applied along $y-$axis, then its path in the $x-y$ plane will be [MP PMT 1999]

(a) A straight line (b) A circle

(c) A parabola (d) An ellipse

24. Cathode rays are similar to visible light rays in that

[SCRA 1994]

(a) They both can be deflected by electric and magnetic fields

(b) They both have a definite magnitude of wavelength

(c) They both can ionise a gas through which they pass

(d) They both can expose a photographic plate

25. Which one of the following devices makes use of the electrons to strike certain substances to produce fluorescence

[SCRA 1994]

(a) Thermionic valve (b) Photoelectric cell

(c) Cathode ray oscilloscope (d) Electron gun

26. An oxide coated filament is useful in vacuum tubes because essentially [SCRA 1994]

(a) It has high melting point

(b) It can withstand high temperatures

(c) It has good machanical strength

(d) It can emit electrons at relatively lower temperatures

27. Gases begin to conduct electricity at low pressure because

[CBSE PMT 1994]

[MP PET 1995]

(a) At low pressure, gases turn to plasma

(b) Colliding electrons can acquire higher kinetic energy due to increased mean free path leading to ionisation of atoms

(c) Atoms break up into electrons and protons

(d) The electrons in atoms can move freely at low pressure

28. A beam of electrons is moving with constant velocity in a region having electric and magnetic fields of strength $20\,Vm^{-1}$ and 0.5 T at right angles to the direction of motion of the electrons. What is the velocity of the electrons

[CBSE PMT 1996]

(a) 20 ms^{-1} (b) 40 ms^{-1}

(c) 8 ms^{-1} (d) 5.5 ms^{-1}

29. Kinetic energy of emitted cathode rays is dependent on [CPMT 1996]

(a) Only voltage

(b) Only work function

(c) Both (a) and (b)

(d) It does not depend upon any physical quantity

30. The radius of the orbital of electron in the hydrogen atom 0.5 Å. The speed of the electron is $2\times10^6 m/s$. Then the current in the loop due to the motion of the electron is [RPMT 1996]

(a) 1 *mA* (b) 1.5 *mA*

(c) 2.5 *mA* (d) $1.5\times10^{-2} mA$

31. The kinetic energy of an electron which is accelerated through a potential of 100 *volts* is [MP PET 1986; CBSE PMT 1997; AIIMS 1998]

(a) $1.602\times10^{-17} J$ (b) 418.6 *calories*

(c) $1.16\times10^4 K$ (d) 6.626×10^{-34} *W- sec*

32. When a proton is accelerated with 1 *volt* potential difference, then its kinetic energy is [CPMT 1997; CBSE PMT 1999; RPET 2003]

(a) $\frac{1}{1840}eV$ (b) 1840 *eV*

(c) 1 *eV* (d) 1840 *c eV*

33. Energy of electrons can be increased by allowing them [JIPMER 1997]

(a) To fall through electric potential

(b) To move in high magnetic field

(c) To fall from great heights

(d) To pass through lead blocks

34. Cathode rays and canal rays produced in a certain discharge tube are deflected in the same direction if [SCRA 1998]

(a) A magnetic field is applied normally

(b) An electric field is applied normally

(c) An electric field is applied tangentially

(d) A magnetic field is applied tangentially

35. In a Millikan's oil drop experiment the charge on an oil drop is calculated to be $6.35\times10^{-19} C$. The number of excess electrons on the drop is [MNR 1998]

(a) 3.9 (b) 4

(c) 4.2 (d) 6

36. Cathode rays consist of [DCE 1999]

(a) Photons (b) Electrons

(c) Protons (d) α -particles

37. A metal plate gets heated, when cathode rays strike against, it due to [CPMT 2000; Pb. PET 2000]

(a) Kinetic energy of cathode rays

(b) Potential energy of cathode rays

(c) Linear velocity of cathode rays

(d) Angular velocity of cathode rays

38. Cathode rays are [RPET 2000]

(a) Positive rays (b) Neutral rays

(c) He rays (d) Electron waves

39. An electron of charge '*e*' coulomb passes through a potential difference of V *volts*. Its energy in '*joules*' will be [MP PET 2000]

(a) V/e (b) eV

(c) e/V (d) V

40. An electron is accelerated through a potential difference of 200 *volts*. If e/m for the electron be 1.6×10^{11} *coulomb/kg*, the velocity acquired by the electron will be [MP PET 2000]

(a) $8\times10^6 m/s$ (b) $8\times10^5 m/s$

(c) $5.9\times10^6 m/s$ (d) $5.9\times10^5 m/s$

41. Which is not true with respect to the cathode rays [Kerala PET 2001]

(a) A stream of electrons

(b) Charged particles

(c) Move with speed same as that of light

(d) Can be deflected by magnetic fields

42. In Milikan's experiment, an oil drop having charge q gets stationary on applying a potential difference V in between two plates separated by a distance 'd'. The weight of the drop is

(a) qVd (b) $q\frac{d}{V}$

(c) $\frac{q}{Vd}$ (d) $q\frac{V}{d}$

43. Electron volt is a unit of [MP PMT 2001]

(a) Potential (b) Charge

(c) Power (d) Energy

44. In Thomson experiment of finding e/m for electrons, beam of electron is replaced by that of muons (particle with same charge as of electrons but mass 208 times that of electrons). No deflection condition in this case satisfied if [Orissa (Engg.) 2002]

(a) B is increased 208 times

(b) E is increased 208 times

(c) B is increased 14.4 times

(d) None of these

45. The colour of the positive column in a gas discharge tube depends on [Kerala (Engg.) 2002]

(a) The type of glass used to construct the tube

(b) The gas in the tube

(c) The applied voltage

(d) The material of the cathode

46. Cathode rays are produced when the pressure is of the order of

(a) 2 *cm* of *Hg* (b) 0.1 *cm* of *Hg*

(c) 0.01 *mm* of *Hg* (d) 1 μm of *Hg*

47. The speed of an electron having a wavelength of $10^{-10}\ m$ is [AIIMS 2002]

(a) $7.25\times10^{6}\ m/s$ (b) $6.26\times10^{6}\ m/s$

(c) $5.25\times10^{6}\ m/s$ (d) $4.24\times10^{6}\ m/s$

48. Which of the following is not the property of a cathode ray [CBSE PMT 2002]

(a) It casts shadow

(b) It produces heating effect

(c) It produces flurosence

(d) It does not deflect in electric field

49. In a Thomson set-up for the determination of *e/m*, electrons accelerated by 2.5 kV enter the region of crossed electric and magnetic fields of strengths $3.6\times10^{4}\,Vm^{-1}$ and $1.2\times10^{-3}\,T$ respectively and go through undeflected. The measured value of e/m of the electron is equal to [AMU 2002]

(a) $1.0\times10^{11}\,C\text{-}kg^{-1}$ (b) $1.76\times10^{11}\,C\text{-}kg^{-1}$

(c) $1.80\times10^{11}\,C\text{-}kg^{-1}$ (d) $1.85\times10^{11}\,C\text{-}kg^{-1}$

50. The ratio of specific charge of an α -particle to that of a proton is

(a) 2 : 1 (b) 1 : 1

(c) 1 : 2 (d) 1 : 3

51. In Bainbridge mass spectrograph a potential difference of 1000 *V* is applied between two plates distant 1 *cm* apart and magnetic field in *B* = 1*T*. The velocity of undeflected positive ions in *m/s* from the velocity selector is [RPMT 1998]

(a) $10^{7}\,m/s$ (b) $10^{4}\,m/s$

(c) $10^{5}\,m/s$ (d) $10^{2}\,m/s$

52. When cathode rays (tube voltage ~ 10 *kV*) collide with the anode of high atomic weight then we get [MP PET 1985]

(a) Positive rays (b) *X*-rays

(c) Gamma rays (d) Canal rays

53. In Thomson's experiment if the value of *q/m* is the same for all positive ions striking the photographic plate, then the trace would be [RPMT 1986]

(a) Straight line (b) Parabolic

(c) Circular (d) Elliptical

54. In a discharge tube at 0.02 *mm*, there is a formation of [CBSE PMT 1996]

(a) FDS (b) CDS

(c) Both space (d) None of these

55. Electric field and magnetic field in Thomson mass spectrograph are applied [RPMT 1998]

(a) Simultaneously, perpendicular

(b) Perpendicular but not simultaneously

(c) Parallel but not simultaneously

(d) Parallel simultaneously

56. The current conduction in a discharged tube is due to [CBSE PMT 1999]

(a) Electrons only

(b) +*ve* ions and electrons

(c) – *ve* ions and electrons

(d) + *ve* ions, – *ve* ions and electrons

57. In Milikan's oil drop experiment, a charged drop falls with terminal velocity *V*. If an electric field *E* is applied in vertically upward direction then it starts moving in upward direction with terminal velocity 2*V*. If magnitude of electric field is decreased to $\frac{E}{2}$, then terminal velocity will become [CBSE PMT 1999]

(a) $\frac{V}{2}$ (b) V

(c) $\frac{3V}{2}$ (d) $2V$

58. An electron is accelerated through a p.d. of 45.5 *volt*. The velocity acquired by it is (in *ms*) [AIIMS 2004]

(a) 4×10^{6} (b) 4×10^{4}

(c) 10^{6} (d) Zero

59. A cathode emits 1.8×10^{14} electrons per second, when heated. [BCECE 2003] When 400*V* is applied to anode all the emitted electrons reach the anode. The charge on electron is $1.6\times10^{-19}\,C$. The maximum anode current is [MP PMT 2004]

(a) $2.7\,\mu A$ (b) $29\,\mu A$

(c) $72\,\mu A$ (d) 29 *mA*

60. Order of *q/m* ratio of proton, α -particle and electron is [AFMC 2004]

(a) $e > p > \alpha$ (b) $p > \alpha > e$

(c) $e > \alpha > p$ (d) None of these

61. A charge of magnitude $3e$ and mass $2m$ is moving in an electric field $\vec{E}$. The acceleration imparted to the charge is [DCE 2004]

(a) $2Ee/3m$ (b) $3Ee/2m$

(c) $2m/3Ee$ (d) $3m/2Ee$

62. An electron initially at rest, is accelerated through a potential difference of 200 *volt*, so that it acquires a velocity $8.4\times10^{6}\,m/s$. The value of *e/m* of electron will be [DPMT 2003]

(a) $2.76\times10^{12}\,C/kg$ (b) $1.76\times10^{11}\,C/kg$

(c) $0.76\times10^{12}\,C/kg$ (d) None of these

63. An α particle is accelerated through a *p.d* of 10^{6} volt then *K.E.* of particle will be [Pb. PET 2003]

(a) 8 *MeV* (b) 4 *MeV*

(c) 2 *MeV* (d) 1 *MeV*

64. Positive rays consists of [RPMT 1996, 2003]

(a) Electrons (b) Neutrons

(c) Positive ions (d) Electro magnetic waves

65. O^{++}, C^{+}, He^{++} and H^{+} ions are projected on the photographic plate with same velocity in a mass spectrograph. Which one will strike farthest [RPMT 2003]

(a) O^{++} (b) C^{+}

(c) He^{++} (d) H_2^{+}

66. An electron beam is moving between two parallel plates having electric field $1.125\times10^{-6}\,N/m$. A magnetic field $3\times10^{-10}\,T$ is also applied so that beam of electrons do not deflect. The velocity of the electron is [MH CHT 2004]

(a) $4225\,m/s$ (b) $3750\,m/s$

(c) $2750\,m/s$ (d) $3200\,m/s$

67. Positive rays was discovered by [RPMT 1998]

(a) Thomson (b) Goldstem

(c) W. Crookes (d) Rutherford

68. An electron is moving in electric field and magnetic field it will gain energy from [DCE 1998]

(a) Electric field (b) Magnetic field

(c) Both of these (d) None of these

69. If an electron oscillates at a frequency of 1 *GHz* it gives [DCE 1999]

(a) *X*-rays (b) Mirowaves

(c) Infrared rays (d) None of these

70. In an electron gun, the electrons are accelerated by the potential *V*. If *e* is the charge and *m* is the mass of an electron, then the maximum velocity of these electrons will be

(a) $\frac{2eV}{m}$ (b) $\sqrt{\frac{2eV}{m}}$

(c) $\sqrt{\frac{2m}{eV}}$ (d) $\frac{V^2}{2em}$

71. Which of the following have highest specific charge [BHU 2005]

(a) Positron (b) Proton

(c) *He* (d) None of these

72. In Millikan's oil drop experiment, an oil drop of mass $16\times10^{-6}\,kg$ is balanced by an electric field of $10^{6}\,V/m$. The charge in coulomb on the drop, assuming $g=10\,m/s^2$ is

(a) 6.2×10^{-11} (b) 16×10^{-9}

(c) 16×10^{-11} (d) 16×10^{-13}

Matter Waves

1. The idea of matter waves was given by

(a) Davisson and Germer (b) de-Broglie

(c) Einstein (d) Planck

2. Wave is associated with matter

(a) When it is stationary

(b) When it is in motion with the velocity of light only

(c) When it is in motion with any velocity

(d) None of the above

3. The de-Broglie wavelength associated with the particle of mass *m* moving with velocity *v* is [CBSE PMT 1992]

(a) h/mv (b) mv/h

(c) mh/v (d) m/hv

4. A photon, an electron and a uranium nucleus all have the same wavelength. The one with the most energy [MP PMT 1992]

(a) Is the photon

(b) Is the electron

(c) Is the uranium nucleus

(d) Depends upon the wavelength and the properties of the particle.

5. A particle which has zero rest mass and non-zero energy and momentum must travel with a speed [MP PMT 1992; DPMT 2001; Kerala PMT 2004]

(a) Equal to *c*, the speed of light in vacuum

(b) Greater than *c*

(c) Less than *c*

(d) Tending to infinity

6. When the kinetic energy of an electron is increased, the wavelength of the associated wave will

(a) Increase

(b) Decrease

(c) Wavelength does not depend on the kinetic energy

(d) None of the above

[MP PMT 1987, 96; BHU 1995; MNR 1998]

7. If the de-Broglie wavelengths for a proton and for a $\alpha-$particle are equal, then the ratio of their velocities will be

(a) 4 : 1 (b) 2 : 1

(c) 1 : 2 (d) 1 : 4

8. The de-Broglie wavelength λ associated with an electron having kinetic energy E is given by the expression [MP PMT 1990; CPMT 1996]

(a) $\frac{h}{\sqrt{2mE}}$ (b) $\frac{2h}{mE}$

(c) $2mhE$ (d) $\frac{2\sqrt{2mE}}{h}$

[UP SEAT 2005]

9. Dual nature of radiation is shown by [MP PET 1991]

(a) Diffraction and reflection

(b) Refraction and diffraction

(c) Photoelectric effect alone

(d) Photoelectric effect and diffraction

10. For the Bohr's first orbit of circumference $2\pi r$, the de-Broglie wavelength of revolving electron will be [MP PMT 1987]

(a) $2\pi r$ (b) πr

(c) $\frac{1}{2\pi r}$ (d) $\frac{1}{4\pi r}$

11. An electron of mass *m* when accelerated through a potential difference *V* has de-Broglie wavelength λ. The de-Broglie

wavelength associated with a proton of mass M accelerated through the same potential difference will be

[CBSE PMT 1995; EAMCET 2001; J & K CET 2004]

(a) $\lambda \frac{m}{M}$ (b) $\lambda \sqrt{\frac{m}{M}}$

(c) $\lambda \frac{M}{m}$ (d) $\lambda \sqrt{\frac{M}{m}}$

12. What will be the ratio of de-Broglie wavelengths of proton and $\alpha -$particle of same energy

[RPET 1991, 96; DCE 2002; Kerala PET 2005]

(a) 2 : 1 (b) 1 : 2

(c) 4 : 1 (d) 1 : 4

13. What is the de-Broglie wavelength of the $\alpha -$particle accelerated through a potential difference V [RPMT 1996]

(a) $\frac{0.287}{\sqrt{V}}$ Å (b) $\frac{12.27}{\sqrt{V}}$ Å

(c) $\frac{0.101}{\sqrt{V}}$ Å (d) $\frac{0.202}{\sqrt{V}}$ Å

14. de-Broglie hypothesis treated electrons as

[BHU 2000]

(a) Particles (b) Waves

(c) Both '*a*' and '*b*' (d) None of these

15. The energy that should be added to an electron, to reduce its de-Broglie wavelengths from 10^{-10} *m* to 0.5×10^{-10} *m*, will be [KCET (Engg./Med.) 2000]

(a) Four times the initial energy

(b) Thrice the initial energy

(c) Equal to the initial energy

(d) Twice the initial energy

16. The de-Broglie wavelength of an electron having $80eV$ of energy is nearly

($1eV$ = 1.6 × 10^{-19} *J*, Mass of electron = 9 × 10^{-31} *kg*

Plank's constant = 6.6 × 10^{-34} *J-sec*)

[EAMCET (Engg.) 2001]

(a) 140 Å (b) 0.14 Å

(c) 14 Å (d) 1.4 Å

17. If particles are moving with same velocity, then maximum de-Broglie wavelength will be for [CBSE PMT 2002]

(a) Neutron (b) Proton

(c) β-particle (d) α -particle

18. If an electron and a photon propagate in the form of waves having the same wavelength, it implies that they have the same [CBSE PMT 1995; DCE 2001; AIIMS 2003]

(a) Energy (b) Momentum

(c) Velocity (d) Angular momentum

19. The de-Broglie wavelength is proportional to [RPET 2003]

(a) $\lambda \propto \frac{1}{v}$ (b) $\lambda \propto \frac{1}{m}$

(c) $\lambda \propto \frac{1}{p}$ (d) $\lambda \propto p$

20. Particle nature and wave nature of electromagnetic waves and electrons can be shown by [AIIMS 2000]

(a) Electron has small mass, deflected by the metal sheet

(b) X-ray is diffracted, reflected by thick metal sheet

(c) Light is refracted and defracted

(d) Photoelectricity and electron microscopy

21. The de-Broglie wavelength of a particle moving with a velocity 2.25 × 10^{8} *m/s* is equal to the wavelength of photon. The ratio of kinetic energy of the particle to the energy of the photon is (velocity of light is 3 × 10^{8} *m/s*)

[EAMCET (Med.) 2003]

(a) 1/8 (b) 3/8

(c) 5/8 (d) 7/8

22. According to de-Broglie, the de-Broglie wavelength for electron in an orbit of hydrogen atom is 10^{-9} *m*. The principle quantum number for this electron is [RPMT 2003]

(a) 1 (b) 2

(c) 3 (d) 4

23. The speed of an electron having a wavelength of $10^{-10} m$ is

[Manipal 1997; AIIMS 2002]

(a) 7.25×10^{6} *m/s* (b) $6.26 \times 10^{6} m/s$

(c) $5.25 \times 10^{6} m/s$ (d) $4.24 \times 10^{6} m/s$

24. The kinetic energy of electron and proton is $10^{-32} J$. Then the relation between their de-Broglie wavelengths is

[CPMT 1999]

(a) $\lambda_p < \lambda_e$ (b) $\lambda_p > \lambda_e$

(c) $\lambda_p = \lambda_e$ (d) $\lambda_p = 2\lambda_e$

25. The de-Broglie wavelength of a particle accelerated with 150 *volt* potential is 10^{-10} *m*. If it is accelerated by 600 *volts* p.d., its wavelength will be [RPET 1988]

(a) 0.25 *Å* (b) 0.5 *Å*

(c) 1.5 *Å* (d) 2 *Å*

26. The de-Broglie wavelength associated with a hydrogen molecule moving with a thermal velocity of 3 *km/s* will be

(a) 1 *Å* (b) 0.66 *Å*

(c) 6.6 *Å* (d) 66 *Å*

27. When the momentum of a proton is changed by an amount p, the corresponding change in the de-Broglie wavelength is found to be 0.25%. Then, the original momentum of the proton was

(a) p (b) 100 p

(c) 400 p (d) 4 p

28. The de-Broglie wavelength of a neutron at $27^{\circ}C$ is λ. What will be its wavelength at $927^{\circ}C$ [DPMT 2002]

(a) $\lambda / 2$ (b) $\lambda / 3$

(c) $\lambda / 4$ (d) $\lambda / 9$

29. An electron and proton have the same de-Broglie wavelength. Then the kinetic energy of the electron is

[Kerala PMT 2004]

(a) Zero
(b) Infinity
(c) Equal to the kinetic energy of the proton
(d) Greater than the kinetic energy of the proton

30. For moving ball of cricket, the correct statement about de-Broglie wavelength is [RPMT 2001]

(a) It is not applicable for such big particle
(b) $\frac{h}{\sqrt{2mE}}$
(c) $\sqrt{\frac{h}{2mE}}$
(d) $\frac{h}{2mE}$

31. Photon and electron are given same energy $(10^{-20} J)$. Wavelength associated with photon and electron are λ_{Ph} and λ_{el} then correct statement will be [RPMT 2001]

(a) $\lambda_{Ph} > \lambda_{el}$ (b) $\lambda_{Ph} < \lambda_{el}$
(c) $\lambda_{Ph} = \lambda_{el}$ (d) $\frac{\lambda_{el}}{\lambda_{Ph}} = C$

32. The kinetic energy of an electron with de-Broglie wavelength of 0.3 nanometer is [UPSEAT 2004]

(a) 0.168 *eV* (b) 16.8 *eV*
(c) 1.68 *eV* (d) 2.5 *eV*

33. A proton and an α-particle are accelerated through a potential difference of 100 *V*. The ratio of the wavelength associated with the proton to that associated with an α-particle is

(a) $\sqrt{2} : 1$ (b) $2 : 1$
(c) $2\sqrt{2} : 1$ (d) $\frac{1}{2\sqrt{2}} : 1$

34. The wavelength of de-Broglie wave is $2\mu m$, then its momentum is ($h = 6.63 \times 10^{-34}$ *J-s*) [DCE 2004]

(a) 3.315×10^{-28} *kg-m/s* (b) 1.66×10^{-28} *kg-m/s*
(c) 4.97×10^{-28} *kg-m/s* (d) 9.9×10^{-28} *kg-m/s*

35. de-Broglie wavelength of a body of mass 1 *kg* moving with velocity of 2000 *m/s* is [Pb. PMT 2003]

(a) 3.32×10^{-27} Å (b) 1.5×10^{7} Å
(c) 0.55×10^{-22} Å (d) None of these

36. The kinetic energy of an electron is 5 *eV*. Calculate the de-Broglie wavelength associated with it ($h = 6.6 \times 10^{-34}$ *Js*, $m_e = 9.1 \times 10^{-31}$ *kg*)

(a) 5.47 Å (b) 10.9 Å
(c) 2.7 Å (d) None of these

37. The wavelength associated with an electron accelerated through a potential difference of 100 *V* is nearly

[RPMT 2003]

(a) 100 Å (b) 123 Å
(c) 1.23 Å (d) 0.123 Å

38. The de-Broglie wavelength λ [RPMT 2004]

(a) is proportional to mass
(b) is proportional to impulse
(c) Inversely proportional to impulse
(d) does not depend on impulse

39. Davission and Germer experiment proved

[RPET 2002; DCE 2004]

(a) Wave nature of light (b) Particle nature of light
(c) Both (a) and (b) (d) Neither (a) nor (b)

40. If the kinetic energy of a free electron doubles, its de-Broglie wavelength changes by the factor [AIEEE 2005]

(a) $\frac{1}{\sqrt{2}}$ (b) $\sqrt{2}$
(c) $\frac{1}{2}$ (d) 2

41. The energy that should be added to an electron to reduce its de Broglie wavelength from one *nm* to 0.5 *nm* is

[KCET 2005]

(a) Four times the initial energy
(b) Equal to the initial energy
(c) Twice the initial energy
(d) Thrice the initial energy

42. de-Broglie wavelength of a body of mass *m* and kinetic energy *E* is given by [BCECE 2005]

(a) $\lambda = \frac{h}{mE}$ (b) $\lambda = \frac{\sqrt{2mE}}{h}$
(c) $\lambda = \frac{h}{2mE}$ (d) $\lambda = \frac{h}{\sqrt{2mE}}$

43. The wavelength of the matter wave is independent of

[Kerala PMT 2005]

[DCE 2002; DPMT 2003]

(a) Mass (b) Velocity
(c) Momentum (d) Charge

Photon and Photoelectric Effect

1. The momentum of a photon is 3.3×10^{-29} *kg – m/sec*. Its frequency will be

[CPMT 1980; MP PET 1992; DPMT 1999]

(a) $3 \times 10^{3} Hz$ (b) $6 \times 10^{3} Hz$
(c) $7.5 \times 10^{12} Hz$ (d) $1.5 \times 10^{13} Hz$

2. The energy of a photon of wavelength λ is given by

[CPMT 1974; CBSE PMT 1992; DCE 1998; BHU 2000; DPMT 2001]

(a) $h\lambda$ (b) $ch\lambda$
(c) λ / hc (d) hc / λ

3. The momentum of a photon is 2×10^{-16} *gm-cm/sec*. Its energy is [Pb. PMT 2004]

(a) $0.61 \times 10^{-26} erg$ (b) $2.0 \times 10^{-26} erg$
(c) $6 \times 10^{-6} erg$ (d) $6 \times 10^{-8} erg$

4. The rest mass of the photon is

[MP PET 1994; CPMT 1996; RPMT 1999; JIPMER 2002]

(a) 0
(b) ∞

(c) Between 0 and ∞

(d) Equal to that of an electron

5. The momentum of the photon of wavelength 5000Å will be [CPMT 1987]

(a) $1.3\times10^{-27}\,kg\text{ - }m/sec$ (b) $1.3\times10^{-28}\,kg\text{ - }m/sec$

(c) $4\times10^{29}\,kg\text{ - }m/sec$ (d) $4\times10^{-18}\,kg\text{ - }m/sec$

6. The momentum of a photon of energy $h\nu$ will be [DCE 2000]

(a) $h\nu$ (b) $h\nu/c$

(c) $h\nu c$ (d) h/ν

7. A photon in motion has a mass [MP PMT 1992]

(a) $c/h\nu$ (b) h/ν

(c) $h\nu$ (d) $h\nu/c^2$

8. If the momentum of a photon is p, then its frequency is [MP PET 1989]

(a) $\frac{ph}{c}$ (b) $\frac{pc}{h}$

(c) $\frac{mh}{c}$ (d) $\frac{mc}{h}$

Where m is the rest mass of the photon

9. An AIR station is broadcasting the waves of wavelength 300 metres. If the radiating power of the transmitter is 10 *kW*, then the number of photons radiated per second is [MP PET 1989; RPMT 2000]

(a) 1.5×10^{29} (b) 1.5×10^{31}

(c) 1.5×10^{33} (d) 1.5×10^{35}

10. The energy of a photon is $E=h\nu$ and the momentum of photon $p=\frac{h}{\lambda}$, then the velocity of photon will be [CPMT 1991]

(a) *E/p* (b) *Ep*

(c) $\left(\frac{E}{p}\right)^2$ (d) $3\times10^8\,m/s$

11. The approximate wavelength of a photon of energy 2.48 *eV* is

(a) 500 Å (b) 5000 Å

(c) 2000 Å (d) 1000 Å

12. An important spectral emission line has a wavelength of 21 *cm*. The corresponding photon energy is [MP PMT 1993]

(a) $5.9\times10^{-4}\,eV$ (b) $5.9\times10^{-6}\,eV$

(c) $5.9\times10^{-8}\,eV$ (d) $11.8\times10^{-6}\,eV$

$(h=6.62\times10^{-34}\,Js;\ c=3\times10^8\,m/s)$

13. The momentum of a photon in an *X*-ray beam of 10^{-10} metre wavelength is [MP PET 1996]

(a) $1.5\times10^{-23}\,kg-m/sec$ (b) $6.6\times10^{-24}\,kg-m/sec$

(c) $6.6\times10^{-44}\,kg-m/sec$ (d) $2.2\times10^{-52}\,kg-m/sec$

14. The energy of a photon of light with wavelength 5000 Å is approximately 2.5 *eV*. This way the energy of an *X*-ray photon with wavelength 1Å would be [MP PET 1997]

(a) 2.5/5000 *eV* (b) $2.5/(5000)^2\,eV$

(c) $2.5\times5000\,eV$ (d) $2.5\times(5000)^2\,eV$

15. Energy of a quanta of frequency $10^{15}\,Hz$ and $h=6.6\times10^{-34}\,J\text{-sec}$ will be [RPMT 1997]

(a) $6.6\times10^{-19}\,J$ (b) $6.6\times10^{-12}\,J$

(c) $6.6\times10^{-49}\,J$ (d) $6.6\times10^{-41}\,J$

16. Momentum of a photon of wavelength λ is [CBSE PMT 1993; JIPMER 2001, 02]

(a) $\frac{h}{\lambda}$ (b) Zero

(c) $\frac{h\lambda}{c^2}$ (d) $\frac{h\lambda}{c}$

17. Wavelength of a 1 *keV* photon is $1.24\times10^{-9}\,m$. What is the frequency of 1 *MeV* photon [CBSE PMT 1993; MP PET 2005]

(a) $1.24\times10^{15}\,Hz$ (b) $2.4\times10^{20}\,Hz$

(c) $1.24\times10^{18}\,Hz$ (d) $2.4\times10^{23}\,Hz$

18. What is the momentum of a photon having frequency $1.5\times10^{13}\,Hz$ [BHU 1997]

(a) $3.3\times10^{-29}\,kg\ m/s$ (b) $3.3\times10^{-34}\,kg\ m/s$

(c) $6.6\times10^{-34}\,kg\ m/s$ (d) $6.6\times10^{-30}\,kg\ m/s$

19. The energy of a photon of light of wavelength 450 *nm* is [BHU 1997; JIPMER 2000]

(a) $4.4\times10^{-19}\,J$ (b) $2.5\times10^{-19}\,J$

(c) $1.25\times10^{-17}\,J$ (d) $2.5\times10^{-17}\,J$

20. Frequency of photon having energy 66 *eV* is [CPMT PMT 1997]

(a) $8\times10^{-15}\,Hz$ (b) $12\times10^{-15}\,Hz$

(c) $16\times10^{15}\,Hz$ (d) None of these

21. Which of the following statement is not correct [AFMC 1999]

(a) Photographic plates are sensitive to infrared rays

(b) Photographic plates are sensitive to ultraviolet rays

(c) Infra-red rays are invisible but can cast shadows like visible light

(d) Infrared photons have more energy than photons of visible light [MP PMT 1987]

22. If we express the energy of a photon in *KeV* and the wavelength in angstroms, then energy of a photon can be calculated from the relation [AMU (Engg.) 1999]

(a) $E=12.4\,h\nu$ (b) $E=12.4\,h/\lambda$

(c) $E=12.4/\lambda$ (d) $E=h\nu$

23. The frequency of a photon, having energy 100 *eV* is $(h=6.6\,10^{-34}\ J\text{-}sec)$ [AFMC 2000]

(a) $2.42\times10^{26}\,Hz$ (b) $2.42\times10^{16}\,Hz$

(c) $2.42\times10^{12}\,Hz$ (d) $2.42\times10^{9}\,Hz$

24. A photon of wavelength 4400 Å is passing through vacuum. The effective mass and momentum of the photon are respectively

(a) $5\times10^{-36}\,kg,\ 1.5\times10^{-27}\,kg\text{ - }m/s$

(b) $5\times10^{-35}\,kg,\ 1.5\times10^{-26}\,kg\text{ - }m/s$

(c) Zero, $1.5\times10^{-26}\ kg\text{-}m/s$

(d) $5\times10^{-36}kg, 1.67\times10^{-43}kg\text{-}m/s$

25. Which of the following is true for photon **[RPET 2001]**

(a) $E=\dfrac{hc}{\lambda}$ (b) $E=\dfrac{1}{2}mu^2$

(c) $p=\dfrac{E}{2v}$ (d) $E=\dfrac{1}{2}mc^2$

26. Which of the following is incorrect statement regarding photon **[MH CET (Med.) 2001]**

(a) Photon exerts no pressure

(b) Photon energy is $h\nu$

(c) Photon rest mass is zero

(d) None of these

27. If a photon has velocity *c* and frequency ν, then which of following represents its wavelength **[AIEEE 2002]**

(a) $\dfrac{hc}{E}$ (b) $\dfrac{h\nu}{c}$

(c) $\dfrac{h\nu}{c^2}$ (d) $h\nu$

28. The mass of a photo electron is **[MP PMT 2002]**

(a) $9.1\times10^{-27}\ kg$ (b) $9.1\times10^{-29}\ kg$

(c) $9.1\times10^{-31}\ kg$ (d) $9.1\times10^{-34}\ kg$

29. Energy of photon whose frequency is $10^{12}\ MHz$, will be **[MH CET 2002]**

(a) $4.14\times10^3 keV$ (b) $4.14\times10^2 eV$

(c) $4.14\times10^3 MeV$ (d) $4.14\times10^3 eV$

30. There are n_1 photons of frequency γ_1 in a beam of light. In an equally energetic beam, there are n_2 photons of frequency γ_2. Then the correct relation is **[KCET 2003]**

(a) $\dfrac{n_1}{n_2}=1$ (b) $\dfrac{n_1}{n_2}=\dfrac{\gamma_1}{\gamma_2}$

(c) $\dfrac{n_1}{n_2}=\dfrac{\gamma_2}{\gamma_1}$ (d) $\dfrac{n_1}{n_2}=\dfrac{\gamma_1^2}{\gamma_2^2}$

31. Einstein's photoelectric equation states that $E_k=h\nu-\phi$. In this equation E_k refers to **[CPMT 1982; MP PMT 1997]**

(a) Kinetic energy of all the emitted electrons

(b) Mean kinetic energy of the emitted electrons

(c) Maximum kinetic energy of the emitted electrons

(d) Minimum kinetic energy of the emitted electrons

32. Kinetic energy with which the electrons are emitted from the metal surface due to photoelectric effect is **[CPMT 1973]**

(a) Independent of the intensity of illumination

(b) Independent of the frequency of light

(c) Inversely proportional to the intensity of illumination

(d) Directly proportional to the intensity of illumination

33. The threshold wavelength for photoelectric emission from a material is 5200 Å. Photo-electrons will be emitted when this material is illuminated with monochromatic radiation from a **[IIT JEE 1982; MP PMT 1994; MP PET 1995; UPSEAT 2001; KCET 2004; J & K CET 2004; BHU 2004]**

(a) 50 watt infrared lamp

(b) 1 watt infrared lamp

(c) 50 watt ultraviolet lamp

(d) 1 watt ultraviolet lamp

(e) Both (c) and (d)

34. Threshold frequency for a metal is 10^{15} *Hz*. Light of $\lambda=4000\mathring{A}$ falls on its surface. Which of the following statements is correct

(a) No photoelectric emission takes place

(b) Photo-electrons come out with zero speed

(c) Photo-electrons come out with 10^3 *m/sec* speed

(d) Photo-electrons come out with 10^5 *m/sec* speed

35. Photo cells are used for the

(a) Reproduction of pictures from the cinema film

(b) Reproduction of sound from the cinema film

(c) Automatic switching of street light

(d) (b) and (c) both

36. Einstein got Nobel prize on which of the following works **[DCE 1995]**

(a) Mass-energy relation

(b) Special theory of relativity

(c) Photoelectric equation

(d) (a) and (b) both

37. The photo-electrons emitted from a surface of sodium metal are such that **[MP PMT 1992]**

(a) They all are of the same frequency

(b) They have the same kinetic energy

(c) They have the same de Broglie wavelength

(d) They have their speeds varying from zero to a certain maximum

38. A metal surface of work function 1.07 *eV* is irradiated with light of wavelength 332 *nm*. The retarding potential required to stop the escape of photo-electrons is **[MP PMT 1992]**

(a) 4.81 *eV* (b) 3.74 *eV*

(c) 2.66 *eV* (d) 1.07 *eV*

39. In a photo cell, the photo-electrons emission takes place

(a) After 10^{-1} *sec* on incident of light rays

(b) After 10^{-3} *sec* on incident of light rays

(c) After 10^{-6} *sec* on incident of light rays

(d) After 10^{-8} *sec* on incident of light rays

40. When light falls on a metal surface, the maximum kinetic energy of the emitted photo-electrons depends upon **[MP PMT 1989; MP PET 1992, 93]**

(a) The time for which light falls on the metal

(b) Frequency of the incident light

(c) Intensity of the incident light

(d) Velocity of the incident light

41. The electrons are emitted in the photoelectric effect from a metal surface **[MP PET 1992]**

(a) Only if the frequency of the incident radiation is above a certain threshold value

(b) Only if the temperature of the surface is high

(c) At a rate that is independent of the nature of the metal

(d) With a maximum velocity proportional to the frequency of the incident radiation

42. The work function of a metal is 4.2 eV, its threshold wavelength will be [BHU 2003; CPMT 2004]

(a) 4000 $\AA$ (b) 3500 $\AA$

(c) 2955 $\AA$ (d) 2500 $\AA$

43. The number of photo-electrons emitted per second from a metal surface increases when

[EAMCET (Med.) 1995; CBSE PMT 1993; MP PMT 1994, 2002; MH CET 1999; KCET 2003]

(a) The energy of incident photons increases

(b) The frequency of incident light increases

(c) The wavelength of the incident light increases

(d) The intensity of the incident light increases

44. The work function of metal is 1 eV. Light of wavelength 3000 $\AA$ is incident on this metal surface. The velocity of emitted photo-electrons will be [MP PMT 1990]

(a) 10 *m/sec* (b) 1×10^3 *m/sec*

(c) 1×10^4 *m/sec* (d) 1×10^6 *m/sec*

45. The retarding potential for having zero photo-electron current

(a) Is proportional to the wavelength of incident light

(b) Increases uniformly with the increase in the wavelength of incident light

(c) Is proportional to the frequency of incident light

(d) Increases uniformly with the increase in the frequency of incident light wave

46. In a dark room of photography, generally red light is used. The reason is

(a) Most of the photographic films are not sensitive to red light

(b) The frequency for red light is low and hence the energy $h\nu$ of photons is less

(c) (a) and (b) both

(d) None of the above

47. The work function of a metal is 1.6×10^{-19} *J*. When the metal surface is illuminated by the light of wavelength 6400 Å, then the maximum kinetic energy of emitted photo-electrons will be

(Planck's constant $h = 6.4 \times 10^{-34}$ Js) [MP PMT 1989]

(a) 14×10^{-19} J (b) 2.8×10^{-19} J

(c) 1.4×10^{-19} J (d) 1.4×10^{-19} eV

48. Ultraviolet radiations of $6.2\,eV$ falls on an aluminium surface (work function 4.2 eV). The kinetic energy in joules of the fastest electron emitted is approximately

[MNR 1987; MP PET 1990; CBSE PMT 1993; Pb. PMT 2001; BVP 2003; Pb. PET 2004]

(a) 3.2×10^{-21} (b) 3.2×10^{-19}

(c) 3.2×10^{-17} (d) 3.2×10^{-15}

49. The work function for tungsten and sodium are 4.5 eV and 2.3 eV respectively. If the threshold wavelength λ for sodium is $5460\AA$, the value of λ for tungsten is

[MP PET 1990]

(a) 5893 $\AA$ (b) 10683 $\AA$

(c) 2791 $\AA$ (d) 528 $\AA$

50. A photon of energy 3.4 eV is incident on a metal having work function 2 eV. The maximum K.E. of photo-electrons is equal to

(a) 1.4 eV (b) 1.7 eV

(c) 5.4 eV (d) 6.8 eV

51. The work function of a metallic surface is 5.01 eV. The photo-electrons are emitted when light of wavelength 2000$\AA$ falls on it. The potential difference applied to stop the fastest photo-electrons is $[h = 4.14 \times 10^{-15}$ eV sec$]$

[MP PET 1991; DPMT 1999]

(a) 1.2 *volts* (b) 2.24 *volts*

(c) 3.6 *volts* (d) 4.8 *volts*

52. The photoelectric threshold wavelength for a metal surface is 6600 $\AA$. The work function for this is [MP PET 1991]

(a) 1.87 V (b) 1.87 eV

(c) 18.7 eV (d) 0.18 eV

53. Photoelectric effect was successfully explained first by

(a) Planck (b) Hallwash

(c) Hertz (d) Einstein

[MP PMT/PET 1988]

54. The spectrum of radiation 1.0×10^{14} Hz is in the infrared region. The energy of one photon of this in joules will be

[MP PET 1982]

(a) 6.62×10^{-48} (b) 6.62×10^{-20}

(c) $\dfrac{6.62}{3} \times 10^{-28}$ (d) $3 \times 6.62 \times 10^{-28}$

55. A radio transmitter operates at a frequency of 880 *kHz* and a power of 10 *kW*. The number of photons emitted per second are[CBSE PMT 1990; MP P

(a) 1.72×10^{31} (b) 1327×10^{34}

(c) 13.27×10^{34} (d) 0.075×10^{-34}

56. A photo cell is receiving light from a source placed at a distance of 1 *m*. If the same source is to be placed at a distance of 2 *m*, then the ejected electron

[MNR 1986; UPSEAT 2000, 01]

(a) Moves with one-fourth energy as that of the initial energy

(b) Moves with one-fourth of momentum as that of the initial momentum

(c) Will be half in number

(d) Will be one-fourth in number

57. In a photoelectric experiment for 4000 $\AA$ incident radiation, the potential difference to stop the ejection is 2 V. If the incident light is changed to 3000 $\AA$, then the potential required to stop the ejection of electrons will be

[MP PET 1995]

(a) 2 V (b) Less than 2 V

(c) Zero (d) Greater than 2 V

58. Light of wavelength 4000 Å is incident on a sodium surface for which the threshold wave length of photo – electrons is 5420 Å. The work function of sodium is

[MP PMT 1993; Pb. PMT 2002]

(a) 4.58 eV (b) 2.29 eV

(c) 1.14 eV (d) 0.57 eV

59. Photo cell is a device to [MP PET 1993]

(a) Store photons

(b) Measure light intensity

(c) Convert photon energy into mechanical energy

(d) Store electrical energy for replacing storage batteries

60. If the work function for a certain metal is 3.2×10^{-19} *joule* and it is illuminated with light of frequency 8×10^{14} *Hz*. The maximum kinetic energy of the photo-electrons would be

[MP PET 1993]

(a) $2.1\times10^{-19}\,J$ (b) $8.5\times10^{-19}\,J$

(c) $5.3\times10^{-19}\,J$ (d) $3.2\times10^{-19}\,J$

$(h=6.63\times10^{-34}\,Js)$

61. Stopping potential for photoelectrons [MP PET 1994]

(a) Does not depend on the frequency of the incident light

(b) Does not depend upon the nature of the cathode material

(c) Depends on both the frequency of the incident light and nature of the cathode material

(d) Depends upon the intensity of the incident light

62. The maximum wavelength of radiation that can produce photoelectric effect in a certain metal is 200 *nm*. The maximum kinetic energy acquired by electron due to radiation of wavelength 100 *nm* will be [MP PMT 1994]

(a) 12.4 *eV* (b) 6.2 *eV*

(c) 100 *eV* (d) 200 *eV*

63. When the light source is kept 20 *cm* away from a photo cell, stopping potential 0.6 *V* is obtained. When source is kept 40 *cm* away, the stopping potential will be [MP PMT 1994]

(a) 0.3 *V* (b) 0.6 *V*

(c) 1.2 *V* (d) 2.4 *V*

64. The minimum energy required to remove an electron is called[AFMC 1995; DPMT 2001]

(a) Stopping potential (b) Kinetic energy

(c) Work function (d) None of these

65. Light of wavelength 4000 Å falls on a photosensitive metal and a negative 2 *V* potential stops the emitted electrons. The work function of the material (in *eV*) is approximately

$(h=6.6\times10^{-34}\,Js,\ e=1.6\times10^{-19}\,C,\ c=3\times10^{8}\,ms^{-1})$

[MP PMT 1995; MH CET 2004]

(a) 1.1 (b) 2.0

(c) 2.2 (d) 3.1

66. Assuming photoemission to take place, the factor by which the maximum velocity of the emitted photoelectrons changes when the wavelength of the incident radiation is increased four times, is

(a) 4 (b) $\frac{1}{4}$

(c) 2 (d) $\frac{1}{2}$

67. Work function of a metal is 2.51 *eV*. Its threshold frequency is

(a) 5.9×10^{14} *cycle/sec* (b) 6.5×10^{14} *cycle/sec*

(c) 9.4×10^{14} *cycle/sec* (d) 6.08×10^{14} *cycle/sec*

68. Energy conversion in a photoelectric cell takes place from

[AFMC 1993; MP PET 1996; MP PMT 1996]

(a) Chemical to electrical (b) Magnetic to electrical

(c) Optical to electrical (d) Mechanical to electrical

69. Which one of the following is true in photoelectric emission

[MP PMT 1996; JIPMER 2001, 02]

(a) Photoelectric current is directly proportional to the amplitude of light of a given frequency

(b) Photoelectric current is directly proportional to the intensity of light of a given frequency at moderate intensities

(c) Above the threshold frequency, the maximum K.E. of photoelectrons is inversely proportional to the frequency of incident light

(d) The threshold frequency depends upon the wavelength of incident light

70. When a point source of light is at a distance of one metre from a photo cell, the cut off voltage is found to be *V*. If the same source is placed at 2 *m* distance from photo cell, the cut off voltage will be

(a) *V* (b) *V*/2

(c) *V*/4 (d) $V/\sqrt{2}$

71. The work function of a photoelectric material is 3.3 *eV*. The threshold frequency will be equal to [UPSEAT 1999]

(a) $8\times10^{4}\,Hz$ (b) $8\times10^{56}\,Hz$

(c) $8\times10^{10}\,Hz$ (d) $8\times10^{14}\,Hz$

72. If the work function of a metal is 'ϕ' and the frequency of the incident light is 'ν', there is no emission of photoelectron if

(a) $\nu<\frac{\phi}{h}$ (b) $\nu=\frac{\phi}{h}$

(c) $\nu>\frac{\phi}{h}$ (d) $\nu>=<\frac{\phi}{h}$

73. A photoelectric cell is illuminated by a point source of light 1 *m* away. When the source is shifted to 2 *m* then

[CBSE PMT 2003]

(a) Number of electrons emitted is half the initial number

(b) Each emitted electron carries half the initial energy

(c) Number of electrons emitted is a quarter of the initial number

(d) Each emitted electron carries one quarter of the initial energy

74. Light of wavelength λ strikes a photo-sensitive surface and electrons are ejected with kinetic energy *E*. If the kinetic energy is to be increased to 2*E*, the wavelength must be changed to λ' where

(a) $\lambda'=\frac{\lambda}{2}$ (b) $\lambda'=2\lambda$

(c) $\frac{\lambda}{2}<\lambda'<\lambda$ (d) $\lambda'>\lambda$

[Haryana CEE 1996]

75. If in a photoelectric experiment, the wavelength of incident radiation is reduced from 6000 Å to 4000 Å then

[MP PMT 1999]

(a) Stopping potential will decrease

(b) Stopping potential will increase

(c) Kinetic energy of emitted electrons will decrease

(d) The value of work function will decrease

76. The photoelectric work function for a metal surface is 4.125 *eV*. The cut-off wavelength for this surface is

[CBSE PMT 1999; KCET 2001]

(a) 4125 Å (b) 2062.5 Å

(c) 3000 Å (d) 6000 Å

77. As the intensity of incident light increases

[CPMT 1999; CBSE PMT 1999; MH CET (Med.) 2000; KCET (Engg./Med.) 2001; Pb. PET 2001]

(a) Photoelectric current increases

(b) Photoelectric current decreases

(c) Kinetic energy of emitted photoelectrons increases

(d) Kinetic energy of emitted photoelectrons decreases

78. Light of wavelength 5000 Å falls on a sensitive plate with photoelectric work function of 1.9 *eV*. The kinetic energy of the photoelectron emitted will be [CBSE PMT 1998]

(a) 0.58 *eV* (b) 2.48 *eV*

(c) 1.24 *eV* (d) 1.16 *eV*

79. Which of the following is dependent on the intensity of incident radiation in a photoelectric experiment

[AIIMS 1998]

(a) Work function of the surface

(b) Amount of photoelectric current

(c) Stopping potential will be reduced

(d) Maximum kinetic energy of photoelectrons

80. The work function of a substance is 4.0 *eV*. The longest wavelength of light that can cause photoelectron emission from this substance is approximately

[IIT JEE 1998; UPSEAT 2002, 03; AIEEE 2004]

(a) 540 *nm* (b) 400 *nm*

(c) 310 *nm* (d) 220 *nm*

81. The maximum kinetic energy of photoelectrons emitted from a surface when photons of energy 6 *eV* fall on it is 4 *eV*. The stopping potential in *volts* is

[IIT JEE 1997 Re-Exam]

(a) 2 (b) 4

(c) 6 (d) 10

82. Work function of a metal is 2.1 *eV*. Which of the waves of the following wavelengths will be able to emit photoelectrons from its surface [Bihar MEE 1995]

(a) 4000 Å, 7500 Å (b) 5500 Å, 6000 Å

(c) 4000 Å, 6000 Å (d) None of these

83. If mean wavelength of light radiated by 100 *W* lamp is 5000 Å, then number of photons radiated per second are

[RPET 1997]

(a) 3×10^{23} (b) 2.5×10^{22}

(c) 2.5×10^{20} (d) 5×10^{17}

84. The frequency of the incident light falling on a photosensitive metal plate is doubled, the kinetic energy of the emitted photoelectrons is

(a) Double the earlier value (b) Unchanged

(c) More than doubled (d) Less than doubled

85. When light of wavelength 300 *nm* (nanometer) falls on a photoelectric emitter, photoelectrons are liberated. For another emitter, however light of 600 *nm* wavelength is sufficient for creating photoemission. What is the ratio of the work functions of the two emitters

[CBSE PMT 1993; JIPMER 2000]

(a) 1 : 2 (b) 2 : 1

(c) 4 : 1 (d) 1 : 4

86. Threshold wavelength for photoelectric effect on sodium is 5000 Å. Its work function is [CBSE PMT 1993]

(a) 15 *J* (b) $16 \times 10^{-14}\ J$

(c) $4 \times 10^{-19}\ J$ (d) $4 \times 10^{-81}\ J$

87. The cathode of a photoelectric cell is changed such that the work function changes from W_1 to W_2 ($W_2 > W_1$). If the current before and after change are I_1 and I_2, all other conditions remaining unchanged, then (assuming $h\nu > W_2$)

[CBSE PMT 1992]

(a) $I_1 = I_2$ (b) $I_1 < I_2$

(c) $I_1 > I_2$ (d) $I_1 < I_2 < 2I_1$

88. A beam of light of wavelength λ and with illumination *L* falls on a clean surface of sodium. If *N* photoelectrons are emitted each with kinetic energy *E*, then [BHU 1994]

(a) $N \propto L$ and $E \propto L$ (b) $N \propto L$ and $E \propto \frac{1}{\lambda}$

(c) $N \propto \lambda$ and $E \propto L$ (d) $N \propto \frac{1}{\lambda}$ and $E \propto \frac{1}{L}$

89. Which of the following statements is correct

[CBSE PMT 1997]

(a) The current in a photocell increases with increasing frequency of light

(b) The photocurrent is proportional to applied voltage

(c) The photocurrent increases with increasing intensity of light

(d) The stopping potential increases with increasing intensity of incident light

90. What is the stopping potential when the metal with work function 0.6 *eV* is illuminated with the light of 2 *eV*

[BHU 1998; MH CET 2003]

(a) 2.6 *V* (b) 3.6 *V*

(c) 0.8 *V* (d) 1.4 *V*

91. When yellow light is incident on a surface, no electrons are emitted while green light can emit. If red light is incident on the surface, then

[MNR 1998; MP PET 2000; MH CET 2000]

(a) No electrons are emitted

(b) Photons are emitted

(c) Electrons of higher energy are emitted

(d) Electrons of lower energy are emitted

92. The photoelectric threshold wavelength of a certain metal is 3000Å. If the radiation of 2000Å is incident on the metal

[MNR 1998; KCET 1994]

(a) Electrons will be emitted

(b) Positrons will be emitted [Roorkee 1992]

(c) Protons will be emitted

(d) Electrons will not be emitted

93. A photocell stops emission if it is maintained at 2 *V* negative potential. The energy of most energetic photoelectron is

[JIPMER 1999]

(a) $2eV$ (b) $2J$
(c) $2kJ$ (d) $2keV$

94. The work functions for sodium and copper are $2eV$ and $4eV$. Which of them is suitable for a photocell with 4000 Å light
(a) Copper (b) Sodium
(c) Both (d) Neither of them

95. For intensity *I* of a light of wavelength 5000Å the photoelectron saturation current is 0.40 μA and stopping potential is 1.36 *V*, the work function of metal is [RPET 1999]
(a) 2.47 *eV* (b) 1.36 *eV*
(c) 1.10 *eV* (d) 0.43 *eV*

96. The work function of aluminium is 4.2 eV. If two photons, each of energy 3.5 eV strike an electron of aluminium, then emission of electrons will be [AFMC 1999]
(a) Possible
(b) Not possible
(c) Data is incomplete
(d) Depend upon the density of the surface

97. In photoelectric effect if the intensity of light is doubled then maximum kinetic energy of photoelectrons will become [RPMT 1999]
(a) Double (b) Half
(c) Four time (d) No change

98. Energy required to remove an electron from aluminium surface is 4.2 *eV*. If light of wavelength 2000 $\mathring{A}$ falls on the surface, the velocity of the fastest electron ejected from the surface will be
(a) $8.4\times10^5 m/sec$ (b) $7.4\times10^5 m/sec$
(c) $6.4\times10^5 m/sec$ (d) $8.4\times10^6 m/sec$

99. Mercury violet light $(\lambda = 4558\mathring{A})$ is falling on a photosensitive material $(\phi = 2.5eV)$. The speed of the ejected electrons is in ms^{-1}, about [AMU (Engg.) 1999]
(a) 3×10^5 (b) 2.65×10^5
(c) 4×10^4 (d) 3.65×10^7

100. The work functions of metals *A* and *B* are in the ratio 1 : 2. If light of frequencies f and $2f$ are incident on the surfaces of *A* and *B* respectively, the ratio of the maximum kinetic energies of photoelectrons emitted is (*f* is greater than threshold frequency of *A*, 2*f* is greater than threshold frequency of *B*)
(a) 1 : 1 (b) 1 : 2
(c) 1 : 3 (d) 1 : 4

101. Light of frequency ν is incident on a substance of threshold frequency $\nu_0(\nu_0 < \nu)$. The energy of the emitted photo-electron will be
(a) $h(\nu-\nu_0)$ (b) h/ν
(c) $he(\nu-\nu_0)$ (d) h/ν_0

102. The stopping potential (V_0) [BHU 2000]
(a) Depends upon the angle of incident light
(b) Depends upon the intensity of incident light
(c) Depends upon the surface nature of the substance
(d) Is independent of the intensity of the incident light

103. If work function of metal is $3\,eV$ then threshold wavelength will be [RPMT 2000]
(a) 4125 $\mathring{A}$ (b) 4000 $\mathring{A}$
(c) 4500 $\mathring{A}$ [RPET 1999] (d) 5000 $\mathring{A}$

104. When wavelength of incident photon is decreased then [RPET 2000]
(a) Velocity of emitted photo-electron decreases
(b) Velocity of emitted photoelectron increases
(c) Velocity of photoelectron do not charge
(d) Photo electric current increases

105. Quantam nature of light is explained by which of the following phenomenon [RPET 2000]
(a) Huygen wave theory
(b) Photoelectric effect
(c) Maxwell electromagnetic theory
(d) de-Broglie theory

106. When a metal surface is illuminated by light of wavelengths 400 *nm* and 250 *nm*, the maximum velocities of the photoelectrons ejected are v and $2v$ respectively. The work function of the metal is (*h* = Planck's constant, *c* = velocity of light in air)
(a) $2hc\times10^6\ J$ (b) $1.5hc\times10^6\ J$
(c) $hc\times10^6\ J$ (d) $0.5\ hc\times10^6\ J$

107. 4 *eV* is the energy of the incident photon and the work function in $2eV$. What is the stopping potential [AMU 1999] [DCE 2000; AIIMS 2004]
(a) $2V$ (b) $4V$
(c) $6V$ (d) $2\sqrt{2}V$

108. Light of frequency ν is incident on a certain photoelectric substance with threshold frequency ν_0. The work function for the substance is
(a) $h\nu$ (b) $h\nu_0$
(c) $h(\nu-\nu_0)$ (d) $h(\nu+\nu_0)$

109. If threshold wavelength for sodium is 6800Å then the work function will be [RPET 2001]
(a) $1.8eV$ (b) $2.5eV$
(c) $2.1eV$ (d) $1.4eV$

110. If intensity of incident light is increased in PEE then which of the following is true [RPET 2001]
(a) Maximum *K.E.* of ejected electron will increase
[EAMCET (Med.) 2000]
(b) Work function will remain unchanged
(c) Stopping potential will decrease
(d) Maximum *K.E.* of ejected electron will decrease

111. Light of frequency $8\times10^{15} Hz$ is incident on a substance of photoelectric work function $6.125eV$. The maximum kinetic energy of the emitted photoelectrons is [MP PET 2000; 03] [AFMC 2001]
(a) 17 eV (b) 22 eV
(c) 27 eV (d) 37 eV

112. The photoelectric threshold wavelength for potassium (work function being $2eV$) is [CPMT 2001]
(a) 310 *nm* (b) 620 *nm*
(c) 1200 *nm* (d) 2100 *nm*

113. Photons of energy 6 eV are incident on a metal surface whose work function is 4 eV. The minimum kinetic energy of the emitted photo-electrons will be [MP PET 2001]

(a) 0 eV (b) 1 eV
(c) 2 eV (d) 10 eV

114. According to photon theory of light which of the following physical quantities associated with a photon do not/does not change as it collides with an electron in vacuum [AMU (Engg.) 2001]

(a) Energy and momentum (b) Speed and momentum
(c) Speed only (d) Energy only

115. The lowest frequency of light that will cause the emission of photoelectrons from the surface of a metal (for which work function is 1.65 eV) will be [JIPMER 2002]

(a) $4\times10^{10}\,Hz$ (b) $4\times10^{11}\,Hz$
(c) $4\times10^{14}\,Hz$ (d) $4\times10^{-10}\,Hz$

116. Light of two different frequencies whose photons have energies $1eV$ and $2.5eV$ respectively, successively illuminates a metal of work function $0.5eV$. The ratio of maximum kinetic energy of the emitted electron will be [AIEEE 2002]

(a) 1 : 5 (b) 1 : 4
(c) 1 : 2 (d) 1 : 1

117. Sodium and copper have work functions 2.3 eV and 4.5 eV respectively. Then the ratio of their threshold wavelengths is nearest to [AIEEE 2002]

(a) 1: 2 (b) 4 : 1
(c) 2 : 1 (d) 1 : 4

118. Photon of 5.5 eV energy fall on the surface of the metal emitting photoelectrons of maximum kinetic energy 4.0 eV. The stopping voltage required for these electrons are [Orissa (Engg.) 2002; DPMT 2004]

(a) 5.5 V (b) 1.5 V
(c) 9.5 V (d) 4.0 V

119. A caesium photocell, with a steady potential difference of 60 V across, is illuminated by a bright point source of light 50 cm away. When the same light is placed 1m away the photoelectrons emitted from the cell [KCET 2002]

(a) Are one quarter as numerous
(b) Are half as numerous
(c) Each carry one quarter of their previous momentum
(d) Each carry one quarter of their previous energy

120. A radio transmitter radiates 1 kW power at a wavelength 198.6 *metres*. How many photons does it emit per second [Kerala (Engg.) 2002]

(a) 10^{10} (b) 10^{20}
(c) 10^{30} (d) 10^{40}

121. The number of photons of wavelength 540 nm emitted per second by an electric bulb of power 100 W is (taking $h = 6\times10^{-34}\ J\text{-}sec$) [Kerala (Engg.) 2002; Pb. PET 2001]

(a) 100 (b) 1000
(c) 3×10^{20} (d) 3×10^{18}

122. When radiation is incident on a photoelectron emitter, the stopping potential is found to be 9 volts. If e/m for the electron is $1.8\times10^{11}\,C\,kg^{-1}$ the maximum velocity of the ejected electrons is [Kerala (Engg.) 2002]

(a) $6\times10^5\,ms^{-1}$ (b) $8\times10^5\,ms^{-1}$
(c) $1.8\times10^6\,ms^{-1}$ (d) $1.8\times10^5\,ms^{-1}$

123. Two identical metal plates show photoelectric effect by a light of wavelength λ_A falls on plate A and λ_B on plate B $(\lambda_A = 2\lambda_B)$. The maximum kinetic energy is [CPMT 2002]

(a) $2K_A = K_B$ (b) $K_A < K_B/2$
(c) $K_A = 2K_B$ (d) $K_A = K_B/2$

124. The threshold wavelength for photoelectric effect of a metal is 6500 Å. The work function of the metal is approximately [MP PMT 2002]

(a) 2 eV (b) 1 eV
(c) 0.1 eV (d) 3 eV

125. When ultraviolet rays are incident on metal plate, then photoelectric effect does not occurs. It occurs by the incidence of [CBSE PMT 2002; DCE 1997;

(a) X-rays (b) Radio wave
(c) Infrared rays (d) Green house effect

126. Light of frequency $4\nu_0$ is incident on the metal of the threshold frequency ν_0. The maximum kinetic energy of the emitted photoelectrons is [MP PET 2002]

(a) $3h\nu_0$ (b) $2h\nu_0$
(c) $\frac{3}{2}h\nu_0$ (d) $\frac{1}{2}h\nu_0$

127. By photoelectric effect, Einstein, proved [MP PET 2003]

(a) $E = hv$ (b) $K.E. = \frac{1}{2}mv^2$
(c) $E = mc^2$ (d) $E = \frac{Rhc^2}{n^2}$

128. The work function of sodium is 2.3 eV. The threshold wavelength of sodium will be [BHU 2003]

(a) 2900 Å (b) 2500 Å
(c) 5380 Å (d) 2000 Å

129. Which of the following shown particle nature of light [AFMC 2003; CBSE PMT 2001]

(a) Refraction (b) Interference
(c) Polarization (d) Photoelectric effect

130. Two identical photo-cathodes receive light of frequencies f_1 and f_2. If the velocities of the photo electrons (of mass m) coming out are respectively v_1 and v_2, then [AIEEE 2003]

(a) $v_1 - v_2 = \left[\frac{2h}{m}(f_1 - f_2)\right]^{1/2}$ (b) $v_1^2 - v_2^2 = \frac{2h}{m}(f_1 - f_2)$
(c) $v_1 + v_2 = \left[\frac{2h}{m}(f_1 + f_2)\right]^{1/2}$ (d) $v_1^2 + v_2^2 = \frac{2h}{m}(f_1 + f_2)$

131. Consider the two following statements A and B and identify the correct choice given in the answers;

(A) In photovlotaic cells the photoelectric current produced is not proportional to the, intensity of incident light.

(B) In gas filled photoemissive cells, the velocity of photoelectrons depends on the wavelength of the incident radiation.

(a) Both *A* and *B* are true (b) Both *A* and *B* are false

(c) *A* is true but *B* is false (d) *A* is false *B* is true

132. When radiation of wavelength λ is incident on a metallic surface, the stopping potential is 4.8 volts. If the same surface is illuminated with radiation of double the wavelength, then the stopping potential becomes 1.6 *volts*. Then the threshold wavelength for the surface is [EAMCET (Engg.) 2003]

(a) 2λ (b) 4λ

(c) 6λ (d) 8λ

133. The frequency and work function of an incident photon are ν and ϕ_0. If ν is the threshold frequency then necessary condition for the emission of photo electron is [RPET 2003]

(a) $\nu < \nu_0$ (b) $\nu = \frac{\nu_0}{2}$

(c) $\nu \geq \nu_0$ (d) None of these

134. Light of wavelength 1824 Å, incident on the surface of a metal, produces photo-electrons with maximum energy 5.3 *eV*. When light of wavelength 1216 Å is used, the maximum energy of photoelectrons is 8.7 *eV*. The work function of the metal surface is

(a) 3.5 *eV* (b) 13.6 *eV*

(c) 6.8 *eV* (d) 1.5 *eV*

135. If the energy of a photon corresponding to a wavelength of 6000 Å is $3.32 \times 10^{-19}\, J$, the photon energy for a wavelength of 4000 Å will be [DPMT 2004]

(a) 1.4 *eV* (b) 4.9 *eV*

(c) 3.1 *eV* (d) 1.6 *eV*

136. If the wavelength of light is 4000 Å, then the number of waves in 1 *mm* length will be [J & K CET 2004]

(a) 25 (b) 0.25

(c) 0.25×10^4 (d) 25×10^4

137. The velocity of photon is proportional to (where ν is frequency)

(a) $\frac{\nu^2}{2}$ (b) $\frac{1}{\sqrt{\nu}}$

(c) $\sqrt{\nu}$ (d) ν

138. If the work function of a photometal is 6.825 *eV*. Its threshold wavelength will be $(c = 3 \times 10^8\, m/s)$

[Pb. PET 2000; BHU 2004]

(a) 1200 Å (b) 1800 Å

(c) 2400 Å (d) 3600 Å

139. A photon of energy 8 *eV* is incident on a metal surface of threshold frequency $1.6 \times 10^{15}\, Hz$, then the maximum kinetic energy of photoelectrons emitted is $(h = 6.6 \times 10^{-34}\, Js)$

(a) 4.8 *eV* (b) 2.4 *eV*

(c) 1.4 *eV* (d) 0.8 *eV*

140. If the energy of the photon is increased by a factor of 4, then its momentum [UPSEAT 2004]

(a) Does not change

(b) Decreases by a factor of 4

(c) Increases by a factor of 4

(d) Decreases by a factor of 2

141. The ratio of the energy of a photon with $\lambda = 150\, nm$ to that with $\lambda = 300\, nm$ is [DCE 2003]

(a) 2 [EAMCET (Engg.) 2003] (b) 1/4

(c) 4 (d) 1/2

142. Photo-electric effect can be explained by [DCE 2003]

(a) Corpusular theory of light (b) Wave nature of light

(c) Bohr's theory (d) Quantum theory of light

143. In photoelectric effect, the K.E. of electrons emitted from the metal surface depends upon [DCE 2003]

(a) Intensity of light

(b) Frequency of incident light

(c) Velocity of incident light

(d) Both intensity and velocity of light

144. The photoelectric effect can be understood on the basis of

[Pb. PET 2004]

(a) The principle of superposition

(b) The electromagnetic theory of light

(c) The special theory of relativity

(d) Line spectrum of the atom

145. If the threshold wavelength for sodium is 5420 Å, then the work function of sodium is [RPMT 2003]

(a) 4.58 *eV* [MP PMT 2004] (b) 2.28 *eV*

(c) 1.14 *eV* (d) 0.23 *eV*

146. The work function of a metal is [RPMT 2004]

(a) The energy for the electron to enter into the metal

(b) The energy for producing X-ray

(c) The energy for the electron to come out from metal surface

(d) None of these

147. The minimum wavelength of photon is 5000 Å, its energy will be

(a) 2.5 *eV* (b) 50 *V*

(c) 5.48 *eV* (d) 7.48 *eV*

148. Which of one is correct [DCE 1998]

(a) $E^2 = p^2c^2$ (b) $E^2 = p^2c$

(c) $E^2 = pc^2$ [Pb. PMT 2004] (d) $E^2 = p^2/c^2$

149. The work function for metals *A*, *B* and *C* are respectively 1.92 *eV*, 2.0 *eV* and 5 *eV*. According to Einstein's equation, the metals which will emit photo electrons for a radiation of wavelength 4100 Å is/are[CBSE PMT

(a) None of these (b) *A* only

(c) *A* and *B* only (d) All the three metals

150. A photosensitive metallic surface has work function $h\nu_0$. If photons of energy $2h\nu_0$ fall on this surface the electrons come out with a maximum velocity of $4 \times 10^6\, m/s$. When the photon energy is increases to $5h\nu_0$ then maximum velocity of photo electron will be[CBSE PMT

(a) $2 \times 10^6\, m/s$ [Pb. PET 2002] (b) $2 \times 10^7\, m/s$

(c) $8 \times 10^5\, m/s$ (d) $8 \times 10^6\, m/s$

151. A photocell is illuminated by a small bright source placed 1 *m* away. When the same source of light is placed $\frac{1}{2} m$ away, the number of electrons emitted by photo cathode would[CBSE PMT 2001; AIEEE 2005]

(a) Decrease by a factor of 2 (b) Increase by a factor of 2

(c) Decrease by a factor of 4 (d) Increase by a factor of 4

152. The magnitude of saturation photoelectric current depends upon[AFMC 2005]

(a) Frequency (b) Intensity
(c) Work function (d) Stopping potential

153. For photoelectric emission, tungsten requires light of 2300 $\mathring{A}$. If light of 1800 $\mathring{A}$ wavelength is incident then emission [AFMC 2005]
(a) Takes place
(b) Don't take place
(c) May or may not take place
(d) Depends on frequency

154. The light rays having photons of energy 1.8 eV are falling on a metal surface having a work function 1.2 eV. What is the stopping potential to be applied to stop the emitting electrons
(a) 3 eV (b) 1.2 eV
(c) 0.6 eV (d) 1.4 eV

155. The incident photon involved in the photoelectric effect experiment.
(a) Completely disappears
(b) Comes out with an increased frequency
(c) Comes out with a decreased frequency
(d) Comes out without change in frequency

156. A photon of energy 8 eV is incident on metal surface of threshold frequency $1.6\times10^{15}\,Hz$. The maximum kinetic energy of the photoelectrons emitted (in eV) (Take $h=6\times10^{-34}\,Js$).
(a) 1.6 (b) 6
(c) 2 (d) 1.2

X-Rays

1. An X-ray tube is operated at 50 kV. The minimum wavelength produced is [CPMT 1996]
(a) 0.5 Å (b) 0.75 Å
(c) 0.25 Å (d) 1 Å

2. Which of the following wavelength falls in X-ray region [CPMT 1975; MP PMT 1984]
(a) 10000 Å (b) 1000 Å
(c) 1 Å (d) 10^{-2} Å

3. A metal block is exposed to beams of X-ray of different wavelength. X-rays of which wavelength penetrate most [NCERT 1980; JIPMER 2002]
(a) 2 Å (b) 4 Å
(c) 6 Å (d) 8 Å

4. X-rays and gamma rays are both electromagnetic waves. Which of the following statements is true [NCERT 1973]
(a) In general X-rays have larger wavelength than of gamma rays
(b) X-rays have smaller wavelength than that of gamma rays
(c) Gamma rays have smaller frequency than that of X-rays
(d) Wavelength and frequency of X-rays are both larger than that of gamma rays

5. In producing X-rays a beam of electrons accelerated by a potential difference V is made to strike a metal target. For what value of V, X-rays will have the lowest wavelength of 0.3094 Å [CPMT 1982; NCERT 1986, 87]
(a) 10 kV (b) 20 kV
(c) 30 kV (d) 40 kV

6. In radio theraphy, X-rays are used to [CPMT 1972; BHU 2005]
(a) Detect bone fractures
(b) Treat cancer by controlled exposure
(c) Detect heart diseases
(d) Detect fault in radio receiving circuits

7. Hydrogen atom does not emit X-rays because [NCERT 1979; CPMT 1980, 90; RPET 1999]
(a) Its energy levels are too close to each other
(b) Its energy levels are too apart
(c) It is too small in size
(d) It has a single electron

8. X-rays were discovered by [NCERT 1977; BHU 2005]
(a) Becquerel (b) Roentgen
(c) Marie Curie (d) Von Laue

[BHU 2005]

9. X-rays are [CPMT 1975; EAMCET 1995; RPET 2000; SCRA 1994]
(a) Stream of electrons

[EAMCET 2005]

(b) Stream of positively charged particles
(c) Electromagnetic radiations of high frequency
(d) Stream of uncharged particles

10. The voltage applied across an X-rays tube is nearly [CPMT 1983]
(a) 10 V (b) 100 V
(c) 10000 V [MP PET 2005] (d) 10^6 V

11. The characteristic X-ray radiation is emitted, when [CPMT 1975, 80, 90; RPET 1999]
(a) The electrons are accelerated to a fixed energy
(b) The source of electrons emits a monoenergetic beam
(c) The bombarding electrons knock out electrons from the inner shell of the target atoms and one of the outer electrons falls into this vacancy
(d) The valence electrons in the target atoms are removed as a result of the collision

12. Molybdenum is used as a target element for production of X-rays because it is [CPMT 1980; RPET 1999]
(a) A heavy element and can easily absorb high velocity electrons
(b) A heavy element with a high melting point
(c) An element having high thermal conductivity
(d) Heavy and can easily deflect electrons

13. Mosley's law relates the frequencies of line X-rays with the following characteristics of the target element [CPMT 1980; NCERT 1985]
(a) Its density
(b) Its atomic weight
(c) Its atomic number
(d) Interplaner spacing of the atomic planes

14. Compton effect is associated with [CPMT 1971]
(a) $\alpha-$rays (b) $\beta-$rays
(c) X-rays (d) Positive rays

15. X-rays are in nature similar to
(a) Beta rays (b) Gamma rays
(c) de-Broglie waves (d) Cathode rays

16. If the cathode–anode potential difference in an X-ray tube be 10^5 V, then the maximum energy of X-ray photon can be
(a) 10^5 J (b) 10^5 MeV
(c) 10^{-1} MeV (d) 10^5 KeV

17. The shortest wavelength of X-rays emitted from an X-ray tube depends on the

[MP PMT 1987; CPMT 1988, 92; IIT 1982]

(a) Current in the tube

(b) Voltage applied to the tube

(c) Nature of gas in the tube

(d) Atomic number of target material

18. The wavelength of X-rays is of the order of

[CPMT 1983; MP PMT 1987; KCET 1994; JIPMER 1997]

(a) *Centimetre* (b) *Micron* (10^{-6} *m*)

(c) *Angstrom* (10^{-10} *m*) (d) *Metre*

19. X – rays and γ – rays of the same energies may be distinguished by

(a) Their velocity (b) Their ionising power

(c) Their intensity (d) Method of production

20. When a beam of accelerated electrons hits a target, a continuous X-ray spectrum is emitted from the target. Which of the following wavelength is absent in the X-ray spectrum, if the X-ray tube is operating at 40,000 *volts*

[MP PMT 1993; NCERT 1984; MNR 1995; RPMT 2002]

(a) 0.25 Å (b) 0.5 Å

(c) 1.5 Å (d) 1.0 Å

21. For continuous X-rays produced wavelength is

(a) Inversely proportional to the energy of the electrons hitting the target

(b) Inversely proportional to the intensity of the electron beam

(c) Proportional to intensity of the electron beam

(d) Proportional to target temperature

22. An X-ray has a wavelength of 0.010 Å. Its momentum is

[AFMC 1980; RPMT 1995; Pb. PMT 2004]

(a) 2.126×10^{-23} *kg-m/sec* (b) 6.626×10^{-22} *kg-m/sec*

(c) 3.456×20^{-25} *kg-m/sec* (d) 3.313×10^{-22} *kg-m/sec*

23. X-rays are not used for radar purpose because

(a) They are not reflected by the target

(b) They are not electromagnetic waves

(c) They are completely absorbed by the air

(d) They sometimes damage the target

24. A direct X-ray photograph of the intestines is not generally taken by the radiologists because **[CPMT 1986, 88]**

(a) Intestines would burst on exposure to X-rays

(b) The X-rays would not pass through the intestines

(c) The X-rays will pass through the intestines without causing a good shadow for any useful diagnosis

(d) A very small exposure of X-rays causes cancer in the intestines

25. The patient is asked to drink $BaSO_4$ for examining the stomach by *X*-rays because *X*-rays are

(a) Reflected by heavy atoms

(b) Refracted by heavy atoms

(c) Less absorbed by heavy atoms

(d) More absorbed by heavy atoms

26. X-rays can be used to study crystal structure, if the wavelength lies in the range

(a) 2 Å to 0.1 Å (b) 10 Å to 5 Å

(c) 50 Å to 10 Å (d) 100 Å to 50 Å

27. When the accelerating voltage applied on the electrons increased beyond a critical value **[CPMT 1975]**

(a) Only the intensity of the various wavelengths is increased

(b) Only the wavelength of characteristic relation is affected

(c) The spectrum of white radiation is unaffected

(d) The intensities of characteristic lines relative to the white spectrum are increased but there is no change in their wavelength

28. The *X*-ray beam coming from an *X*-ray tube will be

[IIT 1985; SCRA 1996; MP PET 1999]

[CPMT 1985]

(a) Monochromatic

(b) Having all wavelengths smaller than a certain maximum wavelength

(c) Having all wavelengths larger than a certain minimum wavelength

(d) Having all wavelengths lying between a minimum and a maximum wavelength

29. The continuous X-rays spectrum produced by an X-ray machine at constant voltage has **[DPMT 1999]**

(a) A maximum wavelength (b) A minimum wavelength

(c) A single wavelength (d) A minimum frequency

30. The penetrating power of X-rays increases with the

[MP PMT 1984]

(a) Increase in its velocity (b) Increase in its frequency

(c) Increase in its intensity (d) Decrease in its velocity

31. If λ_1 and λ_2 are the wavelengths of characteristic X-rays and gamma rays respectively, then the relation between them is

(a) $\lambda_1 = \dfrac{1}{\lambda_2}$ (b) $\lambda_1 = \lambda_2$

(c) $\lambda_1 > \lambda_2$ (d) $\lambda_1 < \lambda_2$

32. The wavelength λ of the K_α line of characteristic *X*-ray spectra varies with atomic number approximately

[MP PMT 1987]

(a) $\lambda \propto Z$ (b) $\lambda \propto \sqrt{Z}$

(c) $\lambda \propto \dfrac{1}{Z^2}$ (d) $\lambda \propto \dfrac{1}{\sqrt{Z}}$

33. The minimum frequency ν of continuous *X*-rays is related to the applied potential difference *V* as

(a) $\nu \propto \sqrt{V}$ (b) $\nu \propto V$

(c) $\nu \propto V^{3/2}$ (d) $\nu \propto V^2$

34. If *V* be the accelerating voltage, then the maximum frequency of continuous *X*-rays is given by

[NCERT 1971; CPMT 1991; MP PET 2000; RPMT 2001; MP PMT 2002]

(a) $\dfrac{eh}{V}$ (b) $\dfrac{hV}{e}$

(c) $\dfrac{eV}{h}$ (d) $\dfrac{h}{eV}$

35. The minimum wavelength of *X*-rays produced by electrons accelerated by a potential difference of *volts* is equal to

[CPMT 1986, 88, 91; RPMT 1997; RPMT 1997, 98; MP PET 1997, 98; MP PMT 1996, 98, 2003; UPSEAT 2005]

(a) $\frac{eV}{hc}$ (b) $\frac{eh}{cV}$

(c) $\frac{hc}{eV}$ (d) $\frac{cV}{eh}$

36. The potential difference applied to an *X*-ray tube is increased. As a result, in the emitted radiation [IIT 1988; ISM Dhanbad 1994; AIIMS 1997; MP PMT 1995, 2004]

(a) The intensity increases
(b) The minimum wavelength increases
(c) The intensity decreases
(d) The minimum wavelength decreases

37. A potential difference of 42,000 *volts* is used in an *X*-ray tube to accelerate electrons. The maximum frequency of the *X*–radiations produced is [MP PMT 1993]

(a) 10^{19} Hz (b) 10^{18} Hz

(c) 10^{16} Hz (d) 10^{20} Hz

$(1eV = 1.6\times10^{-19}\,J$ and $h = 6.63\times10^{-34}\,J-\text{sec})$

38. Which of the following is accompanied by the characteristic *X*-ray emission [MP PET 1993]

(a) $\alpha-$particle emission (b) Electron emission

(c) Positron emission (d) *K*–electron capture

39. *X*-rays are known to be electromagnetic radiations. Therefore the *X*-ray photon has [MP PET 1993]

(a) Electric charge
(b) Magnetic moment
(c) Both electric charge and magnetic moment
(d) Neither electric charge nor magnetic moment

40. *X*-rays of which of the following wavelengths are hardest

(a) 4 Å (b) 1 Å

(c) 0.1 Å (d) 2 Å

41. *X*-ray beam can be deflected by [CPMT 2000; BHU 2001; Pb. PMT 2002]

(a) Magnetic field (b) Electric field

(c) Both (a) and (b) (d) None of these

42. *X*-rays are produced due to [CPMT 1985; JIPMER 2002]

(a) Break up of molecules
(b) Changing in atomic energy level
(c) Changing in nuclear energy level
(d) Radioactive disintegration

43. *X*-rays region lies between [CPMT 1990]

(a) Short radiowave and visible region
(b) Visible and ultraviolet region
(c) Gamma rays and ultraviolet region
(d) Short radiowave and long radiowave

44. The structure of solid crystals is investigated by using [CPMT 1992; NCERT 1975; CBSEPMT 1992]

(a) Cosmic rays (b) *X*-rays

(c) Infrared radiations (d) $\gamma-$ rays

45. In an *X*-rays tube, the intensity of the emitted *X*-rays beam is increased by [MNR 1992; RPMT 1996; UPSEAT 2000]

(a) Increasing the filament current
(b) Decreasing the filament current
(c) Increasing the target potential
(d) Decreasing the target potential

46. The binding energy of the innermost electron in tungsten is 40 *keV*. To produce characteristic *X*-rays using a tungsten target in an *X*-rays tube the potential difference *V* between the cathode and the anti-cathode should be [IIT 1985]

(a) V< 40 *kV* (b) V ≤ 40 *kV*

(c) V > 40 *kV* (d) V >/< 40 *kV*

47. In above question the energy of the characteristic *X*-rays given out is

(a) Less than 40 *keV* (b) More than 40 *keV*

(c) Equal to 40 *keV* (d) ≥ 40 *keV*

48. The wavelength of most energetic *X*-rays emitted when a metal target is bombarded by $40KeV$ electrons, is approximately

$(h = 6.62\times10^{-34}$ *J-sec*; 1 *eV* = 1.6×10^{-19} *J*; *c* = $3\times10^{8}\,m/s)$

[MNR 1991; MP PMT 1999; UPSEAT 2000; Pb. PET 2004]

(a) 300 Å (b) 10 Å

(c) 4 Å (d) 0.31 Å

49. *X*-rays which can penetrate through longer distances in substance are called [EAMCET 1983]

(a) Soft *X*-rays (b) Continuous *X*-rays

(c) Hard *X*-rays (d) None of the above

50. An *X*-ray machine has an accelerating potential difference of 25,000 volts. By calculation the shortest wavelength will be obtained as

$(h = 6.62\times10^{-34}$ *J–sec*; e = 1.6×10^{-19} *coulomb*)

[MP PET 1994]

(a) 0.25 Å (b) 0.50 Å

(c) 1.00 Å (d) 2.50 Å

51. For the production of *X*-rays of wavelength 0.1 Å the minimum potential difference will be [MP PMT 1994; RPMT 1995]

(a) 12.4 *kV* (b) 24.8 *kV*

(c) 124 *kV* (d) 248 *kV*

52. Mosley measured the frequency (*f*) of the characteristic *X*-rays from many metals of different atomic number (Z) and represented his results by a relation known as Mosley's law. This law is (a, b are constants) [MP PMT 1994; RPMT 1996]

(a) $f = a(Z-b)^2$ (b) $Z = a(f-b)^2$

(c) $f^2 = a(Z-b)$ (d) $f = a(Z-b)^{1/2}$

53. Penetrating power of *X*-rays depends on [MP PMT 1994]

(a) Current flowing in the filament
(b) Applied potential difference
(c) Nature of the target
(d) All the above

54. The energy of a photon of characteristic *X*-rays from a Coolidge tube comes from [MP PET 1995]

(a) The kinetic energy of the striking electron
(b) The kinetic energy of the free electrons of the target
(c) The kinetic energy of the ions of the target
(d) An electronic transition of the target atom

55. An *X*-ray tube operates on 30 *kV*. What is the minimum wavelength emitted

$(h = 6.6\times10^{-34}$ *Js*, $e = 1.6\times10^{-19}$ *Coulomb*, $c = 3\times10^{8}$ *ms*)

[MP PMT 1995; DPMT 2001, 03]

(a) 0.133 Å (b) 0.4 Å

(c) 1.2 Å (d) 6.6 Å

56. The wavelength of the most energetic X–ray emitted when a metal target is bombarded by 100 KeV electrons is approximately
(a) 12 Å (b) 4
(c) 0.31 Å (d) 0.124 Å

57. An electron beam in an *X*-ray tube is accelerated through a potential difference of 50000 *volts*. These are then made to fall on a tungsten target. The shortest wavelength of the *X*-ray emitted by the tube is
(a) 2.5 Å (b) 0.25 *nm*
(c) 0.25 *cm* (d) 0.025 *nm*

58. For harder *X*-rays [MP PET 1997]
(a) The wavelength is higher
(b) The intensity is higher
(c) The frequency is higher
(d) The photon energy is lower

59. When cathode rays strike a metal target of high melting point with very high velocity, then [MP PMT 1997; AIIMS 1999]
(a) *X*-rays are produced
(b) Ealpha-rays are produced
(c) TV waves are produced
(d) Ultrasonic waves are produced

60. Penetrating power of *X*-rays can be increased by [MP PMT 1997, 2000]
(a) Increasing the potential difference between anode and cathode
(b) Decreasing the potential difference between anode and cathode
(c) Increasing the cathode filament current
(d) Decreasing the cathode filament current

61. K_α characteristic *X*-ray refers to the transition [MP PMT 1999]
(a) $n = 2$ to $n = 1$ (b) $n = 3$ to $n = 2$
(c) $n = 3$ to $n = 1$ (d) $n = 4$ to $n = 2$

62. *X*-rays are produced in *X*-ray tube operating at a given accelerating voltage. The wavelength of the continuous *X*-rays has values from
(a) 0 to ∞
(b) $\lambda_{\min}$ to ∞, where $\lambda_{\min} > 0$
(c) 0 to $\lambda_{\max}$ where $\lambda_{\max} < \infty$
(d) $\lambda_{\min}$ to $\lambda_{\max}$, where $0 < \lambda_{\min} < \lambda_{\max} < \infty$

63. The wavelength of *X*-rays is [EAMCET (Med.) 1995]
(a) 2000 Å (b) 2 Å
(c) 1 *mm* (d) 1 *cm*

64. The ratio of the energy of an *X*-ray photon of wavelength 1 Å to that of visible light of wavelength 5000 Å is [EAMCET (Med.) 1995]
(a) 1: 5000 (b) 5000 : 1
(c) 1 :25 $\times 10^{6}$ (d) 25 $\times 10^{6}$

65. According to Mosley's law, the frequency of a spectral line in *X*-ray spectrum varies as [EAMCET (Med.) 1995; Pb. PMT 1999]
(a) Atomic number of the element
(b) Square of the atomic number of the element
(c) Square root of the atomic number of the element
(d) Fourth power of the atomic number of the element

66. For the structural analysis of crystals, *X*-rays are used because
(a) *X*-rays have wavelength of the order of interatomic spacing
(b) *X*-rays are highly penetrating radiations
(c) Wavelength of *X*-rays is of the order of nuclear size
(d) *X*-rays are coherent radiations [MP PET 1996]

67. The essential distinction between *X*-rays and $\gamma -$ rays is that [BHU 1994; RPMT 1991; JIPMER 2001, 02]
(a) $\gamma -$ rays have smaller wavelength than *X*-rays
(b) $\gamma -$ rays emanate from nucleus while *X*-rays emanate from outer part of the atom [MP PET 1997]
(c) $\gamma -$ rays have greater ionizing power than *X*-rays
(d) $\gamma -$ rays are more penetrating than *X*-rays

68. The minimum wavelength of the *X*-rays produced by electrons accelerated through a potential difference of V *volts* is directly proportional to [CBSE PMT 1996]
(a) $\sqrt{V}$ (b) V^2
(c) $1/\sqrt{V}$ (d) $1/V$

69. What determines the hardness of the *X*-rays obtained from the Coolige tube [RPMT 1996]
(a) Current in the filament
(b) Pressure of air in the tube
(c) Nature of target
(d) Potential difference between cathode and target

70. The most penetrating radiation out of the following is [CBSE PMT 1997]
(a) *X*-rays (b) β -rays
(c) $\alpha -$ particles (d) $\gamma -$ rays

71. On increasing the number of electrons striking the anode of an *X*-ray tube, which one of the following parameters of the resulting *X*-rays would increase [IIT 1998; BVP 2003] [SCRA 1998; DPMT 2000]
(a) Penetration power (b) Frequency
(c) Wavelength (d) Intensity

72. What kV potential is to be applied on *X*-ray tube so that minimum wavelength of emitted *X*-rays may be 1Å ($h = 6.625 \times 10^{-34}$ *J-sec*)
(a) $12.42 kV$ (b) $12.84 kV$
(c) $11.98 kV$ (d) $10.78 kV$

73. *X*-rays cannot be deflected by means of an ordinary grating due to [Pb. PMT 199
(a) Large wavelength (b) High speed
(c) Short wavelength (d) None of these

74. Consider the following two statements A and B and identify the correct choice in the given answer
A: The characteristic *X*-ray spectrum depends on the nature of the material of the target.
B: The short wavelength limit of continuous *X*-ray spectrum varies inversely with the potential difference applied to the *X*-rays tube [EAMCET (Med.) 2000]
(a) A is true and B is false (b) A is false and B is true
(c) Both A and B are true (d) Both A and B are false

75. The energy of an *X*- ray photon of wavelength 1.65 Å is [IIT 1992; JIPMER 2000]
($h = 6.6 \times 10^{-34}$ *J-sec*, $c = 3 \times 10^8 ms^{-1}$, $1eV = 1.6 \times 10^{-19} J$)
[EAMCET (Engg.) 2000]

(a) 3.5 keV (b) 5.5 keV
(c) 7.5 keV (d) 9.5 keV

76. If λ =10Å, then it corresponds to [DCE 2000]
(a) Infra-red (b) Microwave
(c) Ultra-violet (d) X-rays

77. Bragg's law for X-rays is [UPSEAT 2001]
(a) $d\sin\theta = 2n\lambda$ (b) $2d\sin\theta = n\lambda$
(c) $n\sin\theta = 2\lambda d$ (d) None of these

78. The X-rays produced in a coolidge tube of potential difference 40 V have minimum wavelength of [MH CET (Med.) 2001]
(a) $3.09\times10^{-8} m$ (b) $5.09\times10^{8} m$
(c) $4.09\times10^{-8} m$ (d) $1.09\times10^{8} m$

79. For the production of X-rays, the target should be made of
(a) Steel (b) Copper
(c) Aluminum (d) Tungsten

80. Intensity of X-rays depends upon the number of [SCRA 1998; DPMT 2000; AFMC 2001]
(a) Electrons (b) Protons
(c) Neutrons (d) Positrons

81. In an X-ray tube electrons bombarding the target produce X-rays of minimum wavelength 1 Å. What must be the energy of bombarding electrons [KCET 2001]
(a) 13375 eV (b) 12375 eV
(c) 14375 eV (d) 15375 eV

82. If energy of K-shell electron is – 40000 eV and If 60000 V potential is applied at coolidge tube then which of the following X-ray will get form [RPET 2001]
(a) Continuous
(b) White X-rays
(c) Continuous and all series of characteristic
(d) None of these

83. For production of characteristic K_β X-rays, the electron transition is [MP PET 2001]
(a) $n = 2$ to $n = 1$ (b) $n = 3$ to $n = 2$
(c) $n = 3$ to $n = 1$ (d) $n = 4$ to $n = 2$

84. Penetrating power of X-rays does not depend on [MP PET 2001]
(a) Wavelength (b) Energy
(c) Potential difference (d) Current in the filament

85. The potential difference applied to an X-ray tube is 5kV and the current through it is 3.2 mA. Then the number of electrons striking the target per second is [IIT-JEE (Screening) 2002]
(a) 2×10^{16} (b) 5×10^{16}
(c) 1×10^{17} (d) 4×10^{15}

86. For the production of characteristic K_γ, X-ray, the electron transition is [BHU 2002]
(a) $n = 2$ to $n = 1$ (b) $n = 3$ to $n = 2$
(c) $n = 3$ to $n = 1$ (d) $n = 4$ to $n = 1$

87. When X rays pass through a strong uniform magnetic field, Then they [MP PET 2002; RPMT 2002, 03]
(a) Do not get deflected at all
(b) Get deflected in the direction of the field
(c) Get deflected in the direction opposite to the field
(d) Get deflected in the direction perpendicular to the field

88. If the potential difference applied across X-ray tube is V volts, then approximately minimum wavelength of the emitted X-rays will be RPMT 1995; CBSE PMT 1996]
(a) $\frac{1227}{\sqrt{V}}Å$ (b) $\frac{1240}{V}Å$
(c) $\frac{2400}{V}Å$ (d) $\frac{12400}{V}Å$

89. What is the difference between soft and hard X-rays [MP PMT 2002; AIIMS 2002] [BHU 2000; CPMT 2001]
(a) Velocity (b) Intensity
(c) Frequency (d) Polarization

90. X-ray will travel minimum distance in [MP PET 2003]
(a) Air (b) Iron
(c) Wood (d) Water

91. The minimum wavelength of X-ray emitted by X-rays tube is 0.4125 Å. The accelerating voltage is [BHU 2003; CPMT 2004; MP PMT 2005]
(a) 30 kV (b) 50 kV
(c) 80 kV (d) 60 kV

92. Characteristic X-rays are produced due to [AIIMS 2003]
(a) Transfer of momentum in collision of electrons with target atoms
(b) Transition of electrons from higher to lower electronic orbits in an atom
(c) Heating of the target
(d) Transfer of energy in collision of electrons with atoms in the target

93. X-rays when incident on a metal [BCECE 2003; RPMT 2003]
(a) Exert a force on it (b) Transfer energy to it
(c) Transfer pressure to it (d) All of the above

94. The minimum wavelength of X-rays produced in a coolidge tube operated at potential difference of 40 kV is [BCECE 2003; RPET 2002, 03]
(a) 0.31 $Å$ (b) 3.1 $Å$
(c) 31 $Å$ (d) 311 $Å$

95. The potential difference between the cathode and the target in a Collidge tube is 100 kV. The minimum wavelength of the X-rays emitted by the tube is [Pb. PMT 2004]
(a) 0.66 $Å$ (b) 9.38 $Å$
(c) 0.246 $Å$ (d) 0.123 $Å$

96. X-rays are produced by accelerating electrons by voltage V and let they strike a metal of atomic number Z. The highest frequency of X-rays produced is proportional to [UPSEAT 2004]
(a) V (b) Z
(c) $(Z-1)$ (d) $(Z-1)^2$

97. If the operating potential of an X-ray tube is 50 kV, the velocity of X-rays coming out of it is [RPMT 2003]
(a) $4\times10^{4}\ m/s$ (b) $3\times10^{8}\ m/s$
(c) $10^{8}\ m/s$ (d) $3\ m/s$

98. If the voltage of X-ray tube is doubled, the intensity of X-rays will become [RPMT 2003]

(a) Half (b) Unchanged

(c) Double (d) Four times

99. If the minimum wavelength obtained in an X-ray tube is $2.5\times10^{-10}m$, the operating potential of the tube will be [RPMT 2003]

(a) 2 kV (b) 3 kV

(c) 4 kV (d) 5 kV

100. The wavelength of X-rays decreases, when [RPMT 2002]

(a) Temperature of target is increased

(b) Intensity of electron beam is increased

(c) K.E. of electrons striking the target is increased

(d) K.E. of electrons striking the target is decreased

101. X-rays are produced in laboratory by [RPMT 1998]

(a) Radiation

(b) Decomposition of the atom

(c) Bombardment of high energy electron on heavy metal

(d) None of these

102. In vacuum an electron of energy 10 keV hits tungsten target, then emitted radiation will be [RPMT 2001]

(a) Cathode rays (b) X-rays

(c) Infrared rays (d) Visible spectrum

103. X-rays of $\lambda = 1\,Å$ have frequency [DCE 1998]

(a) $3\times10^{8}\,Hz$ (b) $3\times10^{18}\,Hz$

(c) $3\times10^{10}\,Hz$ (d) $3\times10^{15}\,Hz$

104. Solid targets of different elements are bombarded by highly energetic electron beams. The frequency (f) of the characteristic X-rays emitted from different targets varies with atomic number Z as [AIIMS 2005]

(a) $f\propto\sqrt{Z}$ (b) $f\propto Z^2$

(c) $f\propto Z$ (d) $f\propto Z^{3/2}$

105. Compton effect shows that [DPMT 1995]

(a) X-rays are waves

(b) X-rays have high energy

(c) X-rays can penetrate matter

(d) Photons have momentum

106. An X-ray tube with a copper target emits $Cu\ K_\alpha$ line of wavelength 1.50 $Å$. What should be the minimum voltage through which electrons are to be accelerated to produce this wavelength of X rays

$(h = 6.63\times10^{-34}$ J-sec, $c = 3\times10^{8}m/s)$ [Orissa JEE 1996]

(a) 8280 V (b) 828 V

(c) 82800 V (d) 8.28 V

107. In X-ray spectrum wavelength λ of line K_α depends on atomic number Z as [RPMT 1995; DCE 2002]

(a) $\lambda\propto Z^2$ (b) $\lambda\propto(Z-1)^2$

(c) $\lambda\propto\frac{1}{(Z-1)}$ (d) $\lambda\propto\frac{1}{(Z-1)^2}$

108. Absorption of X-ray is maximum in which of the following different sheets [RPMT 1995]

(a) Copper (b) Gold

(c) Beryllium (d) Lead

109. The wavelength of K_α line in copper is 1.54 $Å$. The ionisation energy of K electron in copper in *Joule* is [EAMCET 1984]

(a) 11.2×10^{-27} (b) 12.9×10^{-16}

(c) 1.7×10^{-15} (d) 10×10^{-16}

110. The wavelength of K_α line for an element of atomic number 43 is λ. Then the wavelength of K_α line for an element of atomic number 29 is

(a) $\frac{43}{29}\lambda$ (b) $\frac{42}{28}\lambda$

(c) $\frac{9}{4}\lambda$ (d) $\frac{4}{9}\lambda$

111. In X-ray experiment K_α, K_β denotes [DCE 2005]

(a) Characteristic

(b) Continuous wavelength

(c) α, β-emissions respectively

(d) None of these

Critical Thinking

Objective Questions

1. A 1μA beam of protons with a cross-sectional area of 0.5 *sq. mm* is moving with a velocity of $3 \times 10^4 ms^{-1}$. Then charge density of beam is [CPMT 2002]

(a) $6.6 \times 10^{-4} C/m^3$ (b) $6.6 \times 10^{-5} C/m^3$

(c) $6.6 \times 10^{-6} C/m^3$ (d) None of these

2. A particle of mass M at rest decays into two particles of masses m_1 and m_2 having non-zero velocities. The ratio of the de-Broglie wavelengths of the particles, λ_1/λ_2 is

[IIT-JEE 1999; KCET 2003]

(a) m_1/m_2 (b) m_2/m_1

(c) 1.0 (d) $\sqrt{m_2}/\sqrt{m_1}$

3. A photon and an electron have equal energy E. $\lambda_{photon}/\lambda_{electron}$ is proportional to

[UPSEAT 2003; IIT-JEE (Screening) 2004]

(a) $\sqrt{E}$ (b) $1/\sqrt{E}$

(c) $1/E$ (d) Does not depend upon E

4. When photon of energy 4.25 *eV* strike the surface of a metal *A*, the ejected photoelectrons have maximum kinetic energy T_A *eV* and de-Brolie wavelength λ_A. The maximum kinetic energy of photoelectrons liberated from another metal *B* by photon of energy 4.70 *eV* is $T_B = (T_A - 1.50)\,eV$. If the de-Broglie wavelength of these photoelectrons is $\lambda_B = 2\lambda_A$, then

(a) The work function of *A* is 2.25 *eV*

(b) The work function of *B* is 4.20 *eV*

(c) $T_A = 2.00\,eV$

(d) $T_B = 2.75\,eV$

5. An image of the sun is formed by a lens of focal length of 30 *cm* on the metal surface of a photoelectric cell and a photoelectric current *I* is produced. The lens forming the image is then replaced by another of the same diameter but of focal length 15 *cm*. The photoelectric current in this case is

(a) $\frac{I}{2}$ (b) *I*

(c) 2*I* (d) 4*I*

6. When an inert gas is filled in the place vacuum in a photo cell, then

(a) Photo-electric current is decreased

(b) Photo-electric current is increased

(c) Photo-electric current remains the same

(d) Decrease or increase in photo-electric current does not depend upon the gas filled

7. A photon of 1.7×10^{-13} *Joules* is absorbed by a material under special circumstances. The correct statement is

[MP PET 1999; JIPMER 2000]

(a) Electrons of the atom of absorbed material will go the higher energy states

(b) Electron and positron pair will be created

(c) Only positron will be produced

(d) Photoelectric effect will occur and electron will be produced

8. The maximum velocity of an electron emitted by light of wavelength λ incident on the surface of a metal of work function ϕ, is[MP PMT/PET 1998]

(a) $\left[\frac{2(hc+\lambda\phi)}{m\lambda}\right]^{1/2}$ (b) $\frac{2(hc-\lambda\phi)}{m}$

(c) $\left[\frac{2(hc-\lambda\phi)}{m\lambda}\right]^{1/2}$ (d) $\left[\frac{2(h\lambda-\phi)}{m}\right]^{1/2}$

Where h = Planck's constant, m = mass of electron and c = speed of light.

9. When a point source of monochromatic light is at a distance of 0.2 *m* from a photoelectric cell, the cut-off voltage and the saturation current are 0.6 *volt* and 18 *mA* respectively. If the same source is placed 0.6 *m* away from the photoelectric cell, then[IIT JEE 1992; MP PMT 1999]

(a) The stopping potential will be 0.2 *V*

(b) The stopping potential will be 0.6 *V*

(c) The saturation current will be 6 *mA*

(d) The saturation current will be 18 *mA*

10. In a photoemissive cell with executing wavelength λ, the fastest electron has speed *v*. If the exciting wavelength is changed to $3\lambda/4$, the speed of the fastest emitted electron will be

(a) $v(3/4)^{1/2}$ (b) $v(4/3)^{1/2}$

(c) Less than $v(4/3)^{1/2}$ (d) Greater than $v(4/3)^{1/2}$

11. Ultraviolet light of wavelength 300 *nm* and intensity 1.0 *watt/m* falls on the surface of a photosensitive material. If 1% of the incident photons produce photoelectrons, then the number of photoelectrons emitted from an area of 1.0 *cm* of the surface is nearly

(a) 9.61×10^{14} *per sec* (b) 4.12×10^{13} *per sec*

(c) 1.51×10^{12} *per sec* [IIT-JEE 1994] (d) 2.13×10^{11} *per sec*

12. Photoelectric emission is observed from a metallic surface for frequencies ν_1 and ν_2 of the incident light rays $(\nu_1 > \nu_2)$. If the maximum values of kinetic energy of the photoelectrons emitted in the two cases are in the ratio of $1:k$, then the threshold frequency of the metallic surface is

[EAMCET (Engg.) 2001]

(a) $\frac{\nu_1 - \nu_2}{k-1}$ (b) $\frac{k\nu_1 - \nu_2}{k-1}$

(c) $\frac{k\nu_2 - \nu_1}{k-1}$ [Manipal MEE 1995] (d) $\frac{\nu_2 - \nu_1}{k}$

13. Light from a hydrogen discharge tube is incident on the cathode of a photoelectric cell the work function of the cathode surface is 4.2 *eV*. In order to reduce the photo-current to zero the voltage of the anode relative to the cathode must be made [MP PMT 1997]

(a) – 4.2 *V* (b) – 9.4 *V*

(c) – 17.8 *V* (d) +9.4 *V*

14. Work function of lithium and copper are respectively 2.3 *eV* and 4.0 *eV*. Which one of the metal will be useful for the photoelectric cell working with visible light ? (h = 6.6 × 10^{-34} *J-s*, c = 3 × 10^{8} *m/s*)

(a) Lithium (b) Copper

(c) Both (d) None of these

15. X-rays of wavelength 0.1 Å allowed to fall on a metal get scattered. The wavelength of scattered radiation is 0.111 Å. If h = 6.624 × 10^{-34} *J-s* and m_0 = 9 × 10^{-31} *kg*, then the direction of the scattered photons will be

(a) $\cos^{-1}$ (0.547) (b) $\cos^{-1}$(0.4484)

(c) $\cos^{-1}(0.5)$ (d) $\cos^{-1}(0.3)$

16. The largest distance between the interatomic planes of a crystal is 10^{-7} *cm*. The upper limit for the wavelength of *X*-rays which can be usefully studied with this crystal is

[CPMT 1984]

(a) 1 Å (b) 2 Å

(c) 10 Å (d) 20 Å

17. An *X*-ray tube is operating at 50 *kV* and 20 *mA*. The target material of the tube has a mass of 1.0 *kg* and specific heat 495 $J\ kg^{\ o}C^{-1}$. One percent of the supplied electric power is converted into *X*-rays and the entire remaining energy goes into heating the target. Then

(a) A suitable target material must have a high melting temperature

(b) A suitable target material must have low thermal conductivity

(c) The average rate of rise of temperature of target would be 2 $^{\circ}C/s$

(d) The minimum wavelength of the *X*-rays emitted is about $0.25 \times 10^{-10}\ m$

18. The wavelength of K_α *X*-rays produced by an *X*-ray tube is 0.76 Å. The atomic number of the anode material of the tube is

(a) 20 (b) 60

(c) 40 (d) 80

19. *X*-ray beam of intensity I_0 passes through an absorption plate of thickness *d*. If absorption coefficient of material of plate is μ, the correct statement regarding the transmitted intensity *I* of *X*-ray is

(a) $I = I_0(1 - e^{-\mu d})$ (b) $I = I_0 e^{-\mu d}$

(c) $I = I_0(1 - e^{-\mu / d})$ (d) $I = I_0 e^{-\mu / d}$

20. The K_α *X*-ray emission line of tungsten occurs at $\lambda = 0.021\ nm$. The energy difference between *K* and *L* levels in this atom is about

(a) 0.51*MeV* (b) 1.2 *MeV*

(c) 59 *KeV* (d) 13.6 eV

21. Electrons with energy 80 *keV* are incident on the tungsten target of an *X*-ray tube. *K* shell electrons of tungsten have ionization energy 72.5 *keV*. *X*-rays emitted by the tube contain only

(a) A continuous *X*-ray spectrum (Bremsstrahlung) with a minimum wavelength of ~ 0.155Å

(b) A continuous *X*-ray spectrum (Bremsstrahlung] with all wavelengths

(c) The characteristic *X*-rays spectrum of tungsten

(d) A continuous *X*-ray spectrum (Bremsstrahlung) with a minimum wavelength of ~ 0.155Å and the characteristic *X*-ray spectrum of tungsten

22. The *X*-ray wavelength of L_α line of platinum (Z=78) is $1.30 Å$. The X –ray wavelength of L_α line of Molybdenum (Z=42) is

(a) 5.41Å (b) 4.20Å

(c) 2.70Å (d) 1.35 Å

23. The ratio of de-Broglie wavelengths of molecules of hydrogen and helium which are at temperature 27°*C* and 127°*C* respectively is

(a) $\frac{1}{2}$ (b) $\sqrt{\frac{3}{8}}$

(c) $\sqrt{\frac{8}{3}}$ (d) 1

24. A silver ball of radius 4.8 *cm* is suspended by a thread in the vacuum chamber. *UV* light of wavelength 200 *nm* is incident on the ball for some times during which a total energy of 1×10^{-7} *J* falls on the surface. Assuming on an average one out of 10^3 photons incident is able to eject electron. The potential on sphere will be

(a) 1 *V* (b) 2 *V*

(c) 3 *V* (d) Zero

25. A photon of wavelength 6630 Å is incident on a totally reflecting surface. The momentum delivered by the photon is equal to

[IIT 1995]

(a) 6.63×10^{-27} *kg-m/sec* (b) 2×10^{-27} *kg-m/sec*

(c) 10^{-27} *kg-m/sec* (d) None of these

26. The ratio of de-Broglie wavelength of a α-particle to that of a proton being subjected to the same magnetic field so that the radii of their path are equal to each other assuming the field induction vector $\vec{B}$ is perpendicular to the velocity vectors of the α-particle and the proton is

[IIT 1996]

(a) 1 (b) $\frac{1}{4}$

(c) $\frac{1}{2}$ (d) 2

27. K_α wavelength emitted by an atom of atomic number *Z* = 11 is λ. Find the atomic number for an atom that emits K_α radiation with wavelength 4λ.

[MP PET 1999] [IIT-JEE (Screening) 2005]

(a) *Z* = 6 (b) *Z* = 4

(c) *Z* = 11 (d) *Z* = 44

28. The potential energy of a particle of mass *m* is given by

$$U(x) = \begin{cases} E_0; & 0 \le x \le 1 \\ 0; & x > 1 \end{cases}$$

[IIT 1997 Cancelled]

λ_1 and λ_2 are the de-Broglie wavelengths of the particle, when $0 \le x \le 1$ and $x > 1$ respectively. If the total energy of particle is $2E_0$, the ratio $\frac{\lambda_1}{\lambda_2}$ will be

[IIT-JEE (Screening) 2000]

[Based on IIT-JEE (Mains) 2005]

(a) 2 (b) 1

(c) $\sqrt{2}$ (d) $\frac{1}{\sqrt{2}}$

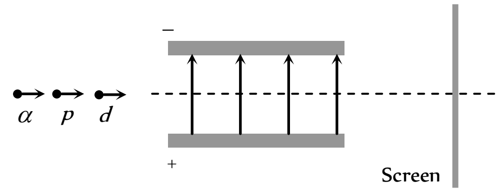
29. Rest mass energy of an electron is 0.51 *MeV*. If this electron is moving with a velocity 0.8 *c* (where *c* is velocity of light in vacuum), then kinetic energy of the electron should be.

[EAMCET (Eng.) 2000]

(a) 0.28 *MeV* (b) 0.34 *MeV*

(c) 0.39 *MeV* (d) 0.46 *MeV*

30. A proton, a deutron and an α-particle having the same momentum, enters a region of uniform electric field between the parallel plates of a capacitor. The electric field is perpendicular to the initial path of the particles. Then the ratio of deflections suffered by them is



(a) 1 : 2 : 8 (b) 1 : 2 : 4

(c) 1 : 1 : 2 (d) None of these

31. In order to coincide the parabolas formed by singly ionised ions in one spectrograph and doubly ionized ions in the other Thomson's mass spectrograph, the electric fields and magnetic fields are kept in the ratios 1 : 2 and 3 : 2 respectively. Then the ratio of masses of the ions is

(a) 3 : 4 (b) 1 : 3

(c) 9 : 4 (d) None of these

32. Let λ_α, λ_β and λ'_α denote the wavelengths of the X-rays of the K_α, K_β and L_α lines in the characteristic X-rays for a metal

(a) $\lambda_\alpha > \lambda'_\alpha > \lambda_\beta$ (b) $\lambda'_\alpha > \lambda_\beta > \lambda_\alpha$

(c) $\frac{1}{\lambda_\beta} = \frac{1}{\lambda_\alpha} + \frac{1}{\lambda'_\alpha}$ (d) $\frac{1}{\lambda_\alpha} + \frac{1}{\lambda_\beta} = \frac{1}{\lambda'_\alpha}$

33. The minimum intensity of light to be detected by human eye is $10^{-10} W/m^2$. The number of photons of wavelength $5.6 \times 10^{-7} m$ entering the eye, with pupil area $10^{-6} m^2$, per second for vision will be nearly

(a) 100 (b) 200

(c) 300 (d) 400

34. In X-ray tube when the accelerating voltage V is halved, the difference between the wavelength of K_α line and minimum wavelength of continuous *X*-ray spectrum

(a) Remains constant

(b) Becomes more than two times

(c) Becomes half

(d) Becomes less than two times

35. In a photocell bichromatic light of wavelength 2475 Å and 6000 Å are incident on cathode whose work function is 4.8 *eV*. If a uniform magnetic field of 3 × 10 *Tesla* exists parallel to the plate, the radius of the path describe by the photoelectron will be (mass of electron = 9 × 10 *kg*)

(a) 1 *cm* (b) 5 *cm*

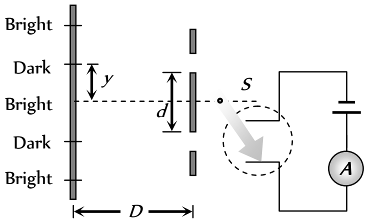
(c) 10 *cm* (d) 25 *cm*

36. Two metallic plates *A* and *B*, each of area 5 × 10 *m* are placed parallel to each other at a separation of 1 *cm*. Plate *B* carries a positive charge of 33.7 *pc*. A monochromatic beam of light, with photons of energy 5 *eV* each, starts falling on plate *A* at *t* = 0, so that 10 photons fall on it per square meter per second. Assume that one photoelectron is emitted for every 10 incident photons. Also assume that all the emitted photoelectrons are collected by plate *B* and the work function of plate *A* remains constant at the value 2 *eV*. Electric field between the plates at the end of 10 seconds is

(a) 2 × 10 *N/C* (b) 10 *N/C*

(c) 5 × 10 *N/C* (d) Zero

37. In the following arrangement *y* = 1.0 *mm*, *d* = 0.24 *mm* and *D* = 1.2 *m*. The work function of the material of the emitter is 2.2 *eV*. The stopping potential *V* needed to stop the photo current will be



(a) 0.9 *V* (b) 0.5 *V*

(c) 0.4 *V* (d) 0.1 *V*

38. The eye can detect 5 × 10 photons per square metre per sec of green light (λ = 5000 Å) while the ear can detect $10^{-13} (W/m^2)$. The factor by which the eye is more sensitive as a power detector than the ear is close to

(a) 5 (b) 10

(c) 10 (d) 15

39. A photon collides with a stationary hydrogen atom in ground state inelastically. Energy of the colliding photon is 10.2 *eV*. After a time interval of the order of micro second another photon collides with same hydrogen atom inelastically with an energy of 15 *eV*. What will be observed by the detector **[IIT-JEE (Screening) 2005]**

(a) 2 photon of energy 10.2 *eV*

(b) 2 photon of energy of 1.4 *eV*

(c) One photon of energy 10.2 *eV* and an electron of energy 1.4 *eV*

(d) One photon of energy 10.2 *eV* and another photon of 1.4 *eV*

GQ Graphical Questions

1. The curve drawn between velocity and frequency of photon in vacuum will be a **[MP PET 2000]**

(a) Straight line parallel to frequency axis

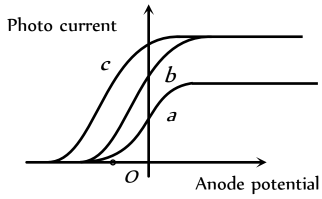
(b) Straight line parallel to velocity axis

(c) Straight line passing through origin and making an angle of 45° with frequency axis

(d) Hyperbola

2. Which of the following figure represents the variation of particle momentum and the associated de-Broglie wavelength

(a) 
(b) 
(c) 
(d) 
3. The figure shows the variation of photocurrent with anode potential for a photo-sensitive surface for three different radiations. Let I_a, I_b and I_c be the intensities and f_a, f_b and f_c be the frequencies for the curves *a*, *b* and *c* respectively **[IIT-JEE (Screening) 2004]**



(a) $f_a = f_b$ and $I_a \neq I_b$

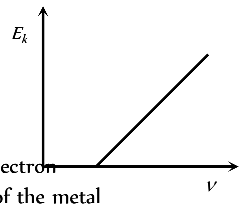
(b) $f_a = f_c$ and $I_a = I_c$

(c) $f_a = f_b$ and $l_a = l_b$

(d) $f_a = f_b$ and $l_a = l_b$

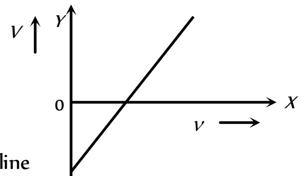
4. According to Einstein's photoelectric equation, the graph between the kinetic energy of photoelectrons ejected and the frequency of incident radiation is [MP PMT 1994; CBSE PMT 1996; CBSE PMT 2004]

(a) 
(b) 
(c) 
(d) 
5. For the photoelectric effect, the maximum kinetic energy E_k of the emitted photoelectrons is plotted against the frequency ν of the incident photons as shown in the figure. The slope of the curve gives [CPMT 1987; MP PET 2001; DPMT 2002]



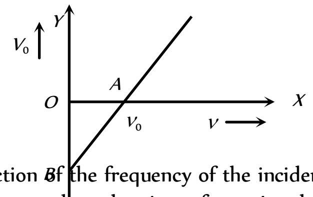
(a) Charge of the electron
(b) Work function of the metal
(c) Planck's constant
(d) Ratio of the Planck's constant to electronic charge

6. The stopping potential V for photoelectric emission from a metal surface is plotted along Y-axis and frequency ν of incident light along X-axis. A straight line is obtained as shown. Planck's constant is given by [CPMT 1987; Similar to MP PMT 2000; Kerala PET 2001]



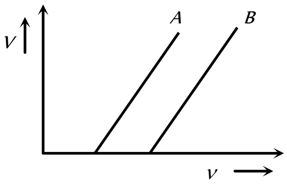
(a) Slope of the line
(b) Product of slope on the line and charge on the electron
(c) Product of intercept along Y-axis and mass of the electron
(d) Product of Slope and mass of electron

7. In an experiment on photoelectric effect the frequency f of the incident light is plotted against the stopping potential V_0. The work function of the photoelectric surface is given by (e is electronic charge) [CPMT 1987]



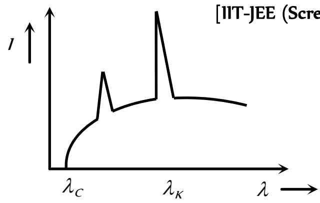
(a) $OB \times e$ in eV
(b) OB in *volt*
(c) OA in eV
(d) The slope of the line AB

8. The stopping potential as a function of the frequency of the incident radiation is plotted for two different photoelectric surfaces A and B. The graphs show that work function of A is



(a) Greater than that of B
(b) Smaller than that of B
(c) Equal to that of B
(d) No inference can be drawn about their work functions from the given graphs

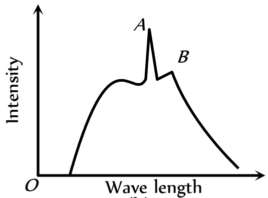
9. The intensity of X-rays from a Coolidge tube is plotted against wavelength as shown in the figure. The minimum wavelength found is λ_c and the wavelength of the K_α line is λ_k. As the accelerating voltage is increased [IIT-JEE (Screening) 2001]



(a) $(\lambda_K - \lambda_C)$ increases (b) $(\lambda_K - \lambda_C)$ decreases

(c) λ_K increases (d) λ_K decreases

10. The figure represents the observed intensity of X-rays emitted by an X-ray tube as a function of wavelength. The sharp peaks A and B denote [CBSE PMT 1995]



(a) Band spectrum (b) Continuous spectrum
(c) Characteristic radiations (d) White radiations

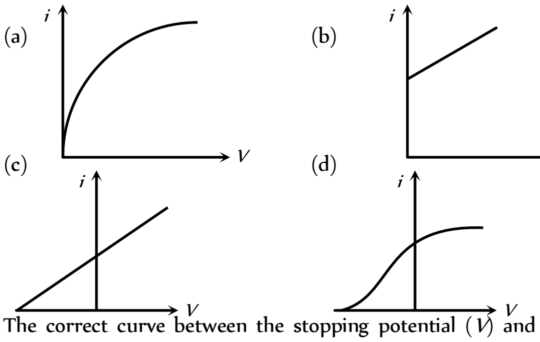
11. The graph between intensity of light falling on a metallic plate (I) with the current (i) generated is [DCE 2001]

(a) 
(b) 
(c) 
(d) 
12. For a photoelectric cell the graph showing the variation of cut of voltage (V) with frequency (ν) of incident light is best represented by [DCE 2001; MP PET 2003]

(a) 
(b) 
[DPMT 1992]

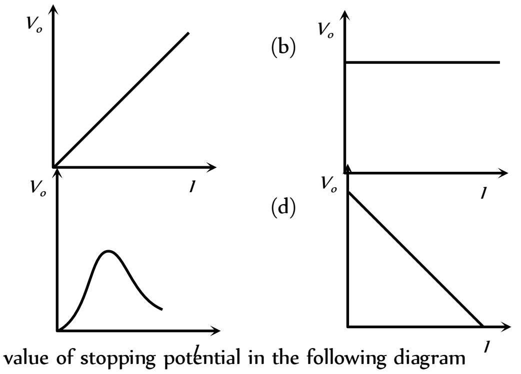
(c) 
(d) 
13. The curve between current (i) and potential difference (V) for a photo cell will be

(a) (b) (c) (d)

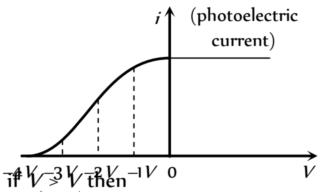


14. The correct curve between the stopping potential (V) and intensity of incident light (I) is

(a) (b) (c) (d)

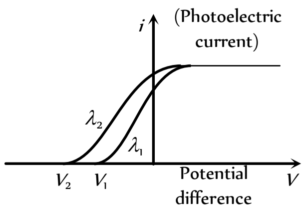


15. The value of stopping potential in the following diagram



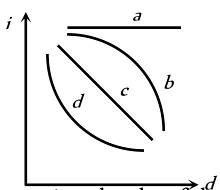
(a) – 4V
(b) – 3 V
(c) – 2V
(d) – 1 V

16. In the following diagram if $V_2 > V_1$ then



(a) $\lambda_1 = \sqrt{\lambda_2}$
(b) $\lambda_1 < \lambda_2$
(c) $\lambda_1 = \lambda_2$
(d) $\lambda_1 > \lambda_2$

17. A point source of light is used in an experiment on photoelectric effect. Which of the following curves best represents the variation of photo current (i) with distance (d) of the source from the emitter

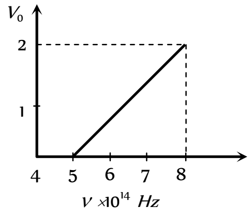


(a) a
(b) b
(c) c
(d) d

18. According to Einstein's photoelectric equation, the plot of the kinetic energy of the emitted photo electrons from a metal versus the frequency, of the incident radiation gives a straight line whose slope

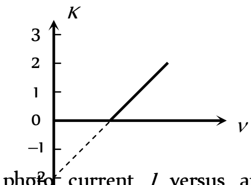
(a) Is the same for all metals and independent of the intensity of the radiation
(b) Depends on the intensity of the radiation
(c) Depends both on the intensity of the radiation and the metal used
(d) Depends on the nature of the metals used

19. The stopping potential (V_0) versus frequency (ν) plot of a substance is shown in figure the threshold wave length is



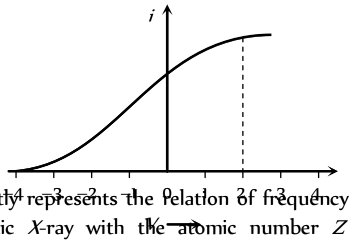
(a) $5 \times 10^{14} m$
(b) 6000Å
(c) 5000 Å
(d) Can not be estimated from given data

20. Figure represents a graph of kinetic energy (K) of photoelectrons (in eV) and frequency (ν) for a metal used as cathode in photoelectric experiment. The work function of metal is



(a) 1 eV
(b) 1.5 eV
(c) 2 eV
(d) 3 eV

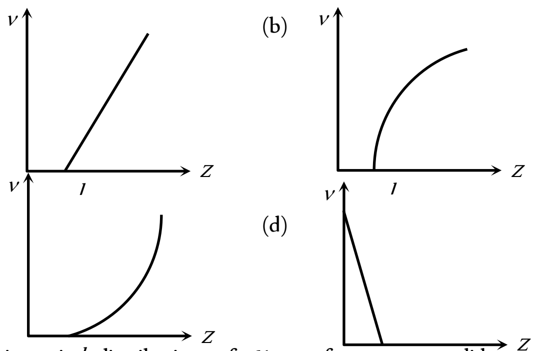
21. Figure represents the graph of photo current I versus applied voltage (V). The maximum energy of the emitted photoelectrons is



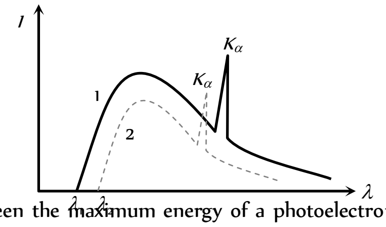
(a) 2eV
(b) 4 eV
(c) 0 eV
(d) 4 J

22. The graph that correctly represents the relation of frequency ν of a particular characteristic X-ray with the atomic number Z of the material is

(a) (b) (c) (d)

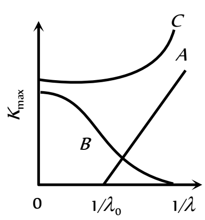


23. The intensity distribution of X-rays from two coolidge tubes operated on different voltages V_1 and V_2 and using different target materials of atomic numbers Z_1 and Z_2 is shown in the figure. Which one of the following inequalities is true? [AIEEE 2004]



(a) $V_1 > V_2, Z_1 < Z_2$
(b) $V_1 > V_2, Z_1 > Z_2$
(c) $V_1 < V_2, Z_1 > Z_2$
(d) $V_1 = V_2, Z_1 < Z_2$

24. The correct graph between the maximum energy of a photoelectron and the inverse of wavelength of the incident radiation is given by the curve



(a) A
(b) B
(c) C
(d) None of the above

(a) A

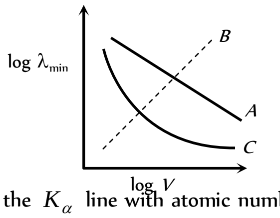
(b) B

(c) C

(d) None of the above

25. The continuous x-ray spectrum obtained from a Coolidge tube is of the form

(a) 
(b) 
(c) 
(d) 
26. The dependence of the short wavelength limit $\lambda_{\min}$ on the accelerating potential V is represented by the curve of figure



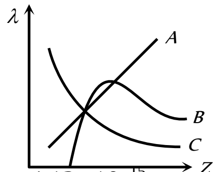
(a) A

(b) B

(c) C

(d) None of these

27. The variation of wavelength λ of the K_α line with atomic number Z of the target is shown by the following curve of



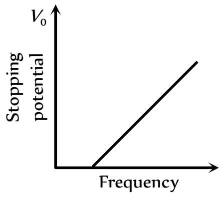
(a) A

(b) B

(c) C

(d) None of these

28. In the graph given below. If the slope is 4.12×10^{-15} V-sec, then value of 'h' should be



(a) 6.6×10^{-31} J-sec

(b) 6.6×10^{-34} J-sec

(c) $9.1 \times 10 - 31$ J-sec

(d) None of these

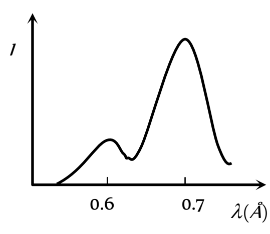
29. The curves (a), (b) (c) and (d) show the variation between the applied potential difference (V) and the photoelectric current (i), at two different intensities of light ($I_1 > I_2$). In which figure is the correct variation shown

(a) 
(b) 
(c) 
(d) 
30. The figure showing the correct relationship between the stopping potential V_0 and the frequency ν of light for potassium and tungsten is

(a) 
(b) 
(c) 
(d) 
31. The log-log graph between the energy E of an electron and its de-Broglie wavelength λ will be

(a) 
(b) 
(c) 
(d) 
32. The graph between the square root of the frequency of a specific line of characteristic spectrum of X-rays and the atomic number of the target will be

(a) 
(b) 
(c) 
(d) 
33. In the diagram a graph between the intensity of X-rays emitted by a molybdenum target and the wavelength is shown, when electrons of 30 keV are incident on the target. In the graph one peak is of K_α line and the other peak is of K_β line



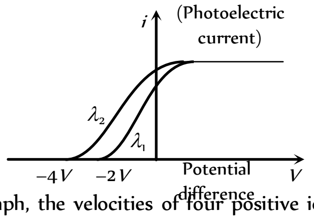
(a) First peak is of K_α line at 0.6 Å

(b) Highest peak is of K_α line at 0.7 Å

(c) If the energy of incident particles is increased, then the peaks will shift towards left

(d) If the energy of incident particles is increased, then the peaks will shift towards right

34. The maximum value of stopping potential in the following diagram is



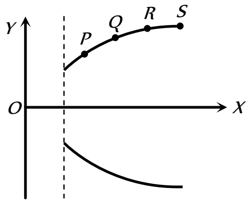
(a) – 4 V

(b) – 1 V

(c) – 3 V

(d) – 2 V

35. In a parabola spectrograph, the velocities of four positive ions P,Q,R and S are v_1, v_2, v_3 and v_4 respectively



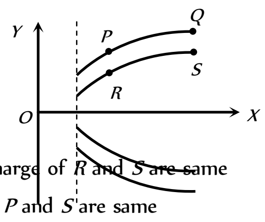
(a) $v_1 > v_2 > v_3 > v_4$

(b) $v_1 < v_2 < v_3 < v_4$

(c) $v_1 = v_2 = v_3 = v_4$

(d) $v_1 << v_2 > v_3 < v_4$

36. In Thomson spectrograph experiment, four positive ions P,Q,R and S are situated on Y-X curve a shown in the figure



(a) The specific charge of R and S are same

(b) The masses of P and S are same

(c) The specific charges of Q and R are same

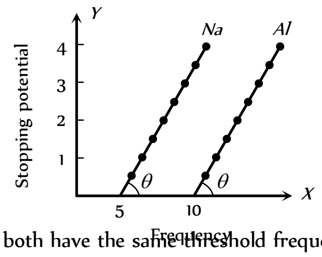
(d) The velocities of R and S are same

37. The slope of frequency of incident light and stopping potential graph for a given surface will be [MP PET 1999; MP PMT 2000; JIPMER 2001, 02; UPSEAT 2003]

(a) h (b) h/e

(c) eh (d) e

38. From the figure describing photoelectric effect we may infer correctly that [KCET 2005]



(a) Na and Al both have the same threshold frequency

(b) Maximum kinetic energy for both the metals depend linearly on the frequency

(c) The stopping potentials are different for Na and Al for the same change in frequency

(d) Al is a better photo sensitive material than Na

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) *If both assertion and reason are true and the reason is the correct explanation of the assertion.*
(b) *If both assertion and reason are true but reason is not the correct explanation of the assertion.*
(c) *If assertion is true but reason is false.*
(d) *If the assertion and reason both are false.*
(e) *If assertion is false but reason is true.*

1. Assertion : The energy (E) and momentum (p) of a photon are related by $p = E/c$.

Reason : The photon behaves like a particle. [AIIMS 2005]

2. Assertion : Photoelectric effect demonstrates the wave nature of light.

Reason : The number of photoelectrons is proportional to the frequency of light. [AIIMS 2004]

3. Assertion : When the speed of an electron increases its specific charge decreases.

Reason : Specific charge is the ratio of the charge to mass. [AIIMS 2001]

4. Assertion : X-ray travel with the speed of light.

Reason : X-rays are electromagnetic rays. [AIIMS 2001]

5. Assertion : Mass of moving photon varies inversely as the wavelength.

Reason : Energy of the particle $= \text{Mass} \times (\text{Speed of light})^2$ [AIIMS 2000]

6. Assertion : Kinetic energy of photo electrons emitted by a photosensitive surface depends upon the intensity of incident photon.

Reason : The ejection of electrons from metallic surface is possible with frequency of incident photon below the threshold frequency. [AIIMS 1999]

7. Assertion : Separation of isotope is possible because of the difference in electron numbers of isotope.

Reason : Isotope of an element can be separated by using a mass spectrometer. [AIIMS 1999]

8. Assertion : The specific charge of positive rays is not constant.

Reason : The mass of ions varies with speed. [AIIMS 1999]

9. Assertion : Photosensitivity of a metal is high if its work function is small.

Reason : Work function $= hf_0$ where f_0 is the threshold frequency. [AIIMS 1997]

10. Assertion : The de-Broglie wavelength of a molecule varies inversely as the square root of temperature.

Reason : The root mean square velocity of the molecule depends on the temperature.

[AIIMS 1997]

11. Assertion : An electron is not deflected on passing through certain region of space. This observation confirms that there is no magnetic field in that region.

Reason : The deflection of electron depends on angle between velocity of electron and direction of magnetic field.

12. Assertion : Electric conduction in gases is possible at normal pressure.

Reason : The electric conduction in gases depends only upon the potential difference between the electrodes.

13. Assertion : Light is produced in gases in the process of electric discharge through them at high pressure.

Reason : At high pressure electrons of gaseous atoms collide and reach and excited state.

14. Assertion : If different gases are filled turn by turn at the same pressure in the discharge tube the discharge in them takes place at the same potential.

Reason : The discharge depends only on the pressure of discharge tube and not on the ionisation potential of gas.

15. Assertion : An electric field is preferred in comparison to magnetic field for detecting the electron beam in a television picture tube.

Reason : Electric field require low voltage.

16. Assertion : The specific charge for positive rays is a characteristic constant.

Reason : The specific charge depends on charge and mass of positive ions present in positive rays.

17. Assertion : In Millikan's experiment for the determination of charge on an electron, oil drops of any size can be used.

Reason : Millikan's experiment determine the charge on electron, by simply measuring the terminal velocity.

18. Assertion : In the process of photoelectric emission, all the emitted photoelectrons have the same kinetic energy.

Reason : The photon transfers its whole energy to the electron of the atom in photoelectric effect.

19. Assertion : In photoelectric effect, on increasing the intensity of light, both the number of electrons emitted and kinetic energy of each of them get increased but photoelectric current remains unchanged.

Reason : The photoelectric current depends only on wavelength of light.

20. Assertion : Though light of a single frequency (monochromatic) is incident on a metal, the energies of emitted photoelectrons are different.

Reason : The energy of electrons emitted from inside the metal surface is lost in collision with the other atoms in the metal.

21. Assertion : The threshold frequency of photoelectric effect supports the particle nature of sunlight.

Reason : If frequency of incident light is less than the threshold frequency, electrons are not emitted from metal surface.

22. Assertion : In photoemissive cell inert gas is used.

Reason : Inert gas in the photoemissive cell gives greater current.

23. Assertion : *X*-rays cannot be diffracted by means of grating.

Reason : *X*-rays does not obey Bragg's law.

24. Assertion : *X*-rays can penetrate through the flesh but not through the bones.

Reason : The penetrating power of *X*-rays depends on voltage.

25. Assertion : Intensity of *X*-rays can be controlled by adjusting the filament current and voltage.

Reason : The intensity of *X*-rays does not depend on number of *X*-ray photons emitted per second from the target.

26. Assertion : Anode of Coolidge tube gets heated up at time of emission of *X*-rays.

Reason : The anode of Coolidge tube is made of a material of high melting point.

27. Assertion : Penetrating power of *X*-rays increases with the increasing the wavelength.

Reason : The penetrating power of *X*-rays increases with the frequency of *X*-rays.

28. Assertion : *X*-rays are used for studying the structure of crystals.

Reason : The distance between the atoms of crystals is of the order of wavelength of *X*-rays.

29. Assertion : The phenomenon of *X*-ray production is basically inverse of photoelectric effect.

Reason : *X*-rays are electromagnetic waves.

30. Assertion : Soft and hard *X*-rays differ in frequency as well as velocity.

Reason : The penetrating power of hard *X*-rays is more than the penetrating power of soft *X*-rays.

Answers and Solutions

Cathode Rays and Positive Rays

1. (b) Electric field $=\frac{V}{d}=\frac{250}{2.5\times10^{-2}}=10000\ V/m$.

2. (b)

3. (d) In Millikan's experiment, drops of non-volatile liquid (cloak oil) are used to prevent evaporation.

4. (b) $E=eV=2e\times5=10\ eV$

5. (d) $E=eV=1.6\times10^{-19}\times10^{5}=1.6\times10^{-14}\ J$

6. (a) Any charge in the universe is given by

$q=ne\Rightarrow e=\frac{q}{n}$ (where n is an integer)

$q_1:q_2:q_3:q_4:q_5:q_6::n_1:n_2:n_3:n_4:n_5:n_6$

$6.563:8.204:11.5:13.13:16.48:18.09::n_1:n_2:n_3:n_4:n_5:n_6$

Divide by 6.563

$1:1.25:1.75:2.0:2.5:2.75::n_1:n_2:n_3:n_4:n_5:n_6$

Multiplied by 4

$4:5:7:8:10:11::n_1:n_2:n_3:n_4:n_5:n_6$

$$e=\frac{q_1+q_2+q_3+q_4+q_5+q_6}{n_1+n_2+n_3+n_4+n_5+n_6}=\frac{73.967\times10^{-19}}{45}$$

$=1.641\times10^{-19}C$

(**Note :** If you take 45.0743 in place of 45, you will get the exact value)

7. (d) Because magnetic force always points perpendicular to the particle velocity. That is why velocity remains unchanged thereby keeping energy $\left(\frac{1}{2}mv^2\right)$ and momentum (mv) unchanged.

8. (b)

9. (c) Mass is basically a constant term for any physical application at low velocity. But in accordance with Einstein's theory of relativity, at higher speeds the mass of the particle change according to formula

$$m=\frac{m_0}{\sqrt{1-(v^2/c^2)}}$$

10. (b) Refer Q.No. 9. Here the velocity of electron increases, so as per Einstein's equation mass of the electron increases, hence the specific charge $\frac{e}{m}$ decreases.

11. (c) If the voltage given is V, then the energy of electron

$$\frac{1}{2}mv^2=eV\Rightarrow v=\sqrt{\frac{2eV}{m}}$$

$$=\sqrt{\frac{2\times1.6\times10^{-19}\times1000}{9.1\times10^{-31}}}=1.875\times10^{7}\approx1.9\times10^{7}m/s$$

12. (b)

13. (d) Momentum $p=mv$ and $v=\sqrt{\frac{2QV}{m}}$

$$\Rightarrow p=\sqrt{2QmV}\Rightarrow p\propto\sqrt{Qm}\Rightarrow\frac{p_e}{p_\alpha}=\sqrt{\frac{e\times m_e}{2e\times m_\alpha}}=\sqrt{\frac{m_e}{2m_\alpha}}$$

14. (b) In an electric field, a force opposite to the direction of electric field acts on negatively charged particles (*i.e.* from lower potential to higher potential).

15. (d)

16. (c) $QE=mg\Rightarrow Q=\frac{mg}{E}\Rightarrow n=\frac{mgd}{Ve}$

$$\Rightarrow n=\frac{1.8\times10^{-14}\times10\times0.9\times10^{-2}}{2\times10^{3}\times1.6\times10^{-19}}=5$$

17. (c)

18. (b) In Millikan's experiment, the charges present on the oil drops are the integral multiples, so $2e$ and $10e(1.6\times10^{-18}\ C)$ charges are present.

19. (c) $eE=evB\Rightarrow v=\frac{E}{B}=\frac{3\times10^{4}}{2\times10^{-3}}=1.5\times10^{7}m/s$

20. (b)

21. (b) Charged particles trace a circular path in a perpendicular magnetic field.

22. (c) $\frac{e}{m}=\frac{1.6\times10^{-19}}{9.1\times10^{-31}}=1.76\times10^{11}C/kg$

23. (c)

24. (d) Light consists of photons and cathode rays consists of electrons. However both effect the photographic plate.

25. (c)

26. (d)

27. (b) For ionisation, high energy electrons are required.

28. (b) $v=\frac{E}{B}=\frac{20}{0.5}=40\ m/\sec$.

29. (c) Higher the voltage, higher is the KE. Higher the work function, smaller is the KE.

30. (a) Time period of revolution of electron $T = \frac{2\pi}{\omega} = \frac{2\pi r}{v}$

Hence corresponding electric current $i = \frac{e}{T} = \frac{ev}{2\pi r}$

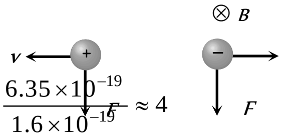
$\Rightarrow i = \frac{1.6\times10^{-19}\times2\times10^{6}}{2\times3.14\times0.5\times10^{-10}} = 1\,mA.$

31. (a) $K = Q.V = 1.6\times10^{-19}\times100 = 1.6\times10^{-17}$ $Joules$

32. (c) $K = Q.V = 1e\times1\,Volt = 1\,e\,V$

33. (a) Kinetic energy $\propto$ Potential difference

34. (a) In discharge tube cathode rays (a beam of negative particles) and canal rays (positive rays) moves opposite to each other. They will experience a magnetic force in the same direction, if a normal magnetic field is switched on



35. (b) $n = \frac{Q}{e} = \frac{6.35\times10^{-19}}{1.6\times10^{-19}} \approx 4$

36. (b)

37. (a) When cathode rays strike the metal plate, they transfer their energy to plate.

38. (d) Cathode rays are beam of electrons.

39. (b) $K = QV = e\times V = eV$

40. (a) $\frac{1}{2}mv^2 = QV \Rightarrow v = \sqrt{\frac{2QV}{m}} = \sqrt{2\left(\frac{e}{m}\right)V}$

$\Rightarrow v = \sqrt{2\times1.6\times10^{11}\times200} = 8\times10^{6}\,m/s$.

41. (c) Speed of the cathode rays is $10^7\,m/\sec - 3\times10^7\,m/s$

42. (d) $QE = mg \Rightarrow mg = \frac{QV}{d}$

43. (d)

44. (c) In the condition of no deflection $\frac{e}{m} = \frac{E^2}{2VB^2} \Rightarrow$ If m is increased by 208 times then B should be increased $\sqrt{208} = 14.4$ times

45. (b) The colour of the positive column in a discharge tube depends on the type of gas e.g. For air, colour is purple red, for H_2, colour is Blue etc.

46. (c)

47. (a) $v = \frac{p}{m} = \frac{h}{m\lambda} = \frac{6.6\times10^{-34}}{9.1\times10^{-31}\times10^{-10}} = 7.25\times10^{6}\ m/s$

48. (d) Cathode rays are stream of negative charged particle, so they deflect in electric field.

49. (c) $\frac{e}{m} = \frac{E^2}{2VB^2} = \frac{(3.6\times10^4)^2}{2\times2.5\times10^3\times(1.2\times10^{-3})^2}$

$= 1.8\times10^{11}\,C/kg$.

50. (c) Specific charge $= \frac{q}{m}$; Ratio $= \frac{\left(\frac{q}{m}\right)_\alpha}{\left(\frac{q}{m}\right)_p} = \frac{q_\alpha}{q_p}\times\frac{m_p}{m_\alpha} = \frac{1}{2}$.

51. (c) $v = \frac{E}{B}$; where $E = \frac{V}{d} = \frac{1000}{1\times10^{-2}} = 10^5\ V/m$

$\Rightarrow v = \frac{10^5}{1} = 10^5\,m/s$.

52. (b)

53. (b)

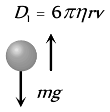
54. (b)

55. (d) In Thomson's mass spectrograph $\vec{E}\,||\,\vec{B}$

56. (d)

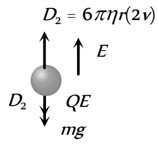
57. (c) In the absence of electric field (*i.e.* $E = 0$)

$mg = 6\pi\eta rv$ ...(i)



In the presence of Electric field

$mg + QE = 6\pi\eta r(2v)$ ...(ii)

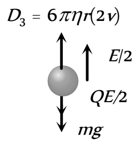


When Electric field to reduced to $E/2$

$mg + Q(E/2) = 6\pi\eta r(v')$ ...(iii)

After solving (i), (ii) and (iii)

We get $v' = \frac{3}{2}v$



58. (a) $v = \sqrt{\frac{2eV}{m}} = \sqrt{\frac{2\times1.6\times10^{-19}\times45.5}{9.1\times10^{-31}}} = 4\times10^{6}\ m/s$

59. (b) $i = \frac{Q}{t} = \frac{ne}{t} = 1.8\times10^{14}\times1.6\times10^{-19} = 28.8\times10^{-6}\,A$

$= 29\,\mu A$

60. (a) $\because\ m_e < m_p < m_\alpha \Rightarrow \left(\frac{q}{m}\right)_e > \left(\frac{q}{m}\right)_p > \left(\frac{q}{m}\right)_\alpha$

61. (b) Acceleration $a = \frac{QE}{m} = \frac{(3e)E}{2m}$

62. (b) $\frac{1}{2}mv^2 = eV \Rightarrow \frac{e}{m} = \frac{v^2}{2V} = \frac{(8.4\times10^6)^2}{2\times200} = 1.76\times10^{11}\,\frac{C}{kg}$.

63. (c) $K = Q.\Delta V = (2e)\times10^6\,V = 2\times10^6\,eV = 2M\,eV$

64. (c) Positive rays consist of positive ions.

65. (b) $2r = \frac{2mv}{qB} \Rightarrow 2r \propto \frac{m}{q} \Rightarrow \frac{m}{q}$ is maximum for C^+

66. (b) $v = \frac{E}{B} = \frac{1.125\times10^{-6}}{3\times10^{-10}} = 3750\,m/s$

67. (a) Positive rays was discovered by J.J. Thomson.

68. (a)

69. (d) If electron oscillate with a frequency of 1 *GHz*, it does not radiate any energy, which corresponds a definite wavelength. It only radiate when it jump from one orbit to another orbit.

70. (b) $eV = \frac{1}{2}mv^2 \Rightarrow v^2 = \frac{2eV}{m} \Rightarrow v = \sqrt{\frac{2eV}{m}}$

71. (a)

72. (c) $eE = mg \Rightarrow e = \frac{mg}{E} = \frac{16\times10^{-6}\times10}{10^6} = 16\times10^{-11}\ C.$

Matter Waves

1. (b)

2. (c) According to de-Broglie hypothesis.

3. (a) $\lambda = \frac{h}{p} = \frac{h}{mv}$

4. (a) $\lambda = \frac{h}{mv} = \frac{h}{\sqrt{2mE}}$: $\therefore E = \frac{h^2}{2m\lambda^2}$

λ is same for all, so $E \propto \frac{1}{m}$. Hence energy will be maximum for particle with lesser mass.

5. (a) Particle is photon and it travels with the velocity equal to light in vacuum.

6. (b) $\lambda = \frac{h}{p} = \frac{h}{\sqrt{2mE}}$; $\therefore \lambda \propto \frac{1}{\sqrt{E}}$ (h and m = constant)

7. (a) $\lambda = \frac{h}{m_1v_1} = \frac{h}{m_2v_2}$; $\therefore \frac{v_1}{v_2} = \frac{m_2}{m_1} = \frac{4}{1}$

8. (a) $\frac{1}{2}mv^2 = E \Rightarrow mv = \sqrt{2mE}$; $\therefore \lambda = \frac{h}{mv} = \frac{h}{\sqrt{2mE}}$

9. (d) $\left.\begin{matrix}\text{Photoelectric effect} \rightarrow \text{Particle nature} \\ \text{Diffraction} \rightarrow \text{Wave nature}\end{matrix}\right\}\text{Dual nature}$

10. (a) $mvr = \frac{nh}{2\pi}$ According to Bohr's theory

$\Rightarrow 2\pi r = n\left(\frac{h}{mv}\right) = n\lambda$ for $n = 1$, $\lambda = 2\pi r$

11. (b) $\lambda = \frac{h}{\sqrt{2mE}} \Rightarrow \lambda \propto \frac{1}{\sqrt{m}}$ (E = same)

12. (a) $\lambda = \frac{h}{\sqrt{2mE}} \Rightarrow \lambda \propto \frac{1}{\sqrt{m}} \Rightarrow \frac{\lambda_p}{\lambda_\alpha} = \sqrt{\frac{m_\alpha}{m_p}} = \frac{2}{1}$

13. (c) $\lambda = \frac{h}{\sqrt{2mE}} = \frac{h}{\sqrt{2m_\alpha Q_\alpha V}}$

On putting $Q_\alpha = 2\times1.6\times10^{-19}\ C$

$m_\alpha = 4m_p = 4\times1.67\times10^{-27}\ kg \Rightarrow \lambda = \frac{0.101}{\sqrt{V}}\ Å$

14. (b)

15. (b) $\lambda = \frac{h}{\sqrt{2mE}} \Rightarrow \lambda \propto \frac{1}{\sqrt{E}} \Rightarrow \frac{\lambda_1}{\lambda_2} = \sqrt{\frac{E_2}{E_1}}$

$\Rightarrow \frac{10^{-10}}{0.5\times10^{-10}} = \sqrt{\frac{E_2}{E_1}} \Rightarrow E_2 = 4E_1$

Hence added energy $= E_2 - E_1 = 3E_1$

16. (d) $\lambda = \frac{h}{\sqrt{2mE}} = \frac{6.6\times10^{-34}}{\sqrt{2\times9\times10^{-31}\times80\times1.6\times10^{-19}}} = 1.4Å$

17. (c) $\lambda = \frac{h}{mv} \Rightarrow \lambda \propto \frac{1}{m}$

18. (b) If an electron and a photon propagates in the from of waves having the same wavelength, it implies that they have same momentum. This is according to de-Broglie equation, $p \propto \frac{1}{\lambda}$

19. (c) $\lambda = \frac{h}{p} \Rightarrow \lambda \propto \frac{1}{p}$

20. (d) In photoelectric effect particle nature of electron is shown. While in electron microscope, beam of electron is considered as electron wave.

21. (b) $K_{\text{particle}} = \frac{1}{2}mv^2$ also $\lambda = \frac{h}{mv}$

$\Rightarrow K_{\text{particle}} = \frac{1}{2}\left(\frac{h}{\lambda v}\right).v^2 = \frac{vh}{2\lambda}$ ...(i)

$K_{\text{photon}} = \frac{hc}{\lambda}$ ...(ii)

$\therefore \frac{K_{\text{particle}}}{K_{\text{photon}}} = \frac{v}{2c} = \frac{2.25\times10^8}{2\times3\times10^8} = \frac{3}{8}$

22. (c) $2\pi r n = \lambda \Rightarrow n = \frac{\lambda}{2\pi r} = \frac{10^{-9}}{2\times3.14\times5.13\times10^{-11}} = 3$

23. (a) By using $\lambda_{electron} = \frac{h}{m_e v} \Rightarrow v = \frac{h}{m_e\lambda_e}$

$= \frac{6.6\times10^{-34}}{9.1\times10^{-31}\times10^{-10}} = 7.25\times10^6\ m/s.$

24. (a) By using $\lambda = \frac{h}{\sqrt{2mE}}$ $E = 10^{-32}\ J$ = Constant for both particles. Hence $\lambda \propto \frac{1}{\sqrt{m}}$ Since $m_p > m_e$ so $\lambda_p < \lambda_e$.

25. (b) By using $\lambda \propto \frac{1}{\sqrt{V}} \Rightarrow \frac{\lambda_1}{\lambda_2} = \sqrt{\frac{V_2}{V_1}}$

$\Rightarrow \frac{10^{-10}}{\lambda_2} = \sqrt{\frac{600}{150}} = 2 \Rightarrow \lambda_2 = 0.5\ Å.$

26. (b) $\lambda = \frac{h}{mv_{rms}} \Rightarrow \lambda = \frac{6.6\times10^{-34}}{2\times1.67\times10^{-27}\times3\times10^3} = 0.66\ Å$

27. (c) $\lambda \propto \frac{1}{p} \Rightarrow \frac{\Delta p}{p} = -\frac{\Delta\lambda}{\lambda} \Rightarrow \left|\frac{\Delta p}{p}\right| = \left|\frac{\Delta\lambda}{\lambda}\right|$

$\Rightarrow \frac{p_0}{p} = \frac{0.25}{100} = \frac{1}{400} \Rightarrow p = 400\ p_0.$

28. (a) $\lambda_{neutron} \propto \frac{1}{\sqrt{T}} \Rightarrow \frac{\lambda_1}{\lambda_2} = \sqrt{\frac{T_2}{T_1}}$

$\Rightarrow \frac{\lambda}{\lambda_2} = \sqrt{\frac{(273+927)}{(273+27)}} = \sqrt{\frac{1200}{300}} = 2 \Rightarrow \lambda_2 = \frac{\lambda}{2}.$

29. (d) $\lambda = \frac{h}{\sqrt{2mE}} \Rightarrow E \propto \frac{1}{\sqrt{m}}$ (λ = constant)

$\because m_e < m_p$ so $E_e > E_p$

30. (b)

31. (a) Wavelength of photon will be greater than that of electron because mass of photon is less than that of electron $\Rightarrow \lambda_{ph} > \lambda_e$

32. (b) $\lambda = \frac{h}{\sqrt{2mE}} \Rightarrow E = \frac{h^2}{2m\lambda^2}$

$= \frac{(6.6\times10^{-34})^2}{2\times9.1\times10^{-31}\times(0.3\times10^{-9})^2} = 2.65\times10^{-18}\,J$

$= 16.8\,eV$

33. (c) $\lambda = \frac{h}{\sqrt{2mQV}} \Rightarrow \lambda \propto \frac{1}{\sqrt{mQ}} \Rightarrow \frac{\lambda_p}{\lambda_\alpha} = \sqrt{\frac{m_\alpha Q_\alpha}{m_p Q_p}}$

$= \sqrt{\frac{4m_p\times2Q_p}{m_p\times Q_p}} = 2\sqrt{2}$

34. (a) $\lambda = \frac{h}{p} \Rightarrow p = \frac{h}{\lambda} = \frac{6.63\times10^{-34}}{2\times10^{-6}}$

$= 3.31\times10^{-28}\,kg\text{-}m/\sec$

35. (a) $\lambda = \frac{h}{mv} = \frac{6.6\times10^{-34}}{1\times2000} = 3.3\times10^{-37}m = 3.3\times10^{-27}\,Å$

36. (a) $\lambda = \frac{h}{\sqrt{2mE}} = \frac{6.6\times10^{-34}}{\sqrt{2\times9.1\times10^{-31}\times5\times1.6\times10^{-19}}}$

$= 5.469\times10^{-10}m = 5.47\,Å$

37. (c) $\lambda = \frac{h}{\sqrt{2mQV}} = \frac{6.6\times10^{-34}}{\sqrt{2\times9.1\times10^{-31}\times1.6\times10^{-19}\times100}}$

$= 1.23\,Å$

38. (c) The De-Broglie wavelength is $\lambda = \frac{h}{|p|} = \frac{h}{|I|} \Rightarrow \lambda \propto \frac{1}{|I|}$

39. (d) Davission and Germer proved the wave nature of electron by performing an experiment.

40. (a) $\lambda = \frac{h}{\sqrt{2mE}} \Rightarrow \lambda \propto \frac{1}{\sqrt{E}}$.

41. (d) $\lambda = \frac{\hbar}{\sqrt{2mE}}$; $\frac{\lambda'}{\lambda} = \sqrt{\frac{E}{E'}} \Rightarrow \frac{E}{E} = \left(\frac{0.5}{1}\right)^2 \Rightarrow E' = \frac{E}{0.25} = 4E$

The energy should be added to decrease wavelength.

$= E' - E = 3E$

42. (d)

43. (d)

Photon and Photoelectric Effect

1. (d) $p = \frac{h\nu}{c} \Rightarrow \nu = \frac{pc}{h} = \frac{3.3\times10^{-29}\times3\times10^8}{6.6\times10^{-34}} = 1.5\times10^{13}\,Hz$

2. (d)

3. (c) $p = \frac{E}{c} \Rightarrow E = p\times c = 2\times10^{-16}\times(3\times10^{10}) = 6\times10^{-6}\,erg.$

4. (a)

5. (a) $p = \frac{h}{\lambda} = \frac{6.6\times10^{-34}}{(5000\times10^{-10})} = 1.3\times10^{-27}\,kg\text{ - }m/s$

6. (b) $p = \frac{E}{c} = \frac{h\nu}{c}$

7. (d) $E = h\nu = mc^2 \Rightarrow m = \frac{h\nu}{c^2}$

8. (b) $p = \frac{E}{c} = \frac{h\nu}{c} \Rightarrow \nu = \frac{pc}{h}$

9. (b) $P = \frac{W}{t} = \frac{nhc}{\lambda t} \Rightarrow \left(\frac{n}{t}\right) = \frac{P\lambda}{hc} = \frac{10\times10^3\times300}{6.6\times10^{-34}\times3\times10^8}$

$= 1.5\times10^{31}$

10. (a) Momentum of photon $p = \frac{E}{c}$

$\Rightarrow$ Velocity of photon $c = \frac{E}{p}$

11. (b) By using $E(eV) = \frac{12375}{\lambda(Å)}$

$\Rightarrow \lambda = \frac{12375}{2.48} = 4989.9\,Å \approx 5000\,Å$

12. (b) $E = \frac{hc}{\lambda} = \frac{3\times10^8\times6.62\times10^{-34}}{0.21\times1.6\times10^{-19}} = 5.9\times10^{-6}\,eV$

13. (b) Momentum of photon

$p = \frac{h}{\lambda} = \frac{6.6\times10^{-34}}{10^{-10}} = 6.6\times10^{-24}\,kg\text{ - }m/sec.$

14. (c) $E \propto \frac{1}{\lambda} \Rightarrow \frac{2.5}{E'} = \frac{1}{5000} \Rightarrow E' = (2.5)\times5000\,eV$

15. (a) $E = h\nu = 6.6\times10^{-34}\times10^{15} = 6.6\times10^{-19}\,J$

16. (a) Since $h\nu = mc^2$, hence $p = mc = \frac{h\nu}{c} = \frac{h}{\lambda}$

17. (b) $E = h\nu \Rightarrow \nu = \frac{E}{h} = \frac{1\times10^6\times1.6\times10^{-19}}{6.6\times10^{-34}} = 2.4\times10^{20}\,Hz$

18. (a) $p = \frac{h\nu}{c} = \frac{6.6\times10^{-34}\times1.5\times10^{13}}{3\times10^8} = 3.3\times10^{-29}\,kg\text{-}m/\sec$

19. (a) $E = \frac{hc}{\lambda} = \frac{6.62\times10^{-34}\times3\times10^8}{450\times10^{-9}} = 4.4\times10^{-19}\,J$

20. (c) $E = h\nu \Rightarrow \nu = \frac{E}{h} = \frac{66\times1.6\times10^{-19}}{6.6\times10^{-34}} = 16\times10^{15}\,Hz$

21. (d) $E \propto \frac{1}{\lambda}$; also $\lambda_{infrared} > \lambda_{visible}$ so $E_{infrared} < E_{visible}$

22. (c) Energy of photon $E = \frac{hc}{\lambda}$ (Joules) $= \frac{hc}{e\lambda}(eV)$

$\Rightarrow E_{(eV)} = \frac{6.6\times10^{-34}\times3\times10^8}{1.6\times10^{-19}\times\lambda(Å)} = \frac{12375}{\lambda(Å)}$

$\Rightarrow E(keV) = \frac{12.37}{\lambda(Å)} \approx \frac{12.4}{\lambda}$

23. (b) $E = h\nu \Rightarrow 100\times1.6\times10^{-19} = 6.6\times10^{-34}\times\nu$

$\Rightarrow \nu = 2.42\times10^{16}\,Hz$.

24. (a) $p = \frac{h}{\lambda} = \frac{6.6\times10^{-34}}{4400\times10^{-10}} = 1.5\times10^{-27}\,kg.m/s$

and mass $m = \frac{p}{c} = \frac{1.5 \times 10^{-27}}{3 \times 10^{8}} = 5 \times 10^{-36} kg$

25. (a)

26. (a)

27. (a) $E = \frac{hc}{\lambda} \Rightarrow \lambda = \frac{hc}{E}$

28. (c)

29. (d) $E(eV) = \frac{h\nu}{e} = \frac{6.0 \times 10^{-34} \times 10^{12} \times 10^{6}}{1.6 \times 10^{-19}} = 4.14 \times 10^{3} eV$.

30. (c) $E = nh\nu \Rightarrow \nu \propto \frac{1}{n} \Rightarrow \frac{n_1}{n_2} = \frac{\gamma_2}{\gamma_1}$.

31. (c) According to Einstein's photoelectric equation.

32. (a) Kinetic energy of photoelectrons depends on the frequency of incident radiations and is independent of the intensity of illumination.

33. (e) In this case, for photoelectric emission the wavelength of incident radiations must be less then $5200 Å$. Wavelength of ultraviolet radiations is less then this value (5200 Å) but wavelength of infrared radiations is higher than this value.

34. (a) Frequency of light of wavelength $(\lambda = 4000\ Å)$ is $\nu = \frac{c}{\lambda} = \frac{3 \times 10^{8}}{4000 \times 10^{-10}} = 0.75 \times 10^{15}$ which is less than the given threshold frequency. Hence no photoelectric emisssion takes place.

35. (d) Refer to the application of photo-cell.

36. (c) Albert Einstein was awarded Nobel Prize in 1921 for discovering the photoelectric effect.

37. (d)

38. (c) Energy of incident light $E(eV) = \frac{12375}{3320} = 3.72\,eV$

$(332\,nm = 3320\ Å)$

According to the relation $E = W_0 + eV_0$

$\Rightarrow V_0 = \frac{(E - W_0)}{e} = \frac{3.72\,eV - 1.07\,eV}{e} = 2.65\ Volt$

39. (d)

40. (b) $K_{max} = (h\nu - W_0)$; $\nu =$ frequency of incident light.

41. (a) Refer to threshold frequency.

42. (c) $W_0(eV) = \frac{12375}{\lambda_0} \Rightarrow \lambda_0 = \frac{12375}{4.2} \approx 2955\ Å$

43. (d) Intensity ∝ (No. of photons) ∝ (No. of photoelectrons)

44. (d) $E = W_0 + K_{max}$; $E = \frac{12375}{3000} = 4.125\ eV$

$\Rightarrow K_{max} = E - W_0 = 4.125\ eV - 1\ eV = 3.125\ eV$

$\Rightarrow \frac{1}{2} mv_{max}^2 = 3.125 \times 1.6 \times 10^{-19}\ J$

$\Rightarrow v_{max} = \sqrt{\frac{2 \times 3.125 \times 1.6 \times 10^{-19}}{9.1 \times 10^{-31}}} = 1 \times 10^{6} m/s$

45. (d) Retarding potential $V_0 = \frac{h}{e}(\nu - \nu_0)$

46. (c)

47. (c) $K_{max} = \frac{hc}{\lambda} - W_0 = \frac{6.4 \times 10^{-34} \times 3 \times 10^{8}}{6400 \times 10^{-10}} - 1.6 \times 10^{-19}$

$= 1.4 \times 10^{-19}\ J$

48. (b) $K_{max}(eV) = E(eV) - W_0(eV) = 6.2 - 4.2 = 2\ eV$

$\therefore\ K_{max}(Joules) = 2 \times 1.6 \times 10^{-19}\ J = 3.2 \times 10^{-19}\ J$

49. (c) Since $W_0 = \frac{hc}{\lambda_0}$; $\therefore \frac{(W_0)_T}{(W_0)_{Na}} = \frac{\lambda_{Na}}{\lambda_T}$ or

$\lambda_T = \frac{\lambda_{Na} \times (W_0)_{Na}}{(W_0)_T} = \frac{5460 \times 2.3}{4.5} = 2791\ Å$

50. (a) $K_{max} = (E - W_0) = (3.4 - 2)\ eV = 1.4\ eV$

51. (a) Energy of incident light $E = \frac{12375}{2000} = 6.18\,eV$

According to relation $E = W_0 + eV_0$

$\Rightarrow V_0 = \frac{(E - W_0)}{e} = \frac{(6.18\,eV - 5.01\,eV)}{e} = 1.17\ V \approx 1.2\ V$

52. (b) $W_0 = \frac{12375}{6600} = 1.87\,eV$.

53. (d)

54. (b) $E = h\nu = 6.64 \times 10^{-34} \times 1.0 \times 10^{14} = 6.62 \times 10^{-20}\ J$

55. (a) Number of photons emitted per second

$n = \frac{p}{h\nu} = \frac{10 \times 10^{3}}{6.6 \times 10^{-34} \times 880 \times 10^{3}} = 1.72 \times 10^{31}$

56. (d) Number of ejected electrons ∝ (Intensity) ∝ $\frac{1}{(\text{Distance})^2}$

Therefore an increment of distance two times will reduce the number of ejected electrons to $\frac{1}{4}th$ of the previous one.

57. (d) According to Einstein's photoelectric equation

$E = W_0 + K_{max} \Rightarrow V_0 = \frac{hc}{e}\left[\frac{1}{\lambda} - \frac{1}{\lambda_0}\right]$

Hence if λ decreases V_0 increases.

58. (b) $W_0 = \frac{12375}{\lambda_0(Å)} = \frac{12375}{5420} = 2.28\,eV$

59. (b) Number of electrons can be measured which are directly proportional to the intensity of radiation.

60. (a) $K_{max} = h\nu - W_0 = 6.6 \times 10^{-34} \times 8 \times 10^{14} - 3.2 \times 10^{-19}$

$= 2.1 \times 10^{-19}\ J$

61. (c)

62. (b) $K_{max}(eV) = 12375\left[\frac{1}{\lambda(Å)} - \frac{1}{\lambda_0(Å)}\right]$

$= 12375\left[\frac{1}{1000} - \frac{1}{2000}\right] = 6.2\,eV$

63. (b) Stopping potential does not depend on the relative distance between the source and the cell.

64. (c)

65. (a) Energy of incident light $E(eV)=\frac{12375}{4000}=3.09\,eV$

Stopping potential is $-2V$ so $K_{max}=2\,eV$

Hence by using $E=W_0+K_{max}$; $W=1.09\,eV\approx 1.1\,eV$

66. (d) $\frac{hc}{\lambda}=W_0+\frac{1}{2}mv^2_{max}$

Assuming W_0 to be negligible in comparison to $\frac{hc}{\lambda}$

i.e. $v^2_{max}\propto\frac{1}{\lambda}\Rightarrow v_{max}\propto\frac{1}{\sqrt{\lambda}}$.

(On increasing wavelength λ to 4λ, v_{max} becomes half).

67. (d) $W_0=h\nu_0\Rightarrow\nu_0=\frac{W_0}{h}=\frac{2.51\times1.6\times10^{-19}}{6.6\times10^{-34}}$

$=6.08\times10^{14}\,Cycle/\sec$.

68. (c)

69. (b)

70. (a) By changing distance of source, photoelectric current changes. But there is no change in stopping potential.

71. (d) $\nu_0=\frac{W_0}{h}=\frac{3.3\times1.6\times10^{-19}}{6.6\times10^{-34}}=8\times10^{14}\,Hz$

72. (a) For no emission of photoelectron, energy of incident light < Work function $\Rightarrow h\nu<\phi\Rightarrow\nu<\frac{\phi}{h}$

73. (c) Number of electrons emitted $\propto$ intensity $\propto\frac{1}{(\text{distance})^2}$

$\Rightarrow\frac{n_1}{n_2}=\left(\frac{d_2}{d_1}\right)^2=\left(\frac{2}{1}\right)=4\Rightarrow n_2=\frac{n_1}{4}$

74. (c) $E=\frac{hc}{\lambda}-W_0$ and $2E=\frac{hc}{\lambda'}-W_0$

$\Rightarrow\frac{\lambda'}{\lambda}=\frac{E+W_0}{2E+W_0}\Rightarrow\lambda'=\lambda\left(\frac{1+W_0/E}{2+W_0/E}\right)$

Since $\frac{(1+W_0/E)}{(2+W_0/E)}>\frac{1}{2}$ so $\lambda'>\frac{\lambda}{2}$

75. (b) Stopping potential $V_0=\frac{hc}{e}\left[\frac{1}{\lambda}-\frac{1}{\lambda_0}\right]$. As λ decreases so V_0 increases.

76. (c) $W.(eV)=\frac{12375}{\lambda_0(Å)}\Rightarrow\lambda_0=\frac{12375}{4.125}=3000Å$

77. (a) Intensity increases means more photons of same energy will emit more electrons of same energy, hence only photoelectric current increases.

78. (a) $E=W_0+K_{max}$; $E=\frac{12375}{5000}=2.475\,eV$

$\therefore K_{max}=E-W_0=2.475-1.9=0.57\,eV$

79. (b)

80. (c) $\lambda_0=\frac{hc}{W_0}=\frac{12400}{4}=3100Å=310\,nm$

81. (b) $K_{max}=(|V_s|)eV\Rightarrow|V_s|=4V$

82. (d) Threshold wavelength $\lambda_0=\frac{12375}{2.1}=5892.8\,Å$

83. (c) $P=\frac{nhc}{\lambda t}\Rightarrow\frac{n}{t}=\frac{P.\lambda}{hc}=\frac{100\times5000\times10^{-10}}{6.6\times10^{-34}\times3\times10^8}$

$=2.50\times10^{20}$

84. (c) $E=W_0+K_{max}\Rightarrow K_{max}=E-W_0=h\nu-W_0$

$\Rightarrow K_1=h\nu-W_0$ and $K_2=2h\nu-W_0\Rightarrow K_2>2K_1$

85. (b) Work function $=\frac{hc}{\lambda_0}$; where λ_0 is threshold wavelength.

$\therefore\frac{W_{0_1}}{W_{0_2}}=\frac{\lambda_{0_2}}{\lambda_{0_1}}=\frac{2}{1}$

86. (c) $W_0=\frac{hc}{\lambda_0}=\frac{6.625\times10^{-34}\times3\times10^8}{5000\times10^{-10}}J=4\times10^{-19}J$

87. (a) The work function has no effect on current so long as $h\nu>W_0$. The photoelectric current is proportional to the intensity of light. Since there is no change in the intensity of light, therefore $I_1=I_2$.

88. (b) Number of photons emitted is proportional to the intensity.

Also $\frac{hc}{\lambda}=W_0+E$.

89. (c) Photoelectric current $\propto$ Intensity of light

90. (d) $V_0=\frac{(E-W_0)}{e}=\frac{(2eV-0.6\,eV)}{e}=1.4V$

91. (a) $\lambda_r>\lambda_y>\lambda_g$. Here threshold wavelength $<\lambda_y$.

92. (a) For electron emission $\lambda_{incident}<\lambda_0$

93. (a) $K_{max}=(|V_0|)eV=2eV$.

94. (b) Threshold wavelength for *Na*, $\lambda_{Na}=\frac{12375}{2}=6187.5Å$

Also $\lambda_{Cu}=\frac{12375}{4}=3093.75$

Since $\lambda_{Na}>4000Å$; So *Na* is suitable.

95. (c) By using $E=W_0+K_{max}$

$E=\frac{12375}{5000}=2.475\,eV$ and $K_{max}=eV_0=1.36\,eV$

So $2.475=W_0+1.36\Rightarrow W_0=1.1\,eV$.

96. (b) For emission of electrons incident energy of each photon must be greater than work function (threshold energy).

97. (d) K_{max} of photoelectrons doesn't depends upon intensity of incident light.

98. (a) By using $E=W_0+\frac{1}{2}mv^2_{max}$ where $E=\frac{12375}{2000}=6.18\,eV$

$\Rightarrow 6.18\,eV=4.2\,eV+\frac{1}{2}mv^2_{max}\Rightarrow 1.98\,eV=\frac{1}{2}mv^2_{max}$

$\Rightarrow 1.98\times1.6\times10^{-19}=\frac{1}{2}\times9.1\times10^{-31}\times v^2_{max}$

$\Rightarrow v_{max}=8.4\times10^5\,m/s$

99. (b) By using $E=W_0+\frac{1}{2}mv^2_{max}$; where $E=\frac{12375}{4558}=2.71\,eV$

$\Rightarrow 2.71\ eV = 2.5\ eV + \frac{1}{2} \times 9.1 \times 10^{-31} \times v_{max}^2$

$\Rightarrow 0.21 \times 1.6 \times 10^{-19} = \frac{1}{2} \times 9.1 \times 10^{-31} \times v_{max}^2$

$\Rightarrow v_{max} = 2.65 \times 10^5\ m/s$

100. (b) $E = W_0 + K_{max}$ .....(i)

$\Rightarrow hf = W_A + K_A$ .....(ii)

and $2hf = W_B + K_B = 2W_A + K_B$ $\left(\because \frac{W_A}{W_B} = \frac{1}{2}\right)$

Dividing equation (i) by (ii)

$\frac{1}{2} = \frac{W_A + K_A}{2W_A + K_B} \Rightarrow \frac{K_A}{K_B} = \frac{1}{2}$

101. (a)

102. (d) Stopping potential depends upon the energy of photon

103. (a) $\lambda_0 = \frac{12375}{W_0(eV)} = \frac{12375}{3} = 4125Å$

104. (b) With decrease in wavelength of incident photons, energy of photoelectrons increases.

105. (b)

106. (a) By using $\frac{hc}{\lambda} = W_0 + \frac{1}{2}mv^2$

$\Rightarrow \frac{hc}{400 \times 10^{-9}} = W_0 + \frac{1}{2}mv^2$ .....(i)

and $\frac{hc}{250 \times 10^{-9}} = W_0 + \frac{1}{2}m(2v)^2$ .....(ii)

On solving (i) and (ii)

$\frac{1}{2}mv^2 = \frac{hc}{3}\left[\frac{1}{250 \times 10^{-9}} - \frac{1}{400 \times 10^{-9}}\right]$ .....(iii)

From equation (i) and (iii) $W_0 = 2hc \times 10^6\ J$.

107. (a) $E = W_0 + eV_0 \Rightarrow 4eV = 2eV + eV_0 \Rightarrow V_0 = 2\ volt$

108. (b)

109. (a) $W_0 = \frac{12375}{6800} = 1.8eV$

110. (b) With the increase in intensity of light photoelectric current increases, but Kinetic energy of ejected electron, stopping potential and work function remains unchanged.

111. (c) $E = h\nu = 6.6 \times 10^{-34} \times 8 \times 10^{15} = 5.28 \times 10^{-18}\ J = 33eV$ By using $E = W_0 + K_{max} \Rightarrow K_{max} = E - W_0$

$= 33 - 6.125 = 27eV$

112. (b) $\lambda = \frac{12375}{W_0} = \frac{12375}{2} = 6187.5Å = 620\ nm$

113. (a) Minimum kinetic energy is always zero.

114. (c) Speed of photon is $3 \times 10^8\ m/s$ in vacuum.

115. (c) Minimum frequency : $W_0 = h\nu_0$

$\Rightarrow \nu_0 = \frac{W_0}{h} = \frac{1.65 \times 1.6 \times 10^{-19}}{6.6 \times 10^{-34}} = 4 \times 10^{14}\ Hz$

116. (b) By using $E = W_0 + K_{max} \Rightarrow K_{max} = E - W_0$

Hence, $K_1 = 1 - 0.5 = 0.5$

and $K_2 = 2.5 - 0.5 = 2 \Rightarrow \frac{K_1}{K_2} = \frac{1}{4}$.

117. (c) $W_0 \propto \frac{1}{\lambda} \Rightarrow \frac{\lambda_1}{\lambda_2} = \frac{(W_0)_2}{(W_0)_1} = \frac{4.5}{2.3} = \frac{2}{1}$.

118. (d) $K_{max} = eV_0 \Rightarrow eV_0 = 4eV \Rightarrow V_0 = 4V$

119. (a) Number of photo electrons

$(N) \propto$ Intensity $\propto \frac{1}{d^2} \Rightarrow \frac{N_1}{N_2} = \left(\frac{d_2}{d_1}\right)^2$

$\Rightarrow \frac{N_1}{N_2} = \left(\frac{100}{50}\right)^2 = \frac{4}{1} \Rightarrow N_2 = \frac{N_1}{4}$.

120. (c) $P = \frac{W}{t} = \frac{nhc}{\lambda t} \Rightarrow 10^3 = \frac{n \times 6.6 \times 10^{-34} \times 3 \times 10^8}{198.6 \times 1}$

$\Rightarrow n = 10^{30}$.

121. (c) $p = \frac{nhc}{\lambda t} \Rightarrow 100 = \frac{n \times 6 \times 10^{-34} \times 3 \times 10^8}{540 \times 10^{-9} \times 1} \Rightarrow n = 3 \times 10^{20}$

122. (c) $\frac{1}{2}mv_{max}^2 = eV_0 \Rightarrow v_{max} = \sqrt{2\left(\frac{e}{m}\right)V_0}$

$= \sqrt{2 \times 1.8 \times 10^{11} \times 9} = 1.8 \times 10^6\ m/s.$

123. (b) $\frac{hc}{\lambda} = W_0 + K_{max} \Rightarrow \frac{hc}{\lambda_A} = W_0 + K_A$ ...(i)

and $\frac{hc}{\lambda_B} = W_0 + K_B$ ...(ii)

Subtracting (i) from (ii), $hc\left[\frac{1}{\lambda_B} - \frac{1}{\lambda_A}\right] = K_B - K_A$

$\Rightarrow hc\left[\frac{1}{\lambda_B} - \frac{1}{2\lambda_B}\right] = K_B - K_A \Rightarrow \frac{hc}{2\lambda_B} = K_B - K_A$ ...(iii)

From (ii) and (iii), $2K_B - 2K_A = W_0 + K_B$

$\Rightarrow K_B - 2K_A = W_0$

$\Rightarrow K_A = \frac{K_B}{2} - \frac{W_0}{2}$ which gives $K_A < \frac{K_B}{2}$.

124. (a) $\lambda_0 = \frac{12375}{6500} = 1.9\ eV \approx 2eV$.

125. (a) $\lambda_{X-ray} < \lambda_{UV-ray}$

126. (a) $E = h\nu_0 + K_{max} \Rightarrow h(4\nu_0) = h\nu_0 + K_{max} \Rightarrow K_{max} = 3h\nu_0$.

127. (a)

128. (c) $W_0 = \frac{12375}{2.3} = 5380Å$.

129. (d)

130. (b) Using Einstein photoelectric equation $E = W_0 + K_{max}$

$hf_1 = W_0 + \frac{1}{2}mv_1^2$ .....(i)

$hf_2 = W_0 + \frac{1}{2}mv_2^2$ .....(ii)

$\Rightarrow h(f_1 - f_2) = \frac{1}{2}m(v_1^2 - v_2^2) \Rightarrow (v_1^2 - v_2^2) = \frac{2h}{m}(f_1 - f_2)$

131. (d)

132. (b) By using $\frac{hc}{e}\left(\frac{1}{\lambda} - \frac{1}{\lambda_0}\right) = V_0$

$\Rightarrow \frac{hc}{e}\left(\frac{1}{\lambda} - \frac{1}{\lambda_0}\right) = 4.8$ .....(i)

and $\frac{hc}{e}\left(\frac{1}{2\lambda} - \frac{1}{\lambda_0}\right) = 1.6$ .....(ii)

From equation (i) by (ii), $\frac{\left(\frac{1}{\lambda} - \frac{1}{\lambda_0}\right)}{\left(\frac{1}{2\lambda} - \frac{1}{\lambda_0}\right)} = \frac{4.8}{1.6} \Rightarrow \lambda_0 = 4\lambda$.

133. (c)

134. (d) $E = W_0 + K_{max}$. From the given data E is 6.78 eV (for λ= 1824 $Å$) or $10.17\, eV$ (for $\lambda = 1216$ $Å$)

$\therefore\ W_0 = E - K_{max} = 6.78 - 5.3 = 1.48\, eV$

or

$W_0 = 10.17 - 8.7 = 1.47\, eV$.

135. (c) $E = \frac{hc}{\lambda} \Rightarrow \frac{E_1}{E_2} = \frac{\lambda_1}{\lambda_2} \Rightarrow \frac{3.32 \times 10^{-19}}{E_2} = \frac{4000}{6000}$

$\Rightarrow E_2 = 4.98 \times 10^{-19}\, J = 3.1\, eV$.

136. (c) Number of waves $= \frac{10^{-3}}{4000 \times 10^{-10}} = 0.25 \times 10^4$

137. (d) Velocity of photon $c = \nu\lambda$

138. (b) $\lambda_0 = \frac{12375}{6.825} = 1813\, Å \approx 1800 Å$

139. (c) Work function $W_0 = h\nu_0 = 6.6 \times 10^{-34} \times 1.6 \times 10^{15}$

$= 1.056 \times 10^{-18}\, J = 6.6\, eV$

From $E = W_0 + K_{max} \Rightarrow K_{max} = E - W_0 = 1.4\, eV$

140. (c) $P = \frac{h}{\lambda}, E = \frac{hc}{\lambda} \Rightarrow E = Pc.$

141. (a) $E = \frac{hc}{\lambda} \Rightarrow \frac{E_1}{E_2} = \frac{300}{150} = \frac{2}{1}$

142. (d)

143. (b) If frequency of incident light increases, kinetic energy of photoelectron also increases.

144. (d) Photoelectric effect can be explained on the basis of spectrum of an atom.

145. (b) $W_0 = \frac{12375}{\lambda_0} = \frac{12375}{5420} = 2.28\, eV$

146. (c)

147. (a) $E = \frac{12375}{\lambda} = \frac{12375}{5000} = 2.47\, eV \approx 2.5\, eV$

148. (a) Momentum $p = \frac{E}{c} \Rightarrow E^2 = p^2c^2$

149. (c) Energy of incident radiations (in eV) $= \frac{12375}{4100} = 3.01\, eV$

Work function of metal A and B are less then $3.01 eV$, so A and B will emit photo electrons.

150. (d) From $E = W_0 + \frac{1}{2}mv_{max}^2$

$\Rightarrow 2h\nu_0 = h\nu_0 + \frac{1}{2}mv_1^2 \Rightarrow h\nu_0 = \frac{1}{2}mv_1^2$ .....(i)

and $5h\nu_0 = h\nu_0 + \frac{1}{2}mv_2^2 \Rightarrow 4h\nu_0 = \frac{1}{2}mv_2^2$ .....(ii)

Dividing equation (ii) by (i) $\left(\frac{v_2}{v_1}\right)^2 = \frac{4}{1}$

$\Rightarrow v_2 = 2v_1 = 2 \times 4 \times 10^6 = 8 \times 10^6\, m/s$

151. (d) Number of photoelectrons $\propto \frac{1}{(\text{Distance})^2}$.

152. (b) The value of saturation current depends on intensity. It is independent of stopping potential

153. (a) In tungsten, photoemission take place with a light of wavelength 2300 $Å$. As emission of electron is inversely proportional to wavelength, all the wavelengths smaller then 2300 $Å$ will cause emission of electrons.

154. (c) Stopping potential = $1.8\, eV - 1.2\, eV = 0.6\, eV$.

155. (a)

156. (a) $K.E. = h\nu - h\nu_0 = 8\ eV - \left(\frac{6 \times 10^{-34} \times 1.6 \times 10^{15}}{1.6 \times 10^{-19}} eV\right)$

$= 8\ eV - 6\ eV = 2\ eV$

X-Rays

1. (c) $\lambda_{min} = \frac{12375}{50 \times 10^3} Å = 0.247 = 0.25\, Å$.

2. (c) X-rays are electromagnetic waves of wavelength ranging from 0.1 to $100\, Å$.

3. (a) Penetrating power is greater for lower wavelength.

4. (a)

5. (d) From the formula

$V = \frac{12375}{\lambda_{min}} = \frac{12375}{0.3094} = 39.99\ kV \approx 40\, kV$

6. (b) Refer to the application of X-rays.

7. (a)

8. (b)

9. (c)

10. (c) The voltage applied across the X-ray tube is of the range of 10 kV – 80 kV.

11. (c)

12. (b) In X-ray tube, target must be heavy element with high melting point.

13. (c) $\nu \propto (Z - b)^2 \Rightarrow \nu = a(Z - b)^2$

Z = atomic number of element (a, b are constant).

14. (c)

15. (b) *X*-rays and gamma rays are electromagnetic waves.

16. (c) Since $\lambda_{\min} = \frac{12375}{V} Å = \frac{12375}{10^5} Å = 0.123 Å$

$E_{\max} = \frac{hc}{\lambda_{\min}}$;

On putting the values. $E_{\max} \cong 10^{-1} MeV$.

17. (b) $\lambda_{\min} = \frac{hc}{eV}$. where *h*, *c* and *e* are constants. Hence $\lambda_{\min} \propto \frac{1}{V}$

18. (c) Range of *X*-rays is 0.1Å to 100 Å.

19. (d) The production of *X*-rays is an atomic property whereas the production of γ -rays is a nuclear property.

20. (a) $\lambda_{\min} = \frac{12375}{40,000} = 0.30 Å$ Hence wavelength less than 0.30 Å is not possible.

21. (a) $\lambda_{\min} = \frac{hc}{eV}$

22. (b) $p = \frac{h}{\lambda} = \frac{6.6 \times 10^{-34}}{0.01 \times 10^{-10}} = 6.6 \times 10^{-22}\ kg\text{-}m/\sec$.

23. (a) *X*-rays are absorbed by the target; they are not reflected by the target.

24. (c)

25. (d)

26. (a)

27. (d)

28. (c)

29. (b) Continuous spectrum of *X*-rays consists of radiations of all possible wavelength range having a definite short wavelength limit.

30. (b) $\frac{E}{t} = P = \frac{h\nu}{t}$

i.e. Penetrating power $\propto$ energy $\propto$ Frequency

31. (c) In general *X*-rays have larger wavelength than that of gamma rays.

32. (c) According to Mosley's law $\nu = a(Z-b)^2$ and $\nu \propto \frac{1}{\lambda}$

33. (b) $E = h\nu = eV \Rightarrow \nu \propto V$

34. (c) $E = eV = h\nu_{\max} \Rightarrow \nu_{\max} = \frac{eV}{h}$

35. (c) $E = eV = h\nu_{\max} = \frac{hc}{\lambda_{\min}} \Rightarrow \lambda_{\min} = \frac{hc}{eV}$

36. (d) $\lambda_{\min} = \frac{hc}{eV}$ or $\lambda_{\min} \propto \frac{1}{V}$ On increasing potential, $\lambda_{\min}$ decreases.

37. (a) $h\nu_o = eV \therefore \nu_o = \frac{eV}{h} = \frac{1.6 \times 10^{-19} \times 42000}{6.63 \times 10^{-34}} = 10^{19}\ Hz$

38. (d) Nucleus of heavy atom captures electron of *k*-orbit. This is a radioactive process, so vacancy of this electron is filled by an outer electron and *x*-rays are produces.

39. (d) Because they are electromagnetic waves.

40. (c) $\nu_{\max} \propto \frac{1}{\lambda_{\min}}$ Hard *X*-rays have high frequency and low wavelength.

41. (d) X-rays are electromagnetic in nature so they remains unaffected in electric and magnetic field.

42. (b)

43. (c)

44. (b) *X*-rays have high energy. They penetrate into the solid crystal and used to find out the internal structure.

45. (a) By changing the filament current with the help of rheostat, thermionic emission intensity of *X*-rays can be changed.

46. (c) Applied voltage must be greater than binding energy.

47. (a)

48. (d) $\lambda = \frac{12375}{(40 \times 10^3)} = 0.309 Å \approx 0.31 Å$

49. (c)

50. (b) $\lambda_{\min} = \frac{hc}{eV} = \frac{12375}{V} Å = 0.495\ Å \approx 0.5\ Å$

51. (c) $\lambda_{\min} = \frac{hc}{eV} = \frac{12375}{V} Å;\ \therefore\ V = \frac{12375}{\lambda \text{ in } Å} = 124\ kV$

52. (a) Mosley's law is $f = a(Z-b)^2$

53. (b) The potential difference across the filament and target determines the energy and thence the penetrating power of *X*-rays.

54. (d) The energy of *X*-ray photon obtained from a coolidge tube by an electronic transition of target atom such as K_α line is obtained from transition from *L* orbit in *K* orbit.

55. (b) $\lambda_{\min} = \frac{12375}{V} = \frac{12375}{30 \times 10^3} = 0.4 Å$

56. (d) $\lambda_{\min} = \frac{12375}{100 \times 10^3} Å = 0.124\ Å$

57. (d) $\lambda_{\min} = \frac{12375}{50000} = 0.025\ nm$

58. (c)

59. (a) Refer theory

60. (a) With the increase in potential difference between anode and cathode energy of striking electrons increases which in turn increases the energy (penetration power) of X-rays.

61. (a)

62. (b)

63. (b) The wavelength range of *X*-ray is 0.1 Å – 100 Å.

64. (b) Energy $E = h\nu = h\frac{c}{\lambda}\ \therefore\ \frac{E_1}{E_2} = \frac{\lambda_2}{\lambda_1} = \frac{5000}{1}$

65. (b)

66. (a) Interatomic spacing in a crystal acts as a diffraction grating.

67. (b) The wavelength of the γ-rays is shorter. However the main distinguishing feature is the nature of emission.

68. (d) $h\nu_{\max} = eV \Rightarrow \frac{hc}{\lambda_{\min}} = eV\ \therefore \lambda_{\min} \propto \frac{1}{V}$

69. (d) Hard X-rays are of higher energy and the energy of X-rays depends on the potential difference between the cathode and the target.

70. (d) Penetration is directly proportional to the energy of radiations.

71. (d) Greater the number of electrons striking the anode, larger is the number of X-ray photons emitted.

72. (a) $\lambda_{\min} = \frac{12375}{V} \mathring{A} \Rightarrow V = \frac{12375}{1} = 12375\, V$

$= 12.375\, kV \approx 12.42\, kV$

73. (c)

74. (c)

75. (c) $E(eV) = \frac{12375}{1.65} = 7500 eV = 7.5\ keV$.

76. (d)

77. (b)

78. (a) $\lambda_{\min} = \frac{12375}{40} \mathring{A} = 3.09 \times 10^{-8} m$

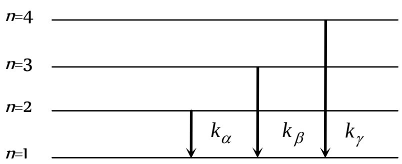
79. (d) Target should be of high atomic number and high melting point

80. (a) Intensity of X-rays depends upon the number of electron striking the target.

81. (b) $E(eV) = \frac{hc}{e\lambda} = \frac{6.6 \times 10^{-34} \times 3 \times 10^{8}}{1.6 \times 10^{-19} \times 1 \times 10^{-10}} = 12375\, eV$

82. (c) When applied voltage is greater then energy of K-electron, continuous and all characterstic X-rays are emitted.

83. (c)



84. (d) When current through the filament increases, number of emitted electrons also increases. Hence intensity of X-ray increases but no effect on penetration power.

85. (a) $i = \frac{Ne}{t} \Rightarrow \frac{N}{t} = \frac{i}{e} = \frac{3.2 \times 10^{-3}}{1.6 \times 10^{-19}} = 2 \times 10^{16}\ / sec$

86. (d)

87. (a) Because X-rays are electromagnetic (Neutral) in nature.

88. (d) $\lambda_{\min} = \frac{hc}{eV} = \frac{6.6 \times^{-34} \times 3 \times 10^{8}}{1.6 \times 10^{-19} V} = \frac{12375}{V} \approx \frac{12400}{V} \mathring{A}$

89. (c) Frequency of hard X-rays is greater than that of soft X-rays.

90. (b)

91. (a) $\lambda_{\min} = \frac{12375}{V} \mathring{A} \Rightarrow V = \frac{12375}{0.4125} = 30\, kV$

92. (b)

93. (d)

94. (a) $\lambda_{\min} = \frac{12375}{40 \times 10^{3}} = 0.309\, \mathring{A} \approx 0.31\, \mathring{A}$

95. (d) $\lambda_{\min} = \frac{hc}{eV} = \frac{6.6 \times 10^{-34} \times 3 \times 10^{8}}{1.6 \times 10^{-19} \times 100 \times 10^{3}} = 0.123 \mathring{A}$

96. (d) According to Mosley's law $\nu \propto (Z - b)^2$

For k_α line, $b = 1$, and it has maximum frequency so $\nu_{\max} \propto (Z-1)^2$

97. (b) The velocity of X-rays is always equal to that of light.

98. (b)

99. (d) $\lambda_{\min} = \frac{12375}{V} \mathring{A} \Rightarrow V = \frac{12375}{2.5} = 4950\ V \simeq 5\ kV.$

100. (c) $\lambda_{\min} = \frac{hc}{eV(\text{energy})}$; when KE (or eV) increases, λ decreases.

101. (c)

102. (b) When a high energy electron incident on heavy metal, it produces X-rays.

103. (b) $\nu = \frac{c}{\lambda} = \frac{3 \times 10^{8}}{1 \times 10^{-10}} = 3 \times 10^{18}\, Hz$

104. (b) $\lambda \propto \frac{1}{Z^2} \Rightarrow \frac{c}{\nu} \propto \frac{1}{Z^2} \Rightarrow \nu \propto Z^2$

105. (d)

106. (a) $eV = \frac{hc}{\lambda} = \frac{6.63 \times 10^{-34} \times 3 \times 10^{8}}{1.5 \times 10^{-10}}$

$\Rightarrow V = \frac{6.63 \times 10^{-34} \times 3 \times 10^{8}}{1.6 \times 10^{-19} \times 1.5 \times 10^{-10}} = 8280\ Volt.$

107. (d)

108. (d)

109. (b) Required ionisation energy

$= \frac{hc}{\lambda} = \frac{6.6 \times 10^{-34} \times 3 \times 10^{8}}{1.54 \times 10^{-10}} J = 12.9 \times 10^{-16} J$

110. (c) $\lambda \propto \frac{1}{(Z-1)^2} \Rightarrow \frac{\lambda_2}{\lambda_1} = \left(\frac{Z_1 - 1}{Z_2 - 1}\right)^2$

$\Rightarrow \frac{\lambda_2}{\lambda} = \left(\frac{43-1}{29-1}\right)^2 = \left(\frac{42}{28}\right)^2 \Rightarrow \lambda_2 = \frac{9}{4}\lambda.$

111. (a)

Critical Thinking Questions

1. (b) For one second, distance = Velocity $= 3 \times 10^4 m/\text{sec}$ and $Q = i \times 1 = 10^{-6} C$. Charge density $= \frac{\text{Charge}}{\text{Volume}}$

$= \frac{10^{-6}}{3 \times 10^{4} \times 0.5 \times 10^{-6}} = 6.6 \times 10^{-5} C/m^3.$

2. (c) By law of conservation of momentum

$0 = m_1 \vec{v_1} + m_2 \vec{v_2} \Rightarrow m_1 \vec{v_1} = -m_2 \vec{v_2}$

– *ve* sign indicates that both he particles are moving in opposite direction. Now de-Broglie wavelengths

$\lambda_1 = \frac{h}{m_1 v_1}$ and $\lambda_2 = \frac{h}{m_2 v_2}$; $\therefore \frac{\lambda_1}{\lambda_2} = \frac{m_2 v_2}{m_1 v_1} = 1$

3. (b) $\lambda_{\text{photon}} = \frac{hc}{E}$ and $\lambda_{\text{proton}} = \frac{h}{\sqrt{2mE}}$

$$\Rightarrow \frac{\lambda_{\text{photon}}}{\lambda_{\text{electron}}} = c\sqrt{\frac{2m}{E}} \Rightarrow \frac{\lambda_{\text{photon}}}{\lambda_{\text{electron}}} \propto \frac{1}{\sqrt{E}}$$

4. (a,b,c) $K_{max} = E - W_0$

$\therefore T_A = 4.25 - (W_0)_A$ ...(i)

$T_B = (T_A - 1.5) = 4.70 - (W_0)_B$ ...(ii)

Equation (i) and (ii) gives $(W_0)_B - (W_0)_A = 1.95\ eV$

De Broglie wave length $\lambda = \frac{h}{\sqrt{2mK}} \Rightarrow \lambda \propto \frac{1}{\sqrt{K}}$

$$\Rightarrow \frac{\lambda_B}{\lambda_A} = \sqrt{\frac{K_A}{K_B}} \Rightarrow 2 = \sqrt{\frac{T_A}{T_A - 1.5}} \Rightarrow T_A = 2eV$$

From equation (i) and (iii)

$W_A = 2.25\ eV$ and $W_B = 4.20\ eV$.

5. (d)

6. (b) In the presence of inert gas photoelectrons emitted by cathode ionise the gas by collision and hence the current increases.

7. (b) For electron and positron pair production, minimum energy is 1.02 MeV.

Energy of photon is given $1.7 \times 10^{-13} J = \frac{1.7 \times 10^{-13}}{1.6 \times 10^{-19}}$

$= 1.06\ MeV$.

Since energy of photon is greater than 1.02 MeV,

So electron, positron pair will be created.

8. (c) According to Einstein's photoelectric equation

$$\frac{hc}{\lambda} = \phi + \frac{1}{2}mv^2 \Rightarrow v = \left[\frac{2(hc - \lambda\phi)}{m\lambda}\right]^{1/2}$$

9. (b) Cut off voltage is independent of intensity and hence remains the same. Since distance becomes 3 times, so intensity (I) becomes $\frac{I}{9}$. Hence photo current also decreases by this factor *i.e.* becomes $\frac{18}{9} = 2mA$.

10. (d) $h\nu - W_0 = \frac{1}{2}mv_{\max}^2 \Rightarrow \frac{hc}{\lambda} - \frac{hc}{\lambda_0} = \frac{1}{2}mv_{\max}^2$

$$\Rightarrow hc\left(\frac{\lambda_0 - \lambda}{\lambda\lambda_0}\right) = \frac{1}{2}mv_{\max}^2 \Rightarrow v_{\max} = \sqrt{\frac{2hc}{m}\left(\frac{\lambda_0 - \lambda}{\lambda\lambda_0}\right)}$$

When wavelength is λ and velocity is v, then

$$v = \sqrt{\frac{2hc}{m}\left(\frac{\lambda_0 - \lambda}{\lambda\lambda_0}\right)} \quad \text{.... (i)}$$

When wavelength is $\frac{3\lambda}{4}$ and velocity is v' then

$$v' = \sqrt{\frac{2hc}{m}\left[\frac{\lambda_0 - (3\lambda/4)}{(3\lambda/4) \times \lambda_0}\right]} \quad \text{....(ii)}$$

Divide equation (ii) by (i), we get

$$\frac{v'}{v} = \sqrt{\frac{[\lambda_0 - (3\lambda/4)]}{\frac{3}{4}\lambda\lambda_0} \times \frac{\lambda\lambda_0}{\lambda_0 - \lambda}}$$

$$v' = v\left(\frac{4}{3}\right)^{1/2}\sqrt{\frac{[\lambda_0 - (3\lambda/4)]}{\lambda_0 - \lambda}} \quad \textit{i.e. } v' > v\left(\frac{4}{3}\right)^{1/2}$$

11. (c) Intensity of light

$I = \frac{Watt}{Area} = \frac{nhc}{A\lambda} \Rightarrow$ Number of photon $n = \frac{IA\lambda}{hc}$

$\therefore$ Number of photo electron $= \frac{1}{100} \times \frac{IA\lambda}{hc}$

$$= \frac{1}{100} \frac{1 \times 10^{-4} \times 300 \times 10^{-9}}{6.6 \times 10^{-34} \times 3 \times 10^8} = 1.5 \times 10^{12}$$

12. (b) By using $h\nu - h\nu_0 = K_{\max}$

$\Rightarrow h(\nu_1 - \nu_0) = K_1$ ....(i)

And $h(\nu_2 - \nu_0) = K_2$ ....(ii)

$\Rightarrow \frac{\nu_1 - \nu_0}{\nu_2 - \nu_0} = \frac{K_1}{K_2} = \frac{1}{K}$, Hence $\nu_0 = \frac{K\nu_1 - \nu_2}{K - 1}$.

13. (b) $E = W_0 + eV_0$

For hydrogen atom, $E = +13.6\,eV$

$\therefore +13.6 = 4.2 + eV_0$

$\Rightarrow V_0 = \frac{(13.6 - 4.2)eV}{e} = 9.4\ V$

Potential at anode $= -9.4\ V$

14. (a) From $\lambda_0 = \frac{12375}{W_0}$

The maximum wavelength of light required for the photoelectron emission, $(\lambda_0)_{Li} = \frac{12375}{2.3} = 5380\text{Å}$.

Similarly $(\lambda_0)_{Cu} = \frac{12375}{4} = 3094$ Å.

Since the wavelength 3094 Å does not in the visible region, but it is in the ultraviolet region. Hence to work with visible light, lithium metal will be used for photoelectric cell.

15. (a) Direction of scattered photon $\cos\phi = 1 - \frac{\Delta\lambda m_e c}{h}$

Here $\Delta\lambda = 0.011\ \text{Å}$

$$\therefore \cos\phi = 1 - \frac{0.011 \times 10^{-10} \times 9.1 \times 10^{-31} \times 3 \times 10^8}{6.624 \times 10^{-34}}$$

$$= 1 - 0.453 = 0.547$$

$\therefore \phi = \cos^{-1}(0.547)$

16. (d) Bragg's law, $2d\sin\theta = n\lambda$ or $\lambda = \frac{2d\sin\theta}{n}$

For maximum wavelength, $n_{\min} = 1$, $(\sin\theta)_{\max} = 1$

$\therefore \lambda_{\max} = 2d$ or $\lambda_{\max} = 2 \times 10^{-7}\,cm = 20\ \text{Å}$

17. (a,c,d) $P = VI = 50 \times 10^3 \times 20 \times 10^{-3} = 1000\ W$

Power converted into heat = 990 W

$ms\Delta T = 990 \Rightarrow \Delta T = 2^o\,C/\sec$

Now $\frac{hc}{\lambda_{\min}} = eV \Rightarrow \lambda_{\min} = \frac{hc}{eV} = 0.248 \times 10^{-10}\,m$

18. (c) The wavelength of X-ray lines is given by Rydberg

Formula $\frac{1}{\lambda} = RZ^2\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$

For K_α line, $n_1 = 1$ and $n_2 = 2$

$$\therefore \frac{1}{\lambda} = RZ^2\left(\frac{3}{4}\right) \Rightarrow Z = \left(\frac{4}{3R\lambda}\right)^{1/2}$$

$$= \left[\frac{4}{3(1.097\times10^7 m^{-1})(0.76\times10^{-10} m)}\right]^{1/2} = 39.99 \approx 40$$

19. (b) If intensity of *X*-ray is decreased by *dI*, when it passes through a length *dx* of absorbing material then, the amount of observed intensity is $\mu I\, dx$.

Thus, $-dI = \mu I\, dx$ or $\frac{dI}{dx} + \mu I = 0$

On solving this equation $I = I_0 e^{\mu x} = I_0 e^{\mu d}$ $(x = d)$

20. (c) $E_K - E_L = \frac{hc}{\lambda} = \frac{(6.6\times10^{-34})\,(3\times10^8)}{(0.021\times10^{-9})\,(1.6\times10^{-19})} eV = 59 keV$

21. (d) Minimum wavelength of continuous *X*-ray spectrum is given by

$$\lambda_{min}(\text{in Å}) = \frac{12375}{E(eV)} = \frac{12375}{80\times10^3} \approx 0.155$$

Also the energy of the incident electrons (80 *KeV*) is more than the ionization energy of the *K*-shell electrons (*i.e.* 72.5 *KeV*). Therefore characteristic *X*-ray spectrum will also be obtained because energy of incident electron is enough to knock out the electron from *K* or *L* shells.

22. (a) The wave length of L_α line is given by

$$\frac{1}{\lambda} = R(z-7.4)^2\left(\frac{1}{2^2} - \frac{1}{3^2}\right) \Rightarrow \lambda \propto \frac{1}{(Z-7.4)^2}$$

$$\Rightarrow \frac{\lambda_1}{\lambda_2} = \frac{(z_2-7.4)^2}{(z_1-7.4)^2} \Rightarrow \frac{1.30}{\lambda_2} = \frac{(42-7.4)^2}{(78-7.4)^2} \Rightarrow \lambda_2 = 5.41 Å$$

23. (c) de-Broglie wavelength $\lambda = \frac{h}{mv_{rms}}$, *rms* velocity of a gas particle at the given temperature (*T*) is given as

$$\frac{1}{2}mv_{rms}^2 = \frac{3}{2}kT \Rightarrow v_{rms} = \sqrt{\frac{3kT}{m}} \Rightarrow mv_{rms} = \sqrt{3mk\,T}$$

$$\therefore \lambda = \frac{h}{mv_{rms}} = \frac{h}{\sqrt{3mkT}}$$

$$\Rightarrow \frac{\lambda_H}{\lambda_{He}} = \sqrt{\frac{m_{He}T_{He}}{m_H T_H}} = \sqrt{\frac{4(273+127)}{2(273+27)}} = \sqrt{\frac{8}{3}}$$

24. (c) $n = \frac{E\lambda}{hc} = \frac{1\times10^{-7}\times200\times10^{-9}}{6.6\times10^{-34}\times3\times10^8} = 1\times10^{11}$

Number of electrons ejected $= \frac{10^{11}}{10^3} = 10^8$

$$\therefore V = \frac{q}{4\pi\varepsilon_0 r} = \frac{(10^8\times1.6\times10^{-19})\times9\times10^9}{4.8\times10^{-2}} = 3\,V$$

25. (b) The momentum of the incident radiation is given as $p = \frac{h}{\lambda}$.

When the light is totally reflected normal to the surface the direction of the ray is reversed. That means it reverses the direction of it's momentum without changing it's magnitude

$$\therefore \Delta p = 2p = \frac{2h}{\lambda} = \frac{2\times6.6\times10^{-34}}{6630\times10^{-10}} = 2\times10^{-27}\ kg\text{-}m/sec.$$

26. (c) When a charged particle (charge *q*, mass *m*) enters perpendicularly in a magnetic field (*B*) than, radius of the path described by it $r = \frac{mv}{qB} \Rightarrow mv = qBr$.

Also de-Broglie wavelength $\lambda = \frac{h}{mv}$

$$\Rightarrow \lambda = \frac{h}{qBr} \Rightarrow \frac{\lambda_\alpha}{\lambda_p} = \frac{q_p r_p}{q_\alpha r_\alpha} = \frac{1}{2}$$

27. (a) $\sqrt{f_1} = \sqrt{\frac{v}{\lambda_1}} = a(11-1)$ and $\sqrt{f_2} = \sqrt{\frac{v}{\lambda_2}} = a(Z-1)$

By dividing, $\sqrt{\frac{\lambda_2}{\lambda_1}} = \frac{10}{Z-1} \Rightarrow \sqrt{\frac{4}{1}} = \frac{10}{Z-1} \Rightarrow Z = 6$

28. (c) $K.E. = 2E_0 - E_0 = E_0$ (for $0 \le x \le 1$) $\Rightarrow \lambda_1 = \frac{h}{\sqrt{2mE_0}}$

$K.E. = 2E_0$ (for $x > 1$) $\Rightarrow \lambda_2 = \frac{h}{\sqrt{4mE_0}} \Rightarrow \frac{\lambda_1}{\lambda_2} = \sqrt{2}$.

29. (b) Given $m_0c^2 = 0.51\ MeV$ and $v = 0.8\,c$

K.E. of the electron $= mc^2 - m_0c^2$

$$\text{But } m = \frac{m_0}{\sqrt{1-\frac{v^2}{c^2}}} = \frac{m_0}{\sqrt{1-\left(\frac{0.8\,c}{c}\right)^2}} = \frac{m_0}{\sqrt{0.36}} = \frac{m_0}{0.6}$$

Now, $mc^2 = \frac{0.51}{0.6}\ MeV = 0.85\ MeV$

$\therefore$ *K.E.* = (0.85 – 0.51)*MeV* = 0.34 *MeV*.

30. (a) The deflection suffered by charged particle in an electric field is

$$y = \frac{q\,ELD}{mu^2} = \frac{q\,ELD}{p^2/m} \qquad (p = mu)$$

$$\Rightarrow y \propto \frac{qm}{p^2} \Rightarrow y_p : y_d : y_\alpha = \frac{q_p m_p}{p_p^2} : \frac{q_d m_d}{p_d^2} : \frac{q_\alpha m_\alpha}{p_\alpha^2}$$

Since $p_\alpha = p_d = p_p$ (given)

$m_p : m_d : m_\alpha = 1 : 2 : 4$ and $q_p : q_d : q_\alpha = 1 : 1 : 2$

$\Rightarrow y_p : y_d : y_\alpha = 1\times1 : 1\times2 : 2\times4 = 1 : 2 : 8$

31. (c) Using $Z^2 = k\left(\frac{q}{m}\right)y$; where $k = \frac{B^2LD}{E}$. For parabolas to coincide in the two photographs, the $\frac{kq}{m}$ should be same for the two cases. Thus, $\frac{B_1^2\,LDe}{E_1m_1} = \frac{B_2^2LD(2e)}{E_2m_2}$

$$\Rightarrow \frac{m_1}{m_2} = \left(\frac{B_1}{B_2}\right)^2 \times \left(\frac{E_2}{E_1}\right) \times \frac{1}{2} = \frac{9}{4} \times \frac{2}{1} \times \frac{1}{2} = \frac{9}{4}$$

32. (c) According to the energy diagram of *X*-ray spectra

$$\because \Delta E = \frac{hc}{\lambda} \Rightarrow \lambda \propto \frac{1}{\Delta E}$$

(ΔE = Energy radiated when *e* jumps from, higher energy orbit to lower energy orbit)

$\because (\Delta E)_{k_\beta} > (\Delta E)_{k_\alpha} > (\Delta E)_{L_\alpha} \therefore \lambda'_\alpha > \lambda_\alpha > \lambda_\beta$

Also $(\Delta E)_{k_\beta} = (\Delta E)_{k_\alpha} + (\Delta E)_{L_\alpha}$

$$\Rightarrow \frac{hc}{\lambda_\beta} = \frac{hc}{\lambda_\alpha} + \frac{hc}{\lambda'_\alpha} \Rightarrow \frac{1}{\lambda_\beta} = \frac{1}{\lambda_\alpha} + \frac{1}{\lambda'_\alpha}$$

33. (c) By using $I = \frac{P}{A}$; where P = radiation power

$$\Rightarrow P = I \times A \Rightarrow \frac{nhc}{t\lambda} = IA \Rightarrow \frac{n}{t} = \frac{IA\lambda}{hc}$$

Hence number of photons entering per sec the eye $\left(\frac{n}{t}\right) = \frac{10^{-10} \times 10^{-6} \times 5.6 \times 10^{-7}}{6.6 \times 10^{-34} \times 3 \times 10^{8}}$ = 300.

34. (d) $\Delta\lambda = \lambda_{K_\alpha} - \lambda_{\min}$ When V is halved $\lambda_{\min}$ becomes two times but λ_{K_α} remains the same.

$\therefore \quad \Delta\lambda' = \lambda_{K_\alpha} - 2\lambda_{\min} = 2(\Delta\lambda) - \lambda_{K_\alpha}$

$\therefore \quad \Delta\lambda' < 2(\Delta\lambda)$

35. (b) Energy of photons corresponding to light of wave length λ_1 = 2475 Å is $E_1 = \frac{12375}{2475} = 5\,eV$.

and that corresponding to λ_2 = 6000 Å is

$$E_2 = \frac{12375}{6000} = 2.06\,eV$$

As $E_1 < W_0$ and $E_2 > W_0$

Photoelectric emission is possible with λ_2 only. Maximum kinetic energy of emitted photoelectrons $K = E - W_0$ = 5 – 4.8 = 0.2 eV.

Photo electrons experiences magnetic force and move along a circular path of radius

$$r = \frac{\sqrt{2mk}}{QB} = \frac{\sqrt{2 \times 9 \times 10^{-31} \times 0.2 \times 1.6 \times 10^{-19}}}{1.6 \times 10^{-19} \times 3 \times 10^{-5}}$$

= 0.05 m = 5 cm.

36. (a) Number of photoelectrons emitted up to t = 10 sec are

$$n = \frac{(\text{Number of photons per unit area per unit time}) \times (\text{Area} \times \text{Time})}{10^6}$$

$$= \frac{1}{10^6}[(10)^{16} \times (5 \times 10^{-4}) \times (10)] = 5 \times 10^7$$

At time t = 10 sec

Charge on plate A ; $q_A = +ne$ = 5 × 10^7 × 1.6 × 10^{-19}

= 8 × 10^{-12} C = 8 pC

and charge on plate B ; q_B = 33.7 – 8 = 25.7 pc

Electric field between the plates

$$E = \frac{(q_B - q_A)}{2\varepsilon_0 A} = \frac{(25.7 - 8) \times 10^{-12}}{2 \times 8.85 \times 10^{-12} \times 5 \times 10^{-4}} = 2 \times 10^3 \frac{N}{C}.$$

37. (a) As we know in Young's double slit experiment fringe width = separation between two consecutive fringe or dark fringes $= \beta = \frac{\lambda D}{d}$

Here $\beta = 2y \Rightarrow 2y = \frac{\lambda D}{d} \Rightarrow \lambda = \frac{2yd}{D}$

$$\Rightarrow \lambda = \frac{2 \times 1 \times 10^{-3} \times 0.24 \times 10^{-3}}{1.2} = 4 \times 10^{-7} m = 4000\,Å$$

Energy of light incident on photo plate

$$E(eV) = \frac{12375}{4000} = 3.1\,eV$$

According to Eienstein photoelectric equation

$$E = W_0 + eV_0 \Rightarrow V_0 = \frac{(E - W_0)}{e} = \frac{(3 + 2.2)}{e} eV \approx 0.9\,V$$

38. (a) $E = \frac{12375}{5000} = 2.475\,eV \approx 4 \times 10^{-19}\,J$

So the minimum intensity to which the eye can respond

I_{Eye} = (Photon flux) × (Energy of a photon)

$\Rightarrow I_{Eye} = (5 \times 10^4) \times (4 \times 10^{-19}) \simeq 2 \times 10^{-14}\,(W/m^2)$

Now as lesser the intensity required by a detector for detection, more sensitive it will be

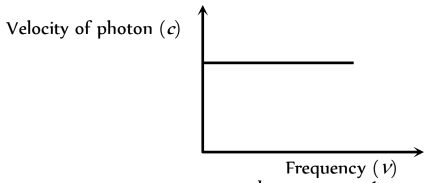
$\frac{S_{Eye}}{S_{Ear}} = \frac{I_{Ear}}{I_{Eye}} = \frac{10^{-13}}{2 \times 10^{-14}} = 5$ *i.e.* as intensity (power) detector, the eye is five times more sensitive than ear.

39. (c) Due to 10.2 eV photon one photon of energy 10.2 eV will be detected.

Due to 15 eV photon the electron will come out of the atom with energy (15 - 13.6) = 1.4 eV.

Graphical Questions

1. (a) Velocity of photon (*i.e.* light) does not depend upon frequency. Hence the graph between velocity of photon and frequency will be as follows



2. (d) De-Broglie wavelength $\lambda = \frac{h}{p} \Rightarrow \lambda \propto \frac{1}{p}$

i.e. graph will be a rectangular hyperbola.

3. (a) The stopping potential for curves a and b is same.

$\therefore \quad f_a = f_b$

Also saturation current is proportional to intensity

$\therefore \quad I_a < I_b$

4. (d) According to Einstein equation

$h\nu = h\nu_0 + K_{\max} \Rightarrow K_{\max} = h\nu - h\nu_0$ on comparing it with $y = mx + c$, it is clear to say that,

This is the equation of straight line having positive slope (h) and negative intercept ($h\nu_0$) on KE axis.

5. (c) Comparing Einstein's equation

$K_{\max} = h\nu - h\nu_0$, with $y = mx + c$, we get slope, $m = h$

6. (b) $K_{max} = h\nu - h\nu_0 \Rightarrow eV_0 = h\nu - h\nu_0 \Rightarrow V_0 = \frac{h}{e}\nu - \frac{h\nu_0}{e}$

Comparing this equation with $y = mx + c$, we get slope $m = \frac{h}{e} \Rightarrow h = m \times e$.

7. (a) Using Einstein's equation, $V_0 = \left(\frac{h}{e}\right)\nu - \frac{W_0}{e}$

Comparing this equation with $y = mx + c$

We get intercept on $-V$ axis $= \frac{W_0}{e}$

$\Rightarrow OB = \frac{W_0}{e} \Rightarrow W_0 = OB \times e$

8. (b) From the given graph it is clear that if we extend the given graph for *A* and *B*, intercept of the line *A* on *V* axis will be smaller as compared to line *B* means work function of *A* is smaller than that of *B*.

9. (a) Wavelength λ_k is independent of the accelerating voltage (V), while the minimum wavelength λ_c is inversely proportional to V. Therefore as V increases, λ_k remains unchanged whereas λ_c decreases or $\lambda_k - \lambda_c$ will increase.

10. (c) In *X*-ray spectra, depending on the accelerating voltage and the target element, we may find sharp peaks super imposed on continuous spectrum. These are at different wavelengths for different elements. They form characteristic *X*-ray spectrum.

11. (b) Photo current (i) directly proportional to light intensity (I) falling on a photosensitive plate. $\Rightarrow i \propto I$

12. (d) According to Einstein's equation

$h\nu = W_0 + K_{max} \Rightarrow V_0 = \left(\frac{h}{e}\right)\nu - \frac{W_0}{e}$

This is the equation of straight line having positive slope (h/e) and intercept on $-V_0$ axis, equals to $\frac{W_0}{e}$

13. (d) In photocell, at a particular negative potential (stopping potential V) of anode, photoelectric current is zero,

At the potential difference between cathode and anode increases current through the circuit increases but after some time constant current (saturation current) flows through the circuit even if potential difference still increasing.

14. (b) Stopping potential does not depend upon intensity of incident light (I).

15. (a) Stopping potential is that negative potential for which photo electric current is zero.

16. (d) $\because V_0 = \left(\frac{h}{e}\right)\nu - \left(\frac{W_0}{e}\right)$. From the graph $V_2 > V_1$

$\Rightarrow \frac{h\nu_2}{e} - \frac{W_0}{e} > \frac{h\nu_1}{e} - \frac{W_0}{e} \Rightarrow \nu_2 > \nu_1$

$\Rightarrow \lambda_1 > \lambda_2$ (as $\lambda \propto \frac{1}{\nu}$)

17. (d) $I \propto \frac{1}{d^2}$ and photo current $i \propto I \Rightarrow i \propto \frac{1}{d^2}$

18. (a) $h\nu = h\nu_0 + KE_{max} \Rightarrow KE_{max} = h\nu - h\nu_0$

On comparing this equation with $y = mx + c$ we get

$m = h =$ Universal constant

19. (b) $\lambda_0 = \frac{c}{\nu_0} = \frac{3 \times 10^8}{5 \times 10^{14}} = 6 \times 10^{-7} m = 6000\ Å$

20. (c) Work function is the intercept on *K.E.* axis *i.e.* $2eV$.

21. (b) From the graph stopping potential $|V| = -V$

Also $k_{max} = (|V|)eV = 4eV$.

22. (c) By Moseley's law, $\sqrt{\nu} = a(Z - b)$ or, $\nu = a^2(Z - b)^2$

Comparing with the equation of a parabola, $y^2 = 4ax$ it conforms to graph *c*.

23. (a) $\lambda_{min} = \frac{hc}{eV} \Rightarrow \lambda \propto \frac{1}{V}$

$\because \lambda_2 > \lambda_1$ (see graph) $\Rightarrow V_1 > V_2$

$\sqrt{\nu} = a(Z - b)$ Moseley's law

$\nu \propto (Z-1)^2 \Rightarrow \lambda \propto \frac{1}{(Z-1)^2}$ $\left(\because \nu \propto \frac{1}{\lambda}\right)$

$\lambda_1 > \lambda_2$ (see graph for characteristic lines) $\Rightarrow Z_2 > Z_1$.

24. (a) $K_{max} = h\nu - h\nu_0 = \frac{hc}{\lambda} - \frac{hc}{\lambda_0}$ *i.e.* graph between K_{max} and $\frac{1}{\lambda}$ will be straight line having slope (hc) and intercept $\frac{hc}{\lambda_0}$ on $-KE$ axis.

25. (a) ν varies from 0 to ν_{max}.

26. (a) $\lambda_{min} = \frac{hc}{eV} \Rightarrow \log.\lambda_{min} = \log\frac{hc}{e} - \log V$

$\Rightarrow \log\lambda_{min} = -\log V + \log\frac{hc}{e}$

This is the equation of straight line having slope (–1) and intercept $\log\frac{hc}{e}$ on $+\log_e \lambda_{min}$ axis.

27. (c) For K_α line $\nu \propto (Z-1)^2 \Rightarrow \lambda \propto \frac{1}{(Z-1)^2}$

i.e. the graph between λ and z will be (c).

28. (b) Slope of $V_0 - \nu$ curve $= \frac{h}{e}$

$\Rightarrow h = \text{Slope} \times e = 1.6 \times 10^{-19} \times 4.12 \times 10^{-15}$

$= 6.6 \times 10^{-34}$ *J*-sec.

29. (b) $I_1 > I_2$ (given) $\Rightarrow i_1 > i_2$ $(\because i \propto I)$

and stopping potential does not depend upon intensity. So its value will be same (V_0).

30. (c) Slope of $V_0 - \nu$ curve for all metals be same $\left(\frac{h}{e}\right)$ *i.e.* curves should be parallel.

31. (c) $\lambda = \frac{h}{\sqrt{2mE}} = \frac{h}{\sqrt{2m}} \cdot \frac{1}{\sqrt{E}}$. Taking log of both sides

$\log\lambda = \log\frac{h}{\sqrt{2m}} + \log\frac{1}{\sqrt{E}} \Rightarrow \log\lambda = \log\frac{h}{\sqrt{2m}} - \frac{1}{2}\log E$

$\Rightarrow \log\lambda = -\frac{1}{2}\log E + \log\frac{h}{\sqrt{2m}}$

This is the equation of straight line having slope (–1/2) and positive intercept on log λ axis.

32. (b) $\sqrt{\nu} \propto (Z-b)$

33. (b) Peak of K_α is greater than peak of K_β line.

34. (a) $|-4V| > |-2V|$

35. (a) $\because x \propto \frac{1}{v^2}$. The ion whose deflection is less, its velocity will be more. From the curve $x_1 < x_2 < x_3 < x_4$, therefore $v_1 > v_2 > v_3 > v_4$.

36. (a) All the positive ions of same specific charge moving with different velocity lie on the same parabola.

37. (b) The equation of curve between V and ν is $\frac{h\nu}{e} - \frac{h\nu_0}{e} = V_0$.

This is equation of a straight line with slope $= \frac{h}{e}$.

38. (b) Stopping potential equals to maximum kinetic energy.
Since stopping potential is varying linearly with the frequency. There fore max. *KE* for both the metals also vary linearly with frequency.

Assertion and Reason

1. (a) Momentum of a photon is given by $p = \frac{h}{\lambda}$

Also the photon is a form of energy packets behaves as a particle having energy $E = \frac{hc}{\lambda}$. So $p = \frac{E}{c}$

2. (d) Photoelectric effect demonstrates the particle nature of light. Number of emitted photoelectrons depends upon the intensity of light.

3. (b) Charge does not change with speed but mass varies with the speed as per relation $m = \frac{m_0}{\sqrt{1-\frac{v^2}{c^2}}}$. Hence specific charge

e/m decreases with increase in speed.

4. (a) X-rays lies in electromagnetic spectrum.

5. (b) Mass of moving photon $m = \frac{h\nu}{c^2} = \frac{h}{c\lambda}$ and $E = mc^2$.

6. (d) According Einstein equation $KE = h\nu - h\nu_0$; *i.e., KE* depends upon the frequency. Photoelectron emitted only if incident frequency more than threshold frequency.

7. (e) The atomic number (number of electrons or protons) remains same in isotope. Isotope of an element can be separated on account of their different atomic weight by using mass spectrograph.

8. (b) The specific charge (e/m) of the positive rays is not universal constant because these rays may consists of ions of different element.

9. (b) Less work function means less energy is required for ejecting out the electrons.

10. (a) de-Broglie wavelength associated with gas molecules varies as $\lambda \propto \frac{1}{\sqrt{T}}$

11. (e) If electron is moving parallel to the magnetic field, then the electron is not deflected *i.e.,* if electron is not deflected we cannot be sure that there is no magnetic field in that region.

12. (d) At normal pressure positive ions and electrons liberated by ionisation of gas atoms, due to cosmic rays are very small in number and they collide constantly with the gas atoms which are present in large numbers, and hence are unable to move a long distance under the electric field and soon get recombined *i.e.,* flow of ions in the gas does not take place.

13. (d) Light is produced in gases in the process of electric discharge at low pressure. When accelerated electrons collide with atoms of the gas, atoms get excited. The excited atoms return to their normal state and in this process light radiations are emitted.

14. (d) The discharge depends on both pressure of discharge tube and ionisation potential of gas. Since the ionisation potential of different gases are different, hence the discharge in different gases takes place at different potential.

15. (d) If electric field is used for detecting the electron beam, then very high voltage will have to be applied or very long tube will have to be taken.

16. (b) Specific charge of a positive ion corresponding to one gas is fixed but it is different for different gases.

17. (e) In Millikan's experiment oil drops should be of microscopic sizes. If much bigger oil drops are used, then a very high electric field will be required to balance it which is not possible to achieve practically.

Further, the apparent weight of the liquid $\frac{4}{3}\pi a^3 g$ $(\rho_{\text{liquid}} - \sigma_{\text{air}}) = 6\pi a \eta v$.

If a is large, v will be large and the experimental errors will be high.

18. (e) Only the photoelectrons emitted from the surface of the metal have maximum kinetic energy. Those emitted from inside the metal loses part of their energy in collision with the other atoms inside the metal.

19. (d) On increasing the intensity of incident light, the current in photoelectric cell will increase. The energy of the photons $(h\nu)$ will, however not increase with increase in intensity, and hence the kinetic energy of the emitted electrons will not increase.

20. (a) When a light of single frequency falls on the electron of inner layer of metal, then this electron comes out of the metal surface after a large number of collisions with atoms of its upper layer.

21. (b) There is no emission of photoelectrons till the frequency of incident light is less than a minimum frequency, however intense light it may be. In photoelectric effect, it is a single particle collision. Intensity is $h\nu \times N$, where $h\nu$ is the individual energy of the photon and *N* is the total number of photon. In the wave theory, the intensity is proportional, not only to ν^2 but also to the amplitude squared. For the same frequency, increase in intensity only increase the number of photons (in the quantum theory of Einstein).

22. (a) The photoemissive cell may be evacuated contain an inert gas at low pressure. An inert gas in the cell gives greater current but causes a time lag in the response of the cell to very rapid changes of radiation which may make it unsuitable for some purpose.

23. (c) Wavelength of *X*-rays is very small $(\approx Å)$. Hence they are not diffracted by means of ordinary grating. *X*-rays follows the Bragg's law.

24. (b) The penetrating power of *X*-rays depends upon the voltage applied across the tube producing *X*-rays. *X*-rays can pass through matter of lighter elements such as flesh (which is composed of oxygen, hydrogen and carbon) but cannot pass through substances made of heavier elements like bones (which are made of phosphorus and calcium).

25. (c) Intensity of *X*-rays (I) is proportional to the filament current and also to the square of the voltage. It is well known that

intensity of *X*-rays depends on the number of photons emitted per second from target.

26. (b) When fast moving electrons strike the atoms of the target, then most of their kinetic energy is used in increasing the thermal agitation of the atoms of the target and only a small part is radiated in the form of *X*-rays. So the temperature of the target rises.

27. (e) Higher is the wavelength of *X*-ray, lesser is the frequency and penetration power.

28. (a) The distance between the atoms of crystals is of the order of wavelength of *X*-rays. When they fall on a crystal, they are diffracted. The diffraction pattern is helpful in the study of crystal structure.

29. (b) In photoelectric effect, the photon falling on some matter is absorbed by the matter and its energy is transferred to an electron of the matter. In *X*-ray production, photons are produced which get energy from energetic electrons ionising the inner shells of the target which in turn cause a cascade of emission lines.

30. (e) Soft and hard *X*-rays differ only in frequency. But both types of *X*-ray travel with speed of light.

Electron, Photon, Photoelectric Effect and X-rays

SET Self Evaluation Test - 25

1. Which of the following will have the least value of $\frac{q}{m}$

(a) Electron (b) Proton

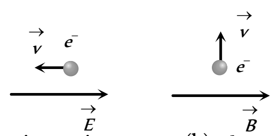
(c) α-particle (d) β-particle

2. When green light is incident on the surface of metal, it emits photo-electrons but there is no such emission with yellow colour light. Which one of the colour can produce emission of photo-electrons

(a) Orange (b) Red

(c) Indigo (d) None of the above

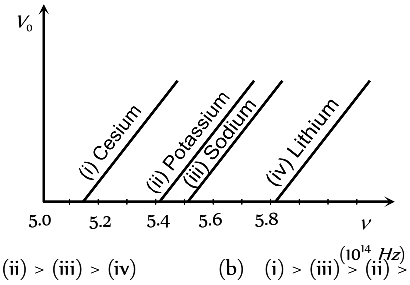
3. An electron is moving through a field. It is moving (i) opposite an electric field (ii) perpendicular to a magnetic field as shown. For each situation the de-Broglie wave length of electron



(a) Increasing, increasing (b) Increasing, decreasing

(c) Decreasing, same (d) Same, Same

4. The figure shows different graphs between stopping potential (V_0) and frequency (ν) for photosensitive surface of cesium, potassium, sodium and lithium. The plots are parallel. Correct ranking of the targets according to their work function greatest first will be



(a) (i) > (ii) > (iii) > (iv) (b) (i) > (iii) > (ii) > (iv)

(c) (iv) > (iii) > (ii) < (i) (d) (i) = (iii) > (ii) = (iv)

5. The K_α X-rays arising from a cobalt (z = 27) target have a wavelength of 179 *pm*. The K_α X-rays arising from a nickel target (z = 28) is

(a) > 179 *pm* (b) < 179 *pm*

(c) = 179 *pm* (d) None of these

6. If a voltage applied to an X-ray tube is increased to 1.5 times the minimum wavelength $(\lambda_{\min})$ of an X-ray continuous spectrum shifts by $\Delta\lambda = 26\ pm$. The initial voltage applied to the tube is

(a) ≈ 10 *kV* (b) ≈ 16 *kV*

(c) ≈ 50 *kV* (d) ≈ 75 *kV*

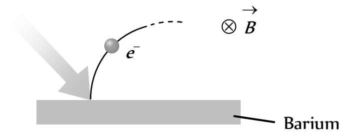
7. Light of wavelength 2475 Å is incident on barium. Photoelectrons emitted describe a circle of radius 100 *cm* by a magnetic field of flux density $\frac{1}{\sqrt{17}} \times 10^{-5}$ *Tesla*. Work function of the barium is (Given $\frac{e}{m} = 1.7 \times 10^{11}$)

(a) 1.8 *eV*

(b) 2.1 *eV*

(c) 4.5 *eV*

(d) 3.3 *eV*



8. Five elements *A*, *B*, *C*, *D* and *E* have work functions 1.2 *eV*, 2.4 *eV*, 3.6 *eV*, 4.8 *eV* and 6 *eV* respectively. If light of wavelength 4000 Å is allowed to fall on these elements, then photoelectrons are emitted by

(a) *A*, *B* and *C* (b) *A*, *B*, *C*, *D* and *E*

(c) *A* and *B* (d) Only *E*

9. If light of wavelength λ_1 is allowed to fall on a metal, then kinetic energy of photoelectrons emitted is E_1. If wavelength of light changes to λ_2 then kinetic energy of electrons changes to E_2. Then work function of the metal is

(a) $\frac{E_1E_2(\lambda_1 - \lambda_2)}{\lambda_1\lambda_2}$ (b) $\frac{E_1\lambda_1 - E_2\lambda_2}{(\lambda_1 - \lambda_2)}$

(c) $\frac{E_1\lambda_1 - E_2\lambda_2}{(\lambda_2 - \lambda_1)}$ (d) $\frac{\lambda_1\lambda_2\ E_1E_2}{(\lambda_2 - \lambda_1)}$

10. If maximum velocity with which an electron can be emitted from a photo cell is $4 \times 10^8\ cm/\sec$, the stopping potential is (mass of electron = $9 \times 10^{-}$ *kg*)

(a) 30 *volt* (b) 45 *volt*

(c) 59 *volt* (d) Information is insufficient

11. Three particles having their charges in the ratio of 1 : 3 : 5 produce the same spot on the screen in Thomson's experiment. Their masses are in the ratio of

(a) 5 : 3 : 1 (b) 3 : 1 : 5

(c) 1 : 3 : 5 (d) 5 : 1 : 3

12. If the momentum of an electron is changed by Δp, then the de-Broglie wavelength associated with it changes by 0.50%. The initial momentum of the electron will be

(a) $\frac{\Delta p}{200}$ (b) $\frac{\Delta p}{199}$

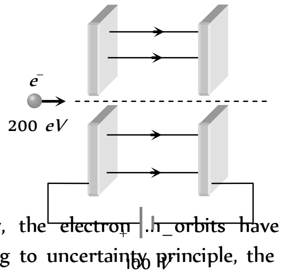
(c) $199\,\Delta p$ (d) $400\,\Delta p$

13. If 10000 *V* is applied across an X-ray tube, what will be the ratio of de-Broglie wavelength of the incident electrons to the shortest wavelength of X-ray produced ($\frac{e}{m}$ for electron is $1.8 \times 10^{11}\ c\,kg^{-1}$)

(a) 1 (b) 0.1

(c) 0.2 (d) 0.3

14. Two large parallel plates are connected with the terminal of 100 V power supply. These plates have a fine hole at the centre. An electron having energy 200 eV is so directed that it passes through the holes. When it comes out it's de-Broglie wavelength is



(a) 1.22 Å

(b) 1.75 Å

(c) 2 Å

(d) None of these

15. According to Bohr's theory, the electron in orbits have definite energy values, then according to uncertainty principle, the life time of an excited state will be

(a) Zero (b) Finite

(c) 10^{-8} sec (d) Infinite

16. Monochromatic light of wavelength 3000 Å is incident on a surface area 4cm^2. If intensity of light is 150 mW/m^2, then rate at which photons strike the target is

(a) $3 \times 10^{10}/sec$ (b) $9 \times 10^{13}/sec$

(c) $7 \times 10^{15}/sec$ (d) $6 \times 10^{19}/sec$

17. For characteristic X-ray of some material

(a) $E(K_\gamma) < E(K_\beta) < E(K_\alpha)$ (b) $E(K_\alpha) < E(L_\alpha) < E(M_\alpha)$

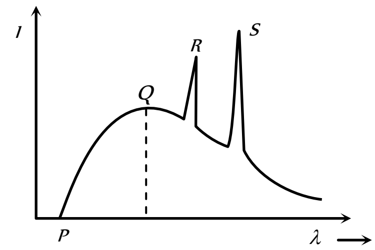
(c) $\lambda(K_\gamma) < \lambda(K_\beta) < \lambda(K_\alpha)$ (d) $\lambda(M_\alpha) < \lambda(L_\alpha) < \lambda(K_\alpha)$

18. The maximum velocity of electrons emitted from a metal surface is V. When frequency of light falling on it is f. The maximum velocity when frequency becomes $4f$ is

(a) 2 V (b) > 2 V

(c) < 2 V (d) Between 2 V and 4 V

19. If the potential difference between the anode and cathode of the X-ray tube is increases



(a) The peaks at R and S would move to shorter wavelength

(b) The peaks at R and S would remain at the same wavelength

(c) The cut off wavelength at P would decrease

(d) (b) and (c) both are correct

20. The collector plate in an experiment on photoelectric effect is kept vertically above the emitter plate. Light source is put on and a saturation photo current is recorded. An electric field is switched on which has a vertically downward direction

(a) The photo current will increase

(b) The kinetic energy of the electrons will increase

(c) The stopping potential will decrease

(d) The threshold wavelength will increase

Answers and Solutions

(SET -25)

1. (c) Mass of α-particle is maximum so $\left(\frac{q}{m}\right)_\alpha$ is least.

2. (c) Wave length of green light is threshold wave length.
Hence for emission of electron, wave length of incident light < wavelength of green light.

3. (c) $\lambda = \frac{h}{mv}$. Since v is increasing in case (i), but it is not changing in case (ii). Hence, in the first case de-Broglie wavelength will change, but it second case, it remain the same

4. (c) The graph between V_0 and ν cut the ν-axis at ν_0.
For the given graphs $(\nu_0)_{(iv)} > (\nu_0)_{(iii)} > (\nu_0)_{(ii)} > (\nu_0)_{(i)}$

$\therefore (W_0)_{(iv)} > (W_0)_{(iii)} > (W_0)_{(ii)} > (W_0)_{(i)}$.

5. (b) $\lambda_{k\alpha} \propto \frac{1}{(Z-1)^2} \Rightarrow \frac{\lambda_{Ni}}{\lambda_{Co}} = \left(\frac{Z_{Co}-1}{Z_{Ni}-1}\right)^2 = \left(\frac{27-1}{28-1}\right)^2$

$\Rightarrow \lambda_{Ni} = \left(\frac{26}{27}\right)^2 \times \lambda_{Co} = \left(\frac{26}{27}\right)^2 \times 179 = 165.9\ pm < 179\ pm$.

6. (b) $\lambda_{min} = \frac{hc}{eV} \Rightarrow \lambda_1 = \frac{hc}{eV_1}$ and $\lambda_2 = \frac{hc}{eV_2}$

$\therefore\ \Delta\lambda = \lambda_2 - \lambda_1 = \frac{hc}{e}\left[\frac{1}{V_2} - \frac{1}{V_1}\right]$. Given $V_2 = 1.5\ V_1$

on solving we get $V_1 = 16000\ volt = 16\ kV$.

7. (c) Radius of circular path described by a charged particle in a magnetic field is given by $r = \frac{\sqrt{2mK}}{qB}$; where K = Kinetic energy of electron $\Rightarrow K = \frac{q^2B^2r^2}{2m} = \left(\frac{e}{m}\right)\frac{eB^2r^2}{2}$

$= \frac{1}{2} \times 1.7 \times 10^{11} \times 1.6 \times 10^{-19} \times \left(\frac{1}{\sqrt{17}} \times 10^{-5}\right)^2 \times (1)^2$

$= 8 \times 10^{-20}\ J = 0.5\ eV$

By using $E = W_0 + K_{max}$

$\Rightarrow W_0 = E - K_{max} = \left(\frac{12375}{2475}\right)eV - 0.5\ eV = 4.5\ eV$

8. (c) $E = \frac{12375}{4000} = 3.09\ eV$ Photoelectrons emits if energy of incident light > work function.

9. (c) $E = W_0 + K_{max} \Rightarrow \frac{hc}{\lambda_1} = W_0 + E_1$ and $\frac{hc}{\lambda_2} = W_0 + E_2$

$\Rightarrow hc = W_0\lambda_1 + E_1\lambda_1$ and $hc = W_0\lambda_2 + E_2\lambda_2$

$\Rightarrow W_0\lambda_1 + E_1\lambda_1 = W_0\lambda_2 + E_2\lambda_2 \Rightarrow W_0 = \frac{E_1\lambda_1 - E_2\lambda_2}{(\lambda_2 - \lambda_1)}$.

10. (b) $v_{max} = 4 \times 10^8\ cm/sec = 4 \times 10^6\ m/sec$.

$\therefore\ K_{max} = \frac{1}{2}mv_{max}^2 = \frac{1}{2} \times 9 \times 10^{-31} \times (4 \times 10^6)^2$

$= 7.2 \times 10^{-18}\ J = 45\ eV$.

Hence, stopping potential $|V_0| = \frac{K_{max}}{e} = \frac{45\ eV}{e} = 45\ volt$.

11. (c) Since spot is same, hence $\frac{e}{m}$ should be same *i.e.*,

As $q_1 : q_2 : q_3 = 1 : 3 : 5$. Hence $m_1 : m_2 : m_3 = 1 : 3 : 5$

12. (c) $\lambda = \frac{h}{p} \Rightarrow \lambda - \frac{0.5}{100}\lambda = \frac{h}{p+\Delta p} \Rightarrow \frac{199\lambda}{200} = \frac{h}{p+\Delta p} = \frac{199}{200}\frac{h}{p}$

$\Rightarrow p + \Delta p = \frac{200}{199}p \Rightarrow p = 199\ \Delta p$

13. (b) For the incident electron $\frac{1}{2}mv^2 = eV$ or $p^2 = 2m\,eV$

$\therefore$ de-Broglie wavelength $\lambda_1 = \frac{h}{p} = \frac{h}{\sqrt{2m\,eV}}$

Shortest X-ray wavelength $\lambda_2 = \frac{hc}{eV}$

$\therefore\ \frac{\lambda_1}{\lambda_2} = \frac{1}{c}\sqrt{\left(\frac{V}{2}\right)\left(\frac{e}{m}\right)} = \frac{\sqrt{\frac{10^4}{2} \times 1.8 \times 10^{11}}}{3 \times 10^8} = 0.1$

14. (a) Energy of the electron, when it comes out from the second plate = 200 eV – 100 eV = 100 eV

Hence accelerating potential difference = 100 V

$\lambda_{Electron} = \frac{12.27}{\sqrt{V}} = \frac{12.27}{\sqrt{100}} = 1.23\mathring{A}$

15. (d) According to Bohr's theory $\Delta E = 0$, since $\Delta E \cdot \Delta t \geq h$

$\Rightarrow \Delta t \rightarrow \infty$

16. (b) $\frac{n}{t} = \frac{I A\lambda}{hc} = \frac{150 \times 10^{-3} \times 4 \times 10^{-4} \times 3 \times 10^{-7}}{6.6 \times 10^{-34} \times 3 \times 10^8} = 9 \times 10^{13}\ \frac{1}{sec}$

17. (c) $\because E(K_\gamma) > E(K_\beta) > E(K_\alpha) \Rightarrow \lambda(K_\gamma) < \lambda(K_\beta) < \lambda(K_\alpha)$

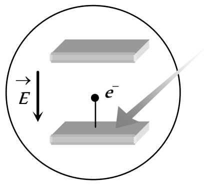
18. (b) $\because E = W_0 + \frac{1}{2}mv_{max}^2 \Rightarrow v_{max} = \sqrt{\frac{2(hf - W_0)}{m}}$

If frequency becomes $4f$ then

$V' = \sqrt{\frac{2(h \times 4f - W_0)}{m}} = 2\sqrt{\frac{2\left(hf - \frac{W_0}{4}\right)}{m}} \Rightarrow V' > 2V$

19. (d) Peaks on the graph represent characteristic X-ray spectrum. Every peak has a certain wavelength, which depends upon the transition of electron inside the atom of the target. While λ_{min} depends upon the accelerating voltage (As. $\lambda_{min} \propto 1/V$).

20. (b) In electric field photoelectron will experience force and accelerate opposite to the field so it's *K.E.* increases (*i.e.* stopping potential will increase), no change in photoelectric current, and threshold wavelength.



***

Chapter
26
Atomic and Nuclear Physics

Thomson's Atomic Model

J.J. Thomson gave the first idea regarding structure of atom. According to this model.

(1) An atom is a solid sphere in which entire and positive charge and it's mass is uniformly distributed and in which negative charge (*i.e.* electron) are embedded like seeds in watermelon.

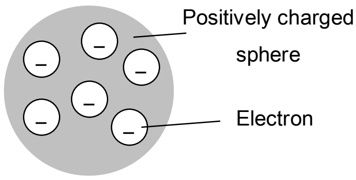


Fig. 26.1

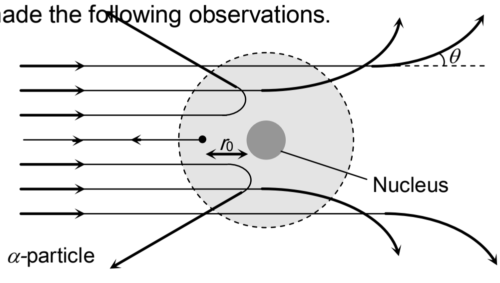
(2) This model explained successfully the phenomenon of thermionic emission, photoelectric emission and ionization.

(3) The model fail to explain the scattering of α- particles and it cannot explain the origin of spectral lines observed in the spectrum of hydrogen and other atoms.

α-Scattering Experiment

'Geiger and Marsden (students of Rutherford) studied the scattering of α-particles by gold foil on the advice of Rutherford and made the following observations.



(1) Most of the α-particles pass through the foil straight away undeflected.

(2) Some of them are deflected through small angles.

(3) A few α-particles (1 in 1000) are deflected through the angle more than 90°.

(4) A few α -particles (very few) returned back *i.e.* deflected by 180°.

(5) Number of scattered particles : $N \propto \frac{1}{\sin^4(\theta/2)}$

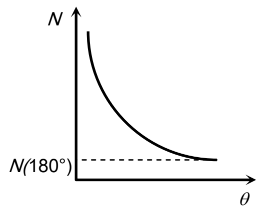


Fig. 26.3

(6) If t is the thickness of the foil and N is the number of α-particles scattered in a particular direction (*i.e.* θ = constant), it was observed that $\frac{N}{t} = \text{constant} \Rightarrow \frac{N_1}{N_2} = \frac{t_1}{t_2}$

(7) **Distance of closest approach** (Nuclear dimension) :

The minimum distance from the nucleus up to which the α-particle approach, is called the distance of closest approach (r_0). At this distance the entire initial kinetic energy has been converted into potential energy so

$$\frac{1}{2}mv^2 = \frac{1}{4\pi\varepsilon_0}.\frac{(Ze)2e}{r_0} \Rightarrow r_0 = \frac{Ze^2}{mv^2\pi\varepsilon_0} = \frac{4kZe^2}{mv^2}$$

(8) **Impact parameter** (b) : The perpendicular distance of the velocity vector ($\vec{v}$) of the α-particle from the centre of the nucleus when it is far away from the nucleus is known as impact parameter. It is given as

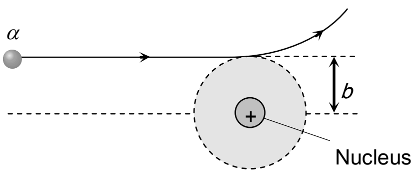

Fig. 26.4

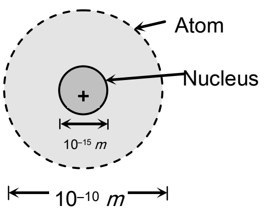
$$b = \frac{Ze^2 \cot(\theta/2)}{4\pi\varepsilon_0\left(\frac{1}{2}mv^2\right)} \Rightarrow b \propto \cot(\theta/2)$$

For large b, α particles will go undeviated and for small b the α-particle will suffer large scattering.

Rutherford's Atomic Model

After α-particles scattering experiment, following conclusions were made by Rutherford as regard as atomic structure :



Size of the nucleus = 1 *Fermi* = 10^{-15} *m*

Size of the atom 1 Å = 10^{-10} *m*

Fig. 26.5

(1) Most of the mass (at least 99.95%) and all of the charge of an atom concentrated in a very small region is called atomic nucleus.

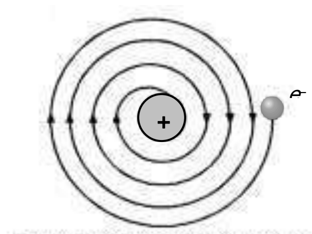
(2) Nucleus is positively charged and it's size is of the order of

10^{-15} *m* ≈ 1 *Fermi*. The nucleus occupies only about 10^{-12} of the total volume of the atom or less.

(3) In an atom there is maximum empty space and the electrons revolve around the nucleus in the same way as the planets revolve around the sun.

Failure of Rutherford's Model

(1) **Stability of atom :** It could not explain stability of atom because according to classical electrodynamics theory an accelerated charged particle should continuously radiate energy. Thus an electron moving in an circular path around the nucleus should ove into smaller and smaller orb us and it should ultimately fall int



Instability of atom

Fig. 26.6

(2) According to this model the spectrum of atom must be continuous where as practically it is a line spectrum.

(3) It did not explain the distribution of electrons outside the nucleus.

Bohr's Atomic Model

Bohr proposed a model for hydrogen atom which is also applicable for some lighter atoms in which a single electron revolves around a stationary nucleus of positive charge *Ze* (called hydrogen like atom)

Bohr's model is based on the following postulates.

(1) He postulated that an electron in an atom can move around the nucleus in certain circular stable orbits without emitting radiations.

(2) Bohr found that the magnitude of the electron's

Angular momentum is quantized *i.e.* $L = mv_n r_n = n\left(\frac{h}{2\pi}\right)$

where n = 1, 2, 3, ... each value of n corresponds to a permitted value of the orbit radius.

r_n = Radius of n^{th} orbit, v_n = corresponding speed

(3) The radiation of energy occurs only when an electron jumps from one permitted orbit to another.

When electron jumps from higher energy orbit (E_2) to lower energy orbit (E_1) then difference of energies of these orbits *i.e.* $E_2 - E_1$ emits in the form of photon. But if electron goes from E_1 to E_2 it absorbs the same amount of energy.

Draw Backs of Bohr's Atomic Model

(1) It is valid only for one electron atoms, *e.g.* : H, He^+, Li^{+2}, Na^{+1} *etc.*

(2) Orbits were taken as circular but according to Sommerfield these are elliptical.

(3) Intensity of spectral lines could not be explained.

(4) Nucleus was taken as stationary but it also rotates on its own axis.

(5) It could not be explained the minute structure in spectrum line.

(6) This does not explain the Zeeman effect (splitting up of spectral lines in magnetic field) and Stark effect (splitting up in electric field)

(7) This does not explain the doublets in the spectrum of some of the atoms like sodium (5890 Å & 5896 Å)

Bohr's Orbits (for Hydrogen and H_2-like Atoms)

(1) **Radius of orbit :** For an electron around a stationary nucleus the electrostatics force of attraction provides the necessary centripetal force

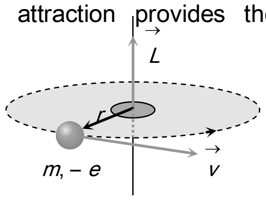


Fig. 26.7

i.e. $\frac{1}{4\pi\varepsilon_0}\frac{(Ze)e}{r^2} = \frac{mv^2}{r}$ .... (i)

also $mvr = \frac{nh}{2\pi}$ ....(ii)

From equation (i) and (ii) radius of n^{th} orbit

$$r_n = \frac{n^2h^2}{4\pi^2 kZme^2} = \frac{n^2h^2\varepsilon_0}{\pi mZe^2} = 0.53\frac{n^2}{Z}\text{Å} \qquad \left(k = \frac{1}{4\pi\varepsilon_0}\right)$$

$$\Rightarrow r_n \propto \frac{n^2}{Z}$$

(2) **Speed of electron :** From the above relations, speed of electron in n^{th} orbit can be calculated as

$$v_n = \frac{2\pi kZe^2}{nh} = \frac{Ze^2}{2\varepsilon_0 nh} = \left(\frac{c}{137}\right).\frac{Z}{n} = 2.2\times10^6\frac{Z}{n}\,m/sec$$

where (c = speed of light 3×10^8 *m/s*)

Table 26.1 : Some other quantities for revolution of electron in n^{th} orbit

Quantity	Formula	Dependency on n and Z
(1) Angular speed	$\omega_n = \frac{v_n}{r_n} = \frac{\pi mz^2e^4}{2\varepsilon_0^2 n^3h^3}$	$\omega_n \propto \frac{Z^2}{n^3}$
(2) Frequency	$\nu_n = \frac{\omega_n}{2\pi} = \frac{mz^2e^4}{4\varepsilon_0^2n^3h^3}$	$\nu_n \propto \frac{Z^2}{n^3}$
(3) Time period	$T_n = \frac{1}{\nu_n} = \frac{4\varepsilon_0^2n^3h^3}{mz^2e^4}$	$T_n \propto \frac{n^3}{Z^2}$
(4) Angular momentum	$L_n = mv_nr_n = n\left(\frac{h}{2\pi}\right)$	$L_n \propto n$
(5) Corresponding current	$i_n = e\nu_n = \frac{mz^2e^5}{4\varepsilon_0^2n^3h^3}$	$i_n \propto \frac{Z^2}{n^3}$
(6) Magnetic moment	$M_n = i_nA = i_n(\pi r_n^2)$ (where $\mu_0 = \frac{eh}{4\pi m}$ = Bohr magneton)	$M_n \propto n$
(7) Magnetic field	$B = \frac{\mu_0 i_n}{2r_n} = \frac{\pi m^2z^3e^7\mu_0}{8\varepsilon_0^3n^5h^5}$	$B \propto \frac{Z^3}{n^5}$

Energy

(1) **Potential energy :** An electron possesses some potential energy because it is found in the field of nucleus potential energy of electron in n^{th} orbit of radius r_n is given by $U = k.\frac{(Ze)(-e)}{r_n} = -\frac{kZe^2}{r_n}$

(2) **Kinetic energy :** Electron posses kinetic energy because of it's motion. Closer orbits have greater kinetic energy than outer ones.

As we know $\frac{mv^2}{r_n} = \frac{k.(Ze)(e)}{r_n^2}$

$\Rightarrow$ Kinetic energy $K = \frac{kZe^2}{2r_n} = \frac{|U|}{2}$

(3) **Total energy :** Total energy (E) is the sum of potential energy and kinetic energy *i.e.* $E = K + U$

$$\Rightarrow \quad E = -\frac{kZe^2}{2r_n} \text{ also } r_n = \frac{n^2h^2\varepsilon_0}{\pi mze^2}.$$

Hence $E = -\left(\frac{me^4}{8\varepsilon_0^2h^2}\right).\frac{z^2}{n^2} = -\left(\frac{me^4}{8\varepsilon_0^2ch^3}\right)ch\frac{z^2}{n^2}$

$$= -R\,ch\frac{Z^2}{n^2} = -13.6\frac{Z^2}{n^2}eV$$

where $R = \frac{me^4}{8\varepsilon_0^2ch^3}$ = Rydberg's constant = 1.09 $\times$ 10^7 *per m*.

(4) **Ionisation energy and potential :** The energy required to ionise an atom is called ionisation energy. It is the energy required to make the electron jump from the present orbit to the infinite orbit.

Hence $E_{ionisation} = E_\infty - E_n = 0 - \left(-13.6\frac{Z^2}{n^2}\right) = +\frac{13.6Z^2}{n^2}eV$

For H_2-atom in the ground state

$$E_{ionisation} = \frac{+13.6(1)^2}{n^2} = 13.6\,eV$$

The potential through which an electron need to be accelerated so that it acquires energy equal to the ionisation energy is called ionisation potential. $V_{ionisation} = \frac{E_{ionisation}}{e}$

(5) **Excitation energy and potential :** When energy is given to an electron from external source, it jumps to higher energy level. This phenomenon is called excitation.

The minimum energy required to excite an atom is called excitation energy of the particular excited state and corresponding potential is called exciting potential.

$E_{Excitation} = E_{Final} - E_{Initial}$ and $V_{Excitation} = \frac{E_{excitation}}{e}$

(6) **Binding energy (B.E.) :** Binding energy of a system is defined as the energy released when it's constituents are brought from infinity to form the system. It may also be defined as the energy needed to separate it's constituents to large distances. If an electron and a proton are initially at rest and brought from large distances to form a hydrogen atom, 13.6 *eV* energy will be released. The binding energy of a hydrogen atom is therefore 13.6 *eV*.

(7) **Energy level diagram :** The diagrammatic description of the energy of the electron in different orbits around the nucleus is called energy level diagram.

Table 26.2 : Energy level diagram of hydrogen/hydrogen like atom

	Principle quantum number	Orbit	Excited state	Energy for H_2 – atom
- - - - - -	$n = \infty$	Infinite	Infinite	0 *eV*
———	$n = 4$	Fourth	Third	– 0.85 *eV*
———	$n = 3$	Third	Second	– 1.51 *eV*
———	$n = 2$	Second	First	– 3.4 *eV*
	$n = 1$	First	Ground	– 13.6 *eV*

Transition of Electron

When an electron makes transition from higher energy level having energy $E_2(n_2)$ to a lower energy level having energy E_1 (n_1) then a photon of frequency ν is emitted

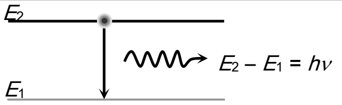

Fig. 26.8

(1) **Energy of emitted radiation**

$$\Delta E = E_2 - E_1 = \frac{-Rch Z^2}{n_2^2} - \left(-\frac{Rch Z^2}{n_1^2}\right)$$

$$= 13.6 Z^2 \left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$$

(2) **Frequency of emitted radiation**

$$\Delta E = h\nu \Rightarrow \nu = \frac{\Delta E}{h} = \frac{E_2 - E_1}{h} = Rc Z^2 \left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$$

(3) **Wave number/wavelength**

Wave number is the number of waves in unit length $\bar{\nu} = \frac{1}{\lambda} = \frac{\nu}{c} \Rightarrow \frac{1}{\lambda} = RZ^2\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right) = \frac{13.6Z^2}{hc}\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$

(4) **Number of spectral lines** : If an electron jumps from higher energy orbit to lower energy orbit it emits raidations with various spectral lines.

If electron falls from orbit n_2 to n_1 then the number of spectral lines emitted is given by

$$N_E = \frac{(n_2 - n_1 + 1)(n_2 - n_1)}{2}$$

If electron falls from n^{th} orbit to ground state (*i.e.* $n_2 = n$ and $n_1 = 1$) then number of spectral lines emitted $\boldsymbol{N_E = \frac{n(n-1)}{2}}$

(5) **Recoiling of an atom** : Due to the transition of electron, photon is emitted and the atom is recoiled

Recoil momentum of atom = momentum of photon $= \frac{h}{\lambda} = hRZ^2\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$

Also recoil energy of atom $= \frac{p^2}{2m} = \frac{h^2}{2m\lambda^2}$ (where m = mass of recoil atom)

Hydrogen Spectrum and Spectral Series

When hydrogen atom is excited, it returns to its normal unexcited (or ground state) state by emitting the energy it had absorbed earlier. This energy is given out by the atom in the form of radiations of different wavelengths as the electron jumps down from a higher to a lower orbit. Transition from different orbits cause different wavelengths, these constitute spectral series which are characteristic of the atom emitting them. When observed through a spectroscope, these radiations are imaged as sharp and straight vertical lines of a single colour.

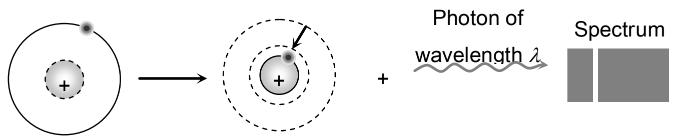

Fig. 26.9 : Emission spectra

The spectral lines arising from the transition of electron forms a spectra series.

(1) Mainly there are five series and each series is named after it's discover as Lymen series, Balmer series, Paschen series, Bracket series and Pfund series.

(2) According to the Bohr's theory the wavelength of the radiations emitted from hydrogen atom is given by

$$\frac{1}{\lambda} = R\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right] \Rightarrow \lambda = \frac{n_1^2 n_2^2}{(n_2^2 - n_1^2)R} = \frac{n_1^2}{\left(1 - \frac{n_1^2}{n_2^2}\right)R}$$

where n_2 = outer orbit (electron jumps from this orbit), n_1 = inner orbit (electron falls in this orbit)

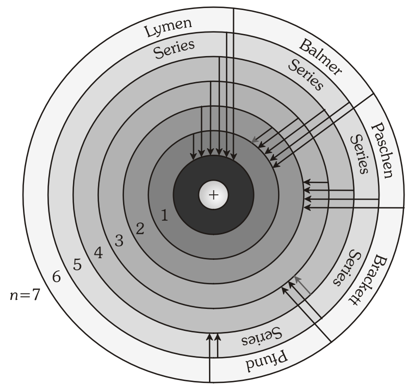

Fig. 26.10

(3) First line of the series is called first member, for this line wavelength is maximum (λ_{max})

For maximum wavelength if $n_1 = n$ then $n_2 = n + 1$

So $\lambda_{max} = \frac{n^2(n+1)^2}{(2n+1)R}$

(4) Last line of the series is called series limit, for this line wavelength is minimum (λ_{min})

For minimum wavelength $n_2 = \infty, n_1 = n$ So $\lambda_{min} = \frac{n^2}{R}$

(5) The ratio of first member and series limit can be calculated as $\frac{\lambda_{max}}{\lambda_{min}} = \frac{(n+1)^2}{(2n+1)}$

Table 26.3 : Different spectral series

Spectral series	Transition	λ_{max}	λ_{min}	$\frac{\lambda_{max}}{\lambda_{min}}$	Region
1. Lymen series	$n_2 = 2, 3, 4 \ldots\infty$ $n_1 = 1$	$\frac{4}{3R}$	$\frac{1}{R}$	$\frac{4}{3}$	Ultraviolet region
2.Balmer series	$n_2 = 3, 4, 5 \ldots\infty$ $n_1 = 2$	$\frac{36}{5R}$	$\frac{4}{R}$	$\frac{9}{5}$	Visible region
3. Paschen series	$n_2 = 4, 5, 6 \ldots\infty$ $n_1 = 3$	$\frac{144}{7R}$	$\frac{9}{R}$	$\frac{16}{7}$	Infrared region
4. Bracket series	$n_2 = 5, 6, 7 \ldots \infty$ $n_1 = 4$	$\frac{400}{9R}$	$\frac{16}{R}$	$\frac{25}{9}$	Infrared region
5. Pfund series	$n_2 = 6, 7, 8 \ldots \infty$ $n_1 = 5$	$\frac{900}{11R}$	$\frac{25}{R}$	$\frac{36}{11}$	Infrared region

Quantum Numbers

An atom contains large number of shells and subshells. These are distinguished from one another on the basis of their size, shape and orientation (direction) in space. The parameters are expressed in terms of different numbers called quantum number.

Quantum numbers may be defined as a set of four number with the help of which we can get complete information about all the electrons in an atom. It tells us the address of the electron *i.e.* location, energy, the type of orbital occupied and orientation of that orbital.

(1) **Principal Quantum number (n) :** This quantum number determines the main energy level or shell in which the electron is present. The average distance of the electron from the nucleus and the energy of the electron depends on it.

$E_n \propto \frac{1}{n^2}$ and $r_n \propto n^2$ (in *H*-atom)

The principal quantum number takes whole number values, $n = 1, 2, 3, 4, \ldots.. \infty$

(2) **Orbital quantum number (l) or azimuthal quantum number (l) :** This represents the number of subshells present in the main shell. These subsidiary orbits within a shell will be denoted as 1, 2, 3, 4 … or *s*, *p*, *d*, *f* … This tells the shape of the subshells.

The orbital angular momentum of the electron is given as $L = \sqrt{l(l+1)}\frac{h}{2\pi}$ (for a particular value of n).

For a given value of n the possible values of l are $l = 0, 1, 2, \ldots..$ upto $(n - 1)$

(3) **Magnetic quantum number (m_l) :** An electron due to it's angular motion around the nucleus generates an electric field. This electric field is expected to produce a magnetic field. Under the influence of external magnetic field, the electrons of a subshell can orient themselves in certain preferred regions of space around the nucleus called orbitals.

The magnetic quantum number determines the number of preferred orientations of the electron present in a subshell.

The angular momentum quantum number m can assume all integral value between $-l$ to $+l$ including zero. Thus m_l can be $-1, 0, +1$ for $l = 1$. Total values of m_l associated with a particular value of l is given by $(2l + 1)$.

(4) **Spin (magnetic) quantum number (m_s) :** An electron in atom not only revolves around the nucleus but also spins about its own axis. Since an electron can spin either in clockwise direction or in anticlockwise direction. Therefore for any particular value of magnetic quantum number, spin quantum number can have two values, *i.e.* $m_s = \frac{1}{2}$ (Spin up) or $m_s = -\frac{1}{2}$ (Spin down)

This quantum number helps to explain the magnetic properties of the substance.

Table 26.4 : Quantum states of the hydrogen atom

n	l	m_l	Spectroscopic notation	Shell
1	0	0	1 s	K
2	0	0	2 s }	L
2	1	– 1, 0, 1	2 p	
3	0	0	3 s }	
3	1	– 1, 0, 1	3 p	M
3	2	– 2, – 1, 0, 1, 2	3 d	
4	0	0	4 s	N

Electronic Configurations of Atoms

The distribution of electrons in different orbitals of an atom is called the electronic configuration of the atom. The filling of electrons in orbitals is governed by the following rules.

(1) **Pauli's exclusion principle :** "It states that no two electrons in an atom can have all the four quantum number (n, l, m_l and m_s) the same."

It means each quantum state of an electron must have a different set of quantum numbers n, l, m_l and m_s. This principle sets an upper limit on the number of electrons that can occupy a shell.

$N_{\max}$ in one shell = $2n^2$; Thus N_{max} in K, L, M, N …. shells are 2, 8, 18, 32,

(2) **Aufbau principle :** Electrons enter the orbitals of lowest energy first.

As a general rule, a new electron enters an empty orbital for which ($n + l$) is minimum. In case the value $(n+l)$ is equal for two orbitals, the one with lower value of n is filled first.

Thus the electrons are filled in subshells in the following order (memorize)

1s, 2s, 2p, 3s, 3p, 4s, 3d, 4p, 5s, 4d, 5p, 6s, 4f, 5d, 6p, 7s, 5f, 6d, 7p, ……

(3) **Hund's Rule :** When electrons are added to a subshell where more than one orbital of the same energy is available, their spins remain parallel. They occupy different orbitals until each one of them has at least one electron. Pairing starts only when all orbitals are filled up.

Pairing takes place only after filling 3, 5 and 7 electrons in p, d and f orbitals, respectively.

Nucleus

(1) Rutherford's α-scattering experiment established that the mass of atom is concentrated with small positively charged region at the centre which is called 'nucleus'.

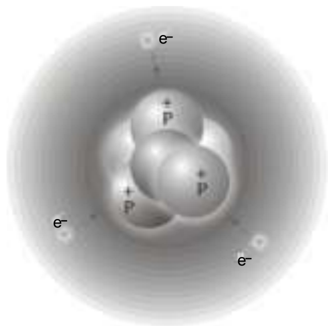

Fig. 26.11

(2) The stability or instability of a particular nucleus is determined by the competition between the attractive nuclear force among the protons and neutrons and the repulsive electrical interactions among the protons. Unstable nuclei *decay*, transforming themselves spontaneously into other structure by a variety of decay processes.

(3) We could not survive without the 3.90×10^{26} *watt* output of one near by fusion reactor, our sun.

(4) Nuclei are made up of proton and neutron. The number of protons in a nucleus (called the atomic number or proton number) is represented by the symbol *Z*. The number of neutrons (neutron number) is represented by *N*. The total number of neutrons and protons in a nucleus is called it's mass number *A* so *A* = *Z* + *N*.

(5) Neutrons and proton, when described collectively are called ***nucleons***. A single nuclear species having specific values of both *Z* and *N* is called a nuclide.

(6) Nuclides are represented as $_Z X^A$; where *X* denotes the chemical symbol of the element.

Neutron

Neutron is a fundamental particle which is essential constituent of all nuclei except that of hydrogen atom. It was discovered by Chadwick. A free neutron outside the nucleus is unstable and decays into proton and electron.

$$_0n^1 \rightarrow \underset{\text{Proton}}{_1H^1} + \underset{\text{Electron}}{_{-1}\beta^0} + \underset{\text{Antinutrino}}{\overline{\nu}}$$

(1) The charge of neutron : It is neutral

(2) The mass of neutron : 1.6750×10^{-27} *kg*

(3) It's spin angular momentum : $\frac{1}{2} \times \left(\frac{h}{2\pi}\right) J\text{-}s$

(4) It's magnetic moment : 9.57×10^{-27} *J/Tesla*

(5) It's half life : 12 minutes

(6) Penetration power : High

(7) Types : Neutrons are of two types slow neutron and fast neutron, both are fully capable of penetrating a nucleus and causing artificial disintegration.

Thermal Neutrons

Fast neutrons can be converted into slow neutrons by certain materials called moderator's (Paraffin wax, heavy water, graphite) when fast moving neutrons pass through a moderator, they collide with the molecules of the moderator, as a result of this, the energy of moving neutron decreases while that of the molecules of the moderator increases. After sometime they both attains same energy. The neutrons are then in thermal equilibrium with the molecules of the moderator and are called thermal neutrons.

Energy of thermal neutron is about 0.025 *eV* and speed is about 2.2 *km/s*.

Types of Nuclei

The nuclei have been classified on the basis of the number of protons (atomic number) or the total number of nucleons (mass number) as follows

(1) **Isotopes :** The atoms of element having same atomic number but different mass number are called isotopes. All isotopes have the same chemical properties. The isotopes of some elements are the following

$$_1H^1,\ _1H^2,\ _1H^3 \qquad _8O^{16},\ _8O^{17},\ _8O^{18} \qquad _2He^3,\ _2He^4$$
$$_{17}Cl^{35},\ _{17}Cl^{37} \qquad _{92}U^{235},\ _{92}U^{238}$$

(2) **Isobars :** The nuclei which have the same mass number (*A*) but different atomic number (*Z*) are called isobars. Isobars occupy different positions in periodic table so all isobars have different chemical properties. Some of the examples of isobars are

$$_1H^3 \text{ and } _2He^3, \quad _6C^{14} \text{ and } _7N^{14},\ _8O^{17} \text{ and } _9F^{17}$$

(3) **Isotones :** The nuclei having equal number of neutrons are called isotones. For them both the atomic number (*Z*) and mass number (*A*) are different, but the value of (*A* – *Z*) is same. Some examples are

$$_4Be^9 \text{ and } _5B^{10},\ _6C^{13} \text{ and } _7N^{14},\ _8O^{18} \text{ and } _9F^{19}$$
$$_3Li^7 \text{ and } _4Be^8,\ _1H^3 \text{ and } _2He^4$$

(4) **Mirror nuclei :** Nuclei having the same mass number *A* but with the proton number (*Z*) and neutron number (*A* – *Z*) interchanged (or whose atomic number differ by 1) are called mirror nuclei for example.

$_1H^3$ and $_2He^3$, $_3Li^7$ and $_4Be^7$

Size of Nucleus

(1) **Nuclear radius :** Experimental results indicates that the nuclear radius is proportional to $A^{1/3}$, where A is the mass number of nucleus *i.e.* $R \propto A^{1/3} \Rightarrow R = R_0 A^{1/3}$, where R_0 = 1.2×10^{-15} *m* = 1.2 *fm*.

(2) **Nuclear volume :** The volume of nucleus is given by $V = \frac{4}{3}\pi R^3 = \frac{4}{3}\pi R_0^3 A \Rightarrow V \propto A$

(3) **Nuclear density** : Mass per unit volume of a nucleus is called nuclear density.

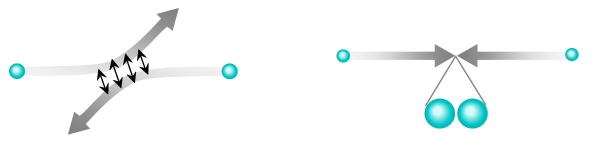
$$\text{Nuclear density}(\rho) = \frac{\text{Mass of nucleus}}{\text{Volume of nucleus}} = \frac{mA}{\frac{4}{3}\pi (R_0 A^{1/3})^3}$$

where *m* = Average of mass of a nucleon (= mass of proton + mass of neutron = 1.66×10^{-27} *kg*) and *mA* = Mass of nucleus

$$\Rightarrow \rho = \frac{3m}{4\pi R_0^3} = 2.38 \times 10^{17}\, kg/m^3$$

Nuclear Force

Forces that keep the nucleons bound in the nucleus are called nuclear forces.



(A) At low speeds, electromagnetic repulsion

(B) At high speeds, nuclei come close enough for the strong

Fig. 26.12

(1) Nuclear forces are short range forces. These do not exist at large distances greater than 10^{-15} *m*.

(2) Nuclear forces are the strongest forces in nature.

(3) These are attractive force and causes stability of the nucleus.

(4) These forces are charge independent.

(5) Nuclear forces are non-central force.

(6) **Nuclear forces are exchange forces :** According to scientist Yukawa the nuclear force between the two nucleons is the result of the exchange of particles called mesons between the nucleons.

π - mesons are of three types – Positive π meson (π^+), negative π meson (π^-), neutral π *meson* (π^0)

The force between neutron and proton is due to exchange of charged meson between them *i.e.*

$$p \to \pi^+ + n, \quad n \to p + \pi^-$$

The forces between a pair of neutrons or a pair of protons are the result of the exchange of neutral meson (π^0) between them *i.e.* $p \to p' + \pi^0$ and $n \to n' + \pi^0$

Thus exchange of π meson between nucleons keeps the nucleons bound together. It is responsible for the nuclear forces.

Dog-Bone analogy

The above interactions can be explained with the dog bone analogy according to which we consider the two interacting nucleons to be two dogs having a common bone clenched in between their teeth very firmly. Each one of these dogs wants to take the bone and hence they cannot be separated easily. They seem to be bound to each other with a strong attractive force (which is the bone) thc emselves are strong enemies. The meson pla of the common bone in between two nucleons

Fig. 26.13

Atomic Mass Unit (*amu*)

(1) In nuclear physics, a convenient unit of mass is the unified atomic mass unit abbreviated *u*.

(2) The *amu* is defined as $\frac{1}{12}th$ mass of a ${}_BC^{12}$ at on.

(3) 1 *amu* (or 1 *u*) = 1.6605402 × 10^{-27} *kg* .

(4) **Masses of electron, proton and neutrons :**

Mass of electron (m_e) = 9.1 × 10^{-31} *kg* = 0.0005486 *amu*, Mass of proton (m_p) = 1.6726 × 10^{-27} *kg* = 1.007276 *amu*

Mass of neutron (m_n) = 1.6750 × 10^{-27} *kg* = 1.00865 *amu*, Mass of hydrogen atom ($m_e + m_p$) = 1.6729 × 10^{-27} *kg* = 1.0078 *amu*

(5) The energy associated with a nuclear process is usually large, of the order of *MeV*.

(6) According to Einstein, mass and energy are inter convertible. The Einstein's mass energy relationship is given by $E = mc^2$

If *m* = 1 *amu*, *c* = 3 × 10^8 *m/sec* then *E* = 931 *MeV* *i.e.* 1 *amu* is equivalent to 931 *MeV* or **1 *amu* (or 1 *u*) = 931 *MeV***

(1 *u*) c^2 = 931 *MeV* ⇒ $1u = 931\frac{MeV}{c^2}$ or $c^2 = 931\frac{MeV}{u}$

Table 26.5 : Neutral atomic masses for some light nuclides

Element and isopore	Atomic mass (*u*)
Hydrogen $({}_1^1H)$	1.007825
Deuterium $({}_1^2H)$	2.014102
Tritium $({}_1^3H)$	3.016049
Helium $({}_2^3He)$	3.016029
Helium $({}_2^4He)$	4.002603
Lithium $({}_3^7Li)$	7.016004
Beryllium $({}_4^9Be)$	9.012182
Carbon $({}_6^{12}C)$	12.000000
Nitrogen $({}_7^{14}N)$	14.003074
Oxygen $({}_8^{16}O)$	15.994915

Pair Production and Pair-Annihilation

When an energetic γ-ray photon falls on a heavy substance. It is absorbed by some nucleus of the substance and an electron and a positron are produced. This phenomenon is called pair production and may be represented by the following equation

$$\underset{(\gamma-\text{photon})}{h\nu} = \underset{(\text{Positron})}{{}_1\beta^0} + \underset{(\text{Electron})}{{}_{-1}\beta^0}$$

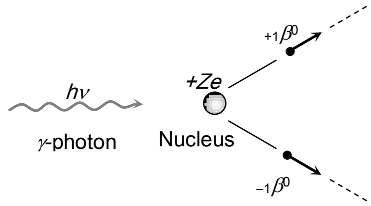


Fig. 26.14

The rest-mass energy of each of positron and electron is

$E_0 = m_0c^2$ = (9.1 × 10^{-31} *kg*) × (3.0 × 10^8 *m/s*)^2

= 8.2 × 10^{-14} *J* = **0.51 *MeV***

Hence, for pair-production it is essential that the energy of γ-photon must be at least 2 × 0.51 = 1.02 *MeV*. If the energy of γ-photon is less than this, it would cause photo-electric effect or Compton effect on striking the matter.

The converse phenomenon pair-annihilation is also possible. Whenever an electron and a positron come very close to each other, they annihilate each other by combining together and two γ-photons (energy) are produced. This phenomenon is called pair annihilation and is represented by the following equation.

$$\underset{(\text{Positron})}{{}_{+1}\beta^0} + \underset{(\text{Electron})}{{}_{-1}\beta^0} = \underset{(\gamma\text{-photon})}{h\nu} + \underset{(\gamma\text{-photon})}{h\nu}$$

Nuclear Stability

Among about 1500 known nuclides, less than 260 are stable. The others are unstable that decay to form other nuclides by emitting α, β-particles and γ - EM waves. (This process is called radioactivity). The stability of nucleus is determined by many factors. Few such factors are given below :

(1) **Neutron-proton ratio** $\left(\frac{N}{Z}\text{Ratio}\right)$: The chemical properties of an atom are governed entirely by the number of protons (*Z*) in the nucleus, the stability of an atom appears to

depend on both the number of protons and the number of neutrons.

(i) For lighter nuclei, the greatest stability is achieved when the number of protons and neutrons are approximately equal ($N \approx Z$) *i.e.* $\frac{N}{Z} = 1$

(ii) Heavy nuclei are stable only when they have more neutrons than protons. Thus heavy nuclei are neutron rich compared to lighter nuclei (for heavy nuclei, more is the number of protons in the nucleus, greater is the electrical repulsive force between them. Therefore more neutrons are added to provide the strong attractive forces necessary to keep the nucleus stable.)

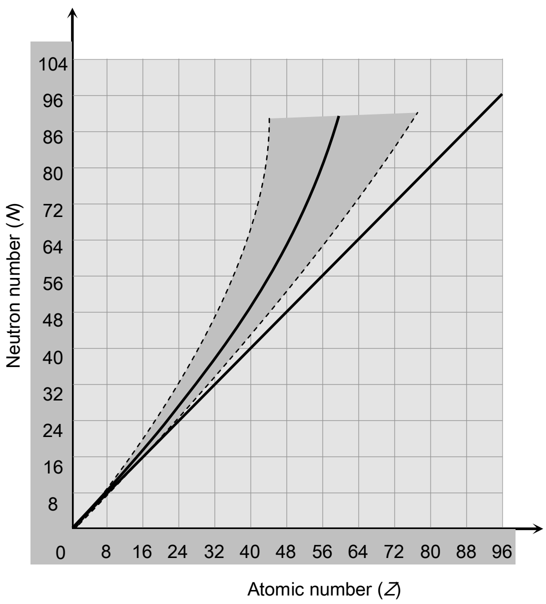

Fig. 26.15

(iii) Figure shows a plot of N verses Z for the stable nuclei. For mass number upto about A = 40. For larger value of Z the nuclear force is unable to hold the nucleus together against the electrical repulsion of the protons unless the number of neutrons exceeds the number of protons. At Bi (Z = 83, A = 209), the neutron excess in $N - Z$ = 43. There are no stable nuclides with Z > 83.

(2) **Even or odd numbers of Z or N :** The stability of a nuclide is also determined by the consideration whether it contains an even or odd number of protons and neutrons.

(i) It is found that an even-even nucleus (even Z and even N) is more stable (60% of stable nuclide have even Z and even N).

(ii) An even-odd nucleus (even Z and odd N) or odd-even nuclide (odd Z and even N) is found to be lesser sable while the odd-odd nucleus is found to be less stable.

(iii) Only five stable odd-odd nuclides are known : ${}_1H^2,\ {}_3Li^6,\ {}_5Be^{10},\ {}_7N^{14}$ and ${}_{75}Ta^{180}$

(3) **Binding energy per nucleon :** The stability of a nucleus is determined by value of it's binding energy per nucleon. In general higher the value of binding energy per nucleon, more stable the nucleus is

Mass Defect and Binding Energy

(1) **Mass defect (Δm) :** It is found that the mass of a nucleus is always less than the sum of masses of it's constituent nucleons in free state. This difference in masses is called mass defect. Hence mass defect

Δm = Sum of masses of nucleons – Mass of nucleus

$$= \{Zm_p + (A-Z)m_n\} - M = \{Zm_p + Zm_e + (A-Z)m_z\} - M'$$

where m_p = Mass of proton, m_n = Mass of each neutron, m_e = Mass of each electron

M = Mass of nucleus, Z = Atomic number, A = Mass number, M' = Mass of atom as a whole.

(2) **Packing fraction :** Mass defect per nucleon is called packing fraction

Packing fraction $(f) = \frac{\Delta m}{A} = \frac{M - A}{A}$ where M = Mass of nucleus, A = Mass number

Packing fraction measures the stability of a nucleus. Smaller the value of packing fraction, larger is the stability of the nucleus.

(i) Packing fraction may be of positive, negative or zero value.

(ii) At A = 16, $f \to$ Zero

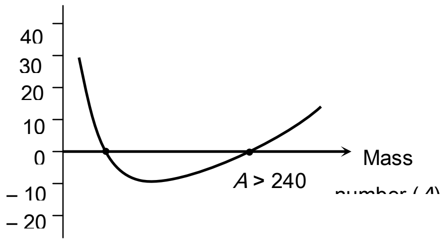

Fig. 26.16

(3) **Binding energy (B.E.) :** The neutrons and protons in a stable nucleus are held together by nuclear forces and energy is needed to pull them infinitely apart (or the same energy is released during the formation of the nucleus). This energy is called the binding energy of the nucleus.

or

The binding energy of a nucleus may be defined as the energy equivalent to the mass defect of the nucleus.

If Δm is mass defect then according to Einstein's mass energy relation

Binding energy = $\Delta m \cdot c^2 = [\{m_p Z + m_n(A - Z)\} - M] \cdot c^2$

(This binding energy is expressed in *joule*, because Δm is measured in *kg*)

If Δm is measured in *amu* then binding energy = Δm *amu* = $[\{m_p Z + m_n(A - Z)\} - M]$ *amu* = $\Delta m \times 931$ *MeV*

(4) **Binding energy per nucleon :** The average energy required to release a nucleon from the nucleus is called binding energy per nucleon.

Binding energy per nucleon

$$= \frac{\text{Total binding energy}}{\text{Mass number } (i.e. \text{ total number of nucleons})} = \frac{\Delta m \times 931}{A} \frac{MeV}{Nucleon}$$

Binding energy per nucleon $\propto$ Stability of nucleus

Binding Energy Curve

It is the graph between binding energy per nucleon and total number of nucleons (*i.e.* mass number *A*)

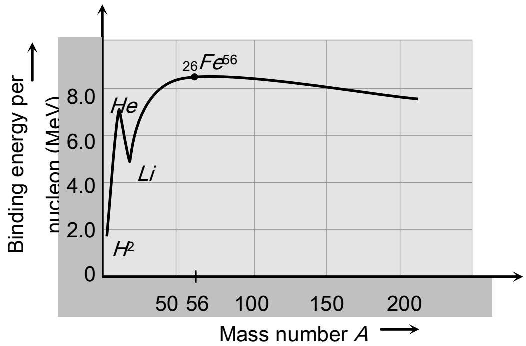

Fig. 26.17

(1) Some nuclei with mass number A < 20 have large binding energy per nucleon than their neighbour nuclei. For example $_2He^4$, $_4Be^8$, $_6C^{12}$, $_8O^{16}$ and $_{10}Ne^{20}$. These nuclei are more stable than their neighbours.

(2) The binding energy per nucleon is maximum for nuclei of mass number A = 56 ($_{26}Fe^{56}$). It's value is 8.8 *MeV* per nucleon.

(3) For nuclei having A > 56, binding energy per nucleon gradually decreases for uranium (A = 238), the value of binding energy per nucleon drops to 7.5 *MeV*.

Nuclear Reactions

The process by which the identity of a nucleus is changed when it is bombarded by an energetic particle is called nuclear reaction. The general expression for the nuclear reaction is as follows.

$$\underset{\text{(Parent nucleus)}}{X} + \underset{\text{(Incident particle)}}{a} \longrightarrow$$

$$\underset{\text{(Compound nucleus)}}{C} \longrightarrow \underset{\text{(Compound nucleus)}}{Y} + \underset{\text{(Product particles)}}{b} + \underset{\text{(Energy)}}{Q}$$

Here *X* and *a* are known as reactants and *Y* and *b* are known as products. This reaction is known as (*a*, *b*) reaction and can be represented as *X*(*a*, *b*) *Y*

(1) **Q value or energy of nuclear reaction :** The energy absorbed or released during nuclear reaction is known as *Q*-value of nuclear reaction.

Q-value = (Mass of reactants – mass of products)c^2 *Joules*

= (Mass of reactants – mass of products) *amu*

If $Q < 0$, The nuclear reaction is known as endothermic. (The energy is absorbed in the reaction)

If $Q > 0$, The nuclear reaction is known as exothermic (The energy is released in the reaction)

(2) **Law of conservation in nuclear reactions**

(i) Conservation of mass number and charge number : In the following nuclear reaction

$${}_2He^4 + {}_7N^{14} \to {}_8O^{17} + {}_1H^1$$

Mass number (*A*) $\to$ Before the reaction After the reaction

4 +14 = 18 17 + 1 = 18

Charge number (*Z*) $\to$ 2 + 7 = 9 8 + 1 = 9

(ii) Conservation of momentum : Linear momentum/angular momentum of particles before the reaction is equal to the linear/angular momentum of the particles after the reaction. That is $\Sigma p = 0$

(iii) Conservation of energy : Total energy before the reaction is equal to total energy after the reaction. Term *Q* is added to balance the total energy of the reaction.

(3) **Common nuclear reactions :** The nuclear reactions lead to artificial transmutation of nuclei. Rutherford was the first to carry out artificial transmutation of nitrogen to oxygen in the year 1919.

$${}_2He^4 + {}_7N^{14} \to {}_9F^{18} \to {}_8O^{17} + {}_1H^1$$

It is called (α, *p*) reaction. Some other nuclear reactions are given as follows.

(*p*, *n*) reaction $\Rightarrow$ ${}_1H^1 + {}_5B^{11} \to {}_6C^{12} \to {}_6C^{11} + {}_0n^1$

(*p*, α) reaction $\Rightarrow$ ${}_1H^1 + {}_3Li^{11} \to {}_4Be^8 \to {}_2He^4 + {}_2He^4$

(*p*, γ) reaction $\Rightarrow$ ${}_1H^1 + {}_6C^{12} \to {}_7N^{13} \to {}_7N^{13} + \gamma$

(*n*, *p*) reaction $\Rightarrow$ ${}_0n^1 + {}_7N^{14} \to {}_7N^{15} \to {}_6C^{14} + {}_1H^1$

(γ, *n*) reaction $\Rightarrow$ $\gamma + {}_1H^2 \to {}_1H^1 + {}_0n^1$

Nuclear Fission

(1) The process of splitting of a heavy nucleus into two lighter nuclei of comparable masses (after bombardment with a energetic particle) with liberation of energy is called nuclear fission.

(2) The phenomenon of nuclear fission was discovered by scientist Ottohann and F. Strassman and was explained by N. Bohr and J.A. Wheeler on the basis of liquid drop model of nucleus.

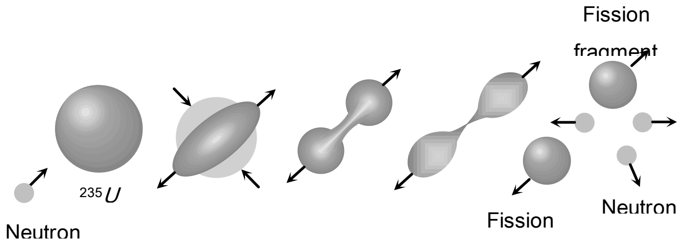

Fig. 26.18

(3) **Fission reaction of U^{235}**

$${}_{92}U^{235} + {}_0n^1 \rightarrow \underset{\text{(unstable nucleus)}}{{}_{92}U^{236}} \rightarrow {}_{56}Ba^{141} + {}_{36}Kr^{92} + 3{}_0n^1 + Q$$

(4) The energy released in U^{235} fission is about 200 *MeV* or 0.8 *MeV* per nucleon.

(5) By fission of ${}_{92}U^{235}$, on an average 2.5 neutrons are liberated. These neutrons are called fast neutrons and their energy is about 2 *MeV* (for each). These fast neutrons can escape from the reaction so as to proceed the chain reaction they are need to slow down.

(6) Fission of U^{235} occurs by slow neutrons only (of energy about 1*eV*) or even by thermal neutrons (of energy about 0.025 *eV*).

(7) 50 *kg* of U^{235} on fission will release $\approx 4 \times 10^{15}$ *J* of energy. This is equivalence to 20,000 tones of *TNT* explosion. The nuclear bomb dropped at Hiroshima had this much explosion power.

(8) The mass of the compound nucleus must be greater than the sum of masses of fission products.

(9) The $\frac{\text{Binding energy}}{\text{A}}$ of compound nucleus must be less than that of the fission products.

(10) It may be pointed out that it is not necessary that in each fission of uranium, the two fragments ${}_{56}Ba$ and ${}_{36}Kr$ are formed but they may be any stable isotopes of middle weight atoms.

(11) Same other U^{235} fission reactions are

$${}_{92}U^{235} + {}_0n^1 \rightarrow {}_{54}Xe^{140} + {}_{38}Sr^{94} + 2{}_0n^1$$

$$\rightarrow {}_{57}La^{148} + {}_{35}Br^{85} + 3\,{}_0n^1$$

$\rightarrow$ Many more

(12) The neutrons released during the fission process are called prompt neutrons.

(13) Most of energy released appears in the form of kinetic energy of fission fragments.

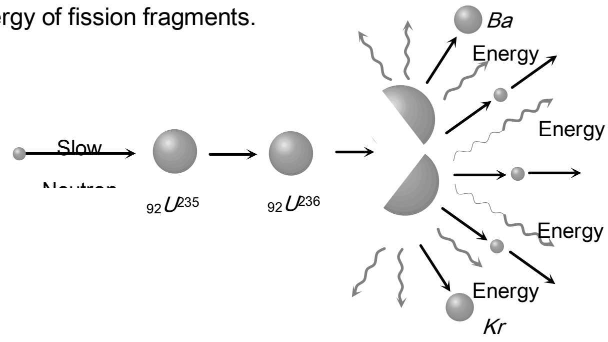

Fig. 26.19

Chain Reaction

In nuclear fission, three neutrons are produced along with the release of large energy. Under favourable conditions, these neutrons can cause further fission of other nuclei, producing large number of neutrons. Thus a chain of nuclear fissions is established which continues until the whole of the uranium is consumed.

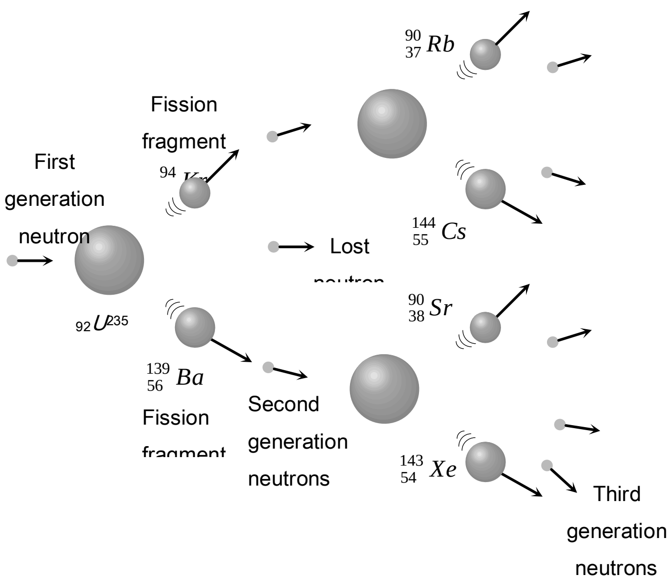

Fig. 26.20

In the chain reaction, the number of nuclei undergoing fission increases very fast. So, the energy produced takes a tremendous magnitude very soon.

Difficulties in Chain Reaction

In chain reaction following difficulties are observed

(1) **Absorption of neutrons by U^{238} :** the major part in natural uranium is the isotope U^{238} (99.3%), the isotope U^{235} is very little (0.7%). It is found that U^{238} is fissionable with fast neutrons, whereas U^{235} is fissionable with slow neutrons. Due to the large percentage of U^{238}, there is more possibility of collision of neutrons with U^{238}. It is found that the neutrons get slowed on coliding with U^{238}, as a result of it further fission of U^{238} is not possible (Because they are slow and they are absorbed by U^{238}). This stops the chain reaction.

Removal : (i) To sustain chain reaction $_{92}U^{235}$ is separated from the ordinary uranium. Uranium so obtained $\left({}_{92}U^{235}\right)$ is known as enriched uranium, which is fissionable with the fast and slow neutrons and hence chain reaction can be sustained.

(ii) If neutrons are slowed down by any method to an energy of about 0.3 *eV*, then the probability of their absorption by U^{238} becomes very low, while the probability of their fissioning U^{235} becomes high. This job is done by moderators. Which reduce the speed of neutron rapidly graphite and heavy water are the example of moderators.

(2) **Critical size :** The neutrons emitted during fission are very fast and they travel a large distance before being slowed down. If the size of the fissionable material is small, the neutrons emitted will escape the fissionable material before they are slowed down. Hence chain reaction cannot be sustained.

Removal : The size of the fissionable material should be large than a critical size.

The chain reaction once started will remain steady, accelerate or retard depending upon, a factor called neutron reproduction factor (*k*). It is defined as follows.

$$k = \frac{\text{Rate of production of neutrons}}{\text{Rate of loss of neutrons}}$$

If $k = 1$, the chain reaction will be steady. The size of the fissionable material used is said to be the critical size and it's mass, the critical mass.

If $k > 1$, the chain reaction accelerates, resulting in an explosion. The size of the material in this case is super critical. (Atom bomb)

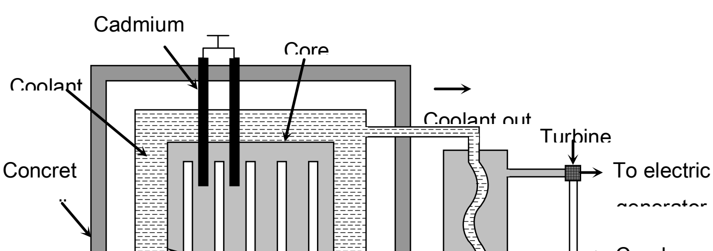
If $k < 1$, the chain reaction gradually comes to a halt. The size of the material used us said to be sub-critical.

Table 26.6 : Types of chain reaction

Controlled chain reaction	Uncontrolled chain reaction
Controlled by artificial method	No control over this type of nuclear reaction
All neurons are absorbed except one	More than one neutron takes part into reaction
It's rate is slow	Fast rate
Reproduction factor $k = 1$	Reproduction factor $k > 1$
Energy liberated in this type of reaction is always less than explosive energy	A large amount of energy is liberated in this type of reaction
Chain reaction is the principle of nuclear reactors	Uncontrolled chain reaction is the principle of atom bomb.

Nuclear Reactor

A nuclear reactor is a device in which nuclear fission can be carried out through a sustained and a controlled chain reaction. It is also called an atomic pile. It is thus a source of controlled energy which is utilised for many useful purposes.



(1) **Fissionable material (Fuel) :** The fissionable material used in the reactor is called the fuel of the reactor. Uranium isotope (U^{235}) Thorium isotope (Th^{232}) and Plutonium isotopes (Pu^{239}, Pu^{240} and Pu^{241}) are the most commonly used fuels in the reactor.

(2) **Moderator :** Moderator is used to slow down the fast moving neutrons. Most commonly used moderators are graphite and heavy water (D_2O).

(3) **Control Material :** Control material is used to control the chain reaction and to maintain a stable rate of reaction. This material controls the number of neutrons available for the fission. For example, cadmium rods are inserted into the core of the reactor because they can absorb the neutrons. The neutrons available for fission are controlled by moving the cadmium rods in or out of the core of the reactor.

(4) **Coolant :** Coolant is a cooling material which removes the heat generated due to fission in the reactor. Commonly used coolants are water, CO_2 nitrogen *etc.*

(5) **Protective shield :** A protective shield in the form a concrete thick wall surrounds the core of the reactor to save the persons working around the reactor from the hazardous radiations.

(6) **Uses of nuclear reactor**

(i) In electric power generation.

(ii) To produce radioactive isotopes for their use in medical science, agriculture and industry.

(iii) In manufacturing of Pu^{239} which is used in atom bomb.

(iv) They are used to produce neutron beam of high intensity which is used in the treatment of cancer and nuclear research.

Nuclear Fusion

(1) In nuclear fusion two or more than two lighter nuclei combine to form a single heavy nucleus. The mass of single nucleus so formed is less than the sum of the masses of parent nuclei. This difference in mass results in the release of tremendous amount of energy

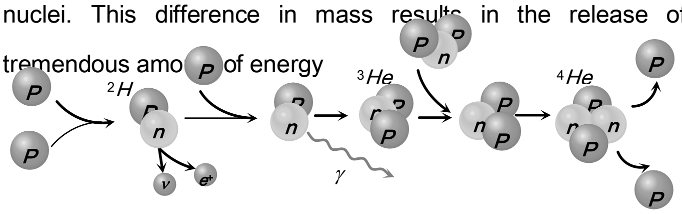


Fig. 26.22

(2) For fusion high pressure (≈ 10^6 *atm*) and high temperature (of the order of 10^7 *K* to 10^8 *K*) is required and so the reaction is called thermonuclear reaction.

(3) Here are three examples of energy-liberating fusion reactions, written in terms of the neutral atoms. Together the reactions make up the process called the proton-proton chain.

$${}_1^1H + {}_1^1H \rightarrow {}_1^2H + \beta^+ + \nu_e$$

$${}_1^2H + {}_1^1H \rightarrow {}_2^3He + \gamma$$

$${}_2^3He + {}_2^3He \rightarrow {}_2^4He + {}_1^1H + {}_1^1H$$

$$4\ {}_1H^1 \rightarrow {}_2He^4 + 2\,\beta^+ + 2\gamma + 26.73\ MeV$$

(4) The proton-proton chain takes place in the interior of the sun and other stars. Each gram of the suns mass contains about 4.5 × 10^{23} protons. If all of these protons were fused into helium, the energy released would be about 130,000 *kWh*. If the sun were to continue to radiate at its present rate, it would take about $75\times10^{9}\ years$ to exhaust its supply of protons.

(5) For the same mass of the fuel, the energy released in fusion is much larger than in fission.

(6) **Plasma :** The temperature of the order of 10^8 *K* required for thermonuclear reactions leads to the complete ionisation of the atom of light elements. The combination of base nuclei and electron cloud is called plasma. The enormous gravitational field of the sun confines the plasma in the interior of the sun.

The main problem to carryout nuclear fusion in the laboratory is to contain the plasma at a temperature of 10^8K. No solid container can tolerate this much temperature. If this problem of containing plasma is solved, then the large quantity of deuterium present in sea water would be able to serve as in-exhaustible source of energy.

Table 26.7 : Nuclear bomb (Based on uncontrolled nuclear reactions)

Atom bomb	Hydrogen bomb
Based on fission process it involves the fission of U^{235}	Based on fusion process. Mixture of deutron and tritium is used in it
In this critical size is important	There is no limit to critical size
Explosion is possible at normal temperature and pressure	High temperature and pressure are required
Less energy is released compared to hydrogen bomb	More energy is released as compared to atom bomb so it is more dangerous than atom bomb

Radioactivity

The phenomenon of spontaneous emission of radiatons by heavy elements is called radioactivity. The elements which shows this phenomenon are called radioactive elements.

(1) Radioactivity was discovered by Henery Becquerel in uranium salt in the year 1896.

(2) After the discovery of radioactivity in uranium, Piere Curie and Madame Curie discovered a new radioactive element called radium (which is 10^6 times more radioactive than uranium)

(3) Some examples of radio active substances are : Uranium, Radium, Thorium, Polonium, Neptunium *etc.*

(4) Radioactivity of a sample cannot be controlled by any physical (pressure, temperature, electric or magnetic field) or chemical changes.

(5) All the elements with atomic number (Z) > 82 are naturally radioactive.

(6) The conversion of lighter elements into radioactive elements by the bombardment of fast moving particles is called artificial or induced radioactivity.

(7) Radioactivity is a nuclear event and not atomic. Hence electronic configuration of atom don't have any relationship with radioactivity.

Nuclear Radiations

According to Rutherford's experiment when a sample of radioactive substance is put in a lead box and allow the emission of radiation through a small hole only. When the radiation enters into the external electric field, they splits into three parts (α-rays, β-rays and γ-rays)

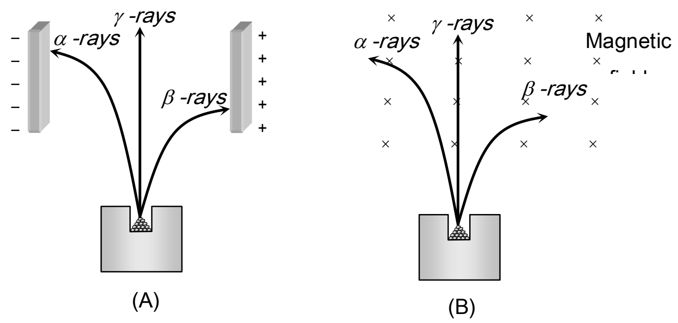

Fig. 26.23

(1) **α-decay** : Nearly 90% of the 2500 known nuclides are radioactive ; they are not stable but decay into other nuclides

(i) When unstable nuclides decay into different nuclides, they usually emit alpha (α) or beta (β) particles.

(ii) Alpha emission occurs principally with nuclei that are too large to be stable. When a nucleus emits an alpha particle, its *N* and *Z* values each decrease by two and *A* decreases by four.

(iii) Alpha decay is possible whenever the mass of the original neutral atom is greater than the sum of the masses of the final neutral atom and the neutral helium- atom.

(2) **β-decay** : There are different simple type of β-decay β^-, β^+ and electron capture.

(i) A beta minus particle (β^-) is an electron. Emission of β^- involves transformation of a neutron into a proton, an electron and a third particle called an antineutrino ($\bar{\nu}$).

(ii) β^- decay usually occurs with nuclides for which the neutron to proton ratio $\left(\frac{N}{Z} ratio\right)$ is too large for stability.

(iii) In β^- decay, *N* decreases by one, *Z* increases by one and *A* doesn't change.

(iv) β^- decay can occur whenever the neutral atomic mass of the original atom is larger than that of the final atom.

(v) Nuclides for which *N*/*Z* is too small for stability can emit a positron, the electron's antiparticle, which is identical to the electron but with positive charge. The basic process called beta plus β^+ decay

$p \rightarrow n + \beta^+ + \nu$ (ν = neutrino)

(vi) β^+ decay can occur whenever the neutral atomic mass of the original atom is at least two electron masses larger than that of the final atom

(vii) The mass of ν and $\bar{\nu}$ is zero. The spin of both is $\frac{1}{2}$ in units of $\frac{h}{2\pi}$. The charge on both is zero. The spin of neutrino is antiparallel to it's momentum while that of antineutrino is parallel to it's momentum.

(viii) There are a few nuclides for which β^+ emission is not energetically possible but in which an orbital electron (usually in the *k*-shell) can combine with a proton in the nucleus to form a neutron and a neutrino. The neutron remains in the nucleus and the neutrino is emitted.

$p + \beta^+ \rightarrow n + \nu$

(3) **γ-decay** : The energy of internal motion of a nucleus is quantized. A typical nucleus has a set of allowed energy levels, including a *ground state* (state of lowest energy) and several excited states. Because of the great strength of nuclear interactions, excitation energies of nuclei are typically of the order of the order of 1 *MeV*, compared with a few *eV* for atomic energy levels. In ordinary physical and chemical transformations the nucleus always remains in its ground state. When a nucleus is placed in an excited state, either by bombardment with high-energy particles or by a radioactive transformation, it can decay to the ground state by emission of one or more photons called gamma rays or gamma-ray photons, with typical energies of 10 *keV* to 5 *MeV*. This process is called gamma (γ) decay.

All the known conservation laws are obeyed in γ-decay.

The intensity of γ-decay after passing through *x* thickness of a material is given by $I = I_0 e^{-\mu x}$ (μ = absorption co-efficient)

Radioactive Disintegration

(1) **Law of radioactive disintegration :** According to Rutherford and Soddy law for radioactive decay is as follows.

"At any instant the rate of decay of radioactive atoms is proportional to the number of atoms present at that instant" *i.e.*

$-\frac{dN}{dt} \propto N \Rightarrow \frac{dN}{dt} = -\lambda N$. It can be proved that $N = N_0 e^{-\lambda t}$

In terms of mass $M = M_0 e^{-\lambda t}$

where *N* = Number of atoms remains undecayed after time *t*, N_0 = Number of atoms present initially (*i.e.* at *t* = 0), *M* = Mass of radioactive nuclei at time *t*, M_0 = Mass of radioactive nuclei at time *t* = 0, $N_0 - N$ = Number of disintegrated nucleus in time *t*

$\frac{dN}{dt}$ = rate of decay, λ = Decay constant or disintegration constant or radioactivity constant or Rutherford Soddy's constant or the probability of decay per unit time of a nucleus.

Table 26.8 : Properties of α, β and γ-rays

Features	α- particles	β - particles	γ - rays
1. Identity	Helium nucleus or doubly ionised helium atom ($_2He^4$)	Fast moving electron $(-\beta^0 \text{ or } \beta^-)$	Photons (E.M. waves)
2. Charge	+ 2*e*	– *e*	Zero
3. Mass 4 m_p (m_p = mass of proton = 1.87 × 10^{-27}	4 m_p	m_e	Massless
4. Speed	≈ 10^7 *m/s*	1% to 99% of speed of light	Speed of light
5. Range of kinetic energy	4 *MeV* to 9 *MeV*	All possible values between a minimum certain value to 1.2 *MeV*	Between a minimum value to 2.23 *MeV*
6. Penetration power (γ, β, α)	1 (Stopped by a paper)	100 (100 times of α)	10,000 (100 times of β upto 30 *cm* of iron (or *Pb*) sheet
7. Ionisation power ($\alpha > \beta > \gamma$)	10,000	100	1
8. Effect of electric or magnetic field	Deflected	Deflected	Not deflected
9. Energy spectrum	Line and discrete	Continuous	Line and discrete
10. Mutual interaction with matter	Produces heat	Produces heat	Produces, photo-electric effect, Compton effect, pair production
11. Equation of decay	$_ZX^A \xrightarrow{\alpha-decay} {}_{Z-2}Y^{A-4} + {}_2He^4$ $_ZX^A \xrightarrow{n\alpha} {}_{Z'}Y^{A'}$ $\Rightarrow \boldsymbol{n_\alpha = \frac{A-A'}{4}}$	$_ZX^A \rightarrow {}_{Z+1}Y^A + {}_{-1}e^0 + \bar{\nu}$ $_ZX^A \xrightarrow{n\beta} {}_{Z'}X^A$ $\Rightarrow \boldsymbol{n_\beta = (2n_\alpha - Z + Z')}$	$_ZX^A \rightarrow {}_ZX^a + \gamma$

(2) **Activity :** It is defined as the rate of disintegration (or count rate) of the substance (or the number of atoms of any material decaying per second) *i.e.*

$$A = -\frac{dN}{dt} = \lambda N = \lambda N_0 e^{-\lambda t} = A_0 e^{-\lambda t}$$

where A_0 = Activity of t = 0, A = Activity after time t

Units of activity (Radioactivity)

It's units are *Becqueral* (*Bq*), Curie (*Ci*) and Rutherford (*Rd*)

1 *Becquerel* = 1 *disintegration/sec*,

1 *Rutherford* = 10^6 *dis/sec*, 1 *Curie* = 3.7×10^{11} *dis/sec*

(3) **Half life ($T_{1/2}$)** : Time interval in which the mass of a radioactive substance or the number of it's atom reduces to half of it's initial value is called the half life of the substance.

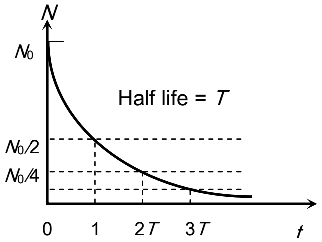

Fig. 26.24

i.e. if $N = \frac{N_0}{2}$

then $t = T_{1/2}$

Hence from $N = N_0 e^{-\lambda t}$

$$\frac{N_0}{2} = N_0 e^{-\lambda (T_{1/2})} \Rightarrow T_{1/2} = \frac{\log_e 2}{\lambda} = \frac{0.693}{\lambda}$$

Table 26.9 : Fraction of active/decayed atom at different time

Time (*t*)	Remaining fraction of active atoms (N/N_0) probability of survival	Fraction of atoms decayed $(N_0 - N)/N_0$ probability of decay
$t = 0$	1 (100%)	0
$t = T_{1/2}$	$\frac{1}{2}$ (50%)	$\frac{1}{2}$ (50%)
$t = 2(T_{1/2})$	$\frac{1}{4}$ (25%)	$\frac{3}{4}$ (75%)
$t = 3(T_{1/2})$	$\frac{1}{8}$ (12.5%)	$\frac{7}{8}$ (87.5%)
$t = 10\ (T_{1/2})$	$\left(\frac{1}{2}\right)^{10} \approx 0.1\%$	$\approx 99.9\%$
$t = n\ (N_{1/2})$	$\left(\frac{1}{2}\right)^n$	$\left\{1 - \left(\frac{1}{2}\right)^n\right\}$

(4) **Mean (or average) life (τ)** : The time for which a radioactive material remains active is defined as mean (average) life of that material.

(i) or it is defined as the sum of lives of all atoms divided by the total number of atoms

i.e. $$\tau = \frac{\text{Sum of the lives of all the atoms}}{\text{Total number of atoms}} = \frac{1}{\lambda}$$

(ii) From $N = N_0 e^{-\lambda t} \Rightarrow \frac{\ln \frac{N}{N_0}}{t} = -\lambda$ slope of the line shown in the graph *i.e.* the magnitude of inverse of slope of $\ln \frac{N}{N_0}$ *vs* t curve is known as mean life (τ).

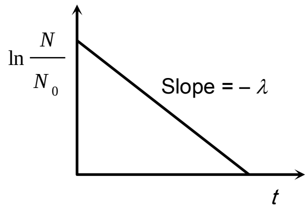

Fig. 26.25

(iii) From $N = N_0 e^{-\lambda t}$, if $t = \frac{1}{\lambda} = \tau$

$$\Rightarrow N = N_0 e^{-1} = N_0 \left(\frac{1}{e}\right) = 0.37 N_0 = 37\% \text{ of } N_0.$$

i.e. mean life is the time interval in which number of undecayed atoms (*N*) becomes $\frac{1}{e}$ times or 0.37 times or 37% of original number of atoms. or

It is the time in which number of decayed atoms ($N_0 - N$) becomes $\left(1 - \frac{1}{e}\right)$ times or 0.63 times or 63% of original number of atoms.

(iv) From $T_{1/2} = \frac{0.693}{\lambda} \Rightarrow \frac{1}{\lambda} = \tau = \frac{1}{0.693}.(t_{1/2}) = 1.44 (T_{1/2})$

i.e. mean life is about 44% more than that of half life. Which gives us $\tau > T_{(1/2)}$

Radioactive Series

(1) If the isotope that results from a radioactive decay is itself radioactive then it will also decay and so on.

(2) The sequence of decays is known as radioactive decay series. Most of the radio-nuclides found in nature are members of four radioactive series. These are as follows

Table 26.10 : Four radioactive series

Mass number	Series (Nature)	Parent	Stable end product	Integer *n*
4*n*	Thorium (natural)	$_{90}Th^{232}$	$_{82}Pb^{208}$	52
4*n* + 1	Neptunium	$_{93}Np^{237}$	$_{83}Bi^{209}$	52

	(Artificial)			
$4n + 2$	Uranium (Natural)	$_{92}U^{238}$	$_{82}Pb^{206}$	51
$4n + 3$	Actinium (Natural)	$_{89}Ac^{227}$	$_{82}Pb^{207}$	51

(3) The $4n + 1$ series starts from $_{94}Pu^{241}$ but commonly known as neptunium series because neptunium is the longest lived member of the series.

(4) The $4n + 3$ series actually starts from $_{92}U^{235}$.

Successive Disintegration and Radioactive Equilibrium

Suppose a radioactive element *A* disintegrates to form another radioactive element *B* which intern disintegrates to still another element *C*; such decays are called successive disintegration.

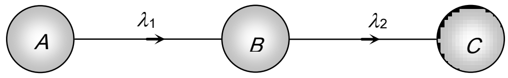

Fig. 26.26

Rate of disintegration of $A = \frac{dN_1}{dt} = -\lambda_1 N_1$ (which is also the rate of formation of *B*)

Rate of disintegration of $B = \frac{dN_2}{dt} = -\lambda_2 N_2$

$\therefore$ Net rate of formation of *B* = Rate of disintegration of *A* – Rate of disintegration of *B*

$$= \lambda_1 N_1 - \lambda_2 N_2$$

Equilibrium

In radioactive equilibrium, the rate of decay of any radioactive product is just equal to it's rate of production from the previous member.

i.e. $\lambda_1 N_1 = \lambda_2 N_2 \Rightarrow \quad \frac{\lambda_1}{\lambda_2} = \frac{N_2}{N_2} = \frac{\tau_2}{\tau_1} = \frac{(T_{1/2})}{(T_{1/2})_1}$

Uses of Radioactive Isotopes

(1) **In medicine**

(i) For testing blood-chromium - 51

(ii) For testing blood circulation - *Na* - 24

(iii) For detecting brain tumor- Radio mercury - 203

(iv) For detecting fault in thyroid gland - Radio iodine - 131

(v) For cancer - cobalt - 60

(vi) For blood - Gold - 189

(vii) For skin diseases - Phospohorous - 31

(2) **In Archaeology**

(i) For determining age of archaeological sample (carbon dating) C^{14}

(ii) For determining age of meteorites - K^{40}

(iii) For determining age of earth-Lead isotopes

(3) **In agriculture**

(i) For protecting potato crop from earthworm- CO^{60}

(ii) For artificial rains - *AgI* (iii) As fertilizers - P^{32}

(4) **As tracers** - (Tracer) : Very small quantity of radioisotopes present in a mixture is known as tracer

(i) Tracer technique is used for studying biochemical reaction in tracer and animals.

(5) **In industries**

(i) For detecting leakage in oil or water pipe lines (ii) For determining the age of planets.

Tips & Tricks

✍ According to Bohr theory the momentum of an e^- revolving in second orbit of H_2 atom will be $\frac{h}{\pi}$

✍ For an electron in the n^{th} orbit of hydrogen atom in Bohr model, circumference of orbit $= n\lambda$; where λ = de-Broglie wavelength.

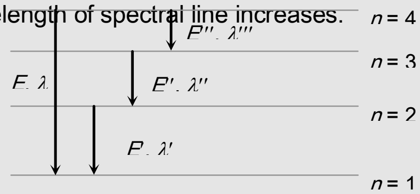
✍ *Rch* = Rydberg's energy $\simeq 2.17 \times 10^{-18}\, J \simeq 13.6\, eV$.

✍ For hydrogen atom principle quantum number $n = \sqrt{\frac{13.6}{(\text{B.E.})}}$.

✍ In an H_2 atom when e^- makes a transition from an excited state to the ground state it's kinetic energy increases while potential and total energy decreases.

✍ The maximum number of electrons in a subshell with orbital quantum number *l* is 2(2*l* + 1).

✍ With the increase in principal quantum number the energy difference between the two successive energy level decreases, while wavelength of spectral line increases.



$E' > E'' > E'''$

$\lambda' < \lambda'' < \lambda'''$

$E = E' + E'' + E'''$

$$\frac{1}{\lambda} = \frac{1}{\lambda'} + \frac{1}{\lambda''} + \frac{1}{\lambda'''}$$

✍ **Rydberg constant is different for different elements**

R(=1.09 × 10^7 m^{-1}) is the value of Rydberg constant when the nucleus is considered to be infinitely massive as compared to the revolving electron. In other words, the nucleus is considered to be stationary.

In case, the nucleus is not infinitely massive or stationary, then the value of Rydberg constant is given as $R' = \frac{R}{1 + \frac{m}{M}}$ where m is the mass of electron and *M* is the mass of nucleus.

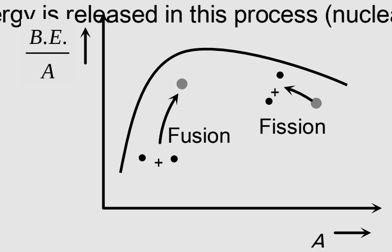
✍ **Atomic spectrum is a line spectrum**

Each atom has it's own characteristic allowed orbits depending upon the electronic configuration. Therefore photons emitted during transition of electrons from one allowed orbit to inner allowed orbit are of some definite energy only. They do not have a continuous graduation of energy. Therefore the spectrum of the emitted light has only some definite lines and therefore atomic spectrum is line spectrum.

✍ Just as dots of light of only three colours combine to form almost every conceivable colour on T.V. screen, only about 100 distinct kinds of atoms combine to form all the materials in the universe.

✍ Density of a nucleus is maximum at it's centre and decreases as we move outwards from the nucleus.

✍ When two very light nuclei combines to form a relatively heavy nucleus, then binding energy per nucleon increases. Thus, energy is released in this process (nuclear fusion).



✍ It may be noted that Plutonium is the best fuel as compared to other fissionable material. It is because fission in Plutonium can be initiated by both slow and fast neutrons. Moreover it can be obtained from U^{238}.

✍ Nuclear reactor is firstly devised by fermi.

✍ Apsara was the first Indian nuclear reactor.

✍ A type of reactor that can produce more fissile fuel than it consumes is the breeder reactor.

✍ To achieve fusion in laboratory a device is used to confine the plasma, called **Tokamak**.

✍ A test tube full of base nuclei will weight heavier than the earth.

✍ The nucleus of hydrogen contains only one proton. Therefore we may say that the proton is the nucleus of hydrogen atom.

✍ If the relative abundance of isotopes in an element has a ratio $n_1 : n_2$ whose atomic masses are m_1 and m_2 then atomic mass of the element is $M = \frac{n_1 m_1 + n_2 m_2}{n_1 + n_2}$

✍ No radioactive substance emits both α and β particles simultaneously. Also γ-rays are emitted after the emission of α or β-particles.

✍ β-particles are not orbital electrons they come from nucleus. The neutron in the nucleus decays into proton and an electron. This electron is emitted out of the nucleus in the form of β-rays.

✍ Activity per *gm* of a substance is known as specific activity. The specific activity of 1 *gm* of radium – 226 is 1 *Curie*.

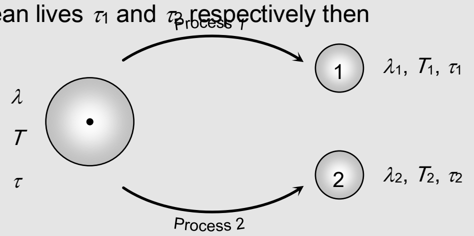
✍ 1 *millicurie* = 37 *Rutherford*

✍ The activity of a radioactive substance decreases as the number of undecayed nuclei decreases with time.

✍ $\text{Activity} \propto \frac{1}{\text{Half life}}$

✍ Half life and mean life of a substance doesn't change with time or with pressure, temperature *etc*.

✍ If a nuclide can decay simultaneously by two different process which have decay constant λ_1 and λ_2, half life T_1 and T_2 and mean lives τ_1 and τ_2 respectively then



$\Rightarrow \lambda = \lambda_1 + \lambda_2$ $\Rightarrow T = \frac{T_1 T_2}{T_1 + T_2}$

✍ There are at least three varieties of neutranas, each with it's corresponding antineutrino; one is associated with beta decay and the other two are associated with the decay of two unstable particles, the muon and the tau particles.

✍ Are all fusion reaction exoergic ?

Fusion reaction between sufficiently light nuclei are exoergic because the $\frac{B.E.}{A}$ increases. If the nuclei are too massive, however $\frac{B.E.}{A}$ decreases and fusion is endoergic (*i.e.* it takes in energy rather than releasing it)

✍ The Zeeman effect is the spliting of atomic energy levels and the associated spectrum lines when the atoms are placed in a magnetic field. This effect confirms experimentally the quantization of angular momentum.

Ordinary Thinking

Objective Questions

Atomic Structure

1. If in nature there may not be an element for which the principal quantum number $n > 4$, then the total possible number of elements will be [IIT 1983; MP PET 1999; RPMT 1999; RPET 2001]
   (a) 60 (b) 32
   (c) 4 (d) 64

2. In the Bohr's hydrogen atom model, the radius of the stationary orbit is directly proportional to (n = principle quantum number) [MNR 1988; SCRA 1994; CBSE PMT 1996; AIIMS 1999; DCE 2002]
   (a) n^{-1} (b) n
   (c) n^{-2} (d) n^2

3. In the n orbit, the energy of an electron $E_n = -\frac{13.6}{n^2} eV$ for hydrogen atom. The energy required to take the electron from first orbit to second orbit will be [MP PMT 1987; CPMT 1991, 97; RPMT 1999; DCE 2001; Kerala PMT 2004]
   (a) $10.2\ eV$ (b) $12.1\ eV$
   (c) $13.6\ eV$ (d) $3.4\ eV$

4. In the following atoms and molecules for the transition from $n = 2$ to $n = 1$, the spectral line of minimum wavelength will be produced by [IIT 1983]
   (a) Hydrogen atom (b) Deuterium atom
   (c) Uni-ionized helium (d) di-ionized lithium

5. The Lyman series of hydrogen spectrum lies in the region [MNR 1993; MP PMT 1995; UPSEAT 2002]
   (a) Infrared (b) Visible
   (c) Ultraviolet (d) Of $X-$ rays

6. The size of an atom is of the order of [CPMT 1990; MP PMT 1984; KCET 1994]
   (a) $10^{-8} m$ (b) $10^{-10} m$
   (c) $10^{-12} m$ (d) $10^{-14} m$

7. Which one of the series of hydrogen spectrum is in the visible region [RPMT 1999;MP PET 1990; MP PMT 1994; AFMC 1998; CBSE PMT 1990; MH CET 2004]
   (a) Lyman series (b) Balmer series
   (c) Paschen series (d) Bracket series

8. The energy levels of the hydrogen spectrum is shown in figure. There are some transitions A, B, C, D and E. Transition A, B and C respectively represent [CPMT 1986, 88]

   (a) First member of Lyman series, third spectral line of Balmer series and the second spectral line of Paschen series
   (b) Ionization potential of hydrogen, second spectral line of Balmer series and third spectral line of Paschen series
   (c) Series limit of Lyman series, third spectral line of Balmer series and second spectral line of Paschen series
   (d) Series limit of Lyman series, second spectral line of Balmer series and third spectral line of Paschen series

9. In the above figure D and E respectively represent [CPMT 1986, 88]
   (a) Absorption line of Balmer series and the ionization potential of hydrogen
   (b) Absorption line of Balmer series and the wavelength lesser than lowest of the Lyman series
   (c) Spectral line of Balmer series and the maximum wavelength of Lyman series
   (d) Spectral line of Lyman series and the absorption of greater wavelength of limiting value of Paschen series

10. The Rutherford α-particle experiment shows that most of the α-particles pass through almost unscattered while some are scattered through large angles. What information does it give about the structure of the atom [AFMC 1997]
    (a) Atom is hollow
    (b) The whole mass of the atom is concentrated in a small centre called nucleus
    (c) Nucleus is positively charged
    (d) All the above

11. Which of the following is true [MP PET 1993]
    (a) Lyman series is a continuous spectrum
    (b) Paschen series is a line spectrum in the infrared
    (c) Balmer series is a line spectrum in the ultraviolet
    (d) The spectral series formula can be derived from the Rutherford model of the hydrogen atom

12. The energy required to knock out the electron in the third orbit of a hydrogen atom is equal to [DPMT 1987]
    (a) $13.6\ eV$ (b) $+\frac{13.6}{9} eV$
    (c) $-\frac{13.6}{3} eV$ (d) $-\frac{3}{13.6} eV$

13. An electron has a mass of $9.1 \times 10^{-31} kg$. It revolves round the nucleus in a circular orbit of radius 0.529×10^{-10} $metre$ at a speed of $2.2 \times 10^6 m/s$. The magnitude of its linear momentum in this motion is

[AFMC 1988]

(a) $1.1\times10^{-34}\,kg-m/s$ (b) $2.0\times10^{-24}\,kg-m/s$

(c) $4.0\times10^{-24}\,kg-m/s$ (d) $4.0\times10^{-31}\,kg-m/s$

14. In a beryllium atom, if a_0 be the radius of the first orbit, then the radius of the second orbit will be in general

[CBSE PMT 1992; Roorkee 1993; BHU 1998]

(a) na_0 (b) a_0

(c) n^2a_0 (d) $\frac{a_0}{n^2}$

15. The ionization potential for second *He* electron is

(a) 13.6 *eV* (b) 27.2 *eV*

(c) 54.4 *eV* (d) 100 *eV*

16. The energy required to remove an electron in a hydrogen atom from $n=10$ state is [MP PMT 1993]

(a) 13.6 *eV* (b) 1.36 *eV*

(c) 0.136 *eV* (d) 0.0136 *eV*

17. Every series of hydrogen spectrum has an upper and lower limit in wavelength. The spectral series which has an upper limit of wavelength equal to 18752 Å is [MP PMT 1993]

(a) Balmer series (b) Lyman series

(c) Paschen series (d) Pfund series

(Rydberg constant $R=1.097\times10^7$ *per metre*)

18. The kinetic energy of the electron in an orbit of radius *r* in hydrogen atom is (*e* = electronic charge) [MP PMT 1987]

(a) $\frac{e^2}{r^2}$ (b) $\frac{e^2}{2r}$

(c) $\frac{e^2}{r}$ (d) $\frac{e^2}{2r^2}$

19. Ionization potential of hydrogen atom is 13.6 *V*.

Hydrogen atoms in the ground state are excited by monochromatic radiation of photon energy 12.1 *eV*. The spectral lines emitted by hydrogen atoms according to Bohr's theory will be

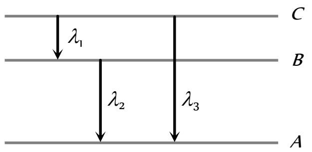
CBSE PMT 1996; MP PMT 1999; AMU (Med.) 2002]

(a) One (b) Two

(c) Three (d) Four

20. Energy levels A, B, C of a certain atom corresponding to increasing values of energy *i.e.* $E_A<E_B<E_C$. If $\lambda_1,\lambda_2,\lambda_3$ are the wavelengths of radiations corresponding to the transitions *C* to *B*, *B* to *A* and *C* to *A* respectively, which of the following statements is correct

[AIIMS 1995; CBSE PMT 1990, 2005]



(a) $\lambda_3=\lambda_1+\lambda_2$ (b) $\lambda_3=\frac{\lambda_1\lambda_2}{\lambda_1+\lambda_2}$

(c) $\lambda_1+\lambda_2+\lambda_3=0$ (d) $\lambda_3^2=\lambda_1^2+\lambda_2^2$

21. The angular momentum of electron in *n* orbit is given by

[Roorkee 1993]

(a) nh (b) $\frac{h}{2\pi n}$

(c) $n\frac{h}{2\pi}$ (d) $n^2\frac{h}{2\pi}$

22. The ratio of the energies of the hydrogen atom in its first to second excited state is [CPMT 1978]

(a) 1/ 4 (b) 4/9

(c) 9/ 4 (d) 4

23. An electron jumps from the 4th orbit to the 2nd orbit of hydrogen atom. Given the Rydberg's constant $R=10^5\,cm^{-1}$. The frequency in *Hz* of the emitted radiation will be

(a) $\frac{3}{16}\times10^5$ (b) $\frac{3}{16}\times10^{15}$

(c) $\frac{9}{16}\times10^{15}$ (d) $\frac{3}{4}\times10^{15}$

24. The ionisation potential of hydrogen atom is 13.6 *volt*. The energy required to remove an electron in the *n* = 2 state of the hydrogen atom is [NCERT 1983; MP PET 2005]

(a) 27.2 *eV* (b) 13.6 *eV*

(c) 6.8 *eV* (d) 3.4 *eV*

25. The ionisation energy of 10 times ionised sodium atom is

[DPMT 1991]

(a) 13.6 *eV* (b) $13.6\times11\,eV$

(c) $\frac{13.6}{11}eV$ (d) $13.6\times(11)^2\,eV$

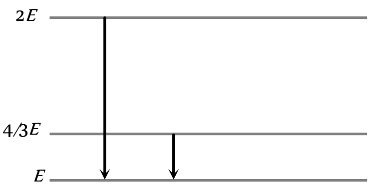
26. If the wavelength of the first line of the Balmer series of hydrogen is $6561\,Å$, the wavelength of the second line of the series should be [CPMT 1984; DPMT 2004]

(a) $13122\,Å$ (b) $3280\,Å$

(c) $4860\,Å$ (d) $2187\,Å$

27. The following diagram indicates the energy levels of a certain atom [CPMT 1990] when the system moves from $2E$ level to *E*, a photon of wavelength λ is emitted. The wavelength of photon produced during its transition from $\frac{4E}{3}$ level to *E* is

[CPMT 1989]

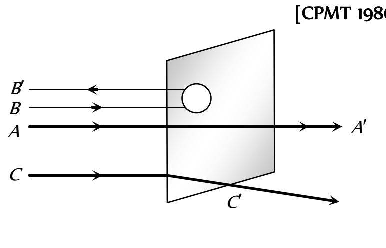


(a) $\lambda/3$ (b) $3\lambda/4$

(c) $4\lambda/3$ (d) 3λ

28. A beam of fast moving alpha particles were directed towards a thin film of gold. The parts A', B' and C' of the transmitted and reflected beams corresponding to the incident parts *A*, *B* and *C* of the beam, are shown in the adjoining diagram. The number of alpha particles in

[CPMT 1986, 88; RPET 2000]



(a) B' will be minimum and in C' maximum

(b) A' will be maximum and in B' minimum

(c) A' will be minimum and in B' maximum

(d) C' will be minimum and in B' maximum

29. According to Bohr's theory the radius of electron in an orbit described by principal quantum number n and atomic number Z is proportional to [CPMT 1988]

(a) Z^2n^2 (b) $\frac{Z^2}{n^2}$

(c) $\frac{Z^2}{n}$ (d) $\frac{n^2}{Z}$

30. The radius of electron's second stationary orbit in Bohr's atom is R. The radius of the third orbit will be

[EAMCET 1992; DPMT 1999]

(a) 3 R (b) 2.25 R

(c) 9 R (d) $\frac{R}{3}$

31. If m is mass of electron, v its velocity, r the radius of stationary circular orbit around a nucleus with charge Ze, then from Bohr's first postulate, the kinetic energy $K = \frac{1}{2}mv^2$ of the electron in *C.G.S.* system is equal to

[NCERT 1977]

(a) $\frac{1}{2}\frac{Ze^2}{r}$ (b) $\frac{1}{2}\frac{Ze^2}{r^2}$

(c) $\frac{Ze^2}{r}$ (d) $\frac{Ze}{r^2}$

32. Consider an electron in the n orbit of a hydrogen atom in the Bohr model. The circumference of the orbit can be expressed in terms of the de Broglie wavelength λ of that electron as

(a) $(0.259)\,n\lambda$ (b) $\sqrt{n}\lambda$

(c) $(13.6)\,\lambda$ (d) $n\lambda$

33. In any Bohr orbit of the hydrogen atom, the ratio of kinetic energy to potential energy of the electron is [MP PET 1994]

(a) 1/2 (b) 2

(c) $-1/2$ (d) -2

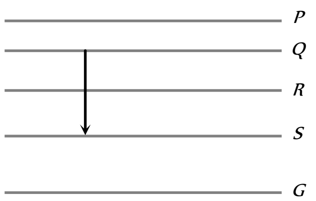
34. The spectral series of the hydrogen spectrum that lies in the ultraviolet region is the

[CPMT 1990; MP PET 1994; MP PMT 2000]

(a) Balmer series (b) Pfund series

(c) Paschen series (d) Lyman series

35. Figure shows the energy levels P, Q, R, S and G of an atom where G is the ground state. A red line in the emission spectrum of the atom can be obtained by an energy level change from Q to S. A blue line can be obtained by following energy level change



(a) P to Q (b) Q to R

(c) R to S (d) R to G

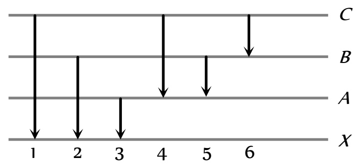
36. A hydrogen atom (ionisation potential 13.6 eV) makes a transition from third excited state to first excited state. The energy of the photon emitted in the process is [MNR 1995]

(a) 1.89 eV (b) 2.55 eV

(c) 12.09 eV (d) 12.75 eV

37. The figure indicates the energy level diagram of an atom and the origin of six spectral lines in emission (*e.g.* line no. 5 arises from the transition from level B to A). The following spectral lines will also occur in the absorption spectrum

[CBSE PMT 1995]



(a) 1, 4, 6 (b) 4, 5, 6

(c) 1, 2, 3 (d) 1, 2, 3, 4, 5, 6

38. When a hydrogen atom is raised from the ground state to an excited state [CBSE PMT 1995; AMU (Med.) 1999]

(a) P.E. increases and K.E. decreases

(b) P.E. decreases and K.E. increases

(c) Both kinetic energy and potential energy increase

(d) Both K.E. and P.E. decrease

39. An electron makes a transition from orbit $n = 4$ to the orbit $n = 2$ of a hydrogen atom. The wave number of the emitted radiations (R = Rydberg's constant) will be [CBSE PMT 1990]

[CBSE PMT 1995]

(a) $\frac{16}{3R}$ (b) $\frac{2R}{16}$

(c) $\frac{3R}{16}$ (d) $\frac{4R}{16}$

40. In Bohr model of the hydrogen atom, the lowest orbit corresponds to [Manipal MEE 1995]

(a) Infinite energy (b) The maximum energy

(c) The minimum energy (d) Zero energy

41. The ratio of the kinetic energy to the total energy of an electron in a Bohr orbit is [Roorkee 1995; BHU 2002]

(a) -1 (b) 2

(c) 1 : 2 (d) None of these

42. An electron in the $n = 1$ orbit of hydrogen atom is bound by 13.6 eV. If a hydrogen atom is in the $n = 3$ state, how much energy is required to ionize it [MP PMT 1995]

[MP PMT 1994]

(a) 13.6 eV (b) 4.53 eV

(c) 3.4 eV (d) 1.51 eV

43. Which of the following statements about the Bohr model of the hydrogen atom is false [MP PMT 1995]
   (a) Acceleration of electron in $n = 2$ orbit is less than that in $n = 1$ orbit
   (b) Angular momentum of electron in $n = 2$ orbit is more than that in $n = 1$ orbit
   (c) Kinetic energy of electron in $n = 2$ orbit is less than that in $n = 1$ orbit
   (d) Potential energy of electron in $n = 2$ orbit is less than that in $n = 1$ orbit

44. If an electron jumps from 1st orbital to 3rd orbital, then it will
   (a) Absorb energy (b) Release energy
   (c) No gain of energy (d) None of these

45. The ratio of the frequencies of the long wavelength limits of Lyman and Balmer series of hydrogen spectrum is [KCEE 1996]
   (a) 27 : 5 (b) 5 : 27
   (c) 4 : 1 (d) 1 : 4

46. Which of the following transitions in a hydrogen atom emits photon of the highest frequency [MP PET 1996; DPMT 2001]
   (a) $n = 1$ to $n = 2$ (b) $n = 2$ to $n = 1$
   (c) $n = 2$ to $n = 6$ (d) $n = 6$ to $n = 2$

47. In terms of Rydberg's constant R, the wave number of the first Balmer line is [MP PMT 1996]
   (a) R (b) $3R$
   (c) $\frac{5R}{36}$ (d) $\frac{8R}{9}$

48. If the ionisation potential of helium atom is 24.6 *volt*, the energy required to ionise it will be [MP PMT 1996]
   (a) 24.6 eV (b) 24.6 V
   (c) 13.6 V (d) 13.6 eV

49. Which of the transitions in hydrogen atom emits a photon of lowest frequency (n = quantum number) [BHU 1999]
   (a) $n = 2$ to $n = 1$ (b) $n = 4$ to $n = 3$
   (c) $n = 3$ to $n = 1$ (d) $n = 4$ to $n = 2$

50. According to Bohr's theory, the expressions for the kinetic and potential energy of an electron revolving in an orbit is given respectively by
   (a) $+\frac{e^2}{8\pi\varepsilon_0 r}$ and $-\frac{e^2}{4\pi\varepsilon_0 r}$ (b) $+\frac{8\pi\varepsilon_0 e^2}{r}$ and $-\frac{4\pi\varepsilon_0 e^2}{r}$
   (c) $-\frac{e^2}{8\pi\varepsilon_0 r}$ and $-\frac{e^2}{4\pi\varepsilon_0 r}$ (d) $+\frac{e^2}{8\pi\varepsilon_0 r}$ and $+\frac{e^2}{4\pi\varepsilon_0 r}$

51. In a hydrogen atom, which of the following electronic transitions would involve the maximum energy change [MP PET 1997]
   (a) From $n = 2$ to $n = 1$ (b) From $n = 3$ to $n = 1$
   (c) From $n = 4$ to $n = 2$ (d) From $n = 3$ to $n = 2$

52. In the lowest energy level of hydrogen atom, the electron has the angular momentum [MP PET 1997; BCECE 2003]
   (a) π / h (b) h / π
   (c) $h / 2\pi$ (d) $2\pi / h$

53. The minimum energy required to excite a hydrogen atom from its ground state is [EAMCET (Engg.) 1995; MP PMT 1997; CPMT 1999; DCE 1999]
   (a) 13.6 eV (b) $-13.6\ eV$
   (c) 3.4 eV (d) 10.2 eV

54. Ratio of the wavelengths of first line of Lyman series and first line of Balmer series is [AFMC 1996] [EAMCET (Engg.) 1995; MP PMT 1997]
   (a) 1: 3 (b) 27 : 5
   (c) 5 : 27 (d) 4 : 9

55. The Rydberg constant R for hydrogen is [MP PMT/PET 1998]
   (a) $R = -\left(\frac{1}{4\pi\varepsilon_0}\right).\frac{2\pi^2 me^2}{ch^2}$ (b) $R = \left(\frac{1}{4\pi\varepsilon_0}\right).\frac{2\pi^2 me^4}{ch^2}$
   (c) $R = \left(\frac{1}{4\pi\varepsilon_0}\right)^2.\frac{2\pi^2 me^4}{c^2h^2}$ (d) $R = \left(\frac{1}{4\pi\varepsilon_0}\right)^2.\frac{2\pi^2 me^4}{ch^3}$

56. The wavelength of the first line of Balmer series is $6563\ Å$. The Rydberg constant for hydrogen is about [MP PMT/PET 1998]
   (a) $1.09 \times 10^7\ per\ m$ (b) $1.09 \times 10^8\ per\ m$
   (c) $1.09 \times 10^9\ per\ m$ (d) $1.09 \times 10^5\ per\ m$

57. According to Bohr's theory the moment of momentum of an electron revolving in second orbit of hydrogen atom will be [MP PET 1999; KCET 2003]
   (a) $2\pi h$ (b) πh
   (c) $\frac{h}{\pi}$ (d) $\frac{2h}{\pi}$

58. The velocity of an electron in the second orbit of sodium atom (atomic number = 11) is v. The velocity of an electron in its fifth orbit will be [MP PET 1999]
   (a) v (b) $\frac{22}{5}v$
   (c) $\frac{5}{2}v$ (d) $\frac{2}{5}v$

59. The absorption transitions between the first and the fourth energy states of hydrogen atom are 3. The emission transitions between these states will be [MP PET 1999]
   (a) 3 (b) 4
   (c) 5 (d) 6

60. The ratio of longest wavelength and the shortest wavelength observed in the five spectral series of emission spectrum of hydrogen is [MP PET 1999]
   (a) $\frac{4}{3}$ (b) $\frac{525}{376}$
   (c) 25 (d) $\frac{900}{11}$

61. In the Bohr model of a hydrogen atom, the centripetal force is furnished by the coulomb attraction between the proton and the electron. If a_0 is the radius of the ground state orbit, m is the mass, e is the charge on the electron and ε_0 is the vacuum permittivity, the speed of the electron is

[CBSE PMT 1998]

(a) 0 (b) $\frac{e}{\sqrt{\varepsilon_0 a_0 m}}$

(c) $\frac{e}{\sqrt{4\pi\varepsilon_0 a_0 m}}$ (d) $\frac{\sqrt{4\pi\varepsilon_0 a_0 m}}{e}$

62. The electron in a hydrogen atom makes a transition $n_1 \to n_2$, where n_1 and n_2 are the principal quantum numbers of the two states. Assume the Bohr model to be valid. The time period of the electron in the initial state is eight times that in the final state. The possible values of n and n are [IIT 1998; KCET 2005]

(a) $n_1 = 4, n_2 = 2$ (b) $n_1 = 8, n_2 = 2$

(c) $n_1 = 8, n_2 = 1$ (d) $n_1 = 6, n_2 = 3$

63. As per Bohr model, the minimum energy (in *eV*) required to remove an electron from the ground state of doubly ionized *Li* atom (*Z* = 3) is [IIT 1997 Re-Exam; MH CET 2000]

(a) 1.51 (b) 13.6

(c) 40.8 (d) 122.4

64. Which one of these is non-divisible [KCET 1994]

(a) Nucleus (b) Photon

(c) Proton (d) Atom

65. In Bohr's model of hydrogen atom, let *PE* represents potential energy and *TE* the total energy. In going to a higher level

(a) *PE* decreases, *TE* increases

(b) *PE* increases, *TE* increases

(c) *PE* decreases, *TE* decreases

(d) *PE* increases, *TE* decreases

66. According to Bohr's model, the radius of the second orbit of helium atom is [Bihar MEE 1995]

(a) 0.53 Å (b) 1.06 Å

(c) 2.12 Å (d) 0.265 Å

67. The fact that photons carry energy was established by

[ISM Dhanbad 1994]

(a) Doppler's effect (b) Compton's effect

(c) Bohr's theory (d) Diffraction of light

68. An ionic atom equivalent to hydrogen atom has wavelength equal to 1/4 of the wavelengths of hydrogen lines. The ion will be

(a) He^+ (b) Li^{++}

(c) Ne^{9+} (d) Na^{10+}

69. The extreme wavelengths of Paschen series are

[RPET 1997]

(a) $0.365\mu m$ and $0.565\mu m$ (b) $0.818\mu m$ and $1.89\mu m$

(c) $1.45\mu m$ and $4.04\mu m$ (d) $2.27\mu m$ and $7.43\mu m$

70. The third line of Balmer series of an ion equivalent to hydrogen atom has wavelength of 108.5 *nm*. The ground state energy of an electron of this ion will be [RPET 1997]

(a) 3.4 *eV* (b) 13.6 *eV*

(c) 54.4 *eV* (d) 122.4 *eV*

71. An electron in the *n* = 1 orbit of hydrogen atom is bound by 13.6 *eV* energy is required to ionize it is [MP PMT 2003]

(a) 13.6 *eV* (b) 6.53 *eV*

(c) 5.4 *eV* (d) 1.51 *eV*

72. Ionization energy of hydrogen is 13.6 *eV*. If $h = 6.6 \times 10^{-34}\ J - sec$, the value of *R* will be of the order of

[RPMT 1997]

(a) $10^{10} m^{-1}$ (b) $10^7 m^{-1}$

(c) $10^4 m^{-1}$ (d) $10^{-7} m^{-1}$

73. To explain his theory, Bohr used

[CBSE PMT 1993; MP PET 2002]

(a) Conservation of linear momentum

(b) Conservation of angular momentum

(c) Conservation of quantum frequency

(d) Conservation of energy

74. The ionisation energy of hydrogen atom is 13.6 *eV*. Following Bohr's theory, the energy corresponding to a transition between the 3rd and the 4th orbit is

[KCET 1994] [CBSE PMT 1992; DPMT 2000; RPMT 1999; AMU (Med.) 2001]

(a) 3.40 *eV* (b) 1.51 *eV*

(c) 0.85 *eV* (d) 0.66 *eV*

75. Hydrogen atoms are excited from ground state of the principal quantum number 4. Then the number of spectral lines observed will be [CBSE PMT 1993]

(a) 3 (b) 6

(c) 5 (d) 2

76. Hydrogen atom emits blue light when it changes from *n* = 4 energy level to the *n* = 2 level. Which colour of light would the atom emit when it changes from the *n* = 5 level to the *n* = 2 level

(a) Red (b) Yellow

(c) Green (d) Violet

77. In Rutherford scattering experiment, what will be the correct angle for α scattering for an impact parameter *b* = 0

[RPET 1997] [CBSE PMT 1994; JIPMER 2000]

(a) 90^o (b) 270^o

(c) 0^o (d) 180^o

78. The radius of hydrogen atom in its ground state is $5.3 \times 10^{-11} m$. After collision with an electron it is found to have a radius of

$21.2 \times 10^{-11} m$. What is the principal quantum number n of the final state of the atom

[CBSE PMT 1994; CPMT 2001; MH CET 2000]

(a) $n = 4$ (b) $n = 2$

(c) $n = 16$ (d) $n = 3$

79. The splitting of line into groups under the effect of electric or magnetic field is called [AFMC 1995]

(a) Zeeman's effect (b) Bohr's effect

(c) Heisenberg's effect (d) Magnetic effect

80. The energy of a hydrogen atom in its ground state is $-13.6\ eV$. The energy of the level corresponding to the quantum number $n = 2$ (first excited state) in the hydrogen atom is [CBSE PMT 1996; CBSE PMT 1997, 2001; MP PET 2000; AFMC 2000, 01, 02; BCECE 2003]

(a) – 2.72 eV (b) – 0.85 eV

(c) – 0.54 eV (d) – 3.4 eV

81. The first line of Balmer series has wavelength 6563 Å. What will be the wavelength of the first member of Lyman series

[RPMT 1996]

(a) 1215.4 Å (b) 2500 Å

(c) 7500 Å (d) 600 Å

82. The wavelength of Lyman series is [BHU 1997]

(a) $\frac{4}{3 \times 10967} cm$ (b) $\frac{3}{4 \times 10967} cm$

(c) $\frac{4 \times 10967}{3} cm$ (d) $\frac{3}{4} \times 10967\ cm$

83. When hydrogen atom is in its first excited level, its radius is .... its ground state radius [CBSE PMT 1997]

(a) Half (b) Same

(c) Twice (d) Four times

84. Hydrogen atom excites energy level from fundamental state to $n = 3$. Number of spectrum lines according to Bohr, is

[CPMT 1997]

(a) 4 (b) 3

(c) 1 (d) 2

85. Number of spectral lines in hydrogen atom is [CPMT 1997]

(a) 3 (b) 6

(c) 15 (d) Infinite

86. In Bohr's model, the atomic radius of the first orbit is r_0, then the radius of the third orbit is

[AIIMS 1997; CPMT 2001; KCET (Engg./Med.) 1999; Pb. PMT 2004]

(a) $\frac{r_0}{9}$ (b) r_0

(c) $9r_0$ (d) $3r_0$

87. The wavelength of the energy emitted when electron come from fourth orbit to second orbit in hydrogen is $20.397\ cm$. The wavelength of energy for the same transition in He^+ is

[AIIMS 1997; JIPMER 2000]

(a) $5.099\ cm^{-1}$ (b) $20.497\ cm^{-1}$

(c) $40.994\ cm^{-1}$ (d) $81.988\ cm^{-1}$

88. Minimum excitation potential of Bohr's first orbit in hydrogen atom is

[BHU 1998; JIPMER 2001, 02; Pb. PMT 2004]

(a) 13.6 V (b) 3.4 V

(c) 10.2 V (d) 3.6 V

89. Which of the following statements are true regarding Bohr's model of hydrogen atom

(I) Orbiting speed of electron decreases as it shifts to discrete orbits away from the nucleus

(II) Radii of allowed orbits of electron are proportional to the principal quantum number

(III) Frequency with which electrons orbits around the nucleus in discrete orbits is inversely proportional to the principal quantum number

(IV) Binding force with which the electron is bound to the nucleus increases as it shifts to outer orbits

Select correct answer using the codes given below

Codes : [SCRA 1998]

(a) I and III (b) II and IV

(c) I, II and III (d) II, III and IV

90. The wavelength of radiation emitted is λ_0 when an electron jumps from the third to the second orbit of hydrogen atom. For the electron jump from the fourth to the second orbit of the hydrogen atom, the wavelength of radiation emitted will be

(a) $\frac{16}{25}\lambda_0$ (b) $\frac{20}{27}\lambda_0$

(c) $\frac{27}{20}\lambda_0$ (d) $\frac{25}{16}\lambda_0$

91. For electron moving in n^{th} orbit of H-atom the angular velocity is proportional to [RPET 1999]

(a) n (b) $1/n$

(c) n^3 (d) $1/n^3$

92. The energy of electron in first excited state of H-atom is $-3.4\ eV$ its kinetic energy is

[RPET 1999; CBSE PMT 2005]

(a) – 3.4 eV (b) + 3.4 eV

(c) – 6.8 eV (d) 6.8 eV

93. The energy required to excite an electron from the ground state of hydrogen atom to the first excited state, is

[Pb. PMT 1999]

(a) $1.602 \times 10^{-14}\ J$ (b) $1.619 \times 10^{-16}\ J$

(c) $1.632 \times 10^{-18}\ J$ (d) $1.656 \times 10^{-20}\ J$

94. Which of the following phenomena suggests the presence of electron energy levels in atoms [JIPMER 1999]

(a) Radio active decay

(b) Isotopes

(c) Spectral lines

(d) α-particles scattering

95. Which of the following spectral series in hydrogen atom give spectral line of 4860 Å [Roorkee 1999]

(a) Lyman (b) Balmer

(c) Paschen (d) Brackett

96. If scattering particles are 56 for 90^o angle then this will be at 60^o angle [RPMT 2000]

(a) 224 (b) 256

(c) 98 (d) 108

97. When an electron in hydrogen atom is excited, from its 4^{th} to 5^{th} stationary orbit, the change in angular momentum of electron is (Planck's constant: $h = 6.6\times10^{-34}$ *J*- s) [AFMC 2000; Pb. PET 2001]

(a) 4.16×10^{-34} *J- s* (b) 3.32×10^{-34} *J-s*

(c) 1.05×10^{-34} *J-s* (d) 2.08×10^{-34} *J-s*

98. Energy of electron in a orbit of *H*-atom is [RPET 2000]

(a) Positive (b) Negative

(c) Zero (d) Nothing can be said

99. The concept of stationary orbits was proposed by [Pb. PMT 2000]

(a) Neil Bohr (b) J.J. Thomson

(c) Ruther ford (d) I. Newton

100. In a hydrogen atom, the distance between the electron and proton is $2.5\times10^{-11}\ m$. The electrical force of attraction between them will be [Pb. PMT 2000]

(a) $2.8\times10^{-7}\ N$ (b) $3.7\times10^{-7}\ N$

(c) $6.2\times10^{-7}\ N$ (d) $9.1\times10^{-7}\ N$

101. If λ_{max} is 6563 Å, then wave length of second line for Balmer series will be [RPMT 2000]

(a) $\lambda = \frac{16}{3R}$ (b) $\lambda = \frac{36}{5R}$

(c) $\lambda = \frac{4}{3R}$ (d) None of the above

102. What will be the angular momentum of a electron, if energy of this electron in *H*-atom is 1.5eV (in *J-sec*) [RPMT 2000]

(a) 1.05×10^{-34} (b) 2.1×10^{-34}

(c) 3.15×10^{-34} (d) -2.1×10^{-34}

103. Who discovered spin quantum number [RPMT 2000]

(a) Unlenbeck and Goudsmit

(b) Nell's Bohr

(c) Zeeman

(d) Sommerfield

104. The time of revolution of an electron around a nucleus of charge *Ze* in *n* Bohr orbit is directly proportional to [MP PET 2003]

(a) n (b) $\frac{n^3}{Z^2}$

(c) $\frac{n^2}{Z}$ (d) $\frac{Z}{n}$

105. In Bohr's model, if the atomic radius of the first orbit is r_0, then the radius of the fourth orbit is [CBSE PMT 2000]

(a) r_0 (b) $4r_0$

(c) $r_0/16$ (d) $16r_0$

106. If *R* is the Rydberg's constant for hydrogen the wave number of the first line in the Lyman series will be [KCET 2000]

(a) $\frac{R}{4}$ (b) $\frac{3R}{4}$

(c) $\frac{R}{2}$ (d) $2R$

107. In hydrogen atom, if the difference in the energy of the electron in $n = 2$ and $n = 3$ orbits is *E*, the ionization energy of hydrogen atom is [EAMCET (Med.) 2000]

(a) 13.2 *E* (b) 7.2 *E*

(c) 5.6 *E* (d) 3.2 *E*

108. The first member of the Paschen series in hydrogen spectrum is of wavelength 18,800 Å. The short wavelengths limit of Paschen series is [EAMCET (Med.) 2000]

(a) 1215 Å (b) 6560 Å

(c) 8225 Å (d) 12850 Å

109. The ratio of the largest to shortest wavelengths in Lyman series of hydrogen spectra is [EAMCET (Med.) 2000]

(a) $\frac{25}{9}$ (b) $\frac{17}{6}$

(c) $\frac{9}{5}$ (d) $\frac{4}{3}$

110. In Bohr model of hydrogen atom, the ratio of periods of revolution of an electron in $n = 2$ and $n = 1$ orbits is [EAMCET (Engg.) 2000]

(a) 2 : 1 (b) 4 : 1

(c) 8 : 1 (d) 16 : 1

111. The ratio of the longest to shortest wavelengths in Brackett series of hydrogen spectra is [EAMCET (Engg.) 2000]

(a) $\frac{25}{9}$ (b) $\frac{17}{6}$

(c) $\frac{9}{5}$ (d) $\frac{4}{3}$

112. The electron in a hydrogen atom makes a transition from an excited state to the ground state. Which of the following statements is true

(a) Its kinetic energy increases and its potential and total energies decrease

(b) Its kinetic energy decreases, potential energy increases and its total energy remains the same

(c) Its kinetic and total energies decrease and its potential energy increases

(d) Its kinetic, potential and total energies decreases

113. The ratio of minimum to maximum wavelength in Balmer series is

(a) 5 : 9 (b) 5 : 36

(c) 1 : 4 (d) 3 : 4

114. The radius of the Bohr orbit in the ground state of hydrogen atom is 0.5 $\mathring{A}$. The radius of the orbit of the electron in the third excited state of He^+ will be **[MP PMT 2000]**

(a) 8 $\mathring{A}$ (b) 4 $\mathring{A}$

(c) 0.5 $\mathring{A}$ (d) 0.25 $\mathring{A}$

115. The ratio of the speed of the electron in the first Bohr orbit of hydrogen and the speed of light is equal to (where *e*, *h* and *c* have their usual meanings) **[MP PMT 2000]**

(a) $2\pi hc/e^2$ (b) $e^2h/2\pi c$

(c) $e^2c/2\pi h$ (d) $2\pi e^2/hc$

116. According to the Rutherford's atomic model, the electrons inside the atom are **[KCET (Med.) 2000]**

(a) Stationary (b) Not stationary

(c) Centralized (d) None of these

117. The energy of hydrogen atom in its ground state is – 13.6 *eV*. The energy of the level corresponding to the quantum number *n* is equal 5 is **[KCET (Engg./Med.) 2001]**

(a) – 5.40 *eV* (b) – 2.72 *eV*

(c) – 0.85 *eV* (d) – 0.54 *eV*

118. According to classical theory, the circular path of an electron in Rutherford atom is **[BHU 2001]**

(a) Spiral (b) Circular

(c) Parabolic (d) Straight line

119. Rutherford's α-particle experiment showed that the atoms have

(a) Proton (b) Nucleus

(c) Neutron (d) Electrons

120. Orbital acceleration of electron is **[RPET 2001]**

(a) $\dfrac{n^2h^2}{4\pi^2m^2r^3}$ (b) $\dfrac{n^2h^2}{2n^2r^3}$

(c) $\dfrac{4n^2h^2}{\pi^2m^2r^3}$ (d) $\dfrac{4n^2h^2}{4\pi^2m^2r^3}$

121. Which of the following is true for number of spectral lines in going form Layman series to Pfund series **[RPET 2001]**

(a) Increases

(b) Decreases

(c) Unchanged

(d) May decreases or increases

122. The wavelength of yellow line of sodium is 5896 $\mathring{A}$. Its wave number will be **[MP PET 2001]**

(a) 50883×10^{10} per *second*

(b) 16961 per *cm*

(c) 17581 per *cm*

(d) 50883 per *cm*

123. Radius of the first orbit of the electron in a hydrogen atom is 0.53 $\mathring{A}$. So, the radius of the third orbit will be **[MP PET 2000]** **[Kerala (Engg.) 2001]**

(a) 2.12 $\mathring{A}$ (b) 4.77 $\mathring{A}$

(c) 1.06 $\mathring{A}$ (d) 1.59 $\mathring{A}$

124. The first line in the Lyman series has wavelength λ. The wavelength of the first line in Balmer series is **[MH CET (Med.) 2001]**

(a) $\dfrac{2}{9}\lambda$ (b) $\dfrac{9}{2}\lambda$

(c) $\dfrac{5}{27}\lambda$ (d) $\dfrac{27}{5}\lambda$

125. In hydrogen atom which quantity is integral multiple of $\dfrac{h}{2\pi}$ **[DCE 2001]**

(a) Angular momentum (b) Angular velocity

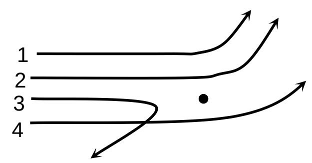
(c) Angular acceleration (d) Momentum

126. In the following transitions, which one has higher frequency **[UPSEAT 2001]**

(a) 3 – 2 (b) 4 – 3

(c) 4 – 2 (d) 3 – 1

127. The diagram shows the path of four α-particles of the same energy being scattered by the nucleus of an atom simultaneously. Which of these are/is not physically possible **[AMU (Med.) 2001]**



(a) 3 and 4 (b) 2 and 3

(c) 1 and 4 (d) 4 only

[AFMC 2001]

128. An electron jumps from 5^{th} orbit to 4^{th} orbit of hydrogen atom. Taking the Rydberg constant as 10^7 *per metre*. What will be the frequency of radiation emitted **[Pb. PMT 2001]**

(a) $6.75 \times 10^{12}\ Hz$ (b) $6.75 \times 10^{14}\ Hz$

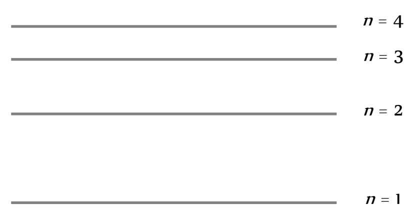
(c) $6.75 \times 10^{13}\ Hz$ (d) None of these

129. For principal quantum number $n = 3$, the possible values of orbital quantum number '*l*' are **[MP PET 2001; MP PMT 2001]**

(a) 1, 2, 3 (b) 0, 1, 2, 3

(c) 0, 1, 2 (d) –1, 0, +1

130. Four lowest energy levels of *H*-atom are shown in the figure. The number of possible emission lines would be **[MP PMT 2001]**



(a) 3 (b) 4

(c) 5 (d) 6

131. The order of the size of nucleus and Bohr radius of an atom respectively are [MP PET 2001; MP PMT 2001]

(a) $10^{-14}m, 10^{-10}m$ (b) $10^{-10}m, 10^{-8}m$

(c) $10^{-20}m, 10^{-16}m$ (d) $10^{-8}m, 10^{-6}m$

132. Energy of an electron in an excited hydrogen atom is – 3.4 *eV*. Its angular momentum will be: $h = 6.626\times10^{-34}\ J-s$

[UPSEAT 1999; Kerala PET 2002]

(a) $1.11\times10^{34}\ J$ sec (b) $1.51\times10^{-31}\ J$ sec

(c) $2.11\times10^{-34}\ J$ sec (d) $3.72\times10^{-34}\ J$ sec

133. The ratio of the wavelengths for 2 $\rightarrow$ 1 transition in *Li*, *He* and *H* is

(a) 1 : 2 : 3 (b) 1 : 4 : 9

(c) 4 : 9 : 36 (d) 3 : 2 : 1

134. The wavelength of light emitted from second orbit to first orbits in a hydrogen atom is [Pb. PMT 2002]

(a) $1.215\times10^{-7}m$ (b) $1.215\times10^{-5}m$

(c) $1.215\times10^{-4}m$ (d) $1.215\times10^{-3}m$

135. Energy of the electron in *n* orbit of hydrogen atom is given by $E_n = -\frac{13.6}{n^2}eV$. The amount of energy needed to transfer electron from first orbit to third orbit is

[MH CET 2002; Kerala PMT 2002]

(a) 13.6 *eV* (b) 3.4 *eV*

(c) 12.09 *eV* (d) 1.51 *eV*

136. The ratio of speed of an electron in ground state in Bohrs first orbit of hydrogen atom to velocity of light in air is

[MH CET 2002]

(a) $\frac{e^2}{2\varepsilon_0 hc}$ (b) $\frac{2e^2\varepsilon_0}{hc}$

(c) $\frac{e^3}{2\varepsilon_0 hc}$ (d) $\frac{2\varepsilon_0 hc}{e^2}$

137. Whenever a hydrogen atom emits a photon in the Balmer series [KCET 2002]

(a) It need not emit any more photon

(b) It may emit another photon in the Paschen series

(c) It must emit another photon in the Lyman series

(d) It may emit another photon in the Balmer series

138. The de-Broglie wavelength of an electron in the first Bohr orbit is

(a) Equal to one fourth the circumference of the first orbit

(b) Equal to half the circumference of the first orbit

(c) Equal to twice the circumference of the first orbit

(d) Equal to the circumference of the first orbit

139. In hydrogen atom, when electron jumps from second to first orbit, then energy emitted is [AIEEE 2002]

(a) – 13.6 *eV* (b) – 27.2 *eV*

(c) – 6.8 *eV* (d) None of these

140. Minimum energy required to takeout the only one electron from ground state of He^+ is [CPMT 2002]

(a) 13.6 *eV* (b) 54.4 *eV*

(c) 27.2 *eV* (d) 6.8 *eV*

141. The frequency of 1st line of Balmer series in H_2 atom is ν_0. The frequency of line emitted by singly ionised *He* atom is

[CPMT 2002]

(a) $2\nu_0$ (b) $4\nu_0$

(c) $\nu_0/2$ (d) $\nu_0/4$

142. When the electron in the hydrogen atom jumps from 2nd orbit to 1st orbit, the wavelength [UPSEAT 2003] of radiation emitted is λ. When the electrons jump from 3rd orbit to 1st orbit, the wavelength of emitted radiation would be [MP PMT 2002]

(a) $\frac{27}{32}\lambda$ (b) $\frac{32}{27}\lambda$

(c) $\frac{2}{3}\lambda$ (d) $\frac{3}{2}\lambda$

143. The possible quantum number for 3*d* electron are

[MP PMT 2002]

(a) $n = 3, l = 1, m_l = +1, m_s = -\frac{1}{2}$

(b) $n = 3, l = 2, m_l = +2, m_s = -\frac{1}{2}$

(c) $n = 3, l = 1, m_l = -1, m_s = +\frac{1}{2}$

(d) $n = 3, l = 0, m_l = +1, m_s = -\frac{1}{2}$

144. The radius of the first (lowest) orbit of the hydrogen atom is a_0. The radius of the second (next higher) orbit will be

[MP PET 2002; MP PMT 2004]

(a) $4a_0$ (b) $6a_0$

(c) $8a_0$ (d) $10a_0$

145. Which of the following transition will have highest emission wavelength [BHU 2003]

(a) $n = 2$ to $n = 1$ (b) $n = 1$ to $n = 2$

(c) $n = 2$ to $n = 5$ (d) $n = 5$ to $n = 2$

146. When the wave of hydrogen atom comes from infinity into the first orbit then the value of wave number is [RPET 2003]

(a) 109700 *cm* (b) 1097*cm*

(c) 109 *cm* (d) None of these

147. [KCET 2002] With the increase in principle quantum number, the energy difference between the two successive energy levels

[RPET 2003]

(a) Increases

(b) Decreases

(c) Remains constant

(d) Sometimes increases and sometimes decreases

148. In which of the following systems will the radius of the first orbit $(n = 1)$ be minimum

[Kerala PET 2002; CBSE PMT 2003]

(a) Single ionized helium
(b) Deuterium atom
(c) Hydrogen atom
(d) Doubly ionized lithium

149. If the binding energy of the electron in a hydrogen atom is 13.6 eV, the energy required to remove the electron from the first excited state of Li^{++} is [AIEEE 2003]

(a) 122.4 eV (b) 30.6 eV
(c) 13.6 eV (d) 3.4 eV

150. Which of the following is quantised according to Bohr's theory of hydrogen atom [MP PMT 2004]

(a) Linear momentum of electron
(b) Angular momentum of electron
(c) Linear velocity of electron
(d) Angular velocity of electron

151. The shortest wavelength in the Lyman series of hydrogen spectrum is 912 $\AA$ corresponding to a photon energy of 13.6 eV. The shortest wavelength in the Balmer series is about

[MP PMT 2004]

(a) 3648 $\AA$ (b) 8208 $\AA$
(c) 1228 $\AA$ (d) 6566 $\AA$

152. Energy E of a hydrogen atom with principal quantum number n is given by $E = \frac{-13.6}{n^2} eV$. The energy of a photon ejected when the electron jumps from $n = 3$ state to $n = 2$ state of hydrogen is approximately [CBSE PMT 2004]

(a) 1.5 eV (b) 0.85 eV
(c) 3.4 eV (d) 1.9 eV

153. The Bohr model of atoms [CBSE PMT 2004]

(a) Assumes that the angular momentum of electrons is quantized
(b) Uses Einstein's photo-electric equation
(c) Predicts continuous emission spectra for atoms
(d) Predicts the same emission spectra for all types of atoms

154. The colour of the second line of Balmer series is

[J & K CET 2004]

(a) Blue (b) Yellow
(c) Red (d) Violet

155. Which state of triply ionised Baryllium (Be^{+++}) has the same orbital radius as that of the ground state of hydrogen

[KCET 2004]

(a) $n = 4$ (b) $n = 3$
(c) $n = 2$ (d) $n = 1$

156. The ratio of areas within the electron orbits for the first excited state to the ground state for hydrogen atom is

[BCECE 2004]

(a) 16 : 1 (b) 18 : 1
(c) 4 : 1 (d) 2 : 1

157. The kinetic energy of an electron revolving around a nucleus will be

(a) Four times of P.E. (b) Double of P.E.
(c) Equal to P.E. (d) Half of its P.E.

158. Taking Rydberg's constant $R_H = 1.097 \times 10^7 m$ first and second wavelength of Balmer series in hydrogen spectrum is

[Pb. PMT 2004]

(a) 2000 $\AA$, 3000 $\AA$ (b) 1575 $\AA$, 2960 $\AA$
(c) 6529 $\AA$, 4280 $\AA$ (d) 6552 $\AA$, 4863 $\AA$

159. The kinetic energy of electron in the first Bohr orbit of the hydrogen atom is [Pb. PET 2000]

(a) – 6.5 eV (b) – 27.2 eV
(c) 13.6 eV (d) – 13.6 eV

160. In the spectrum of hydrogen atom, the ratio of the longest wavelength in Lyman series to the longest wavelength in the Balmer series is [UPSEAT 2004]

(a) 5/27 (b) 1/93
(c) 4/9 (d) 3/2

161. In Bohr's model of hydrogen atom, which of the following pairs of quantities are quantized [UPSEAT 2004]

(a) Energy and linear momentum
(b) Linear and angular momentum
(c) Energy and angular momentum
(d) None of the above

162. The energy of the highest energy photon of Balmer series of hydrogen spectrum is close to [UPSEAT 2004]

(a) 13.6 eV (b) 3.4 eV
(c) 1.5 eV (d) 0.85 eV

163. Energy of an electron in n orbit of hydrogen atom is $\left(k = \frac{1}{4\pi\varepsilon_0}\right)$

(a) $-\frac{2\pi^2 k^2 me^4}{n^2h^2}$ (b) $-\frac{4\pi^2 m ke^2}{n^2h^2}$
(c) $-\frac{n^2h^2}{2\pi k me^4}$ (d) $-\frac{n^2h^2}{4\pi^2 k me^2}$

164. Which one of the relation is correct between time period and number of orbits while an electron is revolving in a orbit

[DPMT 2003]

(a) n^2 (b) $\frac{1}{n^2}$
(c) n^3 (d) $\frac{1}{n}$

165. An electron changes its position from orbit $n = 4$ to the orbit $n = 2$ of an atom. The wavelength of the emitted radiation's is (R = Rydberg's constant) [BHU 2004]

(a) $\frac{16}{R}$ (b) $\frac{16}{3R}$
(c) $\frac{16}{5R}$ (d) $\frac{16}{7R}$

166. If the energy of a hydrogen atom in nth orbit is E_n, then energy in the nth orbit of a singley ionized helium atom will be [BCECE 2004]

(a) $4E_n$ (b) $E_n / 4$
(c) $2E_n$ (d) $E_n / 2$

167. What is the ratio of wavelength of radiations emitted when an electron in hydrogen atom jump from fourth orbit to second orbit and from third orbit to second orbit

[MH CET 2004]

(a) 27 : 25 (b) 20 : 27

(c) 20 : 25 (d) 25 : 27

168. The energy of electron in the *n*th orbit of hydrogen atom is expressed as $E_n = \frac{-13.6}{n^2} eV$. The shortest and longest wavelength of Lyman series will be [Pb. PET 2003]

(a) 910 $\AA$, 1213 $\AA$ (b) 5463 $\AA$, 7858 $\AA$

(c) 1315 $\AA$, 1530 $\AA$ (d) None of these

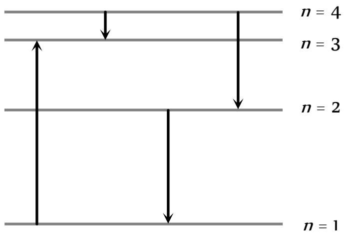
169. The ground state energy of hydrogen atom is – 13.6 *eV*. What is the potential energy of the electron in this state

[AIIMS 2005]

(a) 0 *eV* (b) – 27.2 *eV*

(c) 1 *eV* (d) 2 *eV*

170. The diagram shows-the energy levels for an electron in a certain atom. Which transition shown represents the emission of a photon with the most energy [AIEEE 2005]



(a) I (b) II

(c) III (d) IV

171. As the electron in Bohr orbit of Hydrogen atom passes from state $n = 2$ to $n = 1$, the kinetic energy *K* and potential energy *U* change as [MP PET 2005]

(a) *K* two-fold, *U* four-fold

(b) *K* four-fold, *U* two-fold

(c) *K* four-fold, *U* also four-fold

(d) *K* two-fold, *U* also two-fold

172. The magnetic moment (μ) of a revolving electron around the nucleus varies with principal quantum number *n* as

[AIIMS 2005]

(a) $\mu \propto n$ (b) $\mu \propto 1/n$

(c) $\mu \propto n^2$ (d) $\mu \propto 1/n^2$

173. Bohr's atom model assumes [KCET 2005]

(a) The nucleus is of infinite mass and is at rest

(b) Electrons in a quantized orbit will not radiate energy

(c) Mass of electron remains constant

(d) All the above conditions

174. Radius of first Bohr orbit is *r*. What is the radius of 2nd Bohr orbit? [BHU 2005]

(a) 8*r* (b) 2*r*

(c) 4*r* (d) $2\sqrt{2r}$

Nucleus, Nuclear Reaction

1. Which of the following particles are constituents of the nucleus [CBSE PMT 199

(a) Protons and electrons (b) Protons and neutrons

(c) Neutrons and electrons (d) Neutrons and positrons

2. The particles which can be added to the nucleus of an atom without changing its chemical properties are called

[NCERT 1979]

(a) Electrons (b) Protons

(c) Neutrons (d) None of the above

3. The neutron was discovered by

[MP PMT 1992; RPMT 1996]

(a) Marie Curie (b) Pierre Curie

(c) James Chadwick (d) Rutherford

4. The mass number of a nucleus is

[IIT 1986; ISM Dhanbad 1994; MP PMT 1997; CBSE PMT 2003; MH CET (Med.) 2001]

(a) Always less than its atomic number

(b) Always more than its atomic number

(c) Always equal to its atomic number

(d) Sometimes more than and sometimes equal to its atomic number

5. The energy equivalent of 1 *kilogram* of matter is about

[MP PET/PMT 1988; MNR 1987]

(a) 10^{-15} *J* (b) 1 *J*

(c) 10^{-12} *J* (d) 10^{17} *J*

6. Nuclear binding energy is equivalent to [MP PET/PMT 1988]

(a) Mass of proton (b) Mass of neutron

(c) Mass of nucleus (d) Mass defect of nucleus

7. If the binding energy of the deutrium is 2.23 *MeV*. The mass defect given in *a.m.u.* is [MP PET 1993]

(a) – 0.0024 (b) – 0.0012

(c) 0.0012 (d) 0.0024

8. Which of the following has the mass closest in value to that of the positron [AFMC 1993]

(a) Proton (b) Electron

(c) Photon (d) Neutrino

$(1\ a.m.u = 931\ MeV)$

9. Size of nucleus is of the order of

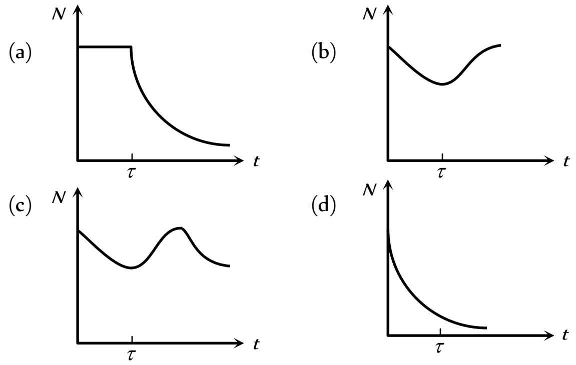
[CPMT 1983; MP PET 2002, 03]

(a) $10^{-10} m$ (b) $10^{-15} m$

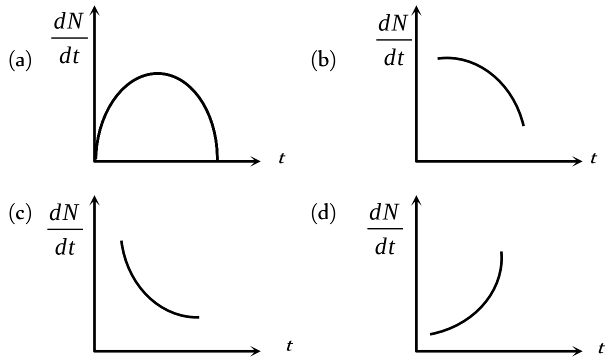
(c) $10^{-12} m$ (d) $10^{-19} m$

4. A radioactive sample consists of two distinct species having equal number of atoms initially. The mean life time of one species is τ and that of the other is 5τ. The decay products in both cases are stable. A plot is made of the total number of radioactive nuclei as a function of time. Which of the following figures best represents the form of this plot

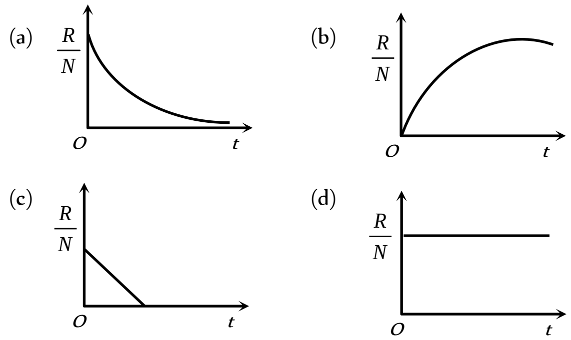
[IIT-JEE (Screening) 2001]



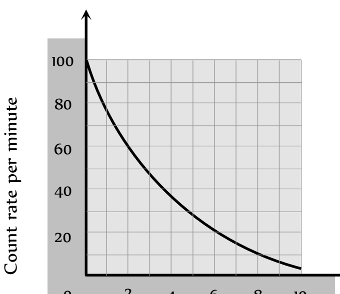
5. Radioactive element decays to form a stable nuclide, then the rate of decay of reactant $\left(\frac{dN}{dt}\right)$ will vary with time (t) as shown in figure



6. A radioactive sample has N_0 active atoms at $t = 0$. If the rate of disintegration at any time is R and the number of atoms is N, then the ratio R/N varies with time as



7. The count rate of 10*g* of radioactive material was measured at different times and this has been shown in the figure. The half life of material and the total counts (approximately) in the first half life period, respectively are [CPMT 1986]



(a) 4*h*, 9000 (b) 3*h*, 14000

(c) 3*h*, 235 (d) 3*h*, 50

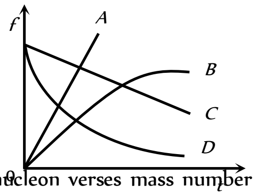
8. The fraction *f* of radioactive material that has decayed in time *t*, varies with time *t*. The correct variation is given by the curve

(a) *A*

(b) *B*

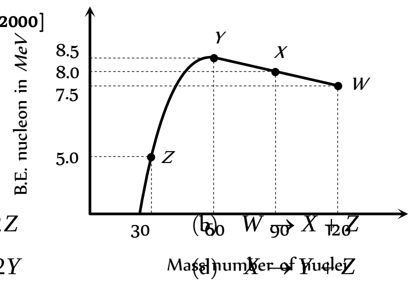
(c) *C*

(d) *D*



9. Binding energy per nucleon verses mass number curve for nuclei is shown in the figure. *W, X, Y and Z* are four nuclei indicated on the curve. The process that would release energy is

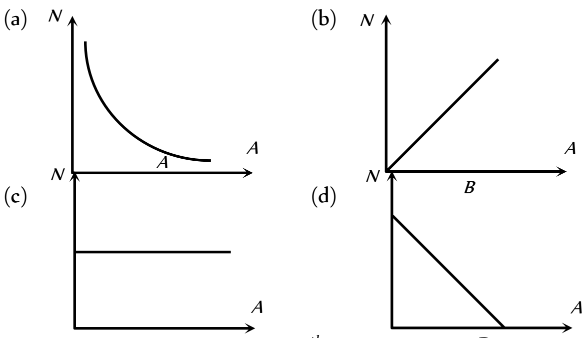
[DCE 2000]



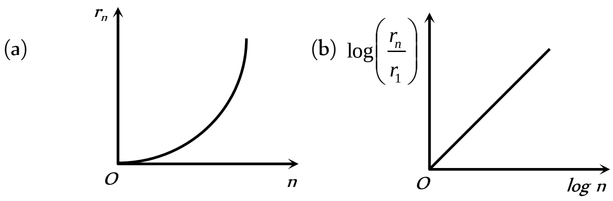
(a) $Y \to 2Z$ (b) $W \to X + Z$

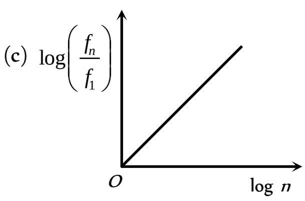
(c) $W \to 2Y$ (d) $X \to Y + Z$

10. The plot of the number (N) of decayed atoms versus activity (A) of a radioactive substance is



11. If in hydrogen atom, radius of n^{th} Bohr orbit is r_n, frequency of revolution of electron in n^{th} orbit is f_n choose the correct option

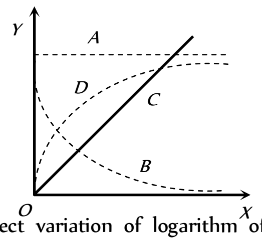




(d) Both (a) and (b)

12. The graph between the instantaneous concentration (N) of a radioactive element and time (t) is

(a) 
(b) 
(c) 
(d) 
13. In Fig. X represents time and Y represent activity of a radioactive sample. Then the activity of sample, varies with time according to the curve



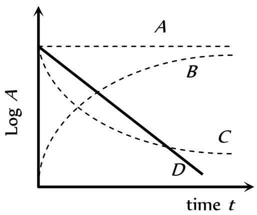
(a) A

(b) B

(c) C

(d) D

14. The graph which represents the correct variation of logarithm of activity (log A) versus time, in figure is



(a) A

(b) B

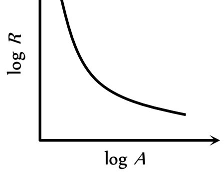
(c) C

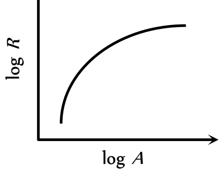
(d) D

15. The charge density in a nucleus varies with distance from the centre of the nucleus according to the curve in Fig.

(a) 
(b) 
(c) 
(d) 
16. The graph between log R and log A where R is the nuclear radius and A *is the mass number is*

(a) 
(b) 



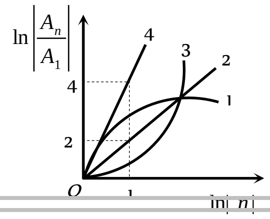


(c) (d)

17. The curve between the activity A of a radioactive sample and the number of active atoms N is

(a) 
(b) 
(c) 
(d) 
18. The graph between number of decayed atoms N' of a radioactive element and time t is

(a) 
(b) 
(c) 
(d) 
19. The figure shows a graph between $\ln\left|\frac{A_n}{A_1}\right|$ and $\ln|n|$, where A_n is the area enclosed by the nth orbit in a hydrogen like atom. The correct curve is



(a) 4

(b) 3

(c) 2

(d) 1

AR Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) *If both assertion and reason are true and the reason is the correct explanation of the assertion.*

(b) *If both assertion and reason are true but reason is not the correct explanation of the assertion.*

(c) *If assertion is true but reason is false.*

(d) *If the assertion and reason both are false.*

(e) *If assertion is false but reason is true.*

1. Assertion : It is not possible to use ^{35}Cl as the fuel for fusion energy.

Reason : The binding energy of ^{35}Cl is too small.

[AIIMS 2005]

2. Assertion : ^{90}Sr from the radioactive fall out from a nuclear bomb ends up in the bones of human beings through the milk consumed by them. It causes impairment of the production of red blood cells.

Reason : The energetics β-particles emitted in the decay of ^{90}Sr damage the bone marrow.

[AIIMS 2004]

3. Assertion : Neutrons penetrate matter more readily as compared to protons.

Reason : Neutrons are slightly more massive than protons. [AIIMS 2003]

4. Assertion : Bohr had to postulate that the electrons in stationary orbits around the nucleus do not radiate.

Reason : According to classical physics all moving electrons radiate. [AIIMS 2003]

5. Assertion : Radioactive nuclei emit β^{-1} particles.

Reason : Electrons exist inside the nucleus.

[AIIMS 2003]

6. Assertion : $_ZX^A$ undergoes $2\alpha -$ decays. $2\beta -$ decays and $2\gamma -$decays and the daughter product is $_{Z-2}Y^{A-8}$.

Reason : In α-decay the mass number decreases by 4 and atomic number decreases by 2. In β- decay the mass number remains unchanged, but atomic number increases by 1 only.

[AIIMS 2001]

7. Assertion : Density of all the nuclei is same.

Reason : Radius of nucleus is directly proportional to the cube root of mass number.

[AIIMS 2000]

8. Assertion : Isobars are the element having same mass number but different atomic number.

Reason : Neutrons and protons are present inside nucleus. [AIIMS 1997]

9. Assertion : The force of repulsion between atomic nucleus and α-particle varies with distance according to inverse square law.

Reason : Rutherford did α-particle scattering experiment.

10. Assertion : The positively charged nucleus of an atom has a radius of almost $10^{-15}\,m$.

Reason : In α-particle scattering experiment, the distance of closest approach for α-particles is $\simeq 10^{-15}\,m$.

11. Assertion : According to classical theory, the proposed path of an electron in Rutherford atom model will be parabolic.

Reason : According to electromagnetic theory an accelerated particle continuously emits radiation.

12. Assertion : Electrons in the atom are held due to coulomb forces.

Reason : The atom is stable only because the centripetal force due to Coulomb's law is balanced by the centrifugal force.

13. Assertion : The electron in the hydrogen atom passes from energy level $n=4$ to the $n=1$ level. The maximum and minimum number of photon that can be emitted are six and one respectively.

Reason : The photons are emitted when electron make a transition from the higher energy state to the lower energy state.

14. Assertion : Hydrogen atom consists of only one electron but its emission spectrum has many lines.

Reason : Only Lyman series is found in the absorption spectrum of hydrogen atom whereas in the emission spectrum, all the series are found.

15. Assertion : It is essential that all the lines available in the emission spectrum will also be available in the absorption spectrum.

Reason : The spectrum of hydrogen atom is only absorption spectrum.

16. Assertion : For the scattering of α-particles at a large angles, only the nucleus of the atom is responsible.

Reason : Nucleus is very heavy in comparison to electrons.

17. Assertion : All the radioactive elements are ultimately converted in lead.

Reason : All the elements above lead are unstable.

18. Assertion : Amongst alpha, beta and gamma rays, α-particle has maximum penetrating power.

Reason : The alpha particle is heavier than beta and gamma rays.

19. Assertion : The ionising power of β-particle is less compared to α-particles but their penetrating power is more.

Reason : The mass of β-particle is less than the mass of α-particle.

20. Assertion : The mass of β-particles when they are emitted is higher than the mass of electrons obtained by other means.

Reason : β-particle and electron, both are similar particles.

21. Assertion : Radioactivity of 10^8 undecayed radioactive nuclei of half life of 50 days is equal to that of 1.2×10^8 number of undecayed nuclei of some other material with half life of 60 days

Reason : Radioactivity is proportional to half-life.

22. Assertion : Fragments produced in the fission of U^{235} are radioactive.

Reason : The fragments have abnormally high proton to neutron ratio.

23. Assertion : Electron capture occurs more often than positron emission in heavy elements.

Reason : Heavy elements exhibit radioactivity.

24. Assertion : The mass of a nucleus can be either less than or more than the sum of the masses of nucleons present in it.

Reason : The whole mass of the atom is considered in the nucleus.

AS Answers and Solutions

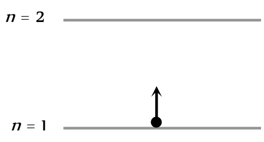
Atomic Structure

1. (a) For $n=1$, maximum number of states $= 2n^2 = 2$ and for $n = 2$, 3, 4, maximum number of states would be 8, 18, 32 respectively, Hence number of possible elements

= 2 + 8 + 18 + 32 = 60.

2. (d) Bohr radius $r = \frac{\varepsilon_0 n^2 h^2}{\pi Zme^2}$; $\therefore r \propto n^2$

3. (a)



$E_2 = -\frac{13.6}{(2)^2} = -3.4\, eV$

$E_1 = -13.6\, eV$

$E_{1\to 2} = -3.4 - (13.6) = +10.2\, eV$

4. (d) $\frac{1}{\lambda} = RZ^2\left(\frac{1}{1^2} - \frac{1}{2^2}\right)$

For di-ionised lithium the value of Z is maximum.

5. (c) Lyman series lies in the UV region.

6. (b) The size of the atom is of the order of $1Å = 10^{-10} m$.

7. (b) Balmer series lies in the visible region.

8. (c) Transition A ($n = \infty$ to 1) : Series limit of Lyman series

Transition B ($n = 5$ to $n = 2$) : Third spectral line of Balmer series

Transition C ($n = 5$ to $n = 3$) : Second spectral line of Paschen series

9. (a) D is excitation of electron from 2^{nd} orbit corresponding to absorption line in Balmer series and E is the energy released to bring the electron from ∞ to ground state *i.e.* ionisation potential.

10. (d)

11. (b) Paschen series lies in the infrared region.

12. (b) Energy required to knock out the electron in the n^{th} orbit $= +\frac{13.6}{n^2} eV \Rightarrow E_3 = +\frac{13.6}{9} eV$.

13. (b) Linear momentum $= mv = 9.1\times 10^{-31} \times 2.2\times 10^{6}$

$= 2.0\times 10^{-24}\, kg - m/s$

14. (c) $r \propto n^2 \Rightarrow r_n = n^2 a_0 \quad (\because r_1 = a_0)$

15. (c) For the ionization of second He electron. He^+ will act as hydrogen like atom.

Hence ionization potential

$= Z^2 \times 13.6\, volt = (2)^2 \times 13.6 = 54.4\, V$

16. (c) Energy required $= \frac{13.6}{n^2} = \frac{13.6}{10^2} = 0.136\, eV$

17. (c) $\frac{1}{\lambda} = R\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right] \Rightarrow \frac{1}{n_1^2} - \frac{1}{n_2^2} = \frac{1}{R\lambda}$

$= \frac{1}{1.097\times 10^7 \times 18752\times 10^{-10}} = 0.0486 = \frac{7}{144}$. But

$\frac{1}{3^2} - \frac{1}{4^2} = \frac{7}{144} \Rightarrow n_1 = 3$ and $n_2 = 4$ (Paschen series)

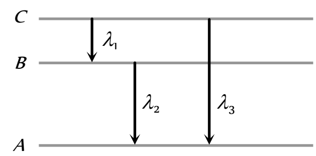
18. (b) Potential energy of electron in n^{th} orbit of radius r in H-atom

$U = -\frac{e^2}{r}$ (in CGS)

$\because$ K.E. $= \frac{1}{2}|\, P.E.| \Rightarrow K = \frac{e^2}{2r}$

19. (c) Final energy of electron $= -13.6 + 12.1 = -1.51\, eV$. which is corresponds to third level *i.e.* $n = 3$. Hence number of spectral lines emitted $= \frac{n(n-1)}{2} = \frac{3(3-1)}{2} = 3$

20. (b) Let the energy in A, B and C state be E_A, E_B and E_C, then from the figure



$(E_C - E_B) + (E_B - E_A) = (E_C - E_A)$ or $\frac{hc}{\lambda_1} + \frac{hc}{\lambda_2} = \frac{hc}{\lambda_3}$

$\Rightarrow \lambda_3 = \frac{\lambda_1 \lambda_2}{\lambda_1 + \lambda_2}$

21. (c) According to Bohr's second postulate.

22. (c) First excited state *i.e.* second orbit ($n = 2$)

Second excited state *i.e.* third orbit ($n = 3$)

$\because E = -\frac{13.6}{n^2} \Rightarrow \frac{E_2}{E_3} = \left(\frac{3}{2}\right)^2 = \frac{9}{4}$

23. (c) $\frac{1}{\lambda} = R\left(\frac{1}{2^2} - \frac{1}{4^2}\right) = \frac{3R}{16} \Rightarrow \lambda = \frac{16}{3R} = \frac{16}{3}\times 10^{-5} cm$

Frequency $n = \frac{c}{\lambda} = \frac{3\times 10^{10}}{\frac{16}{3}\times 10^{-5}} = \frac{9}{16}\times 10^{15}\, Hz$

24. (d) Energy required to remove electron in the $n = 2$ state $= +\frac{13.6}{(2)^2} = +3.4\, eV$

25. (d) $(E)_{\ } = Z^2 (E_{ion})_H = (11)^2 13.6\, eV$

26. (c) The wavelength of spectral line in Balmer series is given by $\frac{1}{\lambda} = R\left[\frac{1}{2^2} - \frac{1}{n^2}\right]$

For first line of Balmer series, $n = 3$

$\Rightarrow \frac{1}{\lambda_1} = R\left[\frac{1}{2^2} - \frac{1}{3^2}\right] = \frac{5R}{36}$; For second line $n = 4$.

$\Rightarrow \frac{1}{\lambda_2} = R\left[\frac{1}{2^2} - \frac{1}{4^2}\right] = \frac{3R}{16}$

$\therefore \frac{\lambda_2}{\lambda_1} = \frac{20}{27} \Rightarrow \lambda_1 = \frac{20}{27} \times 6561 = 4860\ Å$

27. (d) $2E - E = \frac{hc}{\lambda} \Rightarrow E = \frac{hc}{\lambda}$

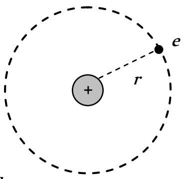
$\frac{4E}{3} - E = \frac{hc}{\lambda'} \Rightarrow \frac{E}{3} = \frac{hc}{\lambda'}\ \therefore \frac{\lambda'}{\lambda} = 3 \Rightarrow \lambda' = 3\lambda$

28. (b) Because atom is hollow and whole mass of atom is concentrated in a small centre called nucleus.

29. (d) $r = \frac{\varepsilon_0 n^2 h^2}{\pi Z m e^2}$; $\therefore r \propto \frac{n^2}{Z}$

30. (b) $r \propto n^2 \Rightarrow \frac{r_{(n=2)}}{r_{(n=3)}} = \frac{4}{9} \Rightarrow r_{(n=3)} = \frac{9}{4}R = 2.25\,R$

31. (a) In the revolution of electron, coulomb force provides the necessary centripetal force



$\Rightarrow \frac{ze^2}{r^2} = \frac{mv^2}{r} \Rightarrow mv^2 = \frac{ze^2}{r}$

$\therefore$ K.E. $= \frac{1}{2}mv^2 = \frac{ze^2}{2r}$

32. (d) According to Bohr's theory $mvr = n\frac{h}{2\pi}$

$\Rightarrow$ Circumference $2\pi r = n\left(\frac{h}{mv}\right) = n\lambda$

33. (c) $K.E = \frac{kZe^2}{2r}$ and $P.E. = -\frac{kZe^2}{r}$; $\therefore \frac{K.E.}{P.E.} = -\frac{1}{2}$.

34. (d) Lyman series lies in the UV region.

35. (d) If E is the energy radiated in transition

then $E_{R\to G} > E_{Q\to S} > E_{R\to S} > E_{Q\to R} > E_{P\to Q}$

For getting blue line energy radiated should be maximum $\left(E \propto \frac{1}{\lambda}\right)$. Hence (d) is the correct option.

36. (b) Energy released $= 13.6\left[\frac{1}{(2)^2} - \frac{1}{(4)^2}\right] = 2.55\,eV$

37. (c) The absorption lines are obtained when the electron jumps from ground state ($n = 1$) to the higher energy states. Thus only 1, 2 and 3 lines will be obtained.

38. (a) P.E. $\propto -\frac{1}{r}$ and K.E. $\propto \frac{1}{r}$

As r increases so K.E. decreases but P.E. increases.

39. (c) Wave number $\frac{1}{\lambda} = R\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right] = R\left[\frac{1}{4} - \frac{1}{16}\right] = \frac{3R}{16}$

40. (c) In hydrogen atom, the lowest orbit ($n = 1$) corresponds to minimum energy (– 13.6 eV).

41. (a) K.E. = – (T.E.)

42. (d) Required energy $E_3 = \frac{+13.6}{3^2} = 1.51eV$

43. (d) As n increases P.E. also increases.

44. (a) When an electron jumps from the orbit of lower energy (n=1) to the orbit of higher energy (n=3), energy is absorbed.

45. (a) For Lyman series

$\nu_{\text{Lymen}} = \frac{c}{\lambda_{\max}} = Rc\left[\frac{1}{(1)^2} - \frac{1}{(2)^2}\right] = \frac{3RC}{4}$

For Balmer series

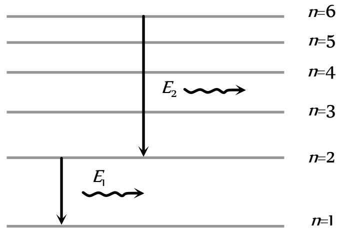
$\nu_{\text{Balmer}} = \frac{c}{\lambda_{\max}} = Rc\left[\frac{1}{(2)^2} - \frac{1}{(3)^2}\right] = \frac{5RC}{36}$

$\therefore \frac{\nu_{\text{Lymen}}}{\nu_{\text{Balmer}}} = \frac{27}{5}$

46. (a) $\because E_1 > E_2$

$\therefore \nu_1 > \nu_2$

i.e. photons of higher frequency will be emitted if transition takes place from n = 2 to 1.



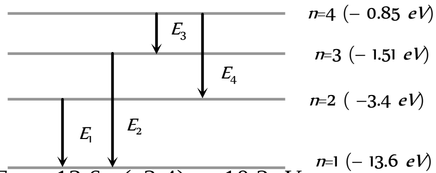
47. (c) Wave number $= \frac{1}{\lambda} = R\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$

For first Balmer line n_1= 2, n_2=3

$\therefore$ Wave number $= R\left(\frac{1}{2^2} - \frac{1}{3^2}\right) = R\left(\frac{9-4}{9\times 4}\right) = \frac{5R}{36}$

48. (a) Energy required to ionise helium atom = 24.6 eV

49. (b) From diagram



$E_1 = -13.6 - (-3.4) = -10.2\,eV$

$E_2 = -13.6 - (-1.51) = -12.09\,eV$

$E_3 = -1.51 - (-0.85) = -0.66\,eV$

$E_4 = -3.4 - (-1.51) = -1.89\,eV$

E_3 is least *i.e.* frequency is lowest.

50. (a) P.E. $= -\frac{ke^2}{r} = -\frac{e^2}{4\pi\varepsilon_0 r}$; K.E. $= -\frac{1}{2}$(P.E.) $= \frac{e^2}{8\pi\varepsilon_0 r}$

51. (b) Similar to Q. 49

52. (c) $mvr = \frac{nh}{2\pi}$, for n =1 it is $\frac{h}{2\pi}$

53. (d) Minimum energy required to excite from ground state

$= 13.6\left[\frac{1}{1^2} - \frac{1}{2^2}\right] = 10.2\ eV$

54. (c) $\frac{1}{\lambda} = R\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$

For first line of Lymen series $n_i = 1$ and $n_f = 2$

For first line of Balmer series $n_i = 2$ and $n_f = 3$

So, $\frac{\lambda_{\text{Lymen}}}{\lambda_{\text{Balmer}}} = \frac{5}{27}$

55. (d) $R = \frac{2\pi^2 k^2 e^4 m}{ch^3} = \left(\frac{1}{4\pi\varepsilon_0}\right)^2 \frac{2\pi^2 me^4}{ch^3}$

56. (a) $\frac{1}{\lambda} = R\left[\frac{1}{4} - \frac{1}{9}\right] = \frac{5R}{36}$

$\therefore R = \frac{36}{5\lambda} = \frac{36}{5 \times 6563 \times 10^{-10}} = 1.09 \times 10^7 m^{-1}$

57. (c) Angular momentum $L = n\left(\frac{h}{2\pi}\right)$

For this case n=2, hence $L = 2 \times \frac{h}{2\pi} = \frac{h}{\pi}$

58. (d) $v \propto \frac{1}{n} \Rightarrow \frac{v_5}{v_2} = \frac{2}{5} \Rightarrow v_5 = \frac{2}{5}v_2 = \frac{2}{5}v$

59. (d) By using $N_E = \frac{n(n-1)}{2} \Rightarrow N_E = \frac{4(4-1)}{2} = 6$

60. (d) Shortest wavelength comes from $n_1 = \infty$ to $n_2 = 1$ and longest wavelength comes from $n_1 = 6$ to $n_2 = 5$ in the given case. Hence $\frac{1}{\lambda_{\min}} = R\left(\frac{1}{1^2} - \frac{1}{\infty^2}\right) = R$

$\frac{1}{\lambda_{\max}} = R\left(\frac{1}{5^2} - \frac{1}{6^2}\right) = R\left(\frac{36-25}{25 \times 36}\right) = \frac{11}{900}R$

$\therefore \frac{\lambda_{\max}}{\lambda_{\min}} = \frac{900}{11}$

61. (c) $\frac{mv^2}{a_0} = \frac{1}{4\pi\varepsilon_0}\frac{e^2}{a_0^2} \Rightarrow v = \frac{e}{\sqrt{4\pi\varepsilon_0 a_0 m}}$

62. (a,d) $T \propto n^3$. Given $T_{n_1} = 8\, T_{n_2}$, hence $n_1 = 2n_2$

Therefore, option (a) and (d) both are correct.

63. (d) $E = -Z^2 \times 13.6\, eV = -9 \times 13.6\, eV = -122.4\, eV$

So ionisation energy = + 122.4 eV.

64. (b)

65. (b) As n increases P.E. increases and K.E. decreases.

66. (b) $r = \frac{n^2}{Z}(r_0)$; $\Rightarrow r_{(n=2)} = \frac{(2)^2}{2} \times 0.53 = 1.06\, Å$

67. (c)

68. (a) $\bar{v} \propto \frac{1}{\lambda} \propto Z^2 \Rightarrow \lambda Z^2 = \text{constant} \Rightarrow \lambda = \frac{\lambda}{4}Z^2 \Rightarrow Z = 2$

69. (b) In Paschen series $\frac{1}{\lambda_{\max}} = R\left[\frac{1}{(3)^2} - \frac{1}{(4)^2}\right]$

$\Rightarrow \lambda_{\max} = \frac{144}{7R} = \frac{144}{7 \times 1.1 \times 10^7} = 1.89 \times 10^{-6} m = 1.89\, \mu m$

Similarly $\lambda_{\min} = \frac{9}{R} = \frac{9}{1.1 \times 10^7} = 0.818\, \mu m$

70. (c) For third line of Balmer series $n_1 = 2$, $n_2 = 5$

$\therefore \frac{1}{\lambda} = RZ^2\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$ gives $Z^2 = \frac{n_1^2 n_2^2}{(n_2^2 - n_1^2)\lambda R}$

On putting values $Z = 2$

From $E = -\frac{13.6 Z^2}{n^2} = \frac{-13.6(2)^2}{(1)^2} = -54.4\, eV$

71. (a) Ionization energy = Binding energy.

72. (b) $E = -Rch \Rightarrow R = -\frac{E}{ch} = -\frac{13.6 \times 1.6 \times 10^{-19}}{3 \times 10^8 \times 6.6 \times 10^{-34}}$

$= 1.098 \times 10^7$ *per m*

73. (b) Bohr postulated that the angular momentum of the electron is conserved.

74. (d) $E_3 = -\frac{13.6}{9} = -1.51\, eV$; $E_4 = -\frac{13.6}{16} = -0.85\, eV$

$\therefore E_4 - E_3 = 0.66\, eV$

75. (b) Number of spectral lines $N_E = \frac{n(n-1)}{2} = \frac{4(4-1)}{2} = 6$

76. (d) In the transition from orbit $5 \to 2$, more energy is liberated as compared to transition from $4 \to 2$.

77. (d) Impact parameter $b \propto \cot\frac{\theta}{2}$

Here $b = 0$, hence $\theta = 180^o$

78. (b) $r \propto n^2$ *i.e.* $\frac{r_f}{r_i} = \left(\frac{n_f}{n_i}\right)^2$

$\Rightarrow \frac{21.2 \times 10^{-11}}{5.3 \times 10^{-11}} = \left(\frac{n}{1}\right)^2 \Rightarrow n^2 = 4 \Rightarrow n = 2$

79. (a)

80. (d) $E_n = \frac{-13.6}{n^2} = \frac{-13.6}{4} = -3.4 eV$

81. (a) $\frac{1}{\lambda_{\text{Balmer}}} = R\left[\frac{1}{2^2} - \frac{1}{3^2}\right] = \frac{5R}{36}$, $\frac{1}{\lambda_{\text{Lyman}}} = R\left[\frac{1}{1^2} - \frac{1}{2^2}\right] = \frac{3R}{4}$

$\therefore \lambda_{\text{Lyman}} = \lambda_{\text{Balmer}} \times \frac{5}{27} = 1215.4\, Å$

82. (a) $\frac{1}{\lambda} = R_H\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$. For Lyman series n_1=1 and n_2=2, 3, 4,

When n_2=2, we get $\lambda = \frac{4}{3R_H} = \frac{4}{3 \times 10967} cm$

83. (b) $r \propto n^2$. For ground state n=1 and for first excited state n=2.

84. (b) No. of lines $N_E = \frac{n(n-1)}{2} = \frac{3(3-1)}{2} = 3$

85. (d) Infinitely large transitions are possible (in principle) for the hydrogen atom.

86. (c) $r_n \propto n^2$

87. (a) $E\left(= \frac{hc}{\lambda}\right) \propto \frac{Z^2}{n^2} \Rightarrow \lambda \propto \frac{1}{Z^2}$

Hence $\lambda_{He^+} = \frac{20.397}{4} = 5.099\,cm$

88. (c) Excitation potential $= \frac{\text{Excitation energy}}{e}$

Minimum excitation energy corresponds to excitation from $n=1$ to $n=2$

$\therefore$ Minimum excitation energy in hydrogen atom $= -3.4-(-13.6) = +10.2\,eV$

so minimum excitation potential = 10.2 eV.

89. (a) Orbital speed varies inversely as the radius of the orbit. Energy increases with the increase in quantum number.

90. (b) $\frac{1}{\lambda} = R\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right] \Rightarrow \frac{1}{\lambda_{3\to 2}} = R\left[\frac{1}{(2)^2} - \frac{1}{(3)^2}\right] = \frac{5R}{36}$

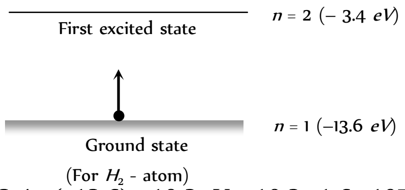
and $\frac{1}{\lambda_{4\to 2}} = R\left[\frac{1}{(2)^2} - \frac{1}{(4)^2}\right] = \frac{3R}{16}$

$\therefore \frac{\lambda_{4\to 2}}{\lambda_{3\to 2}} = \frac{20}{27} \Rightarrow \lambda_{4\to 2} = \frac{20}{27}\lambda_0$

91. (d)

92. (b) Kinetic energy = |Total energy|

93. (c) Energy to excite the e^- from $n=1$ to $n=2$



$E = -3.4-(-13.6) = 10.2\,eV = 10.2\times 1.6\times 10^{-19}$

$= 1.632\times 10^{-18}\,J$

94. (c)

95. (b)

96. (a) According to scattering formula

$N \propto \frac{1}{\sin^4(\theta/2)} \Rightarrow \frac{N_2}{N_1} = \left[\frac{\sin(\theta_1/2)}{\sin(\theta_2/2)}\right]^4$

$\Rightarrow \frac{N_2}{N_1} = \left[\frac{\sin\frac{90^o}{2}}{\sin\frac{60^o}{2}}\right]^4 = \left[\frac{\sin 45^o}{\sin 30^o}\right]^4$

$\Rightarrow N_2 = (\sqrt{2})^4 \times N_1 = 4\times 56 = 224$

97. (c) Change in the angular momentum

$\Delta L = L_2 - L_1 = \frac{n_2 h}{2\pi} - \frac{n_1 h}{2\pi} \Rightarrow \Delta L = \frac{h}{2\pi}(n_2 - n_1)$

$= \frac{6.6\times 10^{-34}}{2\times 3.14}(5-4) = 1.05\times 10^{-34}\,J\text{-}S$

98. (b) $E_n = -\frac{13.6}{n^2}eV$

99. (a)

100. (b) $F = \frac{9\times 10^9 \times 1.6\times 10^{-19}\times 1.6\times 10^{-19}}{(2.5\times 10^{-11})^2} = 3.7\times 10^{-7}\,N$

101. (a) For Balmer series $\frac{1}{\lambda} = R\left(\frac{1}{2^2} - \frac{1}{n^2}\right)$ where n = 3, 4, 5

For second line n = 4

So $\frac{1}{\lambda} = R\left(\frac{1}{2^2} - \frac{1}{4^2}\right) = \frac{3}{16}R \Rightarrow \lambda = \frac{16}{3R}$

102. (c) Energy of electron in H atom $E_n = \frac{-13.6}{n^2}eV$

$\Rightarrow -1.5 = \frac{-13.6}{n^2} \Rightarrow n^2 = \frac{13.6}{1.5} = 3$

Now angular momentum

$p = n\frac{h}{2\pi} = \frac{3\times 6.6\times 10^{-34}}{2\times 3.14} = 3.15\times 10^{-34}\,J\times\sec$

103. (a)

104. (b) $T = \frac{2\pi r}{v}$; r = radius of n orbit $= \frac{n^2h^2}{\pi m Ze^2}$

v = speed of e^- in n orbit $= \frac{ze^2}{2\varepsilon_0 nh}$

$\therefore T = \frac{4\varepsilon_0^2 n^3 h^3}{mZ^2e^4} \Rightarrow T \propto \frac{n^3}{Z^2}$

105. (d) $r_n \propto n^2 \Rightarrow \frac{r_4}{r_1} = \left(\frac{4}{1}\right)^2 = \frac{16}{1} \Rightarrow r_4 = 16\,r_1 \Rightarrow r_4 = 16\,r_0$

106. (b) For Lyman series

$\bar{v} = \frac{1}{\lambda} = R\left(\frac{1}{1^2} - \frac{1}{n^2}\right)$ here n=2, 3, 4, 5.....

For first line

$\bar{v} = R\left(\frac{1}{1^2} - \frac{1}{2^2}\right) \Rightarrow \bar{v} = R\left(1 - \frac{1}{4}\right) = \frac{3R}{4}$

107. (b) Energy $E = K\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$ (K = constant)

n = 2 and n = 3, so $E = K\left[\frac{1}{2^2} - \frac{1}{3^2}\right] = K\left[\frac{5}{36}\right]$

For removing an electron n = 1 to $n_2 = \infty$

Energy $E_1 = K[1] = \frac{36}{5}E = 7.2\,E$

$\therefore$ Ionization energy = 7.2 E

108. (c) For Paschen series $\bar{v} = \frac{1}{\lambda} = R\left[\frac{1}{3^2} - \frac{1}{n^2}\right]$; n=4, 5, 6....

For first member of Paschen series n = 4

$\frac{1}{\lambda_1} = R\left[\frac{1}{3^2} - \frac{1}{4^2}\right] \Rightarrow \frac{1}{\lambda_1} = \frac{7R}{144}$

$\Rightarrow R = \frac{144}{7\lambda_1} = \frac{144}{7\times 18800\times 10^{-10}} = 1.1\times 10^{-7}$

For shortest wave length $n = \infty$

So $\frac{1}{\lambda} = R\left[\frac{1}{3^2} - \frac{1}{\infty^2}\right] = \frac{R}{9}$

$\Rightarrow \lambda = \frac{9}{R} = \frac{9}{1.1\times10^{-7}} = 8.225\times10^{-7}m = 8225\,\AA$

109. (d) For Lyman series $\frac{1}{\lambda_{\max}} = R\left[\frac{1}{1^2}-\frac{1}{2^2}\right] = \frac{3}{4}R$ and

$\frac{1}{\lambda_{\min}} = R\left[\frac{1}{1^2}-\frac{1}{\infty^2}\right] = \frac{R}{1} \Rightarrow \frac{\lambda_{\max}}{\lambda_{\min}} = \frac{4}{3}$

110. (c) $T \propto n^3 \Rightarrow \frac{T_2}{T_1} = \frac{2^3}{1^3} = \frac{8}{1}$

111. (a) For Bracket series $\frac{1}{\lambda_{\max}} = R\left[\frac{1}{4^2}-\frac{1}{5^2}\right] = \frac{9}{25\times16}R$

and $\frac{1}{\lambda_{\min}} = R\left[\frac{1}{4^2}-\frac{1}{\infty^2}\right] = \frac{R}{16} \Rightarrow \frac{\lambda_{\max}}{\lambda_{\min}} = \frac{25}{9}$

112. (a) For hydrogen and hydrogen like atoms $E_n = -13.6\frac{z^2}{n^2}eV$

$U_n = 2E_n = -27.2\frac{z^2}{n^2}eV$ and $K_n = |E_n| = 13.6\frac{z^2}{n^2}eV$

From these three relations we can see that as n decreases, K will increase but E and U will decreases.

113. (a) $\frac{1}{\lambda} = R\left[\frac{1}{n_1^2}-\frac{1}{n_2^2}\right] \Rightarrow \frac{\lambda_{\min}}{\lambda_{\max}} = \frac{\left[\frac{1}{2^2}-\frac{1}{3^2}\right]}{\left[\frac{1}{2^2}-\frac{1}{\infty}\right]} = \frac{5}{9}$

114. (b) By using $r_n = r_0\frac{n^2}{Z}$; Where r_0 = Radius of the Bohr orbit in the ground state atom . So for He^+ third excited state

$n = 4,\ Z = 2,\ r_0 = 0.5\AA \Rightarrow r_4 = 0.5\times\frac{4^2}{2} = 4\AA$

115. (d) Speed of electron in n orbit (in CGS) $v_n = \frac{2\pi Ze^2}{nh}$ $(k = 1)$

For first orbit H_2; $n = 1$ and $Z = 1$

So $v = \frac{2\pi e^2}{h} \Rightarrow \frac{v}{c} = \frac{2\pi e^2}{hc}$

116. (b)

117. (d) $E_n = -\frac{13.6}{n^2}eV \Rightarrow E_5 = \frac{-13.6}{5^2} = \frac{-13.6}{25} = -0.54\ eV$

118. (a)

119. (b)

120. (a) $mvr = \frac{nh}{2\pi} \Rightarrow v = \frac{nh}{2\pi mr} \Rightarrow \frac{v^2}{r} = \frac{n^2h^2}{4\pi^2m^2r^3}$.

121. (b) Maximum number of spectral lines are observed in Lymen series.

122. (b) Wave number $\bar{\nu} = \frac{1}{\lambda} = \frac{1}{5896\times10^{-8}} = 16961$ per cm

123. (b) $r_n \propto n^2 \Rightarrow \frac{r_3}{r_1} = \frac{3^2}{1} \Rightarrow r_3 = 9r_1 = 9\times0.53 = 4.77\AA$

124. (d) For first line in Lyman series $\lambda_{L_1} = \frac{4}{3\,R}$ ..... (i)

For first line in Balmer series $\lambda_{B_1} = \frac{36}{5\,R}$ ..... (ii)

From equation (i) and (ii)

$\frac{\lambda_{B_1}}{\lambda_{L_1}} = \frac{27}{5} \Rightarrow \lambda_{B_1} = \frac{27}{5}\lambda_{L_1} \Rightarrow \lambda_{B_1} = \frac{27}{5}\lambda$

125. (a)

126. (d) 3 – 1 transition has higher energy so it has higher frequency $\left(\nu = \frac{E}{h}\right)$

127. (d) α-particles cannot be attracted by the nucleus.

128. (c) By using $\nu = RC\left[\frac{1}{n_1^2}-\frac{1}{n_2^2}\right]$

$\Rightarrow \nu = 10^7\times(3\times10^8)\left[\frac{1}{4^2}-\frac{1}{5^2}\right] = 6.75\times10^{13}\ Hz$

129. (c) For M shell ($n = 3$), orbital quantum number $l = 0, 1, 2$.

130. (d) Number of possible emission lines $= \frac{n(n-1)}{2}$

Where $n = 4$; Number $= \frac{4(4-1)}{2} = 6$.

131. (a) Diameter of nucleus is of the order of $10^{-14}\,m$ and radius of first Bohr orbit of hydrogen atom $r = 0.53\times10^{-10}\,m$.

132. (c) The electron is in the second orbit (n=2)

Hence $L = \frac{nh}{2\pi} = \frac{2h}{2\pi} = \frac{6.6\times10^{-34}}{\pi} = 2.11\times10^{-34}\ J\text{ - }sec$

133. (c) $\frac{1}{\lambda} = RZ^2\left(\frac{1}{n_1^2}-\frac{1}{n_2^2}\right) \Rightarrow \lambda \propto \frac{1}{Z^2}$

$\lambda_{Li^{++}} : \lambda_{He^+} : \lambda_H = 4 : 9 : 36$

134. (a) Energy radiated $E = 10.2\,eV = 10.2\times1.6\times10^{-19}\,J$

$\Rightarrow E = \frac{hc}{\lambda} \Rightarrow \lambda = 1.215\times10^{-7}m$

135. (c) For $n = 1,\ E_1 = -\frac{13.6}{(1)^2} = -13.6\ eV$

and for $n = 3$, $E_3 = -\frac{13.6}{(3)^2} = -1.51\ eV$

So required energy

$= E_3 - E_1 = -1.51-(-13.6) = 12.09\ eV$

136. (a) Similar to Q. 115

137. (c) Since in spectral series of hydrogen atom, Lymen series lies lower Balmer series.

138. (d) $mvr_n = \frac{nh}{2\pi} \Rightarrow pr_n = \frac{nh}{2\pi} \Rightarrow \frac{h}{\lambda}\times r_n = \frac{nh}{2\pi}$

$\Rightarrow \lambda = \frac{2\pi r_n}{n}$, for first orbit $n = 1$ so $\lambda = 2\pi r_1$

= circumference of first orbit

139. (d) $E_{n_1\to n_2} = -13.6\left[\frac{1}{n_2^2}-\frac{1}{n_1^2}\right]; n_1 = 2\ \&\ n_2 = 1$

$\Rightarrow E_{II} \to E_I = -13.6\times\frac{3}{4} = -10.2\ eV$

140. (b) $E_n = -\frac{13.6z^2}{n^2}eV \Rightarrow E_1 = -\frac{13.6\times(2)^2}{(1)^2} = -54.4\ eV$

141. (b) $\nu \propto Z^2 \Rightarrow \frac{\nu_{H_2}}{\nu_{He}} = \left(\frac{1}{2}\right)^2 = \frac{1}{4} \Rightarrow \nu_{He} = 4\nu_{H_2} = 4\nu$.

142. (a) $\frac{1}{\lambda} = R\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$

First condition $\frac{1}{\lambda} = R\left[\frac{1}{1^2} - \frac{1}{2^2}\right] \Rightarrow R = \frac{4}{3\lambda}$

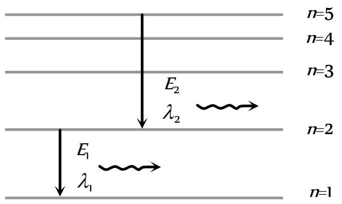
Second condition $\frac{1}{\lambda'} = R\left[\frac{1}{1^2} - \frac{1}{3^2}\right]$

$\Rightarrow \lambda' = \frac{9}{8R} \Rightarrow \lambda' = \frac{9}{8 \times \frac{4}{3\lambda}} = \frac{27\lambda}{32}$

143. (b)

144. (a) $r_n \propto n^2$

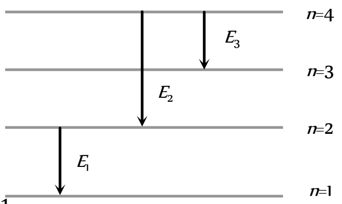
145. (d) $\because E_2 < E_1 \Rightarrow \lambda_2 > \lambda_1$



146. (a) Wave number $\bar{\nu} = \frac{1}{\lambda} = R\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]; n_2 = \infty$ and $n_1 = 1$

$\Rightarrow \bar{\nu} = R = 1.097 \times 10^7 m^{-1} = 109700\, cm^{-1}$

147. (b) $E_1 > E_2 > E_3$



148. (d) $r \propto \frac{1}{Z}$, for double ionized lithium $Z(=3)$ will be maximum. So r will be minimum

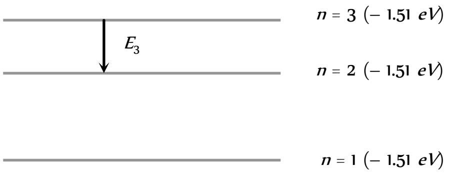
149. (b) $E_n = \frac{13.6}{n^2} \times Z^2$. For first excited state $n = 2$ and for $Li^{++}, z = 3 \Rightarrow E = \frac{13.6}{4} \times 9 = 30.6\, eV$

150. (b)

151. (a) In Lyman series $(\lambda_{\min})_L = \frac{1}{R}$ and $(\lambda_{\min})_B = \frac{4}{R}$

$\Rightarrow (\lambda_{\min})_B = 4 \times (\lambda_{\min})_L = 4 \times 912 = 3648\, Å$

152. (d)



$E_{3\to 2} = -3.4 - (-1.51) = -1.89\, eV \Rightarrow |\, E_{3\to 2}| \approx 1.9\, eV$

153. (a)

154. (a)

155. (c) Radius of n orbit for any hydrogen like atom

$r_n = r_0\left(\frac{n^2}{Z}\right)$ (r_0 = radius of first orbit of H_2 -atom)

If $r_n = r_0 \Rightarrow n = \sqrt{Z}$. For Be, $Z = 4 \Rightarrow n = 2$.

156. (d) $r_n \propto n^4 \Rightarrow A_n \propto n^4 \Rightarrow \frac{A_1}{A_0} = \left(\frac{2}{1}\right)^4 = \frac{16}{1}$

157. (d)

158. (d) $\frac{1}{\lambda} = R\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$. For first wavelength, $n_1 = 2$, $n_2 = 3$

$\Rightarrow \lambda_1 = 6563\, Å$. For second wavelength, $n_1 = 2$, $n_2 = 4$

$\Rightarrow \lambda_2 = 4861\, Å$

159. (c) K.E. = – (Total energy) = – (–13.6 eV) = + 13.6 eV

160. (a) In Lyman series $\lambda_{\max} = \frac{4}{3R}$

In Balmer series $\lambda_{\max} = \frac{36}{5R}$. So required ratio $= \frac{5}{27}$

161. (c)

162. (b) $E = 13.6\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$. For highest energy in Balmer series

$n_1 = 2$ and $n_2 = \infty \Rightarrow E = 13.6\left[\frac{1}{(2)^2} - \frac{1}{(\infty)^2}\right] = 3.4\, eV$

163. (a)

164. (c) $T \propto n^3$

165. (b) $\frac{1}{\lambda} = R\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right] = R\left[\frac{1}{(2)^2} - \frac{1}{(4)^2}\right] \Rightarrow \lambda = \frac{16}{3R}$

166. (a) $E_n \propto Z^2 \Rightarrow \frac{(E_n)_{He}}{(E_n)_H} = \frac{Z_{He}^2}{Z_H^2} = 4 \Rightarrow (E_n)_{He} = 4 \times (E_n)_H$

167. (b) By using $\frac{1}{\lambda} = R\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$

168. (a) $\frac{1}{\lambda_{\max}} = R\left[\frac{1}{(1)^2} - \frac{1}{(2)^2}\right] \Rightarrow \lambda_{\max} = \frac{4}{3R} \approx 1213\, Å$

and $\frac{1}{\lambda_{\min}} = R\left[\frac{1}{(1)^2} - \frac{1}{\infty}\right] \Rightarrow \lambda_{\min} = \frac{1}{R} \approx 910\, Å$

169. (b) P.E. $= 2 \times$ Total energy $= 2 \times (-13.6) = -27.2$ eV

170. (c) Emitted energy $\Delta E = \frac{hc}{\lambda}\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)$.

171. (c) $U = 2E$, $K = -E$ and $E = -\frac{13.6}{n^2} = eV$.

172. (a)

173. (d)

174. (c) $r \propto n^2$

Nucleus, Nuclear Reaction

1. (b)

2. (c) Neutrons are neutral particles.

3. (c) James Chadwick discovered the neutron.

4. (d) In hydrogen, atomic number and mass number are equal.

5. (d) $E = mc^2 = 1 \times (3 \times 10^8)^2 = 9 \times 10^{16} \approx 10^{17}\ J$

6. (d) $B.E. = \Delta m\ amu = \Delta m \times 931\ MeV.$

7. (d) Mass defect $\Delta m = \frac{2.23}{931} = 0.0024.$

8. (b) Positron is the antiparticle of electron.

9. (b)

10. (c)

11. (a) B.E.$= \Delta mc = [2(1.0087 + 1.0073) - 4.0015] = 28.4\ MeV$

12. (b) $\frac{\text{Binding energy}}{\text{Nucleon}} = \frac{0.0303 \times 931}{4} \approx 7$

13. (d) Energy / day $= 200 \times 10^6 \times 24 \times 3600$

$= 2 \times 2.4 \times 3.6 \times 10^{12} = 1728 \times 10^{10}\ J$

14. (c) $E = \Delta mc^2 = 10^{-6} \times (3 \times 10^8)^2 = 9 \times 10^{10}\ J$

15. (c)

16. (c) Mass of ${}_1H^2 = 2.01478\ a.m.u.$

Mass of ${}_2He^4 = 4.00388\ a.m.u.$

Mass of two deuterium $= 2 \times 2.01478 = 4.02956$

Energy equivalent to $2\,{}_1H^2$

$= 4.02956 \times 1.112\ MeV = 4.48\ MeV$

Energy equivalent to ${}_2H^4$

$= 4.00388 \times 7.047\ MeV = 28.21\ MeV$

Energy released $= 28.21 - 4.48 = 23.73\ MeV = 24\ MeV$

17. (c) Energy released while forming a nucleus is known as binding energy (by definition).

18. (c) Nuclear force is stronger than coulomb force.

19. (d)

20. (c)

21. (b) $Q = 4\ (x_2 - x_1)$

22. (d)

23. (a) Rest energy of an electron $= m_e c^2$

Here $m_e = 9.1 \times 10^{-31} kg$ and c = velocity of light

$\therefore$ Rest energy $= 9.1 \times 10^{-31} \times (3 \times 10^8)^2\ joule$

$= \frac{9.1 \times 10^{-31} \times (3 \times 10^8)^2}{1.6 \times 10^{-19}} eV = 510\ keV$

24. (b) ${}_Z X^A = {}_{88}Ra^{226}$

Number of protons $= Z = 88$

Number of neutrons $= A - Z = 226 - 88 = 138.$

25. (c) Out side the Nucleus, neutron is unstable (life $\approx$ 932 *sec*).

26. (b) The order of magnitude of mass and volume of uranium nucleus will be

$m \simeq A(1.67 \times 10^{-27}\ kg)$ (A is atomic number)

$V = \frac{4}{3}\pi r^3 \simeq \frac{4}{3}\pi\,[(1.25 \times 10^{-15} m)A^{1/3}]^3$

$\simeq (8.2 \times 10^{-45} m^3)A$

Hence, $\rho = \frac{m}{V} = \frac{A(1.67 \times 10^{-27} kg)}{(8.2 \times 10^{-45} m^3)A}$

$\simeq 2.0 \times 10^{17} kg / m^3.$

27. (c) We have $r \propto A^{1/3} \Rightarrow \frac{r_2}{r_1} = \left(\frac{A_2}{A_1}\right)^{1/3} = \left(\frac{206}{4}\right)^{1/3}$

$\therefore r_2 = 3\left(\frac{206}{4}\right)^{1/3} = 11.6\ Fermi.$

28. (c) Nucleus does not contains electron.

29. (a) Let the percentage of B^{10} atoms be x, then Average atomic weight

$= \frac{10x + 11(100 - x)}{100} = 10.81 \Rightarrow x = 19 \quad \therefore \frac{N_{B^{10}}}{N_{B^{11}}} = \frac{19}{81}$

30. (a)

31. (b)

32. (a) Nuclear force is charge independent, it also acts between two neutrons.

33. (d) $p \to \pi^+ + n,\ \ n \to p + \pi^-$ and $n \to n' + \pi^0$

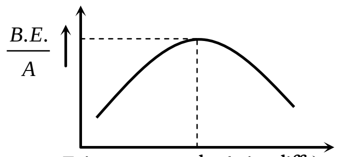
34. (c) Helium nucleus $\to {}_2He^4$.

Number of protons $= Z = 2$

Number of Neutrons $= A - Z = 2.$

35. (c)

36. (b) Binding energy per nucleon increases with atomic number and is maximum for iron. After that it decrease.



37. (a) For isotopes Z is same and A is different. Therefore the number of neutrons $A - Z$ will also be different.

38. (a) This is due to mass defect because a part of mass is used in keeping the neutrons and protons bound as $\alpha -$ particle.

39. (d) B.E. of $Li^7 = 39.20\ MeV$ and $He^4 = 28.24\ MeV$

Hence binding energy of $2He^4 = 56.48\ MeV$

Energy of reaction $= 56.48 - 39.20 = 17.28\ MeV.$

40. (c) $r \propto (A)^{1/3}$

41. (b) $r \propto A^{1/3}$

42. (a) $E = mc^2 = (1 \times 10^{-3})(3 \times 10^8)^2 = 9 \times 10^{13}\ J.$

43. (c) $\Delta E = 8.5 \times 234 - 7.6 \times 236 = 195.4\ MeV = 200\ MeV.$

44. (a) $N = M - Z =$ Total no. of nucleons – no. of protons.

45. (c)

46. (c) Both coulomb and nuclear force act inside the nucleus.

47. (d) For stability in case of lighter nuclei $\frac{N}{Z} = 1$ and for heavier nuclei $\frac{N}{Z} > 1.$

48. (b) Nuclear forces are charge independent.

49. (a) Actual mass of the nucleus is always less than total mass of nucleons so

$M < (NM_n + Zm_p)$.

50. (b) Mass of H_2 nucleus =mass of proton =1 *amu* energy equivalent to 1 *amu* is 931 *MeV* so correct option is *(b).*

51. (d) $R = R_0 A^{1/3} \Rightarrow R \propto A^{1/3}$.

52. (b)

53. (d) Number of neutrons = $A - Z = 23 - 11 = 12$.

54. (c) For ${}_6C^{12}$, $p = 6, e = 6, n = 6$

For ${}_6C^{14}$, $p = 6, e = 6, n = 8$

55. (a)

56. (a) The mass of nucleus formed is always less than the sum of the masses of the constituent protons and neutrons *i.e.* $m < (A - Z)m_n + zm_p$.

57. (d) $E = \Delta m.c^2 \Rightarrow E = \frac{0.3}{1000} \times (3 \times 10^8)^2 = 2.7 \times 10^{13} J$

$= \frac{2.7 \times 10^{13}}{3.6 \times 10^6} = 7.5 \times 10^6 kWh$.

58. (a, d)

59. (c) ${}_5B^{10} + {}_0n^1 \rightarrow {}_3Li^7 + {}_2He^4$.

60. (a)

61. (c) ${}_{92}U^{235}$ is normally fissionable.

62. (b)

63. (a)

64. (a) In atom bomb nuclear fission takes place with huge temperature.

65. (d) The given equation is ${}_2He^4 +_z X^A \rightarrow_{z+2} Y^{A+3} + A$

Applying charge and mass conservation

$4 + A = A + 3 + x \Rightarrow x = 1 \Rightarrow 2 + z = z + 2 + n \Rightarrow n = 0$

Hence *A* is a neutron.

66. (c) Energy of stars is due to the fusion of light hydrogen nuclei into *He*. In this process much energy is released.

67. (a) ${}_1H^2 +_1 H^2 \rightarrow_2 He^4 + 24\ MeV$.

68. (b) Energy $\propto c^2$; $\therefore$ Decrease in energy $\propto \frac{4}{9}$.

69. (b) Fusion reaction requires a very high temperature =(10^7 *K*).

70. (d) ${}_4Be^9 + {}_2He^4 \rightarrow {}_6C^{12} + {}_0n^1$.

71. (b)

72. (d)

73. (b, c)

74. (d)

75. (c) Cadmium rods absorb the neutrons so they are used to control the chain reaction process.

76. (d)

77. (d) No energy and mass enters or goes out of the system of the reaction and no external force is assumed to act.

78. (c)

79. (b)

80. (b) Energy of γ-ray photon = $0.5 + 0.5 + 0.78 = 1.78\ MeV$.

81. (c)

82. (d)

83. (c) When fast moving neutrons pass through a moderator, they collide with the molecules of the moderator. As a result of this the neutrons are in thermal equilibrium with the surrounding molecules of moderator. These neutrons are called thermal neutrons.

84. (b) $E_b + E_c > E_a$

85. (d) Because sound waves require medium to travel through and there is no medium (air) on moon's surface.

86. (b) Heavy water is used as moderators in nuclear reactions to slow down the neutrons.

87. (a) $m = \frac{E}{c^2} = \frac{931 \times 1.6 \times 10^{-13}}{(3 \times 10^8)^2} = 1.66 \times 10^{-27} kg$.

88. (d) $E = \Delta mc^2, \Delta m = \frac{0.1}{100} = 10^{-3} kg$

$\therefore E = 10^{-3} \times (3 \times 10^8)^2 = 10^{-3} \times 9 \times 10^{16} = 9 \times 10^{13} J$.

89. (d) Energy released by γ – rays for pair production must be greater than 1.02 *MeV.*

90. (a) ${}_8O^{18} + {}_1H^1 \rightarrow {}_9F^{18} + {}_on^1$

91. (c) Power $= 1000\ kW = 10^6 J/s$

Rate of nuclear fission $= \frac{10^6}{200 \times 1.6 \times 10^{-13}}$ = 3.125×10^{16}.

92. (b) A = 238 – 4 = 234 and Z = 92 – 2 = 90.

93. (a) $P = n\left(\frac{E}{t}\right) \Rightarrow 1000 = \frac{n \times 200 \times 10^6 \times 1.6 \times 10^{-19}}{t}$

$\Rightarrow \frac{n}{t} = 3.125 \times 10^{13}$.

94. (c) Due to the production of neutrons, a chain of nuclear fission is established which continues until the whole of the source substance is consumed.

95. (a) ${}_{92}U^{235} + {}_0n^1 \rightarrow {}_{38}Sr^{90} + {}_{54}Xe^{143} + 3{}_0n^1$

96. (b) ${}_1H^2 + {}_1H^2 \rightarrow {}_2He^4 + Q$.

97. (c) Fast neutrons can escape from the reaction. So as to proceed the chain reaction. Slow neutrons are best.

98. (d) ${}_1H^2 +_1 H^2 \rightarrow_1 H^3 +_1 H^1$

99. (d)

100. (b) $\Delta m = 1 - 0.993 = 0.007\ gm$

$\therefore E = (\Delta m)c^2 = (0.007 \times 10^{-3})(3 \times 10^8)^2 = 63 \times 10^{10} J$.

101. (c) ${}_{85}X^{297} \rightarrow {}_{77}Y^{281} + 4\left({}_2He^4\right)$

102. (b) x+1= 24 + 4 $\Rightarrow$ x = 27.

103. (a)

104. (d) ${}_6C^{11} \rightarrow_5 B^{11} + \beta^+ + \gamma$ because $\beta^+ =_1 e^0$

105. (c)

106. (b) $\frac{\text{Energy}}{\text{Fission}} = 200\ MeV = 200 \times 10^6 \times 1.6 \times 10^{-19} J$

Fission rate $=\dfrac{5}{200\ MeV}=1.56\times10^{11}$ fission/sec.

107. (a)

108. (b) Energy is released in the sun due to fusion.

109. (d)

110. (c) In nuclear fission, neutrons are released.

111. (c) ${}_1H^1+{}_1H^1+{}_1H^2\rightarrow{}_2He^4+{}_{+1}e^0$ + energy.

112. (c)

113. (b) ${}_0n^1={}_1p^1+{}_{-1}e^0+\bar{\nu}$

Antineutrino is required for conservation of spin.

114. (b)

115. (d) Fusion is the main process of energy production in the sun.

116. (a)

117. (b) Mass of proton = mass of antiproton

$=1.67\times10^{-27}\,kg=1amu$

Energy equivalent to $1\ amu=931\ MeV$

So energy equivalent to 2 *amu* $=2\times931\ MeV$

$=1862\times10^{6}\times1.6\times10^{-19}=2.97\times10^{-10}\,J=3\times10^{-10}\,J$.

118. (a) In fusion reaction, two lighter nuclei combines.

119. (c)

120. (b) Hydrogen bomb is based on nuclear fusion.

121. (d) ${}_{92}U^{235}+{}_0n^1\rightarrow{}_{92}U^{236}$ and

${}_{92}U^{236}\rightarrow{}_{56}Ba^{144}+{}_{36}Kr^{89}+3{}_0n^1+Q$.

122. (d) Fusion reaction of deuterium is

${}_1H^2+{}_1H^2\rightarrow{}_2He^3+{}_0n^1+3.27\ MeV$

So $E=\dfrac{6.02\times10^{23}\times10^{3}\times3.27\times1.6\times10^{-13}}{2\times2}=7.8\times10^{13}\,J$

$=8\times10^{13}\,J$.

123. (a)

124. (a)

125. (c)

126. (c)

127. (b)

128. (d) Energy released in the fission of one nucleus = 200 *MeV*

$=200\times10^{6}\times1.6\times10^{-19}\,J=3.2\times10^{-11}\,J$

$P=16KW=16\times10^{3}\,Watt$

Now, number of nuclei required per *second*

$n=\dfrac{P}{E}=\dfrac{16\times10^{3}}{3.2\times10^{-11}}=5\times10^{14}$.

129. (c)

130. (a) Number of fissions per second

$=\dfrac{\text{Power output}}{\text{Energy released per fission}}$

$=\dfrac{3.2\times10^{6}}{200\times10^{6}\times1.6\times10^{-19}}=1\times10^{17}$

$\Rightarrow$ Number of fission per minute $=60\times10^{17}=6\times10^{18}$

131. (c)

132. (a) $X(n,\alpha)\,{}^7_3Li\Rightarrow{}_ZX^A+{}_0n^1\rightarrow3Li^7+{}_2He^4$

$Z=3+2=5$ and $A=7+4-1=10$

$\therefore{}_5X^{10}={}_5B^{10}$

133. (a)

134. (b) Mass of electron = mass of positron = $9.1\times10^{-31}\,kg$

Energy released $E=(2m).c^2$

$=2\times9.1\times10^{-31}\times(3\times10^{8})^2=1.6\times10^{-13}\,J$.

135. (b) ${}_1H^2+{}_1H^2\rightarrow{}_2He^4$ + energy

Binding energy of a $({}_1H^2)$ deuterium nuclei

$=2\times1.1=2.2\ MeV$

Total binding energy of two deuterium nuclei

$=2.2\times2=4.4\ MeV$

Binding energy of a $({}_2He^4)$ nuclei $=4\times7=28\ MeV$

So, energy released in fusion $=28-4.4=23.6\ MeV$

136. (c) Mass of a uranium nucleus

$=92\times1.6725\times10^{-27}+143\times1.6747\times10^{-27}$

$=393.35\times10^{-27}\,kg$

Number of nuclei in the given mass

$=\dfrac{1}{393.35\times10^{-27}}=2.542\times10^{24}$

Energy released $=200\times2.542\times10^{24}\,MeV$

$=5.08\times10^{26}\,MeV=8.135\times10^{13}\,J=8.2\times10^{13}\,J$

137. (a)

138. (c)

139. (b) In a material medium, when a positron meets an electron both the particles annihilate leading to the emission of two γ ray photons. This process forms the basis of an important diagnostic procedure called PET.

140. (a) Total mass of reactants

$=(2.0141)\times2=4.0282\ amu$

Total mass of products $=4.0024\ amu$

Mass defect $=4.0282\ amu-4.0024\ amu$

$=0.0258\ amu$

$\therefore$ Energy released $E=931\times0.0258=24\ MeV$

141. (b) ${}_7N^{14}+{}_2He^4\rightarrow{}_8O^{17}+{}_1H^1$

142. (b)

143. (b)

144. (d) ${}_8O^{16}+{}_1H^2\rightarrow{}_7N^{14}+{}_2He^4$

145. (d)

146. (a)

147. (b) Nuclear fusion takes place in stars which results in joining of nuclei accompanied by release of tremendous amount of energy.

148. (b)

149. (d) *B.E.* per nucleon $\propto$ stability.

150. (a) Nuclei of different elements having the same mass number are called isotones *e.g.,* ${}_4Be^9$ and ${}_5B^{10}$

151. (c)

152. (b)

153. (d) Packing fraction $= \dfrac{M-A}{A}$

154. (c) $B = [Z M_p + N M_n - M(N, Z)]c^2$

$$\Rightarrow M(M, Z) = Z M_p + N M_n - B/c^2$$

155. (c)

156. (a) In nuclear reacter, nuclear fission can be carried out through a sustained and a controlled chain reaction.

157. (b) ${}_6C^{12} + {}_0n^1 \rightarrow {}_7N^{13} + {}_{-1}\beta^o$

158. (a) ${}_0n^1 + {}_{92}U^{235} \rightarrow {}_{56}Ba^{144} + {}_{36}Kr^{89} + 3\ {}_0n^1$

159. (c) The energy released in sun and hydrogen bomb are due to nuclear fusion.

160. (c)

161. (a)

162. (a) ${}_{84}Po^{210} \rightarrow {}_{82}X^{206} + {}_2He^4$

Using conservation of linear moments

$$206v' + 4v = 0 \Rightarrow v' = -\frac{4v}{(206)} \Rightarrow |v'| = \frac{4v}{206}$$

163. (b) Power $P = \dfrac{\text{Energy}}{\text{time}} = \dfrac{mc^2}{t}$, $= 1 \times 10^{-6} \times (3 \times 10^8)^2$

$= 9 \times 10^{10}\ W = 9 \times 10^7\ kW.$

164. (b)

165. (c)

166. (b) The elements high on the *B.E.* versus mass number plot are very tightly bound and hence, are stable. And the elements those are lower on this plot, are less tightly bound and hence, are unstable.

Since helium nucleus shows a peak on this plot so, it is very stable.

167. (d)

168. (d) $E = \Delta mc^2 = 1 \times (3 \times 10^8)^2 = 9 \times 10^{10}\ J$

$$\Rightarrow E = \frac{9 \times 10^{16}}{1.6 \times 10^{-19}} = 5.625 \times 10^{35}\ eV = 5.625 \times 10^{29}\ MeV.$$

169. (a) $E = \Delta mc^2 = 0.5 \times 10^{-3} \times (3 \times 10^8)^2 = 4.5 \times 10^{13}\ j$

$$\Rightarrow E = \frac{4.5 \times 10^{13}}{3.6 \times 10^6} = 1.25 \times 10^7\ kWH.$$

170. (b) ${}_0n^1 + {}_{92}U^{235} \rightarrow {}_{36}Kr^{94} + {}_{56}Ba^{139} + 3\ {}_0n^1$

171. (b)

172. (a) Number of protons = 2 + 2 + 6 + 2 + 6 = 18

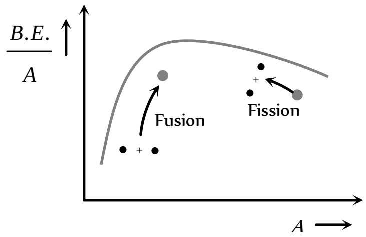
Number of neutrons = 40 – 18 = 22.

173. (c) Neutrons are unstable and having mean life time of 32 *sec,* decaying by emitting an electron and antineutrino to become proton.

174. (b) During fusion binding energy of daughter nucleus is always greater than the total energy of the parent nuclei so energy released = *c* – (*a* + *b*) = *c* – *a* – *b*

175. (a) These nuclei having different *Z* and *A* but equal (*A* – *Z*) are called isotones.

176. (b)



177. (a)

178. (c) $r \propto A^{1/3} \Rightarrow \dfrac{r_1}{r_2} = \left(\dfrac{A_1}{A_2}\right)^{1/3}$

$$\Rightarrow \frac{3.6}{r_2} = \left(\frac{27}{125}\right)^{1/3} = \frac{3}{5} \Rightarrow r_2 = 6\ Fermi$$

179. (b)

Radioactivity

1. (a)

2. (a) By formula $N = N_0\left(\dfrac{1}{2}\right)^{t/T}$ or $10^4 = 8 \times 10^4\left(\dfrac{1}{2}\right)^{t/3}$

or $\left(\dfrac{1}{8}\right) = \left(\dfrac{1}{2}\right)^{t/3}$ or $\left(\dfrac{1}{2}\right)^3 = \left(\dfrac{1}{2}\right)^{t/3} \Rightarrow 3 = \dfrac{t}{3}$

Hence *t* = 9 *years*.

3. (d) Fraction $= \dfrac{N}{N_0} = \left(\dfrac{1}{2}\right)^{\frac{6400}{1600}} = \left(\dfrac{1}{2}\right)^4 = \dfrac{1}{16}$

4. (c) Negative $\beta -$ decay is expressed by the equation

$$n = p^+ + e^- + v^-$$

5. (a) No radioactive substance emit both α and β particles simultaneously. Some substances emit $\alpha -$ particles and some other emits $\beta -$ particles. $\gamma -$ rays are emitted along with both α and $\beta -$ particles.

6. (c) γ-rays are highly penetrating.

7. (c) Average life $\frac{1}{\lambda}=\frac{1600}{0.693}=2308\approx 2319$ years.

8. (d) Fraction of atoms remains after five half lives

$$\frac{N}{N_0}=\left(\frac{1}{2}\right)^{t/T}=\left(\frac{1}{2}\right)^{5T/T}=\frac{1}{32}$$

$\Rightarrow$ Percentage atom remains $=\frac{1}{32}\times 100=3.125\%$

9. (c) β-rays emitted from nucleus and they carry negative charge.

10. (c)

11. (b) ${}_Z X^A \xrightarrow{{}_{-1}\beta^0} {}_{Z+1}Y^A \xrightarrow{2He^4(\alpha)}$

$${}_{Z-1}K^{A-4} \xrightarrow{{}_0\gamma^0} {}_{Z-1}K^{A-4}$$

12. (c) $N_t=N_0\left(\frac{1}{2}\right)^{t/T}=50000\left(\frac{1}{2}\right)^{10/5}=12500$

13. (c) ${}_Z X^A \xrightarrow{{}_{-1}\beta^0} {}_{Z+1}X^A$

14. (c) $N=N_0\left(\frac{1}{2}\right)^{t/T}\Rightarrow\frac{N_0}{64}=N_0\left(\frac{1}{2}\right)^{30/T}\Rightarrow T=\frac{30}{6}=5\text{ sec}$

15. (a)

16. (c)

17. (a) Average life $T=\frac{\text{Sum of all lives of all the atom}}{\text{Total number of atoms}}=\frac{1}{\lambda}$

$\Rightarrow T\lambda=1$

18. (c) Fraction remains after n half lives $\frac{N}{N_0}=\left(\frac{1}{2}\right)^n=\left(\frac{1}{2}\right)^{t/T}$

$$\therefore\ \frac{N}{N_0}=\left(\frac{1}{2}\right)^{\frac{T/2}{T}}=\left(\frac{1}{2}\right)^{1/2}=\frac{1}{\sqrt{2}}$$

19. (b)

20. (a) Penetration power of γ is 100 times of β, while that of β is 100 times of α.

21. (a) $\frac{N_0}{32}=N_0\left(\frac{1}{2}\right)^{60/T}\Rightarrow 5=\frac{60}{T}\Rightarrow T=12$ days

22. (c) By using $N=N_0\left(\frac{1}{2}\right)^{t/T}$; where $N=\left(1-\frac{7}{8}\right)N_0=\frac{1}{8}N_0$

So $\frac{1}{8}N_0=N_0\left(\frac{1}{2}\right)^{t/T}\Rightarrow\left(\frac{1}{2}\right)^3=\left(\frac{1}{2}\right)^{t/5}\Rightarrow t=15$ *days.*

23. (a) ${}_{72}A^{180}\xrightarrow{\alpha}{}_{70}A_1^{176}\xrightarrow{\beta}{}_{71}A_2^{176}\xrightarrow{\alpha}{}_{69}A_3^{172}$

$$\xrightarrow{\gamma}{}_{69}A_4^{172}$$

24. (d)

25. (d) Half life of a substance doesn't depends upon Amount, temperature and pressure. It depends upon the nature of the substance.

26. (d) $T=\frac{0.6931\times 1}{\lambda}=\frac{0.6931\times 1}{4.28\times 10^{-4}}\,year=1620\,years$

27. (c) In fusion two lighter nuclei combines, it is not the radioactive decay.

28. (b) $n_\alpha=\frac{A-A'}{4}=\frac{232-208}{4}=6$

and $n_\beta=(2n_\alpha-Z+Z')=(2\times 6-90+82)=4$

29. (a) Remaining amount

$$=16\times\left(\frac{1}{2}\right)^{32/2}=16\times\left(\frac{1}{2}\right)^{16}=\left(\frac{1}{2}\right)^{12}<1\,mg$$

30. (c) $\frac{N}{N_0}=\left(\frac{1}{2}\right)^{15/5}=\frac{1}{8}\Rightarrow$ Decayed fraction $=1-\frac{1}{8}=\frac{7}{8}$

31. (c)

32. (c) By using $n_\alpha=\frac{A-A'}{4}$ and $n_\beta=2n_\alpha-Z+Z'$

$\Rightarrow A'=A-4n_\alpha=236-4\times 3=224$

and $Z'=(n_\beta-2n_\alpha+Z)=(1-2\times 3+88)=83$

33. (d) Uncertain, because it is infinite. No radioactive element can be disintegrated fully.

34. (c) $\frac{N}{N_0}=\left(\frac{1}{2}\right)^{t/140}\Rightarrow\frac{1}{16}=\left(\frac{1}{2}\right)^{t/140}$.

$\Rightarrow\frac{t}{140}=4\Rightarrow t=560\,days$

35. (c) $\frac{C_{14}}{C_{12}}=\frac{1}{4}=\left(\frac{1}{2}\right)^{t/5700}\Rightarrow\frac{t}{5700}=2\Rightarrow t=11400\,years$

36. (b) Ionising property depends upon the charge and mass.

37. (b) $R=\frac{dN}{dt}\propto N\Rightarrow\frac{R_2}{R_1}=\frac{N_2}{N_1}$

But $\frac{N_2}{N_1}=\left(\frac{1}{2}\right)^{t_{1/2}}\Rightarrow\frac{25}{200}=\frac{1}{8}=\left(\frac{1}{2}\right)^3\Rightarrow\frac{t}{t_{1/2}}=3$

$\therefore t_{1/2}=\frac{t}{3}=\frac{3}{3}=1\,hour=60$ *minutes*

38. (d) $t_{1/2}=\frac{0.6931}{0.01}=69.31$ *seconds.*

39. (d) Because radioactivity is a spontaneous phenomenon.

40. (d) Undecayed isotope $=1-\frac{7}{8}=\frac{1}{8}$

$\therefore\frac{N}{N_0}=\left(\frac{1}{2}\right)^{t/T}\Rightarrow\left(\frac{1}{8}\right)=\left(\frac{1}{2}\right)^{t/15}\Rightarrow\frac{t}{15}=3$

or $t=45$ *hours*

41. (a) Mean life $=\frac{\text{Half life}}{0.6931}=\frac{10}{0.6931}=14.4\,hours$

42. (b) 20 *gm* substance reduces to 10 *gm* (*i.e.* becomes half in 4 min.

So $T_{1/2} = 4$ min . Again $M = M_0\left(\frac{1}{2}\right)^{t/T_{1/2}}$

$\Rightarrow 10 = 80\left(\frac{1}{2}\right)^{t/4} \Rightarrow \frac{1}{8} = \left(\frac{1}{2}\right)^3 = \left(\frac{1}{2}\right)^{t/4} \Rightarrow t = 12$ *min.*

43. (c) $N = N_0\left(\frac{1}{2}\right)^{t/T_{1/2}} \Rightarrow 1 = 16\left(\frac{1}{2}\right)^{\frac{2}{T_{1/2}}} \Rightarrow T_{1/2} = \frac{1}{2}\,hour$

44. (d)

45. (b) $\beta-$ decay from nuclei based on this process only.

46. (b) $A = A_0\left(\frac{1}{2}\right)^{t/T_{1/2}} \Rightarrow 5 = A_0\left(\frac{1}{2}\right)^{\frac{2\times60}{30}} = \frac{A_0}{16} \Rightarrow A_0 = 80\,sec^{-1}$

47. (d) $n_\alpha = \frac{A-A'}{4} = \frac{200-168}{4} = 8$

$n_\beta = 2n_a - Z + Z' = 2\times8 - 90 + 80 = 6$

48. (d) Similar to Q. 47

49. (b) $N = N_0\left(\frac{1}{2}\right)^{\frac{t}{T_{1/2}}}$. Hence fraction of atoms decayed

$= 1 - \frac{N}{N_0} = 1 - \left(\frac{1}{2}\right)^{\frac{t}{T_{1/2}}} = 1 - \left(\frac{1}{2}\right)^{\frac{3\times60}{60}} = \frac{7}{8}$

In percentage it is $\frac{7}{8}\times100 = 87.5\%$

50. (a) *C*-14 is carbon dating substance.

51. (b) $\frac{N}{N_0} = \left(\frac{1}{2}\right)^{t/T} \Rightarrow \left(\frac{1}{16}\right) = \left(\frac{1}{2}\right)^{2/T} \Rightarrow \left(\frac{1}{2}\right)^4 = \left(\frac{1}{2}\right)^{2/T}$

$\Rightarrow T = 0.5\,hour = 30$ *minutes.*

52. (c) $\frac{dN}{dt} = -\lambda N \Rightarrow n = -\lambda N$ (Given $\frac{dN}{dt} = n$)

$\therefore \lambda = -\frac{n}{N}$ $\therefore$ Half life $= \frac{0.693}{\lambda} = \frac{0.693}{\lambda} = \frac{0.693\,N}{n}$ sec

53. (a) ${}_{92}X^{235} \xrightarrow{\alpha} {}_{90}X^{231} \xrightarrow{{}_{-1}e^0} {}_{91}Y^{231}$

54. (d) ${}_7N^{13} \rightarrow {}_6C^{13} + {}_{+1}e^0$

55. (c) $A = A_0\left(\frac{1}{2}\right)^{\frac{t}{T_{1/2}}} \Rightarrow 100 = 1600\left(\frac{1}{2}\right)^{\frac{8}{T_{1/2}}} \Rightarrow T_{1/2} = 2sec$

Again at $t = 6$ *sec*, $A = 1600\left(\frac{1}{2}\right)^{\frac{6}{2}} = 200$ *counts/sec*

56. (d) ${}_{92}U^{238} \rightarrow {}_{92}Th^{234} + {}_2He^4$

57. (b)

58. (d)

59. (d)

60. (b) By using $N = N_0 e^{-\lambda t} \Rightarrow \frac{N_0}{2} = N_0 e^{-\lambda T_{1/2}} \Rightarrow 2 = e^{\lambda T_{1/2}}$

By taking log both the side

$\log_e 2 = \lambda T_{1/2} \Rightarrow \lambda T_{1/2} = 0.693$

61. (a) Number of half lives in 20 min $= n = \frac{20}{5} = 4$

Fraction of material remains after four half lives $= \frac{1}{16}$

Hence fraction that decays $= 1 - \frac{1}{16} = \frac{15}{16} = 93.75\%$

62. (d) In the given case, 12 days = 3 half lives Number of atoms left after 3 half lives.

$= 6.4\times10^{10}\times\frac{1}{2^3} = 0.8\times10^{10}$

63. (a) Decay constant remains unchanged in a chemical reaction.

64. (d) $n_\alpha = \frac{A-A'}{4} = \frac{238-206}{4} = 8$

65. (b) ${}_ZX^A \xrightarrow{\alpha} {}_{Z-2}Y^{A-4} \xrightarrow{2\beta} {}_ZX^{A-4}$

66. (a) Both the β-rays and the cathode rays are made up of electrons. γ-rays are EM waves, α-particles are doubly ionized helium atoms and protons and neutrons have approximately the same mass.

67. (b) ${}^{22}_{10}Ne \rightarrow {}^4_2He + {}^4_2He + {}^{14}_6X$; hence *X* is carbon.

68. (c) For 80 minutes, number of half lives of sample $A = n_A = \frac{80}{20} = 4$ and number of half lives of sample $B = n_B = \frac{80}{40} = 2$. Also by using $N = N_0\left(\frac{1}{2}\right)^n$

$\Rightarrow N \propto \frac{1}{2^n} \Rightarrow \frac{N_A}{N_B} = \frac{2^{n_B}}{2^{n_A}} = \frac{2^2}{2^4} = \frac{1}{4}$

69. (d) ${}_nX^m \xrightarrow{\alpha} {}_{n-2}X^{m-4} \xrightarrow{-\beta} {}_{n-1}X^{m-4}$

70. (c) Half-life $T_{1/2} = \frac{0.693}{\lambda} = \frac{0.693}{1.07\times10^{-4}} = 6476\,years$

71. (d) Number of nuclei decreases exponentially

$N = N_0 e^{-\lambda t}$ and Rate of decay $\left(-\frac{dN}{dt}\right) = \lambda N$

Therefore, decay process losts up to $t = \infty$.

Therefore, a given nucleus may decay at any time after $t = 0$.

72. (a) To becomes $\frac{1}{4}$ *th*, it requires time of two half lives

i.e., $t = 2(T_{1/2}) = 2\times5800 = 2\times58$ *centuries*

73. (a) Carbon dating

74. (d) ${}_7X^{15} + {}_2He^4 \rightarrow {}_1P^1 + {}_8Y^{18}$

75. (c)

76. (d) ${}_{92}U^{238} \xrightarrow{\alpha} {}_{90}X^{234} \xrightarrow{\beta^-} {}_{91}Y^{234}$

77. (d)

78. (c) After three half lives (*i.e.*, 30 days) it remains $\left(\frac{1}{2}\right)^3 = \frac{1}{8}$, so it will remain $\frac{1}{10}th$, approximately in 33 days.

79. (a) $_{92}U^{238} \xrightarrow{\alpha} {_{90}Th^{234}} \xrightarrow{\beta} {_{91}Pa^{234}} \xrightarrow{E(_{-1}\beta^o)} {_{92}U^{234}}$

80. (d) By using $A = A_0\left(\frac{1}{2}\right)^{\frac{t}{T_{1/2}}} \Rightarrow \frac{A}{A_0} = \left(\frac{1}{2}\right)^{9/3} = \frac{1}{8}$

81. (d) $_{48}Cd^{115} \xrightarrow{2(_{-1}\beta^o)} {_{50}Sn^{115}}$

82. (b) In two half lives, the activity becomes one fourth.

83. (a) α decay decreases the mass number by 4 and atomic number by 2, β decay increases the atomic number by 1. Here atomic number of C is same as that of A.

84. (a) Number of half lives in two days four substance 1 and 2 respectively are $n_1 = \frac{2 \times 24}{12} = 4$ and $n_2 = \frac{2 \times 24}{1.6} = 3$

By using $N = N_0\left(\frac{1}{2}\right)^n \Rightarrow \frac{N_1}{N_2} = \frac{(N_0)_1}{(N_0)_2} \times \frac{\left(\frac{1}{2}\right)^{n_1}}{\left(\frac{1}{2}\right)^{n_2}}$

$= \frac{2}{1} \times \frac{\left(\frac{1}{2}\right)^4}{\left(\frac{1}{2}\right)^3} = \frac{1}{1}$

85. (b)

86. (c) $\lambda = \frac{0.693}{T_{1/2}} = \frac{0.693}{2.3} = 0.3$

87. (d) Number of $\alpha -$ particles emitted $= \frac{238-222}{4} = 4$

This decreases atomic number to $90 - 4 \times 2 = 82$

Since atomic number of $_{83}Y^{222}$ is 83, this is possible if one $\beta -$ particle is emitted.

88. (d) Number of half lives in 150 years $n = \frac{150}{75} = 2$

Fraction of the atom of decayed $= 1 - \left(\frac{1}{2}\right)^n$

$= 1 - \left(\frac{1}{2}\right)^2 = \frac{3}{4} = 0.75 \Rightarrow$ Percentage decay = 75%

89. (b) $A = A_0 e^{-\lambda t} \Rightarrow 975 = 9750\, e^{-\lambda \times 5} \Rightarrow e^{5\lambda} = 10$

$\Rightarrow 5\lambda = \log_e 10 = 2.3026 \log_{10} 10 = 2.3026$

$\Rightarrow \lambda = 0.461$

90. (a) Mass number decreases by $8 \times 4 = 32$

Atomic number decreases by $8 \times 2 - 5 = 11$

91. (b)

92. (d) $A = A_0\left(\frac{1}{2}\right)^{t/T_{1/2}} \Rightarrow 5 \times 10^{-6} = 64 \times 10^{-5}\left(\frac{1}{2}\right)^{t/3}$

$\Rightarrow \frac{1}{128} = \left(\frac{1}{2}\right)^{t/3} \Rightarrow t = 21$ *days*

93. (c) Decayed fraction $= \frac{3}{4}$, so undecayed fraction $= \frac{1}{4}$

Now $\frac{N}{N_0} = \left(\frac{1}{2}\right)^n \Rightarrow \frac{1}{4} = \left(\frac{1}{2}\right)^n \Rightarrow n = 2$

$\Rightarrow t = n \times T_{1/2} = 2 \times 3.8 = 7.6$ *days*

94. (c) $_{84}X^{202} \xrightarrow{\alpha-\text{decay}} {_{82}Y^{198}} + {_2He^4}$ and

$_{82}Y^{198} \xrightarrow{\beta-\text{decay}} {_{83}Z^{198}} + {_{-1}\beta^0}$

95. (a) $\frac{N}{N_0} = \left(\frac{1}{2}\right)^n \Rightarrow \frac{1}{8} = \left(\frac{1}{2}\right)^n \Rightarrow n = 3$

Now $t = n \times T_{1/2} = 3 \times 3.8 = 11.4$ *days*

96. (d) $n = \frac{72000}{24000} = 3$; Now $\frac{N}{N_0} = \left(\frac{1}{2}\right)^n = \frac{1}{8}$

97. (d)

98. (a)

99. (b) $n_\alpha = \frac{A - A'}{4} = \frac{232-208}{4} = 6$

$n_\beta = 2n_\alpha - Z + Z' = 2 \times 6 - 90 + 82 = 4$

100. (c)

101. (a) Number of half lives $n = \frac{5}{1} = 5$

Now $\frac{N}{N_0} = \left(\frac{1}{2}\right)^n \Rightarrow \frac{N}{N_0} = \left(\frac{1}{2}\right)^5 = \frac{1}{32}$

102. (d)

103. (b) Number of half lives $n = \frac{10}{5} = 2$, now $\frac{N}{N_0} = \left(\frac{1}{2}\right)^2 = \frac{1}{4}$

Fraction decayed $= 1 - \frac{N}{N_0} = 1 - \frac{1}{4} = \frac{3}{4}$

$\Rightarrow$ In percentage $= \frac{3}{4} \times 100 = 75\%$

104. (b) Number of half lives $n = \frac{19}{3.8} = 5$; Now $\frac{N}{N_0} = \left(\frac{1}{2}\right)^n$

$\Rightarrow \frac{N}{10.38} = \left(\frac{1}{2}\right)^5 \Rightarrow N = 10.38 \times \left(\frac{1}{2}\right)^5 = 0.32gm$

105. (b) $\frac{N}{N_0} = \left(\frac{1}{2}\right)^n = \left(\frac{1}{2}\right)^5$

106. (d) $T_{1/2} = \frac{\log_e 2}{\lambda} = \frac{2.303 \log_{10} 2}{\lambda}$

107. (a) ${}_{Z}^{A}X \rightarrow {}_{Z-2}^{A-4}Y + {}_{2}^{4}He \rightarrow {}_{Z-3}^{A-4}Z + {}_{1}^{0}B$

108. (d) $\frac{N}{N_0} = \left(\frac{1}{2}\right)^n, n = 2 \Rightarrow \frac{N}{N_0} = \left(\frac{1}{2}\right)^2 = \frac{1}{4}$

So disintegrated part $= 1 - \frac{N}{N_0} = 1 - \frac{1}{4} = \frac{3}{4}$

109. (c) Number of half lives $n = \frac{10}{2.5} = 4$

$\Rightarrow \frac{A}{A_0} = \frac{N}{N_0} = \left(\frac{1}{2}\right)^n \Rightarrow A = 1.6 \times \left(\frac{1}{2}\right)^4 = 0.1\, curie$

110. (b) By using $N = N_0 e^{-\lambda t}$ and $t = \tau = \frac{1}{\lambda}$

Substance remains $= N = \frac{N_0}{e} = 0.37 N_0 \simeq \frac{N_0}{3}$

$\therefore$ Substance disintegrated $= N_0 - \frac{N_0}{3} = \frac{2N_0}{3}$

111. (c) $\frac{3}{4} th$ active decay takes place in time

$t = 2(T_{1/2}) \Rightarrow \frac{3}{4} = 2(T_{1/2}) \Rightarrow T_{1/2} = \frac{3}{8}\sec$

112. (c) By using $N = N_0 e^{-\lambda t}$ and average life time $t = \frac{1}{\lambda}$

So $N = N_0 e^{-\lambda \times 1/\lambda} = N_0 e^{-1} \Rightarrow \frac{N}{N_0} = e^{-1} = \frac{1}{e}$

Now disintegrated fraction $= 1 - \frac{N}{N_0} = 1 - \frac{1}{e} = \frac{e-1}{e}$

113. (d) Complete reaction will be as follows

${}_{92}X^{235} \rightarrow {}_{82}Y^{207} + 7\,{}_{2}He^4 + 4\,{}_{-1}e^0$

i.e., seven $\alpha -$ particles and four $\beta -$ particles will be emitted.

114. (d) $n_\alpha = \frac{A - A'}{4} = \frac{235 - 207}{4} = 7$

$n_\beta = (2n_\alpha - Z + Z') = (2 \times 7 - 92 + 82) = 4$

115. (c) During β-decay, a neutron is transformed into a proton and an electron.

116. (b) ${}_{Z}X^A \xrightarrow{\alpha} {}_{Z-2}X^{A-4}$

117. (a)

118. (a)

119. (d) After emitting β-particle (e) mass of nucleus doesn't change.

120. (a) $\frac{N}{N_0} = \left(\frac{1}{2}\right)^n \Rightarrow \frac{1}{16} = \left(\frac{1}{2}\right)^4 = \left(\frac{1}{2}\right)^n \Rightarrow n = 4.$

Also $n = \frac{t}{T_{1/2}} \Rightarrow T_{1/2} = \frac{40}{4} = 10\, days$

121. (c) As the $\gamma -$ particle has no charge and mass.

122. (d) With emission of an α particle $({}_2He^4)$ mass number decreases by 4 unit and atomic number decrease by 2 units and with emission of $2\beta^{-1}$ particle atomic number increases by 2 units. So Z will remain same and *N* will become $N - 4$.

123. (a) $N = N_0\left(\frac{1}{2}\right)^n \Rightarrow \frac{N}{N_0} = \left(\frac{1}{2}\right)^n \Rightarrow \frac{1}{100} = \left(\frac{1}{2}\right)^n \Rightarrow 2^n = 100$

n comes out in between 6 and 7.

124. (d) $N = N_0\left(\frac{1}{2}\right)^n \Rightarrow N = N_0\left(\frac{1}{2}\right)^{t/T_{1/2}}$

$\Rightarrow N = 1 \times \left(\frac{1}{2}\right)^{\frac{8.1}{2.7}} = \left(\frac{1}{2}\right)^3 = \frac{1}{8} \Rightarrow N = \frac{1}{8} mg = 0.125\, mg$

125. (d) $N = N_0\left(\frac{1}{2}\right)^{\frac{t}{T}} \Rightarrow \frac{N_0}{4} = N_0\left(\frac{1}{2}\right)^{\frac{16}{T}} \Rightarrow T = 8$ days.

126. (d) ${}_{92}U^{238} \rightarrow {}_2He^4 + {}_{90}X^{234} \rightarrow {}_{-1}e^0 + {}_{91}U^{234}$

Hence, $A = 234$, $Z = 91$

127. (c) Mean life $= \frac{1}{\lambda} = 6.67 \times 10^8 \sec$.

128. (d) $\frac{dN}{dt} = -\lambda N \Rightarrow \left|\frac{dN}{dt}\right| = \frac{0.693}{T_{1/2}} \times N$

$= \frac{0.693}{1.2 \times 10^7} \times 4 \times 10^{15} = 2.3 \times 10^8\, atoms/\sec$

129. (c) Remaining material $N = \frac{N_0}{2^{t/T}}$

$\Rightarrow N = \frac{10}{(2)^{20/15}} = \frac{10}{2.15} = 3.96\, gm$

So decayed material $= 10 - 3.96 = 6.04\, gm$

130. (b) Number of atoms remains undecayed $N = N_0 e^{-\lambda t}$

Number of atoms decayed $= N_0(1 - e^{-\lambda t})$

$= N_0\left(1 - e^{-\lambda \times \frac{1}{\lambda}}\right) = N_0\left(1 - \frac{1}{e}\right) = 0.63\, N_0 = 63\%$ of N_0.

131. (d)

132. (b) $\frac{N}{N_0} = \left(\frac{1}{2}\right)^n \Rightarrow \left(\frac{1}{16}\right) = \left(\frac{1}{2}\right)^n \Rightarrow n = 4$

also $n = \frac{t}{T_{1/2}} \Rightarrow T_{1/2} = \frac{120}{4} = 30\, days$

133. (c) $N = N_0 e^{-t/T_{1/2}} \Rightarrow \frac{1}{4} = e^{-t/10}$

$\Rightarrow \left(\frac{1}{2}\right)^2 = \frac{1}{e^{t/10}} \Rightarrow t = 20\, years$

134. (a) $N = N_0\left(\frac{1}{2}\right)^{\frac{t}{T_{1/2}}} = N_0\left(\frac{1}{2}\right)^{\frac{15}{5}} = \frac{N_0}{8}$

135. (a)

136. (b) $A = A_0\left(\frac{1}{2}\right)^{\frac{t}{T_{1/2}}} \Rightarrow \frac{1}{64} = \left(\frac{1}{2}\right)^{\frac{60}{T_{1/2}}}$

$\Rightarrow \left(\frac{1}{2}\right)^6 = \left(\frac{1}{2}\right)^{\frac{60}{T_{1/2}}} \Rightarrow T_{1/2} = 10 \sec$

137. (a, c)

138. (b) ${}_{(Z=92)}U^{(A=238)} \xrightarrow{(8\alpha, 6\beta)} {}_{Z'}X^{A'}$

so $A' = A - 4n_\alpha$ = 238 – 4 × 8 = 206

and $Z' = n_\beta - 2n_\alpha + z$ = 6 – 2 × 8 + 92 = 82.

139. (c) $A = A_0 e^{-\lambda t} = A_0 e^{-t/\tau}$; where τ = mean life

So $A_1 = A_0 e^{-t_1/T} \Rightarrow A_0 = \frac{A_1}{e^{-t_1/T}} = A_1 e^{t_1/T}$

$\therefore A_2 = A_0 e^{-t/T} = (A_1 e^{t_1/T})e^{-t_2/T} \Rightarrow A_2 = A_1 e^{(t_1-t_2)/T}$

140. (c)

141. (d) $n_\alpha = \frac{228-212}{4} = 4$ and $n_\beta = 2\times 4 - 90 + 83 = 1$

142. (c) In a gamma decay process. There is no change in either A or Z.

143. (a) The radioactivity of a sample decays to $\frac{1}{16}th$ of its initial value in four half lives.

144. (d) $\frac{N}{N_0} = \left(\frac{1}{2}\right)^{t/T} \Rightarrow \frac{1}{16} = \left(\frac{1}{2}\right)^{t/48}$

$\Rightarrow \left(\frac{1}{2}\right)^4 = \left(\frac{1}{2}\right)^{t/48} \Rightarrow t = 192\ hour.$

145. (c) If λ is the decay constant of a radioactive substance than average life = $\frac{1}{\lambda}$

Also half life $= \frac{0.693}{\lambda} = 0.693 \times (\text{Average life})$

in single average life, more than 63% of radioactive nuclei decay

146. (b)

147. (d) $M = M_0 e^{-\lambda t}$; given $t = 2\left(\frac{1}{\lambda}\right)$

$\Rightarrow M = 10 e^{-\lambda\left(\frac{2}{\lambda}\right)} = 10\left(\frac{1}{e}\right)^2 \Rightarrow M = 1.35\ gm$

148. (b)

149. (b) $\lambda = \frac{\log_e \frac{A_1}{A_2}}{t} = \frac{\log_e \frac{5000}{1250}}{5}$ = 0.4 *ln* 2

150. (c) $Z_{\text{Resuting nucleus}} = 92 - 8\times 2 + 4\times 1 - 2\times 1 = 78$

151. (c) Radioactive nuclei that are injected into a patient collected at certain sites within it's body, undergoing radioactive decay and emitting electromagnetic radiation. These radiation can than be recorded by a detector. This procedure provides an important diagnostic tool called radio tracer technique.

152. (a) By using $n_\alpha = \frac{A - A'}{4}$ and $n_\beta = 2n_\alpha - Z + Z'$

153. (b) $N = N_0\left(\frac{1}{2}\right)^{\frac{t}{T_{1/2}}}$

No of atoms at t = 2*hr*, $N_1 = 8\times 10^{10}\left(\frac{1}{2}\right)^{\frac{2}{1}} = 2\times 10^{10}$

No. of atoms at t = 4*hr*, $N_2 = 8\times 10^{10}\left(\frac{1}{2}\right)^{\frac{4}{1}} = \frac{1}{2}\times 10^{10}$

$\therefore$ No. of atoms decayed in given duration

$= \left(2 - \frac{1}{2}\right)\times 10^{10} = 1.5\times 10^{10}$

154. (b)

155. (d) $A = A_0\left(\frac{1}{2}\right)^n \Rightarrow 30 = 240\left(\frac{1}{2}\right)^n \Rightarrow \left(\frac{1}{2}\right)^3 = \left(\frac{1}{2}\right)^n \Rightarrow n=3$

$\therefore \frac{t}{T_{1/2}} = 3 \Rightarrow T_{1/2} = \frac{t}{3} = \frac{1}{3}hr$ = 20 *min.*

156. (b) $M = M_0\left(\frac{1}{2}\right)^{\frac{t}{T_{1/2}}} \Rightarrow 25 = 100\left(\frac{1}{2}\right)^{\frac{t}{1600}} \Rightarrow t$= 3200 *years.*

157. (c) Activity $R = R_0 e^{-\lambda t}$

$\frac{R_0}{3} = R_0 e^{-\lambda\times 9} \Rightarrow e^{-9\lambda} = \frac{1}{3}$ ...(i)

After further 9 years $R' = R e^{-\lambda t} = \frac{R_0}{3}\times e^{-\lambda\times 9}$ ...(ii)

From equation (i) and (ii) $R' = \frac{R_0}{9}$.

158. (c) To reduce one fourth it takes time $t = 2(T_{1/2})$= 2 × 40 = 80 *years.*

Decay constant $\lambda = \frac{0.693}{T_{1/2}} = \frac{0.693}{40} = 0.0173\,years$

159. (d) $M = M_0\left(\frac{1}{2}\right)^{\frac{t}{T_{1/2}}} = 20\times\left(\frac{1}{2}\right)^{\frac{3.6}{3.6}} = 20\times\left(\frac{1}{2}\right)^{10} = 0.019\,mg$

160. (c) $N = N_0\left(\frac{1}{2}\right)^{\frac{t}{T_{1/2}}} \Rightarrow \frac{N}{N_0} = \left(\frac{1}{2}\right)^{\frac{30}{10}} = \frac{1}{8} = 0.125$.

161. (a) $\frac{7}{8}$ part decays *i.e.* remaining part is $\frac{1}{8}$

$N = N_0\left(\frac{1}{2}\right)^{\frac{t}{T_{1/2}}} \Rightarrow \frac{1}{8} = \left(\frac{1}{2}\right)^{\frac{15}{T_{1/2}}} \Rightarrow T_{1/2}$ =5 *min.*

162. (d) $\frac{A}{A_0} = \left(\frac{1}{2}\right)^{t/T_{1/2}} \Rightarrow \frac{1}{8} = \left(\frac{1}{2}\right)^{t/8} \Rightarrow t = 24\,years.$

163. (c) After $\beta^+({}_{+1}e^0)$ emission atomic number decreases by one and mass number remain unchanged. γ-emission, there will be no change on mass number and atomic number.

164. (c) New mass number $A' = A - 4n_\alpha = 232 - 4\times 6 = 208$

atomic number $Z' = Z + n_\beta - 2n_\alpha = 90 + 4 - 2\times 6 = 82$

165. (d)

166. (d) Using conservation of momentum $P_{daughter} = P_\alpha$

$$\Rightarrow \frac{E_d}{E_\alpha} = \frac{m_\alpha}{m_d} \Rightarrow E_d = \frac{E_\alpha \times m_\alpha}{m_d} = \frac{6.7\times 4}{214} = 0.125\, MeV$$

167. (c)

168. (c)

169. (b) $N = N_0 \times \left(\frac{1}{2}\right)^{11400/5700} = N_0\left(\frac{1}{2}\right)^2 = 0.25 N_0$.

170. (d) Mean life $(T) = 1/\lambda$ = 100 *second*

Half-life = $\frac{0.693}{\lambda} = \frac{0.693\times 100}{60}$ =1.155 *min.*

171. (b) By using $n_\alpha = \frac{A - A'}{4}$ and $n_\beta = 2n_\alpha - Z + Z'$

172. (c)

173. (b) $\lambda = \frac{0.693}{T_{1/2}} = \frac{0.693}{77} = 9\times 10^{-3}\,/\,day$.

174. (a) By using $n_\alpha = \frac{A - A'}{4} = \frac{232 - 204}{4} = 7$.

175. (c) $\therefore \frac{N}{N_0} = \left(\frac{1}{2}\right)^{t/T_{1/2}} \left(\frac{1}{2}\right)^{1/2} = \frac{1}{\sqrt{2}}$.

176. (d)

Critical Thinking Questions

1. (c) At closest distance of approach

Kinetic energy = Potential energy

$$\Rightarrow 5\times 10^6 \times 1.6\times 10^{-19} = \frac{1}{4\pi\varepsilon_0} \times \frac{(ze)(2e)}{r}$$

For uranium *z*= 92, so $r = 5.3\times 10^{-12}\,cm$

2. (c) Speed of electron in *n* orbit of hydrogen atom $v = \frac{e^2}{2\varepsilon_0 n h}$

In ground state *n* = 1 $\Rightarrow v = \frac{e^2}{2\varepsilon_0 h}$

$$\Rightarrow \frac{v}{c} = \frac{e^2}{2\varepsilon_0 ch} = \frac{(1.6\times 10^{-19})^2}{2\times 8.85\times 10^{-12} \times 3\times 10^8 \times 6.6\times 10^{-34}}$$

$$= \frac{1}{137}.$$

3. (b) Recoil momentum = momentum of photon $= \frac{h}{\lambda}$

$$= hR\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right) = \frac{hR\times 15}{16} = 6.8\times 10^{-27}\, N\times \sec$$

4. (a) The average time that the atom spends in this excited state is equal to Δt, so by using $\Delta E.\Delta t = \frac{h}{2\pi}$

$\Rightarrow$ Uncertainty in energy $= \frac{h/2\pi}{\Delta t}$

$= \frac{6.6\times10^{-34}}{2\times3.14\times10^{-8}} = 1.05\times10^{-26}\,J = 6.56\times10^{-8}\,eV$

5. (a) After the removal of first electron remaining atom will be hydrogen like atom.

So energy required to remove second electron from the atom

$E = 13.6\times\frac{2^2}{1} = 54.4\,eV$

$\therefore$ Total energy required = 24.6 + 54.4 = 79 eV.

6. (a) Electron after absorbing 10.2 eV energy goes to its first excited state (n=2) from ground state (n = 1).

$\therefore$ Increase in momentum $= \frac{h}{2\pi}$

$= \frac{6.6\times10^{-34}}{6.28} = 1.05\times10^{-34}\,J\text{-}s$.

7. (a) Using $\Delta E \propto Z^2$ ($\because$ n_1 and n_2 are same)

$\Rightarrow \frac{hc}{\lambda} \propto Z^2 \Rightarrow \lambda Z^2 = \text{constant}$

$\Rightarrow \lambda_1 Z_1^2 = \lambda_2 Z_2^2 = \lambda_3 Z_3^2 = \lambda_4 Z_4^2$

$\Rightarrow \lambda_1\times1 = \lambda_2\times1^2 = \lambda_3\times2^2 = \lambda_4\times3^3$

$\Rightarrow \lambda_1 = \lambda_2 = 4\lambda_3 = 9\lambda_4$.

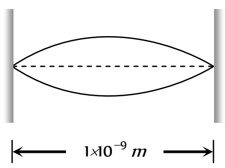
8. (d) $mvr = \frac{h}{2\pi}$ (for first orbit)

$\Rightarrow m\omega r^2 = \frac{h}{2\pi} \Rightarrow m\times2\pi\nu\times r^2 = \frac{h}{2\pi} \Rightarrow \nu = \frac{h}{4\pi^2 mr^2}$

$= \frac{6.6\times10^{-34}}{4(3.14)^2\times9.1\times10^{-31}\times(0.53\times10^{-10})^2} = 6.5\times10^{15}\,\frac{rev}{sec}$

9. (b) It will form a stationary wave

$\lambda = 2l = 2\times10^{-9}\,m$



$\Rightarrow \lambda = \frac{h}{\sqrt{2mE}}$

$\Rightarrow E = \frac{h^2}{2m\lambda^2} = 6\times10^{-20}\,J$

10. (d) Suppose closest distance is r, according to conservation of energy.

$400\times10^3\times1.6\times10^{-19} = 9\times10^9\,\frac{(ze)(2e)}{r}$

$\Rightarrow 6.4\times10^{-14} = \frac{9\times10^9\times(82\times1.6\times10^{-19})\times(2\times1.6\times10^{-19})}{r}$

$\Rightarrow r = 5.9\times10^{-13}\,m = 0.59\,pm$.

11. (a) Here radius of electron orbit $r \propto 1/m$ and energy $E \propto m$, where m is the mass of the electron.

Hence energy of hypothetical atom

$E_0 = 2\times(-13.6\,eV) = -27.2\,eV$ and radius $r_0 = \frac{a_0}{2}$

12. (a) Electronic configuration of iodine is 2, 8, 18, 18, 7,

Here $r_n = (0.053\times10^{-9}\,m)\frac{n^2}{Z}$

Here $n = 5$ and $Z = 53$, hence $r_n = 2.5\times10^{-11}\,m$.

13. (a) $N \propto \left[\frac{1}{\sin^4\theta/2}\right] \Rightarrow N_1 = 7\times\frac{1}{(\sin30^o)^4} = 112$

and $N_2 = 7\times\frac{1}{(\sin60^o)^4} = 12.5$.

14. (d) $E_n = -13.6\,\frac{Z^2}{n^2}\,eV$. Required energy for said transition

$\Delta E = E_3 - E_1 = 13.6\,Z^2\left[\frac{1}{1^2} - \frac{1}{3^2}\right]$

$\Rightarrow \Delta E = 13.6\times3^2\left[\frac{8}{9}\right] = 108.8\,eV$

$\Rightarrow \Delta E = 108.8\times1.6\times10^{-19}\,J$

Now $\Delta E = \frac{hc}{\lambda} = 108.8\times1.6\times10^{-19}$

$\Rightarrow \lambda = \frac{6.6\times10^{-34}\times3\times10^8}{108.8\times1.6\times10^{-19}} = 0.11374\times10^{-7}\,m = 113.74\,Å$

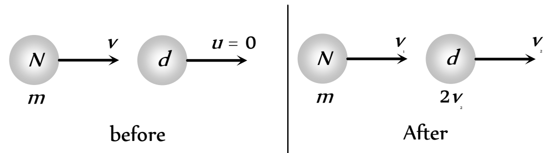
15. (c) $\frac{1}{\lambda} = R\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$

$\Rightarrow \frac{1}{970.6\times10^{-10}} = 1.097\times10^7\left[\frac{1}{1^2} - \frac{1}{n_2^2}\right] \Rightarrow n_2 = 4$

$\therefore$ Number of emission lines $N = \frac{n(n-1)}{2} = \frac{4\times3}{2} = 6$

16. (d) Neutron velocity = v, mass = m

Deuteron contains 1 neutron and 1 proton, mass = $2m$



In elastic collision both momentum and $K.E.$ are conserved $p_i = p_f$

$mv = mv_1 + mv_2 \Rightarrow mv = mv_1 + 2mv_2$ ... (i)

By conservation of kinetic energy

$\frac{1}{2}mv^2 = \frac{1}{2}mv_1^2 + \frac{1}{2}(2m)v_2^2$ ... (ii)

By solving (i) and (ii) we get

$v_1 = \frac{m_1 - m_2}{m_1 + m_2}v + \frac{2m_2}{(m_1 + m_2)}v \Rightarrow v_1 = \frac{m_1 + 2m}{3m} = -\frac{v}{3}$

$K_i = \frac{1}{2}mv^2,\; K_f = \frac{1}{2}mv_1^2 \Rightarrow \frac{K_i - K_f}{K_i} = 1 - \frac{v_1^2}{v^2}$

$= 1 - \frac{1}{9} = \frac{8}{9}$ (Fractional change in $K.E.$)

17. (c) In hydrogen atom $E_n = -\frac{Rhc}{n^2}$

Also $E_n \propto m$; where m is the mass of the electron. Here the electron has been replaced by a particle whose mass is double of an electron. Therefore, for this hypothetical atom energy in n orbit will be given by $E_n = -\frac{2Rhc}{n^2}$

The longest wavelength λ_{max} (or minimum energy) photon will correspond to the transition of particle from $n = 3$ to $n = 2$

$$\Rightarrow \frac{hc}{\lambda_{max}} = E_3 - E_2 = Rhc\left(\frac{1}{2^2} - \frac{1}{3^2}\right)$$

This gives $\lambda_{max} = \frac{18}{5R}$.

18. (d) As the transition $n = 4$ and $n = 3$, results in UV radiation and infrared radiation involves smaller amounts of energy UV. So we require a transition involving initial values of n greater than 4 *e.g.* $5 \to 4$.

19. (c) $\frac{hc}{\lambda} = E = eV$

$$\Rightarrow \lambda = \frac{hc}{eV} - \frac{6.6\times10^{-34}\times3\times10^8}{1.6\times10^{-19}\times4.9} = 2525\,\mathring{A}$$

20. (d) Rydberg constant $R = \frac{\varepsilon_0 n^2 h^2}{\pi m Z e^2}$

Velocity $v = \frac{Ze^2}{2\varepsilon_0 nh}$ and energy $E = -\frac{mZ^2e^4}{8\varepsilon_0^2 n^2 h^2}$

Now, it is clear from above expressions $R.v \propto n$

21. (b) In second excited state $n = 3$

So $l_H = l_{Li} = 3\left(\frac{h}{2\pi}\right)$

While $E \propto Z^2$ and $Z_H = 1$, $Z_{Li} = 3$

So $|E_{Li}| = 9|E_H|$ or $|E_H| < |E_{Li}|$

22. (c) Since the $^{133}_{55}Cs$ has larger size among the four atoms gives, thus the electrons present in the outermost orbit will be away from the nucleus and the electrostatic force experienced by electrons due to nucleus will be minimum. Therefore the energy required to liberate electron from outer will be minimum in the case of $^{133}_{55}Cs$.

23. (d)

24. (a) Potential energy $U = eV = eV_0 \ln\frac{r}{r_0}$

$\therefore$ Force $F = -\left|\frac{dU}{dr}\right| = \frac{eV_0}{r}$.

$\therefore$ The force will provide the necessary centripetal force. Hence $\frac{mv^2}{r} = \frac{eV_0}{r} \Rightarrow v = \sqrt{\frac{eV_0}{m}}$ .....(i)

and $mvr = \frac{nh}{2\pi}$ .....(ii)

From equation (i) and(ii) $mr = \left(\frac{nh}{2\pi}\right)\sqrt{\frac{m}{eV_0}}$ or $r \propto n$

25. (d) $(r_m) = \left(\frac{m^2}{Z}\right)(0.53\mathring{A}) = (n\times0.53\mathring{A}) \Rightarrow \frac{m^2}{Z} = n$

$m = 5$ for $_{100}Fm^{257}$ (the outermost shell)

and $z = 100 \Rightarrow n = \frac{(5)^2}{100} = \frac{1}{4}$

26. (d) Energy radiated $= 1.4\ kW/m^2$

$$= 1.4\ kJ/\sec m^2 = \frac{1.4\ kJ}{\frac{1}{86400} day\, m^2} = \frac{1.4\times86400}{day\, m^2}$$

Total energy radiated/day

$$= \frac{4\pi\times(1.5\times10^{11})^2\times1.4\times86400}{1}\frac{kJ}{day} = E$$

$$\therefore E = mc^2 \Rightarrow m = \frac{E}{c^2}$$

$$= \frac{4\pi(1.5\times10^{11})^2\times1.4\times86400}{(3\times10^8)^2} = 3.8\times10^{14}\,kg.$$

27. (c) The equation is $O^{17} \to _0n^1 + O^{16}$

$\therefore$ Energy required = B.E. of O – B.E. of O

= 17 × 7.75 – 16 × 7.97 = 4.23 MeV

28. (c) $\Delta = mc^2 - m_0c^2 = \frac{m_0c^2}{\sqrt{1-(v^2/c^2)}} - m_0c^2$

$$= m_0c^2\left(\frac{1}{\sqrt{1-(v^2/c^2)}} - 1\right) = 0.511\left(\frac{1}{\sqrt{0.75}} - 1\right)$$

= 0.079 MeV

29. (c,d) Due to mass defect (which is finally responsible for the binding energy of the nucleus), mass of a nucleus is always less then the sum of masses of it's constituent particles $^{20}_{10}Ne$ is made up of 10 protons plus 10 neutrons. Therefore, mass of $^{20}_{10}Ne$ nucleus $M_1 < 10(m_p + m_n)$

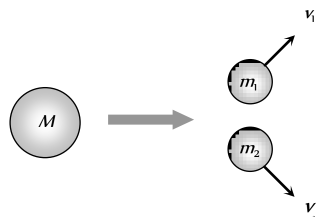
Also heavier the nucleus, more is he mass defect thus $20(m_n + m_p) - M_2 > 10(m_p + m_n) - M_1$

or $10(m_p + m_n) > M_2 - M_1$

$\Rightarrow M_2 < M_1 + 10(m_p + m_n) \Rightarrow M_2 < M_1 + M_1$

$\Rightarrow M_2 < 2M_1$.

30. (a)



By conservation of momentum $m_1v_1 = m_2v_2$

$\Rightarrow \frac{v_1}{v_2} = \frac{8}{1} = \frac{m_2}{m_1}$ ...... (i)

Also from $r \propto A^{1/3} \Rightarrow \frac{r_1}{r_2} = \left(\frac{A_1}{A_2}\right)^{1/3} = \left(\frac{1}{8}\right)^{1/3} = \frac{1}{2}$.

31. (a) Since nuclear density is constant hence mass $\propto$ volume.

32. (c) Mass defect $= 3\times2.014 - 4.001 - 1.007 - 1.008$

$= 0.026\ amu = 0.026\times931\times10^6\times1.6\times10^{-19}\ J$

$= 3.82\times10^{-12}\ J$

Power of star $=10^{16}W$

Number of deuterons used $=\dfrac{10^{16}}{\Delta M}=0.26\times10^{28}$

Deuteron supply exhausts in $\dfrac{10^{40}}{0.26\times10^{28}}=10^{12}\,s$.

33. (a) Since electron and positron annihilate

$$\lambda=\frac{hc}{E_{Total}}=\frac{6.6\times10^{-34}\times3\times10^{8}}{(0.51+0.51)\times10^{6}\times1.6\times10^{-19}}$$

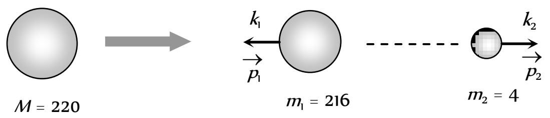
$=1.21\times10^{-12}\,m=0.012\,\AA$.

34. (a) Kinetic energy of the molecules of a gas at a temp. T is $\dfrac{3}{2}kT$

$\therefore$ To initiate the reaction $\dfrac{3}{2}kT=7.7\times10^{-14}\,J$

$\Rightarrow\dfrac{3}{2}\times1.38\times10^{-23}T=7.7\times10^{-14}\Rightarrow T=3.7\times10^{9}\,K$.

35. (b)



Q-value of the reaction is 5.5 eV

i.e. $k_1+k_2=5.5\,MeV$ ......(i)

By conservation of linear momentum

$p_1=p_2\Rightarrow\sqrt{2(216)k_1}=\sqrt{2(4)k_2}$

$\Rightarrow\ k_2=54\ k_1$ ......(ii)

On solving equation (i) and (ii) we get k_2 = 5.4 MeV.

36. (b) By the formula $N=N_0e^{-\lambda t}$

Given $\dfrac{N}{N_0}=\dfrac{1}{20}$ and $\lambda=\dfrac{0.6931}{3.8}\Rightarrow 20=e^{\frac{0.6931\times t}{3.8}}$

Taking log of both sides

or log 20 $=\dfrac{0.6931\times t}{3.8}\log_{10}e$

or 1.3010 $=\dfrac{0.6931\times t\times0.4343}{3.8}\Rightarrow t=16.5$ days.

37. (b) $N=N_0e^{-\lambda t}$

$\therefore 0.9N_0=N_0e^{-\lambda\times5}\Rightarrow5\lambda=\log_e\dfrac{1}{0.9}$ ...... (i)

and $xN_0=N_0e^{-\lambda\times20}\Rightarrow20\lambda=\log_e\left(\dfrac{1}{x}\right)$ ...... (ii)

Dividing (i) by (ii), we get

$$\frac{1}{4}=\frac{\log_e(1/0.9)}{\log_e(1/x)}=\frac{\log_{10}(1/0.9)}{\log_{10}(1/x)}=\frac{\log_{10}0.9}{\log_{10}x}$$

$\Rightarrow\log_{10}x=4\log_{10}0.9\Rightarrow x=0.658=65.8\%$

38. (c) If in the rock there is no Y element, then the time taken by element X to reduce to $\dfrac{1}{8}th$ the initial value will be equal to

$\dfrac{1}{8}=\left(\dfrac{1}{2}\right)^n$ or $n=3$

Therefore, from the beginning three half life time is spent. Hence the age of the rock is

$=3\times1.37\times10^{9}=4.11\times10^{9}\,years$.

39. (b) $\dfrac{N}{N_0}=\left(\dfrac{1}{2}\right)^n\Rightarrow\dfrac{1}{64}=\left(\dfrac{1}{2}\right)^6=\left(\dfrac{1}{2}\right)^n\Rightarrow n=6.$

After 6 half lives intensity emitted will be safe.

$\therefore$ Total time taken $=6\times2=12\,hrs$.

40. (a) $\dfrac{dN}{dt}=\lambda N;\ \lambda=\dfrac{0.6931}{t_{12}}=\dfrac{0.6931}{1620\times365\times24\times60\times60}$,

$N=\dfrac{6.023\times10^{23}}{226}$

$\therefore\dfrac{dN}{dt}=\dfrac{0.6931\times6.023\times10^{23}}{1620\times365\times24\times60\times60\times226}=3.61\times10^{10}$

41. (a) $\lambda=\lambda_1+\lambda_2\Rightarrow\dfrac{1}{T}=\dfrac{1}{T_1}+\dfrac{1}{T_2}$

$\therefore T=\dfrac{T_1T_2}{T_1+T_2}=\dfrac{810\times1620}{810+1620}=540\ years$

Hence $\dfrac{1}{4}\,th$ of material remain after 1080 *years*.

42. (b) Similar to Q. 40.

43. (c) $(T_{1/2})_x=(t_{\text{mean}})_y$

$\Rightarrow\dfrac{0.693}{\lambda_x}=\dfrac{1}{\lambda_y}\Rightarrow\lambda_x=0.693\,\lambda_y$ or $\lambda_x<\lambda_y$

Also rate of decay = λN

Initially number of atoms (N) of both are equal but since $\lambda_y>\lambda_x$, therefore, y will decay at a faster rate than x.

44. (c) $\lambda_\alpha=\dfrac{1}{1620}$ *per year* and $\lambda_\beta=\dfrac{1}{405}$ *per year* and it is given that the fraction of the remained activity $\dfrac{A}{A_0}=\dfrac{1}{4}$

Total decay constant

$\lambda=\lambda_\alpha+\lambda_\beta=\dfrac{1}{1620}+\dfrac{1}{405}=\dfrac{1}{324}\,per\,year$

We know that $A=A_0e^{-\lambda t}\Rightarrow t=\dfrac{1}{\lambda}\log_e\dfrac{A_0}{A}$

$\Rightarrow t=\dfrac{1}{\lambda}\log_e4=\dfrac{2}{\lambda}\log_e2=324\times2\times0.693$ = 449 *years*.

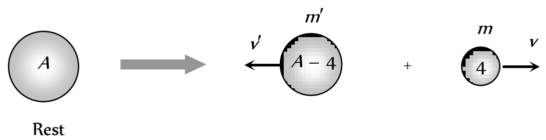
45. (d) $n=\dfrac{24}{24\times138.6}=\dfrac{1}{138.6}$; Now $\dfrac{N}{N_0}=\left(\dfrac{1}{2}\right)^n=\left(\dfrac{1}{2}\right)^{1/138.6}$

$\Rightarrow N=10{,}00000\left(\dfrac{1}{2}\right)^{1/138.6}=995011$

So number of disintegration

$=1000000-995011=4989\approx5000$.

46. (a)



According to conservation of momentum $4v=(A-4)v'\Rightarrow$ $v'=\dfrac{4v}{A-4}$.

47. (b) $\lambda = \frac{0.693}{T_{1/2}} = \frac{0.693}{20} = 0.03465$

Now time of decay $t = \frac{2.303}{\lambda}\log\frac{N_0}{N}$

$\Rightarrow t_1 = \frac{2.303}{0.03465}\log\frac{100}{67} = 11.6\,\text{min}\ min$

and $t_2 = \frac{2.303}{0.03465}\log\frac{100}{33} = 32 min$

Thus time difference between points of time

$= t_2 - t_1 = 32 - 11.6 = 20.4\ min \approx 20\ min.$

48. (d) $N_1 = N_0 e^{-10\lambda t}$ and $N_2 = N_0 e^{-\lambda t}$

$\Rightarrow \frac{N_1}{N_2} = \frac{1}{e} = e^{-1} = e^{(-10\lambda + \lambda)t} = e^{-9\lambda t} \Rightarrow t = \frac{1}{9\lambda}.$

49. (a) $N = N_0\left(\frac{1}{2}\right)^{t/T_{1/2}} \Rightarrow N_A = 10\left(\frac{1}{2}\right)^{t/1}$ and $N_B = 1\left(\frac{1}{2}\right)^{t/2}$

Given $N_A = N_B \Rightarrow 10\left(\frac{1}{2}\right)^{t} = \left(\frac{1}{2}\right)^{t/2}$

$\Rightarrow 10 = \left(\frac{1}{2}\right)^{-t/2} \Rightarrow 10 = 2^{t/2}$. Taking log both the sides.

$\log_{10} 10 = \frac{t}{2}\log_{10} 2 \Rightarrow 1 = \frac{t}{2} \times 0.3010 \Rightarrow t = 6.62$ years.

50. (b) Here $T_{1/2} = 20$ *minutes;* we know $\frac{N}{N_0} = \left(\frac{1}{2}\right)^{t/T_{1/2}}$

For 20% decay $\frac{N}{N_0} = \frac{80}{100} = \left(\frac{1}{2}\right)^{t_1/20}$ ..... (i)

For 80% decay $\frac{N}{N_0} = \frac{20}{100} = \left(\frac{1}{2}\right)^{t_2/20}$ ..... (ii)

Dividing (ii) by (i)

$\frac{1}{4} = \left(\frac{1}{2}\right)^{\frac{(t_2 - t_1)}{20}}$; on solving we get $t_2 - t_1 = 40\ min.$

51. (d) Here the activity of the radioactive sample reduces to half in 140 days. Therefore, the half life of the sample is 140 days. 280 days is it's two half lives. So before two half lives it's activity was ($2^2 \times$ present activity).

$\therefore$ Initial activity = $2^2 \times 6000 = 24000\,dps.$

52. (a) Excitation energy $\Delta E = E_2 - E_1 = 13.6\ Z^2\left[\frac{1}{1^2} - \frac{1}{2^2}\right]$

$\Rightarrow 40.8 = 13.6 \times \frac{3}{4} \times Z^2 \Rightarrow Z = 2.$

Now required energy to remove the electron from ground state

$= \frac{+13.6 Z^2}{(1)^2} = 13.6(Z)^2 = 54.4\,eV.$

53. (b) Rate of disintegration $\frac{dN}{dt} = 10^{17}\,s^{-1}$

Half life $T_{1/2} = 1445$ year

$= 1445 \times 365 \times 24 \times 60 \times 60 = 4.55 \times 10^{10}\ sec$

Now decay constant

$\lambda = \frac{0.693}{T_{1/2}} = \frac{0.693}{4.55 \times 10^{10}} = 1.5 \times 10^{-11}$ per sec

The rate of disintegration

$\frac{dN}{dt} = \lambda \times N_0 \Rightarrow 10^{17} = 1.5 \times 10^{-11} \times N_0$

$\Rightarrow N_0 = 6.6 \times 10^{27}.$

54. (b) $P = \frac{nE}{t} \Rightarrow 300 \times 10^6 = \frac{n \times 170 \times 10^6 \times 1.6 \times 10^{-19}}{t}$

$\therefore$ Number of atoms per sec $\frac{n}{t} = 1.102 \times 10^{19}$

Number of atoms per hour = $1.02 \times 10^{19} \times 3600$

$= 3.97 \times 10^{22}.$

55. (a) According to kinetic interpretation of temperature

$K.E. = \left(\frac{1}{2}mv^2\right) = \frac{3}{2}kT.$

$\Rightarrow 10.2 \times 1.6 \times 10^{-19} = \frac{3}{2} \times (1.38 \times 10^{-23})T$

$\Rightarrow T = 7.9 \times 10^{4} K.$

56. (a) R_0 = Initial activity = 1 micro curie = $3.7 \times 10^4\ dps$

r = Activity in 1 cm^3 of blood at t = 5 *hrs*

$= \frac{296}{60}\,dps = 4.93\,dps$

R = Activity of whole blood at time t = 5 *hr,*

Total volume should be $V = \frac{R}{r} = \frac{R_0 e^{-\lambda t}}{r}$

$= \frac{3.7 \times 10^4 \times 0.7927}{4.93} = 5.94 \times 10^3\ cm^3 = 5.94$ *Litre.*

57. (b) Let ground state energy (in *eV*) be E_1

Then from the given condition

$E_{2n} - E_1 = 204\,eV$ or $\frac{E_1}{4n^2} - E_1 = 204\,eV$

$\Rightarrow E_1\left(\frac{1}{4n^2} - 1\right) = 204\,eV$ .....(i)

and $E_{2n} - E_n = 40.8\,eV$

$\Rightarrow \frac{E_1}{4n^2} - \frac{E_1}{n^2} = E_1\left(-\frac{3}{4n^2}\right) = 40.8\,eV$ .....(ii)

From equation (i) and (ii), $\frac{1 - \frac{1}{4n^2}}{\frac{3}{4n^2}} = 5 \Rightarrow n = 2$

58. (b) Here $\frac{N}{N_0} = \left(\frac{1}{2}\right)^n = \left(\frac{1}{2}\right)^{1/3}$

where n = Number of half lives $= \frac{1}{3}$

$\Rightarrow \frac{N}{N_0} = \frac{1}{1.26} \Rightarrow \frac{N_U}{N_{Pb} + N_U} = \frac{1}{1.26}$

$\Rightarrow N_{Pb} = 0.26\,N_U \Rightarrow \frac{N_{Pb}}{N_U} = 0.26$

59. (b) For K_α X-ray line

$$\frac{1}{\lambda_\alpha} = R(Z-1)^2\left[\frac{1}{1^2} - \frac{1}{2^2}\right] = \frac{3R}{4}(Z-1)^2$$

On putting the given values

$$\frac{1}{0.76\times10^{-10}} = \frac{3}{4}\times1.09\times10^7(Z-1)^2$$

$$\Rightarrow (Z-1)^2 \approx 1600 \Rightarrow Z-1 = 40 \Rightarrow Z = 41$$

60. (a) Maximum energy is liberated for transition $E_n \to 1$ and minimum energy for $E_n \to E_{n-1}$

Hence $\frac{E_1}{n^2} - E_1 = 52.224\, eV$ ......(i)

and $\frac{E_1}{n^2} - \frac{E_1}{(n-1)^2} = 1.224\, eV$ .....(ii)

Solving equations (i) and (ii) we get

$E_1 = -54.4\, eV$ and $n = 5$

Now $E_1 = -\frac{13.6\, Z^2}{1^2} = -54.4\, eV$. Hence $Z = 2$

61. (a) Activity of substance that has 2000 disintegration/sec

$$= \frac{2000}{3.7\times10^{10}} = 0.054\times10^{-6} ci = 0.054\, \mu ci$$

The number of radioactive nuclei having activity A

$$N = \frac{A}{\lambda} = \frac{2000\times T_{1/2}}{\log_e 2}$$

$$= \frac{2000\times138.6\times24\times3600}{0.693} = 3.45\times10^{10}$$

62. (a) Maximum number of nuclei will be present when rate of decay = rate of formation $\Rightarrow \lambda N = \alpha \Rightarrow N = \frac{\alpha}{\lambda}$

63. (b) $r \propto A^{1/3} \Rightarrow \frac{r_1}{r_2} = \left(\frac{A_1}{A_2}\right)^{1/3}$

$$\Rightarrow \frac{3}{5} = \left(\frac{27}{A}\right)^{1/3} \Rightarrow \frac{27}{125} = \frac{27}{A} \Rightarrow A = 125$$

Number of nuclei in atom $X = A - 52 = 125 - 52 = 73$.

64. (c) 1 week ≈ 7 days $\simeq$ $7\times24 hrs \simeq 14$ half lives

Number of atoms left $= \frac{No}{(2)^{14}}$, Activity = $N\lambda$

$\therefore$ Activity left is $\frac{1}{(2)^{14}}$ times the initial

$$\Rightarrow \frac{1}{(2)^{14}}\times1 \text{ curie} = \frac{1}{16384}\times1 \text{ curie} \cong 61\times10^{-6} \text{ curie}$$

$\approx 60\mu$ *curie*.

65. (a) $m_0c^2 = 0.54\, MeV$ and K.E. = $mc^2 - m_0c^2$

Also $m = \frac{m_0}{\sqrt{1-\frac{v^2}{c^2}}} = \frac{m_0}{\sqrt{1-(0.8)^2}} = \frac{m_0}{0.6}$

$$\therefore E = mc^2 = \frac{m_0}{0.6}c^2 = \frac{m_0c}{0.6} = \frac{0.5\, H}{0.6} = 0.9\, MeV$$

$\therefore$ K.E.= (0.9 – 0.54) = 0.36 *MeV*.

Graphical Questions

1. (a) B.E. per nucleon is maximum for Fe^{56}. For further detail refer theory.

2. (a) $\omega = 2\pi\nu = \frac{2\pi c}{\lambda} = 2\pi c\bar{\nu} \Rightarrow \omega \propto \bar{\nu}$.

3. (c)

4. (d) The total number of atoms neither remains constant (as in option (a) nor can ever increase (as in option (b) and (c)). They will continuously decrease with time. Therefore option (d) is correct.

5. (c) $N = N_0e^{-\lambda t} \Rightarrow \frac{dN}{dt} = -N_0\lambda e^{-\lambda t}$

i.e. Rate of decay $\left(\frac{dN}{dt}\right)$ varies exponentially with time (t).

6. (d) Rate $R = -\frac{dN}{dt} = \lambda\, N_0e^{-\lambda t} = \lambda N \Rightarrow \frac{R}{N} = \lambda$ (constant)

i.e. graph between $\frac{R}{N}$ and t, be a straight line parallel to the time axis.

7. (b) Read time for 50 count rate, it gives half life period of 3 *hrs*, one small square gives 600 counts (10 × 60). The number of small squares between graph and time axis are approx 24

Hence count rate = $24\times600 = 14400$

8. (b) Number of atoms undecayed $N = N_0e^{-\lambda t}$

Number of atoms decayed $= N_0 - N = N_0(1-e^{-\lambda t})$

$\Rightarrow$ Decayed fraction $f = \frac{N_0 - N}{N_0} = 1 - e^{-\lambda t}$

i.e. fraction will rise up to 1, following exponential path as shown in graph (B).

9. (c) Energy is released in a process when total Binding energy (B.E.) of the nucleus is increased or we can say when total *B.E.* of products is more than the reactants. By calculation we can see that only in case of option (c), this happens.

Given $W \to 2Y$

B.E. of reactants = 120 × 75 = 900 *MeV*

and *B.E.* of products = $2\times(60\times85) = 1020\, MeV$

i.e. B.E. of products > *B.E.* of reactants.

10. (d) $N = N_0e^{-\lambda t}$ and $A = A_0e^{-\lambda t} = \lambda N_0e^{-\lambda t}$

$\therefore N_{decayed} = N_0 - N = N_0 - N_0 e^{\lambda t} \Rightarrow N_{decayed} = N_0 - \frac{A}{\lambda}$

This is equation of straight line with negative slope.

11. (d) Radius of n^{th} orbit $r_n \propto n^2$, graph between r_n and n is a parabola. Also, $\frac{r_n}{r_1} = \left(\frac{n}{1}\right)^2 \Rightarrow \log_e\left(\frac{r_n}{r_1}\right) = 2\log_e(n)$

Comparing this equation with $y = mx + c$,

Graph between $\log_e\left(\frac{r_n}{r_1}\right)$ and $\log_e(n)$ will be a straight line, passing from origin.

Similarly it can be proved that graph between $\log_e\left(\frac{f_n}{f_1}\right)$ and $\log_e n$ is not a straight line.

12. (d) By using $N = N_0 e^{-\lambda t}$ and $\frac{dN}{dt} = -\lambda N$.

It shows that N decreases exponentially with time.

13. (b) Activity $= -\frac{dN}{dt} = \lambda N = \lambda N_0 e^{-\lambda t}$

i.e., graph between activity and t, be exponential having negative slope.

14. (d) Activity $A = \lambda N_0 e^{-\lambda t} \Rightarrow \log_e A = \log_e \lambda N_0 + \log_e e^{-\lambda t}$

$\Rightarrow \log_e A = \log_e C - \lambda t$ (Take $\lambda N_0 = C$)

$\Rightarrow \log_e A = -\lambda t + \log_e C$

This is the equation of a straight line having negative slope (= $-\lambda$) and positive intercept on $\log_e A$ axis.

15. (c) Charge density is uniform inside and then falls rapidly near the surface of the nucleus.

16. (a) $R = R_0 A^{1/3}$; where $R_0 = 1.2 \times 10^{-15} m$.

$\Rightarrow \log_e R = \log_e R_0 + \frac{1}{3}\log_e A$

This is the equation of a straight line with positive slope.

17. (b) $\left|\frac{dN}{dt}\right| = \lambda N \Rightarrow \left|\frac{dN}{dt}\right| \propto N$

18. (c) Number of atom decayed $N' = N_0(1 - e^{-\lambda t})$

N' will increase with time (t) exponentially.

19. (a) $A_n = \pi r_n^2 \Rightarrow \frac{A_n}{A_1} = \left(\frac{r_n}{r_1}\right)^2 = \left(\frac{n}{1}\right)^4$ $(\because r_n \propto n^2)$

Taking $\log_e$ both the side $\log_e \frac{A_n}{A_1} = 4\log_e(n)$

Comparing it with $y = mx + c$, graph (4) is correct.

Assertion and Reason

1. (c) In fusion, lighter nuclei are used so, fusion is not possible with ^{35}Cl. Also binding energy of ^{35}Cl is not too small.

2. (a) $^{90}_{38}Sr$ decays to $^{90}_{39}Y$ by the emission of $\beta -$ rays. Sr gets absorbed in bones along with calcium.

Reason is also true. $^{90}Sr \xrightarrow{\beta} {}^{90}Y$ which emits $\beta -$ rays of very high energy. Sr does not emit $\gamma -$ rays. The damage is by the $\beta -$ rays only.

3. (b) Neutron is about 0.1 more massive than proton. But the unique thing about the neutron is that while it is heavy, it has no charge (it is neutral). This lack of charge gives it the ability to penetrate matter without interacting as quickly as the beta particles or alpha particles.

4. (b) Bohr postulated that electrons in stationary orbits around the nucleus do not radiate.

This is the one of Bohr's postulate. According to this the moving electrons radiate only when they go from one orbit to the next lower orbit.

5. (c) Nuclear stability depends upon the ratio of neutron to proton. If the n/p ratio is more than the critical value, then a neutron gets converted into a proton forming a β^- particle in the process. $n \to p + e^-$

The β^- particle (e^-) is emitted from the nucleus in some radioactive transformation. So electrons do not exist in the nucleus but they result in some nuclear transformation.

6. (a) ${}_ZX^A \to 2({}_2He^4) + 2({}_{-1}e^0) + 2\gamma + {}_{Z-2}X^{A-8}$

7. (a) Experimentally, it is found that the average radius of a nucleus is given by

$R = R_0 A^{1/3}$ where $R_0 = 1.1 \times 10^{-15} m = 1.1\, fm$

and $A =$ mass number

8. (b)

9. (b) Rutherford confirmed the repulsive force on α-particle due to nucleus varies with distance according to inverse square law and that the positive charges are concentrated at the centre and not distributed throughout the atom.

10. (a) In α-particle scattering experiment, Rutherford found a small number of α-particles which were scattered back through an angle approaching to $180°$. This is possible only if the positive charges are concentrated at the centre or nucleus of the atom.

11. (e) According to classical electromagnetic theory, an accelerated charge continuously emits radiation. As electrons revolving in circular paths are constantly experiencing centripetal acceleration, hence they will be losing their energy continuously and the orbital radius will go on decreasing and form spiral and finally the electron will fall on the nucleus.

12. (c) According to postulates of Bohr's atom model, the electron revolve round the nucleus in fixed orbit of definite radii. As long as the electron is in a certain orbits it does not radiate any energy.

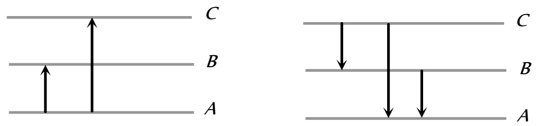
13. (b) Maximum number of photon is given by all the transitions possible $= {}^4C_2 = 6$

Minimum number of transition = 1,

that is directly jump from 4 to 1.

14. (b) When the atom gets appropriate energy from outside, then this electron rises to some higher energy level. Now it can return either directly to the lower energy level or come to the lowest energy level after passing through other lower energy lends, hence all possible transitions take place in the source and many lines are seen in the spectrum.

15. (d) Emission transitions can take place between any higher energy level and any energy level below it while absorption transitions start from the lowest energy level only and may end at any higher energy level. Hence number of absorptions transitions between two given energy levels is always less than the number of emission transitions between same two levels.



Absorption   Emission

16. (a) We knows that an electron is very light particle as compared to an α-particle. Hence electron cannot scatter the α-particle at large angles, according to law of conservation of momentum. On the other hand, mass of nucleus is comparable with the mass of α-particle, hence only the nucleus of atom is responsible for scattering of α-particles.

17. (c) All those elements which are heavier than lead are radioactive. This is because in the nuclei of heavy atoms, besides the nuclear attractive forces, repulsive forces between the protons are also effective and these forces reduce the stability of the nucleus. Hence, the nuclei of heavier elements are being converted into lighter and lighter elements by emission of radioactive radiation. When they are converted into lead, the emission is stopped because the nucleus of lead is stable (or lead is most stable elements in radioactive series).

18. (d) The penetrating power is maximum in case of gamma rays because gamma rays are an electromagnetic radiation of very small wavelength.

19. (b) β-particles, being emitted with very high speed compared to α-particles, pass very little time near the atoms of the medium. So the probability of the atoms being ionised is comparatively less. But due to this reason, their loss of energy is very slow and they can penetrate the medium through a sufficient depth.

20. (b) β-particles are emitted with very high velocity (up to 0.99 c). So, according to Einstein's theory of relatively, the mass of a β-particle is much higher compared to is' its rest mass (m_0). The velocity of electrons obtained by other means is very small compared to c (Velocity of light). So its mass remains nearly m_0. But β-particle and electron both are similar particles.

21. (c) Radioactivity $= -\dfrac{dN}{dt} = \lambda N = \dfrac{0.693N}{T}$

$$= \frac{0.693 \times 10^8}{50} = \frac{0.693 \times 1.2 \times 10^8}{60} = 0.693 \times 2 \times 10^6.$$

Radioactivity is proportional to $1/T_{1/2}$, and not to $T_{1/2}$.

22. (c) Fragments produced in the fission of U^{235} are radioactive. When uranium undergoes fission, barium and krypton are not the only products. Over 100 different isotopes of more than 20 different elements have been detected among fission products. All of these atoms are, however, in the middle of the periodic table, with atomic numbers ranging from 34 to 58. Because the neutron-proton ratio needed for stability in this range is much smaller than that of the original uranium nucleus, the residual nuclei called fission fragments, always have too many neutrons for stability. A few free neutrons are liberated during fission and the fission fragments undergo a series of beta decays (each of which increases Z by one and decreases N by one) until a stable nucleus is reached. During decay of the fission fragments, an average of 15 MeV of additional energy is liberated.

23. (b) Electron capture occurs more often than positron emission in heavy elements. This is because if position emission is energetically allowed, electron capture is necessarily allowed, but the reverse is not true *i.e.* when electron capture is energetically allowed, positron emission is not necessarily allowed.

24. (e) The whole mass of the atom is concentrated at nucleus and $M_{nucleus}$ < (Sum of the masses of nucleous) because, when nucleous combines, some energy is wasted.

Atomic and Nuclear Physics

SET Self Evaluation Test - 26

1. In Bohr model of hydrogen atom, the force on the electron depends on the principal quantum number as

(a) $F \propto 1/n^3$ (b) $F \propto 1/n^4$

(c) $F \propto 1/n^5$ (d) Does not depend on n

2. A nucleus $_Z^AX$ emits 9α-particles and $5p$ particle. The ratio of total protons and neutrons in the final nucleus is

(a) $\frac{Z-13}{(A-Z-23)}$ (b) $\frac{(Z-18)}{(A-36)}$

(c) $\frac{(Z-13)}{(A-36)}$ (d) $\frac{(Z-13)}{(A-Z-13)}$

3. If $t_{1/2}$ is the half life of a substance then $t_{3/4}$ is the time in which substance

(a) Decays $\frac{3}{4}th$ (b) Remains $\frac{3}{4}th$

(c) Decays $\frac{1}{2}$ (d) Remains $\frac{1}{2}$

4. The energy level diagram for an hydrogen like atom is shown in the figure. The radius of its first Bohr orbit is

(a) 0.265 Å (b) 0.53 Å

(c) 0.132 Å (d) None of these

5. How much work must be done to pull apart the electron and the proton that make up the Hydrogen atom, if the atom is initially in the state with $n = 2$

(a) $13.6 \times 1.6 \times 10^{-19}\, J$ (b) $3.4 \times 1.6 \times 10^{-19}\, J$

(c) $1.51 \times 1.6 \times 10^{-19}\, J$ (d) 0

6. The nuclide ^{131}I is radioactive, with a half-life of 8.04 days. At noon on January 1, the activity of a certain sample is 60089. The activity at noon on January 24 will be

(a) 75 *Bq* (b) Less than 75 *Bq*

(c) More than 75 *Bq* (d) 150 *Bq*

7. U^{238} decays into Th^{234} by the emission of an $\alpha-$particle. There follows a chain of further radioactive decays, either by $\alpha-$decay or by β- decay. Eventually a stable nuclide is reached and after that, no further radioactive decay is possible. Which of the following stable nuclides is the and product of the U^{238} radioactive decay chain

(a) Pb^{206} (b) Pb^{207}

(c) Pb^{208} (d) Pb^{209}

8. If the mass of a radioactive sample is doubled, the activity of the sample and the disintegration constant of the sample are respectively

(a) Increases, remains the same

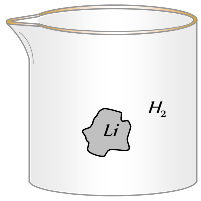
(b) Decreases, increases

(c) Decreases, remains same

(d) Increases, decreases

9. When a sample of solid lithium is placed in a flask of hydrogen gas then following reaction happened

$_1^1H + {}_3Li^7 \rightarrow {}_2He^4 + {}_2He^4$



This statement is

(a) True

(b) False

(c) May be true at a particular pressure

(d) None of these

10. Consider an initially pure *M gm* sample of ^AX, an isotope that has a half life of T hour, what is it's initial decay rate (N_A= Avogrado No.)

(a) $\frac{M\,N_A}{T}$ (b) $\frac{0.693\,M\,N_A}{T}$

(c) $\frac{0.693\,M\,N_A}{AT}$ (d) $\frac{2.303\,M\,N_A}{AT}$

11. At a given instant there are 25% undecayed radioactive nuclei in a same. After 10 *sec* the number of undecayed nuclei reduces to 6.25%, the mean life of the nuclei is

(a) 14.43 *sec* (b) 7.21 *sec*

(c) 5 *sec* (d) 10 *sec*

12. Highly energetic electrons are bombarded on a target of an element containing 30 neutrons. The ratio of radii of nucleus to that of Helium nucleus is $14^{1/3}$. The atomic number of nucleus will be

(a) 25 (b) 26

(c) 56 (d) 30

13. The ratio of ionization energy of Bohr's hydrogen atom and Bohr's hydrogen like lithium atom is

(a) 1 : 1 (b) 1 : 3

(c) 1 : 9 (d) None of these

14. What is the angular momentum of an electron in Bohr's hydrogen atom whose energy is – 0.544 eV.

(a) $\frac{h}{\pi}$ (b) $\frac{2h}{\pi}$

(c) $\frac{5h}{2\pi}$ (d) $\frac{7h}{2\pi}$

15. Consider a hypothetical annihilation of a stationary electron with a stationary positron. What is the wavelength of resulting radiation.

(a) $\frac{h}{2m_0c}$ (b) $\frac{h}{m_0c}$

(c) $\frac{2h}{m_0c}$ (d) $\frac{h}{m_0c^2}$

(h = Plank's constant, c = speed of light, m_o = rest mass)

16. Nuclear reactions are given as

(i) □ $(n, p)_{15}P^{32}$ □ $(p, \alpha)_8O^{16}$ (iii) $_7$□^{14} (p) $_6C^{14}$

missing particle or nuclide (in box □) in these reactions are respectively

(a) S, F, $_0n^1$ (b) F, S, $_0n^1$

(c) Be, F, $_0n^1$ (d) None of these

17. In a sample of hydrogen like atoms all of which are in ground state, a photon beam containing photons of various energies is passed. In absorption spectrum, five dark lines, are observed. The number of bright lines in the emission spectrum will be (assume that all transitions takes place).

(a) 5 (b) 10

(c) 15 (d) None of these

18. A hydrogen atom emits a photon corresponding to an electron transition from n = 5 to n = 1. The recoil speed of hydrogen atom is almost (mass of proton ≈ 1.6×10^{-27} kg).

(a) 10 ms (b) 2×10^{-2} ms

(c) 4 ms (d) 8×10^{-2} ms

19. Number of nuclei of a radioactive substance at time t = 0 are 1000 and 900 at time t = 2 s. Then number of nuclei at time t = 4 s will be

(a) 800 (b) 810

(c) 790 (d) 700

20. The ratio between total acceleration of the electron in singly ionized helium atom and hydrogen atom (both in ground state) is

(a) 1 (b) 8

(c) 4 (d) 16

21. If the series limit of Lymen series for Hydrogen atom is equal to the series limit of Balmer series for a hydrogen like atom, then atomic number o this hydrogen like atom will be

(a) 1 (b) 2

(c) 3 (d) 4

22. Which sample contains greater number of nuclei :

a 5.00- μCi sample of ^{240}Pu (half-life 6560y) or a 4.45-μCi sample of ^{243}Am (half-life 7370 y)

(a) ^{240}Pu (b) ^{243}Am

(c) Equal in both (d) None of these

23. The fission of ^{235}U can be triggered by the absorption of a slow neutrons by a nucleus. Similarly a slow proton can also be used. This statement is

(a) Correct (b) Wrong

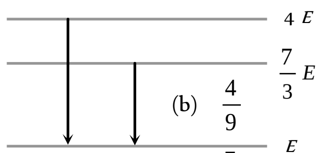
(c) Information is insufficient (d) None of these

24. The radioactivity of a given sample of whisky due to tritium (half life 12.3 years) was found to be only 3% of that measured in a recently purchased bottle marked "7 years old". The sample must have been prepared about

(a) 220 years back (b) 300 years back

(c) 400 years back (d) 70 years back

25. The following diagram indicates the energy levels of a certain atom when the system moves from $4E$ level to E. A photon of wavelength λ_1 is emitted. The wavelength of photon produced during it's transition from $\frac{7}{3}E$ level to E is λ_2. The ratio $\frac{\lambda_1}{\lambda_2}$ will be



(a) $\frac{9}{4}$ (b) $\frac{4}{9}$

(c) $\frac{3}{2}$ (d) $\frac{7}{3}$

Answers and Solutions

(SET -26)

1. (b) $F \propto \frac{v^2}{r}$ also $v \propto \frac{1}{n}$ and $r \propto n^2 \Rightarrow F \propto \frac{1}{n^4}$

2. (a) $_ZX^A \xrightarrow{9\alpha,} {}_{Z-18}X^{A-36} \xrightarrow{5\beta} {}_{Z-13}X^{A-36}$

Number of protons = (Z = 13)

Number of neutrons = (A – 36) – (Z – 13) = (A – Z – 23)

$\therefore \frac{P}{N} = \frac{(Z-13)}{(A-Z-23)}$

3. (a) You must remember that $t_{1/2}$ is time in which substance decays half. Hence in $t_{3/4}$ time substance decays $\frac{3}{4}th$.

4. (a) We know that $E_n = -13.6\frac{Z^2}{n^2}eV$ and $r_n = 0.53\frac{n^2}{Z}(\text{Å})$

Here for n =1, E_1 = – 54.4 eV

Therefore $-54.4 = -13.6\frac{Z^2}{1^1} \Rightarrow Z = 2$

Hence radius of first Bohr orbit $r = \frac{0.53(1)^2}{2} = 0.265\,\text{Å}$

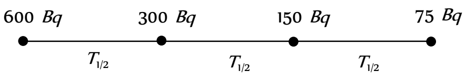
5. (b) The electrostatic $P.E.$ is zero when the electron and proton are far apart from each other. Work done in pulling electron and proton far away from each other

$$W = E_f - E_i = 0 - E_i = -\left(-\frac{13.6}{n^2}eV\right)$$

$$\Rightarrow W = \frac{13.6}{(2)^2}\times 1.6\times 10^{-19}\,J = 3.4 \times 1.6 \times 10^{-19} J.$$

6. (c) Number of days from January 1st to January 24th = 23 days.

Number of half lives $n = \frac{23}{8.04} = 2.86(<3)$



In three half lives activity becomes 75 Bq, but the given number of half lives are lesser than 3 so activity becomes greater than 75 Bq.

7. (a) (4n+2) series starts from U^{238} and it's stable end product is Pb^{206}.

8. (a) Activity depends upon mass, but λ doesn't change.

9. (b) The given reaction is a nuclear reaction, which can take place only if a proton (a hydrogen nucleus) comes into contact with a lithium nucleus. If the hydrogen is in the atomic from, the interaction between it's electron cloud and the electron cloud of a lithium atom keeps the two nuclei from getting close to each other. Even if isolated protons are used, they must be fired at the Li atom with enough kinetic energy to over come the electric repulsion between the proton and Li atom.

10. (c) $N = N_0 e^{-\lambda t} \Rightarrow \left|\frac{dN}{dt}\right| = N_0 \lambda e^{-\lambda t}$

Initially at t = 0, $\left|\frac{dN}{dt}\right|_{t=0} = N_0\lambda$

where N_0 = Initial number of undecayed atoms

$$= \frac{\text{Mass of the sample}}{\text{Mass of a single atom of X}} = \frac{M}{A/N_A} = \frac{MN_A}{A}$$

$$\therefore \left|\frac{dN}{dt}\right|_{t=0} = \frac{MN_A\lambda}{A} = \frac{0.693\,MN_A}{AT}$$

11. (b) In 10 sec, number of nuclei has been reduced to one fourth (25% to 6.25%).

Therefore it's half life is $T_{1/2}$ = 5 sec.

$\therefore$ Mean life $T = \frac{T_{1/2}}{0.693} = \frac{5}{0.693}$ = 7.21 sec.

12. (b) By using $R = R_0\,A^{1/3} \Rightarrow \frac{R_1}{R_2} = \left(\frac{A_1}{A_2}\right)^{1/3}$

$$\Rightarrow \frac{R}{R_{He}} = \left(\frac{A}{4}\right)^{1/3} \Rightarrow (14)^{1/3} = \left(\frac{A}{4}\right)^{1/3}$$

$\Rightarrow$ A = 56 so Z = 56 – 30 = 26.

13. (c) Energy of an electron in ground state of an atom (Bohr's hydrogen like atom) is given as

$E = -13.6\,Z^2 eV$ (Z = atomic number of the atom)

$\Rightarrow E_{ionisation}$ = 13.6 Z

$$\Rightarrow \frac{(E_{ion})_H}{(E_{ion})_{Li}} = \left(\frac{Z_H}{Z_{Li}}\right)^2 = \left(\frac{1}{3}\right)^2 = \frac{1}{9}$$

14. (c) By using $E = -\frac{13.6}{n^2}eV$ (for H_2 atom)

$\Rightarrow$ – 0.544 $= -\frac{13.6}{n^2} \Rightarrow n^2 = 25 \Rightarrow n = 5$

$\therefore$ Angular momentum = $n\frac{h}{2\pi} = \frac{5h}{2\pi}$.

15. (b) From conservation of momentum, two identical photons must travel in opposite directions with equal magnitude of momentum and energy $\frac{hc}{\lambda}$

from conservation of energy $\frac{hc}{\lambda} + \frac{hc}{\lambda} = m_0c^2 + m_0c^2$

$$\Rightarrow \lambda = \frac{h}{m_0 c}.$$

16. (a) (i) ${}_{16}S^{32} + {}_0n^1 \rightarrow {}_{15}p^{32} + {}_1H^1$

(ii) ${}_9F^{19} + {}_1H^1 \rightarrow {}_2He^4 + {}_8O^{16}$

(iii) ${}_7N^{14} + {}_0n^1 \rightarrow {}_6C^{14} + {}_1H^1$

17. (c) Number of lines in absorption spectrum = (n–1)

$\Rightarrow$ 5 = n – 1 $\Rightarrow$ n = 6

$\therefore$ Number of bright lines in the emission spectrum

$$= \frac{n(n-1)}{2} = \frac{6(6-1)}{2} = 15.$$

18. (c) The Hydrogen atom before the transition was at rest. Therefore from conservation of momentum.

$$p_{H-\text{atom}} = p_{\text{photon}} = \frac{E_{\text{radiated}}}{c} = \frac{13.6\left(\frac{1}{n_1^2} - \frac{1}{n_2^2}\right)eV}{c}$$

$$1.6\times 10^{-27}\times v = \frac{13.6\left(\frac{1}{1^2} - \frac{1}{5^2}\right)\times 1.6\times 10^{-19}}{3\times 10^8}$$

$\Rightarrow$ v = 4.352 m/s ≈ 4 m/sec.

19. (b) In 2 *sec* only 90% nuclei are left behind. Thus in next two second 90% of 900 or 810 nuclei will be left.

20. (b) Acceleration $a \propto \frac{v^2}{r}$

where $v \propto \frac{Z}{n}$ and $r \propto \frac{n^2}{Z} \Rightarrow a \propto \frac{Z^3}{n^4}$

Since both are in ground state *i.e.*, $n = 1$

so $a \propto Z \Rightarrow \frac{a_{He^+}}{a_H} = \left(\frac{Z_{He^+}}{Z_H}\right)^3 = \left(\frac{2}{1}\right)^3 = \frac{8}{1}$.

21. (b) By using $\frac{1}{\lambda} = RZ^2\left[\frac{1}{n_1^2} - \frac{1}{n_2^2}\right]$

For Hydrogen atom $\frac{1}{(\lambda_{\min})_H} = R\left[\frac{1}{1^2} - \frac{1}{\infty}\right] = R$

$(4E - E) = \frac{hc}{\lambda_1} \Rightarrow \lambda_1 = \frac{hc}{3E}$ ...... (i)

Transition from $\frac{7}{3}E$ to E

$\left(\frac{7}{3}E - E\right) = \frac{hc}{\lambda_2} \Rightarrow \lambda_2 = \frac{3hc}{4E}$ ...... (i)

From equation (i) and (ii) $\frac{\lambda_1}{\lambda_2} = \frac{4}{9}$

***

$\Rightarrow (\lambda_{\min})_H = \frac{1}{R}$ .....(i)

For hydrogen like atom $\left(\frac{1}{\lambda_{\min}}\right)_{\text{atom}} = RZ^2\left(\frac{1}{2^2} - \frac{1}{\infty}\right)$

$\Rightarrow (\lambda_{\min})_{\text{atom}} = \frac{4}{RZ^2}$ ....(ii)

From equation (i) and (ii) $\frac{1}{R} = \frac{4}{RZ^2} \Rightarrow Z = 2$.

22. (c) The activity $\left(-\frac{dN}{dt}\right) = \lambda N \Rightarrow N = \left(-\frac{dN}{dt}\right)\left(\frac{T_{1/2}}{\log_e 2}\right)$

Taking the ratio of this expression for ^{240}Pu to this same expression for ^{243}Am,

$$\frac{N_{Pu}}{N_{Am}} = \frac{\left(-\frac{dN_{Pu}}{dt}\right)(T_{1/2})_{Pu}}{\left(-\frac{dN_{Am}}{dt}\right)(T_{1/2})_{Am}} = \frac{(5\mu ci)\times(6560y)}{(4.45\mu ci)\times(7370y)} = 1$$

i.e. the two samples contains equal number of nuclei.

23. (b) Because the neutron has no electric charge, it experience no electric repulsion from a U nucleus. Hence a slow moving neutron can approach and enter a U nucleus, thereby providing the excitation needed to trigger fission. By contrast a slow moving proton feels a strong repulsion from a U nucleus. It never get's close to the nucleus, so it cannot trigger fission.

24. (d) After one half life period, the activity of Tritium becomes 50%.

After 2 half life period 25%

After 3 half life period 12.5%

After 4 half life period 6.25%

After 5 half life period 3.12% ≈ 3%

It is 5 × 12.5 years + 7 years *i.e.* approximately 70 years only .

25. (b) Transition from $4E$ to E

Chapter 27
Electronics

Semiconductor electronics

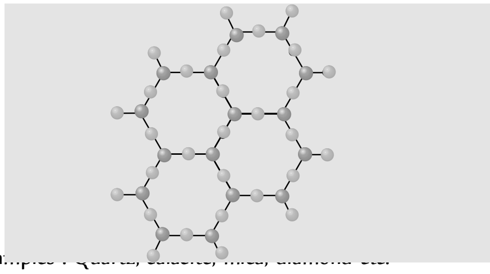
Solids

It is a state of matter which has a definite shape and a definite volume. The characteristic properties of the solid depends upon the nature of forces acting between their constituent particles (*i.e.* ions, atoms or molecules). Solids are divided into two categories.

Crystalline solids

(1) These solids have definite external geometrical form.

(2) Ions, atoms or molecules of these solid are arranged in a definite fashion in all it's three dimensions.



(3) Examples : Quartz, calcite, mica, diamond etc.

(4) They have well defined facets or faces.

(5) They are ordered at short range as well as at long range.

(6) They are anisotropic, *i.e.* the physical properties like elastic modulii, thermal conductivity, electrical conductivity, refractive index have different values in different direction.

(7) They have sharp melting point.

(8) Bond strengths are identical throughout the solid.

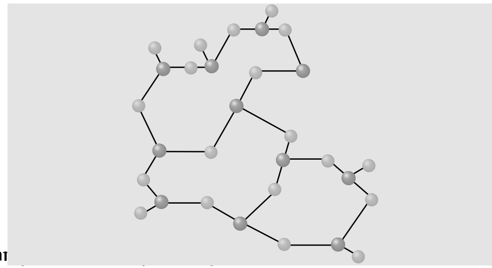
(9) These are considered as true solids.

(10) An important property of crystals is their symmetry.

Amorphous or glassy solids

(1) These solids have no definite external geometrical form.

(2) Ions, atoms or molecules of these solids are not arranged in a definite fashion.



(3) Exa

(4) They do not possess definite facets or faces.

(5) These have short range order, and there is no long range order.

(6) They are isotropic.

(7) They do not have a sharp melting point.

(8) Bond strengths vary.

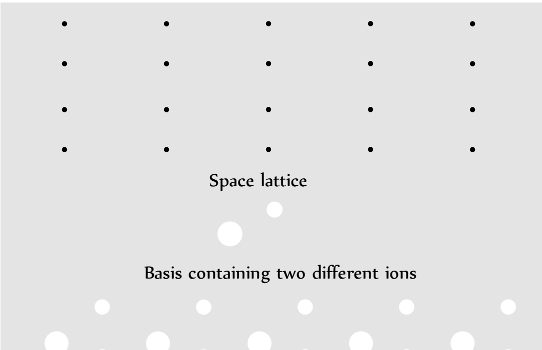
(9) These are considered as pseudo-solids or super cooled liquids.

(10) Amorphous solids do not have any symmetry.

Terms Related with Crystal Structure

(1) **Crystal lattice :** It is a geometrical arrangement of points in space where if atoms or molecules of a solid are placed, we obtain an actual crystal structure of the solid.

(2) **Basis :** The atoms or molecules attached with every lattice point in a crystal structure is called the basis of crystal structure.



(3) **Unit cell :** Is defined as that volume of the solid from which the entire crystal structure can be constructed by the translational repetition in three dimensions. The length of three sides of a unit cell (3*D*) are called primitives or lattice constant they are denoted by *a, b, c*

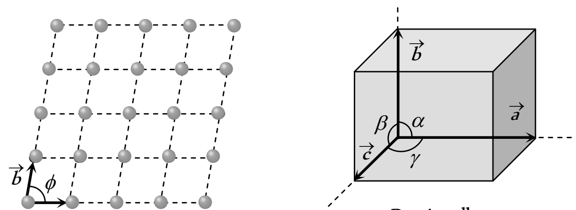


Fig. 27.1

(4) **Primitive cell :** A primitive cell is a minimum volume unit cell or the simple unit cell with particles only at the corners is a primitive unit cell and other types of unit cells are called non-primitive unit cells. There is only one lattice point per primitive cell.

(5) **Crystallographic axis :** The lines drawn parallel to the lines of intersection of the faces of the unit cell are called crystallographic axis.

All the crystals on the basis of the shape of their unit cells, have been divided into seven crystal systems as shown in the following table.

Table 27.1 : Different crystal systems

System	Lattice constants	Angle between lattice constants	Examples
Cubic  Number of lattices = 3	$a = b = c$	$\alpha = \beta = \gamma = 90^\circ$	Diamond, *NaCl, Li, Ag, Cu,* NH_4Cl, *Pb etc.*
Tetragonal  Number of lattices = 2	$a = b \neq c$	$\alpha = \beta = \gamma = 90^\circ$	White tin, $NiSO_4$ *etc.*
Orthorhombic  Number of lattices = 4	$a \neq b \neq c$	$\alpha = \beta = \gamma = 90^\circ$	$HgCl_2$, KNO_3, gallium *etc.*
Monoclinic  Number of lattices = 2	$a \neq b \neq c$	$\alpha = \gamma = 90^\circ$ and $\beta \neq 90^\circ$	$KclO_3$, $FeSO_4$ *etc.*
Triclinic  Number of lattices = 1	$a \neq b \neq c$	$\alpha \neq \beta \neq \gamma \neq 90^\circ$	$K_2Cr_2O_7$, $CuSO_4$ *etc.*
Rhombo-hedral or Trigonal  Number of lattices = 1	$a = b = c$	$\alpha = \beta = \gamma \neq 90^\circ$	Calcite, *As, Sb, Bi etc.*
Hexagonal  Number of lattices = 1	$a = b \neq c$	$\alpha = \beta = 90^\circ$ and $\gamma = 120^\circ$	*Zn, Cd, Ni etc.*

Different Types of Symmetry in Cubic Lattices

(1) **Centre of symmetry :** An imaginary point within the crystal such that any line drawn through it intersects the surface of the crystal at equal distances in both directions.

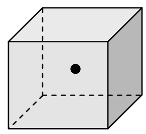

Fig. 27.2

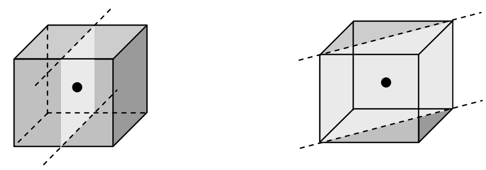
(2) **Plane of symmetry :** It is an imaginary plane which passes through the centre of a crystal and divides it into two equal portions such that one part is exactly the mirror image of the other.



(A) Rectangular plane of symmetry

(B) Diagonal plane of symmetry

Fig. 27.3

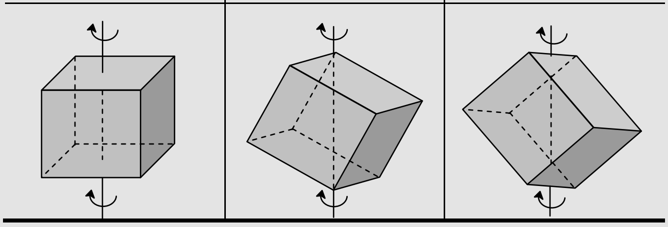
A cubical crystal possesses six diagonal plane of symmetry and three rectangular plane of symmetry.

(3) **Axis of symmetry** : It is an imaginary straight line about which, if the crystal is rotated, it will present the same appearance more than once during the complete revolution.

In general, if the same appearance of a crystal is repeated on rotating through an angle $\frac{360^o}{n}$, around an imaginary axis, the axis is called an *n*-fold axis.

Table 27.2 : A cubical crystal possesses in all 13 axis of symmetry

Axis of four-fold symmetry = 3 (Because of six faces)	Axis of three-fold symmetry = 4 (Because of eight corners)	Axis of two-fold symmetry = 6 (Because of twelve edges)



(4) **Elements of symmetry :** The total number of planes, axes and centre of symmetry possessed by a crystal are termed as elements of symmetry. A cubic crystal possesses a total of 23 elements of symmetry.

Planes of symmetry $=(3+6)=9$,

Axes of symmetry $=(3+4+6)=13$,

Centre of symmetry = 1.

Total number of symmetry elements = 23

More About Cubic Crystals

(1) **Different lattice in cubic crystals :** There are three lattice in the cubic system.

(i) The simple cubic (*sc*) lattice.

(ii) The body-centered cubic (*bcc*).

(iii) The face-centered cubic (*fcc*).

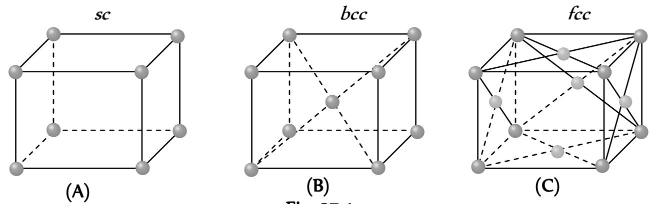


Fig. 27.4

(2) **Atomic radius :** The half of the distance between two atoms in contact is defined as atomic radius.

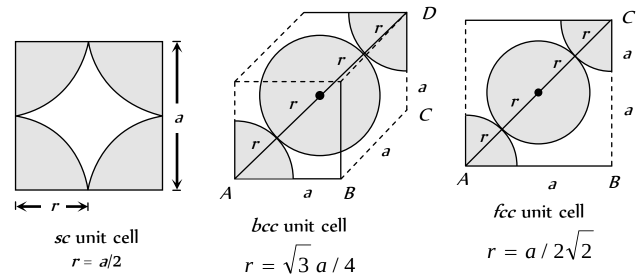

Fig. 27.5

(3) **Atoms per unit cell :** An atom located at the corner of a unit cell of a lattice is shared equally by eight other unit cells in the three dimensional lattice. Therefore, each unit cell has 1/8 share of an atom at its each corner. Similarly, a face of the unit cell is common to the two unit cells in the lattice. Therefore, each unit cell has 1/2 share of an atom at its each face. The atom located at the centre of the unit cell belongs completely to the unit cell.

Let N_c, N_b and N_f be the number of atoms at the corners, centre and face of the unit cell respectively. Therefore the number of atoms per unit cell is given by $N = N_b + \frac{N_f}{2} + \frac{N_c}{8}$

(i) In *sc* lattice : $N_b = 0,\ N_f = 0,\ N_c = 8$ so $N = 1$

(ii) In *bcc* lattice : $N_b = 1,\ N_f = 0,\ N_c = 8$ so $N = 2$

(iii) In *fcc* lattice : $N_b = 0,\ N_f = 6,\ N_c = 8$ so $N = 4$

(4) **Co-ordination number :** It is defined as the number of nearest neighbours that an atom has in a unit cell. It depends upon structure.

(i) Simple cubic structure : Each atom has two neighbours along *X*-axis, two along *Y*-axis and two along *Z*-axis so co-ordination number = 6.

(ii) Face-centred cubic structure: Every corner atom has four neighbours in each of the three planes *XY*, *YZ*, and *ZX* so co-ordination number = 12

(iii) Body-centred cubic structure: The atom of the body of the cell has eight neighbours at eight corner of the unit cell so co-ordination number = 8.

(5) **Atomic packing fraction (or packing factor or relative packing density)**

The atomic packing fraction indicates how close the atoms are packed together in the given crystal structure or the ratio of the volume occupied by atoms in a unit cell in a crystal and the volume of unit cell is defined as APF.

(i) **For *sc* crystal :** Volume occupied by the atom in the unit cell $= \frac{4}{3}\pi r^3 = \frac{\pi a^3}{6}$. Volume of the unit cell $= a^3$

Thus P.F. $= \frac{\pi a^3/6}{a^3} = \frac{\pi}{6} = 0.52 = 52\%$

(ii) **For *bcc* :** P.F. $= \frac{\sqrt{3}\pi}{8} = 68\%$

(iii) **For *fcc* :** P.F. $= \frac{\pi}{3\sqrt{2}} = 74\%$

(6) **Density of unit cell :** Density of unit cell $= \frac{\text{Mass of the unit cell}}{\text{Volume of the unit cell}} = \frac{nA}{NV} = \frac{nA}{Na^3}$

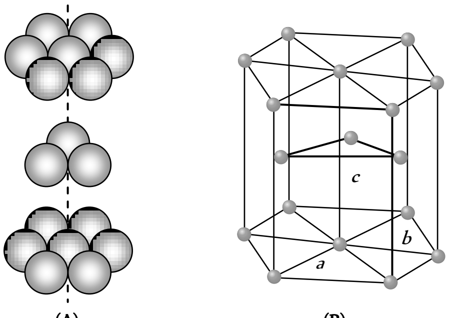
where n = Number of atoms in unit cell (For *sc* lattice n = 1, for *bcc* lattice n = 2, for *fcc* lattice n = 4), A = atomic weight, N = Avogadro's number, V = Volume of the unit cell.

(7) **Bond length :** The distance between two nearest atoms in a unit cell of a crystal is defined as bond length.

(i) In a *sc* lattice : Bond length = a (ii) In a *bcc* lattice : Bond length $= \frac{\sqrt{3}a}{2}$ (iii) In a *fcc* lattice : Bond length $= \frac{a}{\sqrt{2}}$

Hexagonal Close Packed (HCP) Structure

The HCP structure also maximizes the packing fraction



(A) Fig. 27.6 (B)

(1) $a = b \neq c$

(2) Number of atoms per unit cell = 6

(3) The volume of the hexagonal cell = $3\sqrt{2}\,a^3$

(4) The packing fraction $= \frac{\pi\sqrt{2}}{6}$

(5) Coordination number = 12

(6) Magnesium is a special example of HCP lattice structure.

Bonding Forces in Crystals

The properties of a solid are mainly determined by the type of bonding that exists between the atoms. According to bonding in crystals they are classified into following types.

(1) **Ionic crystal :** This type of bonding is formed due to transfer of electrons between atoms and consequent attraction between them.

(i) In *NaCl* crystal, the electron of *Na* atom is transferred to chlorine atom. In this way *Na* atom changes in to *Na* ion and *Cl* atom changes into *Cl* ion.

(ii) Cause of binding is electrostatic force between positive and negative ion.

(iii) These crystal are usually hard, brittle and possesses high melting and boiling point.

(iv) These are bad conductor of electricity.

(v) Common example are *NaCl, CsCl, LiF etc.*

(2) **Covalent crystal :** Covalent bonding is formed by sharing of electrons of opposite spins between two atoms

(i) The conductivity of these solids rise with rise in temperature.

(ii) These crystal posses high melting point.

(iii) Bonding between H_2, Cl_2 molecules *Ge*, *Si*, Quartz, diamond *etc*. are common example of covalent bonding

(3) **Metallic bonds :** This type of bonding is formed due to attraction of valence (free) electrons with the positive ion cores

(i) Their conductivity decreases with rise of temperature.

(ii) When visible light falls on a metallic crystal, the electrons of atom absorb visible light, so they are opaque to visible light. However some orbital electrons absorb energy and reach in excited state. They then return to their normal states, remitting light of same frequency.

Common examples are *Na, Li, K, Cs, Au, Hg etc*.

(4) **Vander waal's crystal :** These crystal consists of neutral atoms or molecules bonded together in solid phase by weak, short range attractive forces called vander Waal's forces.

(i) This bonding is weakest and occurs in solid CO_2, methane, paraffin, ice, etc.

(ii) They are normally insulator, they are soft, easily compressible and posses low melting point.

(5) **Hydrogen bonding :** Hydrogen bonding is due to permanent dipole interaction.

(i) This bond is stronger than vander Waal's bond but much weaker than ionic and covalent bond.

(ii) They possesses low melting point.

(iii) Common examples are H_2O, *HF etc*.

Single, Poly and Liquid Crystals

(1) **Single crystal :** The crystals in which the periodicity of the pattern extends throughout the piece of the crystal are known as single crystals. Single crystals have anisotropic behaviour *i.e.* their physical properties (like mechanical strength, refractive index, thermal and electrical conductivity) are different along different directions. The small sized single crystals are called mono-crystals.

(2) **Poly-crystals :** A poly-crystal is the aggregate of the monocrystals whose well developed faces are joined together so that it has isotropic properties. Ceramics are the important illustrations of the poly-crystalline solids.

(3) **Liquid crystals :** The organic crystalline solid which on heating, to a certain temperature range becomes fluid like but its molecules remain oriented in a particular directions, showing that they retain their anisotropic properties, is called liquid crystal. These crystals are used in a liquid crystal displays (L.C.D.) which are commonly used in electronic watches, clocks and micro-calculators *etc*.

Energy Bands

This theory is based on the Pauli exclusion principle.

In isolated atom the valence electrons can exist only in one of the allowed orbitals each of a sharply defined energy called energy levels. But when two atoms are brought nearer to each other, there are alterations in energy levels and they spread in the form of bands.

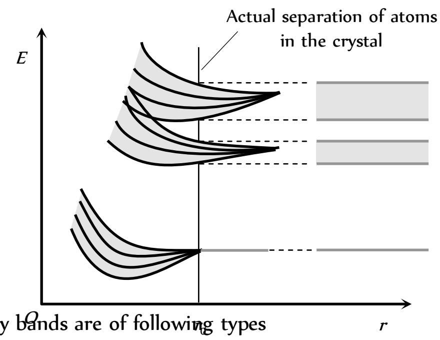


Fig. 27.7 Origin of energy bands in a solid

Energy bands are of following types

(1) **Valence band :** The energy band formed by a series of energy levels containing valence electrons is known as valence band. At 0 *K*, the electrons fills the energy levels in valence band starting from lowest one.

(i) This band is always filled with electrons.

(ii) This is the band of maximum energy.

(iii) Electrons are not capable of gaining energy from external electric field.

(iv) No flow of current due to electrons present in this band.

(v) The highest energy level which can be occupied by an electron in valence band at 0 *K* is called fermi level.

(2) **Conduction band :** The higher energy level band is called the conduction band.

(i) It is also called empty band of minimum energy.

(ii) This band is partially filled by the electrons.

(iii) In this band the electrons can gain energy from external electric field.

(iv) The electrons in the conduction band are called the free electrons. They are able to move any where within the volume of the solid.

(v) Current flows due to such electrons.

(3) **Forbidden energy gap (ΔE) :** Energy gap between conduction band and valence band $\Delta E_g = (C.B.)_{\min} - (V.B.)_{\max}$

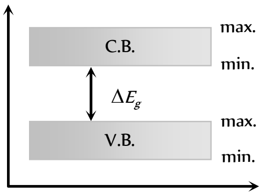

Fig. 27.8

(i) No free electron is present in forbidden energy gap.

(ii) Width of forbidden energy gap depends upon the nature of substance.

(iii) As temperature increases (↑), forbidden energy gap decreases (↓) very slightly.

Table 27.3 : Types of solid

Properties	Conductors	Insulators	Semiconductors
Electrical conductivity	10^2 to 10^8 ℧$/m$	10^{-8} ℧$/m$	10^{-5} to 10^0 ℧$/m$
Resistivity	10^{-2} to 10^{-8} Ω-m (negligible)	10^8 Ω-m	10^5 to 10^0 Ω-m
Band structure	C.B. V.B.	C.B. ΔE_g (large) V.B.	C.B. ΔE_g (small) V.B.
Energy gap (E_g)	Zero or very small	Very large; for diamond it is 6 *eV*	*Ge* → 0.7 *eV* *Si* → 1.1 *eV* *GaAs* →1.3 *eV* GaF_2 → 2.8 *eV*
Current carriers	Free electrons	––	Free electrons and holes
Condition of V.B. and C.B. at ordinary temperature	V.B. and C.B. are completely filled or C.B. is some what empty	V.B. – completely filled C.B. – completely unfilled	V.B. – somewhat empty C.B. – somewhat filled
Temperature co-efficient of resistance	Positive	Zero	Negative
Effect of temperature on conductivity	Decreases	—	Increases
Effect of temperature on resistance	Increases	—	Decreases
Examples	*Cu, Ag, Au, Na, Pt, Hg* etc.	Wood, plastic, mica, diamond, glass etc.	*Ge, Si, Ga, As* etc.
Electron density	$10^{29}/m^3$	—	*Ge* ~ 10^{19} $/m^3$ *Si* ~ 10^{16} $/m^3$

Holes in Semiconductors

(1) When an electron is removed from a covalent bond, it leaves a vacancy behind. An electron from a neighbouring atom can move into this vacancy, leaving the neighbour with a vacancy. In this way the vacancy formed is called hole (or cotter), and can travel through the material and serve as an additional current carriers.

(2) A hole is considered as a seat of positive charge, having magnitude of charge equal to that of an electron.

(3) Holes acts as virtual charge, although there is no physical charge on it.

(4) Effective mass of hole is more than electron.

(5) Mobility of hole is less than electron.

Intrinsic Semiconductors

(1) A pure semiconductor is called intrinsic semiconductor. It has thermally generated current carriers

(2) They have four electrons in the outermost orbit of atom and atoms are held together by covalent bond

(3) Free electrons and holes both are charge carriers and n_e (in C.B.) $= n_h$ (in V.B.)

(4) The drift velocity of electrons (v_e) is greater than that of holes (v_h)

(5) For them fermi energy level lies at the centre of the C.B. and V.B.

(6) In pure semiconductor, impurity must be less than 1 in 10^8 parts of semiconductor.

(7) In intrinsic semiconductor

$n_e^{(o)} = n_h^{(o)} = n_i$; where $n_e^{(o)} =$ Electron density in conduction band, $n_h^{(o)} =$ Hole density in V.B., $n_i =$ Density of intrinsic carriers.

(8) The fraction of electrons of valance band present in conduction band is given by $f \propto e^{-E_g/kT}$; where E_f = Fermi energy or k = Boltzmann's constant and T = Absolute temperature

(9) Because of less number of charge carriers at room temperature, intrinsic semiconductors have low conductivity so they have no practical use.

(10) Number of electrons reaching from valence band to conduction band $n = AT^{3/2}e^{-E_g/2kT}$

Extrinsic Semiconductor

(1) An impure semiconductor is called extrinsic semiconductor

(2) When pure semiconductor material is mixed with small amounts of certain specific impurities with valency different from that of the parent material, the number of mobile electrons/holes drastically changes. The process of addition of impurity is called doping.

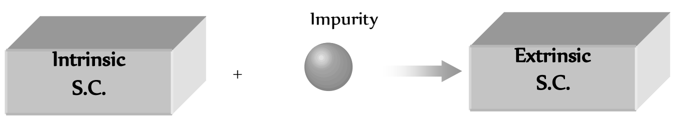

Fig. 27.9

(3) **Pentavalent impurities :** The elements whose atom has five valance electrons are called pentavalent impurities e.g. *As, P, Sb etc.* These impurities are also called donor impurities because they donate extra free electron.

(4) **Trivalent impurities :** The elements whose each atom has three valance electrons are called trivalent impurities e.g. *In, Ga, Al, B, etc.* These impurities are also called acceptor impurities as they accept electron.

(5) The compounds of trivalent and pentavalent elements also behaves like semiconductors *e.g. GaAs, InSb, In P, GaP etc.*

(6) The number of atoms of impurity element is about 1 in 10^8 atoms of the semiconductor.

(7) In extrinsic semiconductors $n_e \neq n_h$

(8) In extrinsic semiconductors fermi level shifts towards valence or conduction energy bands.

(9) Their conductivity is high and they are used for practical purposes.

(10) In a doped extrinsic semiconductor, the number density of e^- of the conduction band (n) and the number density of holes in the valence band (n) differs from that in a pure semiconductor. If n_i is the number density of electron in conduction band or the number density of holes in valence band in a pure semiconductor then $n_e n_h = n_i^2$ (mass action law)

(11) Extrinsic semiconductors are of two types

(i) *N*-type semiconductor (ii) *P*-type semiconductor

N-Type Semiconductor

These are obtained by adding a small amount of pentavalent impurity to a pure sample of semiconductor (*Ge*).

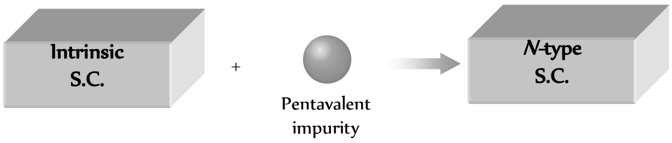

Fig. 27.10

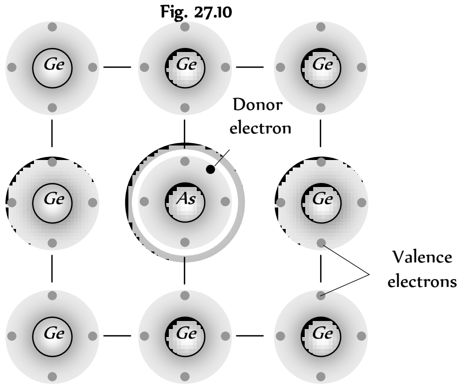

Fig. 27.11

(1) Majority charge carriers – electrons

Minority charge carriers – holes

(2) $n_e >> n_h$; $i_e >> i_h$

(3) Conductivity $\sigma \approx n_e \mu_e e$

(4) *N*-type semiconductor is electrically neutral (not negatively charged)

(5) Impurity is called Donar impurity because one impurity atom generate one electron.

(6) Donor energy level lies just below the conduction band.

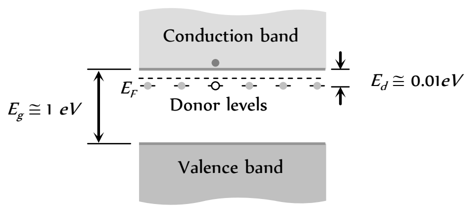

Fig. 27.12

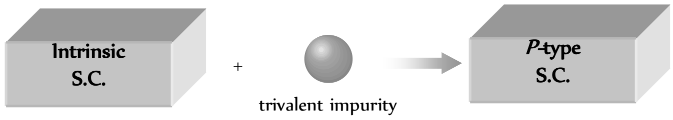
P-Type Semiconductor

These are obtained by adding a small amount of trivalent impurity to a pure sample of semiconductor (*Ge*).



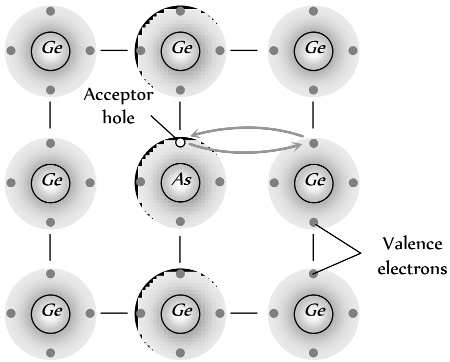


Fig. 27.13

(1) Majority charge carriers – holes

Minority charge carriers – electrons

(2) $n_h >> n_e$; $i_h >> i_e$

(3) Conductivity $\sigma \approx n_h \mu_h e$

(4) *P*-type semiconductor is also electrically neutral (not positively charged)

(5) Impurity is called Acceptor impurity.

(6) Acceptor energy level lies just above the valence band.

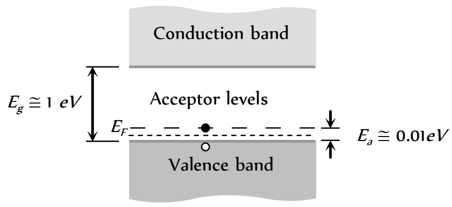

Fig. 27.14

Density of Charge Carriers

Due to thermal collisions, an electron can take up or release energy. Thus, occasionally a valence electron takes up energy and the bond is broken. The electron goes to the conduction band and a hole is created. And occasionally, an electron from the conduction band loses some energy, comes to the valence band and fills up a hole. Thus, new electron-hole pairs are formed as well as old electron-hole disappear. A steady-state situation is reached and the number of electron-hole pairs takes a nearly constant value. For silicon at room temperature (300 *K*), the number of these pairs is about 7×10^{15} *m*. For germanium, this number is about 6×10^{19} /*m*.

Table 27. 4 : Densities of charge carriers

Material	Type	Density of conduction electrons (m^{-3})	Density of holes (m^{-3})
Copper	Conductor	9×10^{28}	0
Silicon	Intrinsic semiconductor	7×10^{15}	7×10^{15}
Silicon doped with phosphorus (1 part in 10^6)	*N*-type semiconductor	5×10^{22}	1 $\times 10^9$

Silicon doped with aluminium (1 part in 10^6	*P*-type semiconductor	1×10^9	5×10^{22}

Conductivity of Semiconductor

(1) In intrinsic semiconductors $n_e = n_h$. Both electron and holes contributes in current conduction.

(2) When some potential difference is applied across a piece of intrinsic semiconductor current flows in it due to both electron and holes *i.e.* $i = i_e + i_h \Rightarrow i = eA[n_e v_e + n_h v_h]$

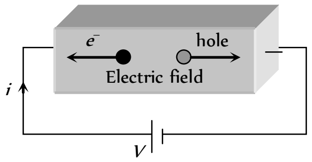

Fig. 27.15

(3) As we know $\sigma = \frac{J}{E} = \frac{i}{AE}$. Hence conductivity of semiconductor

$\sigma = e[n_e \mu_e + n_h \mu_h]$; where v_e = drift velocity of electron, v_h = drift velocity of holes, E = Applied electric field $\mu_e = \frac{v_e}{E}$ = mobility of electron and $\mu_h = \frac{v_h}{E}$ = mobility of holes

(4) Motion of electrons in the conduction band and of holes the valence band under the action of electric field is shown below

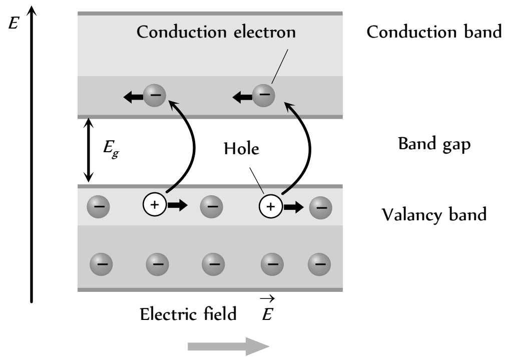

Fig. 27.16

(5) At absolute zero temperature (0 *K*) conduction band of semiconductor is completely empty *i.e.* σ = 0. Hence the semiconductor behaves as an insulator.

P-N Junction Diode

When a *P*-type semiconductor is suitably joined to an *N*-type semiconductor, then resulting arrangement is called *P-N* junction or *P-N* junction diode

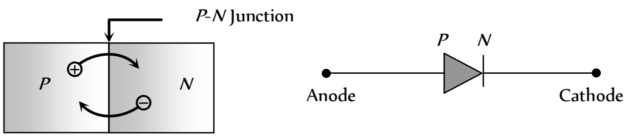

Fig. 27.17

(1) **Depletion region :** On account of difference in concentration of charge carrier in the two sections of *P-N* junction, the electrons from *N*-region diffuse through the junction into *P*-region and the hole from *P* region diffuse into *N*-region.

Due to diffusion, neutrality of both *N* and *P*-type semiconductor is disturbed, a layer of negative charged ions appear near the junction in the *P*-crystal and a layer of positive ions appears near the junction in *N*-crystal. This layer is called depletion layer

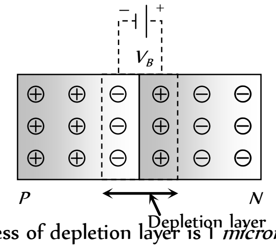

Fig. 27.18

(i) The thickness of depletion layer is 1 *micron* = 10^{-6} *m*.

(ii) Width of depletion layer $\propto \frac{1}{\text{Dopping}}$

(iii) Depletion is directly proportional to temperature.

(iv) The *P-N* junction diode is equivalent to capacitor in which the depletion layer acts as a dielectric.

(2) **Potential barrier :** The potential difference created across the *P-N* junction due to the diffusion of electron and holes is called potential barrier.

For *Ge* $V_B = 0.3V$ and for silicon $V_B = 0.7V$

On the average the potential barrier in *P-N* junction is ~ 0.5 *V* and the width of depletion region ~ 10^{-6} *m*.

So the barrier electric field $E = \frac{V}{d} = \frac{0.5}{10^{-6}} = 5 \times 10^5 \ V/m$

(3) **Some important graphs**

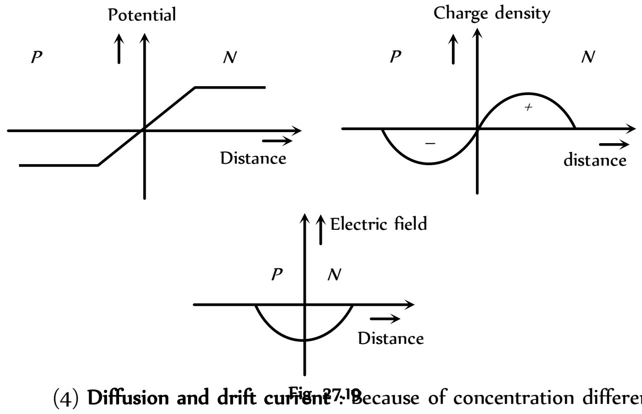

Fig. 27.19

(4) **Diffusion and drift current :** Because of concentration difference holes/electron try to diffuse from their side to other side. Only those holes/electrons crosses the junction, which have high kinetic energy. This diffusion results in an electric current from the *P*-side to the *N*-side known as diffusion current (i_{df})

As electron hole pair (because of thermal collisions) are continuously created in the depletion region. There is a regular flow of electrons towards the *N*-side and of holes towards the *P*-side. This makes a current from the *N*-side to the *P*-side. This current is called the drift current (i_{dr}).

Biasing

It means the way of connecting emf source to *P-N* junction diode. It is of following two types

(1) **Forward biasing :** Positive terminal of the battery is connected to the *P*-crystal and negative terminal of the battery is connected to *N*-crystal

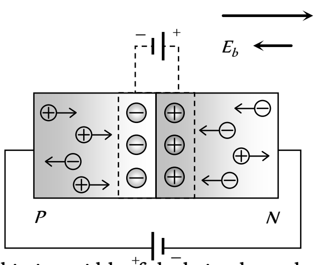

Fig. 27.20

(i) In forward biasing width of depletion layer decreases

(ii) In forward biasing resistance offered $R_{forward} \approx 10\Omega - 25\Omega$

(iii) Forward bias opposes the potential barrier and for $V > V_0$ a forward current is set up across the junction.

(iv) The current is given by $i = i_s(e^{eV/kT} - 1)$; where

$i_s =$ Saturation current, In the exponent $e = 1.6 \times 10^{-19}$ *C*,

k = Boltzmann's constant

(v) Cut-in (Knee) voltage : The voltage at which the current starts to increase rapidly. For *Ge* it is 0.3 *V* and for *Si* it is 0.7 *V*.

(vi) *df* – diffusion

dr – drift

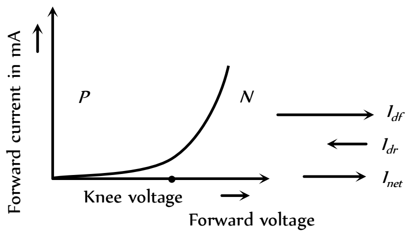

Fig. 27.21

(2) **Reverse biasing :** Positive terminal of the battery is connected to the *N*-crystal and negative terminal of the battery is connected to *P*-crystal

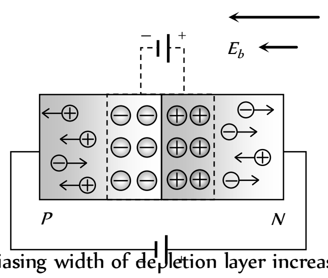

Fig. 27.22

(i) In reverse biasing width of depletion layer increases

(ii) In reverse biasing resistance offered $R_{Reverse} \approx 10\Omega$

(iii) Reverse bias supports the potential barrier and no current flows across the junction due to the diffusion of the majority carriers.

(A very small reverse currents may exist in the circuit due to the drifting of minority carriers across the junction)

(iv) Break down voltage : Reverse voltage at which break down of semiconductor occurs. For *Ge* it is 25 *V* and for *Si* it is 35 *V*.

(v)

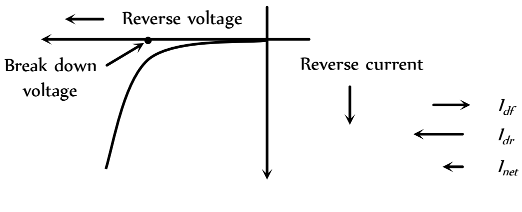

Fig. 27.23

Reverse Breakdown

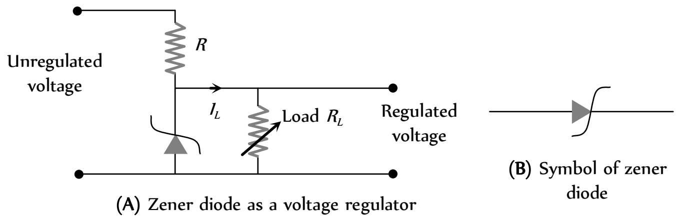
If the reverse biased voltage is too high, then breakdown of *P-N* junction diode occurs. It is of following two types

(1) **Zener breakdown :** When reverse bias is increased the electric field across the junction also increases. At some stage the electric field becomes so high that it breaks the covalent bonds creating electron, hole pairs. Thus a large number of carriers are generated. This causes a large current to flow. This mechanism is known as **Zener breakdown.**

(2) **Avalanche breakdown :** At high reverse voltage, due to high electric field, the minority charge carriers, while crossing the junction acquires very high velocities. These by collision breaks down the covalent bonds, generating more carriers. A chain reaction is established, giving rise to high current. This mechanism is called **avalanche breakdown.**

Special Purpose Diodes

(1) **Zener diode :** It is a highly doped *p-n* junction which is not damaged by high reverse current. It can operate continuously, without being damaged in the region of reverse background voltage. In the forward bias, the zener diode acts as ordinary diode. It can be used as voltage regulator



(A) Zener diode as a voltage regulator (B) Symbol of zener diode

Fig. 27.24

(2) **Light emitting diode (LED :** Specially designed diodes, which give out light radiations when forward biases. LED'S are made of *GaAsp*, *Gap etc.*

These are forward biased *P-N*-junctions which emits spontaneous radiation.

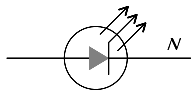


Fig. 27.25

(3) **Photo diode:** Photodiode is a special type of photo-detector. Suppose an optical photons of frequency ν is incident on a semiconductor, such that its energy is greater than the band gap of the semiconductor (*i.e.* $h\nu > E_g$) This photon will excite an electron from the valence band to the conduction band leaving a vacancy or hole in the valence band.

Which obviously increase the conductivity of the semiconductor. Therefore, by measuring the change in the conductance (or resistance) of the semiconductor, one can measure the intensity of the optical signal.

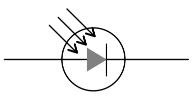

Fig. 27.26

(4) **Solar cells :** It is based on the photovoltic effect. One of the semiconductor region is made so thin that the light incident on it reaches the *P-N*-junction and gets absorbed. It converts solar energy into electrical energy.

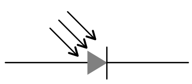

Fig. 27.27

P-N Junction Diode as a Rectifier

Rectifier is a circuit which converts *ac* to unidirectional pulsating output. In other words it converts *ac* to *dc*. It is of following two types

(1) **Half wave rectifier :** When the *P-N* junction diode rectifies half of the *ac* wave, it is called half wave rectifier

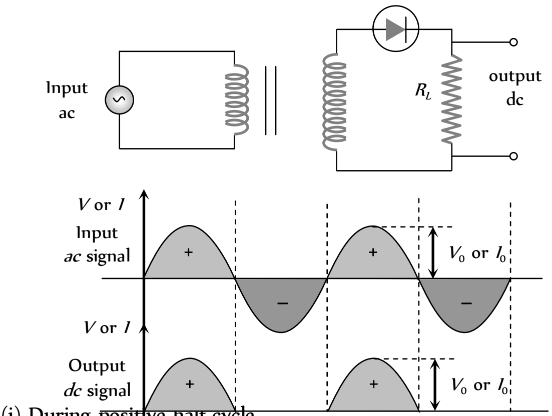

Fig. 27.28

(i) During positive half cycle

Diode ⟶ forward biased

Output signal ⟶ obtained

(ii) During negative half cycle

Diode ⟶ reverse biased

Output signal ⟶ not obtained

(iii) Output voltage is obtained across the load resistance R_L. It is not constant but pulsating (mixture of *ac* and *dc*) in nature .

(iv) Average output in one cycle

$$I_{dc} = \frac{I_0}{\pi} \text{ and } V_{dc} = \frac{V_0}{\pi};\ I_0 = \frac{V_0}{r_f + R_L}$$

(r_f = forward biased resistance)

(v) r.m.s. output : $I_{rms} = \frac{I_0}{2}, V_{rms} = \frac{V_0}{2}$

(vi) The ratio of the effective alternating component of the output voltage or current to the *dc* component is known as ripple factor.

$$r = \frac{I_{ac}}{I_{dc}} = \left[\left(\frac{I_{rms}}{I_{dc}}\right)^2 - 1\right]^{1/2} = 1.21$$

(vii) Peak inverse voltage (PIV) : The maximum reverse biased voltage that can be applied before commoncement of Zener region is called the PIV. When diode is not conducting PIV across it = V_0

(viii) Efficiency : It is given by $\%\eta = \frac{P_{out}}{P_{in}} \times 100 = \frac{40.6}{1 + \frac{r_f}{R_L}}$

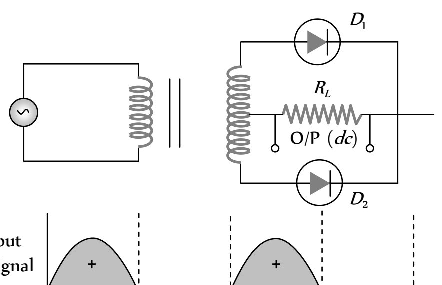
If $R_L >> r_f$ then η = 40.6%

If $R_L = r_f$ then η = 20.3%

(ix) Form factor = $\frac{I_{rms}}{I_{dc}} = \frac{\pi}{2} = 1.57$

(x) The ripple frequency (ω) for half wave rectifier is same as that of *ac*.

(2) **Full wave rectifier :** It rectifies both halves of *ac* input signal.



(i) During positive half cycle

Diode : D_1 ⟶ forward biased

D_2 ⟶ reverse biased

Output signal ⟶ obtained due to D_1 only

(ii) During negative half cycle

Diode : D_1 ⟶ reverse biased

D_2 ⟶ forward biased

Output signal ⟶ obtained due to D_2 only

(iii) Fluctuating *dc* ⟶ Filter ⟶ constant *dc*.

(iv) Output voltage is obtained across the load resistance R_L. It is not constant but pulsating in nature.

(v) Average output : $V_{av} = \frac{2V_0}{\pi}, I_{av} = \frac{2I_0}{\pi}$

(vi) *r.m.s.* output : $V_{rms} = \frac{V_0}{\sqrt{2}}, I_{rms} = \frac{I_0}{\sqrt{2}}$

(vii) Ripple factor : r = 0.48 = 48%

(viii) Ripple frequency : The ripple frequency of full wave rectifier = 2 × (Frequency of input *ac*)

(ix) Peak inverse voltage (PIV) : It's value is $2V_0$

(x) Efficiency : $\eta_{\%} = \frac{81.2}{1 + \frac{r_f}{R_L}}$ for $r_f << R_L$, $\eta = 81.2\%$

(3) **Full wave bridge rectifier :** Four diodes D_1, D_2, D_3 and D_4 are used in the circuit.

During positive half cycle D_1 and D_3 are forward biased and D_2 and D_4 are reverse biased

During negative half cycle D_2 and D_4 are forward biased and D_1 and D_3 are reverse biased

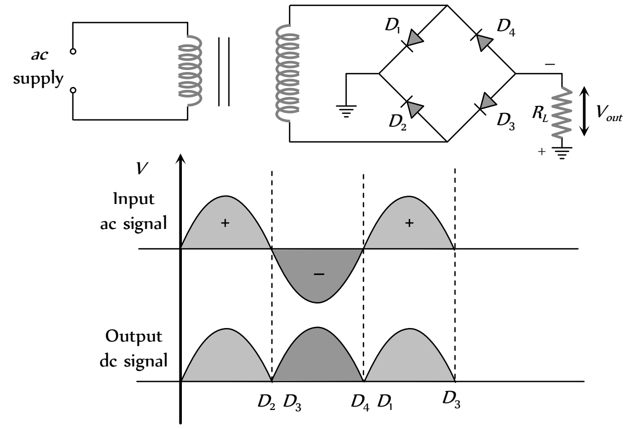


Fig. 27.30

Transistor

(1) The name of this electronic device is derived from it's fundamental action transfer resistor.

(2) Transistor does not need any heater or hot filament, transistor is small in size and light in weight.

(3) Transistor in general is known as bipolar junction transistor.

(4) Transistor is a current operated device.

(5) It consists of three main regions

(i) **Emitter (*E*) :** It provides majority charge carriers by which current flows in the transistor. Therefore the emitter semiconductor is heavily doped.

(ii) **Base (*B*) :** The based region is lightly doped and thin.

(iii) **Collector (*C*) :** The size of collector region is larger than the two other regions.

(6) Junction transistor are of two types :

(i) *NPN* transistor : It is formed by sandwiching a thin layer of *P*-type semiconductor between two *N*-type semiconductors

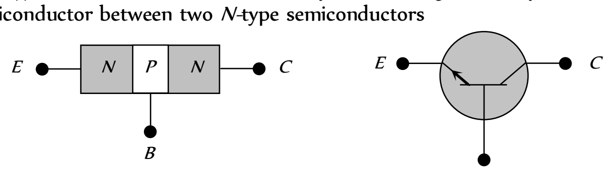

Fig. 27.31

In *NPN* transistor electrons are majority charge carriers and flow from emitter to base.

(ii) *PNP* transistor : It is formed by sandwiching a thin layer of *N*-type semiconductor between two *P*-type semiconductor

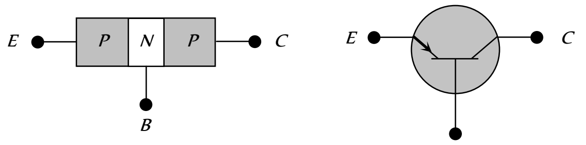

Fig. 27.32

In *PNP* transistor holes are majority charge carriers and flow from emitter to base.

In the symbols of both *NPN* and *PNP* transistor, arrow indicates the direction of conventional current.

Working of Transistor

(1) There are four possible ways of biasing the two *P-N* junctions (emitter junction and collector junction) of transistor.

(i) Active mode : Also known as linear mode operation.

(ii) Saturation mode : Maximum collector current flows and transistor acts as a closed switch from collector to emitter terminals.

(iii) Cut-off mode : Denotes operation like an open switch where only leakage current flows.

(iv) Inverse mode : The emitter and collector are inter changed.

Table 27.5 : Different modes of operation of a transistor

Operating mode	Emitter base bias	Collector base bias
Active	Forward	Reverse
Saturation	forward	Forward
Cut off	Reverse	Reverse
Inverse	Reverse	Forward

(2) A transistor is mostly used in the active region of operation *i.e.* emitter base junction is forward biased and collector base junction is reverse biased.

(3) From the operation of junction transistor it is found that when the current in emitter circuit changes. There is corresponding change in collector current.

(4) In each state of the transistor there is an input port and an output port. In general each electrical quantity (*V* or *I*) obtained at the output is controlled by the input.

Table 27.6 : Circuit diagram of *PNP*/*NPN* transistor

NPN – transistor	*PNP* – transistor
		5% emitter electron combine with the holes in the base region resulting in small base current. Remaining 95% electrons enter the collector region.	5% emitter holes combine with the electrons in the base region resulting in small base current. Remaining 95% holes enter the collector region.
$I_e > I_c$, and $I_e = I_b + I_c$	$I_e > I_c$, and $I_e = I_b + I_c$

Transistor Configurations

A transistor can be connected in a circuit in the following three different configurations.

Common base (CB), Common emitter (CE) and Common collector (CC) configuration.

(1) **CB configurations :** Base is common to both emitter and collector .

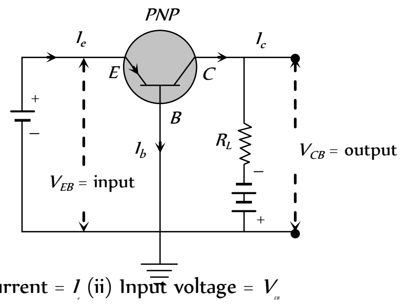

Fig. 27.33

(i) Input current = I_e (ii) Input voltage = V_{eb}

(iii) Output voltage = V_{cb} (iv) Output current = I_c

With small increase in emitter-base voltage V_{eb}, the emitter current I_e increases rapidly due to small input resistance.

(v) **Input characteristics :** If V_{cb} = constant, curve between I_e and V_{eb} is known as input characteristics. It is also known as emitter characteristics

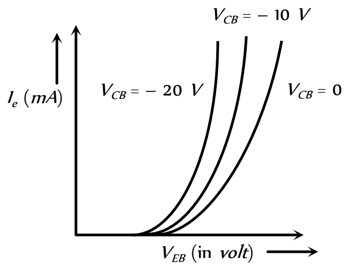

Fig. 27.34

Input characteristics of *NPN* transistor are also similar to the above figure but I_e and V_{eb} both are negative and V_{cb} is positive.

Dynamic input resistance of a transistor is given by

$$R_i = \left(\frac{\Delta V_{EB}}{\Delta I_e}\right)_{V_{CB} = \text{constant}} \quad \{R_i \text{ is of the order of } 100\ \Omega\}$$

(vi) **Output characteristics :** Taking the emitter current i_e constant, the curve drawn between I_c and V_{cb} are known as output characteristics of *CB* configuration.

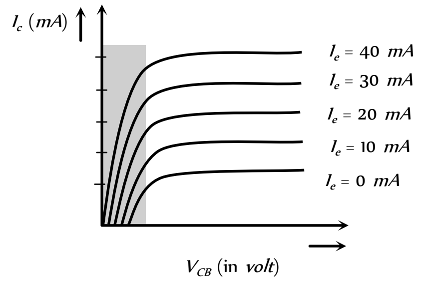

Fig. 27.35

Dynamic output resistance $R_o = \left(\frac{\Delta V_{CB}}{\Delta i_C}\right)_{i_e = \text{constant}}$

(2) **CE configurations :** Emitter is common to both base and collector.

The graphs between voltages and currents when emitter of a transistor is common to input and output circuits are known as CE characteristics of a transistor.

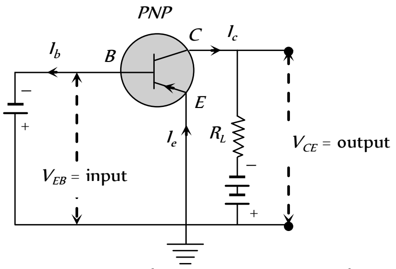

Fig. 27.36

Input characteristics : Input characteristic curve is drawn between base current I_b and emitter base voltage V_{eb}, at constant collector emitter voltage V_{ce}.

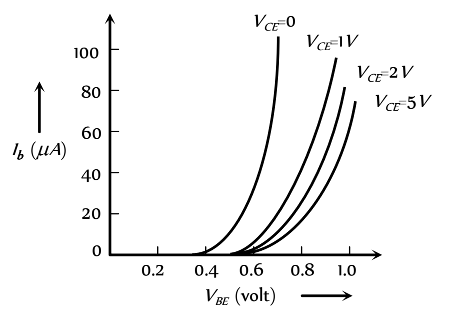

Fig. 27.37

Dynamic input resistance $R_i = \left(\frac{\Delta V_{BE}}{\Delta I_B}\right)_{V_{CE} \to \text{constant}}$

Output characteristics : Variation of collector current I_c with V_{ce} can be noticed for V_{ce} between 0 to 1 *V* only. The value of V_{ce} up to which the I_c changes with V_{ce} is called knee voltage. The transistor are operated in the region above knee voltage.

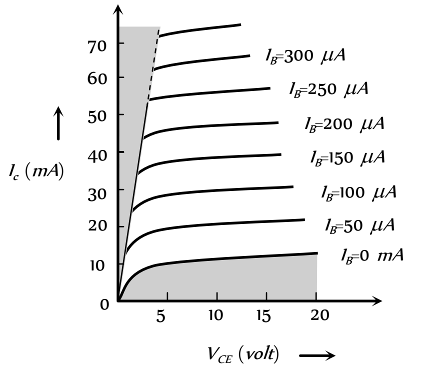

Fig. 27.38

Dynamic output resistance $R_0 = \left(\frac{\Delta V_{CE}}{\Delta I_C}\right)_{I_B \to \text{constant}}$

Field-Effect Transistor

The low input impedance of the junction transistor is a handicap in certain applications. In addition, it is difficult to incorporate large numbers of them in an integrated circuit and they consume relatively large amounts of power. The field-effect transistor (FET) lacks these disadvantages and is widely used today although slower in operation than junction transistors.

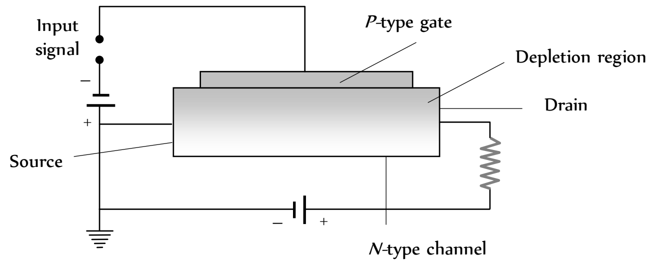

Fig. 27.39

An *n*-channel FET consists of a block of *N*-type material with contacts at each end together with a strip of *P*-type material on one side that is called the gate. When connected as shown, electrons move from the source terminal to the drain terminal through the *N*-type channel. the *PN* junction is given a reverse bias, and as a result both the *N* and *P* materials near the junction are depleted on charge carriers. The higher the reverse potential on the gate, the larger the depleted region in the channel and the fewer the electrons available to carry the current. Thus the gate voltage controls the channel current. Very little current passes through the gate circuit owing to the reverse bias, and the result is an extremely high input impedance. FET is uni-polar.

Transistor as an Amplifier

A device which increases the amplitude of the input signal is called amplifier.

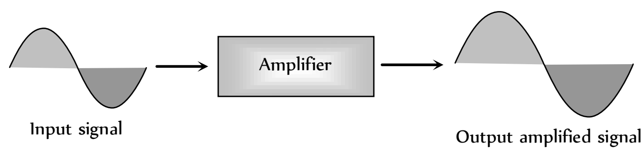

Fig. 27.40

The transistor can be used as an amplifier in the following three configuration

(i) CB amplifier (ii) CE amplifier (iii) CC amplifier

(1) ***NPN* transistor as CB amplifier**

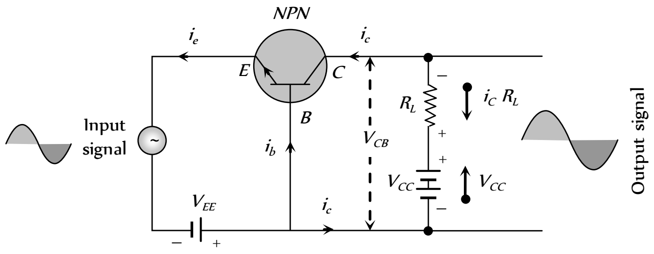

Fig. 27.41

(i) $i_e = i_b + i_C$; i_b = 5% of i_e and i_c = 95% of i_e

(ii) $V_{CB} < V_{CC}$

(iii) Net collector voltage $V_{CB} = V_{CC} - i_C R_L$

When the input signal (signal to be amplified) is fed to the emitter base circuit, it will change the emitter voltage and hence emitter current. This in turn will change the collector current (i). This will vary the collector voltage V_{CB}. This variation of V_{CB} will appear as an amplified output.

(iv) Input and output signals are in same phase

(2) ***NPN* transistor as *CE* amplifier**

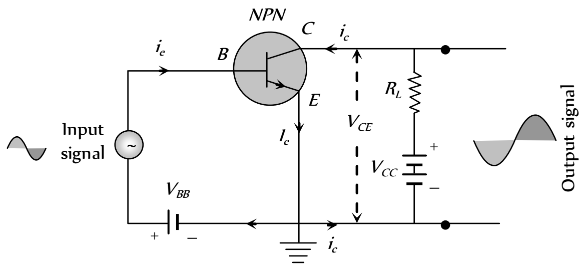

Fig. 27.42

(i) $i_e = i_b + i_C$; i_b = 5% of i_e and i_c = 95% of i_e

(ii) $V_{CC} > V_{BB}$

(iii) Net collector voltage $V_{CE} = V_{CC} - i_C R_L$

(iv) Input and output signals are 180° out of phase.

Different Gains in CE/CB Amplifiers

(1) **Transistor as CB amplifier**

(i) *ac* current gain $\alpha_{ac} = \dfrac{\text{Small change in collector current } (\Delta i_c)}{\text{Small change in collector current } (\Delta i_e)}$

V_{CB} (constant)

(ii) *dc* current gain $\alpha_{dc} (\text{or} \alpha) = \dfrac{\text{Collector current} (i_c)}{\text{Emitter current } (i_e)}$

valve of α_{dc} lies between 0.95 to 0.99

(iii) Voltage gain $A_v = \dfrac{\text{Change in output voltage} (\Delta V_o)}{\text{Change in input voltage} (\Delta V_i)}$

$\Rightarrow A_v = \alpha_{ac} \times$ Resistance gain

(iv) $\text{Power gain} = \dfrac{\text{Change in output power} (\Delta P_o)}{\text{Change in input power} (\Delta P_c)}$

$\Rightarrow \text{Power gain} = \alpha_{ac}^2 \times \text{Resistance gain}$

(2) **Transistor as CE amplifier**

(i) *ac* current gain $\beta_{ac} = \left(\dfrac{\Delta i_c}{\Delta i_b}\right)$ V_{CE} = constant

(ii) *dc* current gain $\beta_{dc} = \dfrac{i_c}{i_b}$

(iii) Voltage gain : $A_v = \dfrac{\Delta V_o}{\Delta V_i} = \beta_{ac} \times \text{Resistance gain}$

(iv) $\text{Power gain} = \dfrac{\Delta P_o}{\Delta P_i} = \beta_{ac}^2 \times \text{Resistance gain}$

(v) Trans conductance (g_m) : The ratio of the change in collector current to the change in emitter base voltage is called trans conductance. *i.e.* $g_m = \dfrac{\Delta i_c}{\Delta V_{EB}}$. Also $g_m = \dfrac{A_V}{R_L}$; R_L = Load resistance

(3) **Relation between α and β** : $\beta = \dfrac{\alpha}{1-\alpha}$ or $\alpha = \dfrac{\beta}{1+\beta}$

Transistor as an Oscillator

(1) It is defined as a circuit which generates an *ac* output signal without any externally applied input signal.

Audio frequency oscillators generates signals of frequencies ranging from a few *Hz* to 20 *kHz* and radio frequency oscillators have a range from few *kHz* to *MHz*.

(2) In an oscillator the frequency, waveform, and magnitude of *ac* power generated is controlled by circuit itself.

(3) An oscillator may be considered as amplifier which provides it's own input signal.

(4) The essential of a transistor oscillator are

(i) **Tank circuit :** Parallel combination of *L* and *C*. This network resonates at a frequency $\nu_0 = \dfrac{1}{2\pi}\sqrt{\dfrac{1}{LC}}$.

(ii) **Amplifier :** It receives *dc* power from the battery and converts into *ac* power.

The amplifier increases the strength of oscillations.

(iii) **Feed back circuit :** This circuit supplies a part of the collector energy to the tank circuit.

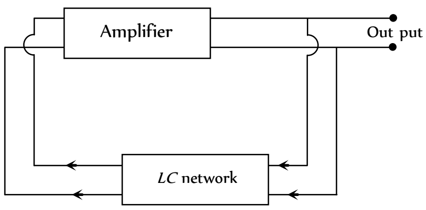

Fig. 27.43

(5) A basic common-emitter *NPN* oscillator is shown in the figure.

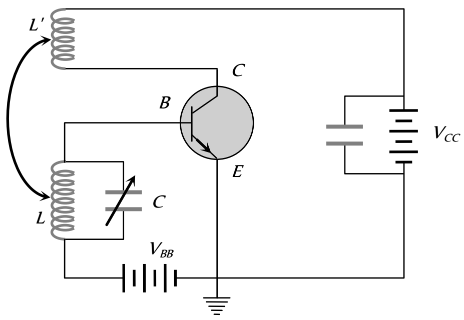

Fig. 27.44

A tank circuit (L-C circuit) is connected in the base-emitter circuit, in which the capacitance C is kept variable. By changing C oscillations of a desired frequency can be obtained. An inductance coil L' connected in the collector-emitter circuit is coupled to coil L.

On completion of the circuit electrical oscillations are developed in the tank circuit. The circuit amplifies these oscillations. A part of the amplifies signal in the collector circuit is fed back in the base circuit by the coupling between L and L'. Due to this feed back amplitude of oscillation builds up till power dissipation in the oscillatory circuit becomes equal to power fed-back. In this state the amplitude of oscillations becomes constant.

The oscillations can be transferred to an external circuit by mutual induction in a coil connected in that circuit.

(6) **Need for positive feedback :** The oscillations are damped due to the presence of some inherent electrical resistance in the circuit. Consequently, the amplitude of oscillations decreases rapidly and the oscillations ultimately stop. Such oscillations are of little practical importance. In order to obtain oscillations of constant amplitude, we make an arrangement for regenerative or positive feedback from the output circuit to the input circuit so that the losses in the circuit can be compensated.

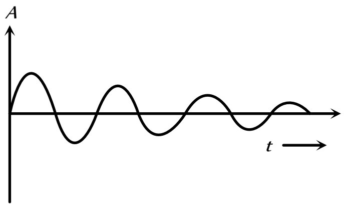

Fig. 27.45

Table 27.7: Comparison between CB, CE and CC amplifier

Characteristic	Amplifier		
	CB	CE	CC
Input resistance (R_i)	≈ 50 to 200 Ω low	≈ 1 to 2 $k\Omega$ medium	≈ 150 – 800 $k\Omega$ high
Output resistance (R_o)	≈ 1 – 2 $k\Omega$ high	≈ 50 $k\Omega$ medium	≈ $k\Omega$ low
Current gain	0.8 – 0.9 low	20 – 200 high	20 – 200 high
Voltage gain	Medium	High	Low
Power gain	Medium	High	Low
Phase difference between input and output voltages	Zero	180°	Zero
Used as amplifier for	current	Power	Voltage

Digital Electronics

Decimal and Binary Number System

(1) **Decimal number system :** In a decimal number system, we have ten digits *i.e.* 0, 1, 2, 3, 4, 5, 6, 7, 8, 9.

A decimal number system has a base of ten (10)

e.g. 1971 = 1000 + 900 + 70 + 1

$= 1 \times 10^3 + 9 \times 10^2 + 7 \times 10^1 + 1 \times 10^0$

MSD LSD

LSD = Least significant digit

MSD = Most significant digit

(2) **Binary number system :** A number system which has only two digits *i.e.* 0 (Low) and 1 (High) is known as binary system. The base of binary number system is 2.

(i) Each digit in binary system is known as a bit and a group of bits is known as a byte.

(ii) The electrical circuit which operates only in these two state *i.e.* 1 (On or High) and 0 (*i.e.* Off or Low) are known as digital circuits.

Table 27. 8 : Different names for the digital signals

State Code	1	0
Name for the State	On	Off
	Up	Down
	Close	Open
	Excited	Unexcited
	True	False
	Pulse	No pulse
	High	Low
	Yes	No

(3) **Decimal to binary conversion**

(i) Divide the given decimal number by 2 and the successive quotients by 2 till the quotient becomes zero.

(ii) The sequence of remainders obtained during divisions gives the binary equivalent of decimal number.

(iii) the most significant digit (or bit) of the binary number so obtained is the last remainder and the least significant digit (or bit) is the first remainder obtained during the division.

***For Example* :** Binary equivalence of 61

2	61	Remainder
2	30	1 LSD
2	15	0

2	7	1
2	3	1
2	1	1
	0	1 MSD

$\Rightarrow (61)_{10} = (111101)_2$

(4) **Binary to decimal conversion :** The least significant digit in the binary number is the coefficient of 2 with power zero. As we move towards the left side of LSD, the power of 2 goes on increasing.

***For Example* :** $(11111100101)_2 = 1\times2^{10} + 1\times2^9 + 1\times2^8 + 1\times2^7 + 1\times2^6 + 1\times2^5 + 0\times2^4 + 0\times2^3 + 1\times2^2 + 0\times2^1 + 1\times2^0 = 2021$

Voltage Signal

(1) **Analogue voltage signal :** The signal which represents the continuous variation of voltage with time is known as analogue voltage signal

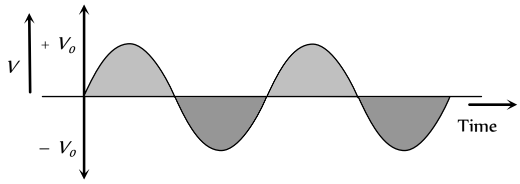

Fig. 27.46

(2) **Digital voltage signal :** The signal which has only two values. *i.e.* either a constant high value of voltage or zero value is called digital voltage signal

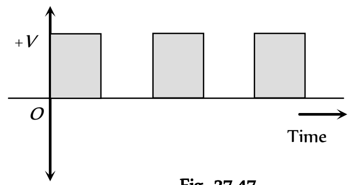

Fig. 27.47

Boolean Algebra

(1) In Boolean algebra only two states of variables (0 and 1) are allowed.

(2) The variables (A, B, C ....) of Boolean Algebra are subjected to three operations.

(i) **OR Operation :** Represented by (+) sign

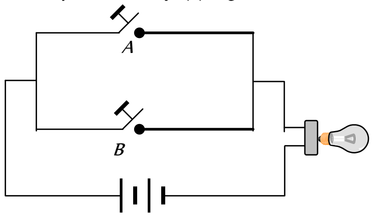

Fig. 27.48

Boolean expression $Y = A + B$

When switch *A* or *B* is closed – Bulb glows

(ii) **AND Operation :** Represented by (·) sign

Boolean expression $Y = A \cdot B$

When switches *A* and *B* both are closed – Bulb glows

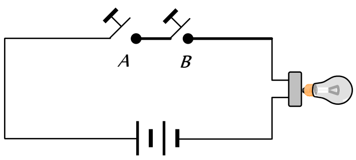

Fig. 27.49

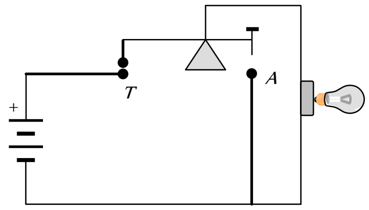
(iii) **NOT Operation :** Represented by bar over the variables

Boolean expression $Y = \overline{A}$



A OFF → Lamp ON
A ON → Contact at *T* is broken
→ Lamp OFF

Fig. 27.50

(3) **Basic Boolean postulates and laws**

(i) Boolean Postulates : $0 + A = A$, $1 \cdot A = A$,

$1 + A = 1$, $0 \cdot A = 0$,

$A + \overline{A} = 1$

(ii) Identity law : $A + A = A$, $A \cdot A = A$

(iii) Negation law : $\overline{\overline{A}} = A$

(iv) Commutative law : $A + B = B + A$, $A \cdot B = B \cdot A$

(v) Associative law : $(A+B) + C = A + (B+C)$,

$(A \cdot B) \cdot C = A \cdot (B \cdot C)$

(vi) Distributive law : $A \cdot (B+C) = A \cdot B + A \cdot C$

$(A + B) \cdot (A + C) = A + BC$

(vii) Absorption laws : $A + A \cdot B = A$, $A \cdot (A + B) = A$

$\overline{A} \cdot (A + B) = \overline{A} \cdot B$

(viii) Boolean identities : $A + \overline{A}B = A + B$, $A(\overline{A} + B) = AB$,

$A + BC = (A + B)(A + C)$, $(\overline{A} + B) \cdot (A + C) = \overline{A}C + AB$

(ix) **De Morgan's theorem** : It states that the complement of the whole sum is equal to the product of individual complements and vice versa *i.e.* $\overline{A+B} = \overline{A} \cdot \overline{B}$ and $\overline{A \cdot B} = \overline{A} + \overline{B}$

Logic Gates and Truth Table

(1) **Logic gate :** The digital circuit that can be analysed with the help of Boolean algebra is called logic gate or logic circuit. A logic gate has two or more inputs but only one output.

There are primarily three logic gates namely the OR gate, the AND gate and the NOT gate.

(2) **Truth table :** The operation of a logic gate or circuit can be represented in a table which contains all possible inputs and their corresponding outputs is called the truth table. To write the truth table we use binary digits 1 and 0.

The 'OR' Gate

(1) It has two inputs (A and B) and only one output (*Y*)

(2) Boolean expression is $Y = A + B$ and is read as "*Y* equals *A* **OR** *B*"

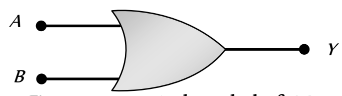


Fig. 27.51 : Logical symbol of OR gate

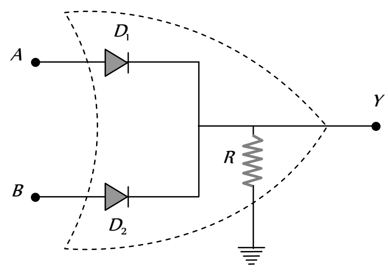
(3) **Realization of OR gate**



(i) $A = 0,\ B = 0$

Both diodes D_1 and D_2 do not conduct and hence $Y = 0$

(ii) $A = 0,\ B = 1$

D_1 = Does not conducts, D_2 = Conducts, hence $Y = 1$

(iii) $A = 1,\ B = 0$

D_1 = Conducts, D_2 = Does not conduct, hence $Y = 1$

(iv) $A = 1,\ B = 1$

Both D_1 and D_2 conducts, hence $Y = 1$

(4) **Truth table for 'OR' gate**

A	*B*	*Y = A + B*
0	0	0
0	1	1
1	0	1
1	1	1

The 'AND' Gate

(1) It has two inputs (A and B) and only one output (*Y*)

(2) Boolean expression is $Y = A \cdot B$ is read as " *Y* equals *A* AND *B*"

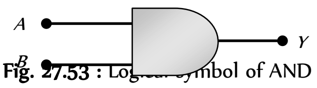


Fig. 27.53 : Logical symbol of AND gate

(3) **Realization of AND gate**

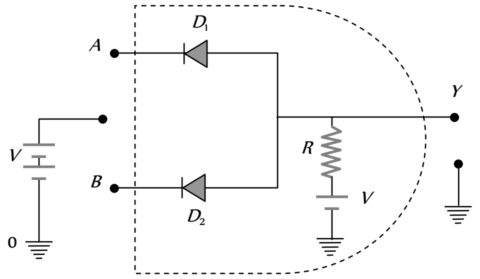

Fig. 27.54

(i) $A = 0,\ B = 0$

The voltage supply through *R* is forward biasing diodes D_1 and D_2 (offers low resistance) the voltage *V* would drop across *R*

The output voltage at *Y* = the voltage across diode = 0

(ii) $A = 0,\ B = 1$

D_1 = conducts, D_2 = Not Conducts

the out voltage at *Y* = The voltage across the diode (D) =0

(iii) $A = 1,\ B = 0$

D_1 = Conducts, D_2 = Not conducts

the out voltage at *Y* = The voltage across the diode (D_1) =0

iv) $A = 1,\ B = 1$

None of the diode conducts

the out voltage at *Y* = Battery voltage =1

(4) **Truth table for 'AND' gate**

A	*B*	*Y = A . B*
0	0	0
0	1	0
1	0	0
1	1	1

The 'NOT' Gate

(1) It has only one input and only one output.

(2) Boolean expression is $Y = \overline{A}$ and is read as "*y* equals not *A*"

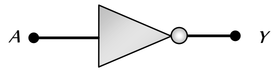

Fig 27.55 : Logical symbol of NOT gate

(3) **Realization of NOT gate :** The transistor is so biased that the collector voltage $V_{cc} = V$ (Voltage corresponding to 1 state)

The resistors R and R_1 are so chosen that if the input is low *i.e.* *O*, the transistor is in the cut off and hence the voltage appearing at the output will be the same as applied *V*. Hence $Y = V$ (or state 1)

If the input is high, the transistor current is in saturation and the net voltage at the output *Y* is 0 (in state 0)

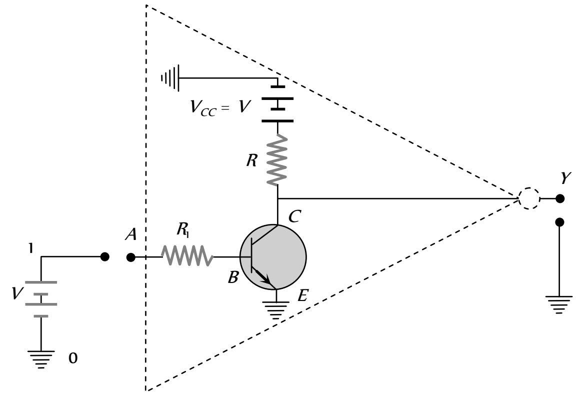

Fig. 27.56

(4) **Truth table for NOT gate :**

A	$Y = \overline{A}$
0	1
1	0

Combination of Logic Gates

(1) **The 'NAND' gate :** From 'AND' and 'NOT' gate

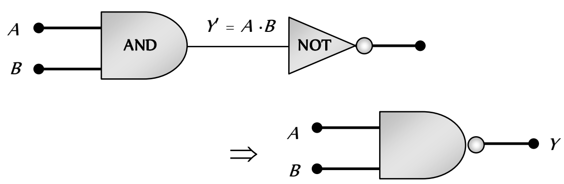

Fig. 27.57

Boolean expression and truth table : $Y = \overline{A \cdot B}$

A	B	$Y' = A \cdot B$	Y
0	0	0	1
0	1	0	1
1	0	0	1
1	1	1	0

(2) **The 'NOR' gate :** From 'OR' and 'NOT' gate

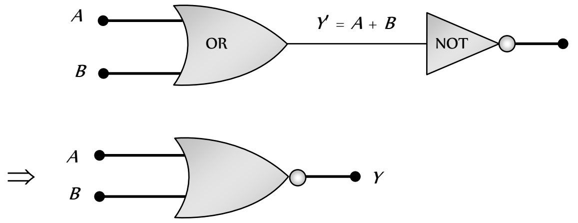

Fig. 27.58

Boolean expression and truth table : $Y = \overline{A + B}$

A	B	$Y' = A + B$	Y
0	0	0	1
0	1	1	0
1	0	1	0
1	1	1	0

(3) **The 'XOR' gate :** From 'NOT', 'AND' and 'OR' gate. Known as exclusive OR gate.

or

The logic gate which gives high output (*i.e.*, 1) if either input A or input B but not both are high (*i.e.* 1) is called exclusive OR gate or the XOR gate.

It may be noted that if both the inputs of the XOR gate are high, then the output is low (*i.e.*, 0).

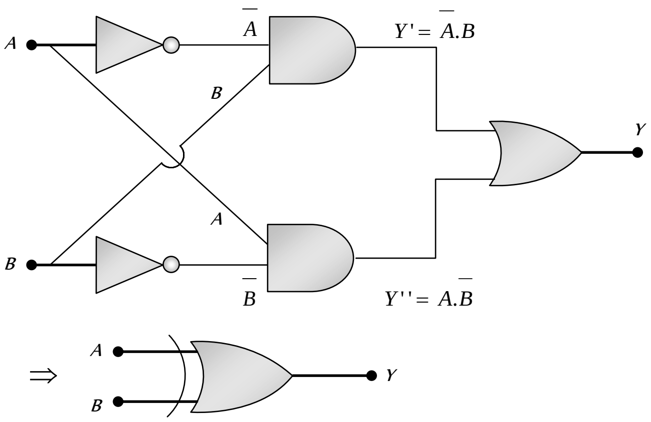

Fig. 27.59

Boolean expression and truth table : $Y = A \oplus B = \overline{A}B + A\overline{B}$

A	B	Y
0	0	0
0	1	1
1	0	1
1	1	0

(4) **The exclusive nor (XNOR) gate**

XOR + NOT ⟶ XNOR

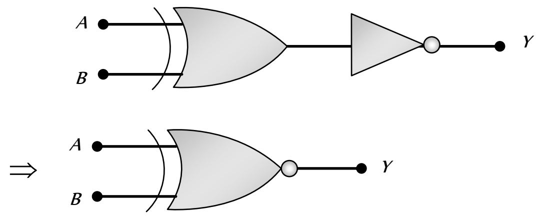

Fig. 27.60

Boolean expression : $Y = A \odot B = \overline{A}\,\overline{B} + AB$

Logic Gates Using 'NAND' Gate

The NAND gate is the building block of the digital electronics. All the logic gates like the OR, the AND and the NOT can be constructed from the NAND gates.

(1) **Construction of the 'NOT' gate from the 'NAND' gate**

(i) When both the inputs (A and B) of the NAND gate are joined together then it works as the NOT gate.

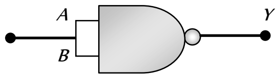

Fig. 27.61

(ii) Truth table and logic symbol

Input	Output
$A = B$	Y
0	1
1	0

(2) **Construction of the 'AND' gate from the 'NAND' gate**

(i) When the output of the NAND gate is given to the input of the NOT gate (made from the NAND gate), then the resultant logic gate works as the AND gate

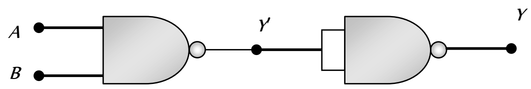

Fig. 27.62

(ii) Truth table and logic symbol

Valve Electronics

Electron Emission from Metal

(1) Free electron in metal experiences a barrier on surface due to attractive Coulombian force.

(2) When kinetic energy of electron becomes greater than barrier potential energy (or binding energy E_b) then electron can come out of the surface of metal.

(3) **Fermi energy (E_f) :** Is the maximum possible energy possessed by free electron in metal at $0K$ temperature

(i) In this energy level, probability of finding electron is 50%.

(ii) This is a reference level and it is different for different metals.

(4) **Threshold energy (or work function W_0) :** Is the minimum energy required to take out an electron from the surface of metal. Also $W_0 = E_b - E_f$

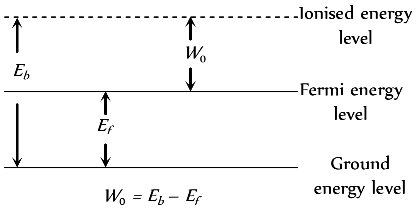

Fig. 27.64

Work function for different materials

$(W_0)_{\text{Pure tungsten}} = 4.5\ eV$

$(W_0)_{\text{Thoriated tungsten}} = 2.6\ eV$

$(W_0)_{\text{Oxide coated tungsten}} = 1\ eV$

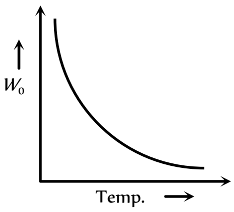

Fig. 27.65

(5) Four processes of electron emission from a metal are

(i) Thermionic emission

(ii) Photoelectric emission

(iii) Field emission

(iv) Secondary emission

Thermionic Emission

(1) The phenomenon of ejection of electrons from a metal surface by the application of heat is called thermionic emission and emitted electrons are called thermions and current flowing is called thermion current.

(2) Thermions have different velocities.

(3) This was discovered by Edison

(4) Richardson – Dushman equation for current density (*i.e.* electric current emitted per unit area of metal surface) is given as

$$J = AT^2 e^{-W_0/kT} = AT^2 e^{-\frac{qV}{kT}} = AT^2 e^{-\frac{11600\ V}{T}}$$

where A = emission constant = 12×10^4 *amp/ m-K*, k = Boltzmann's constant, T = Absolute temp and W_0 = work function.

(5) The number of thermions emitted per second per unit area (J) depends upon following :

(i) $J \propto T^2$ (ii) $J \propto e^{-W_0}$

Table 27.9: Types of thermionic emitters

Directly heated emitter	Indirectly heated emitter
	Cathode is directly heated by passing current.	Cathode is indirectly heated.
Thermionic current is less.	Thermionic current is more.
Energy consumption and life is small.	Energy consumption and life is more.

Vacuum Tubes and Thermionic Valves

(1) Those tubes in which electrons flows in vacuum are called vacuum tubes.

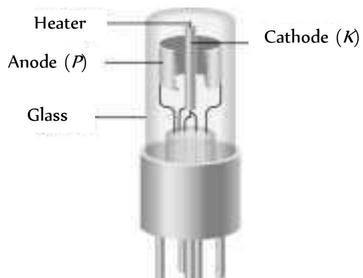
(2) These are also called valves because current flow in them is unidirectional.

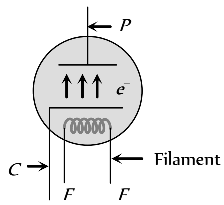
(3) Vacuum in vacuum tubes prevents the emission of secondary electrons and burning of heated filament (which will happen if we use air in place of vacuum)

(4) Every vacuum tube necessarily contains two electrodes out of which one is always electron emitter (cathode) and another one is electron collector (anode or plate).

(5) Depending upon the number of electrodes used the vacuum tubes are named as diode, triode, tetrode, pentode.... respectively, if the number of electrodes used are 2, 3, 4, 5..... respectively.

Diode Valve





(1) **Inventor :** Fleming

(2) **Principle :** Thermionic emission

(3) **Number of electrodes :** Two

(4) **Working :** When plate potential (V_p) is positive, plate current (i_p) flows in the circuit (because some emitted electrons reaches to plate). If $+V_p$ increases i_p also increases and finally becomes maximum (saturation).

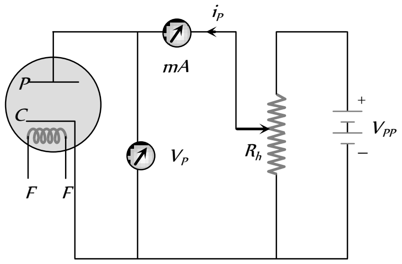


Fig. 27.67

(5) **Space charge :** If V_p is zero or negative, then electrons collect around the plate as a cloud which is called space charge. space charge decreases the emission of electrons from the cathode.

Characteristic Curves of a Diode

A graph represents the variation of i_p with V_p at a given filament current (i_f) is known as characteristic curve.

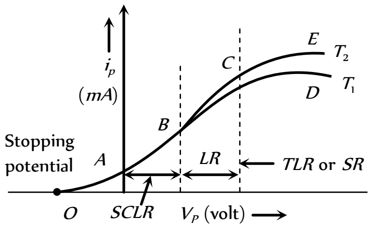

Fig. 27.68

The curve is not linear hence diode valve is a non-ohmic device.

(1) **Space charge limited region (SCLR)** : In this region current is space charge limited current.

Also $i_p \propto V_p^{3/2} \Rightarrow i_p = kV_p^{3/2}$; where k is a constant depending on metal as well as on the shape and area of the cathode. This is called child's law.

(2) **Linear region (LR) :** In this region $i_p \propto V_p$

(3) **Saturated region (SR) or temperature limited region (TLR) :** In this part, the current is independent of potential difference applied between the cathode and anode.

$i_p \neq f(V_p)$, $i_p = f$ (Temperature)

The saturation current follows Richardson Dushman equation *i.e.* $i = AST^2 e^{-\phi_0/kT}$; Here

A = Emission constant = $\dfrac{4\pi\, mek^2}{h^3} amp/m^2 - k^2$

S = Area of emitter in m^2 ; T = Absolute temperature in K

ϕ_0 =Work function of metal in Joule; k =Boltzmann constant

The small increase in i_p after saturation stage due to field emission is known as Shottkey effect.

(4) **Diode resistance**

(i) Static plate resistance or dc plate resistance : $R_p = \dfrac{V_p}{i_p}$.

(ii) Dynamic or ac plate resistance : If at constant filament current, a small change ΔV_p in the plate potential produces a small change Δi_p in the plate current, then the ratio $\Delta V_p / \Delta i_p$ is called the dynamic resistance, or the 'plate resistance' of the diode $r_p = \dfrac{\Delta V_p}{\Delta i_p}$.

(iii) In SCLR : $r_p < R_p$, (iv) In TLR : $R_p < r_p$ and $r_p = \infty$.

(5) **Uses of diode valve**

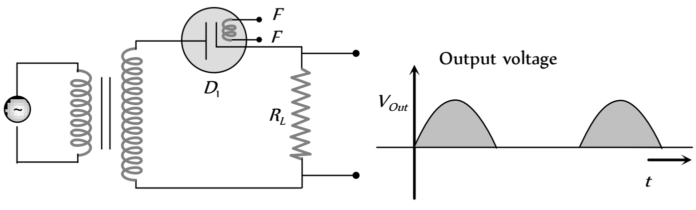
(i) As a rectifier (ii) As a detector

(iii) As a transmitter (iv) As a modulator

Diode Valve as a Rectifier

Rectifier is a device which converts ac into dc

(1) **Half wave rectifier :** The circuit of half wave rectifier is shown below. In the first half cycle of *ac* input the diode conducts and in the second half cycle it does not conducts. Thus half of the input cycle appear as output.



(A) Half wave rectifier (B) Output signal

Fig. 27.69

(i) Output voltage is not constant but pulsating in nature.

(ii) It is a mixture of *ac* and *dc.*

(iii) The *dc* values of the half wave output are given by

$$V_{d.c.} = \frac{V_0}{\pi} \text{ and } i_{d.c.} = \frac{i_0}{\pi}$$

(iv) The *r.m.s.* values of the half wave output are given by

$$V_{rms} = \frac{V_0}{2} \text{ and } i_{rms} = \frac{i_0}{2}$$

(v) The ratio of the effective alternating component to the direct component of the output voltage or current is called ripple factor

$$r = \frac{i_{a.c.}}{i_{d.c.}} = \sqrt{\left(\frac{i_{rms}}{i_{d.c.}}\right)^2 - 1} = \sqrt{\left(\frac{\pi}{2}\right)^2 - 1} = 1.21 = 121\%.$$

(vi) Efficiency of half wave rectifier is given by

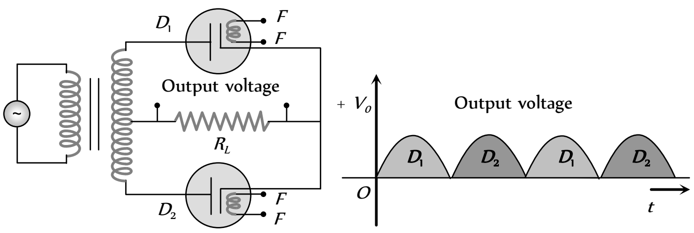
$$\eta = \frac{P_{d.c.}}{P_{a.c.}} \times 100\% = \frac{40.6}{1+\frac{r_p}{R_L}}\%$$

The maximum efficiency (for $R_L >> r_p$) = 40.6%

(vii) Form factor $= \frac{i_{rms}}{i_{d.c.}} = \frac{V_{rms}}{V_{d.c.}} = \frac{\pi}{2} = 1.57$

(viii) Ripple frequency = Frequency of input ac = ω

(2) **Full wave rectifier :** It consist of two diodes D_1 and D_2. They conducts alternately during positive and negative half cycle of input *ac* and a unidirectional (or *dc*) current flows in output



(A) Full wave rectifier (B) Output signal

Fig. 27.70

(i) The average or *dc* output values are

$$V_{d.c.} = \frac{2V_0}{\pi} \text{ and } i_{d.c.} = \frac{2i_0}{\pi}$$

(ii) It is a mixture of *ac* and *dc*

(iii) The *r.m.s.* values of the half wave output are given by

$$V_{rms} = \frac{V_0}{\sqrt{2}} \text{ and } i_{rms} = \frac{i_0}{\sqrt{2}}$$

(iv) Ripple factor $r = \sqrt{\left(\frac{\pi}{2\sqrt{2}}\right)^2 - 1} = 0.48 = 48\%$.

(v) Efficiency of half wave rectifier is given by

$$\eta = \frac{P_{d.c.}}{P_{a.c.}} \times 100\% = \frac{81.2}{1+\frac{r_p}{R_L}}\%$$

The maximum efficiency (for $R_L >> r_p$) = 81.2%

(vii) Form factor $= \frac{i_{rms}}{i_{d.c.}} = \frac{V_{rms}}{V_{d.c.}} = \frac{\pi}{2\sqrt{2}} = 1.11$

(viii) Ripple frequency = Double of frequency of input ac = 2ω

Filter Circuit

Filter circuits smooth out the fluctuations in amplitude of ac ripple of the output voltage obtained from a rectifier.

(i) Filter circuit consists of capacitors or/ and choke coils.

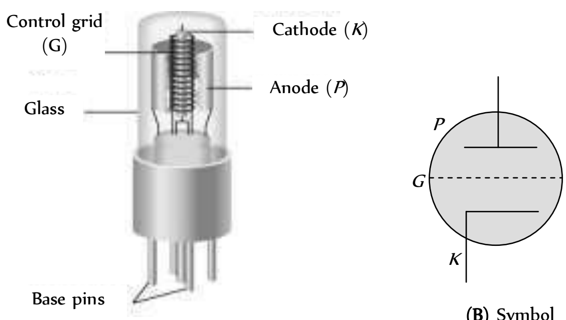
(ii) A capacitor offers a high resistance to low frequency ac ripple (infinite resistance to dc) and a low resistance to high frequency ac ripple. Therefore, it is always used as a shunt to the load.

(iii) A choke coil offers high resistance to high frequency ac, and almost zero resistance to dc. It is used in series.

(iv) π - Filter is best for ripple control.

(v) For voltage regulation choke input filter (*L*-filter) is best.

Triode Valve



(A) Triode valve (B) Symbol

Fig. 27.71

(1) **Inventor :** Dr. Lee De Forest

(2) **Principle :** Thermionic emission

(3) **Number of electrodes :** It consists of three electrodes.

(i) Filament (*F*) : It emits electron on heating.

(ii) Plate or anode (*P*) : It collect the electrons.

(iii) Control grid : It is a third electrode, also known as control grid, which controls the electrons going from cathode to plate. As a result grid controls the plate current. It is kept near the cathode with low negative potential.

When grid is given positive potential then plate current increases but in this case triode cannot be used for amplifier and therefore grid is normally not given positive potential.

When grid is given negative potential then plate current decreases but in this case grid controls plate current most effectively.

(4) **Working :** Plate of triode valve is always kept at positive potential *w.r.t.* cathode. The potential of plate is more than that of grid.

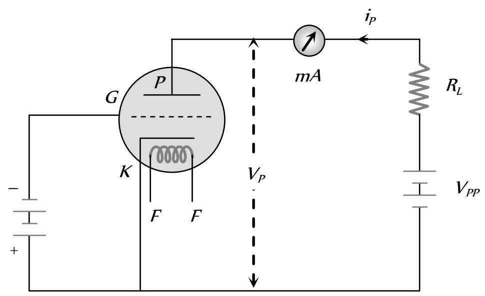


Fig. 27.72

The variation of plate potential affects the plate current as follows $i_p = k\left(V_G + \frac{V_p}{\mu}\right)^{3/2}$; where μ = Amplification factor of triode valve, k = Constant of triode valve.

The valve of V_G for which the plate current becomes zero is known as the cut off voltage. For a given V_p, it is given by $V_G = -\frac{V_p}{\mu}$.

Characteristics of Triode

The triode characteristics can be obtained under two sets of condition as

Static characteristics and dynamic characteristics

(1) **Static characteristics :** Graphical representation of V_p or V_G and i_p without any load

(i) **Static plate characteristic curve :** Graphical representation of i_p and V_p at constant V_g.

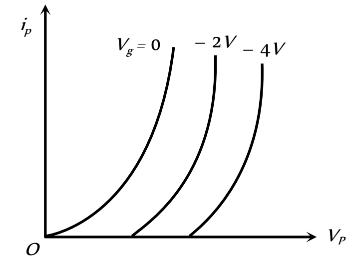

Fig. 27.73

(ii) **Static mutual characteristics curve :** Graphical representation of i_p and V_g when V_p is kept constant

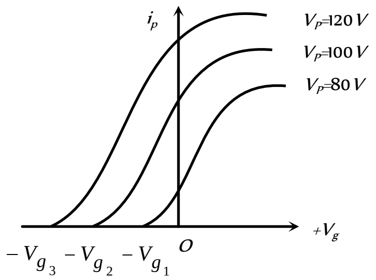

Fig. 27.74

(iii) **Constant current characteristic curve :** Graphical representation between V_p and V_g when i_p is constant.

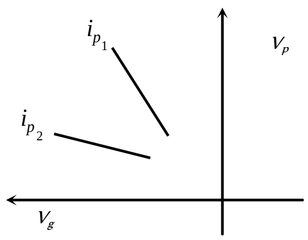

Fig. 27.75

(2) **Dynamic characteristics :** The curve plotted between i_p, V_p and V_g when the triode contains load in the plate circuit are called dynamics characteristics of diode.

(i) **Load line :** Voltage drop iR_L across load R_L which decreases the plate potential will be less then the supply voltage.

Plate voltage $V_p = V_{pp} - iR_L \Rightarrow i_p = -\frac{1}{R_L}V_p + \frac{V_{pp}}{R_L}$

This equation represents a straight line on the static plate characteristics, joining the points (V_{pp} , 0) on plate voltage axis and $(0, V_{pp}/R_L)$ on plate current axis. This line known as load line.

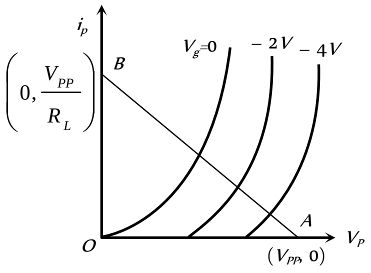

Fig. 27.76

(a) Points at which load line cuts the plate characteristic curves are called operating points.

(b) The slope of load line $AB = \frac{di_p}{dV_p} = -\frac{1}{R_L}$

(c) In graph, $OA = V_{pp}$ = intercept of load line on V_p axis and $OB = V_{pp}/R_L$ = intercept of load line on i_p axis.

(d) Static plate characteristic + load line

→ Dynamic plate characteristic

Static mutual characteristic + load line

→ Dynamic mutual characteristic

Constants of Triode Valve

(1) **Plate or dynamic resistance (r_p)**

(i) The slope of plate characteristic curve is equal to $\frac{1}{\text{plate resistance}}$

or It is the ratio of small change in plate voltage to the change in plate current produced by it, the grid voltage remaining constant. That is, $r_p = \frac{\Delta V_p}{\Delta i_p}, V_G = \text{constant}$.

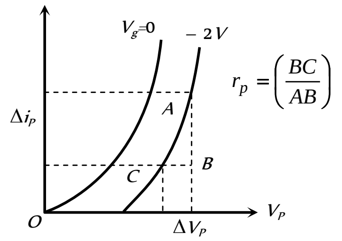

Fig. 27.77

(ii) It is expressed in kilo ohms ($k\Omega$). Typically, it ranges from $8k\Omega$ to $40k\Omega$. The r_p can be determined from plate characteristics. It represents the reciprocal of the slope of the plate characteristic curve.

(iii) If the distance between plate and cathode is increased the r_p increases. The value of r_p is infinity in the state of cut off bias or saturation state.

(2) **Mutual conductance (or *trans* conductance) (g_m)**

(i) It is defined as the ratio of small change in plate current (Δi_p) to the corresponding small change in grid potential (ΔV_g) when plate potential V_p is kept constant *i.e.* $g_m = \left(\frac{\Delta i_p}{\Delta V_g}\right)_{V_p \text{ is constant}}$

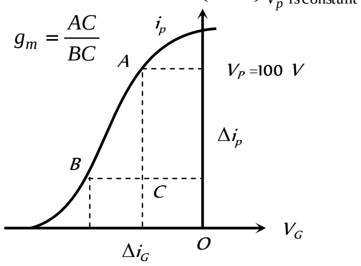

Fig. 27.78

(ii) The value of g_m is equal to the slope of mutual characteristics of triode.

(iii) The value of g_m depends upon the separation between grid and cathode. The smaller is this separation, the larger is the value of g_m and vice versa.

(iv) In the saturation state, the value of $\Delta i_p = 0$, $g_m = 0$

(3) **Amplification factor (μ) :** It is defined as the ratio of change in plate potential (ΔV_p) to produce certain change in plate current (Δi_p) to the change in grid potential (ΔV_g) for the same change in plate current (Δi_p) *i.e.* $\mu = -\left(\frac{\Delta V_p}{\Delta V_g}\right)_{\Delta I_p = \text{a constant}}$; negative sign indicates that V_p and V_g are in opposite phase.

(i) Amplification factor depends upon the distance between plate and cathode (d_{pk}), plate and grid (d_{pg}) and grid and cathode(d_{gk}).

i.e. $\mu \propto d_{pg} \propto d_{pk} \propto \frac{1}{d_{gk}}$

(ii) The value of μ is greater than one.

(iii) Amplification factor is unitless and dimensionless.

(4) **Relation between triode constants :** The triode constants are not independent of each other. They are related by the relation $\mu = r_p \times g_m$

The r_p and g_m depends on i_p in the following manner

$r_p \propto i_p^{-1/3}$, $g_m \propto i_p^{1/3}$, μ does not depend on i_p.

Above three constants may be determined from any one set of characteristic curves.

$r_p = \frac{V_{P1} - V_{P2}}{I_{PA} - I_{PB}}$,

$g_m = \frac{I_{PA} - I_{PB}}{V_{G1} - V_{G2}}$,

$\mu = -\frac{V_{P1} - V_{P2}}{V_{G2} - V_{G1}}$

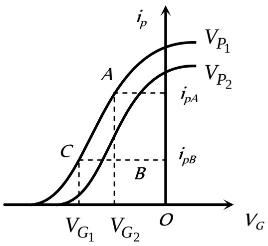

Fig. 27.79

Triode as an Amplifiers

Amplifier is a device by which the amplitude of variation of *ac* signal voltage / current/ power can be increased

(1) The signal to be amplified (V_i) is applied in the grid circuit and amplified output is obtained from the plate circuit

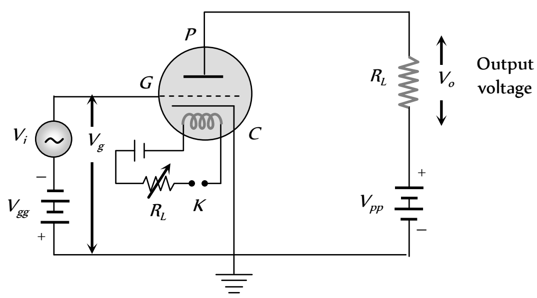

Fig. 27.80

(2) The voltage at grid is the sum of signal V_i and grid bias V_{gg}.

$V_g = V_{gg} + V_i$

(3) Small change in grid voltage results in a large change in plate current so results in a large change in voltage across R_L $(V_0 = i_p R_L \Rightarrow \Delta V_0 = \Delta i_p R_L)$

(4) The linear portion of the mutual characteristic with maximum slope is chosen for amplification without distortion.

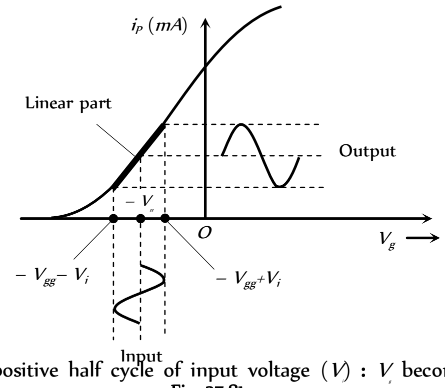

Fig. 27.81

(i) For the positive half cycle of input voltage (V_i) : V_g becomes less negative, so i_p increases

(ii) For the negative half cycle of input voltage (V_i) : V_g becomes more negative, so i_p decreases

(iii) The phase difference between the output signal and input signal is 180° (or π)

(5) **Voltage amplification**

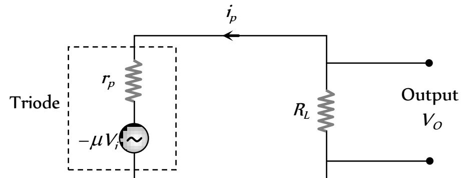

Fig. 27. 82 : Equivalent circuit of triode amplifier

Current through the load resistance is given by $i_p = -\frac{\mu V_i}{r_p + R_L}$

$\Rightarrow V_0 = i_p R_L = \frac{-\mu V_i R_L}{r_p + R_L}$ $\Rightarrow$ Voltage gain $= \frac{V_0}{V_i} = -\frac{\mu R_L}{r_p + R_L}$

Numerically $A = \frac{\mu R_L}{r_p + R_L} = \frac{\mu}{1 + \frac{r_p}{R_L}}$

(i) If $R_L = \infty \Rightarrow A$ will be maximum and $A_{max} = \mu$

(Practically $A < \mu$)

(ii) If $r_p = R_L \Rightarrow A = \frac{\mu}{2}$

(iii) Power at load resistance $P = i_p V_0 = i_p^2 R_L$

Condition for maximum power $R_L = r_p$

$\therefore P_{max} = \left(\frac{\mu V_i}{R_L + R_L}\right)^2 \times R_L = \frac{\mu^2 V_i^2}{4 R_L}$

Tips & Tricks

✍ The most efficient packing of atoms in cubic lattice structure occurs for *fcc*.

- The lattice for $NaCl$ crystal is *fcc*.
- The space lattice of diamond is *fcc*. (The diamond structure may be viewed as two *fcc* structures displaced from each other by one quarter of a body diagonal).
- Carbon, silicon, germanium, tin can crystallize in the diamond structure.
- At room temperature $\sigma_{Ge} > \sigma_{Si}$
- $(n_i)_{Ge} \simeq 2.4 \times 10^{19} / m^3$ and $(n_i)_{Si} \simeq 1.5 \times 10^{16} / m^3$
- In a transistor circuit the reverse bias is high as compared to the forward bias. So that it may exert a large attractive force on the charge carriers to enter the collector region.
- *Ge* is more sensitive to heat since it's forbidden energy gap is smaller than that of silicon. Electrons from the valence band of *Ge* requires less energy to move from the valence band to conduction band.
- Both *N*-type as well as *P*-type semiconductor are neutral.
- Semiconductor devices are current control devices.
- The semiconductor devices are temperature sensitive devices.
- The electric field setup across the potential barrier is of the order of 3×10^5 *V/m* for *Ge* and 7×10^5 *V/m* for *Si*.
- An ideal junction diode when forward biased offers zero resistance. Voltage drop across such a junction diode is zero. In reverse biased diode offers infinite resistance and voltage drop across it is equal to voltage applied.
- A *P-N* junction diode can be considered to be equivalent to a capacitor with *P* and *N* regions acting as the plates of the capacitors and depletion layer as the dielectric medium.
- The mobility of electron is two-three times the mobility of holes. Therefore NPN devices are fast and hence preferred.
- If $E_g \simeq 0\, eV$, the material is good conductor or metal and if $E_g \simeq 1\, eV$, the material is a semiconductor. If $E_g \simeq 6\, eV$ then the material is an insulator.
- A *P-N* junction or diode acts like a valve or voltage controlled switch. When forward biased, it acts like ON switch. When reverse biased, it acts like an OFF switch.
- The current due to minority carriers in the junction diode is independent of the applied voltage. It only depends upon the temperature of the diode.
- Voltage obtained from a diode rectifier is a mixture of alternating and direct voltage.
- Cross sectional area of base is very large as compared to emitter. Cross sectional area of collector is less than base but greater than emitter.
- C.C (common collector) amplifier is called power amplifier or current booster or emitter follower.
- Devices like tunnel diode, tetrode and thyrisisters have negative resistance.
- Transistor provides good power amplification when they are use in CE configuration.
- **MOSFETS :** In a MOSFET, a type of three-terminal transistor, a potential applied to the gate terminal *G* controls the internal flow of electrons from the source terminal *S* to the drain terminal *D*. Commonly, a MOSFET is operated only in its ON (conducting) or OFF (not conducting condition. Installed by the thousands and millions on silicon wafers (chips) to form integrated circuits, MOSFETs form the basis for computer hardware.
- When a *PN* junction is forward biased, it can emit light, hence can serve as a light-emitting diode (LED). The wavelength of the emitted light is $\lambda = \frac{c}{f} = \frac{hc}{E_g}$
- The fermi energy of a given material is the energy of a quantum state that has the probability 0.5 of being occupied by an electron.
- Number of conduction electrons per unit volume

$$= \frac{(\text{Material's density})}{(\text{Molar mass } M)/N_A}$$

(N_A = Avogadro's number = 6.02×10^{23} */mol*)

- The occupancy probability $P(E)$: Electrical conduction of a metal depends on the probability that if an energy level is available at energy E, is it actually occupied by an electron.

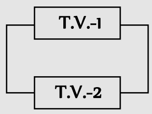
the expression for occupancy probability $P(E)$ is given by

Fermi-Dirac statistics $P(E) = \frac{1}{\exp\left(\frac{E - E_F}{kT}\right) + 1}$; E_F=Fermi energy

- A good emitter should have low work function, high melting point, high working temperature, high electrical and mechanical strength.
- When triode amplifier are in series, total voltage gain

$A = A_1 A_2 A_3$ ....

- When two triode valve are in parallel



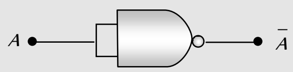
Total plate resistance $\frac{1}{r_p} = \frac{1}{r_{p_1}} + \frac{1}{r_{p_2}}$

Total mutual conductance $G_m = g_{m_1} + g_{m_2}$

Total amplification factor $\mu = G_m R_p$

Voltage amplification $A = \frac{\mu R_L}{r_p + R_L}$

- **NOR** gate is a universal gate because it can be used to perform the basic logic function, AND, OR and NOT.
- Output in Ex-OR gate is '1' only when inputs are different.
- If both inputs of NAND gate are shorted then it will become 'NOT gate



NOT gate

Ordinary Thinking

Objective Questions

Solids and Crystals

1. The nature of binding for a crystal with alternate and evenly spaced positive and negative ions is [CBSE PMT 2000]
   (a) Covalent (b) Metallic
   (c) Dipolar (d) Ionic
2. For a crystal system, $a = b = c$, $\alpha = \beta = \gamma \neq 90^{\circ}$, the system is [BHU 2000]
   (a) Tetragonal system (b) Cubic system
   (c) Orthorhombic system (d) Rhombohedral system
3. Biaxial crystal among the following is [Pb. CET 1998]
   (a) Calcite (b) Quartz
   (c) Selenite (d) Tourmaline
4. The temperature coefficient of resistance of a conductor is [AFMC 1998]
   (a) Positive always (b) Negative always
   (c) Zero (d) Infinite
5. Potassium has a *bcc* structure with nearest neighbour distance 4.525 $\AA$. Its molecular weight is 39. Its density in kg/m is [DCE 1997]
   (a) 900 (b) 494
   (c) 602 (d) 802
6. The expected energy of the electrons at absolute zero is called [RPET 1996]
   (a) Fermi energy (b) Emission energy
   (c) Work function (d) Potential energy
7. In a triclinic crystal system [EAMCET (Med.) 1995]
   (a) $a \neq b \neq c$, $\alpha \neq \beta \neq \gamma$ (b) $a = b = c$, $\alpha \neq \beta \neq \gamma$
   (c) $a \neq b \neq c$, $\alpha \neq \beta = \gamma$ (d) $a = b \neq c$, $\alpha = \beta = \gamma$
8. Metallic solids are always opaque because [AFMC 1994]
   (a) Solids effect the incident light
   (b) Incident light is readily absorbed by the free electron in a metal
   (c) Incident light is scattered by solid molecules
   (d) Energy band traps the incident light
9. In which of the following ionic bond is present [EAMCET (Med.) 1994]
   (a) $NaCl$ (b) Ar
   (c) Si (d) Ge
10. Which of the following materials is non crystalline [CBSE PMT 1993]
   (a) Copper (b) Sodium chloride
   (c) Wood (d) Diamond

11. The coordination number of Cu is [AMU 1992]

(a) 1 (b) 6

(c) 8 (d) 12

12. Which one of the following is the weakest kind of bonding in solids [CBSE PMT 1992; KCET 1992]

(a) Ionic (b) Metallic

(c) Vander Waals (d) Covalent

13. In a crystal, the atoms are located at the position of [AMU 1985]

(a) Maximum potential energy

(b) Minimum potential energy

(c) Zero potential energy

(d) Infinite potential energy

14. Crystal structure of $NaCl$ is [NCERT 1982]

(a) Fcc (b) Bcc

(c) Both of the above (d) None of the above

15. What is the coordination number of sodium ions in the case of sodium chloride structure [CBSE PMT 1988]

(a) 6 (b) 8

(c) 4 (d) 12

16. The distance between the body centred atom and a corner atom in sodium (a = 4.225 $\mathring{A}$) is [CBSE PMT 1995]

(a) 3.66 $\mathring{A}$ (b) 3.17 $\mathring{A}$

(c) 2.99 $\mathring{A}$ (d) 2.54 $\mathring{A}$

17. A solid that transmits light in visible region and has a very low melting point possesses [J & K CET 2001]

(a) Metallic bonding (b) Ionic bonding

(c) Covalent bonding (d) Vander Waal's bonding

18. Atomic radius of *fcc* is [J & K CET 2001]

(a) $\frac{a}{2}$ (b) $\frac{a}{2\sqrt{2}}$

(c) $\frac{\sqrt{3}}{4}a$ (d) $\frac{\sqrt{3}}{2}a$

19. A solid reflects incident light and it's electrical conductivity decreases with temperature. The binding in this solids

(a) Ionic (b) Covalent

(c) Metallic (d) Molecular

20. The laptop PC's modern electronic watches and calculators use the following for display

(a) Single crystal (b) Poly crystal

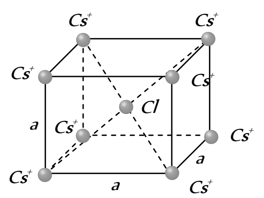
(c) Liquid crystal (d) Semiconductors

21. The nearest distance between two atoms in case of a bcc lattice is equal to [J & K CET 2004]

(a) $a\frac{\sqrt{2}}{3}$ (b) $a\frac{\sqrt{3}}{2}$

(c) $q\sqrt{3}$ (d) $\frac{a}{\sqrt{2}}$

22. What is the net force on a *Cl* placed at the centre of the *bcc* structure of *CsCl* [DCE 2003; AIIMS 2004]



(a) Zero (b) ke^2/a^2

(c) ke^2a^2 (d) Data is incomplete

23. Sodium has body centred packing. If the distance between two nearest atoms is 3.7 Å, then its lattice parameter is [Pb. PET 2002]

(a) 4.8 Å (b) 4.3 Å

(c) 3.9 Å (d) 3.3 Å

24. Which of the following is an amorphous solid [AIIMS 2005; J & K CET 2004]

(a) Glass (b) Diamond

(c) Salt (d) Sugar

25. Copper has face centered cubic (*fcc*) lattice with interatomic spacing equal to 2.54Å. The value of the lattice constant for this lattice is

(a) 1.27 Å (b) 5.08 Å

(c) 2.54 Å (d) 3.59 Å

26. In good conductors of electricity, the type of bonding that exists is

(a) Ionic (b) Vander Waals

(c) Covalent (d) Metallic

27. Bonding in a germanium crystal (semi- conductor) is [CPMT 1986; KCET 1992; EAMCET (Med.) 1995; MP PET/PMT 2004]

(a) Metallic (b) Ionic

(c) Vander Waal's type (d) Covalent

28. The ionic bond is absent in [J & K CET 2005]

(a) *NaCl* (b) *CsCl*

(c) *LiF* (d) H_2O

Semiconductors

1. The majority charge carriers in *P*-type semiconductor are [MP PMT 1999; CBSE PMT 1999; MP PET 1991; MP PET/PMT 1998; MH CET 2003]

(a) Electrons (b) Protons

(c) Holes (d) Neutrons

2. A *P*-type semiconductor can be obtained by adding [NCERT 1979; BIT 1988; MP PMT 1987; 90]

(a) Arsenic to pure silicon

(b) Gallium to pure silicon

(c) Antimony to pure germanium

(d) Phosphorous to pure germanium

3. The valence of an impurity added to germanium crystal in order to convert it into a *P*-type semi conductor is [MP PMT 1989; CPMT 1987]

(a) 6 (b) 5

(c) 4 (d) 3

4. In a semiconductor, the concentration of electrons is $8\times10^{14}/cm^3$ and that of the holes is $5\times10^{12}cm^3$. The semiconductor is [MP PMT 1997; RPET 1999; Kerala PET 2002]

(a) *P*-type (b) *N*-type

(c) Intrinsic (d) *PNP*-type

5. In *P*-type semiconductor, there is [MP PMT 1989]

(a) An excess of one electron

(b) Absence of one electron

(c) A missing atom

(d) A donar level

6. The valence of the impurity atom that is to be added to germanium crystal so as to make it a *N*-type semiconductor, is

[MNR 1993; MP PET 1994; CBSE PMT 1999; AIIMS 2000]

(a) 6 (b) 5

(c) 4 (d) 3

7. Silicon is a semiconductor. If a small amount of *As* is added to it, then its electrical conductivity [MP PMT 1996]

(a) Decreases (b) Increases

(c) Remains unchanged (d) Becomes zero

8. When the electrical conductivity of a semi- conductor is due to the breaking of its covalent bonds, then the semiconductor is said to be

[AIIMS 1997; KCET (Engg.) 2002]

(a) Donar (b) Acceptor

(c) Intrinsic (d) Extrinsic

9. A piece of copper and the other of germanium are cooled from the room temperature to 80 K, then which of the following would be a correct statement

[IIT-JEE 1988; Bihar CEE 1992; CBSE PMT 1993; MP PET 1997; RPET 1999; AIEEE 2004]

(a) Resistance of each increases

(b) Resistance of each decreases

(c) Resistance of copper increases while that of germanium decreases

(d) Resistance of copper decreases while that of germanium increases

10. To obtain *P*-type Si semiconductor, we need to dope pure Si with [IIT-JEE 1988; MP PET 1997, 93; Pb. PMT 2001, 02; UPSEAT 2004]

(a) Aluminium (b) Phosphorous

(c) Oxygen (d) Germanium

11. Electrical conductivity of a semiconductor

[MP PMT 1993, 2000; RPET 1996]

(a) Decreases with the rise in its temperature

(b) Increases with the rise in its temperature

(c) Does not change with the rise in its temperature

(d) First increases and then decreases with the rise in its temperature

12. Three semi-conductors are arranged in the increasing order of their energy gap as follows. The correct arrangement is

[MP PMT 1993]

(a) Tellurium, germanium, silicon

(b) Tellurium, silicon, germanium

(c) Silicon, germanium, tellurium

(d) Silicon, tellurium, germanium

13. When a semiconductor is heated, its resistance

[KCET 1992; MP PMT 1994; MP PET 1992, 2002; RPMT 2001; DCE 2001]

(a) Decreases (b) Increases

(c) Remains unchanged (d) Nothing is definite

14. In an insulator, the forbidden energy gap between the valence band and conduction band is of the order of

[DPMT 1988; EAMCET (Engg.) 1995; MP PET 1996]

(a) $1\,MeV$ (b) $0.1\,MeV$

(c) $1\,eV$ (d) $5\,eV$

15. A *N*-type semiconductor is [AFMC 1988; RPMT 1999]

(a) Negatively charged (b) Positively charged

(c) Neutral (d) None of these

16. The energy band gap of Si is

[MP PET 1994, 2002; BHU 1995; RPMT 2000]

(a) $0.70\,eV$

(b) 1.1 *eV*

(c) Between $0.70\,eV$ to $1.1\,eV$

(d) 5 *eV*

17. The forbidden energy band gap in conductors, semiconductors and insulators are EG_1, EG_2 and EG_3 respectively. The relation among them is

[MP PMT 1994; RPMT 1997]

(a) $EG_1 = EG_2 = EG_3$ (b) $EG_1 < EG_2 < EG_3$

(c) $EG_1 > EG_2 > EG_3$ (d) $EG_1 < EG_2 > EG_3$

18. Which statement is correct [MP PMT 1994]

(a) *N*-type germanium is negatively charged and *P*-type germanium is positively charged

(b) Both *N*-type and *P*-type germanium are neutral

(c) *N*-type germanium is positively charged and *P*-type germanium is negatively charged

(d) Both *N*-type and *P*-type germanium are negatively charged

19. When *Ge* crystals are doped with phosphorus atom, then it becomes [AFMC 1995; Orissa PMT 2004]

(a) Insulator (b) *P*-type

(c) *N*-type (d) Superconductor

20. Let n_P and n_e be the number of holes and conduction electrons respectively in a semiconductor. Then

[MP PET 1995]

(a) $n_P > n_e$ in an intrinsic semiconductor

(b) $n_P = n_e$ in an extrinsic semiconductor

(c) $n_P = n_e$ in an intrinsic semiconductor

(d) $n_e > n_P$ in an intrinsic semiconductor

21. Wires P and Q have the same resistance at ordinary (room) temperature. When heated, resistance of P increases and that of Q decreases. We conclude that [MP PMT 1995; MP PET 2001]

(a) P and Q are conductors of different materials
(b) P is N-type semiconductor and Q is P-type semiconductor
(c) P is semiconductor and Q is conductor
(d) P is conductor and Q is semiconductor

22. The impurity atoms which are mixed with pure silicon to make a P-type semiconductor are those of [MP PMT 1995]

(a) Phosphorus (b) Boron
(c) Antimony (d) Copper

23. Holes are charge carriers in [IIT-JEE 1996]

(a) Intrinsic semiconductors (b) Ionic solids
(c) P-type semiconductors (d) Metals

24. In extrinsic P and N-type, semiconductor materials, the ratio of the impurity atoms to the pure semiconductor atoms is about

(a) 1 (b) 10^{-1}
(c) 10^{-4} (d) 10^{-7}

25. A hole in a P-type semiconductor is [MP PET 1996]

(a) An excess electron (b) A missing electron
(c) A missing atom (d) A donor level

26. The forbidden gap in the energy bands of germanium at room temperature is about [MP PMT/PET 1998]

(a) $1.1eV$ (b) $0.1eV$
(c) $0.67eV$ (d) $6.7eV$

27. In P-type semiconductor the majority and minority charge carriers are respectively

[EAMCET 1994; MP PMT/PET 1998; MH CET 2000]

(a) Protons and electrons (b) Electrons and protons
(c) Electrons and holes (d) Holes and electrons

28. At zero Kelvin a piece of germanium [MP PET 1999]

(a) Becomes semiconductor
(b) Becomes good conductor
(c) Becomes bad conductor
(d) Has maximum conductivity

29. Electronic configuration of germanium is 2, 8, 18 and 4. To make it extrinsic semiconductor small quantity of antimony is added

(a) The material obtained will be N-type germanium in which electrons and holes are equal in number
(b) The material obtained will be P-type germanium
(c) The material obtained will be N-type germanium which has more electrons than holes at room temperature
(d) The material obtained will be N-type germanium which has less electrons than holes at room temperature

30. A semiconductor is cooled from T_1K to T_2K. Its resistance

[MP PET 1999]

(a) Will decrease
(b) Will increase
(c) Will first decrease and then increase
(d) Will not change

31. If N_P and N_e be the numbers of holes and conduction electrons in an extrinsic semiconductor, then

[MP PMT 1999; AMU 2001]

(a) $N_P > N_e$
(b) $N_P = N_e$
(c) $N_P < N_e$
(d) $N_P > N_e$ or $N_P < N_e$ depending on the nature of impurity

32. In intrinsic semiconductor at room temperature, number of electrons and holes are

[EAMCET (Engg.) 1995; JIPMER 2001, 02]

(a) Equal (b) Zero
(c) Unequal (d) Infinite

33. (USS 133) Indium impurity in germanium makes

[EAMCET (Engg.) 1995]

[MP PET 2003]

(a) N-type (b) P-type
(c) Insulator (d) Intrinsic

34. Fermi level of energy of an intrinsic semiconductor lies

[EAMCET (Med.) 1995]

(a) In the middle of forbidden gap
(b) Below the middle of forbidden gap
(c) Above the middle of forbidden gap
(d) Outside the forbidden gap

35. In a semiconductor the separation between conduction band and valence band is of the order of

[EAMCET (Med.) 1995; AIIMS 2000]

(a) $100\,eV$ (b) $10\,eV$
(c) $1eV$ (d) 0 eV

36. The intrinsic semiconductor becomes an insulator at

[EAMCET (Med.) 1995; KCET (Engg./Med.) 1999; MP PET 2000; CBSE PMT 2001]

(a) $0°C$ (b) $-100°C$
(c) $300\,K$ (d) $0\,K$

37. The addition of antimony atoms to a sample of intrinsic germanium transforms it to a material which is

[AMU 1995]

[MP PET 1999]

(a) Superconductor (b) An insulator
(c) N-type semiconductor (d) P-type semiconductor

38. Resistance of semiconductor at $0°K$ is [RPET 1997]

(a) Zero (b) Infinite
(c) Large (d) Small

39. In a good conductor the energy gap between the conduction band and the valence band is

[KCET 1993; EMCET (Med.) 1994]

(a) Infinite (b) Wide
(c) Narrow (d) Zero

40. The impurity atom added to germanium to make it N-type semiconductor is [KCET 1993; KCET (Engg./Med.) 2000]

(a) Arsenic (b) Iridium
(c) Aluminium (d) Iodine

41. When *N*-type of semiconductor is heated [CBSE PMT 1993; DPMT 2000]
(a) Number of electrons increases while that of holes decreases
(b) Number of holes increases while that of electrons decreases
(c) Number of electrons and holes remains same
(d) Number of electrons and holes increases equally

42. To obtain a *P*-type germanium semiconductor, it must be doped with [CBSE PMT 1997; Pb. PET 2000]
(a) Arsenic (b) Antimony
(c) Indium (d) Phosphorus

43. The temperature coefficient of resistance of a semiconductor [AFMC 1998, MNR 1998]
(a) Is always positive
(b) Is always negative
(c) Is zero
(d) May be positive or negative or zero

44. *P*-type semiconductor is formed when [RPET 1999]
A. *As* impurity is mixed in *Si*
B. *Al* impurity is mixed in *Si*
C. *B* impurity is mixed in *Ge*
D. *P* impurity is mixed in *Ge*
(a) A and C (b) A and D
(c) B and C (d) B and D

45. In case of a semiconductor, which of the following statement is wrong [Pb. PMT 1999]
(a) Doping increases conductivity
(b) Temperature coefficient of resistance is negative
(c) Resisitivity is in between that of a conductor and insulator
(d) At absolute zero temperature, it behaves like a conductor

46. Energy bands in solids are a consequence of [DCE 1999, 2000; AIEEE 2004]
(a) Ohm's Law
(b) Pauli's exclusion principle
(c) Bohr's theory
(d) Heisenberg's uncertainty principle

47. In a *P*-type semiconductor [AIIMS 1997; Orissa JEE 2002; MP PET 2003]
(a) Current is mainly carried by holes
(b) Current is mainly carried by electrons
(c) The material is always positively charged
(d) Doping is done by pentavalent material

48. At ordinary temperatures, the electrical conductivity of semi conductors in $mho/meter$ is in the range [MP PET 2003]
(a) 10^{-3} to 10^{-4} (b) 10^{6} to 10^{9}
(c) 10^{-6} to 10^{-10} (d) 10^{-10} to 10^{-16}

49. When the temperature of silicon sample is increased from $27°C$ to $100°C$, the conductivity of silicon will be [RPMT 1999]
(a) Increased (b) Decreased
(c) Remain same (d) Zero

50. In a *P*-type semiconductor, germanium is doped with [AFMC 1999]
(a) Boron (b) Gallium
(c) Aluminium (d) All of these

51. In *N*-type semiconductors, majority charge carriers are [AIIMS 1999]
(a) Holes (b) Protons
(c) Neutrons (d) Electrons

52. Semiconductor is damaged by the strong current due to [MH CET 2000]
(a) Lack of free electron (b) Excess of electrons
(c) Excess of proton (d) None of these

53. GaAs is [RPMT 2000]
(a) Element semiconductor
(b) Alloy semiconductor
(c) Bad conductor
(d) Metallic semiconductor

54. If n_e and n_h are the number of electrons and holes in a semiconductor heavily doped with phosphorus, then [MP PMT 2000]
(a) $n_e >> n_h$ (b) $n_e << n_h$
(c) $n_e \le n_h$ (d) $n_e = n_h$

55. An *N*-type and *P*-type silicon can be obtained by doping pure silicon with [EAMCET (Med.) 2000]
(a) Arsenic and Phosphorous (b) Indium and Aluminium
(c) Phosphorous and Indium (d) Aluminium and Boron

56. *N*-type semiconductors will be obtained, when germanium is doped with [AIIMS 2000]
(a) Phosphorus (b) Aluminium
(c) Arsenic (d) Both (a) or (c)

57. The state of the energy gained by valance electrons when the temperature is raised or when electric field is applied is called as
(a) Valance band (b) Conduction band
(c) Forbidden band (d) None of these

58. To obtain electrons as majority charge carriers in a semiconductor, the impurity mixed is [MP PET 2000]
(a) Monovalent (b) Divalent
(c) Trivalent (d) Pentavalent

59. For germanium crystal, the forbidden energy gap in joules is [MP PET 2000]
(a) 1.12×10^{-19} (b) 1.76×10^{-19}
(c) 1.6×10^{-19} (d) Zero

60. A pure semiconductor behaves slightly as a conductor at [MH CET (Med.) 2001; BHU 2000; AFMC 2001]
(a) Room temperature (b) Low temperature

(c) High temperature (d) Both (b) and (c)

61. Which is the correct relation for forbidden energy gap in conductor, semi conductor and insulator

[RPMT 2001; AIEEE 2002]

(a) $\Delta Eg_{c} > \Delta Eg_{sc} > \Delta Eg_{\text{insulator}}$

(b) $\Delta Eg_{\text{insulator}} > \Delta Eg_{sc} > \Delta Eg_{\text{conductor}}$

(c) $\Delta Eg_{\text{conductor}} > \Delta Eg_{\text{insulator}} > \Delta Eg_{sc}$

(d) $\Delta Eg_{sc} > \Delta Eg_{\text{conductor}} > \Delta Eg_{\text{insulator}}$

62. The band gap in Germanium and silicon in *eV* respectively is

(a) 0.7, 1.1 (b) 1.1, 0.7

(c) 1.1, 0 (d) 0, 1.1

63. *P*-type semiconductors are made by adding impurity element

(a) *As* (b) *P*

(c) *B* (d) *Bi*

64. At room temperature, a *P*-type semiconductor has

[Kerala PMT 2002]

(a) Large number of holes and few electrons

(b) Large number of free electrons and few holes

(c) Equal number of free electrons and holes

(d) No electrons or holes

65. In intrinsic semiconductor at room temperature, number of electrons and holes are [JIPMER 2001, 02; MP PMT 2002]

(a) Unequal (b) Equal

(c) Infinite (d) Zero

66. The valence band and conduction band of a solid overlap at low temperature, the solid may be

[Orissa JEE 2002; BCECE 2004]

(a) A metal (b) A semiconductor

(c) An insulator (d) None of these

67. Which impurity is doped in *Si* to form *N*-type semi-conductor? [CBSE PMT 1996; AIEEE 2002]

(a) *Al* (b) *B*

(c) *As* (d) None of these

68. In a semiconductor [AIEEE 2002; AIIMS 2002]

(a) There are no free electrons at any temperature

(b) The number of free electrons is more than that in a conductor

(c) There are no free electrons at 0 *K*

(d) None of these

69. The energy band gap is maximum in [AIEEE 2002]

(a) Metals (b) Superconductors

(c) Insulators (d) Semiconductors

70. The process of adding impurities to the pure semiconductor is called [MH CET 2002]

(a) Drouping (b) Drooping

(c) Doping (d) None of these

71. When phosphorus and antimony are mixed in zermaniun, then

(a) *P*-type semiconductor is formed

(b) *N*-type semiconductor is formed

(c) Both (a) and (b)

(d) None of these

72. To a germanium sample, traces of gallium are added as an impurity. The resultant sample would behave like

[AIIMS 2003]

(a) A conductor

(b) A *P*-type semiconductor

(c) An *N*-type semiconductor

(d) An insulator [MP PMT 2001]

73. For non-conductors, the energy gap is

[EAMCET (Engg.) 1995; MP PET 1996; RPET 2003]

(a) 6 *eV* [MP PMT 2001] (b) 1.1 *eV*

(c) 0.8 *eV* (d) 0.3 *eV*

74. Donor type impurity is found in [RPET 2003]

(a) Trivalent elements (b) Pentavalent elements

(c) In both the above (d) None of these

75. The difference in the variation of resistance with temperature in a metal and a semiconductor arises essentially due to the difference in the [AIEEE 2003]

(a) Variation of scattering mechanism with temperature

(b) Crystal structure

(c) Variation of the number of charge carriers with temperature

(d) Type of bon

76. The charge on a hole is equal to the charge of

[MP PMT 2004]

(a) Zero (b) Proton

(c) Neutron (d) Electron

77. When germanium is doped with phosphorus, the doped material has

(a) Excess positive charge

(b) Excess negative charge

(c) More negative current carriers

(d) More positive current carriers

78. A *Ge* specimen is doped with *Al*. The concentration of acceptor atoms is ~10^{21} *atoms*/m^3. Given that the intrinsic concentration of electron hole pairs is $\sim 10^{19}/m^3$, the concentration of electrons in the specimen is [AIIMS 2004]

(a) $10^{17}/m^3$ (b) $10^{15}/m^3$

(c) $10^{4}/m^3$ (d) $10^{2}/m^3$

79. Which of the following has negative temperature coefficient of resistance [AFMC 2004]

(a) Copper (b) Aluminium

(c) Iron (d) Germanium

80. In semiconductors at a room temperature [CPMT 2003] [CBSE PMT 2004]

(a) The valence band is partially empty and the conduction band is partially filled

(b) The valence band is completely filled and the conduction band is partially filled

(c) The valence band is completely filled

(d) The conduction band is completely empty

81. Regarding a semiconductor which one of the following is wrong

(a) There are no free electrons at room temperature

(b) There are no free electrons at 0 K

(c) The number of free electrons increases with rise of temperature

(d) The charge carriers are electrons and holes

82. Which of the following statements is true for an *N*-type semi-conductor **[CPMT 2004]**

(a) The donor level lies closely below the bottom of the conduction band

(b) The donor level lies closely above the top of the valence band

(c) The donor level lies at the halfway mark of the forbidden energy gap

(d) None of above

83. Choose the correct statement **[DCE 2004]**

(a) When we heat a semiconductor its resistance increases

(b) When we heat a semiconductor its resistance decreases

(c) When we cool a semiconductor to 0 K then it becomes super conductor

(d) Resistance of a semiconductor is independent of temperature

84. In a *P*-type semi-conductor, germanium is dopped with **[MH CET 2003]**

(a) Gallium (b) Boron

(c) Aluminium (d) All of these

85. A piece of semiconductor is connected in series in an electric circuit. On increasing the temperature, the current in the circuit will

(a) Decrease (b) Remain unchanged

(c) Increase (d) Stop flowing

86. Intrinsic semiconductor is electrically neutral. Extrinsic semiconductor having large number of current carriers would be

(a) Positively charged

(b) Negatively charged

(c) Positively charged or negatively charged depending upon the type of impurity that has been added

(d) Electrically neutral

87. If n and v be the number of electrons and drift velocity in a semiconductor. When the temperature is increased **[Pb. CET 2000]**

(a) n increases and v decreases

(b) n decreases and v increases

(c) Both n and v increases

(d) Both n and v decreases

88. In extrinsic semiconductors **[EAMCET (Engg.) 1999]**

(a) The conduction band and valence band overlap

(b) The gap between conduction band and valence band is more than 16 eV

(c) The gap between conduction band and valence band is near about 1 eV

(d) The gap between conduction band and valence band will be 100 eV and more **[CPMT 2004]**

89. Resistivity of a semiconductor depends on **[MP PMT 1999]**

(a) Shape of semiconductor

(b) Atomic nature of semiconductor

(c) Length of semiconductor

(d) Shape and atomic nature of semiconductor

90. Electric current is due to drift of electrons in **[CPMT 1996]**

(a) Metallic conductors

(b) Semi-conductors

(c) Both (a) and (b)

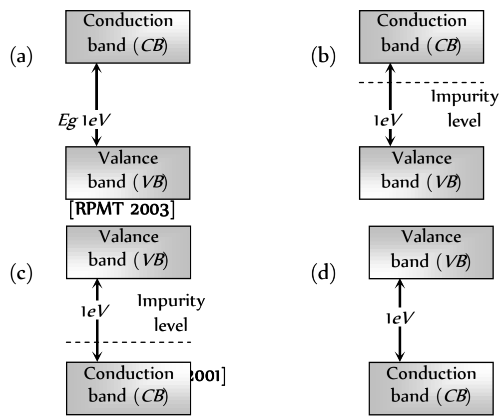
(d) None of these

91. The energy gap of silicon is 1.14 eV. The maximum wavelength at which silicon will begin absorbing energy is **[MP PMT 1993]**

(a) 10888 $\AA$ (b) 1088.8 $\AA$

(c) 108.88 $\AA$ (d) 10.888 $\AA$

92. Which of the following energy band diagram shows the *N*-type semiconductor **[RPET 1986]**



93. The mobility of free electron is greater than that of free holes because

(a) The carry negative charge

(b) They are light

(c) They mutually collide less

(d) They require low energy to continue their motion

94. The relation between the number of free electrons in semiconductors (n) and its temperature (T) is

(a) $n \propto T^2$ (b) $n \propto T$

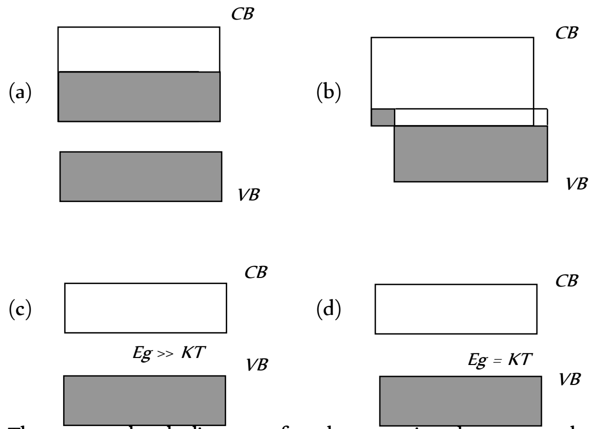
(c) $n \propto \sqrt{T}$ (d) $n \propto T^{3/2}$

95. The electron mobility in *N*-type germanium is 3900 $cm^2/v\text{-}s$ and its conductivity is 6.24 *mho/cm*, then impurity concentration will be if the effect of cotters is negligible

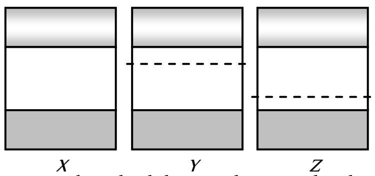
(a) $10^{15}\ cm^3$ (b) $10^{13}\ /cm^3$

(c) $10^{12}\ /cm^3$ (d) $10^{16}\ /cm^3$

96. Which of the energy band diagrams shown in the figure corresponds to that of a semiconductor [Orissa JEE 2003]



97. The energy band diagrams for three semiconductor samples of silicon are as shown. We can then assert that [Haryana CEE 1996]



(a) Sample *X* is undoped while samples *Y* and *Z* have been doped with a third group and a fifth group impurity respectively
(b) Sample *X* is undoped while both samples *Y* and *Z* have been doped with a fifth group impurity
(c) Sample *X* has been doped with equal amounts of third and fifth group impurities while samples *Y* and *Z* are undoped
(d) Sample *X* is undoped while samples *Y* and *Z* have been doped with a fifth group and a third group impurity respectively

98. Carbon, silicon and Germanium atoms have four valence electrons each. Their valence and conduction band are separated by energy band gaps represented by $(E_g)_C$. $(E_g)_{Si}$ and $(E_g)_{Ge}$ respectively. Which one of the following relationship is true in their case

(a) $(E_g)_C > (E_g)_{Si}$ (b) $(E_g)_C = (E_g)_{Si}$

(c) $(E_g)_C < (E_g)_{Ge}$ (d) $(E_g)_C < (E_g)_{Si}$

99. A semiconductor dopped with a donor impurity is [AFMC 2005]

(a) *P*-type (b) *N*-type

(c) *NPN* type (d) *PNP* type

100. In a semiconducting material the mobilities of electrons and holes are μ_e and μ_h respectively. Which of the following is true

(a) $\mu_e > \mu_h$ (b) $\mu_e < \mu_h$

(c) $\mu_e = \mu_h$ (d) $\mu_e < 0; \mu_h > 0$

101. Doping of intrinsic semiconductor is done [Orissa JEE 2005]

(a) To neutralize charge carriers
(b) To increase the concentration of majority charge carriers
(c) To make it neutral before disposal
(d) To carry out further purification

Semiconductor Diode

1. In the forward bias arrangement of a *PN*-junction diode [MP PMT 1994, 96, 99]

(a) The *N*-end is connected to the positive terminal of the battery
(b) The *P*-end is connected to the positive terminal of the battery
(c) The direction of current is from *N*-end to *P*-end in the diode
(d) The *P*-end is connected to the negative terminal of battery

2. In a *PN*-junction diode [MP PET 1993]

(a) The current in the reverse biased condition is generally very small
(b) The current in the reverse biased condition is small but the forward biased current is independent of the bias voltage
(c) The reverse biased current is strongly dependent on the applied bias voltage
(d) The forward biased current is very small in comparison to reverse biased current

3. The cut-in voltage for silicon diode is approximately

(a) 0.2 V (b) 0.6 V

(c) 1.1 V (d) 1.4 V

4. The electrical circuit used to get smooth dc output from a rectifier circuit is called [KCET 2003]

(a) Oscillator (b) Filter

(c) Amplifier (d) Logic gates

5. *PN*-junction diode works as a insulator, if connected [CPMT 1987]

(a) To A.C. (b) In forward bias

(c) In reverse bias (d) None of these

6. The reverse biasing in a *PN* junction diode [MP PMT 1991; EAMCET 1994; CBSE PMT 2003]

(a) Decreases the potential barrier
(b) Increases the potential barrier
(c) Increases the number of minority charge carriers
(d) Increases the number of majority charge carriers

[CBSE PMT 2005]

7. The electrical resistance of depletion layer is large because

(a) It has no charge carriers
(b) It has a large number of charge carriers
(c) It contains electrons as charge carriers
(d) It has holes as charge carriers

8. In the circuit given below, the value of the current is [AIIMS 2005]

(a) 0 *amp* (b) 10^{-2} *amp*

(c) 10^{2} *amp* (d) 10^{-3} *amp*

9. What is the current in the circuit shown below [AFMC 2000; RPMT 2001]

(a) 0 *amp* (b) 10^{-2} *amp*

(c) 1 *amp* (d) 0.10 *amp*

10. If the forward voltage in a semiconductor diode is doubled, the width of the depletion layer will [MP PMT 1996]

(a) Become half (b) Become one-fourth

(c) Remain unchanged (d) Become double

11. The *PN* junction diode is used as [CPMT 1972; AFMC 1997; CBSE PMT 1999; AIIMS 1999; RPMT 2000; MP PMT 04]

(a) An amplifier (b) A rectifier

(c) An oscillator (d) A modulator

12. When a *PN* junction diode is reverse biased

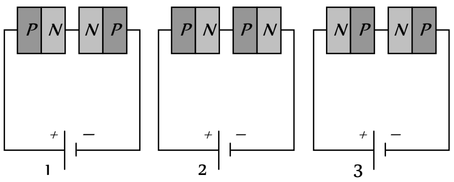
(a) Electrons and holes are attracted towards each other and move towards the depletion region

(b) Electrons and holes move away from the junction depletion region

(c) Height of the potential barrier decreases

(d) No change in the current takes place

13. Two *PN*-junctions can be connected in series by three different methods as shown in the figure. If the potential difference in the junctions is the same, then the correct connections will be



(a) In the circuit (1) and (2) (b) In the circuit (2) and (3)

(c) In the circuit (1) and (3) (d) Only in the circuit (1)

14. A *PN*- junction has a thickness of the order of [BIT 1990]

(a) $1\,cm$ (b) $1\,mm$

(c) $10^{-6}\,m$ (d) $10^{-12}\,cm$

15. In the depletion region of an unbiased *P-N* junction diode there are [KCET 1999; CBSE PMT 1999; RPMT 2001; MP PMT 1994, 2003]

(a) Only electrons

(b) Only holes

(c) Both electrons and holes

(d) Only fixed ions

16. On increasing the reverse bias to a large value in a *PN*-junction diode, current [MP PMT 1994; BHU 2002]

(a) Increases slowly (b) Remains fixed

(c) Suddenly increases (d) Decreases slowly

17. In the case of forward biasing of *PN*-junction, which one of the following figures correctly depicts the direction of flow of carriers

(a) 
(b) 
(c) 
(d) 
18. Which of the following statements concerning the depletion zone of an unbiased *PN* junction is (are) true [IIT-JEE 1995]

(a) The width of the zone is independent of the densities of the dopants (impurities)

(b) The width of the zone is dependent on the densities of the dopants

(c) The electric field in the zone is produced by the ionized dopant atoms

(d) The electric field in the zone is provided by the electrons in the conduction band and the holes in the valence band

19. A semiconductor device is connected in a series circuit with a battery and a resistance. A current is found to pass through the circuit. If the polarity of the battery is reversed, the current drops almost to zero. The device may be [MP PET 1995; CBSE PMT 1998]

(a) A *P*-type semiconductor (b) An *N*-type semiconductor

(c) A *PN*-junction [IIT-JEE 1989] (d) An intrinsic semiconductor

20. The approximate ratio of resistances in the forward and reverse bias of the *PN*-junction diode is [MP PET 2000; MP PMT 1999, 2002, 03; Pb. PMT 2003]

(a) $10^2:1$ (b) $10^{-2}:1$

(c) $1:10^{-4}$ (d) $1:10^4$

21. In a junction diode, the holes are due to [CBSE PMT 1999; Pb. PMT 2003]

(a) Protons (b) Neutrons

(c) Extra electrons (d) Missing of electrons

22. In forward bias, the width of potential barrier in a *P-N* junction diode [EAMCET (Engg.) 1995; CBSE PMT 1999 RPMT 1997, 2002, 03]

(a) Increases

(b) Decreases

(c) Remains constant

(d) First increases then decreases

23. The cause of the potential barrier in a *P-N* diode is [CBSE PMT 1998; RPMT 2001]

(a) Depletion of positive charges near the junction

(b) Concentration of positive charges near the junction

(c) Depletion of negative charges near the junction

(d) Concentration of positive and negative charges near the junction

24. In a *PN*[CBSE PMT 1995] junction diode not connected to any circuit [IIT-JEE 1998]

(a) The potential is the same everywhere

(b) The *P*-type is a higher potential than the *N*-type side

(c) There is an electric field at the junction directed from the *N*-type side to the *P*- type side

(d) There is an electric field at the junction directed from the *P*-type side to the *N*-type side

25. Which of the following statements is not true [IIT-JEE 1997 Re-Exam]

(a) The resistance of intrinsic semiconductors decrease with increase of temperature

(b) Doping pure Si with trivalent impurities give *P*-type semiconductors

(c) The majority carriers in *N*-type semiconductors are holes

(d) A *PN*-junction can act as a semiconductor diode

26. The dominant mechanisms for motion of charge carriers in forward and reverse biased silicon *P-N* junctions are [IIT-JEE 1997 Cancelled; RPMT 2000; AIIMS 2000]

(a) Drift in forward bias, diffusion in reverse bias

(b) Diffusion in forward bias, drift in reverse bias

(c) Diffusion in both forward and reverse bias

(d) Drift in both forward and reverse bias

27. In *P-N* junction, avalanche current flows in circuit when biasing is

(a) Forward (b) Reverse

(c) Zero (d) Excess

28. The depletion layer in the *P-N* junction region is caused by [CBSE PMT 1994]

(a) Drift of holes

(b) Diffusion of charge carriers

(c) Migration of impurity ions

(d) Drift of electrons

29. Which one is reverse-biased [DCE 1999]

(a) 
(b) 
(c) 
(d) 
30. In a *P-N* junction diode if *P* region is heavily doped than *n* region then the depletion layer is [RPMT 1999]

(a) Greater in *P* region

(b) Greater in *N* region

(c) Equal in both region

(d) No depletion layer is formed in this case

31. Which one is in forward bias [RPMT 2000]

(a) 
(b) 
(c) 
(d) None of these

32. The reason of current flow in *P-N* junction in forward bias is [RPMT 2000]

(a) Drifting of charge carriers

(b) Minority charge carriers

(c) Diffusion of charge carriers

(d) All of these

33. The resistance of a reverse biased *P-N* junction diode is about

(a) 1 *ohm* (b) 10^2 *ohm*

(c) 10^3 *ohm* (d) 10^6 *ohm*

34. Consider the following statements *A* and *B* and identify the correct choice of the given answers

A: The width of the depletion layer in a *P-N* junction diode increases in forwards bias

B: In an intrinsic semiconductor the fermi energy level is exactly in the middle of the forbidden gap [EAMCET (Engg.) 2000]

(a) *A* is true and *B* is false (b) Both *A* and *B* are false

(c) *A* is false and *B* is true (d) Both *A* and *B* are true

[RPET 1997]

35. In comparison to a half wave rectifier, the full wave rectifier gives lower [AFMC 2001]

(a) Efficiency (b) Average *dc*

(c) Average output voltage (d) None of these

36. Avalanche breakdown is due to [RPMT 2001]

(a) Collision of minority charge carrier

(b) Increase in depletion layer thickness

(c) Decrease in depletion layer thickness

(d) None of these

37. Which is reverse biased diode [DCE 2001]

(a) 
(b) 
(c) 
(d) 
38. Zener breakdown in a semi-conductor diode occurs when [UPSEAT 2002]

(a) Forward current exceeds certain value

(b) Reverse bias exceeds certain value

(c) Forward bias exceeds certain value

(d) Potential barrier is reduced to zero

39. When forward bias is applied to a *P-N* junction, then what happens to the potential barrier V_B, and the width of charge depleted region *x* [UPSEAT 2002, 03; Roorkee 1999; RPET 2003; AIEEE 2004]

(a) V_B increases, *x* decreases

(b) V_B decreases, *x* increases

(c) V_B increases, *x* increases

(d) V_B decreases, *x* decreases

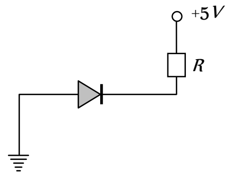
40. The potential barrier, in the depletion layer, is due to [EAMCET (Engg.) 1998; Pb. PMT 1999; Pb. PET 2001; AIIMS 2002]

(a) Ions (b) Holes

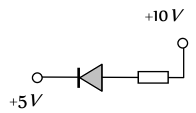
(c) Electrons (d) Both (b) and (c)

41. In the given figure, which of the diodes are forward biased ? [Kerala PET 2002]

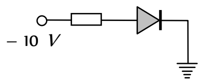
1.



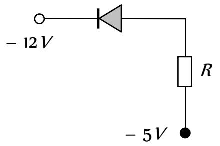
2.



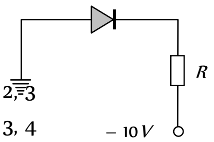
3.



4.



5.



(a) 1, 2, 3 (b) 2, 4, 5

(c) 1, 3, 4 (d) 2, 3, 4

42. Function of rectifier is [AFMC 2002, 04]

(a) To convert *ac* into *dc* (b) To convert *dc* into *ac*

(c) Both (a) and (b) (d) None of these

43. When the *P* end of *P*-*N* junction is connected to the negative terminal of the battery and the *N* end to the positive terminal of the battery, then the *P*-*N* junction behaves like

(a) A conductor (b) An insulator

(c) A super-conductor (d) A semi-conductor

44. If the two ends *P* and *N* of a *P*-*N* diode junction are joined by a wire [MP PMT 2002]

(a) There will not be a steady current in the circuit

(b) There will be a steady current from *N* side to *P* side

(c) There will be a steady current from *P* side to *N* side

(d) There may not be a current depending upon the resistance of the connecting wire

45. A potential barrier of 0.50 *V* exists across a *P*-*N* junction. If the depletion region is 5.0×10^{-7} *m* wide, the intensity of the electric field in this region is [UPSEAT 2002]

(a) 1.0×10^{6} *V/m* (b) 1.0×10^{5} *V/m*

(c) 2.0×10^{5} *V/m* (d) 2.0×10^{6} *V/m*

46. If no external voltage is applied across *P*-*N* junction, there would be

(a) No electric field across the junction

(b) An electric field pointing from *N*-type to *P*-type side across the junction

(c) An electric field pointing from *P*-type to *N*-type side across the junction

(d) A temporary electric field during formation of *P*-*N* junction that would subsequently disappear

47. In a *PN*-junction [CBSE PMT 2002]

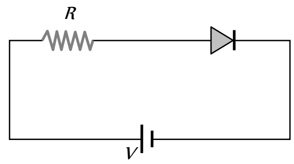
(a) *P* and *N* both are at same potential

(b) High potential at *N* side and low potential at *P* side

(c) High potential at *P* side and low potential at *N* side

(d) Low potential at *N* side and zero potential at *P* side

48. For the given circuit of *PN*-junction diode, which of the following statement is correct [CBSE PMT 2002]



(a) In forward biasing the voltage across *R* is *V*

(b) In forward biasing the voltage across *R* is 2*V*

(c) In reverse biasing the voltage across *R* is *V*

(d) In reverse biasing the voltage across *R* is 2*V*

49. On adjusting the *P*-*N* junction diode in forward biased [RPET 2003]

(a) Depletion layer increases (b) Resistance increases

(c) Both decreases (d) None of these

50. In the middle of the depletion layer of a reverse-biased *PN* junction, the [AIEEE 2003]

(a) Potential is zero (b) Electric field is zero

(c) Potential is maximum (d) Electric field is maximum

51. Barrier potential of a *P*-*N* junction diode does not depend on

(a) Temperature (b) Forward bias

(c) Doping density [MP PET 2002] (d) Diode design

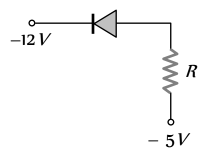
52. A crystal diode is a [MP PET 2004]

(a) Non-linear device (b) Amplifying device

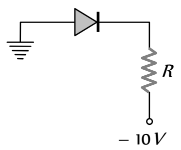
(c) Linear device (d) Fluctuating device

53. Of the diodes shown in the following diagrams, which one is reverse biased [CBSE PMT 2004]

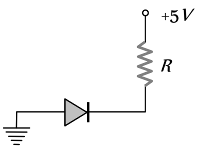
(a)



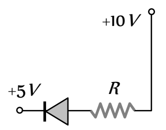
(b)



(c)



(d)



[Orissa JEE 2002]

54. In a *PN* junction photo cell, the value of photo-electromotive force produced by monochromatic light is proportional to [CBSE PMT 2004]

(a) The voltage applied at the *PN* junction

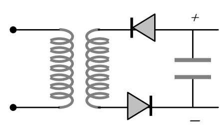
(b) The barrier voltage at the *PN* junction

(c) The intensity of the light falling on the cell

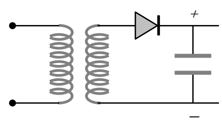
(d) The frequency of the light falling on the cell

55. Which is the correct diagram of a half-wave rectifier [Orissa PMT 2004]

(a)



(b)



(c) 
(d) 
56. The maximum efficiency of full wave rectifier is [J & K CET 2004]

(a) 100% (b) 25.20%

(c) 40.2% (d) 81.2%

57. Serious draw back of the semiconductor device is [Pb. PMT 2004]

(a) They cannot be used with high voltage

(b) They pollute the environment

(c) They are costly

(d) They do not last for long time

58. Select the correct statement [RPMT 2003]

(a) In a full wave rectifier, two diodes work alternately

(b) In a full wave rectifier, two diodes work simultaneously

(c) The efficiency of full wave and half wave rectifiers is same

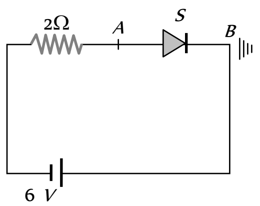
(d) The full wave rectifier is bi-directional.

59. In order to forward bias a *PN* junction, the negative terminal of battery is connected to [RPMT 2003]

(a) *P*–side (b) Either *P*–side or *N*–side

(c) *N*–side (d) None of these

60. The diode shown in the circuit is a silicon diode. The potential difference between the points *A* and *B* will be [RPMT 2002]



(a) 6 V

(b) 0.6 V

(c) 0.7 V

(d) 0 V

61. Zener breakdown takes place if [RPMT 2000]

(a) Doped impurity is low (b) Doped impurity is high

(c) Less impurity in *N*-part (d) Less impurity in *P*-type

62. Consider the following statements *A* and *B* and identify the correct choice of the given answers

(A) A zener diode is always connected in reverse bias

(B) The potential barrier of a *PN* junction lies between 0.1 to 0.3 V approximately [EAMCET 2000]

(a) *A* and *B* are correct

(b) *A* and *B* are wrong

(c) *A* is correct but *B* is wrong

(d) *A* is wrong but *B* is correct

63. The correct symbol for zener diode is [RPMT 2000]

(a) 
(b) 
(c) 
(d) 
64. Which one of the following statements is not correct [SCRA 2000]

(a) A diode does not obey Ohm's law

(b) A *PN* junction diode symbol shows an arrow identifying the direction of current (forward) flow

(c) An ideal diode is an open switch

(d) An ideal diode is an ideal one way conductor

65. Which of the following semi-conductor diodes is reverse biased

(a) 
(b) 
(c) 
(d) 
66. No bias is applied to a *P-N* junction, then the current [RPMT 1999]

(a) Is zero because the number of charge carriers flowing on both sides is same

(b) Is zero because the charge carriers do not move

(c) Is non-zero

(d) None of these

67. Zener diode is used as [CBSE PMT 1999]

(a) Half wave rectifier (b) Full wave rectifier

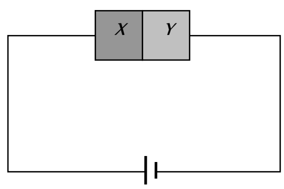
(c) ac voltage stabilizer (d) dc voltage stabilizer

68. The width of forbidden gap in silicon crystal is 1.1 eV. When the crystal is converted in to a *N*-type semiconductor the distance of Fermi level from conduction band is [EAMCET (Med.) 1999]

(a) Greater than 0.55 eV (b) Equal to 0.55 eV

(c) Lesser than 0.55 eV (d) Equal to 1.1 eV

69. A semiconductor *X* is made by doping a germanium crystal with arsenic (Z = 33). A second semiconductor *Y* is made by doping germanium with indium (Z = 49). The two are joined end to end and connected to a battery as shown. Which of the following statements is correct [Orissa JEE 1998]



(a) *X* is *P*-type, *Y* is *N*-type and the junction is forward biased

(b) *X* is *N*-type, *Y* is *P*-type and the junction is forward biased

(c) *X* is *P*-type, *Y* is *N*-type and the junction is reverse biased

(d) *X* is *N*-type, *Y* is *P*-type and the junction is reverse biased

70. In *P-N* junction, the barrier potential offers resistance to [AMU 1995, 96]

(a) Free electrons in *N* region and holes in *P* region

(b) Free electrons in *P* region and holes in *N* region

(c) Only free electrons in *N* region

(d) Only holes in *P* region

71. Symbolic representation of photodiode is [RPMT 1995]

(a)  (b) 
(c)  (d) 
72. To make a *PN* junction conducting [IIT-JEE 1994]

(a) The value of forward bias should be more than the barrier potential

(b) The value of forward bias should be less than the barrier potential

(c) The value of reverse bias should be more than the barrier potential

(d) The value of reverse bias should be less than the barrier potential

73. Which is the wrong statement in following sentences? A device in which *P* and *N*-type semiconductors are used is more useful then a vacuum type because [MP PET 1992]

(a) Power is not necessary to heat the filament

(b) It is more stable

(c) Very less heat is produced in it

(d) Its efficiency is high due to a high voltage across the junction

74. The depletion layer in silicon diode is 1 μm wide and the knee potential is 0.6 *V*, then the electric field in the depletion layer will be

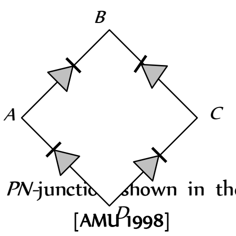
(a) Zero

(b) 0.6 Vm^{-1}

(c) 6×10^{4} V/m

(d) 6×10^{5} V/m

75. In the diagram, the input is across the terminals *A* and *C* and the output is across the terminals *B* and *D*, then the output is



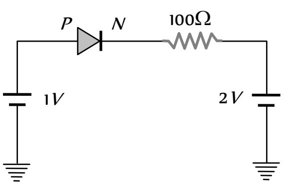
(a) Zero

(b) Same as input

(c) Full wave rectifier

(d) Half wave rectifier

76. The current through an ideal *PN*-junction shown in the following circuit diagram will be [AMU 1998]



(a) Zero

(b) 1 *mA*

(c) 10 *mA*

(d) 30 *mA*

77. If a full wave rectifier circuit is operating from 50 *Hz* mains, the fundamental frequency in the ripple will be

[UPSEAT 2000; CBSE PMT 2003; AIEEE 2005]

(a) 50 *Hz* (b) 70.7 *Hz*

(c) 100 *Hz* (d) 25 *Hz*

78. In a full wave rectifiers, input *ac* current has a frequency 'ν'. The output frequency of current is [BHU 2005]

(a) $\nu/2$ (b) ν

(c) 2ν (d) None of these

79. A diode having potential difference 0.5 *V* across its junction which does not depend on current, is connected in series with resistance of 20 Ω across source. If 0.1 *A* passes through resistance then what is the voltage of the source

[DCE 2005]

(a) 1.5 *V* (b) 2.0 *V*

(c) 2.5 *V* (d) 5 *V*

Junction Transistor

1. When *NPN* transistor is used as an amplifier

[AIEEE 2004]

(a) Electrons move from base to collector

(b) Holes move from emitter to base

(c) Electrons move from collector to base

(d) Holes move from base to emitter

2. The phase difference between input and output voltages of a CE circuit is [MP PET 2004]

(a) 0° (b) 90°

(c) 180° (d) 270°

3. An oscillator is nothing but an amplifier with

[MP PET 2004]

(a) Positive feed back (b) Large gain

(c) No feedback (d) Negative feedback

4. The emitter-base junction of a transistor is ...... biased while the collector-base junction is .... biased

[CBSE PMT 1994] [KCET 2004]

(a) Reverse, forward (b) Reverse, reverse

(c) Forward, forward (d) Forward, reverse

5. In an *NPN* transistor the collector current is 24 *mA*. If 80% of electrons reach collector its base current in *mA* is

[Kerala PMT 2004]

(a) 36 (b) 26

(c) 16 (d) 6

6. A *NPN* transistor conducts when [CPMT 2003]

(a) Both collector and emitter are positive with respect to the base

(b) Collector is positive and emitter is negative with respect to the base

(c) Collector is positive and emitter is at same potential as the base

(d) Both collector and emitter are negative with respect to the base

7. In the case of constants α and β of a transistor [CET 2003]

(a) $\alpha = \beta$ (b) $\beta < 1 \quad \alpha > 1$

(c) $\alpha\beta = 1$ (d) $\beta > 1 \quad \alpha < 1$

8. Which of the following is true [DPMT 2002]

(a) Common base transistor is commonly used because current gain is maximum

(b) Common emitter is commonly used because current gain is maximum

(c) Common collector is commonly used because current gain is maximum

(d) Common emitter is the least used transistor

9. If α = 0.98 and current through emitter i_e = 20 *mA*, the value of β is [DPMT 2002]

(a) 4.9 (b) 49

(c) 96 (d) 9.6

10. For a common base configuration of *PNP* transistor $\frac{I_C}{I_E} = 0.98$ then maximum current gain in common emitter configuration will be [CBSE PMT 2002]

(a) 12 (b) 24

(c) 6 (d) 5

11. In a *PNP* transistor working as a common-base amplifier, current gain is 0.96 and emitter current is 7.2 *mA*. The base current is [AFMC 2002, Pb. PET 2002]

(a) 0.4 *mA* (b) 0.2 *mA*

(c) 0.29 *mA* (d) 0.35 *mA*

12. If l_1, l_2, l_3 are the lengths of the emitter, base and collector of a transistor then [KCET 2002]

(a) $l_1 = l_2 = l_3$ (b) $l_3 < l_2 > l_1$

(c) $l_3 < l_1 < l_2$ (d) $l_3 > l_1 > l_2$

13. In an *NPN* transistor circuit, the collector current is 10 *mA*. If 90% of the electrons emitted reach the collector, the emitter current (i_E) and base current (i_B) are given by [KCET 2001]

(a) $i_E = -1$ *mA*, $i_B = 9$ *mA*

(b) $i_E = 9$ *mA*, $i_B = -1$ *mA*

(c) $i_E = 1$ *mA*, $i_B = 11$ *mA*

(d) $i_E = 11$ *mA*, $i_B = 1$ *mA*

14. In a common emitter transistor, the current gain is 80. What is the change in collector current, when the change in base current is 250 μA [CBSE PMT 2000]

(a) 80×250 μA (b) $(250 - 80)$ μA

(c) $(250 + 80)$ μA (d) 250/80 μA

15. Least doped region in a transistor [KCET 2000]

(a) Either emitter or collector

(b) Base

(c) Emitter

(d) Collector

16. The transistors provide good power amplification when they are used in [AMU 1999]

(a) Common collector configuration

(b) Common emitter configuration

(c) Common base configuration

(d) None of these

17. The transfer ratio of a transistor is 50. The input resistance of the transistor when used in the common-emitter configuration is 1 $K\Omega$. The peak value for an A.C input voltage of 0.01 *V* peak is

(a) 100 μA (b) 0.01 *mA*

(c) 0.25 *mA* (d) 500 μA

18. For a transistor the parameter β = 99. The value of the parameter α is [Pb CET 1998]

(a) 0.9 (b) 0.99

(c) 1 (d) 9

19. A transistor is used in common emitter mode as an amplifier. Then

(a) The base-emitter junction is forward biased

(b) The base-emitter junction is reverse biased

(c) The input signal is connected in series with the voltage applied to the base-emitter junction

(d) The input signal is connected in series with the voltage applied to bias the base collector junction

20. In a *PNP* transistor the base is the *N*-region. Its width relative to the *P*-region is [DCE 1997]

(a) Smaller (b) Larger

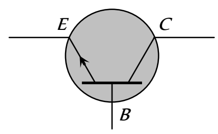
(c) Same (d) Not related

21. A common emitter amplifier is designed with *NPN* transistor (α = 0.99). The input impedance is 1 $K\Omega$ and load is 10 $K\Omega$. The voltage gain will be [CPMT 1996]

(a) 9.9 (b) 99

(c) 990 (d) 9900

22. The symbol given in figure represents [AMU 1995, 96]



(a) *NPN* transistor

(b) *PNP* transistor

(c) Forward biased *PN* junction diode

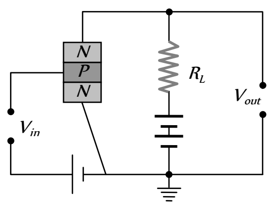
(d) Reverse biased *NP* junction diode

23. The most commonly used material for making transistor is [MNR 1995]

(a) Copper (b) Silicon

(c) Ebonite (d) Silver

24. An *NPN*-transistor circuit is arranged as shown in figure. It is [BHU 1994]



(a) A common base amplifier circuit

(b) A common emitter amplifier circuit

(c) A common collector amplifier circuit

(d) Neither of the above

25. The part of a transistor which is heavily doped to produce a large number of majority carriers, is [CBSE PMT 1993]

(a) Base (b) Emitter

(c) Collector (d) None of these

26. For a transistor, the current amplification factor is 0.8. The transistor is connected in common emitter configuration. The change in the collector current when the base current changes by 6 *mA* is [Haryana CET 1991]

(a) 6 *mA* (b) 4.8 *mA*

(c) 24 *mA* (d) 8 *mA*

27. In a common base amplifier circuit, calculate the change in base current if that in the emitter current is 2 *mA* and $\alpha = 0.98$ [BHU 1995]

(a) 0.04 *mA* (b) 1.96 *mA*

(c) 0.98 *mA* (d) 2 *mA*

28. In case of *NPN*-transistors the collector current is always less than the emitter current because [AIIMS 1983]

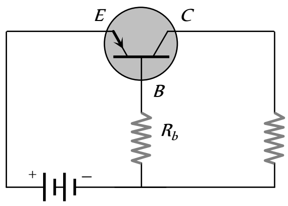
(a) Collector side is reverse biased and emitter side is forward biased

(b) After electrons are lost in the base and only remaining ones reach the collector

(c) Collector side is forward biased and emitter side is reverse biased

(d) Collector being reverse biased attracts less electrons

29. In a transistor circuit shown here the base current is 35 μA. The value of the resistor R_b is



(a) 123.5 $k\Omega$

(b) 257 $k\Omega$

(c) 380.05 $k\Omega$

(d) None of these

30. In a transistor, a change of 8.0 *mA* in the emitter current produces a change of 7.8 *mA* in the collector current. What change in the base current is necessary to produce the same change in the collector current

(a) 50 μA (b) 100 μA

(c) 150 μA (d) 200 μA

31. In a transistor configuration β-parameter is [Orissa PMT 2004]

(a) $\frac{l_b}{l_c}$ (b) $\frac{l_c}{l_b}$

(c) $\frac{l_c}{l_a}$ (d) $\frac{l_a}{l_c}$

32. Which of these is unipolar transistor [Pb PMT 2004]

(a) Point contact transistor (b) Field effect transistor

(c) *PNP* transistor (d) None of these

33. For a transistor, in a common emitter arrangement, the alternating current gain β is given by [DPMT 2004]

(a) $\beta = \left(\frac{\Delta I_C}{\Delta I_B}\right)_{V_C}$ (b) $\beta = \left(\frac{\Delta I_B}{\Delta I_C}\right)_{V_C}$

(c) $\beta = \left(\frac{\Delta I_C}{\Delta I_E}\right)_{V_C}$ (d) $\beta = \left(\frac{\Delta I_E}{\Delta I_C}\right)_{V_C}$

34. The relation between α and β parameters of current gains for a transistors is given by [Pb. PET 2000]

(a) $\alpha = \frac{\beta}{1-\beta}$ (b) $\alpha = \frac{\beta}{1+\beta}$

(c) $\alpha = \frac{1-\beta}{\beta}$ (d) $\alpha = \frac{1+\beta}{\beta}$

35. When *NPN* transistor is used as an amplifier [DCE 2002]

(a) Electrons move from base to emitter

(b) Electrons move from emitter to base

(c) Electrons moves from base to emitter

(d) Holes moves from base to emitter

36. In the *CB* mode of a transistor, when the collector voltage is changed by 0.5 *volt*. The collector current changes by 0.05 *mA*. The output resistance will be [Pb. PMT 2003]

(a) 10 $k\Omega$ (b) 20 $k\Omega$

(c) 5 $k\Omega$ (d) 2.5 $k\Omega$

37. Which of the following is used to produce radio waves of constant amplitude [DCE 2004]

(a) Oscillator (b) FET

(c) Rectifier (d) Amplifier

38. While a collector to emitter voltage is constant in a transistor, the collector current changes by 8.2 *mA* when the emitter current changes by 8.3 *mA*. The value of forward current ratio h_{fe} is

(a) 82 (b) 83

(c) 8.2 (d) 8.3

39. Consider an *NPN* transistor amplifier in common-emitter configuration. The current gain of the transistor is 100. If the collector current changes by 1 *mA,* what will be the change in emitter current [AIIMS 2005]

(a) 1.1 *mA* (b) 1.01 *mA*

(c) 0.01 *mA* (d) 10 *mA*

40. In a common base amplifier the phase difference between the input signal voltage and the output voltage is [CBSE PMT 1990; AIEEE 2005]

(a) 0 (b) $\pi / 4$

(c) $\pi / 2$ (d) π

41. In *NPN* transistor the collector current is 10 *mA*. If 90% of electrons emitted reach the collector, then [Kerala PMT 2005]

(a) Emitter current will be 9 *mA*
(b) Emitter current will be 11.1 *mA*
(c) Base current will be 0.1 *mA*
(d) Base current will be 0.01 *mA*

42. *NPN* transistor are preferred to *PNP* transistor because they have [J & K CET 2005]

(a) Low cost
(b) Low dissipation energy
(c) Capability of handing large power
(d) Electrons having high mobility than holes

43. In a transistor in CE configuration, the ratio of power gain to voltage gain is [J & K CET 2005]

(a) α (b) β / α
(c) $\beta\alpha$ (d) β

44. In the study of transistor as an amplifier, if $\alpha = I_c / I_e$ and $\beta = I_c / I_b$, where I_c, I_b and I_e are the collector, base and emitter currents, then

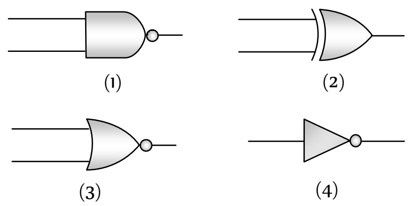
[CBSE PMT 2000; KCET 2000; Orissa JEE 2005]

(a) $\beta = \dfrac{1-\alpha}{\alpha}$ (b) $\beta = \dfrac{\alpha}{1-\alpha}$

(c) $\beta = \dfrac{\alpha}{1+\alpha}$ (d) $\beta = \dfrac{1+\alpha}{\alpha}$

Digital Electronics

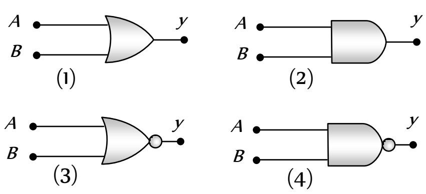
1. Given below are symbols for some logic gates



The XOR gate and NOR gate respectively are [AFMC 1994]

(a) 1 and 2 (b) 2 and 3
(c) 3 and 4 (d) 1 and 4

2. Given below are four logic gate symbol (figure). Those for OR, NOR and NAND are respectively [NSEP 1994]



(a) 1, 4, 3 (b) 4, 1, 2
(c) 1, 3, 4 (d) 4, 2, 1

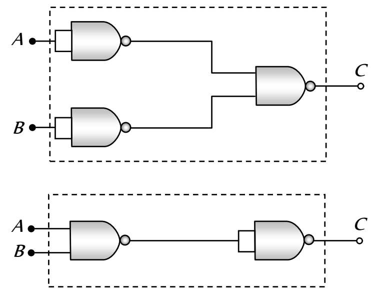
3. The following truth table corresponds to the logic gate

[BHU 1994; CPMT 2000; J & K CET 2004]

A	0	0	1	1
B	0	1	0	1
X	0	1	1	1

(a) NAND (b) OR
(c) AND (d) XOR

4. The combination of 'NAND' gates shown here under (figure) are equivalent to [Haryana CEET 1996]



(a) An OR gate and an AND gate respectively
(b) An AND gate and a NOT gate respectively
(c) An AND gate and an OR gate respectively
(d) An OR gate and a NOT gate respectively.

5. A truth table is given below. Which of the following has this type of truth table [CBSE PMT 1996; UPSEAT 2002]

A	0	1	0	1
B	0	0	1	1
y	1	0	0	0

(a) XOR gate (b) NOR gate
(c) AND gate (d) OR gate

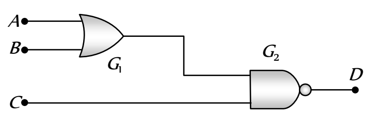
6. The truth table shown in figure is for [Pb. CET 1998]

A	0	0	1	1
B	0	1	0	1
Y	1	0	0	1

(a) XOR (b) AND
(c) XNOR (d) OR

7. For the given combination of gates, if the logic states of inputs *A*, *B*, *C* are as follows *A* = *B* = *C* = 0 and *A* = *B* = 1, *C* = 0 then the logic states of output *D* are

(a) 0, 0
(b) 0, 1
(c) 1, 0
(d) 1, 1



8. Boolean algebra is essentially based on [AIIMS 1999]

(a) Truth (b) Logic
(c) Symbol (d) Numbers

9. The logic behind 'NOR' gate is that it gives

[CPMT 1999, AFMC 1999]

(a) High output when both the inputs are low
(b) Low output when both the inputs are low
(c) High output when both the inputs are high

(d) None of these

10. A logic gate is an electronic circuit which **[BHU 2000]**

(a) Makes logic decisions

(b) Allows electrons flow only in one direction

(c) Works binary algebra

(d) Alternates between 0 and 1 values

11. A gate has the following truth table **[CBSE PMT 2000]**

P	1	1	0	0
Q	1	0	1	0
R	1	0	0	0

The gate is

(a) NOR (b) OR

(c) NAND (d) AND

12. How many NAND gates are used to form an AND gate **[MP PET 2004]**

(a) 1 (b) 2

(c) 3 (d) 4

13. Which of the following gates will have an output of 1 **[CBSE PMT 1998]**

(a) 
(b) 
(c) 
(d) 
14. Which represents NAND gate **[DCE 2002]**

(a) 
(b) 
(c) 
(d) 
15. The given truth table is of **[AMU 1998; J & K CET 2002]**

A	*X*
0	1
1	0

(a) OR gate (b) AND gate

(c) NOT gate (d) None of above

16. What will be the input of *A* and *B* for the Boolean expression $\overline{(A+B)}\cdot\overline{(A\cdot B)}=1$ **[TNPCEE 2002]**

(a) 0, 0 (b) 0, 1

(c) 1, 0 (d) 1, 1

17. If *A* and *B* are two inputs in AND gate, then AND gate has an output of 1 when the values of *A* and *B* are **[TNPCEE 2002]**

(a) $A = 0,\ B = 0$ (b) $A = 1,\ B = 1$

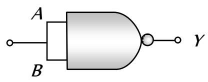
(c) $A = 1,\ B = 0$ (d) $A = 0,\ B = 1$

18. The Boolean equation of NOR gate is **[Haryana CET 2002]**

(a) $C = A + B$ (b) $C = \overline{A+B}$

(c) $C = A\cdot B$ (d) $C = \overline{A\cdot B}$

19. This symbol represents **[CBSE PMT 1996]**



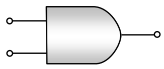
(a) NOT gate

(b) OR gate

(c) AND gate

(d) NOR gate

20. Which logic gate is represented by following diagram **[DCE 2001]**



(a) AND

(b) OR

(c) NOR

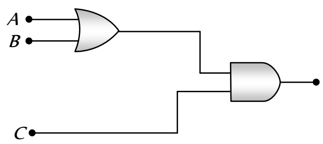
(d) XOR

21. Symbol  represents **[Kerala PMT 2001]**

(a) NAND gate (b) NOR gate

(c) NOT gate (d) XNOR gate

22. To get an output 1 from the circuit shown in the figure, the input must be **[UPSEAT 2002]**



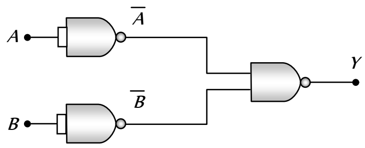
(a) $A=0,\ B=1,\ C=0$

(b) $A=1,\ B=0,\ C=0$

(c) $A=1,\ B=0,\ C=1$

(d) $A=1,\ B=1,\ C=0$

23. The combination of the gates shown in the figure below produces



(a) NOR gate

(b) OR gate

(c) AND gate

(d) XOR gate

24. The output of a NAND gate is 0 **[UPSEAT 2004]**

(a) If both inputs are 0

(b) If one input is 0 and the other input is 1

(c) If both inputs are 1

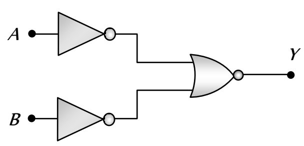
(d) Either if both inputs are 1 or if one of the inputs is 1 and the other 0

25. A gate in which all the inputs must be low to get a high output is called **[UPSEAT 2004]**

(a) A NAND gate (b) An inverter

(c) A NOR gate (d) An AND gate

26. Which logic gate is represented by the following combination of logic gates **[AIIMS 2004]**



(a) OR (b) NAND

(c) AND (d) NOR

27. The output of OR gate is 1 [CBSE PMT 2004]

(a) If both inputs are zero

(b) If either or both inputs are 1

(c) Only if both input are 1

(d) If either input is zero

28. Which gates is represented by this figure [DCE 2003]

(a) NAND gate

(b) AND gate

(c) NOT gate

(d) OR gate

29. Sum of the two binary numbers $(1000010)_2$ and $(11011)_2$ is

(a) $(111101)_2$ (b) $(111111)_2$

(c) $(101111)_2$ (d) $(111001)_2$

30. The truth-table given below is for which gate

[CBSE PMT 1994, 98 2002; DPMT 2002; BCECE 2005]

A	0	0	1	1
B	0	1	0	1
C	1	1	1	0

(a) XOR (b) OR

(c) AND (d) NAND

31. Which of the following logic gate is an universal gate

[AIIMS 2005]

(a) OR (b) NOT

(c) AND (d) NOR

Valve Electronics (Diode and Triode)

1. Thermionic emission from a heated filament varies with its temperature *T* as

[CBSE PMT 1990; RPMT 2000; CPMT 2002]

(a) T^{-1} (b) T

(c) T^2 (d) $T^{3/2}$

2. Number of secondary electrons emitted per number of primary electrons depends on [RPET 2000]

(a) Material of target

(b) Frequency of primary electrons

(c) Intensity

(d) None of the above

3. Due to S.C.R in vacuum tube [RPET 2000]

(a) $I_p \rightarrow$ Decrease (b) $I_p -$ Increase

(c) $V_p =$ Increase (d) $V_g =$ Increase

4. In diode, when there is saturation current, the plate resistance (r_p) is [AIIMS 1997; Haryana PMT 2000]

(a) Zero (b) Infinite

(c) Some finite quantity (d) Data is insufficient

5. The grid voltage of any triode valve is changed from –1 volt to – 3 *volt* and the mutual conductance is 3×10^{-4} *mho*. The change in plate circuit current will be [MNR 1999]

(a) 0.8 *mA* (b) 0.6 *mA*

(c) 0.4 *mA* (d) 1 *mA*

6. In a triode, $g_m = 2 \times 10^{-3} ohm^{-1}; \mu = 42$, resistance load, $R = 50$ kilo ohm. The voltage amplification obtained from this triode will be [MNR 1999]

(a) 30.42 (b) 29.57

(c) 28.18 (d) 27.15

7. In an amplifier the load resistance R_L is equal to the plate resistance (r_p). The voltage amplification is equal to [DCE 2004]

[CPMT 1995]

(a) μ (b) 2μ

(c) $\mu / 2$ (d) $\mu / 4$

8. For a given plate-voltage, the plate current in a triode is maximum when the potential of

[IIT-JEE 1985; CPMT 1995; AFMC 1999]

(a) The grid is positive and plate is negative

(b) The grid is positive and plate is positive

(c) The grid is zero and plate is positive

(d) The grid is negative and plate is positive

9. If $R_p = 7K\Omega, g_m = 2.5$ *millimho*, then on increasing plate voltage by $50V$, how much the grid voltage is changed so that plate current remains the same [RPET 1996]

(a) – 2.86 *V* (b) – 4 *V*

(c) + 4 *V* (d) + 2 *V*

10. The amplification factor of a triode is 20 and trans-conductance is 3 *milli mho* and load resistance $3 \times 10^4 \Omega$, then the voltage gain is

(a) 16.36 (b) 28

(c) 78 (d) 108

11. In a triode amplifier, $\mu = 25, r_p = 40$ kilo ohm and load resistance $R_L = 10$ kilo ohm. If the input signal voltage is 0.5 volt, then output signal voltage will be [RPMT 1995]

(a) 1.25 *volt* (b) 5 *volt*

(c) 2.5 *volt* (d) 10 *volt*

12. The amplification factor of a triode is 20. If the grid potential is reduced by 0.2 *volt* then to keep the plate current constant its plate voltage is to be increased by

[RPMT 1993, 95]

(a) 10 *volt* (b) 4 *volt*

(c) 40 *volt* (d) 100 *volt*

13. For a triode $r_p = 10$ *kilo ohm* and $g_m = 3$ *milli mho*. If the load resistance is double of plate resistance, then the value of voltage gain will be [RPMT 1994]

(a) 10 (b) 20

(c) 15 (d) 30

14. The amplification produced by a triode is due to the action of

(a) Filament (b) Cathode

(c) Grid (d) Plate

15. In an experiment, the saturation in the plate current in a diode is observed at 240 *V*. But a student still wants to increase the plate current. It can be done, if [MNR 1994]

(a) The plate voltage is increased further

(b) The plate voltage is decreased

(c) The filament current is decreased

(d) The filament current is increased

16. In a triode amplifier, the value of maximum gain is equal to

[MP PMT 1992]

(a) Half the amplification factor

(b) Amplification factor

(c) Twice the amplification factor

(d) Infinity

17. For a given triode $\mu = 20$. The load resistance is 1.5 times the anode resistance. The maximum gain will be

[CPMT 1992]

(a) 16 (b) 12

(c) 10 (d) None of the above

18. The voltage gain of a triode depends upon [CPMT 1992]

(a) Filament voltage (b) Plate voltage

(c) Plate resistance (d) Plate current

19. In a triode valve [MP PET 1992]

(a) If the grid voltage is zero then plate current will be zero

(b) If the temperature of filament is doubled, then the thermionic current will also be doubled

(c) If the temperature of filament is doubled, then the thermionic current will nearly be four times [RPMT 1996]

(d) At a definite grid voltage the plate current varies with plate voltage according to Ohm's law

20. The amplification factor of a triode valve is 15. If the grid voltage is changed by 0.3 *volt* the change in plate voltage in order to keep the plate current constant (in volt) is

[CPMT 1990]

(a) 0.02 (b) 0.002

(c) 4.5 (d) 5.0

21. The slope of plate characteristic of a vacuum tube diode for certain operating point on the curve is $10^{-3} \frac{mA}{V}$. The plate resistance of the diode and its nature respectively

[MP PMT 1990]

(a) 100 kilo-ohms static (b) 1000 *kilo-ohms* static

(c) 1000 *kilo-ohms* dynamic (d) 100 *kilo-ohms* dynamic

22. A triode has a mutual conductance of $2 \times 10^{-3} mho$ and an amplification factor of 50. The anode is connected through a resistance of 25×10^3 *ohms* to a 250 *volts* supply. The voltage gain of this amplifier is [MP PMT 1989]

(a) 50 (b) 25

(c) 100 [AFMC 1994] (d) 12.5

23. 14×10^{15} electrons reach the anode per second. If the power consumed is 448 *milliwatts*, then the plate (anode) voltage is

(a) 150 *V* (b) 200 *V*

(c) $14 \times 448V$ (d) 448/14 *V*

24. In the circuit of a triode valve, there is no change in the plate current, when the plate potential is increased from 200 *volt* to 220 *volt* and the grid potential is decreased from – 0.5 *volt* to –1.3 *volt*. The amplification factor of this valve is

[MP PMT 1989]

(a) 15 (b) 20

(c) 25 (d) 35

25. If the amplification factor of a triode (μ) is 22 and its plate resistance is 6600 *ohm*, then the mutual conductance of this valve is mho is [MP PMT 1989]

(a) $\frac{1}{300}$ (b) 25×10^{-2}

(c) 2.5×10^{-2} (d) 0.25×10^{-2}

26. For a triode, at $V_g = -1$ *volt*, the following observations were taken $V_p = 75V, I_p = 2mA$, $V_p = 100V, I_p = 4mA$. The value of plate resistance will be [MP PMT 1989]

(a) 25 $k\Omega$ (b) 20.8 $k\Omega$

(c) 12.5 $k\Omega$ (d) 100 $k\Omega$

27. The triode constant is out of the following **[RPMT 1989]**

(a) Plate resistance (b) Amplification factor

(c) Mutual conductance (d) All the above

28. The unit of mutual conductance of a triode valve is **[MP PMT 1988]**

(a) Siemen (b) *Ohm*

(c) *Ohm metre* (d) *Joule Coulomb*

29. With a change of load resistance of a triode, used as an amplifier, from 50 *kilo ohms* to 100 *kilo ohms*, its voltage amplification changes from 25 to 30. Plate resistance of the triode is

(a) 25 $k\Omega$ (b) 75 $k\Omega$

(c) 7.5 $k\Omega$ (d) 2.5 $k\Omega$

30. Select the correct statements from the following **[IIT-JEE 1984]**

(a) A diode can be used as a rectifier

(b) A triode cannot be used as a rectifier

(c) The current in a diode is always proportional to the applied voltage

(d) The linear portion of the I–V characteristic of a triode is used for amplification without distortion

31. The introduction of a grid in a triode valve affects plate current by

(a) Making the thermionic emission easier at low temperature

(b) Releasing more electrons from the plate

(c) By increasing plate voltage

(d) By neutralising space charge

32. Before the saturation state of a diode at the plate voltages of 400 V and 200 V respectively the currents are i and i respectively. The ratio i/i will be

(a) $\sqrt{2}/4$ (b) $2\sqrt{2}$

(c) 2 (d) 1/2

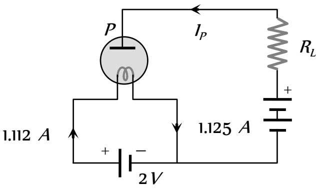
33. The value of plate current in the given circuit diagram will be

(a) 3 mA

(b) 8 mA

(c) 13 mA

(d) 18 mA



34. Coating of strontium oxide on Tungsten cathode in a valve is good for thermionic emission because **[RPMT 1998]**

(a) Work function decreases

(b) Work function increases

(c) Conductivity of cathode increases

(d) Cathode can be heated to high temperature

35. Correct relation for triode is **[RPMT 2000]**

(a) $\mu = g_m \times r_p$ (b) $\mu = \frac{g_m}{r_p}$

(c) $\mu = 2g_m \times r_p$ (d) None of these

36. Following is the relation between current and charge $I = AT^2 e^{qt/V_L}$ then value of V will be **[RPMT 2000]**

(a) $\frac{V}{kT}$ (b) $\frac{kV}{T}$

(c) $\frac{kT}{V}$ (d) $\frac{VT}{k}$

37. Which one is correct relation for thermionic emission **[RPMT 2000]**

(a) $J = AT^{1/2} e^{-\phi/kT}$ (b) $J = AT^2 e^{-\phi/kT}$

(c) $J = AT^{3/2} e^{-\phi/kT}$ (d) $J = AT^2 e^{-\phi/2kT}$

[MP PET 1986]

38. When plate voltage in diode valve is increased from 100 *volt* to 150 *volt* then plate current increases from 7.5 mA to 12 mA. The dynamic plastic resistance will be **[RPMT 2000]**

(a) 10 $k\Omega$ (b) 11 $k\Omega$

(c) 15 $k\Omega$ (d) 11.1 $k\Omega$

39. In a diode valve, the state of saturation can be obtained easily by

(a) High plate voltage and high filament current

(b) Low filament current and high plate voltage

(c) Low plate voltage and high cathode temperature

(d) High filament current and high plate voltage

40. Plate resistance of two triode valves is 2 $K\Omega$ and 4 $K\Omega$, amplification factor of each of the valves is 40. The ratio of voltage amplification, when used with 4 $K\Omega$ load resistance, will be **[CPMT 1975, 90]**

(a) 10 (b) $\frac{4}{3}$

(c) $\frac{3}{4}$ (d) $\frac{16}{3}$

41. Diode is used as a/an **[AIIMS 1999]**

(a) Oscillator (b) Amplifier

(c) Rectifier (d) Modulator

42. The electrical circuits used to get smooth d.c. output from a rectifier circuit is called **[KCET 2000]**

(a) Filter (b) Amplifier

(c) Full wave rectifier (d) Oscillator

43. Which of the following does not vary with plate or grid voltages

(a) g (b) R

(c) μ (d) Each of them varies

44. The grid in a triode valve is used **[UPSEAT 2000]**

(a) To increases the thermionic emission

(b) To control the plate to cathode current

(c) To reduce the inter-electrode capacity

(d) To keep cathode at constant potential

45. In a triode valve the amplification factor is 20 and mutual conductance is 10 *mho*. The plate resistance is **[UPSEAT 2000]**

(a) 2 × 10 Ω (b) 4 × 10 Ω

(c) 2 × 10· Ω (d) 2 × 10· Ω

46. The thermionic emission of electron is due to [UPSEAT 2000]

(a) Electromagnetic field (b) Electrostatic field

(c) High temperature (d) Photoelectric effect

47. The amplification factor of a triode is 50. If the grid potential is decreased by 0.20 *V*, what increase in plate potential will keep the plate current unchanged [RPMT 1999]

(a) 5 *V* (b) 10 *V*

(c) 0.2 *V* (d) 50 *V*

48. The slope of plate characteristic of a vacuum diode is $2 \times 10^{-2}\, mA / V$. The plate resistance of diode will be [RPMT 1999]

(a) 50 Ω (b) 50 *k*Ω

(c) 500 *k*Ω (d) 500 *k*Ω

49. The transconductance of a triode amplifier is 2.5 *mili mho* having plate resistance of 20 *k*Ω, amplification 10. Find the load resistance

(a) 5 *k*Ω (b) 25 *k*Ω

(c) 20 *k*Ω (d) 50 *k*Ω

50. The amplification factor of a triode is 18 and its plate resistance is 8 × 10Ω. A load resistance of 10Ω is connected in the plate circuit. The voltage gain will be [RPMT 2002]

(a) 30 (b) 20

(c) 10 (d) 1

51. The ripple factor in a half wave rectifier is [RPMT 2002]

(a) 1.21 (b) 0.48

(c) 0.6 (d) None of these

52. The correct relation for a triode is [RPET 2000, 02]

(a) $g_m = \left.\frac{\Delta I_p}{\Delta V_p}\right|_{V_g = constt.}$ (b) $g_m = \left.\frac{\Delta I_p}{\Delta V_g}\right|_{V_p = constt.}$

(c) Both (d) None of these

53. In a diode valve the cathode temperature must be (ϕ = work function) [RPET 2002]

(a) High and ϕ should be high

(b) High and ϕ should be low

(c) Low and ϕ should be high

(d) Low and ϕ should be high

54. The plate resistance of a triode is 2.5 × 10· Ω and mutual conductance is 2 × 10· *mho*. What will be the value of amplification factor [RPET 2002]

(a) 50 (b) 1.25 × 10·

(c) 75 (d) 2.25 × 10·

55. Plate voltage of a triode is increased from 200 *V* to 225 *V*. To maintain the plate current, change in grid voltage from 5 *V* to 5.75 *V* is needed. The amplification factor is [RPET 2002]

(a) 40 (b) 45

(c) 33.3 (d) 25

56. The current in a triode at anode potential 100 *V* and grid potential – 1.2 *V* is 7.5 *mA*. If grid potential is changed to – 2.2 *V*, the current becomes 5.5 *mA*. the value of trans conductance (g) will be

(a) 2 *mili mho* (b) 3 *mili mho*

(c) 4 *mili mho* (d) 0.2 *mili mho*

57. Select the correct statement [RPMT 2003]

(a) In a full wave rectifier, two diodes work alternately

(b) In a full wave rectifier, two diodes work simultaneously

(c) The efficiency of full wave and half wave rectifiers is same

(d) The full wave rectifier is bi-directional

58. The amplification factor of a triode is 20. Its plate resistance is 10 kilo ohms. Mutual conductance is [MNR 1992; Orissa JEE 2005]

(a) 2×10^{5} *mho* (b) 2×10^{4} *mho*

(c) 500 *mho* (d) 2×10^{-3} *mho*

[RPMT 2001]

Critical Thinking

Objective Questions

1. A silicon speciman is made into a *P*-type semi-conductor by dopping, on an average, one Indium atom per 5×10^7 silicon atoms. If the number density of atoms in the silicon specimen is 5×10^{28} atoms $/m^3$ then the number of acceptor atoms in silicon per cubic centimetre will be [MP PMT 1993, 2003]

(a) $2.5\times10^{30}\,atoms/cm^3$ (b) $1.0\times10^{13}\,atoms/cm^3$

(c) $1.0\times10^{15}\,atoms/cm^3$ (d) $2.5\times10^{36}\,atoms/cm^3$

2. The probability of electrons to be found in the conduction band of an intrinsic semiconductor at a finite temperature [IIT-JEE 1995; DPMT 2004]

(a) Decreases exponentially with increasing band gap

(b) Increases exponentially with increasing band gap

(c) Decreases with increasing temperature

(d) Is independent of the temperature and the band gap

3. The typical ionisation energy of a donor in silicon is [IIT-JEE 1992]

(a) $10.0\,eV$ (b) $1.0\,eV$

(c) $0.1\,eV$ (d) $0.001\,eV$

4. In *PN*-junction diode the reverse saturation current is 10^{-5} *amp* at $27°C$. The forward current for a voltage of $0.2 volt$ is

(a) $2037.6\times10^{-3}amp$ (b) $203.76\times10^{-3}amp$

(c) $20.376\times10^{-3}amp$ (d) $2.0376\times10^{3}amp$

$[\exp(7.62) = 2038.6, K = 1.4\times10^{-23}\,J/K]$

5. When a potential difference is applied across, the current passing through [IIT-JEE 1999]

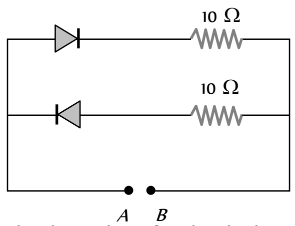
(a) An insulator at $0K$ is zero

(b) A semiconductor at $0K$ is zero

(c) A metal at $0K$ is finite

(d) A *P-N* diode at $300K$ is finite, if it is reverse biased

6. A 2 *V* battery is connected across the points *A* and *B* as shown in the figure given below. Assuming that the resistance of each diode is zero in forward bias and infinity in reverse bias, the current supplied by the battery when its positive terminal is connected to *A* is [UPSEAT 2002]



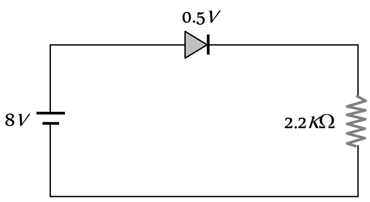
(a) 0.2 *A*

(b) 0.4 *A*

(c) Zero

(d) 0.1 *A*

7. In the circuit, if the forward voltage drop for the diode is 0.5 *V*, the current will be [UPSEAT 2003]



(a) 3.4 *mA*

(b) 2 *mA*

(c) 2.5 *mA*

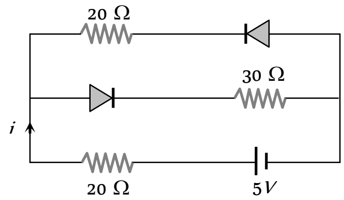
(d) 3 *mA*

8. A *P*-type semiconductor has acceptor levels 57 *meV* above the valence band. The maximum wavelength of light required to create a hole is (Planck's constant $h = 6.6\times10^{-34}$ *J-s*)

(a) 57 Å (b) 57×10^{-3} Å

(c) 217100 Å (d) 11.61×10^{-33} Å

9. Current in the circuit will be [CBSE PMT 2001]



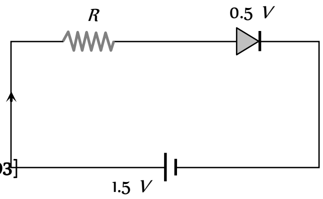
(a) $\frac{5}{40}A$

(b) $\frac{5}{50}A$

(c) $\frac{5}{10}A$

(d) $\frac{5}{20}A$

10. The diode used in the circuit shown in the figure has a constant voltage drop of 0.5 *V* at all currents and a maximum power rating of 100 *milliwatts*. What should be the value of the resistor *R*, connected in series with the diode for obtaining maximum current [CBSE PMT



(a) 1.5 Ω

(b) 5 Ω

(c) 6.67 Ω

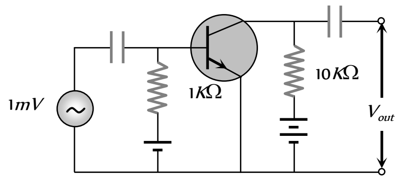
(d) 200 Ω [MP PMT 1993]

11. For a transistor amplifier in common emitter configuration for load impedance of 1 *k*Ω (h_{fe} = 50 and h_{oe} = 25 *μA/V*) the current gain is

(a) – 5.2 (b) – 15.7

(c) – 24.8 (d) – 48.78

12. In the following common emitter configuration an *NPN* transistor with current gain β = 100 is used. The output voltage of the amplifier will be [AIIMS 2003]



(a) 10 *mV*

(b) 0.1 *V*

(c) 1.0 *V*

(d) 10 *V*

13. In semiconductor the concentrations of electrons and holes are 8 × 10-/*m* and 5 × 10-/*m* respectively. If the mobilities of electrons and hole are 2.3 *m*/*volt-sec* and 0.01 *m*/*volt-sec* respectively, then semiconductor is

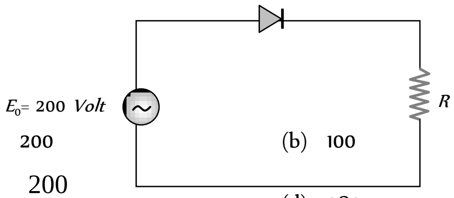
(a) *N*-type and its resistivity is 0.34 *ohm-metre*

(b) *P*-type and its resistivity is 0.034 *ohm-metre*

(c) *N*-type and its resistivity is 0.034 *ohm-metre*

(d) *P*-type and its resistivity is 3.40 *ohm-metre*

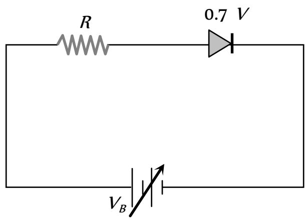
14. A sinusoidal voltage of peak value 200 *volt* is connected to a diode and resistor *R* in the circuit shown so that half wave rectification occurs. If the forward resistance of the diode is negligible compared to *R* the *rms* voltage (in *volt*) across *R* is approximately



(a) 200 (b) 100

(c) $\frac{200}{\sqrt{2}}$ (d) 280

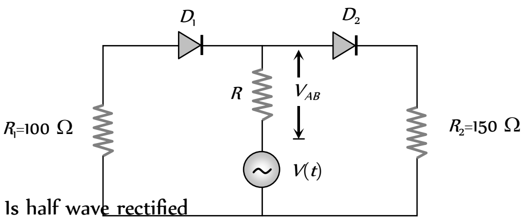
15. The junction diode in the following circuit requires a minimum current of 1 *mA* to be above the knee point (0.7 *V*) of its I-V characteristic curve. The voltage across the diode is independent of current above the knee point. If V_B = 5 *V*, then the maximum value of *R* so that the voltage is above the knee point, will be



(a) 4.3 $k\Omega$ (b) 860 $k\Omega$

(c) 4.3 Ω (d) 860 Ω

16. In the circuit given below, *V*(*t*) is the sinusoidal voltage source, voltage drop $V_{AB}(t)$ across the resistance *R* is [IIT 1993]



(a) Is half wave rectified

(b) Is full wave rectified

(c) Has the same peak value in the positive and negative half cycles

(d) Has different peak values during positive and negative half cycle

17. The peak voltage in the output of a half-wave diode rectifier fed with a sinusoidal signal without filter is 10 *V*. The dc component of the output voltage is [CBSE PMT 2004]

(a) $10/\sqrt{2}\ V$ (b) $10/\pi\ V$

(c) 10 *V* (d) $20/\pi\ V$

18. A transistor is used as an amplifier in *CB* mode with a load resistance of 5 $k\,\Omega$ the current gain of amplifier is 0.98 and the input resistance is 70 Ω, the voltage gain and power gain respectively are [Pb. PET 2003]

(a) 70, 68.6 (b) 80, 75.6

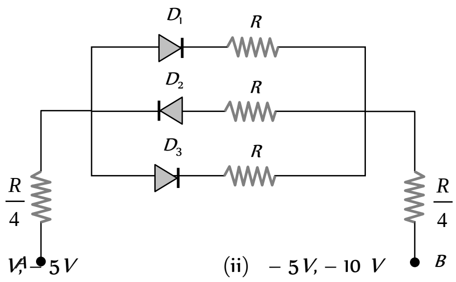
(c) 60, 66.6 (d) 90, 96.6

19. The Bohr radius of the fifth electron of phosphorus (atomic number = 15) acting as dopant in silicon (relative dielectric constant = 12) is

(a) 10.6 Å (b) 0.53 Å

(c) 21.2 Å (d) None of these

20. In the following circuits *PN*-junction diodes D_1, D_2 and D_3 are ideal for the following potential of *A* and *B*, the correct increasing order of resistance between *A* and *B* will be



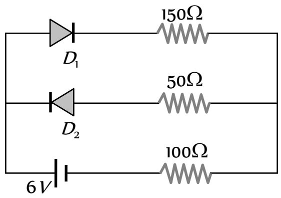
(i) – 10 *V*, – 5 *V* (ii) – 5 *V*, – 10 *V*

(iii) – 4 *V*, – 12 *V*

(a) (i) < (ii) < (iii) (b) (iii) < (ii) < (i)

(c) (ii) = (iii) < (i) (d) (i) = (iii) < (ii)

21. The circuit shown in following figure contains two diode D_1 and D_2 each with a forward resistance of 50 *ohms* and with infinite backward resistance. If the battery voltage is 6 *V*, the current through the 100 *ohm* resistance (in *amperes*) is [IIT-JEE 1997]



(a) Zero (b) 0.02

(c) 0.03 (d) 0.036

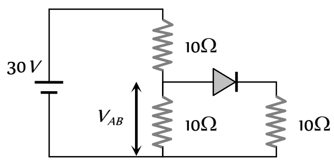
22. Find V_{AB} [RPMT 2000]

(a) 10 *V*

(b) 20 *V*

(c) 30 *V*

(d) None of these



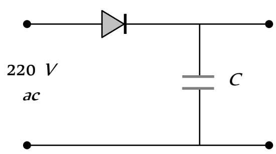
23. A diode is connected to 220 *V* (*rms*) *ac* in series with a capacitor as shown in figure. The voltage across the capacitor is

(a) 220 *V*

(b) 110 *V*

(c) 311.1 *V*

(d) $\frac{220}{\sqrt{2}}\ V$



24. A potential difference of 2 *V* is applied between the opposite faces of a *Ge* crystal plate of area 1 *cm* and thickness 0.5 *mm*. If the concentration of electrons in *Ge* is $2 \times 10^{-}/m$ and mobilities of electrons and holes are $0.36\frac{m^2}{volt-\sec}$ and $0.14\frac{m^2}{volt-\sec}$ respectively, then the current flowing through the plate will be

(a) 0.25 A (b) 0.45 A

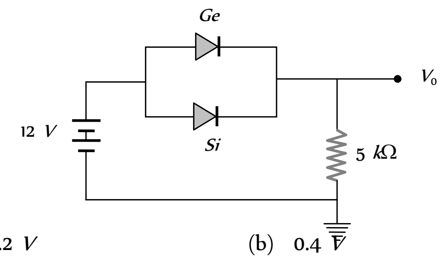
(c) 0.56 A (d) 0.64 A

25. The contribution in the total current flowing through a semiconductor due to electrons and holes are $\frac{3}{4}$ and $\frac{1}{4}$ respectively. If the drift velocity of electrons is $\frac{5}{2}$ times that of holes at this temperature, then the ratio of concentration of electrons and holes is

(a) 6 : 5 (b) 5 : 6

(c) 3 : 2 (d) 2 : 3

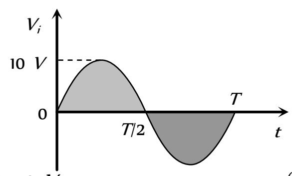
26. *Ge* and *Si* diodes conduct at 0.3 V and 0.7 V respectively. In the following figure if *Ge* diode connection are reversed, the valve of V_0 changes by [Based on Roorkee 2000]

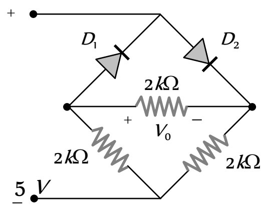


(a) 0.2 V (b) 0.4 V

(c) 0.6 V (d) 0.8 V

27. In the circuit shown in figure the maximum output voltage V_0 is

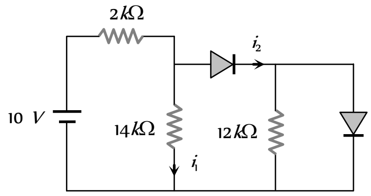




(a) 0 V (b) 5 V

(c) 10 V (d) $\frac{5}{\sqrt{2}}V$

28. In the following circuit find I_1 and I_2



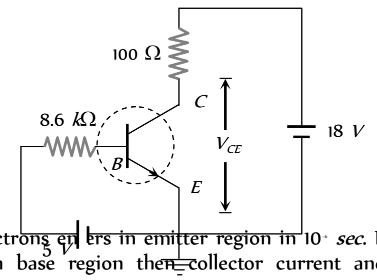
(a) 0, 0

(b) 5 mA, 5 mA

(c) 5 mA, 0

(d) 0, 5 mA

29. For the transistor circuit shown below, if β = 100, voltage drop between emitter and base is 0.7 V then value of V_{ce} will be



(a) 10 V

(b) 5 V

(c) 13 V

(d) 0 V

30. In *NPN* transistor, 10^{10} electrons enters in emitter region in 10^{-6} *sec*. If 2% electrons are lost in base region then collector current and current amplification factor (β) respectively are

(a) 1.57 mA, 49 (b) 1.92 mA, 70

(c) 2 mA, 25 (d) 2.25 mA, 100

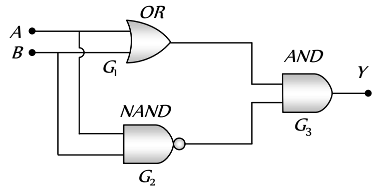
31. The following configuration of gate is equivalent to [AMU 1999]

(a) NAND

(b) XOR

(c) OR

(d) None of these



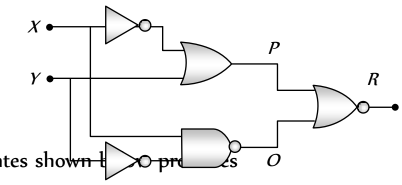
32. Figure gives a system of logic gates. From the study of truth table it can be found that to produce a high output (1) at R, we must have

(a) X = 0, Y = 1

(b) X = 1, Y = 1

(c) X = 1, Y = 0

(d) X = 0, Y = 0



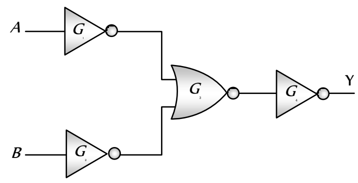
33. The combination of gates shown below produces

(a) AND gate

(b) XOR gate

(c) NOR gate

(d) NAND gate



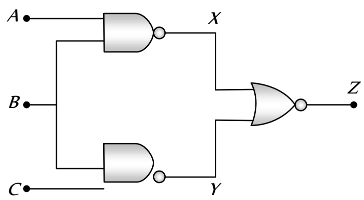
34. The shows two NAND gates followed by a NOR gate. The system is equivalent to the following logic gate

(a) OR

(b) AND

(c) NAND

(d) None of these



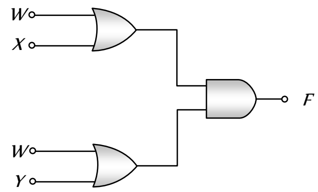
35. The diagram of a logic circuit is given below. The output F of the circuit is represented by

(a) $W.(X+Y)$

(b) $W\cdot(X\cdot Y)$

(c) $W+(X\cdot Y)$

(d) $W+(X+Y)$



36. The plate current i_p in a triode valve is given $i_p = K(V_p + \mu V_g)^{3/2}$ where i_p is in milliampere and V_p and V_g are in *volt*. If r_p = 10^4 *ohm*, and $g_m = 5\times10^{-3} mho$, then for $i_p = 8\,mA$ and $V_p = 300\,volt$, what is the value of K and grid cut off voltage [Roorkee 1992]

(a) – 6V, $(30)^{3/2}$ (b) $-6V,(1/30)^{3/2}$

(c) + 6V, $(30)^{3/2}$ (d) + 6V, $(1/30)^{3/2}$

37. The linear portions of the characteristic curves of a triode valve give the following readings [Roorkee 1985]

V_g (*volt*)	0	– 2	– 4	– 6

$I_p(mA)$ for $V_p = 150$ *volts*	15	12.5	10	7.5
$I_p(mA)$ for $V_p = 120$ *volts*	10	7.5	5	2.5

The plate resistance is

(a) 2000 *ohms* (b) 4000 *ohms*

(c) 8000 *ohms* (d) 6000 *ohms*

38. The relation between dynamic plate resistance (r_p) of a vacuum diode and plate current in the space charge limited region, is

(a) $r_p \propto I_p$ (b) $r_p \propto I_p^{3/2}$

(c) $r_p \propto \frac{1}{I_p}$ (d) $r_p \propto \frac{1}{(I_p)^{1/3}}$

39. The relation between I_p and V_p for a triode is

$$I_p = (0.125V_p - 7.5)mA$$

Keeping the grid potential constant at 1*V*, the value of r_p will be

(a) 8 $k\Omega$ (b) 4 $k\Omega$

(c) 2 $k\Omega$ (d) 8 $k\Omega$

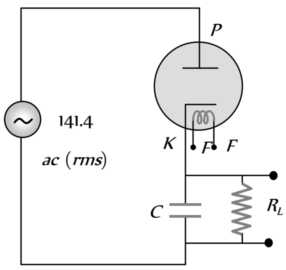
40. An alternating voltage of 141.4 *V* (*rms*) is applied to a vacuum diode as shown in the figure. The maximum potential difference across the condenser will be

(a) 100 *V*

(b) 200 *V*

(c) $100\sqrt{2}V$

(d) $200\sqrt{2}V$



41. A metallic surface with work function of 2 *eV*, on heating to a temperature of 800 *K* gives an emission current of 1 *mA*. If another metallic surface having the same surface area, same emission constant but work function 4 *eV* is heated to a temperature of 1600 *K*, then the emission current will be

(a) 1 *mA* (b) 2 *mA*

(c) 4 *mA* (d) None of these

42. A change of 0.8 *mA* in the anode current of a triode occurs when the anode potential is changed by 10 *V*. If μ = 8 for the triode, then what change in the grid voltage would be required to produce a change of 4 *mA* in the anode current

(a) 6.25 *V* (b) 0.16 *V*

(c) 15.2 *V* (d) None of these

43. The plate current in a triode is given by

$$I_p = 0.004\,(V_p + 10V_g)^{3/2} mA$$

where I_p, V_p and V_g are the values of plate current, plate voltage and grid voltage, respectively. What are the triode parameters μ, r_p and g_m for the operating point at $V_p = 120\,volt$ and $V_g = -2\,volt$?

(a) 10, 16.7 $k\Omega$, 0.6 *m mho* (b) 15, 16.7 $k\Omega$, 0.06 *m mho*

(c) 20, 6 $k\Omega$, 16.7 *m mho* (d) None of these

44. A triode whose mutual conductance is 2.5 *m A/volt* and anode resistance is 20 *kilo ohm*, is used as an amplifier whose amplification is 10. The resistance connected in plate circuit will be [MP PET 1989; RPMT 1998]

(a) 1 $k\Omega$ (b) 5 $k\Omega$

(c) 10 $k\Omega$ (d) 20 $k\Omega$

45. In the grid circuit of a triode a signal $E = 2\sqrt{2}\cos\omega t$ is applied. If μ = 14 and r_p =10 $k\Omega$ then root mean square current flowing through $R_L = 12\,k\Omega$ will be

(a) 1.27 *mA* (b) 10 *mA*

(c) 1.5 *mA* (d) 12.4 *mA*

46. For a triode μ = 64 and g_m =1600 μ *mho*. It is used as an amplifier and an input signal of 1 *V* (*rms*) is applied. The signal power in the load of 40 $k\Omega$ will be

(a) 23.5 *mW* (b) 48.7 *mW*

(c) 25.6 *mW* (d) None of these

47. Amplification factor of a triode is 10. When the plate potential is 200 *volt* and grid potential is – 4 *volt*, then the plate current of 4 *mA* is observed. If plate potential is changed to 160 *volt* and grid potential is kept at – 7 *volt*, then the plate current will be

(a) 1.69 *mA* (b) 3.95 *mA*

(c) 2.87 (d) 7.02 *mA*

48. On applying a potential of – 1 *volt* at the grid of a triode, the following relation between plate voltage V_p (*volt*) and plate current $I_p(\text{in}\,mA)$ is found

$$I_p = 0.125\,V_p - 7.5$$

If on applying – 3 *volt* potential at grid and 300 *V* potential at plate, the plate current is found to be 5 *mA*, then amplification factor of the triode is

(a) 100 (b) 50

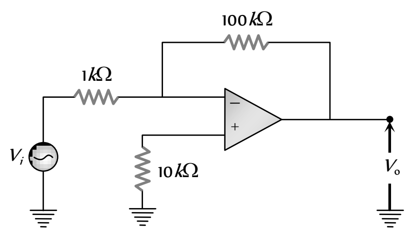
(c) 30 (d) 20

49. The slopes of anode and mutual characteristics of a triode are 0.02 *mA V* and 1 *mA V* respectively. What is the amplification factor of the valve [MP PMT 1990]

(a) 5 (b) 50

(c) 500 (d) 0.5

50. The voltage gain of the following amplifier is [AIIMS 2005]



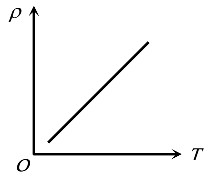
(a) 10 (b) 100

(c) 1000 (d) 9.9

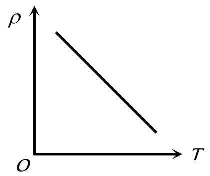
Graphical Questions

1. The temperature (T) dependence of resistivity (ρ) of a semiconductor is represented by **[AIIMS 2004]**

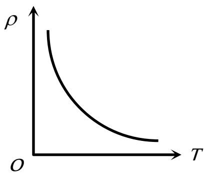
(a)



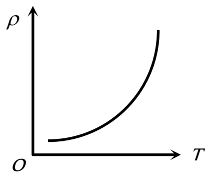
(b)



(c)

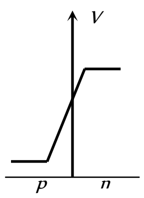


(d)

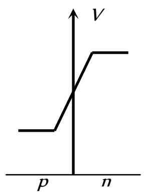


2. In a forward biased *PN*-junction diode, the potential barrier in the depletion region is of the form ... **[KCET 2004]**

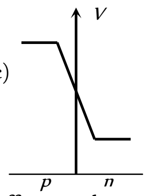
(a)



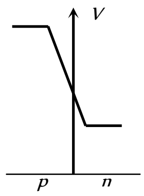
(b)



(c)



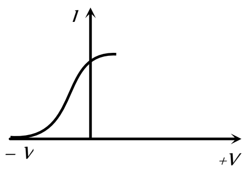
(d)



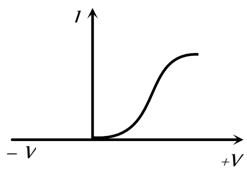
3. Different voltages are applied across a *P-N* junction and the currents are measured for each value. Which of the following graphs is obtained between voltage and current

[MP PET 1996; UPSEAT 2002]

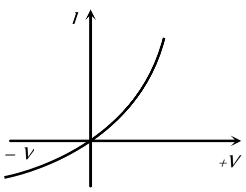
(a)



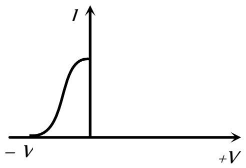
(b)



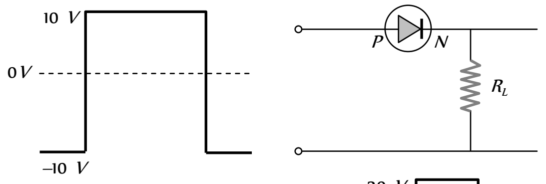
(c)



(d)

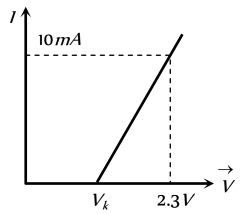


4. If the following input signal is sent through a *PN*-junction diode, then the output signal across R_L will be



(a) 
(b) 
(c) 
(d) 
5. The curve between charge density and distance near *P-N* junction will be

(a) 
(b) 
(c) 
(d) 
6. The resistance of a germanium junction diode whose $V - I$ is shown in figure is $(V_k = 0.3V)$



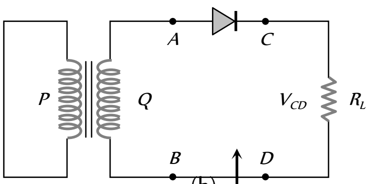
(a) 5 $k\Omega$

(b) 0.2 $k\Omega$

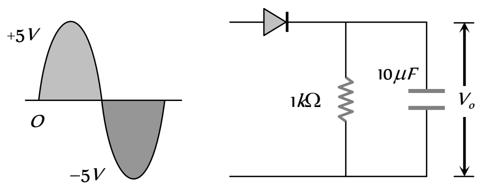
(c) 2.3 $k\Omega$

(d) $\left(\frac{10}{2.3}\right) k\Omega$

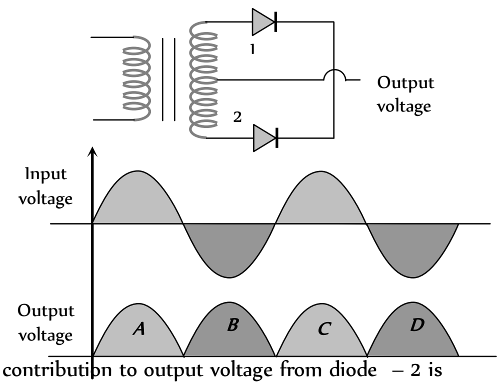
7. In the half-wave rectifier circuit shown. Which one of the following wave forms is true for V_{CD}, the output across *C* and *D*?



(a) 
(b) 
(c) 
(d) 
8. The output in the circuit of figure is taken across a capacitor. It is as shown in figure



(a) 
(b) 
(c) 
(d) 
9. A full wave rectifier circuit along with the input and output voltages is shown in the figure



The contribution to output voltage from diode – 2 is

[MP PMT 2001]

(a) *A, C* (b) *B, D*

(c) *B, C* (d) *A, D*

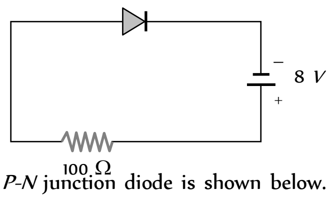
10. A source voltage of 8*V* drives the diode in fig. through a current-limiting resistor of 100 *ohm*. Then the magnitude of the slope load line on the *V-I* characteristics of the diode is

(a) 0.01

(b) 100

(c) 0.08

(d) 12.5



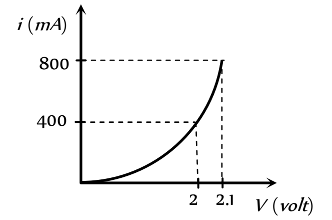
11. The *i-V* characteristic of a *P-N* junction diode is shown below. The approximate dynamic resistance of the *P-N* junction when a forward bias of 2*volt* is applied

(a) 1 Ω

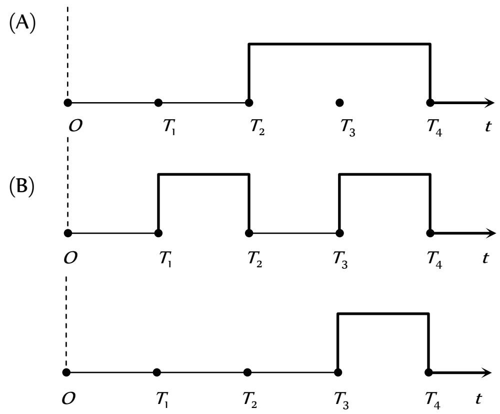
(b) 0.25 Ω

(c) 0.5 Ω

(d) 5 Ω



12. The given figure shows the wave forms for two inputs *A* and *B* and that for the output *Y* of a logic circuit. The logic circuit is

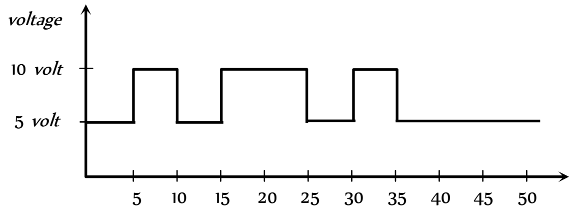


(Y)

(a) An AND gate (b) An OR gate

(c) A NAND gate (d) An NOT gate

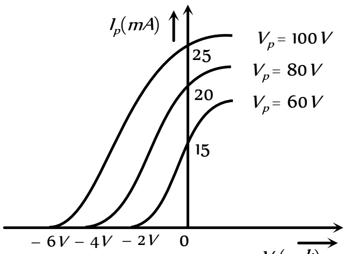
13. In a negative logic the following wave form corresponds to the



(a) 0000000000 000

(c) 111111111 (d) 1010010111

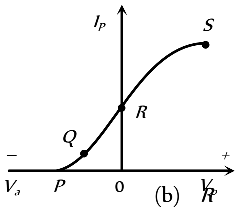
14. The variation of anode current in a triode corresponding to a change in grid potential at three different values of the plate potential is shown in the diagram. The mutual conductance of the triode is



(a) 2.5 $m\ mho$ (b) 5.0 $m\ mho$

(c) 7.5 $m\ mho$ (d) 10.0 $m\ mho$

15. The point representing the cut off grid voltage on the mutual characteristic of triode is

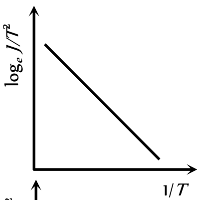


(a) S (b) R

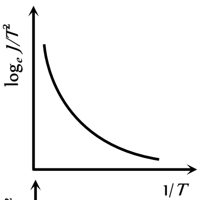
(c) O (d) P

16. For a thermionic emitter (metallic) if J represents the current density and T is its absolute temperature then the correct curve between $\log_e \frac{J}{T^2}$ and $\frac{1}{T}$ is

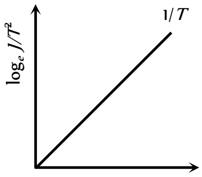
(a)



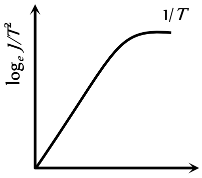
(b)



(c)

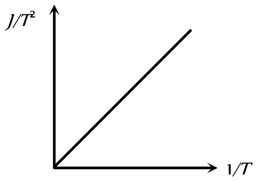


(d)

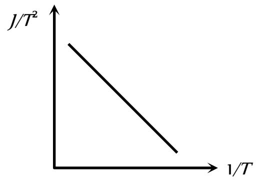


17. If the thermionic current density is J and emitter temperature is T then the curve between $\frac{J}{T^2}$ and $\frac{1}{T}$ will be

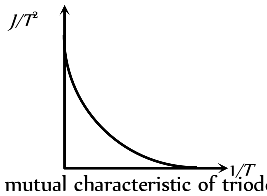
(a)



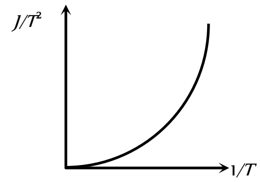
(b)



(c)

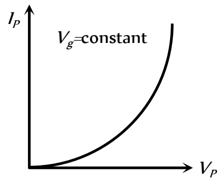


(d)

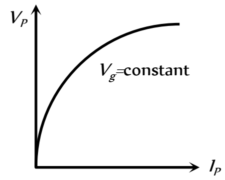


18. The mutual characteristic of triode is

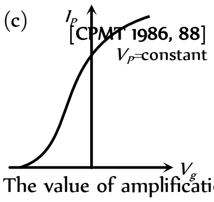
(a)



(b)

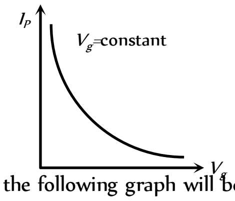


(c)

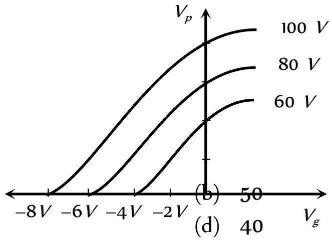


[CPMT 1986, 88]

(d)



19. The value of amplification factor from the following graph will be

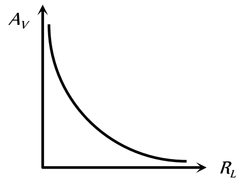


(a) 10 (b) 50

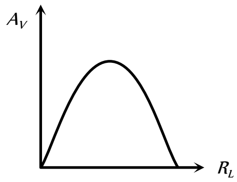
(c) 25 (d) 40

20. The correct curve between voltage gain (A_v) and load resistance (R_L) is

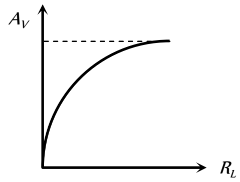
(a)



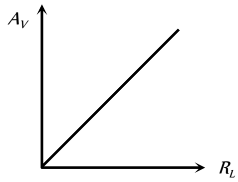
(b)



(c)

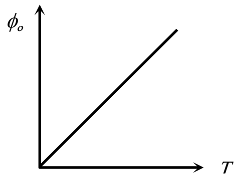


(d)

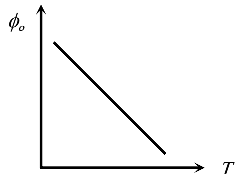


21. The curve between the work function of a metal (ϕ_o) and its temperature (T) will be

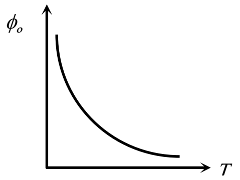
(a)



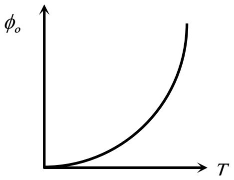
(b)



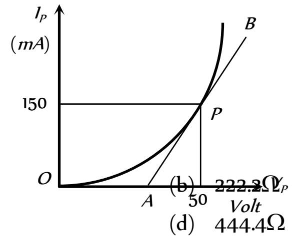
(c)



(d)

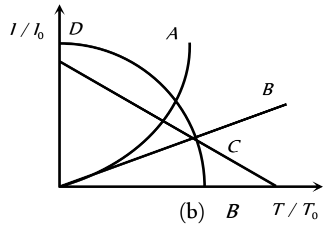


22. The plate characteristic curve of a diode in space charge limited region is as shown in the figure. The slope of curve at point *P* is 5.0 *mA*/*V*. The static plate resistance of diode will be



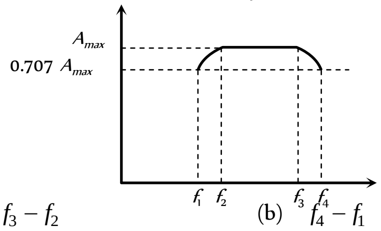
(a) 111.1Ω (b) 222.2Ω
(c) 333.3Ω (d) 444.4Ω

23. The ratio of thermionic currents (I/I_0) for a metal when the temperature is slowly increased T_0 to T as shown in figure. (*I* and I_0 are currents at *T* and respectively). Then which one is correct?



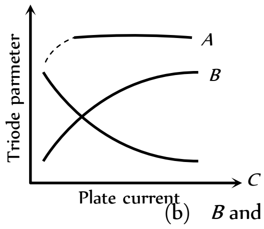
(a) *A* (b) *B*
(c) *C* (d) *D*

24. The frequency response curve of *RC* coupled amplifier is shown in figure. The band width of the amplifier will be



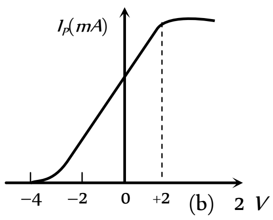
(a) $f_3 - f_2$ (b) $f_4 - f_1$
(c) $\frac{f_4 - f_2}{2}$ (d) $f_3 - f_1$

25. The figure represents variation of triode parameter (μ or r_p or g_m) with the plate current. The correct variation of μ and r_p are given, respectively by the curves



(a) *A* and *B* (b) *B* and *C*
(c) *A* and *C* (d) None of the above

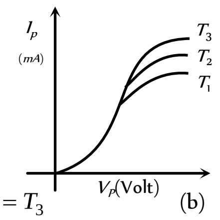
26. The mutual characteristic curves of a triode are as shown in figure. The cut off voltage for the triode is



(a) 0 *V* (b) 2 *V*
(c) – 4 *V* (d) 6 *V*

27. For the diode, the characteristic curves are given at different temperature. The relation between the temperatures is

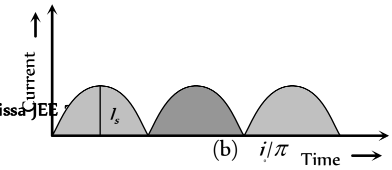
[RPET 1990]



(a) $T_1 = T_2 = T_3$ (b) $T_1 < T_2 < T_3$
(c) $T_1 > T_2 > T_3$ (d) None of the above

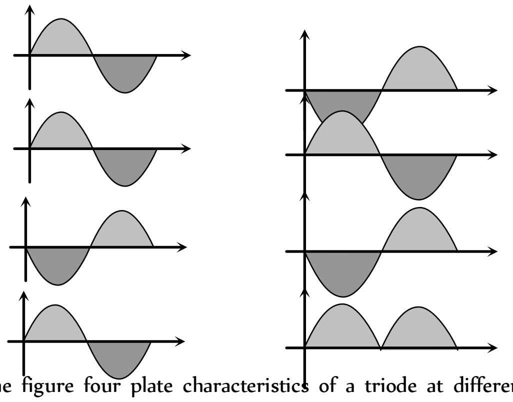
28. The output current versus time curve of a rectifier is shown in the figure. The average value of the output current in this case is

[Orissa JEE]



(a) 0 (b) i_0/π
(c) $2i_0/\pi$ (d) i_0

29. Which of the following figures correctly shows the phase relation between the input signal and the output signal of triode amplifier



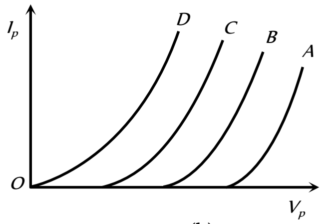
(a)

(b)

(c)

(d)

30. In the figure four plate characteristics of a triode at different grid voltage are shown. The difference between successive grid voltage is 1 *V*. Which curve will have maximum grid voltage and what is its value?



(a) *A*, V_g = + 4 *V* (b) *B*, V_g = + 4 *V*
(c) *A*, V_g = 0 (d) *D*, V_g = 0

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) *If both assertion and reason are true and the reason is the correct explanation of the assertion.*
(b) *If both assertion and reason are true but reason is not the correct explanation of the assertion.*
(c) *If assertion is true but reason is false.*
(d) *If the assertion and reason both are false.*
(e) *If assertion is false but reason is true.*

1.	Assertion	:	The logic gate NOT can be built using diode.
	Reason	:	The output voltage and the input voltage of the diode have 180° phase difference. [AIIMS 2005]
2.	Assertion	:	The number of electrons in a *P*-type silicon semiconductor is less than the number of electrons in a pure silicon semiconductor at room temperature.
	Reason	:	It is due to law of mass action. [AIIMS 2005]
3.	Assertion	:	In a common emitter transistor amplifier the input current is much less than the output current.
	Reason	:	The common emitter transistor amplifier has very high input impedance. [AIIMS 2005]
4.	Assertion	:	A transistor amplifier in common emitter configuration has a low input impedence.
	Reason	:	The base to emitter region is forward biased. [AIIMS 2004]
5.	Assertion	:	The resistivity of a semiconductor increases with temperature.
	Reason	:	The atoms of a semiconductor vibrate with larger amplitude at higher temperature there by increasing it's resistivity. [AIIMS 2003]
6.	Assertion	:	If the temperature of a semiconductor is increased then it's resistance decreases.
	Reason	:	The energy gap between conduction band and valence band is very small [AIIMS 1997]
7.	Assertion	:	The temperature coefficient of resistance is positive for metals and negative for *P-type* semiconductor.
	Reason	:	The effective charge carriers in metals are negatively charged whereas in *P*-type semiconductor they are positively charged. [AIIMS 1996]
8.	Assertion	:	Electron has higher mobility than hole in a semiconductor.
	Reason	:	Mass of electron is less than the mass of hole.
9.	Assertion	:	An *N*-type semiconductor has a large number of electrons but still it is electrically neutral.
	Reason	:	An *N*-type semiconductor is obtained by doping an intrinsic semiconductor with a pentavalent impurity.
10.	Assertion	:	The crystalline solids have a sharp melting point.
	Reason	:	All the bonds between the atoms or molecules of a crystalline solids are equally strong, that they get broken at the same temperature.
11.	Assertion	:	Silicon is preferred over germanium for making semiconductor devices.
	Reason	:	The energy gap for germanium is more than the energy gap of silicon.
12.	Assertion	:	We can measure the potential barrier of a *PN* junction by putting a sensitive voltmeter across its terminals.
	Reason	:	The current through the *PN* junction is not same in forward and reversed bias.
13.	Assertion	:	Semiconductors do not Obey's Ohm's law.
	Reason	:	Current is determined by the rate of flow of charge carriers.

14. Assertion : Two P-N junction diodes placed back to back, will work as a NPN transistor.

Reason : The P-region of two PN junction diodes back to back will form the base of NPN transistor.

15. Assertion : In transistor common emitter mode as an amplifier is preferred over common base mode.

Reason : In common emitter mode the input signal is connected in series with the voltage applied to the base emitter function.

16. Assertion : The dominant mechanism for motion of charge carriers in forward and reverse biased silicon P-N junction are drift in both forward and reverse bias.

Reason : In reverse biasing, no current flow through the junction.

17. Assertion : A transistor is a voltage-operating device.

Reason : Base current is greater than the collector current.

18. Assertion : NAND or NOR gates are called digital building blocks.

Reason : The repeated use of NAND (or NOR) gates can produce all the basic or complicated gates.

19. Assertion : At 0 K Germanium is a superconductor.

Reason : At 0 K Germanium offers zero resistance.

20. Assertion : Base in a transistor is made very thin as compared to collector and emitter regions.

Reason : Due to thin base power gain and voltage gain is obtained by a transistor.

21. Assertion : The current gain in common base circuit is always less than one.

Reason : At constant collector voltage the change in collector current is more than the change in emitter current.

22. Assertion : V-i characteristic of P-N junction diode is same as that of any other conductor.

Reason : P-N junction diode behave as conductor at room temperature.

23. Assertion : Zener diode works on a principle of breakdown voltage.

Reason : Current increases suddenly after breakdown voltage.

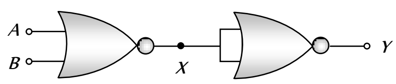
24. Assertion : NOT gate is also called inverter circuit.

Reason : NOT gate inverts the input order.

25. Assertion : In vacuum tubes (valves), vacuum is necessary for the movement of electrons between electrodes otherwise electrons collide with air particle and loses their energy.

Reason : In semiconductors devices, external heating or vacuum is not required.

26. Assertion : The following circuit represents 'OR' gate



Reason : For the above circuit $Y = \overline{X} = \overline{\overline{A+B}} = A+B$

27. Assertion : A P-N photodiode is made from a semiconductor for which E_g = 2.8 eV. This photo diode will not detect the wavelength of 6000 nm.

Reason : A PN photodiode detect wavelength λ if $\frac{hc}{\lambda} > E_g$.

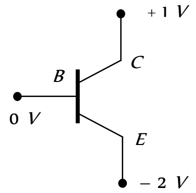
28. Assertion : 29 is the equivalent decimal number of binary number 11101.

Reason : $(11101)_2 = (1 \times 2^4 + 1 \times 2^3 + 1 \times 2^2 + 0 \times 2^1 + 1 \times 2^0)_{10}$

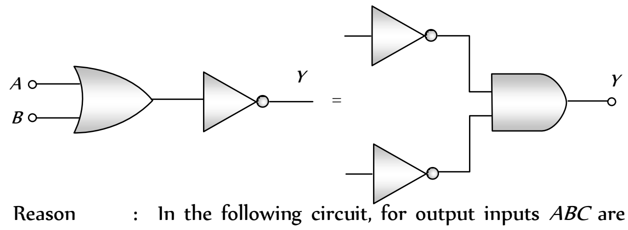
$= (16 + 8 + 4 + 0 + 1)_{10} = (29)_{10}$

29. Assertion : When PN-junction is forward biased then motion of charge carriers at junction is due to diffusion. In reverse biasing. The cause of motion of charge is drifting.

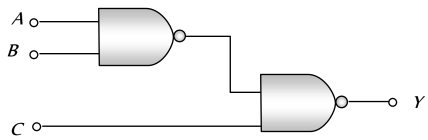
Reason : In the following circuit emitter is reverse biased and collector is forward biased.



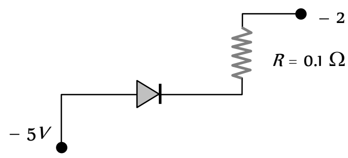
30. Assertion : De-morgan's theorem $\overline{A+B} = \overline{A} \cdot \overline{B}$ may be explained by the following circuit



Reason : In the following circuit, for output inputs ABC are 101



31. Assertion : In the following circuit the potential drop across the resistance is zero.



Reason : The given resistance has low value.

Answers and Solutions

Solids and Crystals

1. (d) Ionic bonds cone into being when atoms that have low ionization energies, and hence lose electrons rapidly, interact with other atoms that and to acquire excess electrons. The former atoms give up electrons to the latter and they there upon become positive and negative ions respectively.

2. (d) For tetragonal, cubic and orthorhombic system $\alpha = \beta = \gamma = 90°$.

3. (d) Tourmaline crystal is biaxial.

4. (a) The temperature co-efficient of resistance of conductor is positive.

5. (a) Density $\rho = \frac{nA}{N(a)^3}$

where $n = 2$ for bcc structure , $A = 39 \times 10^{-3}$ kg,

$N = 6.02 \times 10^{23}$, $a = \frac{2}{\sqrt{3}}d = \frac{2}{\sqrt{3}} \times (4.525 \times 10^{-10})m$

(d = nearest neighbour distance = distance between centres of two neighbouring atoms $= \frac{a}{\sqrt{2}}$)

On putting the values we get $\rho = 907$

6. (a) The highest energy level which an electron can occupy in the valence band at 0 K, is called Fermi energy level.

7. (a) In a triclinic crystal $a \neq b \neq c$ and $\alpha \neq \beta \neq \gamma \neq 90°$

8. (b) Metallic solids are opaque because incident light is absorbed by the free electrons in a metal.

9. (a) In ionic bonding electrons are transferred from one type of atoms to the other type creating positive and negative ions. For example in $NaCl$, Na loses one electrons and Cl gains one so that Na and Cl ions have a stable shell structure.

10. (c) Wood is non-crystalline.

11. (d) Cu has fcc structure, for fcc structure co-ordination number = 12

12. (c) Vander Waal force is weak dipole-dipole interaction.

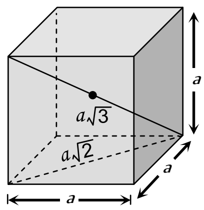
13. (b)

14. (a) The sodium chloride crystal structure has a fcc lattice with one chloride ion at each lattice point and one sodium ion half a cube length above it.

15. (a) In $NaCl$ crystal Na ion is surrounded by $6\,Cl^-$ ion, therefore coordination number of Na is 6.

16. (a) Sodium has bcc structure. The distance between body centre and a corner $= \frac{\sqrt{3}\,a}{2}$

$= \frac{\sqrt{3} \times 4.225}{2} = 3.66\ \mathring{A}$

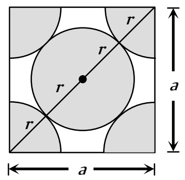


17. (d)

18. (b) For the fcc structure

$4r = (a^2 + a^2)^{1/2} = a\sqrt{2}$

$\Rightarrow r = \frac{a\sqrt{2}}{4} = \frac{a}{2\sqrt{2}}$



19. (c) Metals reflects incident light by the vibrations of free electrons under the influence of electric field of incident wave. The conductivity of metals decreases with increase of temperature due to increase in random motion of free electrons. The bonding is therefore metallic.

20. (c)

21. (b) The nearest distance between two atoms in a bcc lattice = 2 (atomic radius) $= 2 \times \left(\frac{\sqrt{3}\,a}{4}\right) = \frac{\sqrt{3}a}{2}$

22. (a) The net force on electron placed at the centre of bcc structure is zero. (By the principle of superposition of couloumb forces)

23. (b) For bcc packing, distance between two nearest atoms

$d = 2r = 2\left(\frac{\sqrt{3}\,a}{4}\right)$

$\Rightarrow$ Lattice constant $a = \frac{2d}{\sqrt{3}} = \frac{2 \times 3.7}{\sqrt{3}} = 4.3\mathring{A}$

24. (a)

25. (d) $\sqrt{2}\,a = 4r \Rightarrow a = \frac{4r}{\sqrt{2}} = \sqrt{2}(2r) = \sqrt{2} \times 2.54 = 3.59\ \mathring{A}$

26. (d)

27. (d) Covalent bonding exists in semi-conductor.

28. (d) In H_2O covalent bonding is present.

Semiconductors

1. (c) In P-type semiconductors, holes are the majority charge carriers

2. (b) Ga has a valancy of 3.

3. (d) Ge + Trivalent impurity → P-type semiconductor

4. (b) Since $n_e > n_h$; the semiconductor is N-type.

5. (b) Absence of one electron, creates the positive charge of magnitude equal to that of electronic charge.

6. (b) [Ge] + [Pantavalent impurity] → [N - type semiconductor]

7. (b) Impurity increases the conductivity.

8. (c) [Intrinsic semiconductor] → Conductivity is due to the breaking of covalent bond

[Extrisnsic semiconductor] → Conductivity is due to the breaking of covalent bond and excess of charge carriers due to impurity.

9. (d) Resistance of conductors (*Cu*) decreases with decrease in temperature while that of semi-conductors (*Ge*) increases with decrease in temperature.

10. (a) Aluminum is trivalent impurity.

11. (b) With temperature rise conductivity of semiconductors increases.

12. (a)

13. (a) Similar to Q. 11

14. (d) In insulators, the forbidden energy gap is largest and it is of the order of 6 *eV*.

15. (c) *N*-type semiconductors are neutral because neutral atoms are added during doping.

16. (b)

17. (b) In insulators, the forbidden energy gap is very large, in case of semiconductor it is moderate and in conductors the energy gap is zero.

18. (b) Similar to Q. 15.

19. (c) Phosphorus is pentavalent.

20. (c) In intrinsic semiconductors, the creation or liberation of one free electron by the thermal energy has created one hole. Thus in intrinsic semiconductors $n = n$

21. (d) Conductor has positive temperature coefficient of resistance but semiconductor has negative temperature coefficient of resistance.

22. (b) Boron is trivalent.

23. (a, c) In intrinsic semiconductors, electrons and holes both are charge carriers. In *P*-type semiconductors (Extrinsic semiconductors) holes are majority charge carriers.

24. (d)

25. (b)

26. (c) $\Delta E_{g(Germanium)} = 0.67\ eV$

27. (d) In *P*-type semiconductors, holes are majority charge carrier and electrons are minority charge carriers.

28. (c) At zero Kelvin, there is no thermal agitation and therefore no electrons from valence band are able to shift to conduction band.

29. (c) Antimony is a fifth group impurity and is therefore a donor of electrons.

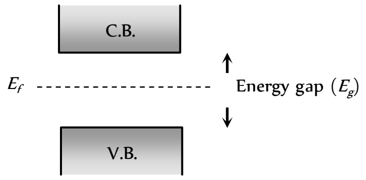
30. (b) Resistance of semiconductor $\propto \frac{1}{\text{Temperature}}$

31. (d) [Extrinsic S.C.] → $P - \text{Type}\,(n_p >> n_e)$; → $N - \text{Type}\,(n_e >> n_p)$

32. (a) At room temperature the number of electrons and holes are equal in the intrinsic semiconductor.

33. (b) Indium is trivalent, hence on doping with it, the intrinsic semiconductor becomes *P*-type semiconductor.

34. (a)



35. (c) In semiconductors, Forbidden energy gap is of the order of 1 *eV*.

36. (d) At 0*K* temperature semiconductor behaves as an insulator, because at very low temperature electrons cannot jump from the valence band to conduction band.

37. (c) Antimony is pentavalent.

38. (b) At 0*K* semiconductor behaves as insulator so it's resistance is infinite.

39. (d) The conduction and valence bands in the conductors merge into each other.

40. (a) For *N*-type semiconductor, the impurity should be pentavalent.

41. (d) When a free electron is produced, simultaneously a hole is also produced.

42. (c) For $P -$ type semiconductor the doping impurity should be trivalent.

43. (b) The temperature co-efficient of resistance of a semiconductor is always negative.

44. (c) The resistance of semiconductor decreases with the increase in temperature.

45. (d) At absolute zero temperature, semiconductor.

46. (b) Formation of energy bands in solids are due to Pauli's exclusion principle.

47. (a) In *P*-type semiconductors, holes are majority charge carriers.

48. (b)

49. (a) Conductivity of semiconductors increases with rise in temperature.

50. (d) All are trivalent in nature.

51. (d) In *N*-type semiconductors, electrons are majority charge corners.

52. (b) When a strong current passes through the semiconductor it heats up the crystal and covalent bond are broken. Hence because of excess number of free electrons it behaves like a conductor.

53. (b)

54. (a) Phosphorus is a pentavalent impurity so $n > n$.

55. (c) Phosphorus is pentavalent while Indium is trivalent.

56. (d) Phosphorus and Arsenic both are pentavalent.

57. (b)

58. (d)

59. (a) For *Ge*, $E_g = 0.7\,eV = 0.7 \times 1.6 \times 10^{-19}\,J = 1.12 \times 10^{-19}\,J$

60. (a) At room temperature some covalent bond breaks and semiconductor behaves slightly as a conductor.

61. (b)

62. (a)

63. (c) Because boron is a trivalent impurity.

64. (a) In P-type semi conductor, holes are majority charge carriers.

65. (b) In intrinsic semiconductors, at room temperature $n_e = n_h$.

66. (a) In conductors valence band and conduction band overlaps.

67. (c) Because As is pentavalent impurity.

68. (c) At 0 K semiconductor behaves as an insulator.

69. (c)

70. (c)

71. (b) Antimony and phosphorous both are pentavalent.

72. (b) Gallium is trivalent impurity.

73. (a)

74. (b) One atom of pentavalent impurity, donates one electron.

75. (c)

76. (b) The charge on hole is positive.

77. (c) Phosphorus is pentavalent impurity.

78. (a) $n_i^2 = n_h n_e \Rightarrow (10^{19})^2 = 10^{21} \times n_e \Rightarrow n_e = 10^{17} / m^3$.

79. (d) Temperature co-efficient of semiconductor is negative.

80. (a) Copper, Aluminum, Iron are conductors, while Ge is semiconductor.

81. (a) At room temperature, few bonds breaks and electron hole pair generates inside the semiconductor.

82. (a)

83. (b) With rise in temperature, conductivity of semiconductor increases while resistance decreases.

84. (d) Gallium, boron and aluminum are trivalent.

85. (c) Because with rise in temperature, resistance of semiconductor decreases, hence overall resistance of the circuit increases, which in turn increases the current in the circuit.

86. (d) Extrinsic semiconductor (N-type or P-type) are neutral.

87. (a) Because $v_d = \dfrac{i}{(n_e)eA}$

88. (c)

89. (b) Resistivity is the intrinsic property, it doesn't depend upon length and shape of the semiconductors.

90. (c)

91. (a) $\lambda_{max} = \dfrac{hc}{E} = \dfrac{6.6 \times 10^{-34} \times 3 \times 10^8}{1.14 \times 1.6 \times 10^{-19}} = 10888 Å$

92. (b) In N-type semiconductor impurity energy level lies just below the conduction band.

93. (d)

94. (d)

95. (d) $\sigma = e n_e \mu_e$

$$\Rightarrow n_e = \frac{\sigma}{e\mu_e} = \frac{6.24}{1.6 \times 10^{-19 \times 3900}} = 10^{16} / cm^3$$

96. (d) In semiconductors, the forbidden energy gap between the valence band and conduction band is very small, almost equal to kT. Moreover, valence band is completely filled where as conduction band is empty.

97. (d) In sample x no impurity level seen, so it is undoped. In sample y impurity energy level lies below the conduction bond so it is doped with fifth group impurity.

In sample z, impurity energy level lies above the valence band so it is doped with third group impurity.

98. (a) Forbidden energy gap for carbon is greater than that of silicon.

99. (b)

100. (a) Because electrons needed less energy to move.

101. (b)

Semiconductor Diode

1. (b)

2. (a) In forward biased *PN*-junction, external voltage decreases the potential barrier, so current is maximum. While in reversed biased *PN*-junction, external voltage increases the potential barrier, so the current is very small.

3. (b)

4. (b) Filter circuits are used to get smooth *dc* π -filter is the best filter.

5. (c) In reverse bias no current flows.

6. (b) In reverse biasing, width of depletion layer increases.

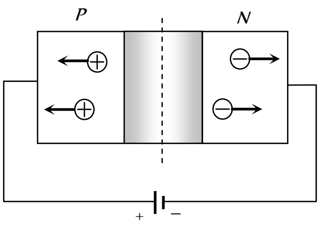
7. (a) Depletion layer consist of mainly stationary ions.

8. (b) Current flow is possible and $i = \frac{V}{R} = \frac{(4-1)}{300} = 10^{-2} A$

9. (a) The potential of *P*-side is more negative that of *N*-side, hence diode is in reverse biasing. In reverse biasing it acts as open circuit, hence no current flows.

10. (a)

11. (b) It is used to convert *ac* into *dc* (rectifier)



12. (b)

13. (b) Because in case (1) N is connected with N. This is not a series combination of transistor.

14. (c)

15. (d)

16. (c) After a large reverse voltage is *PN*-junction diode, a huge current flows in the reverse direction suddenly. This is called Breakdown of *PN*-junction diode.

17. (c) In forward biasing both positive and negative charge carriers move towards the junction.

18. (b,c)

19. (c) When polarity of the battery is reversed, the *P-N* junction becomes reverse biased so no current flows.

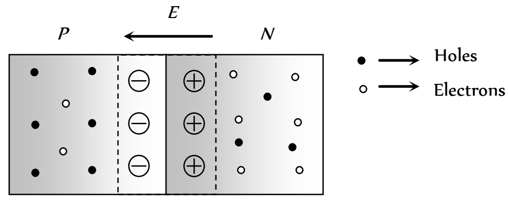
20. (d) Resistance in forward biasing $R_{fr} \approx 10\,\Omega$ and resistance in reverse biasing $R_{Rw} \approx 10^5 \Omega \Rightarrow \frac{R_{fr}}{R_{Rw}} = \frac{1}{10^4}$

21. (d)

22. (b) In forward biasing width of depletion layer decreases.

23. (d)

24. (c) At junction a potential barrier/depletion layer is formed, with *N*-side at higher potential and *P*-side at lower potential. Therefore there is an electric field at the junction directed from the *N*-side to *P*-side



25. (c) In *N*-type semiconductor majority charge carriers are electrons.

26. (b) In forward biasing the diffusion current increases and drift current remains constant so not current is due to the diffusion.

In reverse biasing diffusion becomes more difficult so net current (very small) is due to the drift.

27. (b) At a particular reverse voltage in *PN*-junction, a huge current flows in reverse direction known as avalanche current.

28. (b) Due to the large concentration of electrons in *N*-side and holes in *P*-side, they diffuses from their own side to other side. Hence depletion region produces.

29. (c) Only in option (c), *P*-side is more negative as compared to *N*-side.

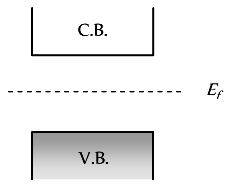
30. (b) Depletion layer is more in less doped side.

31. (b) In forward biasing *P*-side is connected with positive terminal and *N*-side with negative terminal of the battery

32. (c) In forward biasing of *PN*-junction diode, current mainly flows due to the diffusion of majority charge carriers.

33. (d)

34. (c) In forward biasing of *PN* junction diode width of depletion layer decreases. In intrinsic semiconductor fermi energy level is exactly in the middle of the forbidden gap



35. (d)

36. (a) At high reverse voltage, the minority charge carriers, acquires very high velocities. These by collision break down the covalent bonds, generating more carriers. This mechanism is called Avalanche breakdown.

37. (b) Because *P*-side is more negative as compared to *N*-side.

38. (b) When reverse bias is increased, the electric field at the junction also increases. At some stage the electric field breaks the covalent bond, thus the large number of charge carriers are generated. This is called Zener breakdown.

39. (d) In forward biasing both V and x decreases.

40. (a)

41. (b) In figure 2,4 and 5. *P*-crystals are more positive as compared to *N*-crystals.

42. (a) *ac* → Rectifier → *dc*

43. (b) In this condition $P-N$ junction is reverse biased.

44. (a)

45. (a) $E = \frac{V}{d} = \frac{0.5}{5 \times 10^{-7}} = 10^6\ V/m$.

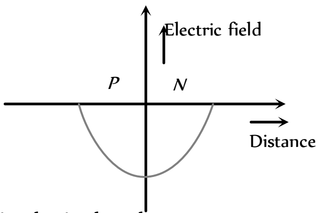
46. (b) Across the $P-N$ junction, a barrier potential is developed whose direction is from N region to P region.

47. (b)

48. (a) In forward biasing, resistance of PN junction diode is zero, so whole voltage appears across the resistance.

49. (c)

50. (d) The electric field strength versus distance curve across the *P-N* junction is as follows



51. (d)

52. (a) It doesn't Obey's ohms law.

53. (c) Because *N*-side is more positive as compared to *P*-side.

54. (c) When a light (wavelength sufficient to break the covalent bond) falls on the junction, new hole electron pairs are created. No. of produced electron hole pair deponed upon no. of photons. So photo emf or current proportional to intensity of light.

55. (b)

56. (d) For full wave rectifier $\eta = \dfrac{81.2}{1+\dfrac{r_f}{R_L}}$

$\Rightarrow n_{max} = 81.2\%$ $(r_f << R_L)$

57. (a)

58. (a)

59. (c) In reverse biasing negative terminal of the battery is connected to *N*-side.

60. (a) In the given condition diode is in reverse biasing so it acts as open circuit. Hence potential difference between *A* and *B* is 6 *V*

61. (b) Zener breakdown can occur in heavily doped diodes. In lightly doped diodes the necessary voltage is higher, and avalanche multiplication is then the chief process involved.

62. (c)

63. (a)

64. (c) Diode acts as open switch only when it is reverse biased

65. (a) Because *P*-side is more negative than *N*-side.

66. (b) In unbiased condition of *PN*-junction, depletion region is generated which stops the movement of charge carriers.

67. (c) For a wide range of values of load resistance, the current in the zener diode may change but the voltage across it remains unaffected. Thus the output voltage across the zener diode is a regulated voltage.

68. (c)

69. (d) Arsenic has five valence electrons, so it a donor impurity. Hence *X* becomes *N*-type semiconductor. Indium has only three outer electrons, so it is an acceptor impurity. Hence *Y* becomes *P*-type semiconductor. Also *N* (*i.e. X*) is connected to positive terminal of battery and *P*(*i.e. Y*) is connected to negative terminal of battery so *PN*-junction is reverse biased.

70. (a)

71. (c) In photodiode, it is illuminated by light radiations, which in turn produces electric current.

72. (a)

73. (d)

74. (d) By using $E = \dfrac{V}{d} = \dfrac{0.6}{10^{-6}} = 6\times10^5\ V/m$

75. (c) The given circuit is full wave rectifier.

76. (a) The diode is in reverse biasing so current through it is zero.

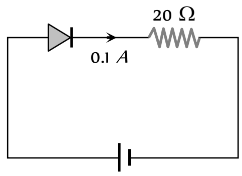
77. (c) In full wave rectifier, the fundamental frequency in ripple is twice that of input frequency.

78. (c)

79. (c) $V' = V + IR$

$= 0.5 + 0.1 \times 20$

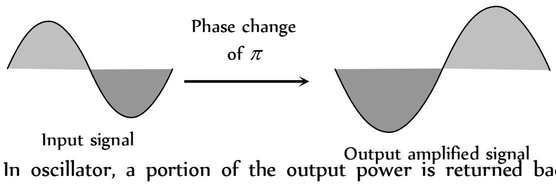
$= 2.5\ V$



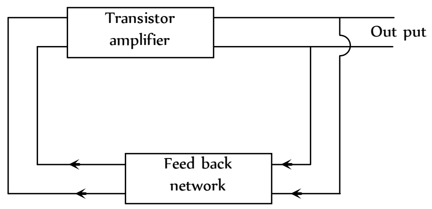
Junction Transistor

1. (a) When *NPN* transistor is used as an amplifier, majority charge carrier electrons of *N*-type emitter move from emitter to base and than base to collector.

2. (c)



3. (a) In oscillator, a portion of the output power is returned back (feed back) to the input in phase with the starting power. This process is termed as positive feedback.

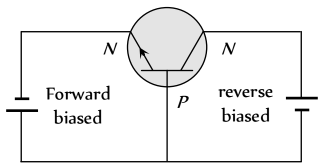


4. (d) The emitter base junction is forward biased while collector base junction is reversed biased.

5. (d) Given $i_c = \dfrac{80}{100}\times i_e \Rightarrow 24 = \dfrac{80}{100}\times i_e \Rightarrow i_e = 30\,mA$

By using $i_e = i_b + i_c \Rightarrow i_b = 30 - 24 = 6\ mA$.

6. (b)



7. (d) α is the ratio of collector current and emitter current while β is the ratio of collector current and base current.

8. (b)

9. (b) $\beta = \dfrac{\alpha}{1-\alpha} = \dfrac{0.98}{1-0.98} = 49.$

10. (b) $\beta = \dfrac{\alpha}{1-\alpha} = \dfrac{0.96}{1-0.96} = 24.$

11. (c) $\alpha = \frac{i_c}{i_e}$ =0.96 and i_e = 7.2 mA

$\Rightarrow i_c = 0.96 \times i_e$ = 0.96 × 7.2 = 6.91 mA

$\therefore i_e = i_c + i_b \Rightarrow$ 7.2 = 6.91 + $i_b \Rightarrow i_b$ = 0.29 mA.

12. (d)

13. (d) $i_C = \frac{90}{100} \times i_E \Rightarrow$ 10 = 0.9 × i_e = 11mA

Also $i_E = i_B + i_C \Rightarrow i_B = 11 - 10 = 1mA$.

14. (a) Current gain $\beta = \frac{\Delta i_c}{\Delta i_b} \Rightarrow \Delta i_c = \beta \times \Delta i_b$ = 80 × 250 μA.

15. (b) In transistor, base is least doped.

16. (b)

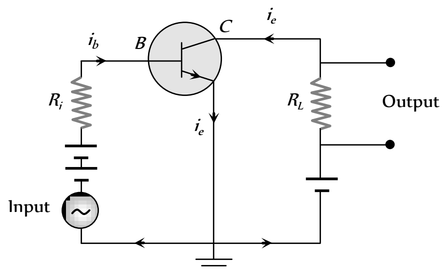
17. (d) β = 50, R_i = 1000 Ω, V_i = 0.01V

$$\beta = \frac{i_c}{i_b} \text{ and } i_b = \frac{V_i}{R_i} = \frac{0.01}{10^3} = 10^{-5} A$$

Hence $i_c = 50 \times 10^{-5} A = 500\, \mu A$.

18. (b) $\alpha = \frac{\beta}{1+\beta} = \frac{99}{1+99} = 0.99$.

19. (a,c) The circuit of a CE amplifier is as shown below.



This has been shown a NPN transistor. Therefore base emitter are forward, biased and input signal is connected between base and emitter.

20. (a) The base is always thin

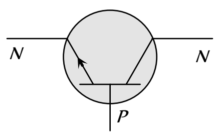
21. (c) Voltage gain = β × Resistance gain

$$\beta = \frac{\alpha}{1-\alpha} = \frac{0.99}{(1-0.99)} = 99$$

Resistance gain $= \frac{10 \times 10^3}{10^3} = 10$

$\Rightarrow$ Voltage gain = 99 × 10 = 990.

22. (a) The arrow head in the transistor symbol always shows the direction of hole flow in the emitter region.



23. (b)

24. (b) Because emitter (N) is common to both, base (P) and collector (N).

25. (b) Emitter is heavily doped.

26. (c) α = 0.8 $\Rightarrow \beta = \frac{0.8}{(1-0.8)}$ =4

Also $\beta = \frac{\Delta i_c}{\Delta i_b} \Rightarrow \Delta i_c = \beta \times \Delta i_b$ = 4 × 6 = 24mA.

27. (a) $\Delta i_c = \alpha\, \Delta i_e = 0.98 \times 2 = 1.96\, mA$

$\therefore \quad \Delta i_b = \Delta i_e - \Delta i_c = 2 - 1.96 = 0.04\, mA$.

28. (b) $i_e = i_b + i_c \Rightarrow i_c = i_e - i_b$

29. (b) $V_b = i_b R_b \Rightarrow R_b = \frac{9}{35 \times 10^{-6}}$ =257 $k\Omega$.

30. (d) $\Delta i_e = \Delta i_c + \Delta i_b$

$\Rightarrow$ 8 = 7.8 + $\Delta i_b \Rightarrow \Delta i_b$ =0.2mA = 200 μA.

31. (b) $\beta = \frac{i_c}{i_b}$

32. (b) FET is unipolar.

33. (a)

34. (b) $i_e = i_b + i_c \Rightarrow \frac{i_e}{i_c} = \frac{i_b}{i_c} + 1 \Rightarrow \frac{1}{\alpha} = \frac{1}{\beta} + 1 \Rightarrow \alpha = \frac{\beta}{(1+\beta)}$.

35. (b) In NPN transistor when emitter-base is forward biased, electrons move from emitter to base.

36. (a) Here $\Delta V_c = 0.5\, V$, Δi_c =0.05mA = 0.05 × 10^{-3}A

Output resistance is given by

$$R_{out} = \frac{\Delta V_c}{\Delta i_c} = \frac{0.5}{0.05 \times 10^{-3}} = 10^4 \Omega = 10 k\Omega.$$

37. (a) Oscillator can produce radio waves of constant amplitude.

38. (a) $h_{fe} = \left(\frac{\Delta i_c}{\Delta i_b}\right)_{V_{ce}} = \frac{8.2}{8.3 - 8.2} = 82$

39. (b) Current gain $\beta = \frac{\Delta i_c}{\Delta i_b} \Rightarrow \Delta i_b = \frac{1 \times 10^{-3}}{100} = 10^{-5} A$ =0.01mA.

By using $\Delta i_e = \Delta i_b + \Delta i_c \Rightarrow \Delta i_e$ = 1.01 + 1 = 1.01mA.

40. (a) In CB amplifier Input and output voltage signal are in same phase.

41. (b)

42. (d)

43. (d) For CE configuration voltage gain $= \beta \times R_L / R_i$

Power gain $= \beta^2 \times R_L / R_i \Rightarrow \frac{\text{Power gain}}{\text{Voltage gain}} = \beta$

44. (b) As we know $i_E = i_C + i_B$

$$\Rightarrow \frac{i_e}{i_c} = 1 + \frac{i_b}{i_c} \Rightarrow \frac{1}{\alpha} = 1 + \frac{1}{\beta} \Rightarrow \beta = \frac{\alpha}{1-\alpha}.$$

Digital Electronics

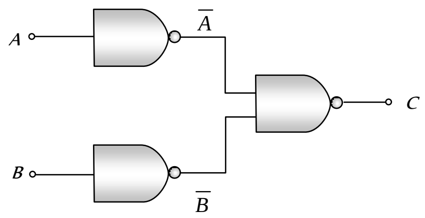
1. (b)

2. (c)

3. (b) For 'OR' gate $X = A + B$

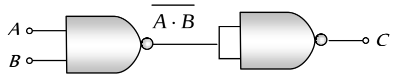
i.e. $0+0=0$, $0+1=1$, $1+0=1$, $1+1=1$

4. (a)



$C=\overline{\bar A.\bar B}=\overline{\bar A}+\overline{\bar B}=A+B$ (De morgan's theorem)

Hence output C is equivalent to OR gate.



$C=\overline{\overline{AB}.\overline{AB}}=\overline{\overline{AB}}+\overline{\overline{AB}}=AB+AB=AB$

In this case output C is equivalent to AND gate.

5. (b) In 'NOR' gate $Y=\overline{A+B}$

i.e. $\overline{0+0}=\bar 0=1$, $\overline{1+0}=\bar 1=0$

$\overline{0+1}=\bar 1=0$, $\overline{1+1}=\bar 1=0$

6. (c) For 'XNOR' gate $Y=\bar A\,\bar B+AB$

i.e. $\bar 0.\bar 0+0.0=1.1+0.0=1+0=1$

$\bar 0.\bar 1+0.1=1.0+0.1=0+0=0$

$\bar 1.\bar 0+1.0=0.1+1.0=0+0=0$

$\bar 1.\bar 1+1.1=0.0+1.1=0+1=1$

7. (d) The output D for the given combination

$D=\overline{(A+B).C}=\overline{(A+B)}+\bar C$

If $A=B=C=0$ then $D=\overline{(0+0)}+\bar 0=\bar 0+\bar 0=1+1=1$

If $A=B=1, C=0$ then $D=\overline{(1+1)}+\bar 0=\bar 1+\bar 0=0+1=1$

8. (b)

9. (a) The Boolean expression for 'NOR' gate is $Y=\overline{A+B}$

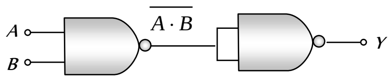
i.e. if $A=B=0$ (Low), $Y=\overline{0+0}=\bar 0=1$ (High)

10. (a)

11. (d) The Boolean expression for 'AND' gate is $R=P.Q$

$\Rightarrow 1.1=1,\ 1.0=0,\ 0.1=0,\ 0.0=0$

12. (b) Two 'NAND' gates are required as follows



$Y=\overline{\overline{AB}.\overline{AB}}=AB$

13. (c) For 'NAND' gate (option c), output $=\overline{0.1}=\bar 0=1$

14. (a) AND + NOT $\rightarrow$ NAND

15. (c) For 'NOT' gate $X=\bar A$

16. (a) The given Boolean expression can be written as

$Y=\overline{(A+B)}.\overline{(A.B)}=(\bar A.\bar B).(\bar A+\bar B)=(\bar A\,\bar A).\bar B+\bar A(\bar B.\bar B)$

$=\bar A.\bar B+\bar A\,\bar B=\bar A\,\bar B$

A	B	Y
0	0	1
1	0	0
0	1	0
1	1	0

17. (b) For 'AND' gate, if output is 1 then both inputs must be 1.

18. (b)

19. (a)

20. (a) The given symbol is of 'AND' gate.

21. (b) It is the symbol of 'NOR' gate.

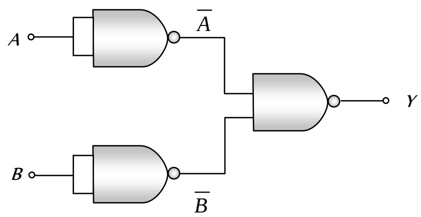
22. (c) The Boolean expression for the given combination is output $Y=(A+B).C$

The truth table is

A	B	C	Y =(A+B).C
0	0	0	0
1	0	0	0
0	1	0	0
0	0	1	0
1	1	0	0
0	1	1	1
1	0	1	1
1	1	1	1

Hence $A=1$, $B=0$, $C=1$

23. (b)



$Y=\overline{\bar A.\bar B}=\bar{\bar A}+\bar{\bar B}=A+B$

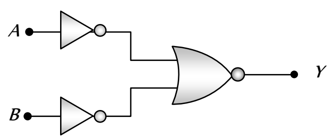
This output equation is equivalent to OR gate.

24. (c) If inputs are A and B then output for NAND gate is $Y=\overline{AB}$

$\Rightarrow$ If $A=B=1$, $Y=\overline{1.1}=\bar 1=0$

25. (b)

26. (c)



$Y=\overline{\bar A+\bar B}$

According to De morgan's theorem

$Y=\overline{\bar A+\bar B}=\bar{\bar A}.\bar{\bar B}=A.B$

This is the output equation of 'AND' gate.

27. (b) The output of OR gate is $Y = A + B$.

28. (a) The given symbol is of NAND gate.

29. (a) $(100010)_2 = 2^5 \times 1 + 2^4 \times 0 + 2^3 \times 0 + 2^2 \times 0 +$

$2^1 \times 1 + 2^0 \times 0 = 32 + 0 + 0 + 0 + 2 + 0 = (34)_{10}$

and $(11011)_2 = 2^4 \times 1 + 2^3 \times 1 + 2^2 \times 0 + 2^1 \times 1 + 2^0 \times 1$

$= 16 + 8 + 0 + 2 + 1 = (27)_{10}$

$\therefore$ Sum $(100010)_2 + (11011)_2 = (34)_{10} + (27)_{10} = (61)_{10}$

Now

2	61	Remainder
2	30	1 LSD
2	15	0
2	7	1
2	3	1
2	1	1
	0	1 MSD

$\therefore$ Required sum (in binary system)

$(100010)_2 + (11011)_2 = (111101)_2$

30. (d) For 'NAND' gate $C = \overline{A.B}$

i.e. $\overline{0.0} = \overline{0} = 1$, $\overline{0.1} = \overline{0} = 1$

$\overline{1.0} = \overline{0} = 1$, $\overline{1.1} = \overline{1} = 0$

31. (d) 'NOR' gates are considered as universal gates, because all the gates like AND, OR, NOT can be obtained by using only NOR gates.

Valve Electronics (Diode and Triode)

1. (c) According to Richardson-Dushman equation, number of thermions emitted per sec per unit area $J = AT^2 e^{-W_0/kT} \Rightarrow J \propto T^2$

2. (c) Intensity $\propto$ Number of electrons

3. (a) In SCR (Space charge region) electrons collect around the plate, this cloud decreases the emission of electrons from the cathode, hence plate current decreases.

4. (b)

5. (b) By using $g_m = \frac{\Delta i_p}{\Delta v_g} \Rightarrow 3 \times 10^{-4} = \frac{\Delta i_p}{-1-(-3)}$

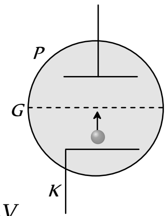
$\Rightarrow \Delta i_p = 6 \times 10^{-4} A = 0.6\, mA$

6. (b) Voltage gain $A_v = \frac{\mu}{1 + \frac{r_p}{R_L}}$ and $\mu = r_p \times g_m$

$\Rightarrow r_p = \frac{42}{2 \times 10^{-3}} = 21000\,\Omega \Rightarrow A_v = \frac{42}{1 + \frac{21000}{50 \times 10^3}} = 29.57$

7. (c) Voltage gain $A_v = \frac{\mu}{1 + \frac{r_p}{R_L}}$, for $r_p = R_L \Rightarrow A_v = \frac{\mu}{2}$

8. (b) When grid is given positive potential more electrons will cross the grid to reach the positive plate *P*. Hence current increases.



9. (a) By using $\mu = -\frac{\Delta V_p}{\Delta V_g} = r_p \times g_m$

$\Rightarrow 7 \times 10^3 \times 2.5 \times 10^{-3} = -\frac{50}{\Delta V_g} \Rightarrow \Delta V_g = -2.86\, V$.

10. (a) Using voltage gain $A_v = \frac{\mu}{1 + \frac{r_p}{R_L}}$ also $\mu = r_p \times g_m$

$\Rightarrow r_p = \frac{\mu}{g_m} = \frac{20}{3 \times 10^{-3}}$

$\therefore A_v = \frac{20}{1 + \frac{20}{3 \times 10^{-3} \times 3 \times 10^4}} = \frac{180}{11} = 16.36.$

11. (c) Voltage gain $= \frac{V_{out}}{V_{in}} = \frac{\mu}{1 + \frac{r_p}{R_L}} \Rightarrow \frac{V_{out}}{0.5} = \frac{25}{1 + \frac{40 \times 10^3}{10 \times 10^3}}$

$\Rightarrow V_{out} = 2.5\, V$.

12. (b) $\mu = -\frac{\Delta V_p}{\Delta V_G} \Rightarrow \Delta V_p = -\mu \Delta V_G = -20 \times (-0.2) = 4\, V$.

13. (b) Voltage gain $A_V = \frac{\mu}{1 + \frac{r_p}{R_L}}$ and $\mu = r_p \times g_m$

$\Rightarrow \mu = 10 \times 10^3 \times 3 \times 10^{-3} = 30$

$\therefore A_v = \frac{\mu}{1 + \frac{r_p}{2r_p}} = \frac{2}{3}\mu = \frac{2}{3} \times 30 = 20.$

14. (c)

15. (d) After saturation plate current can be increased by increasing the temperature of filament. It can be done by increasing the filament current.

16. (b) The maximum voltage gain $(A)_{max} = \mu$

(Which is obtained when $R_L = \infty$).

17. (b) Voltage gain $A_v = \frac{\mu}{1 + \frac{r_p}{R_L}}$

$\because R_L = 1.5\, r_p \Rightarrow A_v = \frac{\mu}{1 + \frac{r_p}{1.5\, r_p}} = \frac{3}{5}\mu = \frac{3}{5} \times 20 = 12$.

18. (c)

19. (c)

20. (c) $\mu = \frac{\Delta V_p}{\Delta V_g} \Rightarrow \Delta V_p = \mu \Delta V_g = 15 \times 0.3 = 4.5$ *volt.*

21. (b) Plate resistance $=\dfrac{1}{\text{slope}}=\dfrac{1}{10^{-3}\times10^{-3}}=10^6\Omega$

$= 1000\ k\Omega$ (static).

22. (b) Using $A_v=\dfrac{\mu}{1+\dfrac{r_p}{R_L}}$ and $\mu=r_p\times g_m$

$\Rightarrow r_p=\dfrac{\mu}{g_m}=\dfrac{50}{2\times10^{-3}}=25\times10^3\Omega$

$\therefore A_v=\dfrac{50}{1+\dfrac{25\times10^3}{25\times10^3}}=25.$

23. (b) $P=Vi\Rightarrow V=\dfrac{P}{i}=\dfrac{448\times10^{-3}}{14\times10^{15}\times1.6\times10^{-19}}=200V$

24. (c) $\mu=\dfrac{(V_{p_1}-V_{p_2})}{(V_{G_1}-V_{G_2})}=\dfrac{(200-220)}{(0.5-1.3)}=25.$

25. (a) $\mu=r_p\times g_m\Rightarrow g_m=\dfrac{\mu}{r_p}=\dfrac{22}{6600}=\dfrac{1}{300}.$

26. (c) $r_p=\dfrac{V_{p_1}-V_{p_2}}{I_{p_1}-I_{p_2}}=\dfrac{75-100}{(2-4)\times10^{-3}}=12.5\times10^3\Omega=12.5k\Omega.$

27. (d)

28. (a)

29. (a) Voltage amplification $A_v=\dfrac{\mu}{1+\dfrac{r_p}{R_L}}$

$\Rightarrow\ 25=\dfrac{\mu}{1+\dfrac{r_p}{50\times10^3}}$ ......(i)

and $30=\dfrac{\mu}{1+\dfrac{r_p}{100\times10^3}}$ ......(ii)

an solving equation (i) and (ii), $r_p=25k\Omega.$

30. (a, d)

31. (d)

32. (c) Before saturation region, linear region comes. In linear region $i_p\propto V_p$

$\Rightarrow\dfrac{i_1}{i_2}=\dfrac{V_{p_1}}{V_{p_2}}=\dfrac{400}{200}=\dfrac{2}{1}.$

33. (c) $i_p = 1.125 - 1.112 = 0.013A = 13\ mA.$

34. (a)

35. (a)

36. (c) Comparing the given equation with standard equation

$i=AT^2e^{qV/kT}\Rightarrow V_L=\dfrac{kT}{V}.$

37. (b)

38. (d) $r_p=\dfrac{\Delta V_p}{\Delta i_p}=\dfrac{150-100}{(12-7.5)\times10^{-3}}=\dfrac{50}{4.5}\times10^3=11.1k\Omega.$

39. (b)

40. (c) Voltage amplification $A_v=\dfrac{\mu}{1+\dfrac{r_p}{R_L}}=\dfrac{\mu R_L}{R_L+r_p}$

$\Rightarrow\dfrac{A_1}{A_2}=\dfrac{2+4}{4+4}=\dfrac{3}{4}.$

41. (c) A diode is used as a rectifier to convert *ac* in to *dc*.

42. (b) Fluctuating *dc* → Filter circuit → smooth *dc*.

43. (d)

44. (b)

45. (c) $\mu=r_p\times g_m\Rightarrow r_p=\dfrac{20}{10^{-3}}=2\times10^4\Omega.$

46. (c)

47. (b) $\mu=-\dfrac{\Delta V_p}{\Delta V_g}$

$\Rightarrow\Delta V_p=-\mu\times\Delta V_g=-50(-0.20)=10\,V.$

48. (b) $r_p=\dfrac{1}{\text{slope}}=\dfrac{1}{2\times10^{-2}\times10^{-3}}=50k\Omega.$

49. (a) Voltage amplification $A_v=\dfrac{\mu}{1+\dfrac{r_p}{R_L}}=\dfrac{r_p\times g_m\times R_L}{R_L+r_p}$

$\Rightarrow10=\dfrac{20\times10^3\times2.5\times10^{-3}\times R_L}{(R_L+20\times10^3)}\Rightarrow R_L=5k\Omega.$

50. (c) Voltage gain $A_v=\dfrac{\mu}{1+\dfrac{r_p}{R_L}}=\dfrac{18}{1+\dfrac{8\times10^3}{10^4}}=10.$

51. (a) Ripple factor $r=\sqrt{\left(\dfrac{I_{rms}}{I_{dc}}\right)^2-1}=\sqrt{\dfrac{(I_0/2)^2}{(I_0/\pi)^2}-1}=1.21.$

52. (b)

53. (b)

54. (a) $\mu=r_p\times g_m=2.5\times10^4\times2\times10^{-3}=50.$

55. (c) $\mu=\left(\dfrac{\Delta V_p}{\Delta V_g}\right)_{i_p=\text{constant}}=\dfrac{(225-200)}{(5.75-5)}=33.3$

56. (a) $g_m=\left(\dfrac{\Delta I_p}{\Delta V_g}\right)_{V_p=\text{constant}}=\dfrac{(7.5-5.5)}{-1.2-(-2.2)}=2m\,mho$

57. (a)

58. (d) Using $\mu=r_p\times g_m\Rightarrow g_m=\dfrac{20}{10\times10^3}=2\times10^{-3}.$

Critical Thinking Questions

1. (c) Number density of atoms in silicon specimen $= 5\times10^{28}$ *atom/m*^{3} $= 5\times10^{22}$ *atom/cm*^{3}

Since one atom of indium is doped in 5×10^7 *Si* atom. So number of indium atoms doped per *cm*^{3} of silicon.

$$n=\frac{5\times10^{22}}{5\times10^7}=1\times10^{15}\ atom/cm^3.$$

2. (a) The probability of electrons to be found in the conduction band of an intrinsic semiconductor

$P(E)=\dfrac{1}{1+e^{\frac{(E-E_F)}{kT}}}$; where k = Boltzmann's constant

Hence, at a finite temperature, the probability decreases exponentially with increasing band gap.

3. (c) When donor impurity (+5 valence) added to a pure silicon (+4 valence), the +5 valence donor atom sits in the place of + 4 valence silicon atom. So it has a net additional + 1 electronic charge. The four valence electron form covalent bond and get fixed in the lattice. The fifth electron (with net – 1 electronic charge) can be approximated to revolve around + 1 additional charge. The situation is like the hydrogen atom for which energy is given by $E=-\dfrac{13.6}{n^2}eV$. For the case of hydrogen, the permittivity was taken as ε_0. However, if the medium has a permittivity ε_r relative to ε_0, then $E=-\dfrac{13.6}{\varepsilon_r^2 n^2}eV$

For *Si*, ε_r = 12 and for n = 1, $E \simeq 0.1\,eV$

4. (c) The forward current

$$i=i_s(e^{eV/kT}-1)=10^{-5}\left[e^{\frac{1.6\times10^{-19}\times0.2}{1.4\times10^{-23}\times300}}-1\right]$$

$$=10^{-5}[2038.6-1]=20.376\times10^{-3}A$$

5. (a,b,d) At 0 *K*, a semiconductor becomes a perfect insulator. Therefore at 0 *K*, if some potential difference is applied across an insulator or a semiconductor, current is zero. But a conductor will become a superconductor at 0 *K*. Therefore, current will be infinite. In reverse biasing at 300 *K* through a *P-N* junction diode, a small finite current flows due to minority charge carriers.

6. (a) Since diode in upper branch is forward biased and in lower branch is reversed biased. So current through circuit $i=\dfrac{V}{R+r_d}$; here r_d = diode resistance in forward biasing = 0

$\Rightarrow\ i=\dfrac{V}{R}=\dfrac{2}{10}=0.2A$.

7. (a) The voltage drop across resistance = 8 – 0.5 = 7.5 *V*

$\therefore$ Current $i=\dfrac{7.5}{2.2\times10^3}=3.4\,mA$

8. (c) $E=\dfrac{hc}{\lambda}\Rightarrow\lambda=\dfrac{hc}{E}=\dfrac{6.6\times10^{-34}\times3\times10^{8}}{57\times10^{-3}\times1.6\times10^{-19}}$ =217100Å.

9. (b) The diode in lower branch is forward biased and diode in upper branch is reverse biased

$\therefore\quad i=\dfrac{5}{20+30}=\dfrac{5}{50}A$.

10. (b) The current through circuit $i=\dfrac{P}{V}=\dfrac{100\times10^{-3}}{0.5}=0.2A$

$\therefore$ voltage drop across resistance = 1.5 – 0.5 = 1 *V*

$\Rightarrow R=\dfrac{1}{0.2}=5\,\Omega$.

11. (d) In common emitter configuration current gain

$A_i=\dfrac{-h_{fe}}{1+h_{oe}R_L}=\dfrac{-50}{1+25\times10^{-6}\times10^{3}}$ = – 48.78.

12. (c) Voltage gain $=\dfrac{\text{Output voltage}}{\text{Input voltage}}$

$\Rightarrow V_{out} = V_{in}\times$ Voltage gain

$\Rightarrow V_{out} = V_{in}\times$ Current gain × Resistance gain

$= V_{in}\times\beta\times\dfrac{R_L}{R_{BE}} = 10^{-3}\times100\times\dfrac{10}{1}=1V.$

13. (a) $n_e=8\times10^{18}/m^3,\ n_h=5\times10^{18}/m^3$

$\mu_e=2.3\dfrac{m^2}{volt-\sec},\ \mu_h=0.01\dfrac{m^2}{volt-\sec}$

$\because n_e>n_h$ so semiconductor is *N*-type

Also conductivity $\sigma=\dfrac{1}{\text{Resistivity}(\rho)}=e(n_e\mu_e+n_h\mu_h)$

$\Rightarrow\dfrac{1}{\rho}=1.6\times10^{-19}[8\times10^{18}\times2.3+5\times10^{18}\times0.01]$

$\Rightarrow\rho$ = 0.34 Ω-*m*.

14. (b) $V_{rms}=\dfrac{V_0}{2}=\dfrac{200}{2}=100V$

15. (a) At knee point voltage across the diode is 0.7 *V*.

Hence voltage across resistance *R* is 5 – 0.7 = 4.3 *V*.

$\Rightarrow$ using $V = iR \Rightarrow 4.3 = 1\times10^{-3}\times R\Rightarrow R$ = 4.3 *k*Ω.

16. (d) In positive half cycle one diode is in forward biasing and other is in reverse biasing while in negative half cycle their polarity reverses, and direction of current is opposite through *R* for positive and negative half cycles so out put is not rectified.

Since R_1 and R_2 are different hence the peaks during positive half and negative half of the input signal will be different.

17. (b) In half wave rectifier $V_{dc}=\dfrac{V_0}{\pi}=\dfrac{10}{\pi}$

18. (a) In common base mode α = 0.98, *R* = 5 *k*Ω, R_{in} = 70Ω

$\therefore$ voltage gain $A_v=\alpha\times\dfrac{R}{R_{in}}=0.98\times\dfrac{5\times10^3}{70}=70$

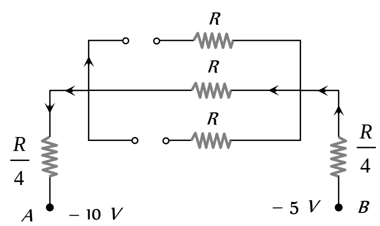
Power gain = Current gain × Voltage gain

= 0.98 × 70 = 68.6

19. (a) $r_n=\varepsilon_r\left(\dfrac{n^2}{Z}\right)a_o=12\times\dfrac{(5^2)}{15}\times0.53$ = 10.6 Å.

20. (c) (i) V_A = –10 *V* and V_B = –5 *V*

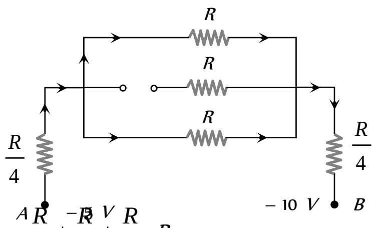
Diodes D_1 and D_3 are reveres biased and D_2 is forward biased.



$$\Rightarrow R_{AB} = R + \frac{R}{4} + \frac{R}{4} = \frac{3}{2}R.$$

(ii) When $V_A = -5V$ and $V_B = -10V$

Diodes D_2 is reverse biased D_1 and D_3 are forward biased



$$\Rightarrow R_{AB} = \frac{R}{4} + \frac{R}{2} + \frac{R}{4} = R.$$

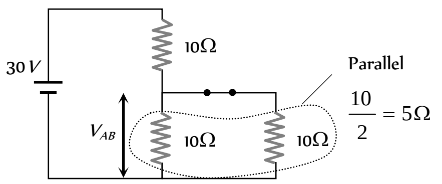
(iii) In this case equivalent resistance between A and B is also R.

Hence (ii) = (iii) < (i).

21. (b) According to the given polarity, diode D_1 is forward biased while D_2 is reverse biased. Hence current will pass through D_1 only.

So current $i = \frac{6}{(150+50+100)} = 0.02\ A$

22. (a) Diode is in forwards biasing hence the circuit can be redrawn as follows



$$V_{AB} = \frac{30}{(10+5)} \times 5 = 10\ V$$

23. (d) The diode D will conduct for positive half cycle of *a.c.* supply because this is forward biased. For negative half cycle of *a.c.* supply, this is reverse biased and does not conduct. So out put would be half wave rectified and for half wave rectified out put

$$V_{rms} = \frac{V_0}{2} = \frac{200\sqrt{2}}{2} = \frac{200}{\sqrt{2}}$$

24. (d) $\sigma = ne(\mu_e + \mu_h) = 2\times10^{19} \times 1.6\times10^{-19}(0.36+0.14)$

$= 1.6\,(\Omega\text{-}m)^{-1}$

$$R = \rho\frac{l}{A} = \frac{l}{\sigma A} = \frac{0.5\times10^{-3}}{1.6\times10^{-4}} = \frac{25}{8}\Omega$$

$$\therefore\ i = \frac{V}{R} = \frac{2}{25/8} = \frac{16}{25}A = 0.64\ A$$

25. (a) As we know current density $J = nqv$

$\Rightarrow J_e = n_e q v_e$ and $J_h = n_h q v_h$

$$\Rightarrow \frac{J_e}{J_h} = \frac{n_e}{n_h} \times \frac{v_e}{v_h} \Rightarrow \frac{3/4}{1/4} = \frac{n_e}{n_h} \times \frac{5}{20} \Rightarrow \frac{n_e}{n_h} = \frac{6}{5}$$

26. (b) Consider the case when *Ge* and *Si* diodes are connected as show in the given figure.

Equivalent voltage drop across the combination *Ge* and *Si* diode = 0.3 V

$\Rightarrow$ Current $i = \frac{12-0.3}{5\,k\Omega} = 2.34\ mA$

$\therefore$ Out put voltage $V_0 = Ri = 5\ k\Omega \times 2.34\ mA = 11.7\ V$

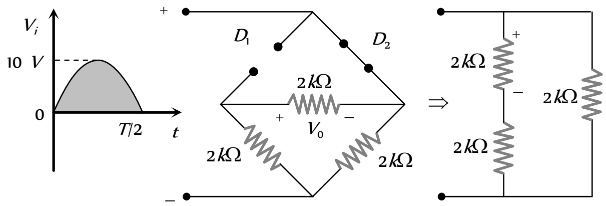
Now consider the case when diode connection are reversed. In this case voltage drop across the diode's combination = 0.7 V

$\Rightarrow$ Current $i = \frac{12-0.7}{5\,k\Omega} = 2.26\ mA$

$\therefore\ V_0 = iR = 2.26\,mA \times 5\,k\Omega = 11.3\ V$

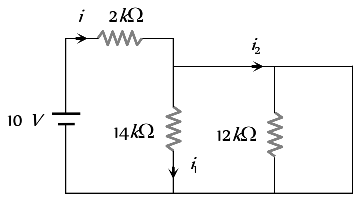
Hence charge in the value of V_0 = 11.7 –11.3 = 0.4 V

27. (b) For the positive half cycle of input the resulting network is shown below



$\Rightarrow (V_0)_{max} = \frac{1}{2}(V_i)_{max} = \frac{1}{2}\times 10 = 5\ V.$

28. (d) The equivalent circuit can be redrawn as follows



From figure it is clear that current drawn from the battery

$i = i_2 = \frac{10}{2} = 5mA$ and $i_1 = 0.$

29. (c) $i_b = \frac{5-0.7}{8.6} = 0.5\ mA \Rightarrow I_c = \beta I_b = 100\times0.5\ mA$

By using $V_{CE} = V_{CC} - I_c R_L = 18 - 50\times10^{-3}\times100 = 13V$

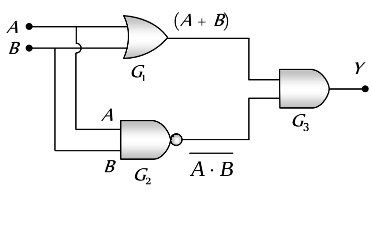
30. (a) $I_e = 10^{10}\times1.6\times10^{-19}\times\frac{1}{10^{-6}} = 1.6\ mA \quad \left(\because I = \frac{Q}{t}\right)$

Since 2% electrons are absorbed by base, hence 98% electrons reaches the collector *i.e.* α = 0.98

$\Rightarrow I_c = \alpha I_e = 0.98\times1.6 = 1.568\ mA \approx 1.57\ mA$

Also current amplification factor $\beta = \frac{\alpha}{1-\alpha} = \frac{0.98}{0.02} = 49$

31. (b)



$Y = (A+B).\overline{AB}$

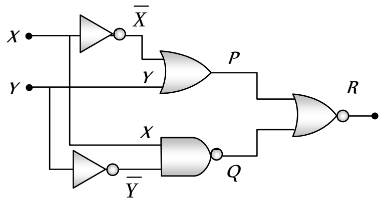
The given output equation can also be written as

$Y = (A+B).(\overline{A}+\overline{B})$ (De morgan's theorem)

$= A\overline{A} + A\overline{B} + B\overline{A} + B\overline{B} = 0 + A\overline{B} + \overline{A}B + 0 = \overline{A}B + A\overline{B}$

This is the expression for XOR gate.

32. (c)

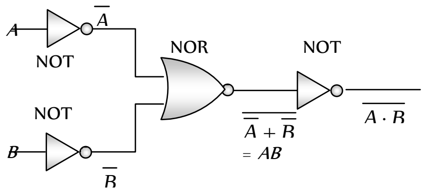


The truth table can be written as

X	Y	$\overline{X}$	$\overline{Y}$	$P = \overline{X} + Y$	$Q = \overline{X.\overline{Y}}$	$R = \overline{P+Q}$
0	1	1	0	1	1	0
1	1	0	0	1	1	0
1	0	0	1	0	0	1
0	0	1	1	1	1	0

Hence $X = 1$, $Y = 0$ gives output $R = 1$

33. (d)



Hence option (d) is correct.

34. (b) The truth table of the circuit is given

A	B	C	$X = \overline{AB}$	$Y = \overline{BC}$	$Z = \overline{X+Y}$
0	0	0	1	1	0
1	0	0	1	1	0
0	0	1	1	1	0
1	0	1	1	1	0
0	1	0	1	1	0
1	1	0	0	1	0
0	1	1	1	0	0
1	1	1	0	0	1

Output Z of single three input gate is that of AND gate.

35. (c) Output of upper OR gate = $W + X$

Output of lower OR gate = $W + Y$

Net output $F = (W + X)(W + Y)$

$= WW + WY + XW + XY$ (Since $WW = W$)

$= W(1 + Y) + XW + XY$ (Since $1 + Y = 1$)

$= W + XW + XY = W(1 + X) + XY = W + XY$

36. (b) $\mu = r_p\, g_m = 50$

From $i_p = KV_p^{3/2} \Rightarrow \dfrac{\Delta V_p}{\Delta i_p} = r_p = \dfrac{2i_p^{-1/3}}{3K^{2/3}}$

$\Rightarrow g_m = \dfrac{\mu}{r_p} = \dfrac{3\mu K^{2/3} i_p^{1/3}}{2} = \dfrac{3}{2}\mu K^{2/3}\left[K^{1/3}(V_p + \mu V_g)^{1/2}\right]$

$= \dfrac{3}{2}\mu K(V_p + \mu V_g)^{1/2} = 75\, K\,(i_p/K)^{1/3}$

Because i_p was in mA, g_m is substituted as 5 $m℧$

$\Rightarrow 5 = 75K^{2/3} i_p^{1/3} = 75\, K^{2/3}(8)^{1/3} \Rightarrow K = \left(\dfrac{1}{30}\right)^{3/2}$

Cut off grid voltage $V_G = -\dfrac{V_p}{\mu} = -\dfrac{300}{50} = -6V$

37. (d) $g_m = \left(\dfrac{\Delta i_p}{\Delta V_g}\right)_{V_p = \text{constant}} = \dfrac{(15-10)\times 10^{-3}}{0-(-4)} = 1.25 \times 10^{-3}\Omega$

$\mu = \left(\dfrac{\Delta V_p}{\Delta V_g}\right)_{I_p = \text{constant}} = \dfrac{150-120}{0-(-4)} = 7.5$

$\therefore\ r_p = \dfrac{\mu}{g_m} = \dfrac{7.5}{1.25\times 10^{-3}} = 6000\ ohms$

38. (d) The dynamic plate resistance is $r_p = \dfrac{\Delta V_p}{\Delta i_p}$

Now for a vacuum diode $i_p = KV_p^{3/2} \Rightarrow V_p = \left(\dfrac{i_p}{K}\right)^{2/3}$

$\Rightarrow \dfrac{\Delta V_p}{\Delta i_p} = \dfrac{2}{3\,K^{2/3}}\, i_p^{\left(\frac{2}{3}-1\right)}$

$\Rightarrow r_p = (\text{constant}) I_p^{-1/3} \Rightarrow r_p \propto \dfrac{1}{I_p^{1/3}}$

39. (d) $i_p = [0.125\, V_p - 7.5]\times 10^{-3}\ amp$

Differentiating this equation $w.r.t.$ V_p

$\dfrac{\Delta i_p}{\Delta V_p} = 0.125\times 10^{-3}$ or $\dfrac{1}{r_p} = 0.125 \times 10^{-3} \Rightarrow r_p = 8\ k\Omega$

40. (b) $V_{peak} = \sqrt{2}\ \ V_{rms} = \sqrt{2}\times 141.4 = 200\ V$

41. (c) The emission current $i = AT^2 Se^{-\phi/kT}$

For the two surfaces $A_1 = A_2$, $S_1 = S_2$, $T_1 = 800\ K$, $T_2 = 1600\, K, \phi_1 / T_1 = \phi_2 / T_2$

Therefore, $\dfrac{i_2}{i_1} = \left(\dfrac{T_2}{T_1}\right)^2 = (2)^2 = 4 \Rightarrow i_2 = 4i_1 = 4\ mA.$

42. (a) The first data gives value of plate resistance $r_p = \dfrac{\Delta V_p}{\Delta i_p} = \dfrac{10}{0.8\times 10^{-3}} = \dfrac{10^5}{8}\Omega$

Also $g_m = \dfrac{\Delta i_p}{\Delta V_g}$ and $g_m = \dfrac{\mu}{r_p}$

$$\Rightarrow \Delta V_g = \frac{\Delta i_p \times r_p}{\mu} = \frac{4\times10^{-3}\times10^5/8}{8} = 6.25\ V$$

43. (a) $I_p = 0.004\,(V_p + 10V_g)^{3/2}$

$$\Rightarrow \frac{\Delta I_p}{\Delta V_g} = 0.004\left[\frac{3}{2}(V_p+10V_g)^{1/2}\times 10\right]$$

$$\Rightarrow g_m = 0.004\times\frac{3}{2}(120+10\times -2)^{1/2}\times 10$$

$$\Rightarrow g_m = 6\times10^{-4}\,mho = 0.6\,m\,mho$$

Comparing the given equation of I_p with standard equation $I_p = K(V_p+\mu V_g)^{3/2}$ we get $\mu = 10$

Also from $\mu = r_p \times g_m \Rightarrow r_p = \frac{\mu}{g_m} = \frac{10}{0.6\times10^{-3}}$

$$\Rightarrow r_p = 16.67\times10^3\Omega = 16.67\,k\Omega.$$

44. (b) $\mu = r_P \times g_m = 20\times2.5 = 50$

From $A = \frac{\mu R_L}{r_P + R_L} \Rightarrow r_P + R_L = \frac{\mu R_L}{A} = \frac{50R_L}{10} = 5R_L$

$$\Rightarrow 4R_L = r_p \Rightarrow R_L = \frac{r_p}{4} = \frac{20}{4} = 5k\Omega$$

45. (a) $A = \frac{\mu R_L}{r_p + R_L} = \frac{14\times12}{10+12} = \frac{84}{11}$. Peak value of output signal

$$V_0 = \frac{84}{11}\times2\sqrt{2}V \Rightarrow V_{rms} = \frac{V_0}{\sqrt{2}} = \frac{84\times2}{11}V$$

$\Rightarrow$ *r.m.s.* value of current through the load

$$= \frac{84\times2}{11\times12\times10^3}A = 1.27\,mA$$

46. (c) $r_p = \frac{\mu}{g_m} = \frac{64}{1600\times10^{-6}} = 4\times10^4\Omega$

Voltage gain $A_v = \frac{\mu}{1+\frac{r_p}{R_L}} = \frac{64}{1+\frac{4\times10^4}{40\times10^3}} = 32$

$\therefore$ Output signal voltage

$$V_0 = A_v \times V_i = 32\times1 = 32\,V(r.m.s.)$$

Signal power in load $= \frac{V_0^2}{R_L} = \frac{(32)^2}{40\times10^3} = 25.6\,mW$

47. (a) $i_p = k(V_p+\mu V_g)^{3/2}mA$

$\Rightarrow 4 = k(200 - 10\times4)^{3/2} = k\times(160)^{3/2}$ ....(i)

and $i_p = k(160-10\times7)^{3/2} = k\times(90)^{3/2}$ ....(ii)

From equation (i) and (ii) we get

$$i_p = 4\times\left(\frac{90}{160}\right)^{3/2} = 4\times\left(\frac{3}{4}\right)^3 = 1.69\,mA$$

48. (a) At $V_g = -3V, V_p = 300\ V$ and $I_p = 5mA$

At $V_g = -1V$, for constant plate current *i.e.* $I_p = 5mA$

From $I_p = 0.125\,V_p - 7.5$

$$\Rightarrow 5 = 0.125V_p - 7.5 \Rightarrow V_p = 100V$$

$\therefore$ change in plate voltage $\Delta V_p = 300 - 100 = 200V$

Change in grid voltage $\Delta V_g = -1-(-3) = 2V$

So, $\mu = \frac{\Delta V_p}{\Delta V_g} = \frac{200}{2} = 100$

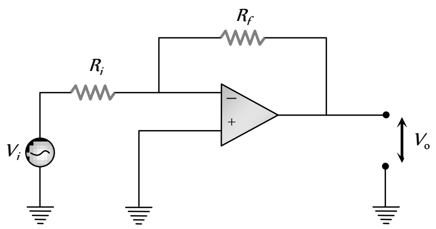
49. (b) The slope of anode characteristic curve $= \frac{1}{r_p}$

$$\Rightarrow r_p = \frac{1}{0.02\,mA/V} = 50\frac{V}{mA} = 50\times10^3\frac{V}{A}$$

The slope of mutual characteristic curve = g_m = 1×10^{-3} *A/V*.

$\therefore \mu = r_p\times g_m = 50\times10^3\times10^{-3} = 50$.

50. (b) Voltage gain $A = \frac{V_o}{V_i} = \frac{R_f}{R_i} = \frac{100\,k\Omega}{1\,k\Omega} = 100$.



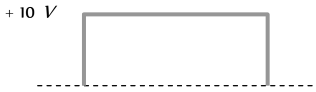
Graphical Questions

1. (c) With rise in temperature, resistivity of semiconductors decreases exponentially.

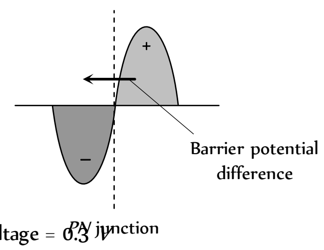
2. (b) Potential across the *PN* junction varies symmetrically linear, having *P* side negative and *N* side positive.

3. (c) *PN* junction has low resistance in one direction of potential difference $+V$, so a large current flows (forward biasing). It has a high resistance in the opposite potential difference direction $-V$, so a very small current flows (Reverse biasing).

4. (c) When input voltage is − 10 *V*, the diode is reverse biased and no output is obtained. On the other hand, when input is +10 *V*, the diode is forward biased and output is obtained which is +10 *V*. Therefore the output is of the form as show in the following figure.



5. (a) In the depletion layer of *PN* junction, stationary, positive ions exists in the *N*-side and stationary negative ions exists in the *P* side.



6. (b) V_k = knee voltage = 0.3 *V*

$\therefore$ Resistance $= \frac{\Delta V}{\Delta i} = \frac{(2.3-0.3)}{(10-0)\times10^{-3}} = 200\Omega = 0.2k\Omega$

7. (b) Half wave rectifier, rectifies only the half cycle of input ac signal and it blocks the other half.

8. (c) As *RC* time constant of the capacitor is quite large ($\tau = RC = 10 \times 10^3 \times 10 \times 10^{-6} = 0.1\,sec$), if will not discharge appreciably. Hence voltage remains nearly constant.

9. (b) In the positive half cycle of input *ac* signal diode D_1 is forward biased and D_2 is reverse biased so in the output voltage signal, *A* and *C* are due to D_1. In negative half cycle of Input *ac* signal D_2 conducts, hence output signals *B* and *D* are due to D_2.

10. (a) If *i* is the current in the diode and *V* is voltage drop across it, then for given figure voltage equation is

$$i \times 100 + V = 8 \Rightarrow i = -\frac{1}{100}V + \frac{8}{100} \Rightarrow i = -(0.01)V + 0.08$$

Thus the slope of *i-V* graph $= \frac{1}{R_L} = 0.01$

11. (b) The current at 2 *V* is 400 *mA* and at 2.1 *V* it is 800 *mA*. The dynamic resistance in this region

$$R = \frac{\Delta V}{\Delta i} = \frac{(2.1 - 2)}{(800 - 400) \times 10^{-3}} = \frac{1}{4} = 0.25\Omega$$

12. (a) From the given waveforms, the following truth table can be made

Time interval	Inputs		Output
	A	*B*	*Y*
$0 \to T_1$	0	0	0
$T_1 \to T_2$	0	1	0
$T_2 \to T_3$	1	0	0
$T_3 \to T_4$	1	1	1

This truth table is equivalent to 'AND' gate.

13. (d) 5 *volt* is low signal (0) and 10 *volt* is high signal (1) and taking 5 *μ-sec* as 1 unit. In a negative logic, low signal (0) gives high output (1) and high signal (1) gives low output (0). The output is therefore 1010010111.

14. (a) $g_m = \frac{\Delta i_p}{\Delta V_g} = \frac{(20 - 15) \times 10^{-3}}{(4 - 2)} = 2.5\,millimho$

15. (d) The cut off grid voltage is that negative grid bias corresponding to which the plate current becomes zero. At point *P*, $i_p = 0$

16. (a) According to Richardson-Dushman equation $J = AT^2 e^{-b/T}$

Taking log of this equation $\log_e \frac{J}{T^2} = \log_e A - \frac{b}{T}$

i.e. graph between $\log_e \frac{J}{T^2}$ and $\frac{1}{T}$ will be a straight line having negative slope and positive intercept ($\log_e A$) on $\log_e \frac{J}{T^2}$ axis.

17. (c) $J = AT^2 e^{-b/T} \Rightarrow \frac{J}{T^2} \propto e^{-b/T}$

i.e. $\frac{J}{T^2}$ will vary exponentially with $\frac{1}{T}$, having negative slope.

18. (c) This is the graph between i_p and V_p and i_p becomes zero at certain negative potential.

19. (a) $\mu = -\left(\frac{\Delta V_p}{\Delta V_g}\right)_{\Delta i_p = \text{const.}} = \frac{-(80 - 60)}{[-6 - (-4)]} = \frac{20}{2} = 10$

20. (c) According to $|A_v| = \frac{\mu}{1 + \frac{r_p}{R_L}}$

as R_L increases A_v also increases. When R_L becomes too high then A_v = maximum = μ

Hence only option (*c*) is correct.

21. (c) With rise in temperature, work function decreases (non-linearly).

22. (c) $R_p = \frac{V_p}{i_p} = \frac{50}{150 \times 10^{-3}} = 333.3\,\Omega$

23. (a) $i \propto T^2 \Rightarrow \frac{i}{i_0} = \left(\frac{T}{T_0}\right)^2$

This is the equation of a parabola.

24. (b) The band width is defined as the frequency band in which the amplifier gain remains above $\frac{1}{\sqrt{2}} = 0.707$ of the mid frequency gain (A_{max}). The low frequency f_1 at which the gain falls to $\frac{1}{\sqrt{2}}$ *i.e.* 0-.707 times it's mid frequency value is called lower cut off frequency and the high frequency f_4 at which the gain falls to $\frac{1}{\sqrt{2}}$ *i.e.* 0.707 times of it's mid frequency is known as higher cut off frequency so band width = $f_4 - f_1$.

25. (c) r_p varies with i_p according to relation $r_p \propto i_p^{-1/3}$ *i.e.* when i_p increases, r_p decreases, hence graph *C* represents the variation of r_p.

μ doesn't depends upon i_p, hence graph *A* is correct.

26. (c) From the graph it is clear that of for $V_g = -4V, i_p = 0,$ so cut off voltage is – 4 *volt*.

27. (b) As temperature increases saturation current also increases.

28. (c)

29. (a) Output signal voltage has phase difference of 180° with respect to input.

30. (d) Grid is maintained between 0 *volt* to certain negative voltage.

Assertion and Reason

1. (d) In diode the output is in same phase with the input therefore it cannot be used to built NOT gate.

2. (a) According to law of mass action, $n_i^2 = n_e n_h$. In intrinsic semiconductors $n_i = n_e = n_h$ and for *P*-type semiconductor n_e would be less than n_i, since n_h is necessarily more than n_i.

3. (c) In common emitter transistor amplifier current gain $\beta > 1,$ so output current > Input current, hence assertion is correct.

Also, input circuit has low resistance due to forward biasing to emitter base junction, hence reason is false.

4. (a) Input impedance of common emitter configuration

$$= \left.\frac{\Delta V_{BE}}{\Delta i_B}\right|_{V_{CE} = \text{constant}}$$

where ΔV_{BE} = voltage across base and emitter (base emitter region is forward biased)

Δi_B = base current which is order of few microampere.

Thus input impedance of common emitter is low.

5. (d) Resistivity of semiconductors decreases with temperature. The atoms of a semiconductor vibrate with larger amplitudes at higher temperatures there by increasing it's conductivity not resistivity.

6. (a) In semiconductors the energy gap between conduction band and valence band is small ($\approx$ 1 *eV*). Due to temperature rise, electron in the valence band gained thermal energy and may jump across the small energy gap, goes in to the conduction band. Thus conductivity increases and hence resistance decreases.

7. (b)

8. (a) The ratio of the velocity to the applied field is called the mobility. Since electron is lighter than holes, they move faster in applied field than holes.

9. (b)

Intrinsic semiconductor	+	Pentalvalent impurity	→	*N*-type semiconductor
(Neutral)		(Neutral)		(Neutral)

10. (a) At a particular temperature all the bonds of crystalline solids breaks and show sharp melting point.

11. (c) The energy gap for germanium is less $(0.72 eV)$ than the energy gap of silicon $(1.1 eV)$. Therefore, silicon is preferred over germanium for making semiconductor devices.

12. (e) We cannot measure the potential barrier of a *PN*-junction by connecting a sensitive voltmeter across its terminals because in the depletion region, there are no free electrons and holes and in the absence of forward biasing, *PN*- junction offers infinite resistance.

13. (e) The assertion is not true. In fact, semiconductor Obeys Ohm's law for low values of electric field (~ 10^6 *V/m*). Above this, the current becomes almost independent of electric field.

14. (d) Two *PN*-junctions placed back to back cannot work as *NPN* transistor because in transistor the width and concentration of doping of *P*-semiconductor is less as compared to width doping of *N*-type semiconductor type.

15. (b) Common emitter is prepared over common base because all the current, voltage and power gain of common emitter amplifier is much more than the gains of common base amplifier.

16. (d) In *PN*-junction, the diffusion of majority carriers takes place when junction is forward biased and drifting of minority carriers takes place across the function, when reverse biased. The reverse bias opposes the majority carriers but makes the minority carriers to cross the *PN*-junction. Thus the small current in μA flows during reverse bias.

17. (d) A transistor is a current operating device because the action of transistor is controlled by the charge carriers (electrons or holes). Base current is very much lesser than the collector current.

18. (a) These gates are called digital building blocks because using these gates only (either NAND or NOR) we can compile all other gates also (like OR, AND, NOT, XOR).

19. (d) At 0*K*, Germanium offers infinite resistance, and it behaves as an insulator.

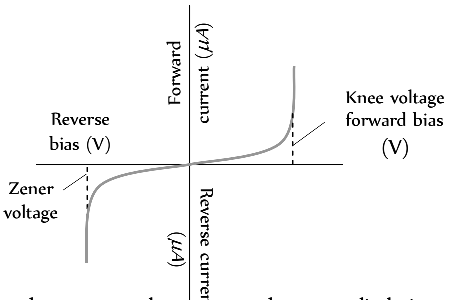
20. (a) In a transistor, the base is made extremely thin to reduce the combinations of holes and electrons. Under this condition, most of the holes (or electrons) arriving from the emitter diffuses across the base and reach the collector. Hence, the collector current, is almost equal to the emitter current, the base current being comparatively much smaller. This is the main reason that power gain and voltage gain are obtained by a transistor. If the base region was made quite thick, then majority of carriers from emitter will combine with the carriers in the base and only small number of carriers will reach the collector, so there would be little collector current and the purpose of transistor would be defeated.

21. (c) The current gain in common base circuit $\alpha = \left(\frac{\Delta I_C}{\Delta I_E}\right)_{V_C}$

The change in collector current is always less than the change in emitter current.

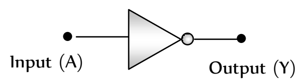
$\Delta I_C < \Delta I_E$. Therefore, $\alpha < 1$.

22. (d) The *V-i* characteristic of *PN*- diode depends whether the junction is forward biased or reverse biased. This can be showed by graph between voltage and current.



23. (a) When the reverse voltage across the zener diode is equal to or more than the breakdown voltage, the reverse current increases sharply.

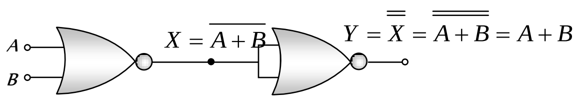
24. (a)



If A = 0, Y = 1 and A = 1, Y = 0.

25. (b) In vacuum tubes, vacuum is necessary and the working of semiconductor devices is independent of heating or vacuum.

26. (a)



This is the Boolean expression for 'OR' gate.

27. (a) For detection of a particular wavelength (λ) by a *PN* photo diode, energy of incident light > $E_g \Rightarrow \frac{hc}{E_g} > \lambda$

For $E_g = 2.8\, eV, \frac{hc}{E_g} = \frac{6.6 \times 10^{-34} \times 3 \times 10^8}{2.8 \times 1.6 \times 10^{-19}} = 441.9\, nm$

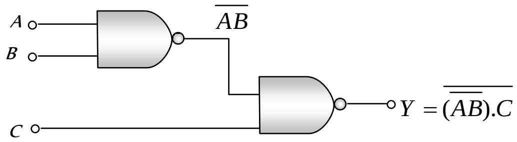
i.e. $\frac{hc}{E_g} < 6000\, nm$, so diode will not detect the wavelength of 6000Å.

28. (a)

29. (b) In forward biasing of *PN* junction current flows due to diffusion of majority charge carriers. While in reverse biasing current flows due to drifting of minority charge carriers.

The circuit given in the reason is a *PNP* transistor having emitter is more negative *w.r.t.* base so it is reverse biased and collector is more positive *w.r.t.* base so it is forward biased.

30. (c) Assertion is true but reason is false



If $A = 1$, $B = 0$, $C = 1$ then $Y = 0$

31. (b) Both assertion and reason are true but potential difference across the resistance is zero, because diode is in reverse biasing hence no current flows.

Electronics

SET Self Evaluation Test - 27

1. In a pure silicon ($n_i = 10^{16}/m^3$) crystal at 300 *K*, 10^{21} atoms of phosphorus are added per cubic meter. The new hole concentration will be

(a) 10^{21} per m^3 (b) 10^{19} per m^3

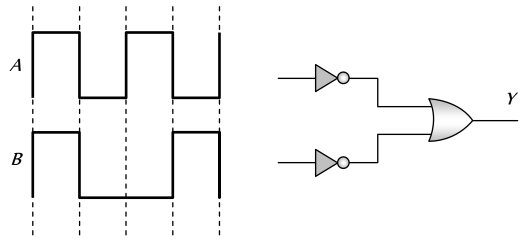
(c) 10^{11} per m^3 (d) 10^{5} per m^3

2. In the Boolean algebra $\overline{(\overline{A}\cdot\overline{B})}\cdot A$ equals to

(a) $\overline{A+B}$ (b) A

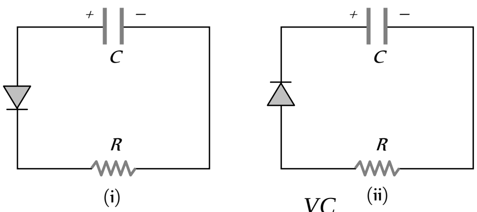
(c) $\overline{A\cdot B}$ (d) $A + B$

3. In a given circuit as shown the two input waveform *A* and *B* are applied simultaneously. The resultant waveform *Y* is



(a)  (b) 

(c)  (d) 
4. Two identical capacitors *A* and *B* are charged to the same potential *V* and are connected in two circuits at $t = 0$, as shown in figure. The charge on the capacitors at time $t = CR$ are respectively



(a) *VC*, *VC* (b) $\frac{VC}{e}$, *VC*

(c) *VC*, $\frac{VC}{e}$ (d) $\frac{VC}{e}, \frac{VC}{e}$

5. In transistor, forward bias is always smaller than the reverse bias. The correct reason is

(a) To avoid excessive heating of transistor

(b) To maintain a constant base current

(c) To produce large voltage gain

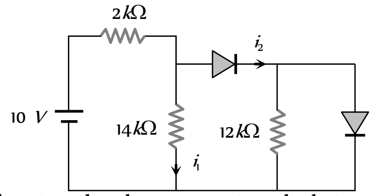
(d) None of these

6. In *NPN* transistor, if doping in base region is increased then collector current

(a) Increases (b) Decreases

(c) Remain same (d) None of these

7. In the following circuit I_1 and I_2 are respectively



(a) 0, 0

(b) 5 *mA*, 5 *mA*

(c) 5 *mA*, 0

(d) 0, 5 *mA*

8. In space charge limited region, the plate current in a diode is 10 *mA* for plate voltage 150 *V*. If the plate voltage is increased to 600 *V*, then the plate current will be

(a) 10 *mA* (b) 40 *mA*

(c) 80 *mA* (d) 160 *mA*

9. A triode has a plate resistance of 10 *k*Ω and amplification factor 24. If the input signal voltage is 0.4 *V* (*r.m.s.*), and the load resistance is 10 *k ohm*, then, the output voltage (*r.m.s.*) is

(a) 4.8 *V* (b) 9.6 *V*

(c) 12.0 *V* (d) None of these

10. Pure sodium (*Na*) is a good conductor of electricity because the 3*s* and 3*p* atomic bands overlap to form a partially filled conduction band. By contrast the ionic sodium chloride (*NaCl*) crystal is

(a) Insulator (b) Conductor

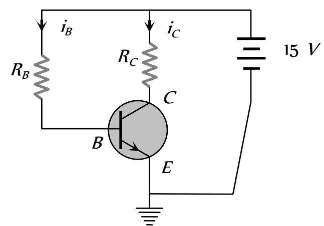
(c) Semiconductor (d) None of these

11. Would there be any advantage to adding *n*-type or *p*-type impurities to copper

(a) Yes (b) No

(c) May be (d) Information is insufficient

12. In the following common emitter circuit if $\beta = 100$, $V_{CE} = 7V$, V_{BE} = Negligible $R_C = 2\ k\Omega$ then $I_B = ?$



(a) 0.01 *mA*

(b) 0.04 *mA*

(c) 0.02 *mA*

(d) 0.03 *mA*

13. When a battery is connected to a *P*-type semiconductor with a metallic wire, the current in the semiconductor (predominantly), inside the metallic wire and that inside the battery respectively due to

(a) Holes, electrons, ions (b) Holes, ions, electrons

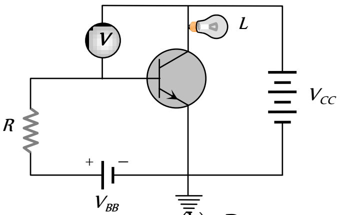
(c) Electrons, ions, holes (d) Ions, electrons, holes

14. Is the ionisation energy of an isolated free atom different from the ionisation energy E_g for the atoms in a crystalline lattice

(a) Yes (b) No

(c) May be (d) None of these

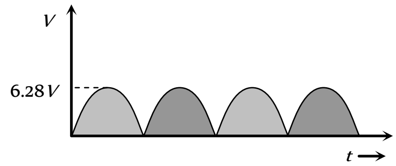
15. In the following circuit, a voltmeter V is connected across a lamp L. What change would occur in voltmeter reading if the resistance R is reduced in value



(a) Increases (b) Decreases

(c) Remains same (d) None of these

16. For given electric voltage signal dc value is



(a) 6.28 V (b) 3.14 V

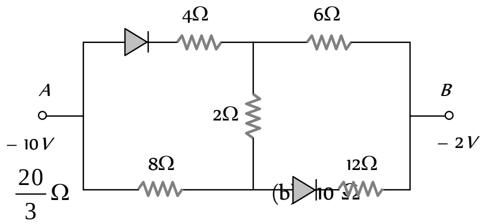
(c) 4 V (d) 0 V

17. When a silicon PN junction is in forward biased condition with series resistance, it has knee voltage of 0.6 V. Current flow in it is 5 mA, when PN junction is connected with 2.6 V battery, the value of series resistance is

(a) 100 Ω (b) 200 Ω

(c) 400 Ω (d) 500 Ω

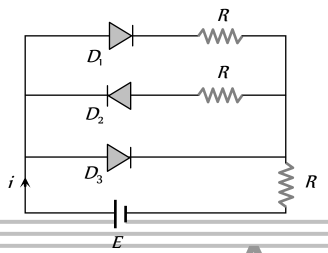
18. In the following circuit the equivalent resistance between A and B is



(a) $\frac{20}{3}\Omega$ (b) 10 Ω

(c) 16 Ω (d) 20 Ω

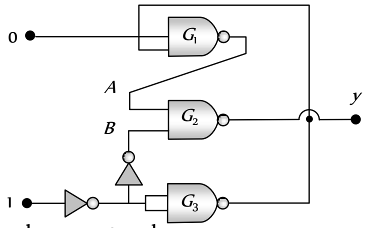
19. In the following circuit of PN junction diodes D_1, D_2 and D_3 are ideal then i is



(a) E/R (b) $E/2R$

(c) $2E/3R$ (d) Zero

20. In circuit in following fig. the value of Y is



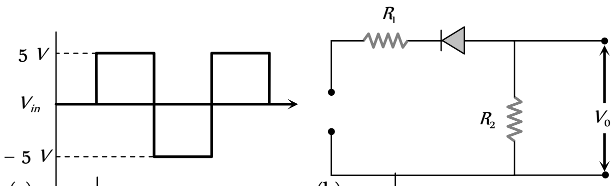
(a) 0

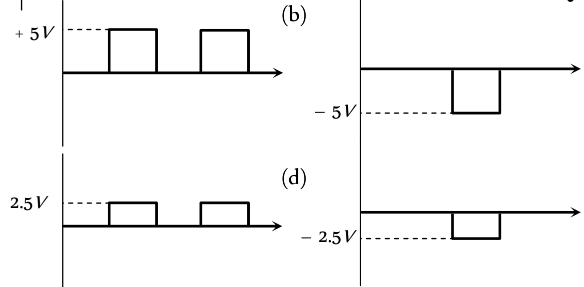
(b) 1

(c) Fluctuates between 0 and 1

(d) Indeterminate as the circuit can't be realised

21. A waveform shown when applied to the following circuit will produce which of the following output waveform. Assuming ideal diode configuration and $R_1 = R_2$





22. In a triode, cathode, grid and plate are at 0, – 2 and 80 V respectively. The electrons is emitted from the cathode with energy 3 eV. The energy of the electron reaching the plate is

(a) 77 eV (b) 85 eV

(c) 81 eV (d) 83 eV

23. The energy gap of silicon is 1.5 eV. At what wavelength the silicon will stop to absorb the photon

(a) 8250 Å (b) 7250 Å

(c) 6875.5 Å (d) 5000 Å

AS Answers and Solutions

(SET -27)

1. (c) By using mass action law $n_i^2 = n_e n_h$

$$\Rightarrow n_h = \frac{n_i^2}{n_e} = \frac{(10^{16})^2}{10^{21}} = 10^{11}\ per\ m^3$$

2. (b) $(\overline{\overline{A} \cdot \overline{B}}) \cdot A = (\overline{\overline{A}} + \overline{\overline{B}}) \cdot A = (A + B) \cdot A$

$= A \cdot A + AB = A + AB = A(1 + B) = A$

3. (a) (1 = high, 0 = low)

Input to A is in the sequence, 1,0,1,0.

Input to B is in the sequence, 1, 0, 0, 1.

Sequence is inverted by NOT gate.

Thus inputs to OR gate becomes 0, 1, 0, 1 and output of OR gate becomes 0, 1, 1, 1

Since for OR gate 0 + 1 = 1. Hence choice (a) is correct.

4. (b) Time $t = CR$ is known as time constant. It is time in which charge on the capacitor decreases to $\frac{1}{e}$ times of it's initial charge (steady state charge).

In figure (i) PN junction diode is in forward bias, so current will flow the circuit *i.e.*, charge on the capacitor decrease and in time t it becomes $Q = \frac{1}{e}(Q_o)$; where $Q_o = CV$

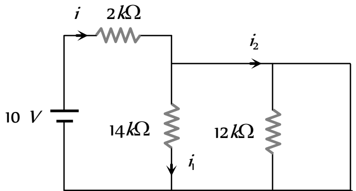
$\Rightarrow Q = \frac{CV}{e}$

In figure (ii) P-N junction diode is in reverse bias, so no current will flow through the circuit hence change on capacitor will not decay and it remains same *i.e.* CV after time t.

5. (a) If forward bias is made large, the majority charge carriers would move from the emitter to the collector through the base with high velocity. This would give rise to excessive heat causing damage to transistor.

6. (b) Number of holes in base region increases hence recombination of electron and hole are also increases in this region. As result base current increases which in turn decreases the collector current.

7. (d) Equivalent circuit can be redrawn as follows



$i = \frac{10}{2} = 5\,mA = i_2$

$i_1 = 0$

8. (c) In space charge limited region, the plate current is given by Child's law $i_p = KV_p^{3/2}$

Thus, $\frac{i_{p_2}}{i_{p_1}} = \left(\frac{V_{p_2}}{V_{p_1}}\right)^{3/2} = \left(\frac{600}{150}\right)^{3/2} = (4)^{3/2} = 8$

or $i_{p_2} = i_{p_1} \times 8 = 10 \times 8\ mA = 80\ mA$.

9. (a) Use $V_0 = AV_s$

Now $A = \frac{24 \times 10k}{10k + 10k} = \frac{24 \times 10}{20} = 12$

Therefore, $V_0 = 12 \times 0.4 = 4.8\,volt(r.m.s.)$

10. (a) In sodium chloride the Na^+ and Cl^- ions both have noble gas electron configuration corresponding to completely filled bands. Since the bands do not overlap, there must be a gap between the filled bands and the empty bands above them, so $NaCl$ is an insulator.

11. (b) Pure Cu is already an excellent conductor, since it has a partially filled conduction band, furthermore, Cu forms a metallic crystal as opposed to the covalent crystals of silicon or germanium, so the scheme of using an impurity to donate or accept an electron does not work for copper. In fact adding impurities to copper decreases the conductivity because an impurity tends to scatter electrons, impeding the flow of current.

12. (b) $V = V_{CE} + I_C R_L$

$\Rightarrow 15 = 7 + I_c \times 2 \times 10^3 \Rightarrow i_c = 4\ mA$

$\because\ \beta = \frac{i_C}{i_B} \Rightarrow i_B = \frac{4}{100} = 0.04\,mA$

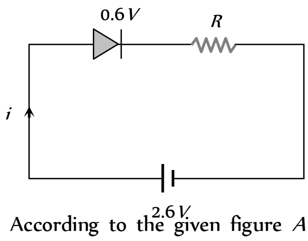
13. (a) Charge carriers inside the P-type semiconductor are holes (mainly). Inside the conductor charge carriers are electrons and for cell ions are the charge carriers.

14. (a) The ionisation energy of an isolated atom is different from it's value in crystalline lattice, because in the latter case each bound electron is influenced by many atoms in the periodic crystalline lattice.

15. (a) Here the emitter base junction of N-P-N transistor is forward biased with battery V_{BB} through resistance R. When the value of R is reduced, then the emitter current i_e will increase. As a result the collector current will also increase. ($i_c = i_e - i_b$). Due to increase in i_c, the potential difference across L increases and hence the reading of voltmeter will increases.

16. (c) $V_{dc} = V_{ac} = \frac{2V_0}{\pi} = \frac{2 \times 6.28}{3.14} = 4V.$

17. (c)

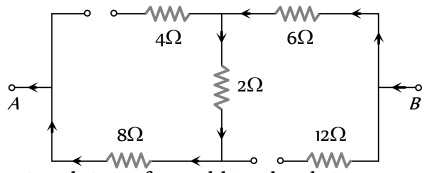


$R = \frac{(2.6 - 0.6)}{5 \times 10^{-3}} = 400\ \Omega.$

18. (c) According to the given figure A is at lower potential *w.r.t.* B. Hence both diodes are in reverse biasing, so equivalent, circuit can be redrawn as follows.

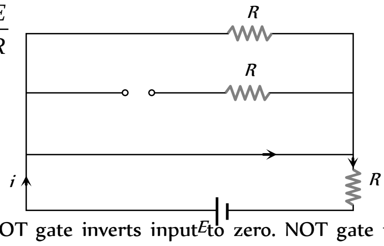
$\Rightarrow$ Equivalent resistance between A and B

$R = 8 + 2 + 6 = 16\ \Omega.$



19. (a) Diodes D_1 and D_3 are forward biased and D_2 is reverse biased so the circuit can be redrawn as follows.

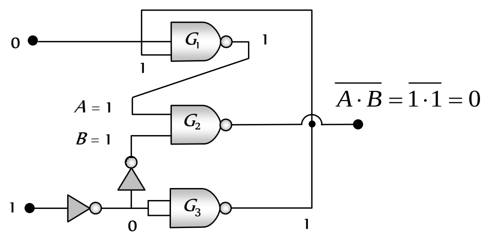
$\Rightarrow i = \frac{E}{R}$



20. (a) Lower NOT gate inverts input to zero. NOT gate from NAND gate inverts this output to 1 upper NAND gate converts this input 1 and input 0 to 1.

Thus $A = 1$ and $B = 1$ become inputs of NAND gate giving final output as zero. Choice A is correct.

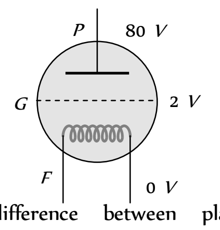
***



21. (d) The *P-N* junction will conduct only when it is forward biased *i.e.* when $-5V$ is fed to it, so it will conduct only for 3rd quarter part of signal shown and when it conducts potential drop 5 *volt* will be across both the resistors, so output voltage across R is 2.5 *V*.

$\therefore V_0 = -2.5\ V$

22. (d) There is a loss of kinetic energy of 2 *eV* from filament to grid. The energy of the electron after passing through the grid will be 3 – 2 = 1 *eV*



The potential difference between plate and grid is $80-(-2)=82V$. The electron will gain energy 82 *eV* from the grid to the plate. The energy of electron reaching the plate = 1 + 82 = 83 *eV*

23. (a) $\lambda = \frac{hc}{E} = \frac{6.6\times10^{-34}\times3\times10^{8}}{1.5\times1.6\times10^{-19}} = 8.25\times10^{-7}m = 8250Å$

The photon having wavelength equal to 8250Å or more than this will not able to overcome the energy gap of silicon.

Chapter 28
Communication

The term communication refers to the transmitting, receiving and processing of information by electronic means.

Basic Communication System

A basic communication system consists of an information source, a transmitter, a link and a receiver.

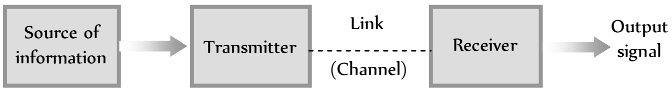


Fig. 28.1

(1) **Information :** The idea/message that is to be conveyed is information. The message may be individual one or a set of messages. The message may be a symbol, code, group of words or any pre decided unit.

(2) **Transmitter :** In radio transmission, the transmitter consists of a transducer, modulator, amplifier and transmitting anteena.

Transducer : Converts sound signals into electric signal.

Modulator : Mixing of audio electric signal with high frequency radio wave.

Amplifier : Boosting the power of modulated signal.

Anteena : Signal is radiated in the space with the aid of an anteena.

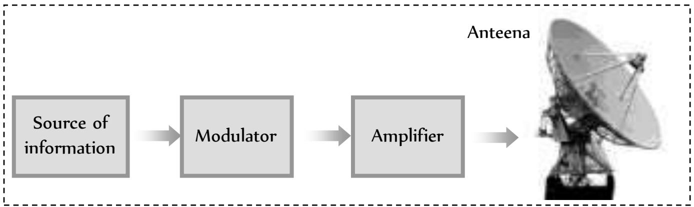

Fig. 28.2 : Transmitter

(3) **Communication channel :** The function of communication channel is to carry the modulated signal from transmitter to receiver. The communication channel is also called transmission medium or link.

The term channel refers to the frequency range allocated to a particular service or transmission.

Table 28.1 : Different channels

Type of communication	Channels or links
Radio communication	Free space
Telephony and Telegraphy communication	Transmission line
Optical communication	Optical fibre

(4) **Receiver :** The receiver consists of

Pickup anteena : To pick the signal

Demodulator : To separate out the audio signal from the modulated signal

Amplifier : To boost up the weak audio signal

Transducer : To convert back audio signal in the form of electrical pulses into sound waves.

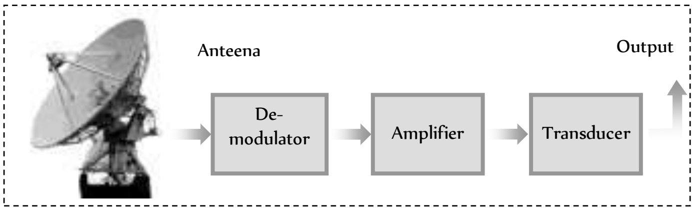

Fig. 28.3 : Receiver

Types of Communication System

Communication systems can be classified according to the nature of information or mode of transmission or types of transmission channel.

(1) **According to the nature of information source**

(i) Speech transmission

(ii) Picture transmission

(iii) **Facsimile transmission (FAX) :** This involves exact reproduction of a document or picture which are static.

(2) **According to the mode of transmission**

(i) **Analog communication :** The communication system, which make use of analog signals are called analog communication system.

Table 28.2 : Few analog communication system

System	Specification
Telegraphy	Message in the form of codes are sent.
Television broadcast	Both sound as well as pictures are sent.
Telephony	It sends voice signal from one place to another by means of wire.
Radar	It means radio detection and ranging. It is used for determining the distance and direction of objects using microwave.
Teleprinting	Message can be typed and telegraphed to distant receivers

(ii) **Digital communication :** In this system digital signals are used.

Table 28.3 : Few digital communication system

System	Specification
Facsimile transmission (FAX)	This involves exact reproduction of a document or picture which are static
Mobile phone	Such telephones are also called cellular phones, because they operate within a network of radio cells.
E-mail	the message sent via a computer network are called e-mail
Tele conferencing	It is a system in which persons sitting at coloured television screens. See and talk to each other via a computer communication network.
Communication satellite	Used to relay radio and television programmers.
Global positioning system (GPS)	It is a navigation system based on a network of earth orbiting satellites. The users can find their positions within an accuracy of 100 *m* by receiving.

(3) **According to the transmission channel**

(i) Line communication (ii) Space communication

(4) **According to the type of modulation**

(i) Amplitude modulation (AM)

(ii) Frequency modulation (FM)

(iii) Phase modulation (PM)

(iv) Pulse amplitude modulation (PAM)

(v) Pulse time modulation (PTM)

(vi) Pulse code modulation (PCM)

Analog and Digital Signals

In communication system, a signal means a time varying electrical signal containing informations.

(1) **Analog signals :** It is a continuous wave form which changes smoothly over time.

(i) Such signals can be easily generated from the source of information by using an appropriate transducer *e.g.* pressure variations in the sound waves can be converted into corresponding current or voltage pulses with the help of a microphone.

(ii) A simple analog signal is represented by a sine wave

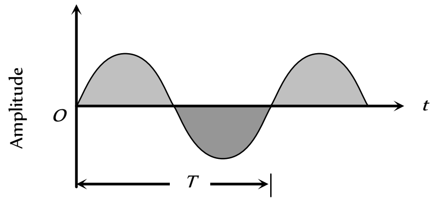

Fig. 28.4

(iii) The frequency of analog signals associated with speed or music varies over a range between 20 *Hz* to 20 *KHz*.

(iv) The range over which the frequencies of a signal vary is called band width.

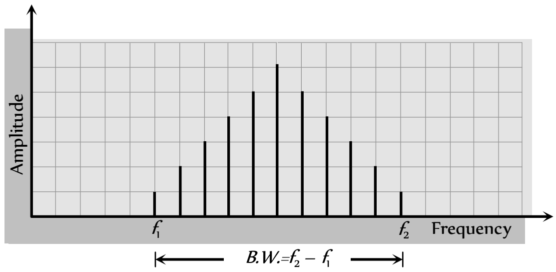

Fig. 28.5

(v) The term base band designates the band of frequencies representing the signal supplied by the source of information.

(vi) A signal consist of two or more waves of different frequencies is known as a complex analog signal.

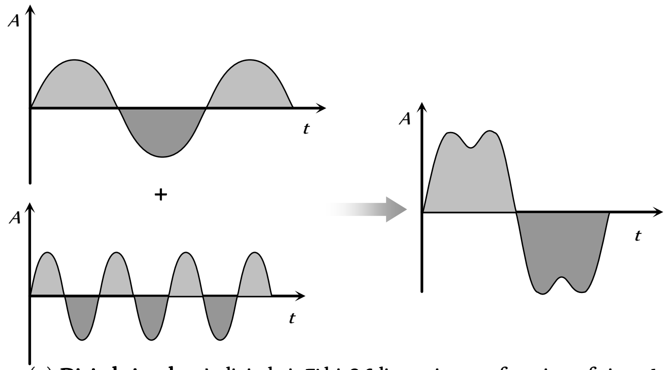

Fig. 28.6

(2) **Digital signals :** A digital signal is a discontinuous function of time. It has only two voltage level *i.e.* either low (0) or high (1).

Either of 0 and 1 is known as bit. A group of bit is called byte.

A byte comprising of 2 bits can give on the four code combination *i.e.* 00, 01, 10 and 11.

The number of code combination increase with number of bits in a byte is given by $N = 2^x$, where x = number of bits in a byte.

The number of binary digits (bits) per second, which describe a digital signal is called it's bit rate. Bit rate is expressed in bits per second (bps).

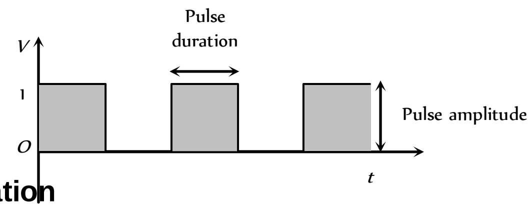

Fig. 28.7

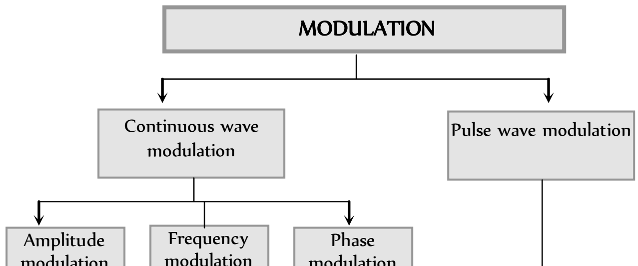
Modulation

(1) Digital and analog signals to be transmitted are usually of low frequency and hence cannot be transmitted as such.

(2) These signals require some carrier to be transported. These carriers are known as carrier waves or high frequency signals.

(3) The process of placement of a low frequency (LF) signal over the high frequency (HF) signal is known as modulation.



(4) **Need for modulation :** The sound wave (20 *Hz* to 20 *KHz*) cannot be transmitted directly from one place to another for the following reasons.

(i) **Height of anteena :** For efficient radiation and reception , the height of transmitting and receiving antennas should be comparable to a quarter of wavelength of the frequency used. For 15 *KHz* it is 5000 *m* (too large) and for 1 *MHz* it is 75 *m*.

The energy radiated from an anteena is practically zero, when the frequency of the signal to be transmitted is below 15 *Hz*.

(ii) **Detecting signals :** All audible signals are in the range of 20 *Hz* to 20 *KHz* so the signals from all sources remains heavily mixed up in air. It will be very difficult to differentiate or detect the broadcast signal at the receiving station.

Thus modulation is necessary for a low frequency signal. When it is to be sent to a distant place so that the information may not die out in the way it self as well as for the proper identification of a signal and to keep the height of anteena small also

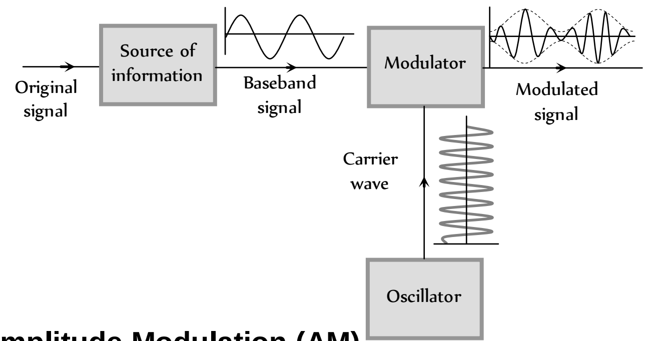


Fig. 28.9

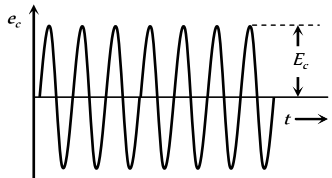
Amplitude Modulation (AM)

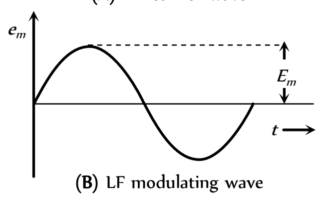
The process of changing the amplitude of a carrier wave in accordance with the amplitude of the audio frequency (AF) signal is known as amplitude modulation (AM).

In AM frequency of the carrier wave remains unchanged.

The amplitude of modulated wave is varied in accordance with the amplitude of modulating wave.



(A) HF carrier wave



(B) LF modulating wave

(1) **Modulation index :** The ratio of change of amplitude of carrier wave to the amplitude of original carrier wave is called the modulation factor or degree of modulation or modulation index (*m*).

$$m_a = \frac{\text{Change in amplitude of carrier wave}}{\text{Amplitude of original carrier wave}} = \frac{kE_m}{E_c}$$

where k = A factor which determines the maximum change in the amplitude for a given amplitude E_m of the modulating signal. If k = 1 then $m_a = \frac{E_m}{E_c} = \frac{E_{max} - E_{min}}{E_{max} + E_{min}}$

If a carrier wave is modulated by several sine waves the total modulated index m_t is given by $m_t = \sqrt{m_1^2 + m_2^2 + m_3^2 + ...}$

(2) **Voltage equation for AM wave :** Suppose voltage equations for carrier wave and modulating wave are $e_c = E_c \cos \omega_c t$ and $e_m = E_m \sin \omega_m t = mE_c \sin \omega_m t$

where e_c = Instantaneous voltage of carrier wave, E_c = Amplitude of carrier wave, $\omega_c = 2\pi f_c =$ Angular velocity at carrier frequency f_c, $e_m =$ Instantaneous voltage of modulating, $E_m =$ Amplitude of modulating wave, $\omega_m = 2\pi f_m =$ Angular velocity of modulating frequency f_m

Voltage equation for AM wave is

$$e = E \sin \omega_c t = (E_c + e_m) \sin \omega_c t = (E_c + e_m \sin \omega_m t) \sin \omega_c t$$

$$= E_c \sin \omega_c t + \frac{m_a E_c}{2} \cos(\omega_c - \omega_m)t - \frac{m_a E_c}{2} \cos(\omega_c + \omega_m)t$$

The above AM wave indicated that the AM wave is equivalent to summation of three sinusoidal wave, one having amplitude E_c and the other two having amplitude $\frac{m_a E_c}{2}$.

(3) **Side band frequencies and band width in AM wave**

(i) **Side band frequencies :** The AM wave contains three frequencies $f_c, (f_c + f_m)$ and $(f_c - f_m)$, f_c is called carrier frequency, $(f_c + f_m)$ and $(f_c - f_m)$ are called side band frequencies.

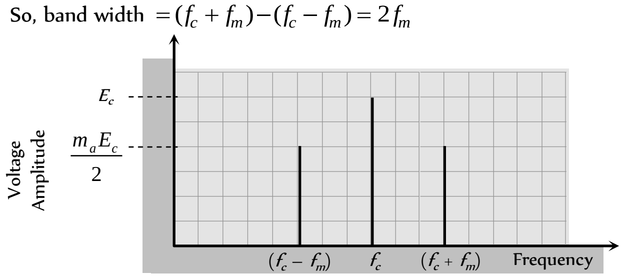
$(f_c + f_m)$: Upper side band (USB) frequency

$(f_c - f_m)$: Lower side band (LSB) frequency

Side band frequencies are generally close to the carrier frequency.

(ii) **Band width :** The two side bands lie on either side of the carrier frequency at equal frequency interval f_m.

So, band width $= (f_c + f_m) - (f_c - f_m) = 2f_m$



(4) **Power in AM waves** : Power dissipated in any circuit $P = \frac{V_{rms}^2}{R}$.

Hence (i) carrier power $P_c = \frac{\left(\frac{E_c}{\sqrt{2}}\right)^2}{R} = \frac{E_c^2}{2R}$

(ii) Total power of side bands $P_{sb} = \frac{\left(\frac{m_a E_c}{2\sqrt{2}}\right)^2}{R} + \frac{\left(\frac{m_a E_c}{2\sqrt{2}}\right)^2}{R} = \frac{m_a^2 E_c^2}{4R}$

(iii) Total power of AM wave $P_{Total} = P_c + P_{sb} = \frac{E_c^2}{2R}\left(1 + \frac{m_a^2}{2}\right)$

(iv) $\frac{P_t}{P_c} = \left(1 + \frac{m_a^2}{2}\right)$ and $\frac{P_{sb}}{P_t} = \frac{m_a^2/2}{\left(1 + \frac{m_a^2}{2}\right)}$

(v) Maximum power in the AM (without distortion) will occur when $m_a = 1$ *i.e.* $P_t = 1.5P = 3P_{sb}$

(vi) If I_c = Unmodulated current and I_t = total or modulated current $\Rightarrow$ $\frac{P_t}{P_c} = \frac{I_t^2}{I_c^2} \Rightarrow \frac{I_t}{I_c} = \sqrt{\left(1 + \frac{m_a^2}{2}\right)}$

(5) **Limitation of amplitude modulation**

(i) Noisy reception (ii) Low efficiency

(iii) Small operating range (iv) Poor audio quality

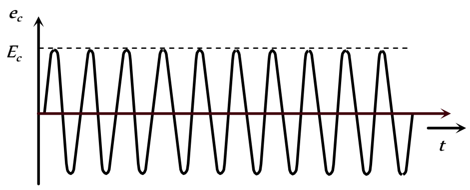
Frequency Modulation (FM)

The process of changing the frequency of a carrier wave in accordance with the audio frequency signal is known as frequency modulation

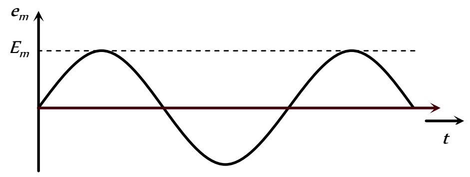
(1) Audio quality of AM transmission is poor. There are need to eliminate amplitude sensitive noise. This is possible if we eliminate amplitude variation. (*i.e.* a need to keep the amplitude of the carrier constant). This is precisely what we do in FM.

(2) In FM the overall amplitude of FM wave remains constant at all times.

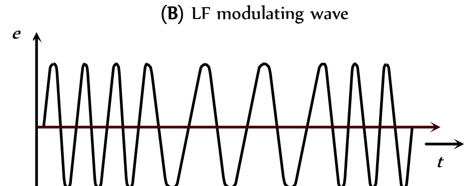
(3) In FM, the total transmitted power remains constant.



(A) HF carrier wave



(B) LF modulating wave



(4) **Frequency deviation :** The maximum change in frequency from mean value (ν) is known as frequency deviation. This is also the change or shift either above or below the frequency ν_c and is called as frequency deviation.

$$\therefore \quad \delta = (f_{\max} - f_c) = f_c - f_{\min} = k_f . \frac{E_m}{2\pi}$$

k_f = Constant of proportionality. It determines the maximum variation in frequency of the modulated wave for a given modulating signal.

(5) **Carrier swing (CS) :** The total variation in frequency from the lowest to the highest is called the carrier swing

i.e. $CS = 2 \times \Delta f$

(6) **Frequency modulation index (*m*) :** The ratio of maximum frequency deviation to the modulating frequency is called modulation index.

$$m_f = \frac{\delta}{f_m} = \frac{f_{\max} - f_c}{f_m} = \frac{f_c - f_{\min}}{f_m} = \frac{k_f E_m}{f_m}$$

(7) **Frequency spectrum :** FM side band modulated signal consist of infinite number of side bands whose frequencies are

$$(f_c \pm f_m), (f_c \pm 2f_m), (f_c \pm 3f_m) ....$$

The number of side bands depends on the modulation index m_f

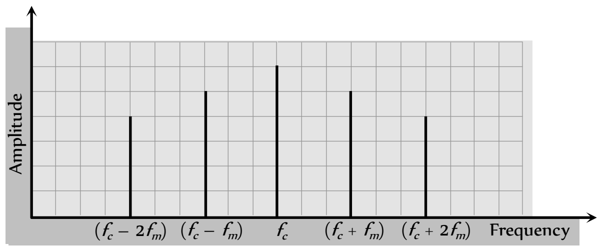


Fig. 28.13

In FM signal, the information (audio signal) is contained in the side bands. Since the side bands are separated from each other by the frequency of modulating signal f_m so

Band width $= 2n \times f_m$; where n = number of significant side band pairs

(8) **Deviation ratio :** The ratio of maximum permitted frequency deviation to the maximum permitted audio frequency is known as deviation ratio. Thus, deviation ratio $= \frac{(\Delta f)_{\max}}{(f_m)_{\max}}$

(9) **Percent modulation :** The ratio of actual frequency deviation to the maximum allowed frequency deviation is defined as percent modulation. Thus, percent modulation, $m = \frac{(\Delta f)_{\text{actual}}}{(\Delta f)_{\max}}$

Table 28.4 : Range of frequency allotted for FM radio/TV broadcast

Type of broadcast	Frequency band
FM radio	88 to 108 *MHz*
UHF TV	47 to 230 *MHz*
UHF TV	470 to 960 *MHz*

Pulse Modulation

Here the carrier wave is in the form of pulses.

(1) **Pulse amplitude modulation (PAM) :** The amplitude of the pulse varies in accordance with the modulating signal.

(2) **Pulse width modulation (PWM) :** The pulse duration varies in accordance with the modulating signal.

(3) **Pulse position modulation (PPM) :** In PPM, the position of the pulses of the carrier wave train is varied in accordance with the instantaneous value of the modulating signal.

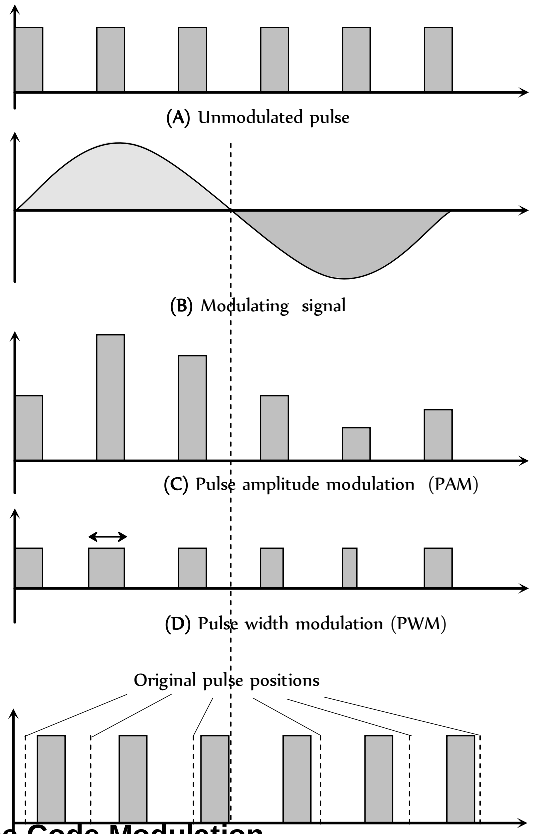

Fig. 28.14

Pulse Code Modulation

The pulse amplitude, pulse width and pulse position modulations are not completely digital.

A completely digital modulation is obtained by pulse code modulation (PCM).

An analog signal is pulse code modulated by following three operation.

(1) **Sampling :** It is the process of generating pulses of zero width and of amplitude equal to the instantaneous amplitude of the analog signal.

The number of samples taken per second is called sampling rate.

(2) **Quantisation :** The process of dividing the maximum amplitude of the analog voltage signal into a fixed number of levels is called quantisation.

e.g. amplitude 5 *V* of the analog voltage signal divides into six. Quantisation level viz 0, 1, 2, 3, 4, 5.

Pulses having amplitude between – 0.5 *V* to 0.5 *V* are approximated (quantised) to a value 0 *V*, amplitude between 0.5 *V* to 1.5 *V* are approximated to a value of 1 *V* and so on.

(3) **Coding :** The process of digitising the quantised pulses according to some code is called coding.

Table 28.5 : Coding

Quantisation level	0	1	2	3	4	5	6	7
Binary code	000	001	010	011	100	101	110	111

For example consider that voltage amplitude of an analog signal varies between 0 and 7 *V*.

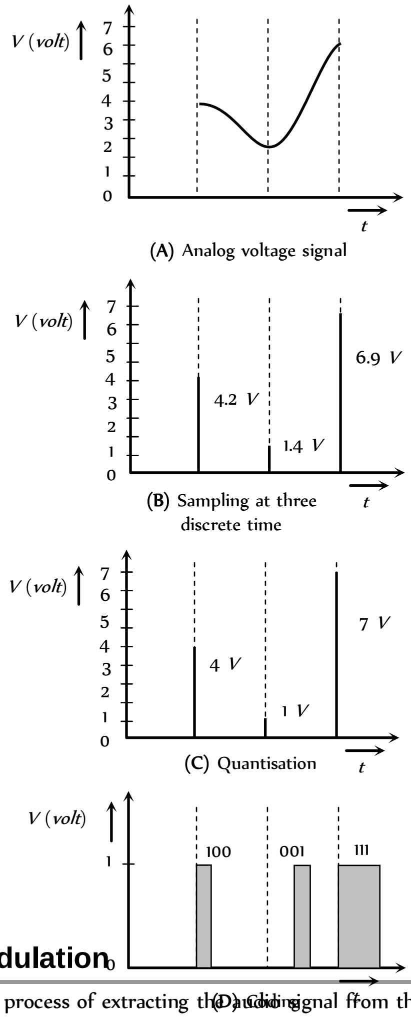

Fig. 28.15

Demodulation

The process of extracting the audio signal from the modulated wave is known as demodulation or detection.

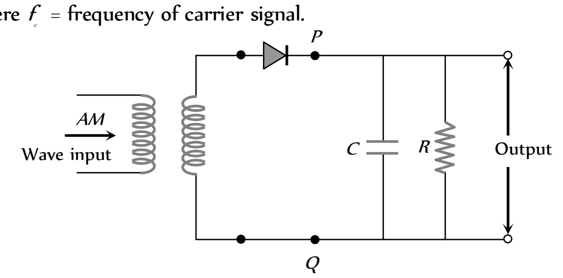
The wireless signals consist of radio frequency (high frequency) carrier wave modulated by audio frequency (low frequency). The diaphragm of a telephone receiver or a loud speaker cannot vibrate with high frequency. So it is necessary to separate the audio frequencies from the radio frequency carrier wave.

Simple demodulator circuit : A diode can be used to detect or demodulate an amplitude modulated (AM) wave. A diode basically acts as a rectifier *i.e.* it reduces the modulated carrier wave into positive envelope only.

The AM wave input is shown in figure. It appears at the output of the diode across *PQ* as a rectified wave (since a diode conducts only in the positive half cycle). This rectified wave after passing through the *RC* network does not contain the radio frequency carrier component. Instead, it has only the envelope of the modulated wave.

In the actual circuit the value of RC is chosen such that $\frac{1}{f_c} << RC$;

where f_c = frequency of carrier signal.



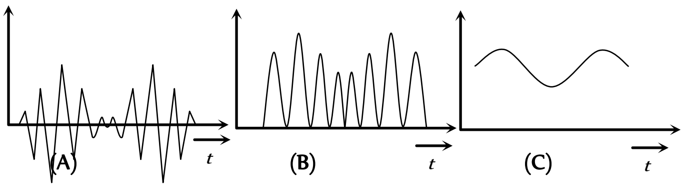


Fig. 28.16

Data Transmission and Retrieval

The term data is applied to a representation of facts, concepts or instructions suitable for communication, interpretation or processing by human beings or by automatic means. Data in most cases consists of pulse type of signals.

The pulse code modulated (PCM) signal is a series of 1's and 0's. The following three modulation techniques are used to transmit a PCM signal.

(1) **Amplitude shift keying (ASK) :** Two different amplitudes of the carrier represent the two binary values of the PCM signal. This method is also known as on-off keying (OOK)

1 : Presence of carrier of same constant amplitude.

0 : Carrier of zero amplitude.

(2) **Frequency shift keying (FSK) :** The binary values of the PCM signal are represented by two frequencies.

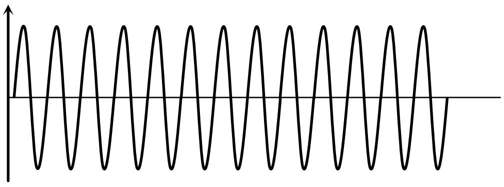
1 : Increase in frequency

0 : Frequency unaffected

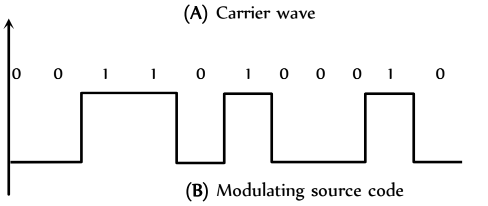
(3) **Phase shift keying (PSK) :** The phase of the carrier wave is changed in accordance with modulating data signal.

1 : Phase changed by π

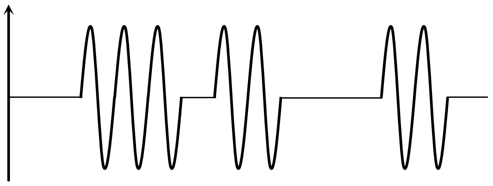
0 : Phase remains unchanged.



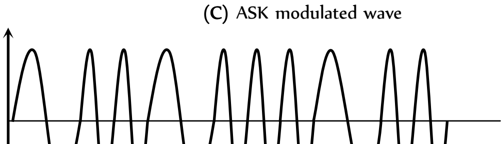
(A) Carrier wave



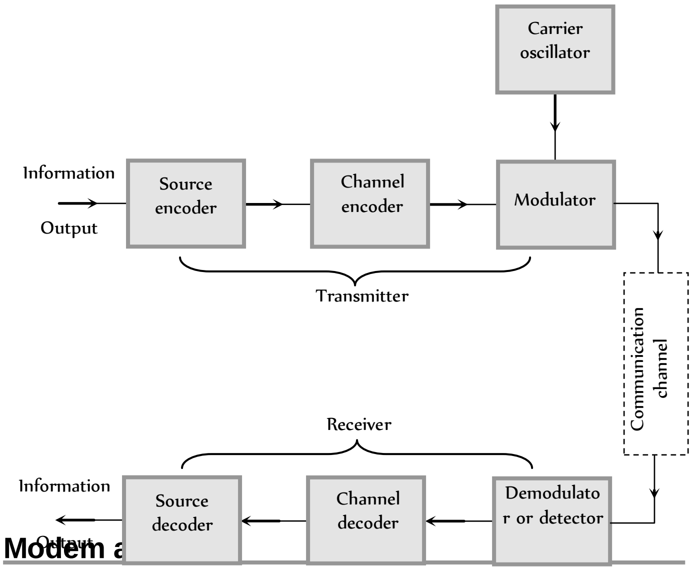
(B) Modulating source code



(C) ASK modulated wave



The analog signal is sampled by the sampler. The sampled pulses are then quantised. The encoder codes the quantised pulses according to the binary codes. After modulating the PCM signal (by ASK, FSK or PSK method) the modulated signal is, then transmitted into free space in the form of bits.



Modem a

Fig. 28.18

(1) **Modem :** Modems are used to interface two digital sources/receivers.

(i) Word modem has been obtained from the words modulator and demodulator. As the name implies both the functions (modulation) and demodulation) are included in a signal unit.

(ii) Modems are placed at both ends of the communication circuit as shown.

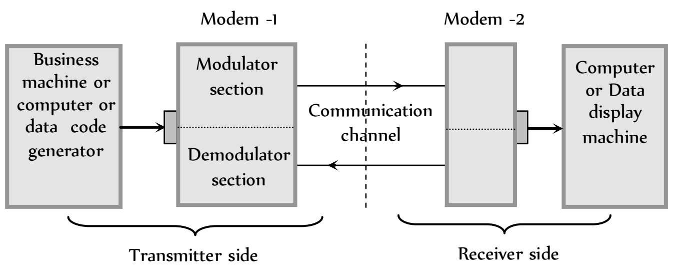


Fig. 28.19

(iii) The modem at the transmitting station changes the digital output from a computer (or any other business machine) to a from (analog signal) which can be easily sent via a communication channel (Telephone line *etc.*). While the receiving modem reverses the process.

(iv) There are three modes of operation of a modem.

(a) Simplex mode : In this mode data is transmitted in only one direction.

(b) Half duplex : In this mode data is transmitted between the transmitter and the receiver in both direction, but only in one direction at a time.

(c) Full duplex : In this mode, the data are transmitted between the transmitter and receiver in both directions at the same time.

Table 28.6 : Modem data transmission speed

Types	Speed in bits per sec and (bps)
Low speed modem	600 bps
Medium speed modem	600 to 2400 bps
High speed modem	2400 to 10,800 bps

(2) **Fax (Facsimile transmission) :** The electronic reproduction of a document at a distance place is known as facsimile transmission (FAX).

The original written document is converted into transmittable codes at the sending end. These codes are converted back into a copy of the original document at the receiving end.

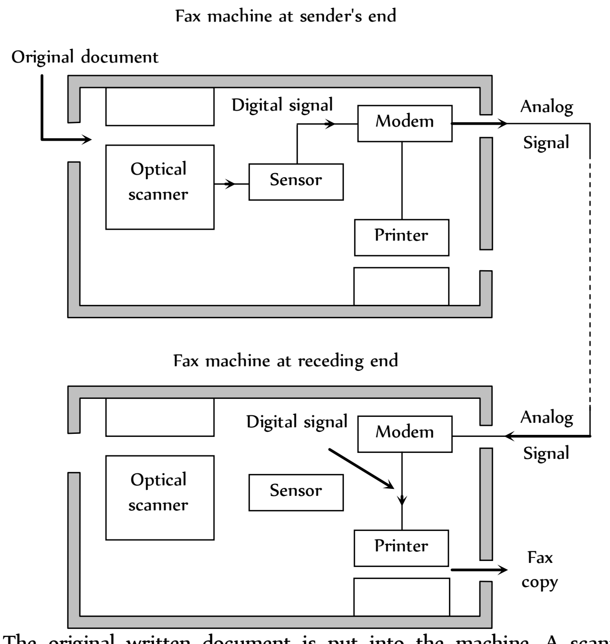

Fig. 28.20

The original written document is put into the machine. A scanner scans the whole document.

The scanned written document is then moved on a glass plate. A beam of light from a given source is projected through the glass and is reflected from the surface of the document.

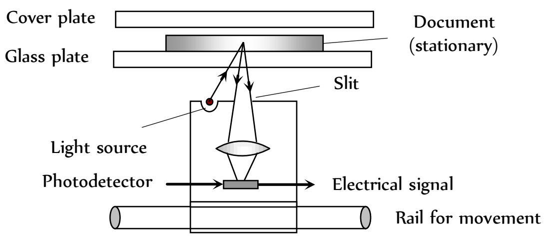

Fig. 28.21

The reflected light is focussed on a device known as photo detector which converts the optical signals (carrying the information regarding the patterns/writings/signatures *etc.*) in to electrical signals.

These electrical signals are then modulated and transmitted on to the telephone lines to the receiving end.

Space Communication

The communication process utilising the physical space around the earth is termed as space communication.

Electromagnetic waves which are used in Radio, Television and other communication system are radio waves and microwaves.

The radio waves emitted from a transmitter anteena can reach the receiver antenna by the following mode of operation.

+ Ground wave propagation

+ Sky wave propagation.

+ Space wave propagation.

(1) **Ground wave propagation**

(i) In ground wave propagation, radio waves travel along the surface of the earth (following the curvature of earth).

(ii) These waves induce currents in the ground as they propagate due to which some energy is lost.

(iii) The decrease in the value of energy (*i.e.* attenuation) increases with the increase in the frequency of radiowave.

(iv) As the ground wave propagates over the earth, it tilts over more and more due to diffraction. (This is another cause of attenuation of ground wave). After covering some distance, the wave just lie down which means it's death.

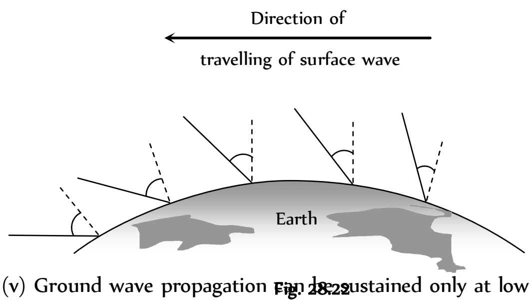

Fig. 28.22

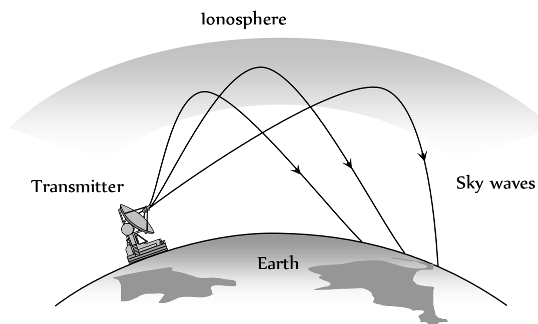
(v) Ground wave propagation can be sustained only at low frequencies (~ 500 *kHz* to 1500 *kHz*) or for radio broadcast at long wavelengths.

(2) **Sky wave propagation**

(i) These are the waves which are reflected back to the earth by ionosphere.

Ionosphere is a layer of atmosphere having charged particles, ions and electrons and extended above 80 *km* – 300 *km* from the earth's surface.



(ii) These are the radio waves of frequency range 2 *MHz* to 30 *MHz*.

(iii) Sky waves are used for very long distance radio communication at medium and high frequencies (*i.e.* at medium waves and short waves).

(iv) The sky waves being electromagnetic in nature, changes the dielectric constant and refractive index of the ionosphere. The effective refractive index of the ionosphere is

$$n_{eff} = n_0\left[1-\frac{Ne^2}{\varepsilon_0 m\omega^2}\right]^{1/2} = n_0\left[1-\frac{80.5N}{f^2}\right]^{1/2}$$

where n_0 = refractive index of free space, N = electron density of ionosphere, ε_0 = dielectric constant of free space, e = charge on electron, m = mass of electron ω = angular frequency of EM wave.

(v) As we go deep into the ionosphere, N increases so n_{eff} decreases. The refractions or bending of the beam will continue and finally it reflects back.

(vi) **Critical frequency (f_c) :** It is defined as the highest frequency of radio wave, which gets reflected to earth by the ionosphere after having been sent straight to it.

If maximum electron density of the ionosphere is N_{max} per m^3, then $f_c \approx 9(N_{max})^{1/2}$. Above f_c a wave will penetrate the ionosphere and is not reflected by it.

(vii) **Maximum usable frequency (MUF) :** It is the highest frequency of radio waves which when sent at some angle of incidence θ, towards the ionosphere, get reflected and return to the earth. $MUF = \frac{f_c}{\cos\theta}$

(viii) **Skip distance :** It is the smallest distance from a transmitter along the earth's surface at which a sky wave of a fixed frequency but more than f_c is sent back to the earth.

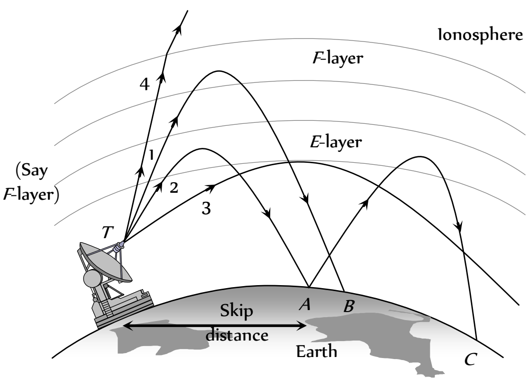


Fig. 28.24

(ix) **Fading :** It is defined as the fluctuation in the strength of a signal at a receiver due to interference of two waves.

Fading is more at high frequencies. It results into errors in data transmission and retrieval.

Space Wave Propagation

The space waves are the radio waves of very high frequency (30 *MHz* to 300 *MHz*) ultra high frequency (300 *MHz* to 3000 *MHz*) and microwave (more than 3000 *MHz*). At such high frequencies, the sky wave as well as ground wave propagation both fails.

These waves can be transmitted from transmitting to receiving antenna either directly or after reflection from the ground or in troposphere, the wave propagation is called space wave propagation.

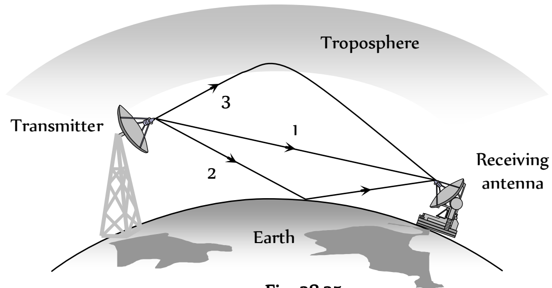

Fig. 28.25

The space wave propagation is also called as line of sight propagation. The line of sight distance is the distance between transmitting antenna and receiving antenna at which they can see each other.

Space wave propagation can be utilised for transmitting high frequency TV and FM signals.

(1) **Television signal propagation :** Frequency range for propagation is 80 *MHz* to 200 *MHz*

Height of transmitting antenna : $h = \frac{d^2}{2R}$ (d = distance covered by the signal, R = Radius of the Earth)

Area covered : $A = \pi d = 2\pi Rh$

Population cover : Population density × Area covered

(2) **Microwave communication :** Microwave communication systems are used for long distance communication. Since at microwave frequencies, electromagnetic waves cannot bend across the obstacles, such as the top of the buildings, mountains *etc.*, it is therefore necessary that microwave transmission is in line-of-sight.

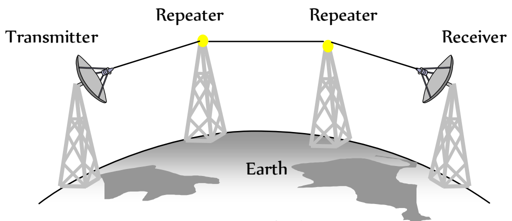

Fig. 28.26

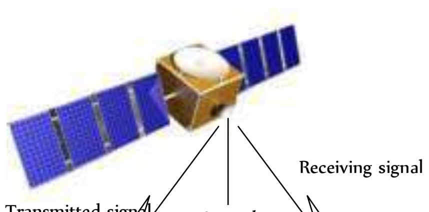
Due to curvature in the surface of earth, the range of microwave transmission is very small (≈ 50 *km*). The range of microwave transmission is also limited by the fact that signals gets weaker and weaker as it propagates. However, these problems are overcome by using repeaters (A repeater is basically an amplifier, which amplifies the attenuated signal and then retransmits it.) at intervals between the transmitter and the receiver. Due to this, the cost of transmission of signal between the two stations increases.

The problems faced in a microwave communication system are solved to a large extent by using a geostationary satellite as a communication satellite.

Satellite Communication

(1) Satellite communication is like the line-of-sight microwave transmission. In this case, a beam of modulated microwave is projected towards the satellite.



(2) Satellite communication is mainly done through geostationary satellites (for steady reliable transmission and reception)

(3) A geostationary satellite has the same time period of revolution of earth (*i.e.* 24 *hrs.*). It appears stationary *w.r.t.* earth. It locates at the height of 36000 *km* above the earth's surface (well above the ionosphere).

(4) A communication satellite is a spacecraft placed in an orbit around the earth which carriers a transmitting and receiving equipment called radio transponder. It amplifies the microwave signals emitted by the transmitter from the surface of earth and send then to the receiving station on earth.

(5) The transmitted signal is UP-LINKED and received by the satellite station which DOWN-LINKS it with the ground station through it's transmitter.

The up-link and down-link frequencies are kept different (both frequencies being in the regions of UHF/microwave).

(6) A single satellite cannot cover the entire surface of the earth. At least three geo-stationary satellites are required which are 120° apart from each other to have the communication link over the entire globe of earth.

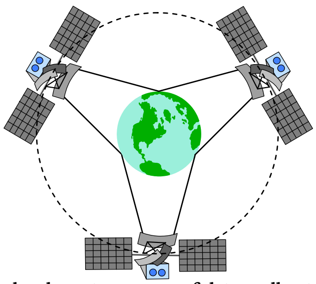


Fig. 28.28

(7) Satellite technology is very useful in collecting information about various factors of the atmosphere which governs the weather and climatic conditions.

The satellite communication can be used for establishing mobile communication with great use the communication satellites are now being used in Global Positioning System (GPS). The ordinary users can find their positions within an accuracy of 100 *m*.

There are two types of satellites used for long distance transmission.

(i) Passive satellite : It act as reflector only for the signals transmitted from earth. Moon the natural satellite of earth is a passive satellite.

(ii) Active satellite : It carries all the equipment used for receiving signals sent from the earth, processing them and then re-transmitting them to the earth. Now a days active satellites are in use.

(8) The Indian communication satellites INSAT-2B and INSAT-2C are positioned in such away in the outer space that they are accessible from any place in India.

Remote Sensing

Remote sensing is the technique to obtain information about an object (in respect of it's size, colour nature, location, temperature *etc.*) by observing it from a distance and without coming to actual contact with it.

(1) There are two types of remote sensing instruments : active and passive. Active instruments provide their own energy to illuminate the object of interest, as radar does. They send an energy pulse to the object and then receive and process the pulse reflected from the object. Passive instruments sense only radiations emitted by the object or solar radiation reflected from the object.

(2) The remote sensing is done through a satellite. The satellite used in remote sensing should move in an orbit around the earth in such away that it always passes over the particular area of the earth at the same local time.

The orbit of such a satellite is known as sun-synchronous orbit. A remote sensing orbit can be circular polar orbit or in highly inclined elliptical orbit.

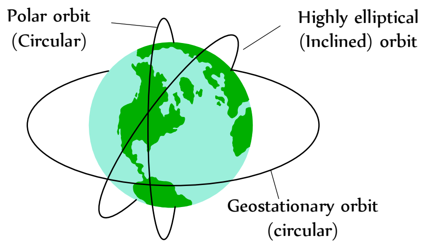

Fig. 28.29

(3) A remote sensing satellite takes, photographs of a particular region which nearly the same illumination every time it passes through that region.

(4) The most useful remote sensing technology is that it makes possible the repetitive surveys of vast areas in a very short time, even if the areas are inaccessible.

(5) Space based remote sensing is a new technology. It has high potential for applications in nearly all aspects of resource management.

(6) The Indian remote sensing satellites are IRS-1A, JRS-1B, and IRS-1C.

(7) **Some applications of remote sensing includes**

(i) Meteorology : (development of weather systems and weather for casting).

(ii) Climatology : Monitoring climatic changes.

(iii) Oceanography : (Sea surface temperatures, mapping of sea-ice and oil pollution monitoring).

(iv) Archaeology, geological surveys.

(v) Water resource surveys,

(vi) Urban land use surveys.

(vii) Agriculture and forestry and natural disaster.

(viii) In the field of spying to detect movements of enemy army an their positions.

(ix) It is used to locate the place where under ground nuclear explosion has carried out.

Line Communication

Line communication means interconnection of two points that are at some distance from each other with the help of wires for exchange of information *e.g.* interconnection between a transmitter and receiver or a transmitter and anteena or an anteena and receiver.

Two Wire Transmission Line

The most commonly used two wire lines are : Parallel wire, twisted pair wires and co-axial cable.

(1) **Parallel wire line :** In a two wire transmission line, two metallic wires are arranged parallel to each other inside a protective insulation coating.

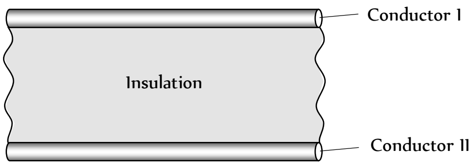

Fig. 28.30

(i) The wires may be hard or flexible depending on the power to be handled.

(ii) It is commonly used to connect an anteena with TV receiver.

(iii) Such wires can suffer from interferences and losses.

(2) **Twisted pair wire :** It consists of two insulated copper wires twisted around each other at regular intervals to minimize electrical interference.

(i) Twisted pair wires are used to connect telephone systems. It works well up to a distance of about 10 *cm*. They cannot transmit signals over very large distances.

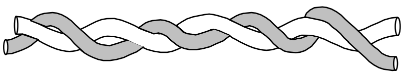

Fig. 28.31

(ii) They can be used for transmitting both, the analog and digital signals.

(iii) They are easy to install and cost effective.

(3) **Coaxial wire lines :** It consist of a central copper wire (which transmits the signals) surrounded by a PVC insulation over which a sleeve of copper mesh (outer conductor) is placed. The outer conductor is normally connected to ground and thus it provides an electrical shield to the signals carried by the central conductor. The outer conductor is externally covered with a polymer jacket for protection.

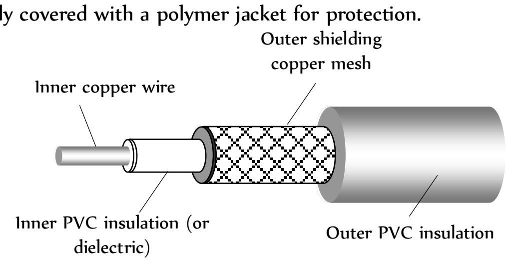

Fig. 28.32

(i) Co-axial line wires can be used for microwaves and ultra high frequency waves.

(ii) The communication through co-axial lines is more efficient than through a twisted pair wire lines.

(iii) Co-axial cables can be gas filled also. To reduce flash over between the conductor handling high power, N_2-gas is used in the cable.

Impedance of Line

Each portion of the transmission line can be considered as a small inductor, resistor and capacitor as shown.

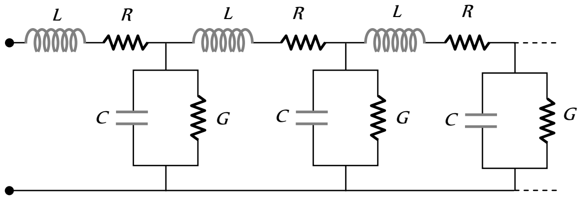

Fig. 28.33

(1) Such inductors, resistors and capacitors are distributed throughout the transmission line.

As a result each length of transmission line has a characteristic impedance.

(2) In case of co-axial cable, the dielectric can be represented by a shunt resistance *G*.

(3) When co-axial cable is used to transmit a radio frequency signal, X_L and X_C are large as compared to *R* and *G* respectively. Hence *R* and *G* can be neglected.

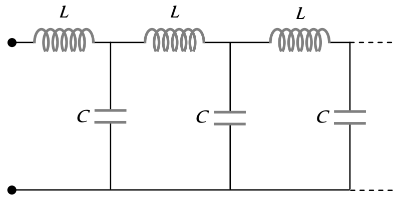

Fig. 28.34

(4) In co-axial cable, *R* is zero, so no loss of energy and hence no attenuation of frequency signal occurs when transmitted along it. That's why co-axial cables are specially used in cable TV network.

(5) **Characteristic impedance (Z_0) :** It is defined as the impedance measured at the input of a line of infinite length.

For parallel line $Z_0 = \frac{276}{\sqrt{k}} \log \frac{2s}{d}$

d = Diameter of each wire

s = Separation between the two wires

k = Dielectric constant of the insulating medium

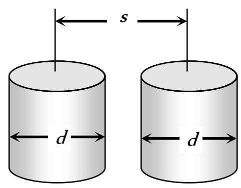

Fig. 28.35

For co-axial line wire $Z_0 = \frac{138}{\sqrt{k}} \log \frac{D}{d}$

d = Diameter of inner conductor

D = Diameter of outer conductor

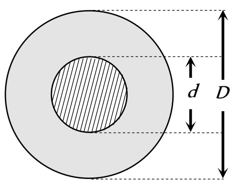

Fig. 28.36

At radio frequency $Z_0 = \sqrt{\frac{L}{C}}$

the usual range of characteristic impedance for parallel wire lines is 150Ω to 600 Ω and for co-axial wire it is 40 Ω to 150 Ω.

(6) **Velocity factor of a line** (*v. f.*) **:** It is the ratio of reduction of speed of light in the dielectric of the cable

$$v.f. = \frac{v}{c} = \frac{\text{Speed of light in medium}}{\text{Speed of light in vacuum}} = \frac{1}{\sqrt{K}}$$

For a line *v.f.* is generally of the order of 0.6 to 0.9.

Telephone Links

(1) Telephone is the most common means of communication. Now a days, the telephone system is required to converse from earth to another heavenly bodies like moon *etc.*

(2) A telephone link can be established with the help of co-axial cables, ground waves, sky waves, microwaves or optical fibre cables.

(3) Simultaneous transmission of a number of messages over a single channel without their interfering with one another is called multiplexing. Two types of multiplexing techniques are in use :

(i) Frequency division multiplexing uses analog modulation of message signals.

(ii) Time division multiplexing makes use of pulse modulation of message signals.

(4) Twisted pair wire lines provide a band width of 2 *MHz*, while co-axial cable provides a band width of 20 *MHz*. For further increase in band width, we use

(i) microwave link

(ii) communication satellite link.

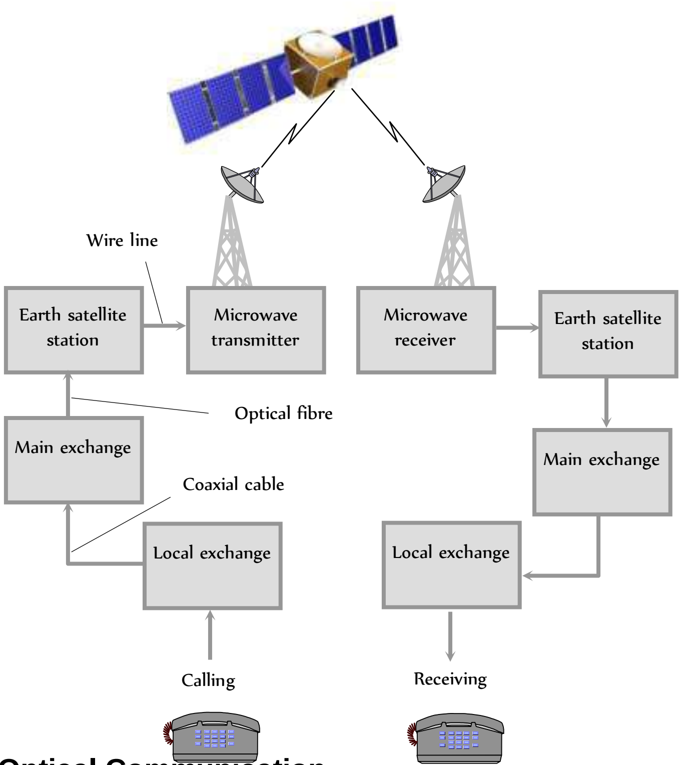

Fig. 28.37

Optical Communication

(1) The use of optical carrier waves for transmission of information from one place to another is called optical communication.

(2) The useful optical frequency range is 10^{12} *Hz* to 10^{16} *Hz* which is very high as compared to radio and microwave frequencies (10^{6} *Hz* – 10^{11} *Hz*).

(3) The information carrying capacity ∝ bandwidth ∝ frequency of carrier wave. So optical communication is better than others. (because of high frequency).

(4) Basic setup of optical communication shown below

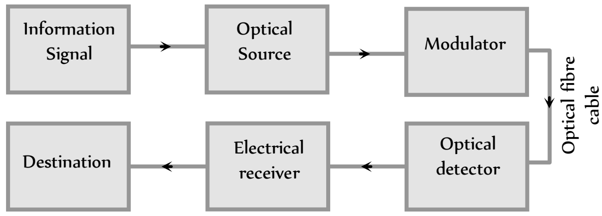

Fig. 28.38

(5) Light emitting diodes (LED) and diode lasers are preferred for optical source. LED's are used for small distance transmission while diode laser is used for very large distance transmission.

(6) In order to transmit information signal via an optical communication system, it is necessary to modulate light with the information signal.

(7) The optical signal reaching the receiving end has to be detected by a detector which converts light into electrical signals, So that the transmitted information may be decoded. Semiconductor based photo-electors are used

Optical Fibre

The optical fibres are used to transmit light signals from one place to another without any practical loss in the intensity of light signal.

(1) **Design :** Optical fibre is made of a thin glass core (diameter 10 to 100 μm) surrounded by a glass coating called cladding are protected by a jacket of plastic.

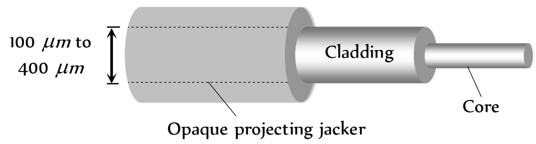

Fig. 28.39

(2) **Principle :** It works on the principle of total internal reflection.

(3) **Action :** The refractive index of the glass used for making core (μ_1 ≈ 1.7) is a little more than the refractive index of the glass (μ_2 ≈ 1.5) used for making the cladding *i.e.* $\mu_1 > \mu_2$.

The core dimension is so small (≈ 10 μm) that the light entering will almost essentially be having incident angle (θ) more than the critical angle (θ) and will suffer total internal reflection at the core. Cladding boundary such successive total reflections at opposite boundaries will confine the light to the core as shown in figure.

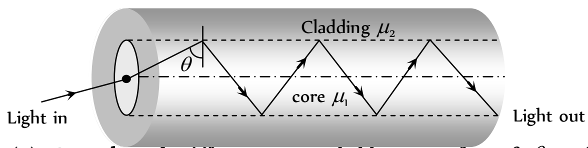

Fig. 28.40

(4) **Critical angle (θ) :** At core-cladding interface if $\theta = \theta_c$ then

$$\cos\theta_c = \frac{\sqrt{\mu_1^2 - \mu_2^2}}{\mu_1} \Rightarrow \theta_c = \cos^{-1}\left(\frac{\sqrt{\mu_1^2 - \mu_2^2}}{\mu_1}\right)$$

(5) **Acceptance angle (θ) :** The value of maximum angle of incidence with the axis of fibre in air for which all the incident light is totally reflected is known as acceptance angle.

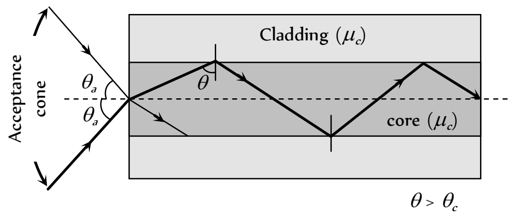

Fig. 28.41

If θ_a = Acceptance angle then μ_1 = refractive index of core, μ_2 = refractive index of cladding.

$$\sin\theta_a = \frac{\sqrt{\mu_1^2 - \mu_2^2}}{\mu_0} \Rightarrow \theta_a = \sin^{-1}\sqrt{\mu_1^2 - \mu_2^2} \quad \text{(for air } \mu_0 = 1\text{)}$$

(6) **Numerical aperture :** Light gathering capability of a fibre is related to numerical aperture. This is defined as the sine of acceptance angle *i.e.*

$$NA = \sin i = \sqrt{\mu_1^2 - \mu_2^2}$$

The numerical aperture can also be given in terms of relative core-cladding index difference (Δ), where $\Delta = \frac{\mu_1^2 - \mu_2^2}{2\mu_1^2}$

Thus, $NA = \sqrt{\mu_1^2 - \mu_2^2} = \mu_1\sqrt{2\Delta}$

(7) **Fibre attenuation :** In practice a very small part of light energy is lost from an optical fibre. This reduction in energy of the light is called attenuation and is described by $I = I_0 e^{-\alpha x}$

where I_0 = Intensity of light when it enters the fibre

I = Intensity of light at a distance x along the fibre

α = Absorption co-efficient or attenuation co-efficient

Also attenuation (in *dB*) $= 10 \log_{10} \frac{I}{I_0}$

(8) **Types of optical fibre**

(i) **Monomode optical fibre :** It has a very narrow core of diameter about 5μm or less, cladding is relatively big.

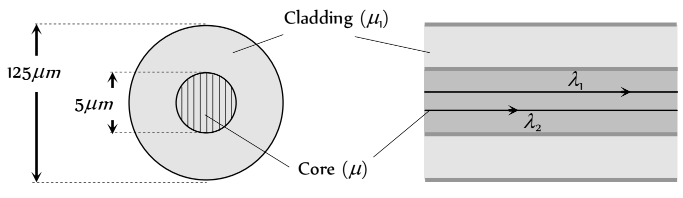

Fig. 28.42

(ii) **Multimode optical fibre :** It is again of two types

(a) Step index multimode fibre :

The diameter of the core is about 50 μm.

Core has constant R.I μ_1 from it's centre to boundary.

The refractive index then changes to a lower value of μ_2 which remains constant through the cladding.

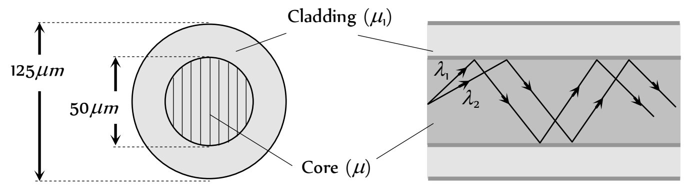

Fig. 28.43

Since refractive index of a material depend on the wavelength of light. The wavelength fellow diff. paths.

The overall time difference between two wavelengths reaches the other end is of the order of 33 × 10^{-9} *sec/cm* length of the fibre.

(iii) **Graded index multimode fibre :** Refractive index decreases smoothly from it's centre to the outer surface of the fibre (cladding). There is no notieable boundary between core and cladding.

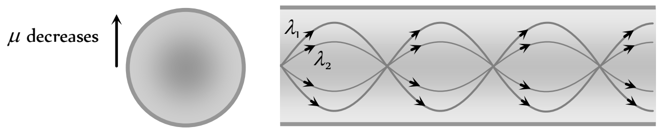

Fig. 28.44

Advantages of Optical Fibres Over Wires

(1) Lower cost in the long run.

(2) Low loss of signal typically less than 0.3 *dB/km*), so repeater-less transmission over long distances is possible.

(3) Large data-carrying capacity (thousands of times greater, reaching speeds of up to 1.6 *Tb/s* in field deployed systems and up to 10 *Tb/s* in lab systems).

(4) No electromagnetic radiation; difficult to eavesdrop.

(5) High electrical resistance, so safe to use near high-voltage equipment or between areas with different earth potentials.

(6) Low weight.

(7) Signals contain very little power.

(8) No cross talk between cables.

(9) No sparks (*e.g.* in automobile applications)

(10) Difficult to place a tap or listening device on the line, providing better physical network security.

Laser

Laser is a process by which we get a beam which is coherent, highly monochromatic and almost perfectly parallel. Such a beam is also called laser.

Coherent : Because all the photons in the light beam, emitted by different atoms, at different instant are in phase.

Monochromatic :	Because, the spread $\Delta\lambda$ in wavelength is very small, of the order of 10^{-6} *nm*.
Perfectly parallel :	Because, a laser beam can be sent to a far off place and returns back without any practical loss of intensity.

The term LASER stands for **L**ight **A**mplification by **S**timulated **E**mission **R**adiation.

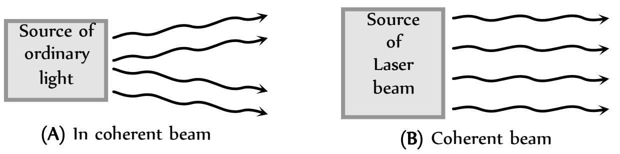

Fig. 28.45

Concepts Related to Production of LASER

(1) **Stimulated absorption :** Consider an atom which has an allowed state at energy E_1 and another allowed state at a higher energy E_2. Suppose the atom is in the lower energy state E_1. If a photon of light having energy $E_2 - E_1$ is incident on this atom, the atom may absorb the photon and jump to the higher energy state E_2. This process is called stimulated absorption of light photon. The incident photon has stimulated the atom to absorb the energy.

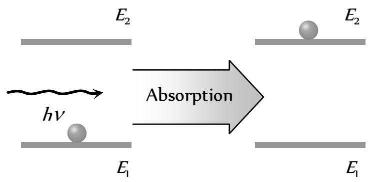

Fig. 28.46

(2) **Spontaneous emission :** If an atom is present in the higher energy state, it tends to return to the lower energy state within a time of 10^{-8} *sec* by emitting a photon of energy $h\nu = E_2 - E_1$. We call this process spontaneous emission. Spontaneous because the event was not triggered by any outside influence.

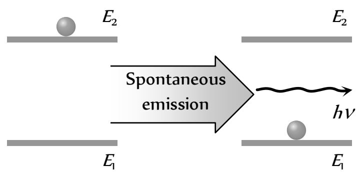

Fig. 28.47

(3) **Stimulated emission :** Suppose a photon of energy $h\nu = E_2 - E_1$ interacts with an atom that is already in the excited state E_2.

The incident photon may stimulate the atom to emit a photon, the energy, phase, and direction of travel of this second photon are exactly the same as those of the incident photon. That is the quantum state of the stimulated photon is identical to that of the incident photon. This process is called stimulated emission.

If these two photons then interact with two more excited state atoms, two more photons are produced, and soon. Therefore, the stimulation process leads to photon amplification.

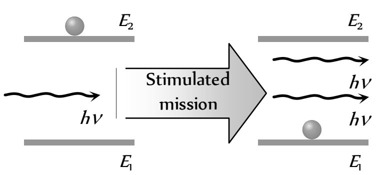

Fig. 28.48

(4) **Population inversion :** Usually the number of atoms in the lower energy state is more than the number of atoms in the excited state. To emit photons which are coherent (*i.e.* in phase), the number of atoms in the higher state must be greater than the number of atoms in the lower energy state. In other words, population of atoms in the higher energy state must be larger than the population of atoms in the lower energy state. The process of making the population of atoms in the higher energy state more than that of lower energy state is known as population inversion.

The method used to invert the population of atoms is known as pumping.

(5) **Metastable states :** A metastable state is one, which has a mean life time of the order of 10^{-3} *s* or more *i.e.* much larger than 10^{-8} *s*, the life time of a higher energy state. Some atomic systems, such as chromium, neon, *etc* possess metastable states. The atom of such an atomic system, when in higher energy state, does not come down to lower energy state directly. It first returns to metastable state and then after a finite lapse of time of the order of 10^{-3} *s*, returns to the lower energy state. Since such atom stays in metastable state for a sufficiently long time, the population inversion can sustain in such atomic system.

A system in which population inversion is achieved is called the active system.

Principle of Laser

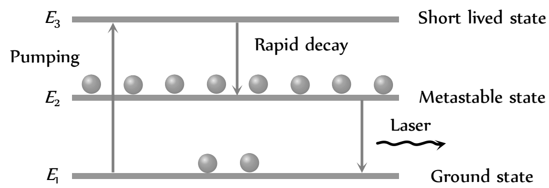

Fig. 28.49

Atoms from the ground state E_1 are 'pumped' up to an excited state E_3. From E_3 the atom decay rapidly to state of energy E_2. For lasing (lasing means laser action) to occur, this state must be metastable. If conditions are right, state E_2 can then become more heavily populated than state E_1, thus providing the needed population inversion.

When photon of energy $h\nu = E_2 - E_1$ is incident on one of the atoms present in the metastable state, the atom will drop to lower energy state E_1, emitting a photon of same energy as that of the incident photon, which is in phase with it and is emitted in the same direction. The two photons, then interact with two more atoms present in metastable state and so on. This process is called amplification of light.

For smooth process two conditions are necessary

(1) The metastable state should all the time have larger number of atoms than the number of atoms in lower energy state.

(It is achieved by pumping)

(2) The photons emitted due to stimulated emission should stimulate other atoms to multiply the photons inside the system.

(It is achieved by two mirrors are fixed at the ends of the system containing lasing material. The mirrors reflect the photons back and forth to keep them inside the region for a long time.)

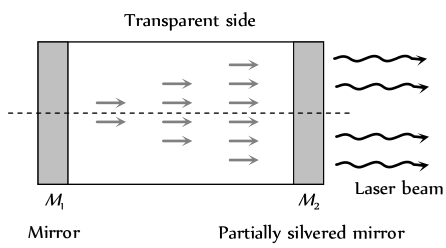

Fig. 28.50

Helium-Neon Laser

This laser contains a mixture of helium (≈ 90%) and neon (≈ 10%) at low pressure in a cylindrical tube with mirrors at each end. The energy level diagram in figure shows the important energy levels for the helium and neon atoms. A large electric field is established in the tube by electrodes connected to a high-voltage power supply, Electrons from ionized atoms are accelerated by the field and collide with atoms.

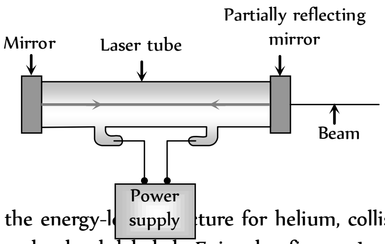

Fig. 28.51

Because of the energy-l[illegible]ture for helium, collisions often excite helium atoms to the level labeled E_3 in the figure. In a process called collision transfer, energy is transferred from excited helium atoms to neon atoms during collisions, thus producing a population of neon atoms in the E_2 level. The transition from level E_2 to E_1 in neon is forbidden, but the transition out of the E_1 level is allowed. This means that the population of atoms in the E_2 level builds up, and that of the E_1 level is rapidly depleted.

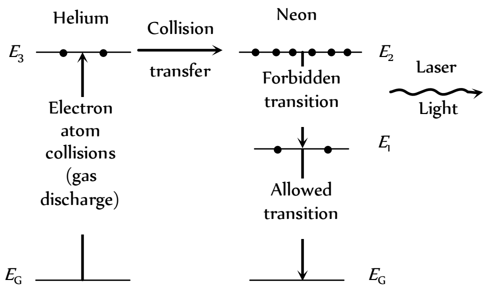

Fig. 28.52

Stimulated emission from E_2 to E_1 predominates and laser light is generated.

The mirrors at each end of the tube encourage emissions along the tube axis by reflecting the light back and forth inside the tube. One of the mirrors is slightly leaky, transmitting about 1 percent of the incident light. This transmitted light forms the laser beam which we find so useful.

Tips & Tricks

✍ Parallel wire lines are never used for transmission of microwaves. This is because at the frequency of microwaves, separation between the two wires approaches half a wavelength ($\lambda/2$). Therefore radiation loss of energy becomes maximum.

✍ Number of channel accommodated for

$$\text{Transmission} = \frac{\text{Total band width of channel}}{\text{Band width needed per channel}}$$

✍ Bit rate = Sampling rate × no. of bits per sample.

✍ Modulation factor determines the strength and quality of the transmitted signal.

✍ A Hertz antenna is a straight conductor of length equal to half the wavelength of radio signals to be transmitted or received. A Marconi antenna is a straight conductor of length $l = \lambda/4$

✍ In a digital signal, information is carried by the pattern of pulses and not by the shape of pulses.

✍ Sampling converts an analog signal into digital. For example when an analog signal is sampled at interval of 125 μ*-sec* the number of samples taken per second $= \dfrac{1}{125 \times 10^{-6}} = 8000.$

✍ AGC stands for automatic gain control. It is used in receive.

✍ Sputinik-I launched by Russia in 1957 was the first active satellite.

✍ First communication satellite was put in an orbit by USA in 1958.

✍ The first India experimental satellite *i.e.* Apple was launched on June 19, 1981.

✍ The national information cenre at Delhi has linked computers at all head quarters through INSAT 2B.

✍ First communication satellite was put in an orbit by USA in 1958.

✍ Just as $\sqrt{\dfrac{Z}{Y}}$ represents characteristic impedance (Z) of a transmission line, $\sqrt{ZY}$ represents propagation constant of the line.

✍ Glass-core and glass cladding (often called SCS fire *i.e.* silica clad silica fibre) have the best propagation characteristics.

✍ The dish type antenna's used for satellite communication are generally of cassegrain type

✍ Ground waves propagate along the surface of the earth. These are vertically polarised to prevent short circuiting of the electric field at a distance d is given by $E = \dfrac{120\,\pi h_t I}{\lambda d}$ and signal received by an antenna of height h_r is given by $V\,(\text{volts}) = \dfrac{120\pi h_t h_r I}{\lambda d}$

✍ Receivers may be of two types, tuned radio frequency (TRF) receivers and superheterodyne receivers. Super heterodyne receivers use local oscillators and intermediate frequency amplifiers before the signal is detected. In this way the reception becomes free of signal frequency but depends only on intermediate frequency which is fixed.

✍ A rectifier with peak detection is used in the AM wave detection and FM detection is achieved by an *LC* circuit tuned at off resonant frequency.

✍ APDs (Avalanche photodiodes) are best suited for detection in fiber optic communication.

✍ **MASER** is microwave amplification by stimulated emission of radiation. It is used as a microwave amplifier or oscillator. The principle of MASER is identical to that of LASER. Only frequency range is $\leq 10^{11}$ *Hz* in masers.

✍ In frequency modulation m_f (frequency modulation index) is inversely proportional to modulating frequency f_m. While in PM it does not vary with modulating frequency. Moreover, FM is more noise immune.

✍ AM with single side band suppressed carrier is better as it contains maximum modulating power.

Ordinary Thinking

Objective Questions

Communication

1. In short wave communication waves of which of the following frequencies will be reflected back by the ionospheric layer, having electron density 10^{11} per *m*

[AIIMS 2003]

(a) 2 *MHz* (b) 10 *MHz*

(c) 12 *MHz* (d) 18 *MHz*

2. In an amplitude modulated wave for audio frequency of 500 *cycle/second*, the appropriate carrier frequency will be

[AMU 1996]

(a) 50 *cycles/sec* (b) 100 *cycles/sec*

(c) 500 *cycles/sec* (d) 50,000 *cycles/sec*

3. AM is used for broadcasting because

(a) It is more noise immune than other modulation systems

(b) It requires less transmitting power compared with other systems

(c) Its use avoids receiver complexity

(d) No other modulation system can provide the necessary bandwidth faithful transmission

4. Range of frequencies allotted for commercial FM radio broadcast is

(a) 88 to 108 *MHz* (b) 88 to 108 *kHz*

(c) 8 to 88 *MHz* (d) 88 to 108 *GHz*

5. The velocity factor of a transmission line *x*. If dielectric constant of the medium is 2.6, the value of *x* is

[AFMC 1995]

(a) 0.26 (b) 0.62

(c) 2.6 (d) 6.2

6. The process of superimposing signal frequency (*i.e.* audio wave) on the carrier wave is known as [AIIMS 1987]

(a) Transmission (b) Reception

(c) Modulation (d) Detection

7. Long distance short-wave radio broadcasting uses

[AFMC 1996]

(a) Ground wave (b) Ionospheric wave

(c) Direct wave (d) Sky wave

8. A step index fibre has a relative refractive index of 0.88%. What is the critical angle at the corecladding interface

[Manipal 2003]

(a) 60° (b) 75°

(c) 45° (d) None of these

9. The characteristic impedance of a coaxial cable is of the order of

(a) 50 Ω (b) 200 Ω

(c) 270 Ω (d) None of these

10. In which frequency range, space waves are normally propagated

(a) HF (b) VHF

(c) UHF (d) SHF

11. If μ_1 and μ_2 are the refractive indices of the materials of core and cladding of an optical fibre, then the loss of light due to its leakage can be minimised by having [BVP 2003]

(a) $\mu_1 > \mu_2$ (b) $\mu_1 < \mu_2$

(c) $\mu_1 = \mu_2$ (d) None of these

12. Through which mode of propagation, the radio waves can be sent from one place to another [JIPMER 2003]

(a) Ground wave propagation

(b) Sky wave propagation

(c) Space wave propagation

(d) All of them

13. A laser beam of pulse power 10^{12} *watt* is focussed on an object are 10^{-4} *cm*. The energy flux in *watt*/ *cm* at the point of focus is

(a) 10^{20} (b) 10^{16}

(c) 10^{8} (d) 10^{4}

14. The carrier frequency generated by a tank circuit containing 1 *nF* capacitor and 10 μH inductor is [AFMC 2003]

(a) 1592 *Hz* (b) 1592 *MHz*

(c) 1592 *kHz* (d) 159.2 *Hz*

15. Broadcasting antennas are generally [AFMC 2003]

(a) Omnidirectional type (b) Vertical type

(c) Horizontal type (d) None of these

16. For television broadcasting, the frequency employed is normally

(a) 30-300 *MHz* (b) 30-300 *GHz*

(c) 30-300 *KHz* (d) 30-300 *Hz*

17. The radio waves of frequency 300 *MHz* to 3000 *MHz* belong to [MNR 1997]

(a) High frequency band

(b) Very high frequency band

(c) Ultra high frequency band

(d) Super high frequency band

18. An antenna behaves as resonant circuit only when its length is

(a) $\frac{\lambda}{2}$

(b) $\frac{\lambda}{4}$

(c) λ

(d) $\frac{\lambda}{2}$ or integral multiple of $\frac{\lambda}{2}$

19. Maximum useable frequency (MUF) in *F*-region layer is *x*, when the critical frequency is 60 *MHz* and the angle of incidence is 70°. Then *x* is [Himachal PMT 2003]

(a) 150 *MHz* (b) 170 *MHz*

(c) 175 *MHz* (d) 190 *MHz*

20. The electromagnetic waves of frequency 2 *MHz* to 30 *MHz* are [CPMT 2003]

(a) In ground wave propagation

(b) In sky wave propagation

(c) In microwave propagation

(d) In satellite communication

21. A laser is a coherent source because it contains

[JIPMER 2003] [EAMCET 2002]

(a) Many wavelengths

(b) Uncoordinated wave of a particular wavelength

(c) Coordinated wave of many wavelengths

(d) Coordinated waves of a particular wavelength

22. The attenuation in optical fibre is mainly due to [AFMC 2003]

(a) Absorption

(b) Scattering

(c) Neither absorption nor scattering

(d) Both (a) and (b)

23. The maximum distance upto which TV transmission from a TV tower of height h can be received is proportional to [AIIMS 2003]

(a) $h^{1/2}$ (b) h

(c) $h^{3/2}$ (d) h^2

24. A laser beam is used for carrying out surgery because it [AIIMS 2003]

(a) Is highly monochromatic (b) Is highly coherent

(c) Is highly directional (d) Can be sharply focussed

25. Laser beams are used to measure long distances because [DCE 2002, 03]

(a) They are monochromatic

(b) They are highly polarised

(c) They are coherent

(d) They have high degree of parallelism

26. An oscillator is producing FM waves of frequency 2 *kHz* with a variation of 10 *kHz*. What is the modulating index [DCE 2004]

(a) 0.20 (b) 5.0

(c) 0.67 (d) 1.5

27. The maximum peak to peak voltage of an AM wire is 24 *mV* and the minimum peak to peak voltage is 8 *mV*. The modulation factor is

(a) 10% (b) 20%

(c) 25% (d) 50%

28. Sinusoidal carrier voltage of frequency 1.5 *MHz* and amplitude 50 *V* is amplitude modulated by sinusoidal voltage of frequency 10 *kHz* producing 50% modulation. The lower and upper side-band frequencies in *kHz* are

(a) 1490, 1510 (b) 1510, 1490

(c) $\frac{1}{1490}, \frac{1}{1510}$ (d) $\frac{1}{1510}, \frac{1}{1490}$

29. What is the modulation index of an over modulated wave

(a) 1 (b) Zero

(c) < 1 (d) > 1

30. Basically, the product modulator is

(a) An amplifier (b) A mixer

(c) A frequency separator (d) A phase separator

31. If f_a and f_f represent the carrier wave frequencies for amplitude and frequency modulations respectively, then

(a) $f_a > f_f$ (b) $f_a < f_f$

(c) $f_a \approx f_f$ (d) $f_a \geq f_f$

32. Which of the following is the disadvantage of FM over AM

(a) Larger band width requirement

(b) Larger noise

(c) Higher modulation power

(d) Low efficiency

33. If a number of sine waves with modulation indices n_1, n_2, n_3 .... modulate a carrier wave, then total modulation index (n) of the wave is

(a) $n_1 + n_2 .... + 2(n_1 + n_2.....)$

(b) $\sqrt{n_1 - n_2 + n_3..........}$

(c) $\sqrt{n_1^2 + n_2^2 + n_3^2.........}$

(d) None of these

34. An AM wave has 1800 *watt* of total power content, For 100% modulation the carrier should have power content equal to

(a) 1000 *watt* (b) 1200 *watt*

(c) 1500 *watt* (d) 1600 *watt*

35. The frequency of a FM transmitter without signal input is called

(a) Lower side band frequency

(b) Upper side band frequency

(c) Resting frequency

(d) None of these

36. What type of modulation is employed in India for radio transmission

(a) Amplitude modulation (b) Frequency modulation

(c) Pulse modulation (d) None of these

37. When the modulating frequency is doubled, the modulation index is halved and the modulating voltage remains constant, the modulation system is

(a) Amplitude modulation (b) Phase modulation

(c) Frequency modulation (d) All of the above

38. An antenna is a device

(a) That converts electromagnetic energy into radio frequency signal

(b) That converts radio frequency signal into electromagnetic energy

(c) That converts guided electromagnetic waves into free space electromagnetic waves and vice-versa

(d) None of these

39. While tuning in a certain broadcast station with a receiver, we are actually

(a) Varying the local oscillator frequency

(b) Varying the frequency of the radio signal to be picked up

(c) Tuning the antenna

(d) None of these

40. Indicate which one of the following system is digital

(a) Pulse position modulation

(b) Pulse code modulation

(c) Pulse width modulation

(d) Pulse amplitude modulation

41. In a communication system, noise is most likely to affect the signal

(a) At the transmitter

(b) In the channel or in the transmission line

(c) In the information source

(d) At the receiver

42. The waves used in telecommunication are

(a) IR (b) UV

(c) Microwave (d) Cosmic rays

43. In an FM system a 7 *kHz* signal modulates 108 *MHz* carrier so that frequency deviation is 50 *kHz*. The carrier swing is

(a) 7.143 (b) 8

(c) 0.71 (d) 350

44. Consider telecommunication through optical fibres. Which of the following statements is not true [AIEEE 2003]

(a) Optical fibres may have homogeneous core with a suitable cladding

(b) Optical fibres can be of graded refractive index

(c) Optical fibres are subject to electromagnetic interference from outside

(d) Optical fibres have extremely low transmission loss

45. The phenomenon by which light travels in an optical fibres is

(a) Reflection (b) Refraction

(c) Total internal reflection (d) Transmission

46. Television signals on earth cannot be received at distances greater than 100 *km* from the transmission station. The reason behind this is that [DCE 1995]

(a) The receiver antenna is unable to detect the signal at a distance greater than 100 *km*

(b) The TV programme consists of both audio and video signals

(c) The TV signals are less powerful than radio signals

(d) The surface of earth is curved like a sphere

47. Advantage of optical fibre [DCE 2005]

(a) High bandwidth and EM interference

(b) Low bandwidth and EM interference

(c) High band width, low transmission capacity and no EM interference

(d) High bandwidth, high data transmission capacity and no EM interference

48. In frequency modulation [Kerala PMT 2005]

(a) The amplitude of modulated wave varies as frequency of carrier wave

(b) The frequency of modulated wave varies as amplitude of modulating wave

(c) The amplitude of modulated wave varies as amplitude of carrier wave

(d) The frequency of modulated wave varies as frequency of modulating wave

(e) The frequency of modulated wave varies as frequency of carrier wave

49. Audio signal cannot be transmitted because

[Kerala PMT 2005]

(a) The signal has more noise

(b) The signal cannot be amplified for distance communication

(c) The transmitting antenna length is very small to design

(d) The transmitting antenna length is very large and impracticable

(e) The signal is not a radio signal

50. In which of the following remote sensing technique is not used

(a) Forest density (b) Pollution

(c) Wetland mapping (d) Medical treatment

51. For sky wave propagation of a 10 *MHz* signal, what should be the minimum electron density in ionosphere

[AIIMS 2005]

(a) $\sim 1.2 \times 10^{12}\ m^{-3}$ (b) $\sim 10^{6}\ m^{-3}$

(c) $\sim 10^{14}\ m^{-3}$ (d) $\sim 10^{22}\ m^{-3}$

52. What should be the maximum acceptance angle at the aircore interface of an optical fibre if n_1 and n_2 are the refractive indices of the core and the cladding, respectively

[AIIMS 2005]

(a) $\sin^{-1}(n_2/n_1)$ (b) $\sin^{-1}\sqrt{n_1^2 - n_2^2}$

(c) $\left[\tan^{-1}\frac{n_2}{n_1}\right]$ (d) $\left[\tan^{-1}\frac{n_1}{n_2}\right]$

[DCE 2001]

Critical Thinking

Objective Questions

1. A sky wave with a frequency 55 *MHz* is incident on *D*-region of earth's atmosphere at 45°. The angle of refraction is (electron density for *D*-region is 400 $electron/cm^3$)

[Haryana PMT 2003]

(a) 60° (b) 45°

(c) 30° (d) 15°

2. In a diode AM-detector, the output circuit consist of $R = 1k\Omega$ and $C = 10\ pF$. A carrier signal of 100 *kHz* is to be detected. Is it good

(a) Yes

(b) No

(c) Information is not sufficient

(d) None of these

3. Consider an optical communication system operating at $\lambda \sim 800\ nm$. Suppose, only 1% of the optical source frequency is the available channel bandwidth for optical communication. How many channels can be accommodated for transmitting audio signals requiring a bandwidth of 8 *kHz*

(a) 4.8×10^{8} (b) 48

(c) 6.2×10^{8} (d) 4.8×10^{5}

4. A photodetector is made from a semiconductor $In_{0.53}Ga_{0.47}As$ with $E_g = 0.73\ eV$. What is the maximum wavelength, which it can detect

(a) 1000 *nm* (b) 1703 *nm*

(c) 500 *nm* (d) 173 *nm*

5. A transmitter supplies 9 kW to the aerial when unmodulated. The power radiated when modulated to 40% is

(a) 5 kW (b) 9.72 kW

(c) 10 kW (d) 12 kW

6. The antenna current of an AM transmitter is 8 A when only carrier is sent but increases to 8.96 A when the carrier is sinusoidally modulated. The percentage modulation is

(a) 50% (b) 60%

(c) 65% (d) 71%

7. The total power content of an AM wave is 1500 W. For 100% modulation, the power transmitted by the carrier is

(a) 500 W (b) 700 W

(c) 750 W (d) 1000 W

8. The total power content of an AM wave is 900 W. For 100% modulation, the power transmitted by each side band is

(a) 50 W (b) 100 W

(c) 150 W (d) 200 W

9. The modulation index of an FM carrier having a carrier swing of 200 kHz and a modulating signal 10 kHz is

(a) 5 (b) 10

(c) 20 (d) 25

10. A 500 Hz modulating voltage fed into an FM generator produces a frequency deviation of 2.25 kHz. If amplitude of the voltage is kept constant but frequency is raised to 6 kHz then the new deviation will be

(a) 4.5 kHz (b) 54 kHz

(c) 27 kHz (d) 15 kHz

11. The audio signal used to modulate 60 sin $(2\pi \times 10^6\ t)$ is $15 \sin 300\pi t$. The depth of modulation is

(a) 50% (b) 40%

(c) 25% (d) 15%

12. The bit rate for a signal, which has a sampling rate of 8 kHz and where 16 quantisation levels have been used is

(a) 32000 *bits/sec* (b) 16000 *bits/sec*

(c) 64000 *bits/sec* (d) 72000 *bits/sec*

13. An amplitude modulated wave is modulated to 50%. What is the saving in power if carrier as well as one of the side bands are suppressed

(a) 70% (b) 65.4%

(c) 94.4% (d) 25.5%

14. In AM, the centpercent modulation is achieved when

(a) Carrier amplitude = signal amplitude

(b) Carrier amplitude ≠ signal amplitude

(c) Carrier frequency = signal frequency

(d) Carrier frequency ≠ signal frequency

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : Diode lasers are used as optical sources in optical communication.

Reason : Diode lasers consume less energy. [AIIMS 2005]

2. Assertion : Television signals are received through sky-wave propagation.

Reason : The ionosphere reflects electromagnetic waves of frequencies greater than a certain critical frequency. [AIIMS 2005]

3. Assertion : In high latitude one sees colourful curtains of light hanging down from high altitudes.

Reason : The high energy charged particles from the sun are deflected to polar regions by the magnetic field of the earth. [AIIMS 2003]

4. Assertion : Short wave bands are used for transmission of radio waves to a large distance.

Reason : Short waves are reflected by ionosphere [AIIMS 1994]

5. Assertion : The electrical conductivity of earth's atmosphere decreases with altitude.

Reason : The high energy particles (*i.e.* γ-rays and cosmic rays) coming from outer space and entering our earth's atmosphere cause ionisation of the atoms of the gases present there and the pressure of gases decreases with increase in altitude.

6. Assertion : The electromagnetic waves of shorter wavelength can travel longer distances on earth's surface than those of longer wavelengths.

Reason : Shorter the wavelength, the larger is the velocity of wave propagation.

7. Assertion : The surface wave propagation is used for medium wave band and for television broadcasting.

Reason : The surface waves travel directly from transmitting antenna to receiver antenna through atmosphere.

8. Assertion : The television broadcasting becomes weaker with increasing distance.

Reason : The power transmitted from TV transmitter varies inversely as the distance of the receiver

9. Assertion : Microwave propagation is better than the sky wave propagation.

Reason : Microwaves have frequencies 100 to 300 GHz, which have very good directional properties.

10. Assertion : Satellite is an ideal platform for remote sensing.

Reason : Satellite in polar orbit can provide global coverage or continuous coverage of the fixed area in geostationary configuration.

11. Assertion : Fax is a modulating and demodulating device.

Reason : It is necessary for exact reproduction of a document.

12. Assertion : A dish antenna is highly directional.

Reason : This is because a dipole antenna is omni directional.

Answers and Solutions

Communication

1. (a) By using $f_c \approx 9(N_{\max})^{1/2} \Rightarrow f_c \approx 2\ MHz$

2. (d) Carrier frequency > audio frequency

3. (c)

4. (a) A maximum frequency deviation of 75 *kHz* is permitted for commercial FM broadcast stations in the 88 to 108 *MHz VHF* band.

5. (b) $v.f. = \frac{1}{\sqrt{k}} = \frac{1}{\sqrt{2.6}} = 0.62$

6. (c) Carrier + signal → modulation.

7. (c)

8. (d) Here $\frac{n_1 - n_2}{n_1} = \frac{0.88}{100} \Rightarrow \frac{n_2}{n_1} = 0.9912$

   ∴ Critical angle $\theta_c = \sin^{-1}\left(\frac{n_2}{n_1}\right) = \sin^{-1}(0.9912) = 84°24'$

9. (c)

10. (c)

11. (a)

12. (d) Radio waves can be transmitted from one place to another as grand wave or sky wave or space wave propagation.

13. (b) The energy flux $\phi = \frac{\text{Pulsepower}}{\text{Area}} = \frac{10^{12}}{10^{-4}} = 10^{16}\ \frac{W}{cm^2}$

14. (c) $\nu = \frac{1}{2\pi\sqrt{LC}} = \frac{1}{2 \times 3.14\sqrt{10 \times 10^{-6} \times 1 \times 10^{-9}}}$ = 1592 *kHz*

15. (b)

16. (a) VHF (Very High Frequency) band having frequency range 30 *MHz* to 300 *MHz* is typically used for TV and radar transmission.

17. (c)

18. (d)

19. (c) $MUF = \frac{f_c}{\cos\theta} = \frac{60}{\cos 70°} = 175\ MHz$

20. (b)

21. (d)

22. (d) A very small part of light energy is lost from an optical fibre due to absorption or due to light leaving the fibre as a result of scattering of light sideways by impurities in the glass fibre.

23. (a) $d = \sqrt{2hR} \Rightarrow d \propto h^{1/2}$

24. (d) Surgery needs sharply focused beam of light and laser can be sharply focused.

25. (d) Laser beams are perfectly parallel. So that they are very narrow and can travel a long distance without spreading. This is the feature of laser while they are monochromatic and coherent these are characteristics only.

26. (b) The formula for modulating index is given by

$$m_f = \frac{\delta}{v_m} = \frac{\text{Frequency variation}}{\text{Modulatingfrequency}} = \frac{10 \times 10^3}{2 \times 10^3} = 5$$

27. (d) Here, $V_{\max} = \frac{24}{2} = 12\,mV$ and $V_{\min} = \frac{8}{2} = 2\,mV$

   Now, $m = \frac{V_{\max} - V_{\min}}{V_{\max} + V_{\min}} = \frac{12-4}{12+4} = \frac{8}{16} = \frac{1}{2} = 0.5 = 50\%$

28. (a) Here, $f_c = 1.5\,MHz = 1500\,kHz,\ f_m == 10\,kHz$

   ∴ Low side band frequency

   $= f_c - f_m = 1500\,kHz - 10\,kHz = 1490\,kHz$

   Upper side band frequency

   $= f_c + f_m = 1500\,kHz + 10\,kHz = 1510\,kHz$

29. (d) When $m_a > 1$ then carrier is said to be over modulated.

30. (b) It mix weak signals with carrier signals.

31. (b)

32. (a) Frequency modulation requires much wider channel (7 to 15 times) as compared to AM.

33. (c)

34. (b) $P_t = P_c\left(1 + \frac{m_a^2}{2}\right)$; Here $m_a = 1$

$$\Rightarrow 1800 = P_c\left(1 + \frac{(1)^2}{2}\right) \Rightarrow P_c = 1200W$$

35. (c)

36. (a)

37. (c)

38. (c) An antenna is a metallic structure used to radiate or receive EM waves.

39. (a)

40. (b) Pulse code modulation is a digital system.

41. (b)

42. (c) In telecommunication, microwaves are used.

43. (a) Carrier swing $= \frac{\text{Frequency deviation}}{\text{Modulating frequency}} = \frac{50}{7} = 7.143$

44. (c) Optical fibres are not subjected to electromagnetic interference from outside.

45. (c) In optical fibre, light travels inside it, due to total internal reflection.

46. (d)

47. (d) Few advantages of optical fibres are that the number of signals carried by optical fibres is much more than that carried by the *Cu* wire or radio waves. Optical fibres are practically free from electromagnetic interference and problem of cross talks whereas ordinary cables and microwave links suffer a lot from it.

48. (b) The process of changing the frequency of a carrier wave (modulated wave) in accordance with the audio frequency signal (modulating wave) is known as frequency modulation (FM).

49. (d) Following are the problems which are faced while transmitting audio signals directly.

(i) These signals are relatively of short range.

(ii) If every body started transmitting these low frequency signals directly, mutual interference will render all of them ineffective.

(iii) Size of antenna required for their efficient radiation would be larger *i.e.* about 75 *km*.

50. (d) Remote sensing is the technique to collect information about an object in respect of its size, colour, nature, location, temperature *etc.* without physically touching it. There are some areas or location which are inaccessible. So to explore these areas or locations, a technique known as remote sensing is used. Remote sensing is done through a satellite.

51. (a) The critical frequency of a sky wave for reflection from a layer of atmosphere is given by $f_c = 9(N_{max})^{1/2}$

$\Rightarrow 10 \times 10^6 = 9(N_{max})^{1/2}$

$\Rightarrow N_{max} = \left(\frac{10 \times 10^6}{9}\right)^2 \simeq 1.2 \times 10^{12} m^{-3}$

52. (b) Core of acceptance angle $\theta = \sin^{-1}\sqrt{n_1^2 - n_2^2}$

Critical Thinking Questions

1. (b) $n_{eff} = n_0\sqrt{1 - \left(\frac{80.5\,N}{\nu^2}\right)} = 1\sqrt{1 - \frac{80.5 \times (400 \times 10^6)}{(55 \times 10^6)^2}} \approx 1$

Also $n_{eff} = \frac{\sin i}{\sin r} \Rightarrow \sin r = \sin i \Rightarrow r = i = 45°$

2. (b) For demodulation $\frac{1}{f_c} << RC$

$\frac{1}{f_c} = \frac{1}{100 \times 10^3} = 10^{-5}\,s$

$RC = 10^3 \times 10 \times 10^{-12}\,s = 10^{-8}\,s$

We see that $\frac{1}{f_c}$ here is not less than *RC* as required by the above condition. Hence, this is not good.

3. (a) Optical source frequency $f = \frac{c}{\lambda}$

$= 3 \times 10^8/(800 \times 10^{-9}) = 3.8 \times 10^{14}\,Hz$

Bandwidth of channel (1% of above) $= 3.8 \times 10^{12}\,Hz$

Number of channels =(Total bandwidth of channel)/(Bandwidth needed per channel)

(a) Number of channels for audio signal

$= (3.8 \times 10^{12})/(8 \times 10^3) \sim 4.8 \times 10^8$

4. (b) Limiting value of $h\nu$ is E_g, such that $h\nu = \frac{hc}{\lambda} = E_g$

or $\lambda = \frac{hc}{E_g} = \frac{6.63 \times 10^{-34}\,J\text{-}s \times 3 \times 10^8\,ms^{-1}}{0.73 \times 1.6 \times 10^{-19}\,J}$

$= 1703\,nm$

5. (b) $P_t = P_c\left[1 + \frac{m^2}{2}\right] = 9\left[1 + \frac{(0.4)^2}{2}\right]$

$= 9\left[1 + \frac{0.16}{2}\right]$ $(\because m = 40\% = 0.4)$

$= 9\,(1.08) = 9.72\,kW$

6. (d) We know that $\left(\frac{I_t}{I_c}\right)^2 = 1 + \frac{m^2}{2}$

Here, $I_t = 8.96A$ and $I_c = 8A$

$\therefore \left(\frac{8.96}{8}\right)^2 = 1 + \frac{m^2}{2}$ or $1.254 = 1 + \frac{m^2}{2}$

or $\frac{m^2}{2} = 0.254$ or $m^2 = 0.508$

or $m = 0.71 = 71\%$

7. (d) $\frac{P_t}{P_c} = 1 + \frac{m^2}{2}$ or $P_c = P_t\left[\frac{2}{2 + m^2}\right]$

$\therefore P_c = 1500\left[\frac{2}{2+1}\right]$ $\because m = 100\% = 1$

$= 1000\,W$

8. (c) $P_c = P_t\left[\frac{2}{2 + m^2}\right] = 900\left[\frac{2}{2+1}\right] = 600W$

Now, $P_{LSB} = \frac{m^2}{4} \times P_c = \frac{1}{4} \times 600 = 150\,W$

9. (b) CS = 2 × Δf or $\Delta f = CS/2$

$\therefore \Delta f = \frac{200}{2} = 100\,kHz$

Now $m_f = \frac{\Delta f}{f_m} = \frac{100}{10} = 10$

10. (b) $m_f = \frac{\delta}{f_m} = \frac{2250}{500} = 4.5$

$\therefore$ New deviation $= 2(m_f\, f_m) = 2 \times 4.5 \times 6 = 54\, kHz$.

11. (c) $m_a = \frac{E_m}{E_c} = \frac{15}{60} \times 100 = 25\%$

12. (a) If n is the number of bits per sample, then number of quantisation level = 2·

Since the number of quantisation level is 16

$\Rightarrow$ 2· = 16 $\Rightarrow n = 4$

$\therefore$ bit rate = sampling rate × no. of bits per sample

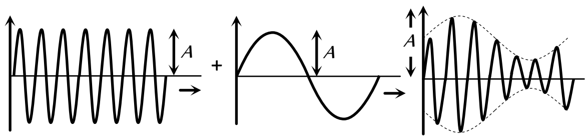
= 8000 × 4 = 32,000 *bits/sec*.

13. (c) $P_{sb} = P_c\left(\frac{m_a}{2}\right)^2 = P_c\frac{(0.5)^2}{4} = 0.0625\, P_c$

Also $P = P_c\left(1 + \frac{m_a^2}{2}\right) = P_c\left(1 + \frac{(0.5)^2}{2}\right) = 1.125 P_c$

$\therefore$ % saving $= \frac{(1.125P_c - 0.0625P_c)}{1.125P_c} \times 100 = 94.4\%$.

14. (a) When signal amplitude is equal to the carrier amplitude, the amplitude of carrier wave varies between $2A$ and zero.



$$m_a = \frac{\text{Amplitude charge of carrier}}{\text{Amplitude of normal carrier}} = \frac{2A - A}{A} \times 100 = 100\%$$

Assertion and Reason

1. (b) In optical communication, diode laser is used to generate analog signals or digital pulses for transmission or digital pulses for transmission trough optical fibres. The advantage of diode lasers are their small size and low power input.

2. (d) TV signals (frequency greater than 30 *MHz*) cannot be propagated through sky wave propagation.

Above critical frequency, an electromagnetic wave penetratates the ionosphere and is not reflected by it.

3. (a) Microwave communication is preferred over optical communication because microwaves provide large number of channels and wider band width compared to optical signals as information carrying capacity is directly proportional to band width. So, wider the band width, greater the information carrying capacity.

4. (a) Having the range of wavelength from 30 *km* to 30 *cm* are known as short wave. These waves are used for radio transmission and for general communication purpose to a longer distance from ionosphere. Ionosphere is the outermost region of atmosphere extending from height of 80 *km* to 400 *km* approximately, above the surface of earth. Therefore, both the assertion and reason are true and reason is the correct explanation of assertion.

5. (e) The electrical conductivity of earth's atmosphere increases with height so assertion is false.

When high energy particles enters in earth's atmosphere. They ionises the gases present in atmosphere. Also as we go up, the air thins out gradually and air pressure decreases.

6. (c) The electromagnetic waves of shorter wavelength do not suffer much diffraction from the obstacles of earth's atmosphere so they can travel long distance.

Also, shorter the wavelength, shorter is the velocity of wave propagation.

7. (a) Both assertion and reason are true and reason is the correct explanation of assertion. (For more detail, refer theory).

8. (c) As the distance increases, TV signals becomes weaker. So assertion is true. The power transmitted from TV transmitter is inversely proportional to the square of the distance of the receiver. That's why reason is false.

9. (a) Microwaves have got good directional properties. Due to it, the microwaves can be directed as beam signals in a particular direction, much better than radio waves, because microwaves do not bend around the corners of any obstacle coming in their way.

10. (a) The remote sensing is done through a satellite. A remote sensing satellite files in a polar orbit at an altitude of 918 *km*, around the earth, in such away that it passes over a given location on the earth at the same local time.

11. (e) The electronic reproduction of a document at a distance plane is known as FAX modulation and demodulation is done by modem.

12. (b) A dish antenna is a directional antenna because it can transmit or sec.

Communication

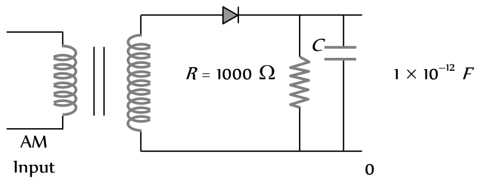
SET Self Evaluation Test - 28

1. A ground receiver station is receiving a signal at (i) 5 *MHz* and transmitted from a ground transmitter at a height of 300 *m*, located at a distance of 100 *km* from the receiver station. The signal is coming via. Radius of earth = 6.4×10^6 *m*. N_{max} of isosphere = 10^{12} m^3

(a) Space wave (b) Sky wave propagation

(c) Satellite transponder (d) All of these

2. In the given detector circuit, the suitable value of carrier frequency is



(a) $<< 10^9$ *Hz* (b) $<< 10^5$ *Hz*

(c) $>> 10^9$ *Hz* (d) None of these

3. The impedance of coaxial cable, when its inductance is 0.40 μH and capacitance is 1×10^{-11} *F*, can be

(a) $2 \times 10^2\ \Omega$ (b) $100\ \Omega$

(c) $3 \times 10^3\ \Omega$ (d) $3 \times 10^{-2}\ \Omega$

4. A wave is represented as

$$e = 10 \sin(10^8 t + 6 \sin 1250t)$$

then the modulating index is

(a) 10 (b) 1250

(c) 10^8 (d) 6

5. An optical fibre communication system works on a wavelength of 1.3 μm. The number of subscribers it can feed if a channel requires 20 *kHz* are

(a) 2.3×10^{10} (b) 1.15×10^{10}

(c) 1×10^5 (d) None of these

6. In an FM system a 7 *kHz* signal modulates 108 *MHz* carrier so that frequency deviation is 50 *kHz*. The carrier swing is

(a) 7.143 (b) 8

(c) 0.71 (d) 350

7. In a radio receiver, the short wave and medium wave stations are tuned by using the same capacitor but coils of different inductance L_s and L_m respectively then

(a) $L_s > L_m$ (b) $L_s < L_m$

(c) $L_s = L_m$ (d) None of these

8. The electron density of E, F_1, F_2 layers of ionosphere is 2×10^{11}, 5×10^{11} and 8×10^{11} m^3 respectively. What is the ratio of critical frequency for reflection of radiowaves

(a) 2 : 4 : 3 (b) 4 : 3 : 2

(c) 2 : 3 : 4 (d) 3 : 2 : 4

9. A carrier is simultaneously modulated by two sine waves with modulation indices of 0.4 and 0.3. The resultant modulation index will be

(a) 1.0 (b) 0.7

(c) 0.5 (d) 0.35

10. Mean optical power launched into an 8 *km* fibre is 120 μW and mean output power is 4 μW, then the overall attenuation is (Given log 30 = 1.477)

(a) 14.77 *dB* (b) 16.77 *dB*

(c) 3.01 *dB* (d) None of these

11. A antenna current of an AM broadcast transmitter modulated by 50% is 11 *A*. The carrier current is

(a) 10.35 *A* (b) 9.25 *A*

(c) 10 *A* (d) 5.5 *A*

12. Because of tilting which waves finally disappear

(a) Microwaves (b) Surface waves

(c) Sky waves (d) Space waves

13. A transmitter transmits a power of 10 *kW* when modulation is 50%. Power of carrier wave is

(a) 5 *kW* (b) 8.89 *kW*

(c) 14 *kW* (d) 5.7 *kW*

14. A telephone link operating at a central frequency of 10 *GHz* is established. If 1% of this is available then how many telephone channel can be simultaneously given when each telephone covering a band width of 5 *kHz*

(a) 2×10^4 (b) 2×10^6

(c) 5×10^4 (d) 5×10^6

AS Answers and Solutions

(SET -28)

1. (b) Maximum distance covered by space wave communication $\sqrt{2Rh} = 62\,km$

Critical frequency = $f_c = 9(N_{\max})^{1/2} \simeq 9\ MHz$

5 MHz < f_c sky wave propagation (ionospheric propagation)

2. (a) Using $\frac{1}{f_{carrier}} << RC$

We get time constant, $RC = 1000 \times 10^{-12} = 10^{-9}\,s$

Now $\nu = \frac{1}{T} = \frac{1}{10^{-9}} = 10^{9}\,Hz$

Thus the value of carrier frequency should be much less than $10^{9}\,Hz$, say 100 kHz.

3. (a) Using $Z = \sqrt{\frac{L}{C}}$ we get $Z = \sqrt{\frac{0.40 \times 10^{-6}}{10^{-11}}} = 2 \times 10^{2}\,\Omega$

4. (d) Comparing with standard equation.

5. (b) Optical source frequency $f = \frac{c}{\lambda} = \frac{3 \times 10^{8}}{1.3 \times 10^{-6}} = 2.3 \times 10^{14}\,Hz$

$\therefore$ Number of channels or subscribers $= \frac{2.3 \times 10^{14}}{20 \times 10^{3}}$

= 1.15 × 10^{10}

6. (a) Carrier swing $= \frac{\text{Frequency deviation}}{\text{Modulatingfrequency}} = \frac{50}{7} = 7.143$

7. (b) As $\nu = \frac{c}{\lambda} \Rightarrow \nu_m = \frac{c}{\lambda_m}$ and $\nu_s = \frac{c}{\lambda_s}$

$\because \lambda_m > \lambda_s \Rightarrow \nu_m < \nu_s$

Also $\nu_m = \frac{1}{2\pi\sqrt{L_m C}}$ and $\nu_s = \frac{1}{2\pi\sqrt{L_s C}}$

$\Rightarrow \frac{\nu_m}{\nu_s} = \sqrt{\frac{L_s}{L_m}} \Rightarrow L_s < L_m.$

8. (c) $f_c \propto (N)^{1/2} \Rightarrow (f_c)_E : (f_c)_{F_1} : (f_c)_{F_2}$

$= (2 \times 10^{11})^{1/2} : (5 \times 10^{11})^{1/2} : (8 \times 10^{11})^{1/2}$ = 2 : 3 : 4

9. (c) $m = \sqrt{m_1^2 + m_2^2} = \sqrt{(0.16) + (0.09)} = 0.5$

10. (a) Attenuation $= 10\log\frac{120}{4} = 10\log 30$

$= 10 \times 1.4771 = 14.77\,dB.$

11. (a) $I_{Carrier} = \frac{I_{rms}}{\sqrt{1 + \frac{m_a^2}{2}}} = \frac{11}{\sqrt{1 + \frac{(0.5)^2}{2}}} = 10.35\,A$

12. (b)

13. (b) $P_c = \frac{P}{\left(1 + \frac{m_a^2}{2}\right)} = \frac{10000}{\left(1 + \frac{(0.5)^2}{2}\right)} = \frac{10000}{1.125} = 8.89\,kW$

14. (a) 1% of 10 GHz = $10 \times 10^{9} \times \frac{1}{100} = 10^{8}\,Hz$

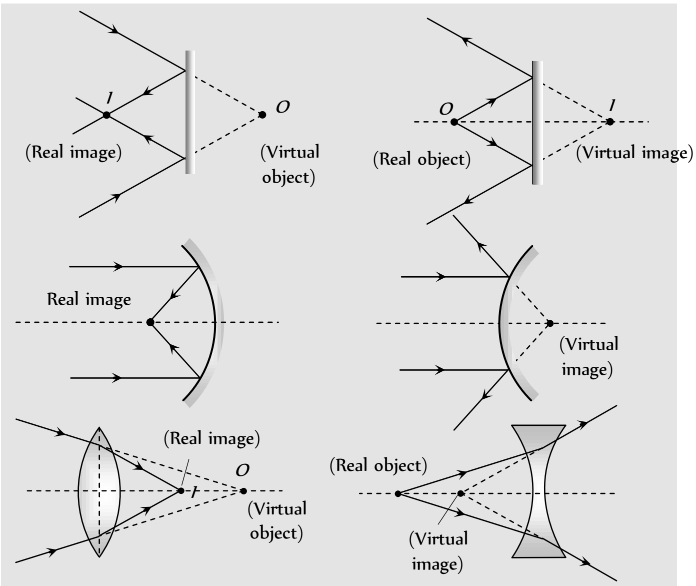
Number of channels $= \frac{10^{8}}{5 \times 10^{3}} = 2 \times 10^{4}$

***

Chapter 29
Ray Optics

Real and Virtual Images

If light rays, after reflection or refraction, actually meets at a point then real image is formed and if they appears to meet virtual image is formed.



Reflection of Light

When a ray of light after incidenting on a boundary separating two media comes back into the same media, then this phenomenon, is called reflection of light.

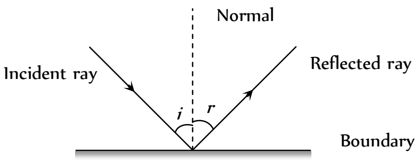


Fig. 29.1

(1) $\angle i = \angle r$

(2) After reflection, velocity, wave length and frequency of light remains same but intensity decreases.

(3) There is a phase change of π if reflection takes place from denser medium.

Reflection From a Plane Surface (Plane Mirror)

The image formed by a plane mirror is virtual, erect, laterally inverted, equal in size that of the object and at a distance equal to the distance of the object in front of the mirror.

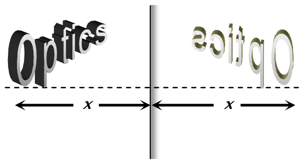

Fig. 29.2

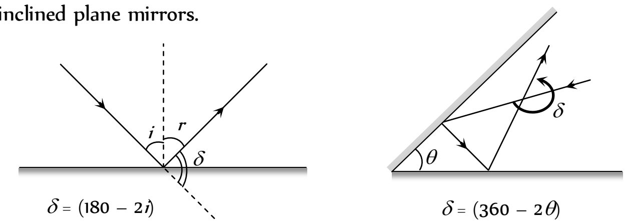
(1) Deviation produced by a plane mirror and by two inclined plane mirrors.



$\delta = (180 - 2i)$
(A) Single Reflection

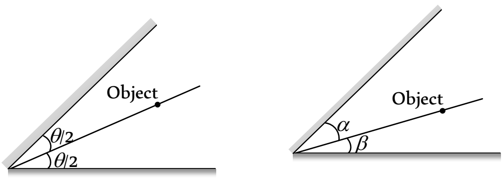
$\delta = (360 - 2\theta)$
(B) Double Reflection

Fig. 29.3

(2) **Images by two inclined plane mirrors :** When two plane mirrors are inclined to each other at an angle θ, then number of images (n) formed of an object which is kept between them.

(i) $n = \left(\frac{360^o}{\theta} - 1\right)$; If $\frac{360^o}{\theta}$ = even integer

(ii) If $\frac{360^o}{\theta}$ = odd integer then there are two possibilities



(A) Object is placed symmetrically

(B) Object is placed asymmetrically

Fig. 29.4

$$n = \left(\frac{360}{\theta} - 1\right) \qquad n = \frac{360}{\theta}$$

(3) **Other important informations**

(i) When the object moves with speed u towards (or away) from the plane mirror then image also moves towards (or away) with speed u. But relative speed of image *w.r.t.* object is $2u$.

(ii) When mirror moves towards the stationary object with speed u, the image will move with speed $2u$ in same direction as that of mirror.

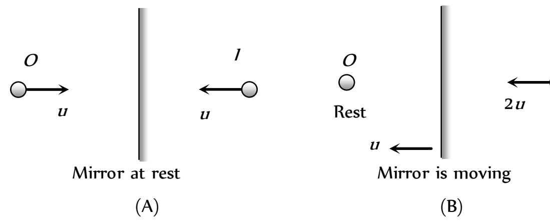


Fig. 29.5

(iii) A man of height h requires a mirror of length at least equal to $h/2$, to see his own complete image.

(iv) To see complete wall behind himself a person requires a plane mirror of at least one third the height of wall. It should be noted that person is standing in the middle of the room.

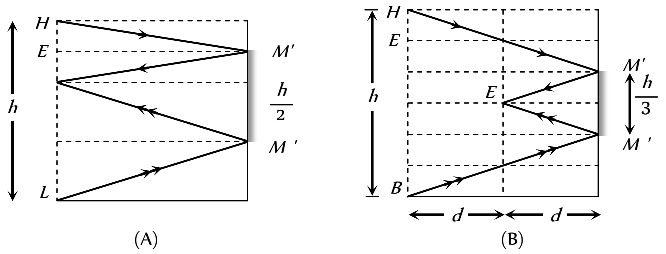

Fig. 29.6

Curved Mirror

It is a part of a transparent hollow sphere whose one surface is polished.

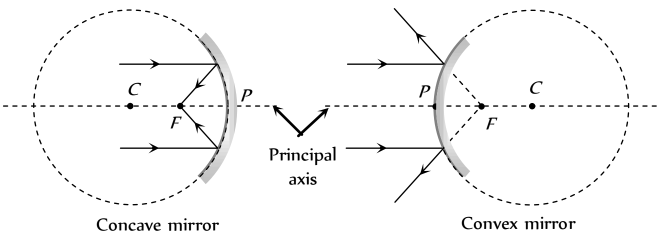

Fig. 29.7

Concave mirror converges the light rays and used as a shaving mirror, In search light, in cinema projector, in telescope, by E.N.T. specialists etc.

Convex mirror diverges the light rays and used in road lamps, side mirror in vehicles *etc*.

(1) **Terminology**

(i) Pole (P) **:** Mid point of the mirror

(ii) Centre of curvature (C) : Centre of the sphere of which the mirror is a part.

(iii) Radius of curvature (R): Distance between pole and centre of curvature. ($R_{concave} = -ve$, $R_{convex} = +ve$, $R_{plane} = \infty$)

(iv) Principle axis : A line passing through P and C.

(v) Focus (F) : An image point on principle axis for an object at ∞.

(vi) Focal length (f) : Distance between P and F.

(vii) Relation between f and R : $f = \frac{R}{2}$

($f_{concave} = -ve$, $f_{convex} = +ve$, $f_{plane} = \infty$)

(viii) Power : The converging or diverging ability of mirror

(ix) Aperture : Effective diameter of light reflecting area. Intensity of image $\propto$ Area $\propto$ (Aperture)^2

(x) Focal plane : A plane passing from focus and perpendicular to principle axis.

(2) **Sign conventions :**

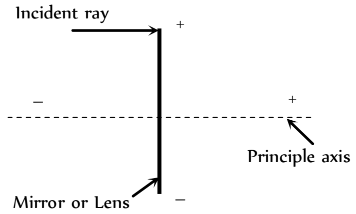

Fig. 29.8

(i) All distances are measured from the pole.

(ii) Distances measured in the direction of incident rays are taken as positive while in the direction opposite of incident rays are taken negative.

(iii) Distances above the principle axis are taken positive and below the principle axis are taken negative.

Table 29.1 : Useful sign

Concave mirror		Convex mirror
Real image ($u \geq f$)	Virtual image ($u < f$)	
Distance of object $u \rightarrow -$	$u \rightarrow -$	$u \rightarrow -$
Distance of image $v \rightarrow -$	$v \rightarrow +$	$v \rightarrow +$
Focal length $f \rightarrow -$	$f \rightarrow -$	$f \rightarrow +$
Height of object $O \rightarrow +$	$O \rightarrow +$	$O \rightarrow +$
Height of image $I \rightarrow -$	$I \rightarrow +$	$I \rightarrow +$
Radius of curvature $R \rightarrow -$	$R \rightarrow -$	$R \rightarrow +$
Magnification $m \rightarrow -$	$m \rightarrow +$	$m \rightarrow +$

Image Formation by Curved Mirrors

Concave mirror : Image formed by concave mirror may be real or virtual, may be inverted or erect, may be smaller, larger or equal in size of object.

(1) When object is placed at infinite (*i.e.* $u = \infty$)

Image

⟶ At F
⟶ Real

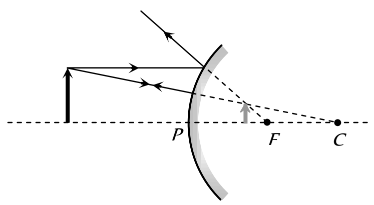

Fig. 29.16

Mirror Formula and Magnification

For a spherical mirror if u = Distance of object from pole, v = distance of image from pole, f = Focal length, R = Radius of curvature, O = Size of object, I = size of image

(1) **Mirror formula :** $\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$

(2) **Lateral magnification :** When an object is placed perpendicular to the principle axis, then linear magnification is called lateral or transverse magnification.

$$m = \frac{I}{O} = -\frac{v}{u} = \frac{f}{f-u} = \frac{f-v}{f}$$

(* Always use sign convention while solving the problems)

Axial magnification : When object lies along the principle axis then its axial magnification $m = \frac{I}{O} = \frac{-(v_2 - v_1)}{(u_2 - u_1)}$

If object is small; $m = -\frac{dv}{du} = \left(\frac{v}{u}\right)^2 = \left(\frac{f}{f-u}\right)^2 = \left(\frac{f-v}{f}\right)^2$

Areal magnification : If a $2D$-object is placed with it's plane perpendicular to principle axis. It's Areal magnification

$$m_s = \frac{\text{Area of image } (A_i)}{\text{Area of object} (A_o)} \Rightarrow m_s = m^2 = \frac{A_i}{A_o}$$

Refraction of Light

The bending of the ray of light passing from one medium to the other medium is called refraction.

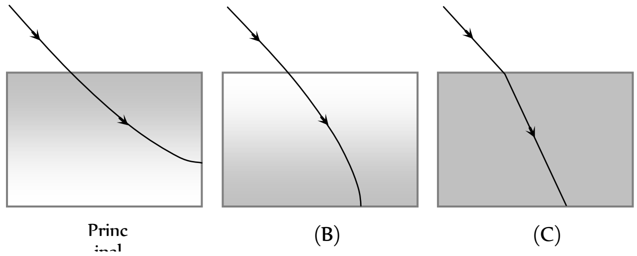

Fig. 29.17

(1) The refraction of light takes place on going from one medium to another because the speed of light is different in the two media.

(2) Greater the difference in the speeds of light in the two media, greater will be the amount of refraction.

(3) A medium in which the speed of light is more is known as optically rarer medium and a medium is which the speed of light is less, is known as optically denser medium.

(4) When a ray of light goes from a rarer medium to a denser medium, it bends towards the normal.

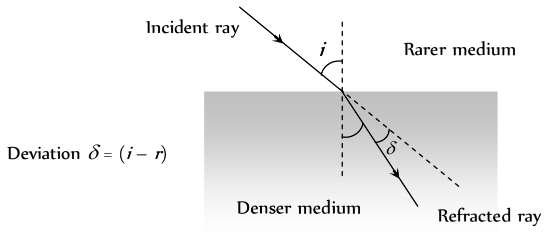

Fig. 29.18

(5) When a ray of light goes from a denser medium to a rarer medium, it bends away from the normal.

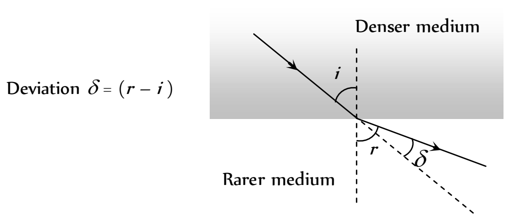

Fig. 29.19

(6) **Snell's law :** The ratio of sine of the angle of incidence to the angle of refraction (r) is a constant called refractive index

i.e. $\frac{\sin i}{\sin r} = \mu$ (a constant). For two media, Snell's law can be written as ${}_1\mu_2 = \frac{\mu_2}{\mu_1} = \frac{\sin i}{\sin r}$

$\Rightarrow \mu_1 \times \sin i = \mu_2 \times \sin r$ *i.e.* $\mu \sin\theta =$ constant

Also in vector form : $\hat{\boldsymbol{i}} \times \hat{\boldsymbol{n}} = \mu(\hat{\boldsymbol{r}} \times \hat{\boldsymbol{n}})$

Refractive Index

(1) Refractive index of a medium is that characteristic which decides speed of light in it.

(2) It is a scalar, unit less and dimensionless quantity.

(3) **Absolute refractive index :** When light travels from vacuum to any transparent medium then refractive index of medium *w.r.t.* vacuum is called it's absolute refractive index *i.e.* ${}_{\text{vacuum}}\mu_{\text{medium}} = \frac{c}{v}$

Absolute refractive indices for glass, water and diamond are respectively $\mu_g = \frac{3}{2} = 1.5$, $\mu_w = \frac{4}{3} = 1.33$ and $\mu_D = \frac{12}{5} = 2.4$

(4) **Relative refractive index :** When light travels from medium (1) to medium (2) then refractive index of medium (2) *w.r.t.* medium (1) is called it's relative refractive index *i.e.* ${}_1\mu_2 = \frac{\mu_2}{\mu_1} = \frac{v_1}{v_2}$ (where v_1 and v_2 are the speed of light in medium 1 and 2 respectively).

(5) When we say refractive index we mean absolute refractive index.

(6) The minimum value of absolute refractive index is 1. For air it is very near to 1. ($\cong 1.003$)

(7) Cauchy's equation : $\mu = A + \frac{B}{\lambda^2} + \frac{C}{\lambda^4} + ...$

($\lambda_{\text{Red}} > \lambda_{\text{violet}}$ so $\mu_{\text{Red}} < \mu_{\text{violet}}$)

(8) If a light ray travels from medium (1) to medium (2), then

$${}_1\mu_2 = \frac{\mu_2}{\mu_1} = \frac{\lambda_1}{\lambda_2} = \frac{v_1}{v_2}$$

(9) **Dependence of Refractive index**

(i) Nature of the media of incidence and refraction.

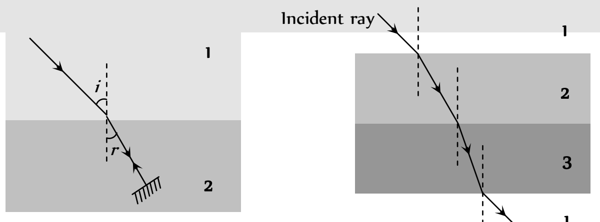
(ii) Colour of light or wavelength of light.

(iii) Temperature of the media : Refractive index decreases with the increase in temperature.

Table 29.2 : Indices of refraction for various substances, Measured with light of vacuum wavelength λ_0 = 589 *nm*

Substance	Refractive index	Substance	Refractive index
Solids at 20°*C*		**Liquids at 20°*C***	
Diamond (*C*)	2.419	Benzene	1.501
Fluorite (CaF_2)	1.434	Carbon disulfide	1.628
Flused quartz (SiO_2)	1.458	Carbon tetrachloride	1.461
Glass, crown	1.52	Ethyl alcohol	1.361
Glass, flint	1.66	Glycerine	1.473
Ice (H_2O) (at 0°*C*)	1.309	Water	1.333
Polystyrene	1.49	**Gases at 0°*C*, 1 *atm***	
Sodium chloride	1.544	Air	1.000293
Zircon	1.923	Carbon dioxide	1.00045

(10) **Reversibility of light and refraction through several media**



(A) ${}_1\mu_2 = \frac{1}{{}_2\mu_1}$

(B) ${}_1\mu_2 \times {}_2\mu_3 \times {}_3\mu_1 = 1$ or ${}_2\mu_3 = \frac{{}_1\mu_3}{{}_1\mu_2}$

Fig. 29.20

Real and Apparent Depth

If object and observer are situated in different medium then due to refraction, object appears to be displaced from it's real position.

(1) **When object is in denser medium and observer is in rarer medium**

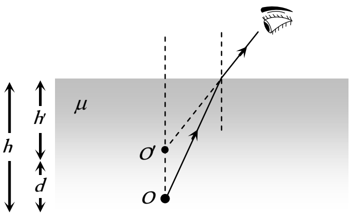


Fig. 29.21

(i) $\mu = \dfrac{\text{Real depth}}{\text{Apparent depth}} = \dfrac{h}{h'}$

(ii) Real depth > Apparent depth

(iii) Shift $d = h - h' = \left(1 - \dfrac{1}{\mu}\right)h$. For water $\mu = \dfrac{4}{3} \Rightarrow d = \dfrac{h}{4}$;

For glass $\mu = \dfrac{3}{2} \Rightarrow d = \dfrac{h}{3}$

(iv) Lateral magnification : consider an object of height x placed vertically in a medium μ such that the lower end (B) is a distance h from the interface and the upper end (A) at a distance ($h - x$) from the interface.

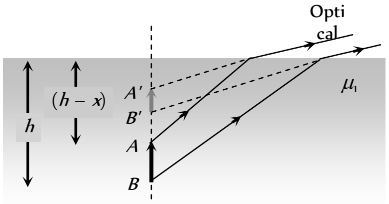

Fig. 29.22

Distance of image of B (*i.e.* B') from the interface = $\dfrac{\mu_2}{\mu_1}h$

Distance of image of A (*i.e.* A') from the interface $= \dfrac{\mu_2}{\mu_1}(h - x)$

Therefore, length of the image $\dfrac{\mu_2}{\mu_1}x$

or, the lateral magnification of the object $m = \dfrac{\mu_2}{\mu_1} = \dfrac{1}{\mu}$

(v) If a beaker contains various immiscible liquids as shown then

Apparent depth of bottom $= \dfrac{d_1}{\mu_1} + \dfrac{d_2}{\mu_2} + \dfrac{d_3}{\mu_3} + ...$

$\mu = \dfrac{d_{AC}}{d_{App.}} = \dfrac{d_1 + d_2 + ...}{\dfrac{d_1}{\mu_1} + \dfrac{d_2}{\mu_2} + ...}$

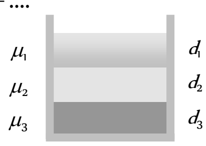

Fig. 29.23

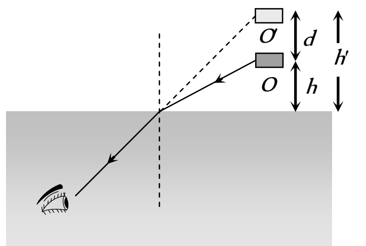
(In case of two liquids if $d_1 = d_2$ than $\mu = \dfrac{2\mu_1\mu_2}{\mu_1 + \mu_2}$)

(2) **Object is in rarer medium and observer is in denser medium**



(i) $\mu = \dfrac{h'}{h}$

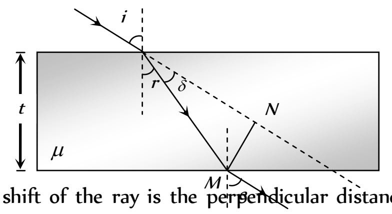
(ii) Real depth < Apparent depth.

(iii) $d = (\mu - 1)h$

(iv) Shift for water $d_w = \dfrac{h}{3}$; Shift for glass $d_g = \dfrac{h}{2}$

Refraction Through a Glass Slab

(1) **Lateral shift :** The refracting surfaces of a glass slab are parallel to each other. When a light ray passes through a glass slab it is refracted twice at the two parallel faces and finally emerges out parallel to it's incident direction *i.e.* the ray undergoes no deviation $\delta = 0$. The angle of emergence (e) is equal to the angle of incidence (i)



The Lateral shift of the ray is the perpendicular distance between the incident and the emergent ray, and it is given by

Fig. 29.25

$MN = t \sec r \sin (i - r)$

(2) **Normal shift :** If a glass slab is placed in the path of a converging or diverging beam of light then point of convergence or point of divergence appears to be shifted as shown

Normal shift

$OO' = x = \left(1 - \dfrac{1}{\mu}\right)t$

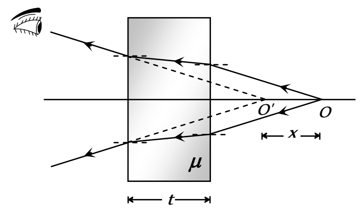


Fig. 29.26

(3) **Optical path :** It is defined as distance travelled by light in vacuum in the same time in which it travels a given path length in a medium.

Time taken by light ray to pass through the medium $= \dfrac{\mu x}{c}$; where x = geometrical path and μx = optical path

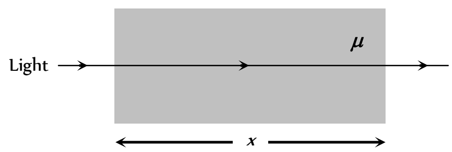

Fig. 29.27

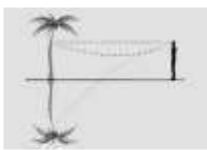
Total Internal Reflection (TIR)



When a ray of light goes from denser to rarer medium it bends away from the normal and as the angle of incidence in denser medium increases, the angle of refraction in rarer medium also increases and at a certain angle, angle of refraction becomes 90°, this angle of incidence is called critical angle (C).

When Angle of incidence exceeds the critical angle than light ray comes back in to the same medium after reflection from interface. This phenomenon is called Total internal reflection (TIR).

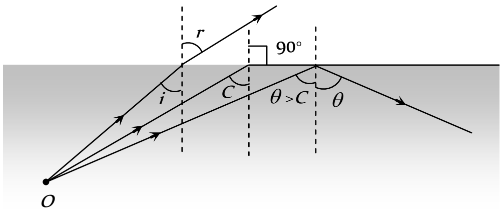


Fig. 29.28

(1) $\mu = \dfrac{1}{\sin C} = \mathbf{cosec}\ C$ where $\mu \rightarrow {}_{\text{Rarer}}\mu_{\text{Denser}}$

(2) **Conditions for TIR**

(i) The ray must travel from denser medium to rarer medium.

(ii) The angle of incidence i must be greater than critical angle C

(3) **Dependence of critical angle**

(i) Colour of light (or wavelength of light) : Critical angle depends upon wavelength as $\lambda \propto \dfrac{1}{\mu} \propto \sin C$

(a) $\lambda_R > \lambda_V \Rightarrow C_R > C_V$

(b) Sin $C = \dfrac{1}{{}_R\mu_D} = \dfrac{\mu_R}{\mu_D} = \dfrac{\lambda_D}{\lambda_R} = \dfrac{v_D}{v_R}$ (for two media)

(ii) Nature of the pair of media : Greater the refractive index lesser will be the critical angle.

(a) For (glass- air) pair $\rightarrow C_{\text{glass}} = 42^o$

(b) For (water-air) pair $\rightarrow C_{\text{water}} = 49^o$

(c) For (diamond-air) pair $\rightarrow C_{\text{diamond}} = 24^o$

(iii) Temperature : With temperature rise refractive index of the material decreases therefore critical angle increases.

Common Examples of TIR

(1) **Looming :** An optical illusion in cold countries

(2) **Mirage :** An optical illusion in deserts

Fig. 29.29

(3) **Brilliance of diamond :** Due to repeated internal reflections diamond sparkles.

(4) **Optical fibre :** Optical fibres consist of many long high quality composite glass/quartz fibres. Each fibre consists of a core and cladding.

(i) The refractive index of the material of the core (μ) is higher than that of the cladding (μ).

(ii) When the light is incident on one end of the fibre at a small angle, the light passes inside, undergoes repeated total internal reflections along the fibre and finally comes out. The angle of incidence is always larger than the critical angle of the core material with respect to its cladding.

(iii) Even if the fibre is bent, the light can easily travel through along the fibre

(iv) A bundle of optical fibres can be used as a 'light pipe' in medical and optical examination. It can also be used for optical signal transmission. Optical fibres have also been used for transmitting and receiving electrical signals which are converted to light by suitable transducers.

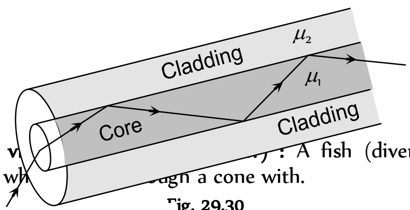

Fig. 29.30

(5) **Field of v**...) : A fish (diver) inside the water can see the wh... ugh a cone with.

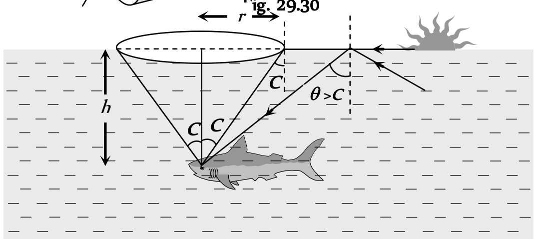

Fig. 29.31

(a) Apex angle $= 2C = 98^o$

(b) Radius of base $r = h \tan C = \dfrac{h}{\sqrt{\mu^2 - 1}}$; for water $r = \dfrac{3h}{\sqrt{7}}$

(c) Area of base $A = \dfrac{\pi h^2}{(\mu^2 - 1)}$; for water $a = \dfrac{9\pi}{7} h^2$

(6) **Porro prism :** A right angled isosceles prism, which is used in periscopes or binoculars. It is used to deviate light rays through 90^o and 180^o and also to erect the image.

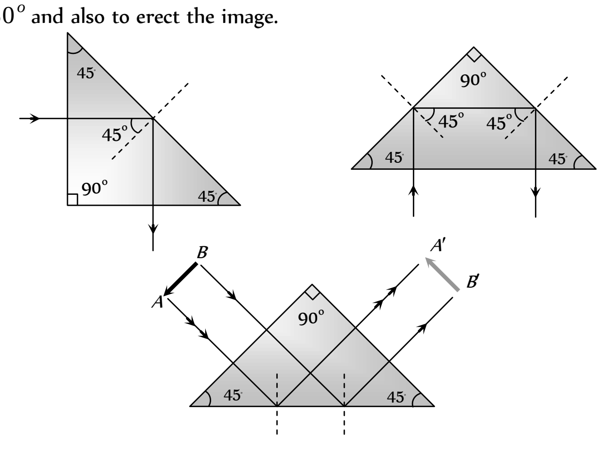

Fig. 29.32

Refraction From Spherical Surface

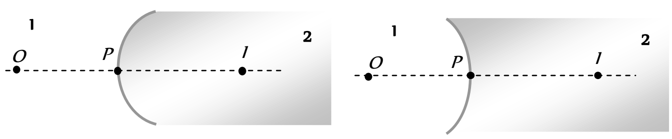

Fig. 29.33

(1) **Refraction formula :** $\dfrac{\mu_2 - \mu_1}{R} = \dfrac{\mu_2}{v} - \dfrac{\mu_1}{u}$

Where μ_1 = Refractive index of the medium from which light rays are coming (from object).

μ_2 = Refractive index of the medium in which light rays are entering.

u = Distance of object, v = Distance of image, R = Radius of curvature

(2) **Lateral magnification :** The lateral magnification m is the ratio of the image height to the object height

or $m = \left(\dfrac{h_i}{h_0}\right) = \left(\dfrac{\mu_1}{\mu_2}\right)\left(\dfrac{v}{u}\right)$

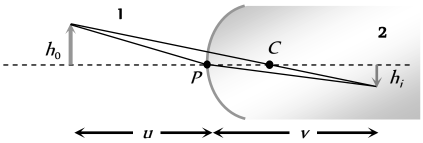

Fig. 29.34

Lens

(1) Lens is a transparent medium bounded by two refracting surfaces, such that at least one surface is curved. Curved surface can be spherical, cylindrical etc.

(2) Lenses are of two basic types convex which are thicker in the middle than at the edges and concave for which the reverse holds.

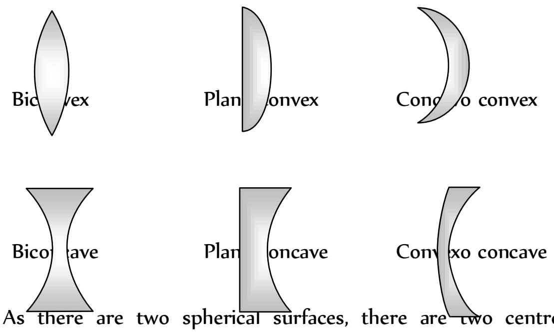

Fig. 29.35

(3) As there are two spherical surfaces, there are two centres of curvature C_1 and C_2 and correspondingly two radii of curvature R_1 and R_2

(4) The line joining C_1 and C_2 is called the principal axis of the lens. The centre of the thin lens which is on the principal axis, is called the optical centre.

(5) A ray passing through optical centre proceeds undeviated through the lens.

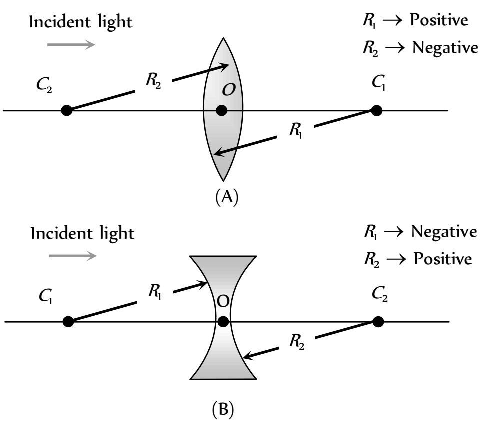

Fig. 29.36

(6) **Principal focus :** We define two principal focus for the lens. We are mainly concerned with the second principal focus (F). Thus wherever we write the focus, it means the second principal focus.

First principal focus : An object point for which image is formed at infinity.

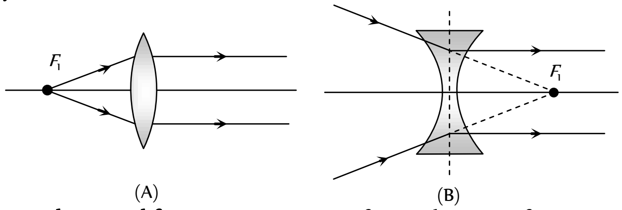

Fig. 29.37

Second principal focus : An image point for an object at infinity.

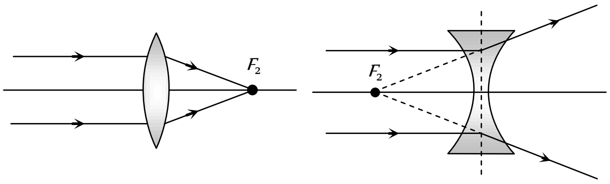

Fig. 29.38

Focal Length, Power and Aperture of Lens

(1) **Focal length (f) :** Distance of second principle focus from optical centre is called focal length

$f_{\text{convex}} \rightarrow$ positive, $f_{\text{concave}} \rightarrow$ negative, $f_{\text{plane}} \rightarrow \infty$

(2) **Aperture :** Effective diameter of light transmitting area is called aperture. $\text{Intensity of image} \propto (\text{Aperture})^2$

(3) **Power of lens (P) :** Means the ability of a lens to deviate the path of the rays passing through it. If the lens converges the rays parallel to the principal axis its power is positive and if it diverges the rays it is negative.

Power of lens $P = \dfrac{1}{f(m)} = \dfrac{100}{f(cm)}$; Unit of power is Diopter (D)

$P_{\text{convex}} \rightarrow$ positive, $P_{\text{concave}} \rightarrow$ negative, $P_{\text{plane}} \rightarrow$ zero.

Rules of Image Formation by Lens

Convex lens : The image formed by convex lens depends on the position of object.

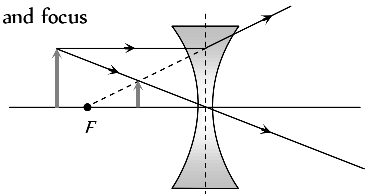

Fig. 29.46

Lens Maker's Formula and Lens Formula

(1) **Lens maker's formula :** If R_1 and R_2 are the radii of curvature of first and second refracting surfaces of a thin lens of focal length f and refractive index μ (*w.r.t.* surrounding medium) then the relation between f, μ, R_1 and R_2 is known as lens maker's formula.

$$\frac{1}{f} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$$

Table 29.3 : Focal length of different lenses

Lens	Focal length	For $\mu = 1.5$
Biconvex lens $R_1 = R$, $R_2 = -R$ 	$f = \frac{R}{2(\mu - 1)}$	$f = R$
Plano-convex lens $R_1 = \infty$, $R_2 = -R$ 	$f = \frac{R}{(\mu - 1)}$	$f = 2R$
Biconcave $R_1 = -R$, $R_2 = +R$ 	$f = -\frac{R}{2(\mu - 1)}$	$f = -R$
Plano-concave $R_1 = \infty$, $R_2 = R$ 	$f = \frac{-R}{(\mu - 1)}$	$f = -2R$

(2) **Lens formula :** The expression which shows the relation between u, v and f is called lens formula.

$$\frac{1}{f} = \frac{1}{v} - \frac{1}{u}$$

Magnification

The ratio of the size of the image to the size of object is called magnification.

(1) Transverse magnification : $m = \frac{I}{O} = \frac{v}{u} = \frac{f}{f+u} = \frac{f-v}{f}$ (use sign convention while solving the problem)

(2) Longitudinal magnification : $m = \frac{I}{O} = \frac{v_2 - v_1}{u_2 - u_1}$. For very small object $m = \frac{dv}{du} = \left(\frac{v}{u}\right)^2 = \left(\frac{f}{f+u}\right)^2 = \left(\frac{f-v}{f}\right)^2$

(3) Areal magnification : $m_s = \frac{A_i}{A_o} = m^2 = \left(\frac{f}{f+u}\right)^2$,

(A_i = Area of image, A_o = Area of object)

(4) **Relation between object and image speed :** If an object moves with constant speed (V_o) towards a convex lens from infinity to focus, the image will move slower in the beginning and then faster. Also $V_i = \left(\frac{f}{f+u}\right)^2 . V_o$

Newton's Formula

If the distance of object (x) and image (x) are not measured from optical centre, but from first and second principal foci then Newton's formula states $f^2 = x_1 x_2$

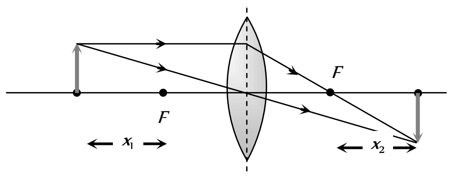

Fig. 29.47

Lens Immersed in a Liquid

If a lens (made of glass) of refractive index μ is immersed in a liquid of refractive index μ_l then its focal length in liquid, f_l is given by

$$\frac{1}{f_l} = ({}_l\mu_g - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right) \quad ......(i)$$

If f_a is the focal length of lens in air, then

$$\frac{1}{f_a} = ({}_a\mu_g - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right) \quad ......(ii)$$

$$\Rightarrow \quad \frac{f_l}{f_a} = \frac{({}_a\mu_g - 1)}{({}_l\mu_g - 1)}$$

(1) If $\mu_g > \mu_l$, then f_l and f_a are of same sign and $f_l > f_a$.

That is the nature of lens remains unchanged, but it's focal length increases and hence power of lens decreases.

(2) If $\mu_g = \mu_l$, then $f_l = \infty$. It means lens behaves as a plane glass plate and becomes invisible in the medium.

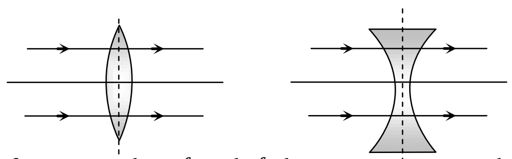

Fig. 29.48

(3) If $\mu_g < \mu_l$, then f_l and f_a have opposite signs and the nature of lens changes *i.e.* a convex lens diverges the light rays and concave lens converges the light rays.

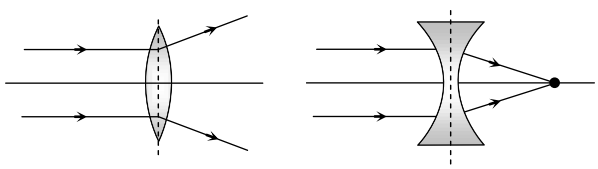

Fig. 29.49

Displacement Method

By this method focal length of convex lens is determined.

Consider an object and a screen placed at a distance D (> $4f$) apart. Let a lens of focal length f be placed between the object and the screen.

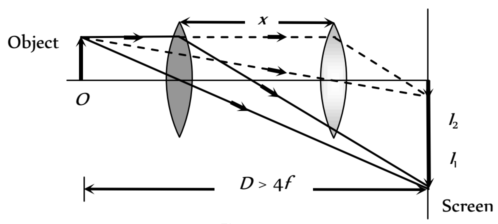

Fig. 29.50

(1) For two different positions of lens two images $(I_1 \text{ and } I_2)$ of an object are formed at the screen.

(2) Focal length of the lens $f = \frac{D^2 - x^2}{4D} = \frac{x}{m_1 - m_2}$

where $m_1 = \frac{I_1}{O}$; $m_2 = \frac{I_2}{O}$ and $m_1 m_2 = 1$.

(3) Size of object $O = \sqrt{I_1 . I_2}$

Cutting of Lens

(1) A symmetric lens is cut along optical axis in two equal parts. Intensity of image formed by each part will be same as that of complete lens. Focal length is double the original for each part.

(2) A symmetric lens is cut along principle axis in two equal parts. Intensity of image formed by each part will be less compared as that of complete lens.(aperture of each part is $\frac{1}{\sqrt{2}}$ times that of complete lens). Focal length remains same for each part.

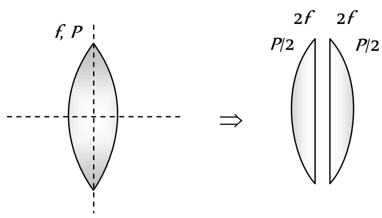

Fig. 29.51

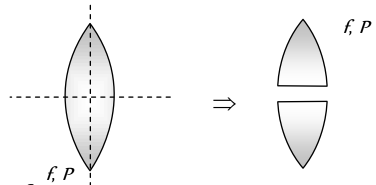

Fig. 29.52

Combination of Lens

(1) For a system of lenses, the net power, net focal length and magnification are given as follows :

$$P = P_1 + P_2 + P_3 ...., \qquad \frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} + \frac{1}{f_3} + ... ,$$

$$m = m_1 \times m_2 \times m_3 \times ....$$

(2) In case when two thin lens are in contact : Combination will behave as a lens, which have more power or lesser focal length.

$$\frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} \Rightarrow F = \frac{f_1 f_2}{f_1 + f_2} \quad \text{and} \quad P = P_1 + P_2$$

(3) If two lens of equal focal length but of opposite nature are in contact then combination will behave as a plane glass plate and $F_{combination} = \infty$

(4) When two lenses are placed co-axially at a distance d from each other then equivalent focal length (F).

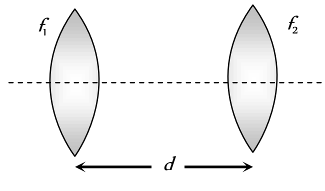

Fig. 29.53

$$\frac{1}{F}=\frac{1}{f_1}+\frac{1}{f_2}-\frac{d}{f_1 f_2} \text{ and } P=P_1+P_2-dP_1P_2$$

(5) Combination of parts of a lens :

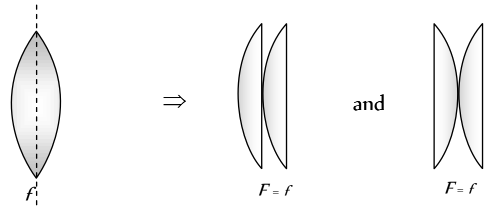

Fig. 29.54

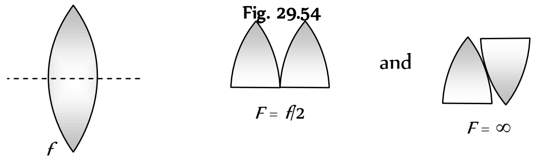

Fig. 29.55

Silvering of Lens

On silvering the surface of the lens it behaves as a mirror. The focal length of the silvered lens is $\frac{1}{F}=\frac{2}{f_l}+\frac{1}{f_m}$

where f_l = focal length of lens from which refraction takes place (twice)

f_m = focal length of mirror from which reflection takes place.

(1) Plano convex is silvered

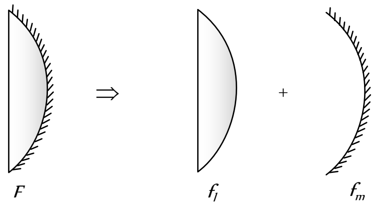

Fig. 29.56

$$f_m=\frac{R}{2},\ f_l=\frac{R}{(\mu-1)} \text{ so } F=\frac{R}{2\mu}$$

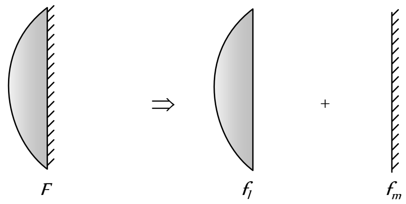

Fig. 29.57

$$f_m=\infty,\ f_l=\frac{R}{(\mu-1)} \text{ so } F=\frac{R}{2(\mu-1)}$$

(ii) Double convex lens is silvered

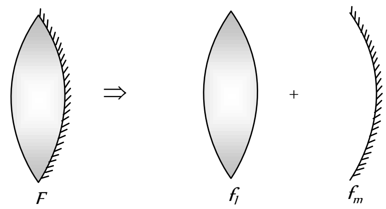

Fig. 29.58

Since $f_l=\frac{R}{2(\mu-1)},\ f_m=\frac{R}{2}$ so $F=\frac{R}{2(2\mu-1)}$

Defects in Lens

(1) **Chromatic aberration :** Image of a white object is coloured and blurred because μ (hence f) of lens is different for different colours. This defect is called chromatic aberration.

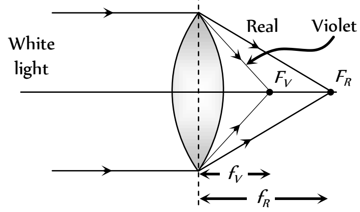

Fig. 29.59

$\mu_V>\mu_R$ so $f_R>f_V$

Mathematically chromatic aberration = $f_R-f_V=\omega f_y$

ω = Dispersive power of lens.

f = Focal length for mean colour $=\sqrt{f_R f_V}$

Removal : To remove this defect *i.e.* for Achromatism we use two or more lenses in contact in place of single lens.

Mathematically condition of Achromatism is : $\frac{\omega_1}{f_1}+\frac{\omega_2}{f_2}=0$ or $\omega_1 f_2=-\omega_2 f_1$

(2) **Spherical aberration :** Inability of a lens to form the point image of a point object on the axis is called Spherical aberration.

In this defect all the rays passing through a lens are not focussed at a single point and the image of a point object on the axis is blurred.

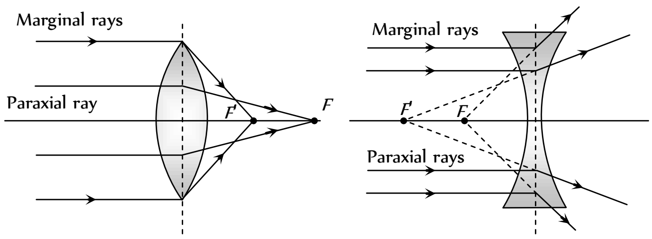

Fig. 29.60

Removal : A simple method to reduce spherical aberration is to use a stop before and infront of the lens. (but this method reduces the intensity of the image as most of the light is cut off). Also by using plano-convex lens, using two lenses separated by distance $d = F - F'$, using crossed lens.

(3) **Coma :** When the point object is placed away from the principle axis and the image is received on a screen perpendicular to the axis, the shape of the image is like a comet. This defect is called Coma.

It refers to spreading of a point object in a plane $\perp$ to principle axis.

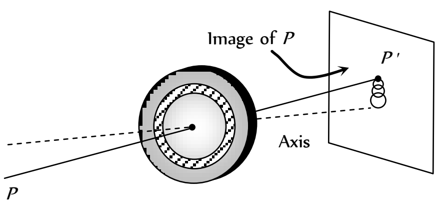

Fig. 29.61

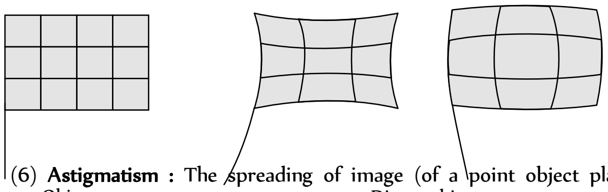
Removal : It can be reduced by properly designing radii of curvature of the lens surfaces. It can also be reduced by appropriate stops placed at appropriate distances from the lens.

(4) **Curvature :** For a point object placed off the axis, the image is spread both along and perpendicular to the principal axis. The best image

is, in general, obtained not on a plane but on a curved surface. This defect is known as Curvature.

Removal : Astigmatism or the curvature may be reduced by using proper stops placed at proper locations along the axis.

(5) **Distortion :** When extended objects are imaged, different portions of the object are in general at different distances from the axis. The magnification is not the same for all portions of the extended object. As a result a line object is not imaged into a line but into a curve.



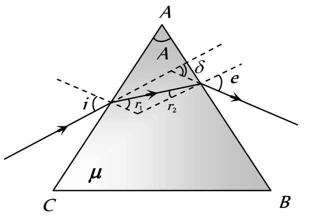
(6) **Astigmatism :** The spreading of image (of a point object placed away from the principal axis) along the principal axis is called Astigmatism.

Fig. 29.62

Prism

Prism is a transparent medium bounded by refracting surfaces, such that the incident surface (on which light ray is incidenting) and emergent surface (from which light rays emerges) are plane and non parallel.

(1) **Refraction through a prism**



i – Angle of incidence,
e – Angle of emergence,
A – Angle of prism or refracting angle of prism,
r_1 and r_2 – Angle of refraction,
δ – Angle of deviation

Fig. 29.63

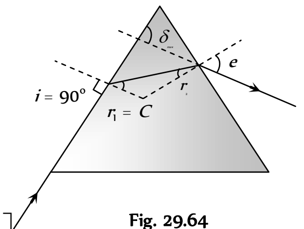
$A = r_1 + r_2$ and $i + e = A + \delta$

For surface AC $\mu = \dfrac{\sin i}{\sin r_1}$; For surface AB $\dfrac{1}{\mu} = \dfrac{\sin r_2}{\sin e}$

(2) **Deviation through a prism :** For thin prism $\delta = (\mu - 1)A$. Also deviation is different for different colour light *e.g.* $\mu_R < \mu_V$ so $\delta_R < \delta_V$.

$\mu_{\text{Flint}} > \mu_{\text{Crown}}$ so $\delta_F > \delta_C$

(i) Maximum deviation : Condition of maximum deviation is $\angle i = 90^o \Rightarrow r_1 = C,\ r_2 = A - C$ and from Snell's law on emergent surface



$$e = \sin^{-1}\left[\frac{\sin(A-C)}{\sin C}\right]$$

$$\delta_{\max} = \frac{\pi}{2} + \sin^{-1}\left[\frac{\sin(A-C)}{\sin C}\right] - A$$

Fig. 29.64

(ii) Minimum deviation : It is observed if $\angle i = \angle e$ and $\angle r_1 = \angle r_2 = r$, deviation produced is minimum.

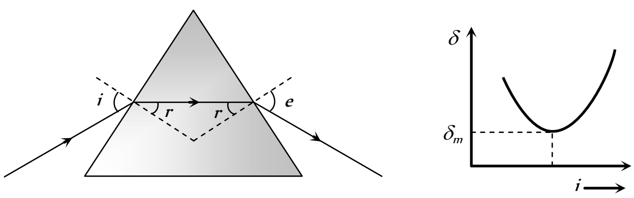


Fig. 29.65

(a) Refracted ray inside the prism is parallel to the base of the prism for equilateral and isosceles prisms.

(b) $r = \dfrac{A}{2}$ and $i = \dfrac{A + \delta_m}{2}$

(c) $\mu = \dfrac{\sin i}{\sin A/2}$ or $\mu = \dfrac{\sin \dfrac{A+\delta_m}{2}}{\sin A/2}$ (Prism formula).

(3) **Condition of no emergence :** For no emergence of light, TIR must takes place at the second surface

For TIR at second surface $r_2 > C$

So $A > r_1 + C$ (From $A = r_1 + r_2$)

As maximum value of $r_1 = C$

So, $A \ge 2C$. for any angle of incidence.

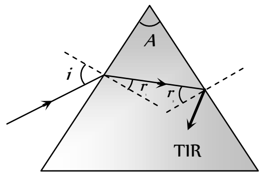

Fig. 29.66

If light ray incident normally on first surface *i.e.* $\angle i = 0°$ it means $\angle r_1 = 0°$. So in this case condition of no emergence from second surface is $A > C$.

$$\Rightarrow \sin A > \sin C \Rightarrow \sin A > \frac{1}{\mu} \Rightarrow \mu > \text{cosec}\, A$$

Dispersion Through a Prism

The splitting of white light into it's constituent colours is called dispersion of light.

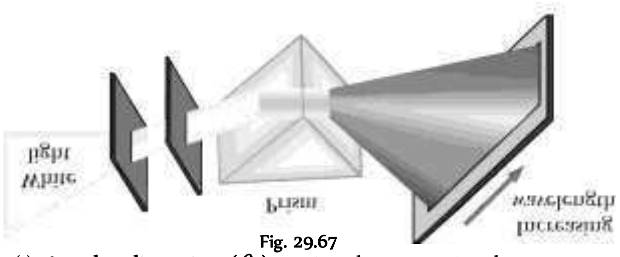

Fig. 29.67

(1) **Angular dispersion (θ) :** Angular separation between extreme colours *i.e.* $\theta = \delta_V - \delta_R = (\mu_V - \mu_R)A$. It depends upon μ and A.

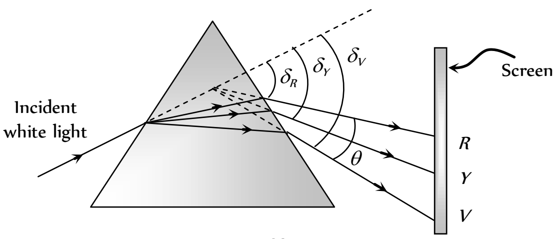

Fig. 29.68

(2) **Dispersive power (ω) :**

$$\omega = \frac{\theta}{\delta_y} = \frac{\mu_V - \mu_R}{\mu_y - 1} \quad \text{where} \left\{\mu_y = \frac{\mu_V + \mu_R}{2}\right\}$$

$\Rightarrow$ It depends only upon the material of the prism *i.e.* μ and it doesn't depends upon angle of prism A

(3) **Combination of prisms :** Two prisms (made of crown and flint material) are combined to get either dispersion only or deviation only.

(i) Dispersion without deviation (chromatic combination)

$$\frac{A'}{A} = -\frac{(\mu_y - 1)}{(\mu'_y - 1)}$$

$$\theta_{net} = \theta\left(1 - \frac{\omega'}{\omega}\right) = (\omega\delta - \omega'\delta')$$

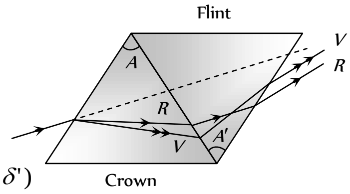

Fig. 29.69

(ii) Deviation without dispersion (Achromatic combination)

$$\frac{A'}{A} = -\frac{(\mu_V - \mu_R)}{(\mu'_V - \mu'_R)}$$

$$\delta_{net} = \delta\left(1 - \frac{\omega}{\omega'}\right)$$

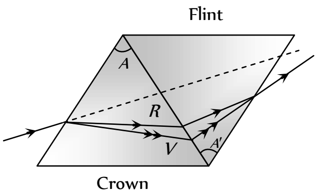

Fig. 29.70

Scattering of Light

Molecules of a medium after absorbing incoming light radiations, emits them in all direction. This phenomenon is called Scattering.

(1) **According to scientist Rayleigh :** Intensity of scattered light $\propto \frac{1}{\lambda^4}$

(2) **Some phenomenon based on scattering :** (i) Sky looks blue due to scattering.

(ii) At the time of sunrise or sunset sun looks reddish.

(iii) Danger signals are made of red colour.

(3) **Elastic scattering :** When the wavelength of radiation remains unchanged, the scattering is called elastic.

(4) **Inelastic scattering (Raman's effect) :** Under specific condition, light can also suffer inelastic scattering from molecules in which it's wavelength changes.

Rainbow

Rainbow is formed due to the dispersion of light suffering refraction and TIR in the droplets present in the atmosphere. Observer should stand with its back towards sun to observe rainbow.

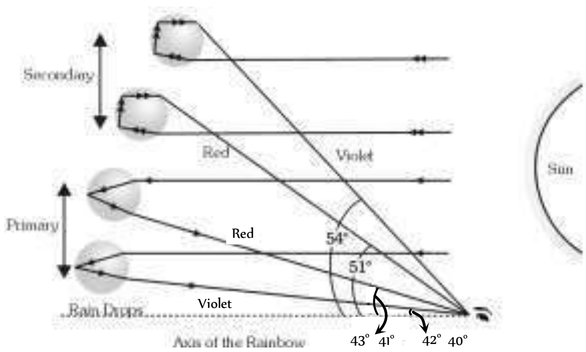

Fig. 29.71

(1) **Primary rainbow :** (i) Two refraction and one TIR. (ii) Innermost arc is violet and outermost is red. (iii) Subtends an angle of 42^o at the eye of the observer. (iv) More bright

(2) **Secondary rainbow :** (i) Two refraction and two TIR. (ii) Innermost arc is red and outermost is violet. (iii) It subtends an angle of 52.5^o at the eye. (iv) Comparatively less bright.

Colours of Objects

Colour is defined as the sensation received by the eye (rod cells of the eye) due to light coming from an object.

(1) **Colours of opaque object :** The colours of opaque bodies are due to selective reflection. *e.g.*

(i) A rose appears red in white light because it reflects red colour and absorbs all remaining colours.

(ii) When yellow light falls on a bunch of flowers, then yellow and white flowers looks yellow. Other flowers looks black.

(2) **Colours of transparent object :** The colours of transperent bodies are due to selective transmission..

(i) A red glass appears red because it absorbs all colours, except red which it transmits.

(ii) When we look on objects through a green glass or green filter then green and white objects will appear green while other black.

(3) **Colour of the sky :** Light of shorter wavelength is scattered much more than the light of longer wavelength. Since blue colour has relatively shorter wavelength, it predominates the sky and hence sky appears bluish.

(4) **Colour of clouds :** Large particles like water droplets and dust do not have this selective scattering power. They scatter all wavelengths alomost equally. Hence clouds appear to the white.

(5) **Colour triangle for spectral colours :** Red, Green and blue are primary colours.

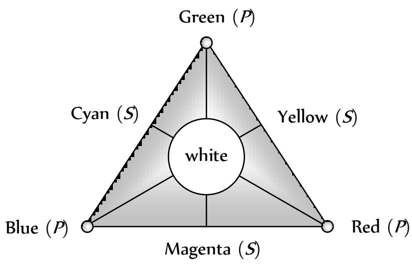

Fig. 29.72

(i) Complementary colours : Green and Magenta, Blue and Yellow, Red and Cyan.

(ii) Combination : Green + Red + Blue = White, Blue + Yellow = White, Red + Cyan = White, Green + Magenta = White

(6) **Colour triangle for pigment and dyes :** Red, Yellow and Blue are the primary colours.

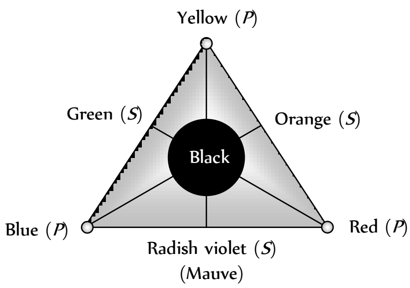

Fig. 29.73

(i) Complementary colours : Yellow and Mauve, Red and Green, Blue and Orange.

(ii) Combination : Yellow + Red + Blue = Black, Blue + Orange = Black, Red + Green = Black, Yellow + Mauve = Black

Spectrum

The ordered arrangements of radiations according to wavelengths or frequencies is called Spectrum. Spectrum can be divided in two parts Emission spectrum and Absorption spectrum.

(1) **Emission spectrum :** When light emitted by a self luminous object is dispersed by a prism to get the spectrum, the spectrum is called emission spectra.

Continuous emission spectrum

(i) It consists of continuously varying wavelengths in a definite wavelength range.

(ii) It is produced by solids, liquids and highly compressed gases heated to high temperature.

(iii) *e.g.* Light from the sun, filament of incandescent bulb, candle flame *etc.*

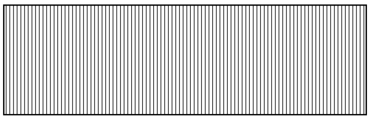

Fig. 29.74

Line emission spectrum

(i) It consist of distinct bright lines.

(ii) It is produced by an excited source in atomic state.

(iii) *e.g.* Spectrum of excited helium, mercury vapours, sodium vapours or atomic hydrogen.

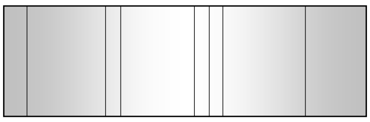

Fig. 29.75

Band emission spectrum

(i) It consist of district bright bands.

(ii) It is produced by an excited source in molecular state.

(iii) *e.g.* Spectra of molecular H_2, CO, NH_3 *etc.*

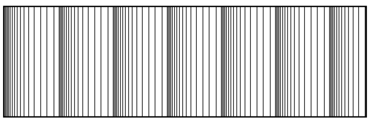

Fig. 29.76

(2) **Absorption spectrum :** When white light passes through a semi-transparent solid, or liquid or gas, it's spectrum contains certain dark lines or bands, such spectrum is called absorption spectrum (of the substance through which light is passed).

(i) Substances in atomic state produces line absorption spectra. Polyatomic substances such as H_2, CO_2 and $KMnO_4$ produces band absorption spectrum.

(ii) Absorption spectra of sodium vapour have two (yellow lines) wavelengths $D_1(5890\ Å)$ and $D_2(5896\ Å)$

(3) **Fraunhoffer's lines :** The central part (photosphere) of the sun is very hot and emits all possible wavelengths of the visible light. However, the outer part (chromosphere) consists of vapours of different elements. When the light emitted from the photosphere passes through the chromosphere, certain wavelengths are absorbed. Hence, in the spectrum of sunlight a large number of dark lines are seen called Fraunhoffer lines.

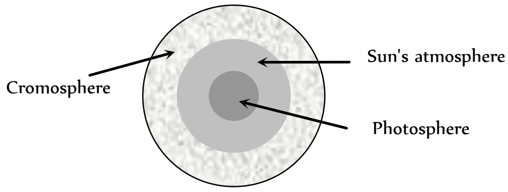

Fig. 29.77

(i) The prominent lines in the yellow part of the visible spectrum were labelled as *D*-lines, those in blue part as *F*-lines and in red part as *C*-line.

(ii) From the study of Fraunhoffer's lines the presence of various elements in the sun's atmosphere can be identified *e.g.* abundance of hydrogen and helium.

(iii) In the event of a solar eclipse, dark lines become bright. This is because of the reason that the presence of an opaque obstacle in between sun and earth cuts the light off from the central region (photo-sphere), while light from corner portion (cromosphere) is still being received. The bright lines appear exactly at the places where dark lines were present.

(4) **Spectrometer :** A spectrometer is used for obtaining pure spectrum of a source in laboratory and calculation of μ of material of prism and μ of a transparent liquid.

It consists of three parts : Collimator which provides a parallel beam of light; Prism Table for holding the prism and Telescope for observing the spectrum and making measurements on it.

The telescope is first set for parallel rays and then collimator is set for parallel rays. When prism is set in minimum deviation position, the spectrum seen is pure spectrum. Angle of prism (*A*) and angle of minimum deviation (δ_m) are measured and μ of material of prism is calculated using prism formula. For μ of a transparent liquid, we take a hollow prism with thin glass sides. Fill it with the liquid and measure (δ_m) and *A* of liquid prism. μ of liquid is calculated using prism formula.

(5) **Direct vision spectroscope :** It is an instrument used to observe pure spectrum. It produces dispersion without deviation with the help of n crown prisms and $(n-1)$ flint prisms alternately arranged in a tabular structure.

For no deviation $n(\mu-1)A=(n-1)\,(\mu'-1)A'$.

Human Eye

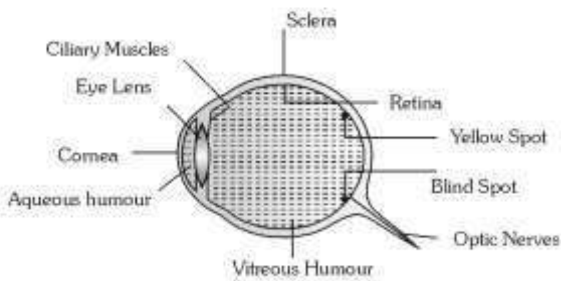

Fig. 29.78

(1) **Eye lens :** Over all behaves as a convex lens of $\mu=1.437$

(2) **Retina :** Real and inverted image of an object, obtained at retina, brain sense it erect.

(3) **Yellow spot :** It is the most sensitive part, the image formed at yellow spot is brightest.

(4) **Blind spot :** Optic nerves goes to brain through blind spot. It is not sensitive for light.

(5) **Ciliary muscles :** Eye lens is fixed between these muscles. It's both radius of curvature can be changed by applying pressure on it through ciliary muscles.

(6) **Power of accomodation :** The ability of eye to see near objects as well as far objects is called power of accomodation.

(7) **Range of vision :** For healthy eye it is 25 *cm* (near point) to ∞ (far point).

A normal eye can see the objects clearly, only if they are at a distance greater than 25 *cm*. This distance is called Least distance of distinct vision and is represented by *D*.

(8) **Persistence of vision :** Is 1/10 *sec. i.e.* if time interval between two consecutive light pulses is lesser than 0.1 *sec.*, eye cannot distinguish them separately.

(9) **Binocular vision :** The seeing with two eyes is called binocular vision.

(10) **Resolving limit :** The minimum angular separation between two objects, so that they are just resolved is called resolving limit. For eye it is $1' = \left(\frac{1}{60}\right)^o$.

Defects in Eye

(1) **Myopia (short sightness) :** A short-sighted eye can see only nearer objects. Distant objects are not seen clearly.

(i) In this defect image is formed before the retina and Far point comes closer.

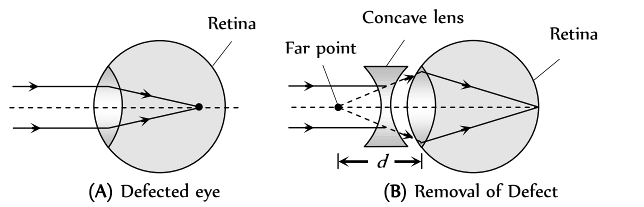

Fig. 29.79

(ii) In this defect focal length or radii of curvature of lens reduced or power of lens increases or distance between eye lens and retina increases.

(iii) This defect can be removed by using a concave lens of suitable focal length.

(iv) If defected far point is at a distance *d* from eye then

Focal length of used lens $f = -d = -$ (defected far point)

(v) A person can see upto distance → *x*, wants to see distance → *y* ($y > x$) so $f = \frac{xy}{x - y}$ or power of the lens $P = \frac{x - y}{xy}$

(2) **Hypermetropia (long sightness) :** A long-sighted eye can see distant objects clearly but nearer object are not clearly visible.

(i) Image formed behind the retina and near point moves away

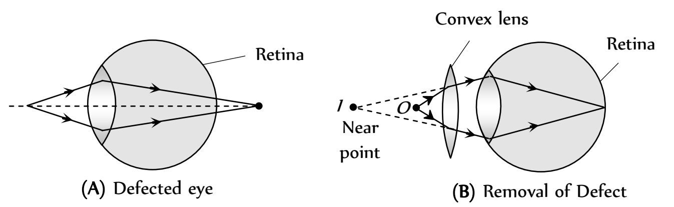

Fig. 29.80

(ii) In this defect focal length or radii of curvature of lens increases or power of lens decreases or distance between eye lens and retina decreases.

(iii) This defect can be removed by using a convex lens.

(iv) If a person cannot see before distance d but wants to see the object placed at distance *D* from eye so $f = \frac{dD}{d - D}$ and power of the lens $P = \frac{d - D}{dD}$

(3) **Presbyopia :** In this defect both near and far objects are not clearly visible. It is an old age disease and it is due to the loosing power of accommodation. It can be removed by using bifocal lens.

(4) **Astigmatism :** In this defect eye cannot see horizontal and vertical lines clearly, simultaneously. It is due to imperfect spherical nature of eye lens. This defect can be removed by using cylindrical lens (Torric lenses).

Lens Camera

(1) In lens camera a converging lens of adjustable aperture is used.

(2) Distance of film from lens is also adjustable.

(3) In photographing an object, the image is first focused on the film by adjusting the distance between lens and film. It is called focusing. After focusing, aperture is set to a specific value and then film is exposed to light for a given time through shutter.

(4) ***f*-number :** The ratio of focal length to the aperture of lens is called *f*-number of the camera.

2, 2.8, 4, 5.6, 8, 11, 22, 32 are the *f*-numbers marked on aperture.

$f\text{-number} = \frac{\text{Focal length}}{\text{Aperture}} \Rightarrow \text{Aperture} \propto \frac{1}{f\text{-number}}$

(5) **Time of exposure :** It is the time for which the shutter opens and light enters the camera to expose film.

(i) If intensity of light is kept fixed then for proper exposure

Time of exposure $(t) \propto \frac{1}{(\text{Aperture})^2}$

(ii) If aperture is kept fixed then for proper exposure

Time of exposure $(t) \propto \frac{1}{[\text{Intensity}(I)]^2}$

$\Rightarrow It = \text{constant} \Rightarrow I_1 t_1 = I_2 t_2$

(iii) Smaller the *f*-number larger will be the aperture and lesser will be the time of exposure and faster will be the camera.

(6) **Depth of focus :** It refers to the range of distance over which the object may lie so as to form a good quality image. Large *f*-number increase the depth of focus.

Microscope

It is an optical instrument used to see very small objects. It's magnifying power is given by

$$m = \frac{\text{Visual angle with instrument}(\beta)}{\text{Visual angle when object is placed at least distance of distinct vision}(\alpha)}$$

(1) **Simple microscope**

(i) It is a single convex lens of lesser focal length.

(ii) Also called magnifying glass or reading lens.

(iii) Magnification's, when final image is formed at *D* and ∞ (*i.e.* m_D and m_∞) $\quad m_D = \left(1+\frac{D}{f}\right)_{\max}$ and $m_\infty = \left(\frac{D}{f}\right)_{\min}$

(iv) If lens is kept at a distance *a* from the eye then $m_D = 1 + \frac{D-a}{f}$ and $m_\infty = \frac{D-a}{f}$

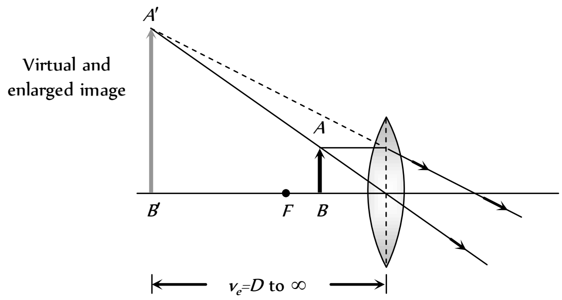

Fig. 29.81

(2) **Compound microscope**

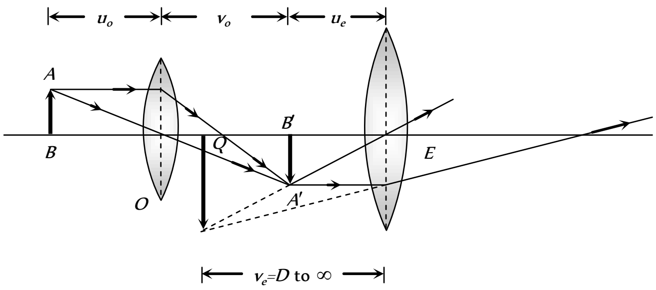

Fig. 29.82

(i) Consist of two converging lenses called objective and eye lens.

(ii) $f_{\text{eye lens}} > f_{\text{objective}}$ and $(\text{diameter})_{\text{eye lens}} > (\text{diameter})_{\text{objective}}$

(iii) Intermediate image is real and enlarged.

(iv) Final image is magnified, virtual and inverted.

(v) u_o = Distance of object from objective (*o*), v_o = Distance of image $(A'B')$ formed by objective from objective, u_e = Distance of $A'B'$ from eye lens, v_e = Distance of final image from eye lens, f_o = Focal length of objective, f_e = Focal length of eye lens.

(vi) **Final image is formed at *D* :** Magnification $m_D = -\frac{v_o}{u_o}\left(1+\frac{D}{f_e}\right)$ and length of the microscope tube (distance between two lenses) is $L_D = v_o + u_e$.

Generally object is placed very near to the principal focus of the objective hence $u_o \cong f_o$. The eye piece is also of small focal length and the image formed by the objective is also very near to the eye piece.

So $v_o \cong L_D$, the length of the tube.

Hence, we can write $m_D = \frac{-L}{f_o}\left(1+\frac{D}{f_e}\right)$

(vii) **Final image is formed at ∞ :** Magnification

$m_\infty = -\frac{v_0}{u_0}\cdot\frac{D}{f_e}$ and length of tube $L_\infty = v_0 + f_e$

In terms of length $m_\infty = \frac{(L_\infty - f_o - f_e)D}{f_o f_e}$

(viii) For large magnification of the compound microscope, both f_o and f_e should be small.

(ix) If the length of the tube of microscope increases, then its magnifying power increases.

(x) The magnifying power of the compound microscope may be expressed as $M = m_o \times m_e$; where m_o is the magnification of the objective and m_e is magnifying power of eye piece.

Astronomical Telescope (Refracting Type)

By astronomical telescope heavenly bodies are seen.

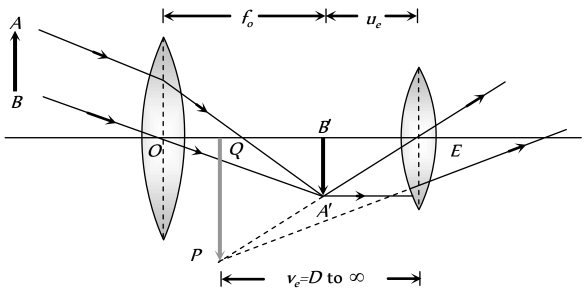

Fig. 29.83

(1) $f_{\text{objective}} > f_{\text{eyelens}}$ and $d_{\text{objective}} > d_{\text{eye lens}}$.

(2) Intermediate image is real, inverted and small.

(3) Final image is virtual, inverted and small.

(4) Magnification : $m_D = -\frac{f_0}{f_e}\left(1+\frac{f_e}{D}\right)$ and $m_\infty = -\frac{f_o}{f_e}$

(5) Length : $L_D = f_0 + u_e$ and $L_\infty = f_0 + f_e$

Terrestrial Telescope

It is used to see far off object on the earth.

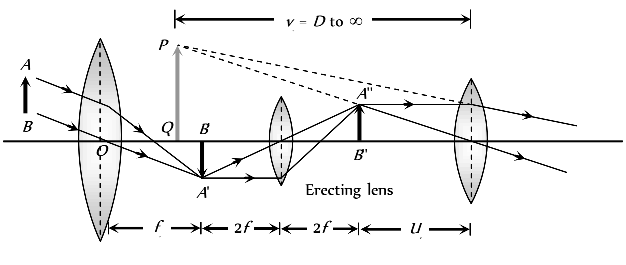

Fig. 29.84

(1) It consists of three converging lens : objective, eye lens and erecting lens.

(2) It's final image is virtual, erect and smaller.

(3) Magnification : $m_D = \frac{f_0}{f_e}\left(1+\frac{f_e}{D}\right)$ and $m_\infty = \frac{f_0}{f_e}$

(4) Length : $L_D = f_0 + 4f + u_e$ and $L_\infty = f_0 + 4f + f_e$

Galilean Telescope

It is also type of terrestrial telescope but of much smaller field of view.

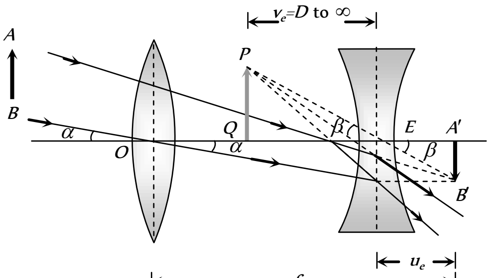

Fig. 29.85

(1) Objective is a converging lens while eye lens is diverging lens.

(2) Magnification : $m_D = \frac{f_0}{f_e}\left(1-\frac{f_e}{D}\right)$ and $m_\infty = \frac{f_0}{f_e}$

(3) Length : $L_D = f_0 - u_e$ and $L_\infty = f_0 - f_e$

Reflecting Telescope

Reflecting telescopes are based upon the same principle except that the formation of images takes place by reflection instead of by refraction.

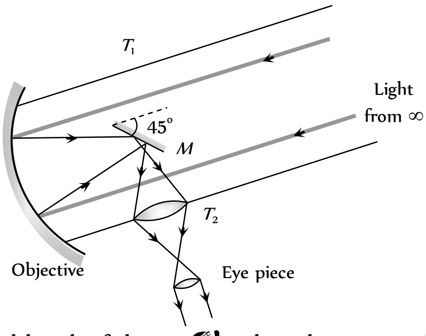

Fig. 29.86

If f_o is focal length of the concave spherical mirror used as objective and f_e the focal length of the eye-piece, the magnifying power of the reflecting telescope is given by $m = \frac{f_o}{f_e}$

Further, if D is diameter of the objective and d, the diameter of the pupil of the eye, then brightness ratio (β) is given by $\beta = \frac{D^2}{d^2}$

Resolving Limit and Resolving Power

(1) **Microscope :** In reference to a microscope, the minimum distance between two lines at which they are just distinct is called Resolving limit (*RL*) and it's reciprocal is called Resolving power (*RP*)

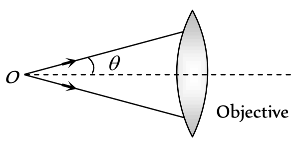

Fig. 29.87

$$R.L. = \frac{\lambda}{2\mu\sin\theta} \text{ and } R.P. = \frac{2\mu\sin\theta}{\lambda} \Rightarrow R.P. \propto \frac{1}{\lambda}$$

λ = Wavelength of light used to illuminate the object,

μ = Refractive index of the medium between object and objective,

θ = Half angle of the cone of light from the point object, $\mu\sin\theta$ = Numerical aperture.

(2) **Telescope :** Smallest angular separations ($d\theta$) between two distant objects, whose images are separated in the telescope is called resolving limit. So resolving limit $d\theta = \frac{1.22\lambda}{a}$

and resolving power $(RP) = \frac{1}{d\theta} = \frac{a}{1.22\lambda} \Rightarrow R.P. \propto \frac{1}{\lambda}$ where a = aperture of objective.

Binocular

If two telescopes are mounted parallel to each other so that an object can be seen by both the eyes simultaneously, the arrangement is called 'binocular'. In a binocular, the length of each tube is reduced by using a set of totally reflecting prisms which provide intense, erect image free from lateral inversion. Through a binocular we get two images of the same object from different angles at same time. Their superposition gives the perception of depth along with length and breadth, *i.e.*, binocular vision gives proper three-dimensional (3*D*) image.

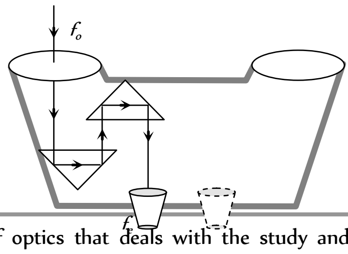

Fig. 29.88

Photometry

The branch of optics that deals with the study and measurement of the light energy is called photometry.

(1) **Radiant flux (*R*) :** The total energy radiated by a source per second is called radiant flux. It's S.I. unit is **Watt (*W*)**.

(2) **Luminous flux (ϕ) :** The total light energy emitted by a source per second is called luminous flux. It represents the total brightness producing capacity of the source. It's S.I. unit is **Lumen (*lm*)**.

(3) **Luminous efficiency (η) :** The Ratio of luminous flux and radiant flux is called luminous efficiency *i.e.* $\eta = \frac{\phi}{R}$.

Table 29.4 : Luminous flux and efficiency

Light source	Flux (lumen)	Efficiency (lumen/watt)
40 W tungsten bulb	465	12
60 W tungsten bulb	835	14
500 W tungsten bulb	9950	20
30 W fluorescent tube	1500	50

(4) **Luminous Intensity (*L*) :** In a given direction it is defined as luminous flux per unit solid angle *i.e.*

$$L = \frac{\phi}{\omega} \rightarrow \frac{\text{Light energy}}{\text{sec} \times \text{solid angle}} \xrightarrow{\text{S.I. unit}} \frac{\text{lumen}}{\text{steradian}} = \text{candela}\,(Cd)$$

The luminous intensity of a point source is given by : $L=\frac{\phi}{4\pi}\Rightarrow$ $\phi=4\pi\times(L)$

(5) **Illuminance or intensity of illumination (*I*) :** The luminous flux incident per unit area of a surface is called illuminance. $I=\frac{\phi}{A}$. It's S.I. unit is $\frac{\text{Lumen}}{m^2}$ or Lux (*lx*) and it's C.G.S. unit is Phot. $1\,\text{Phot}=10^4\,\text{Lux}=\frac{1\,\text{Lumen}}{cm^2}$

(i) Intensity of illumination at a distance *r* from a point source is $I=\frac{\phi}{4\pi r^2}\Rightarrow I\propto\frac{1}{r^2}$.

(ii) Intensity of illumination at a distance *r* from a line source is $I=\frac{\phi}{2\pi rl}\Rightarrow I\propto\frac{1}{r}$

(iii) In case of a parallel beam of light $I\propto r^0$.

(iv) The illuminance represents the luminous flux incident on unit area of the surface, while luminance represents the luminous flux reflected from a unit area of the surface.

(6) **Relation Between Luminous Intensity (*L*) and Illuminance (*I*) :** If S is a unidirectional point source of light of luminous intensity L and there is a surface at a distance r from source, on which light is falling normally.

(i) Illuminance of surface is given by : $I=\frac{L}{r^2}$

(ii) For a given source L = constant so $I\propto\frac{1}{r^2}$; This is called. Inverse square law of illuminance.

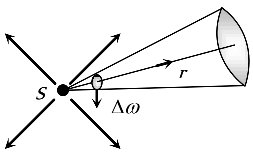

Fig. 29.89

(7) **Lambert's Cosine Law of Illuminance :** In the above discussion if surface is so oriented that light from the source falls, on it obliquely and the central ray of light makes an angle θ with the normal to the surface, then

(i) Illuminance of the surface $I=\frac{L\cos\theta}{r^2}$

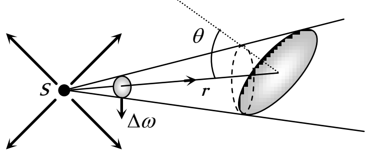

Fig. 29.90

(ii) For a given light source and point of illumination (*i.e.* *L* and *r* = constant) $I\propto\cos\theta$ this is called Lambert's cosine law of illuminance. $\Rightarrow I_{\max}=\frac{L}{r^2}=I_o(\text{at}\,\theta=0^o)$

(iii) For a given source and plane of illuminance (*i.e.* *L* and *h* = constant)

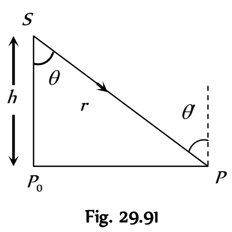

Fig. 29.91

$\cos\theta=\frac{h}{r}$ so $I=\frac{L}{h^2}\cos^3\theta$

or $I=\frac{Lh}{r^3}$ *i.e.* $I\propto\cos^3\theta$ or $I\propto\frac{1}{r^3}$

(8) **Photometer and Principle of Photometry :** A photometer is a device used to compare the illuminance of two sources.

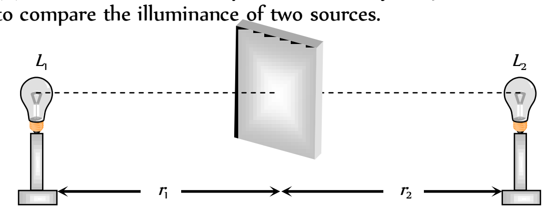

Fig. 29.92

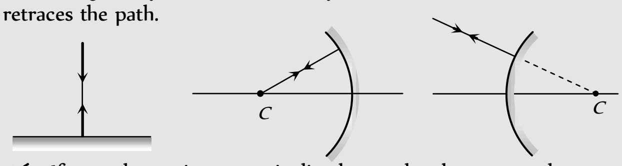
Two sources of luminous intensity L_1, and L_2 are placed at distances r_1 and r_2 from the screen so that their flux are perpendicular to the screen. The distance r_1 and r_2 are adjusted till $I_1=I_2$. So $\frac{L_1}{r_1^2}=\frac{L_2}{r_2^2}\Rightarrow\frac{L_1}{L_2}=\left(\frac{r_1}{r_2}\right)^2$; This is called principle of photometry.

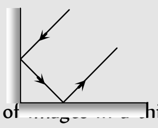
Tips & Tricks

✍ After reflection velocity, wavelength and frequency of light remains same but intensity decreases.

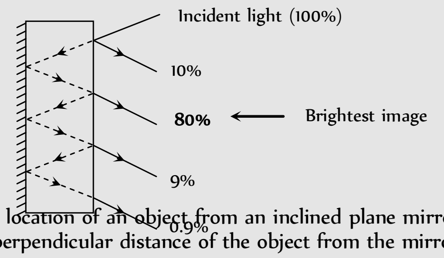
✍ If light ray incident normally on a surface, after reflection it retraces the path.



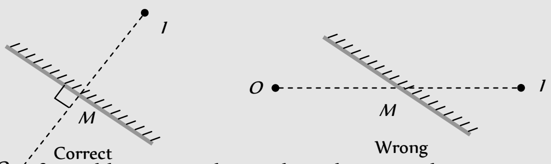
✍ If two plane mirrors are inclined to each other at 90°, the emergent ray is anti-parallel to incident ray, if it suffers one reflection from each. Whatever be the angle to incidence.



✍ We observe number of ... hick plane mirror, out of them only second is brightest.



✍ To find the location of an object from an inclined plane mirror, you have to see the perpendicular distance of the object from the mirror.



✍ Images formed by mirrors do not show chromatic aberration.

✍ In concave mirror, minimum distance between a real object and it's real image is zero. (*i.e.* when *u* = *v* = 2*f*)

✍ If a spherical mirror produces an image '*m*' times the size of the object (m = magnification) then u, v and f are given by the followings

$$u = \left(\frac{m-1}{m}\right)f,\quad v = -(m-1)f \text{ and } f = \left(\frac{m}{m-1}\right)u$$

✍ Focal length of a mirror is independent of material of mirror and medium in which it is placed and wavelength of incident light

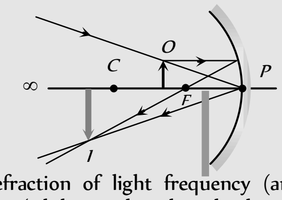
✍ Divergence or Convergence power of a mirror does not change with the change in medium.

✍ If an object is moving at a speed v towards a spherical mirror along it's axis then speed of image away from mirror is

$$v_i = -\left(\frac{f}{u-f}\right)^2 . v_o$$

✍ When object is moved from focus to infinity at constant speed, the image will move faster in the beginning till object moves from f to $2f$, and slower later on, towards the mirror.

✍ As every part of mirror forms a complete image, if a part of the mirror is obstructed, full image will be formed but intensity will be reduced.



✍ In case of refraction of light frequency (and hence colour) and phase do not change (while wavelength and velocity will change).

✍ *In the refraction intensity of incident light decreases as it goes from one medium to another medium.*

✍ A transparent solid is invisible in a liquid of same refractive index (Because of No refraction).

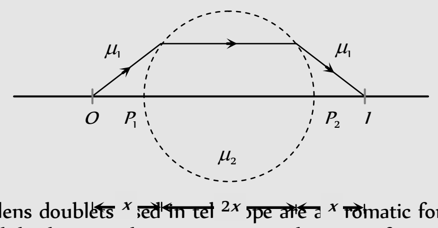
✍ When a glass slab is kept over various coloured letters and seen from the top, the violet colour letters appears closer (Because $\lambda_V < \lambda_R$ so $\mu_V > \mu_R$ and from $\mu = \frac{h}{h'}$ if μ increases then h' decreases i.e. Letter appears to be closer)

✍ Minimum distance between an object and it's real image formed by a convex lens is $4f$.

✍ Component lenses of an achromatic doublet cemented by canada blasam because it is transparent and has a refractive index almost equal to the refractive index of the glass.

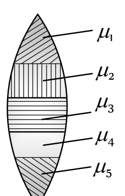
✍ Parabolic mirrors are free from spherical aberration.

✍ If a sphere of radius R made of material of refractive index μ_2 is placed in a medium of refractive index μ_1, then if the object is placed at a distance $\left(\frac{\mu_1}{\mu_2-\mu_1}\right)R$ from the pole, the real image formed is equidistant from the sphere



✍ The lens doublets used in telescope are achromatic for blue and red colours, while these used in camera are achromatic for violet and green colours. The reason for this is that our eye is most sensitive between blue and red colours, while the photographic plates are most sensitive between violet and green colours.

✍ **Composite lens :** If a lens is made of several materials then



Number of images formed = Number of materials used

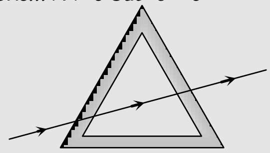
Here no. of images = 5

✍ For the condition of grazing emergence through a prism. Minimum angle of incidence $i_{min} = \sin^{-1}\left[\sqrt{\mu^2-1}\sin A - \cos A\right]$.

✍ If a substance emits spectral lines at high temperature then it absorbs the same lines at low temperature. This is Kirchoff's law.

✍ When a ray of white light passes through a glass prism red light is deviated less than blue light.

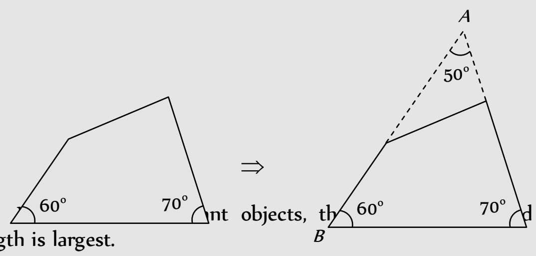
✍ For a hollow prism $A \neq 0$ but $\delta = 0$



✍ If an opaque coloured object or crystal is crushed to fine powder it will appear white (in sun light) as it will lose it's property of selective reflection.

✍ Our eye is most sensitive to that part of the spectrum which lies between the F line (sky green) and the C-line (red) of hydrogen, and the mean refractive index of this part is nearly equal to the refractive index for the D line (yellow) of sodium. Hence for the dispersive power, the following formula is internationally accepted $\omega = \frac{\mu_F - \mu_C}{\mu_D - 1}$

✍ Sometimes a part of prism is given and we keep on thinking whether how should we proceed ? To solve such problems first complete the prism then solve as the problems of prism are solved



✍ ...nt objects, th... d it's focal length is largest.

✍ Minimum separation (d) between objects, so they can just resolved by a telescope is : $d = \frac{r}{R.P.}$

Where r = distance of objects from telescope.

✍ As magnifying power astronomical telescope is negative, the image seen in astronomical telescope is truly inverted, i.e., left is turned right with upside down simultaneously. However, as most of the astronomical objects are symmetrical this inversion does not affect the observations.

✍ If objective and eye lens of a telescope are interchanged, it will not behave as a microscope but object appears very small.

✍ In a telescope, if field and eye lenses are interchanged magnification will change from (f_o/f_e) to (f_e/f_o), *i.e.,* it will change from m to $(1/m)$, i.e., will become $(1/m)$ times of its initial value.

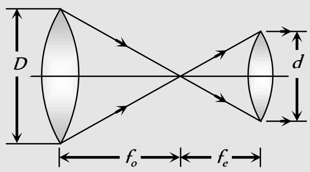
✍ As magnification produced by telescope for normal setting is (f_o/f_e), so to have large magnification, f_o must be as large as practically possible and f_e small. This is why in a telescope, objective is of large focal length while eye piece of small.

✍ In a telescope, aperture of the field lens is made as large as practically possible to increase its resolving power as resolving power of a telescope $\propto (D/\lambda)$. Large aperture of objective also helps in improving the brightness of image by gathering more light from distant object. However, it increases aberrations particularly spherical.

✍ For a telescope with increase in length of the tube, magnification decreases.

✍ In case of a telescope if object and final image are at infinity then :

$m = \frac{f_o}{f_e} = \frac{D}{d}$



✍ If we are given four convex lenses having focal lengths $f_1 > f_2 > f_3 > f_4$. For making a good telescope and microscope. We choose the following lenses respectively.

Telescope $f_1(o), f_4(e)$ Microscope $f_4(o), f_3(e)$

✍ If a parrot is sitting on the objective of a large telescope and we look towards (or take a photograph)of distant astronomical object (say moon) through it, the parrot will not be seen but the intensity of the image will be slightly reduced as the parrot will act as obstruction to light and will reduce the aperture of the objective.

✍ The luminous flux of a source of (1/685) watt emitting monochromatic light of wavelength 5500 Å is called 1 lumen.

✍ While solving the problems of photometry keep in mind.

$R \propto \phi \propto L$ (As $\phi = \eta R = 4\pi L$)

$\Rightarrow \frac{R_1}{R_2} = \frac{\phi_1}{\phi_2} = \frac{L_1}{L_2}$

Ordinary Thinking

Objective Questions

Plane Mirror

1. Two vertical plane mirrors are inclined at an angle of $60°$ with each other. A ray of light travelling horizontally is reflected first from one mirror and then from the other. The resultant deviation is
   (a) $60°$ (b) $120°$
   (c) $180°$ (d) $240°$

2. A plane mirror reflects a pencil of light to form a real image. Then the pencil of light incident on the mirror is [MP PMT 1997; DCE 2001, 03]
   (a) Parallel (b) Convergent
   (c) Divergent (d) None of the above

3. What should be the angle between two plane mirrors so that whatever be the angle of incidence, the incident ray and the reflected ray from the two mirrors be parallel to each other [KCET 1994; SCRA 1994]
   (a) $60°$ (b) $90°$
   (c) $120°$ (d) $175°$

4. A plane mirror reflecting a ray of incident light is rotated through an angle θ about an axis through the point of incidence in the plane of the mirror perpendicular to the plane of incidence, then
   (a) The reflected ray does not rotate
   (b) The reflected ray rotates through an angle θ
   (c) The reflected ray rotates through an angle 2θ
   (d) The incident ray is fixed

5. A plane mirror is approaching you at a speed of $10\,cm/sec$ You can see your image in it. At what speed will your image approach you [CPMT 1974]
   (a) $10 cm/sec$ (b) $5 cm/sec$
   (c) $20 cm/sec$ (d) $15 cm/sec$

6. A light bulb is placed between two plane mirrors inclined at an angle of $60°$. The number of images formed are
   SCRA 1994; AIIMS 1997; RPMT 1999; AIEEE 2002; Orissa JEE 2003; MP PMT 2004; MP PET 2004]
   (a) 6 (b) 2
   (c) 5 (d) 4

7. It is desired to photograph the image of an object placed at a distance of $3m$ from the plane mirror. The camera which is at a distance of $4.5m$ from the mirror should be focussed for a distance of [NCERT 1971]
   (a) $3m$ (b) $4.5m$
   (c) $6m$ (d) $7.5m$

8. A thick plane mirror shows a number of images of the filament of an electric bulb. Of these, the brightest image is the
   (a) First (b) Second
   (c) Fourth (d) Last

9. A man is $180cm$ tall and his eyes are $10cm$ below the top of his head. In order to see his entire height right from toe to head, he uses a plane mirror kept at a distance of $1m$ from him. The minimum length of the plane mirror required is [MP PMT 1993; DPMT 2001]
   (a) $180cm$ (b) $90cm$
   (c) $85cm$ (d) $170cm$

10. A person is in a room whose ceiling and two adjacent walls are mirrors. How many images are formed [AFMC 2002]
    (a) 5 (b) 6
    (c) 7 (d) 8

11. When a plane mirror is placed horizontally on a level ground at a distance of $60m$ from the foot of a tower, the top of the tower and its image in the mirror subtend an angle of $90°$ at the eye. The height of the tower will be [CPMT 1984]
    (a) $30m$ (b) $60m$
    (c) $90m$ (d) $120m$

12. A ray of light incidents on a plane mirror at an angle of $30°$. The deviation produced in the ray is [NCERT 1978; CPMT 1991]
    (a) $30°$ (b) $60°$
    (c) $90°$ (d) $120°$

13. A ray of light is incidenting normally on a plane mirror. The angle of reflection will be [MP PET 2000]

(a) $0°$ (b) $90°$

(c) Will not be reflected (d) None of the above

14. When light wave suffers reflection at the interface from air to glass, the change in phase of the reflected wave is equal to [CPMT 1991; J & KCET 2004]

(a) 0 (b) $\frac{\pi}{2}$

(c) π (d) 2π

15. A ray is reflected in turn by three plain mirrors mutually at right angles to each other. The angle between the incident and the reflected rays is [Roorkee 1995]

(a) $90°$ (b) $60°$

(c) $180°$ (d) None of these

16. Two plane mirrors are at right angles to each other. A man stands between them and combs his hair with his right hand. In how many of the images will he be seen using his right hand [MP PMT 1995; UPSEAT 2001]

(a) None (b) 1

(c) 2 (d) 3

17. When a plane mirror is rotated through an angle θ then the reflected ray turns through the angle 2θ then the size of the image

(a) Is doubled (b) Is halved

(c) Remains the same (d) Becomes infinite

18. A plane mirror produces a magnification of [MP PET/PMT 1997]

(a) -1 (b) $+1$

(c) Zero (d) Between 0 and $+\infty$

19. A plane mirror makes an angle of $30°$ with horizontal. If a vertical ray strikes the mirror, find the angle between mirror and reflected ray [RPET 1997]

(a) $30°$ (b) $45°$

(c) $60°$ (d) $90°$

20. A watch shows time as $3:25$ when seen through a mirror, time appeared will be [RPMT 1997; JIPMER 2001, 02]

(a) $8:35$ (b) $9:35$

(c) $7:35$ (d) $8:25$

21. If an observer is walking away from the plane mirror with $6m/sec$. Then the velocity of the image with respect to observer will be [RPMT 1999]

(a) $6m/sec$ (b) $-6m/sec$

(c) $12m/sec$ (d) $3m/sec$

22. A man runs towards mirror at a speed of $15m/s$. What is the speed of his image [CBSE PMT 2000]

(a) 7.5 m/s (b) 15 m/s

(c) 30 m/s (d) 45 m/s

23. A small object is placed 10 cm infront of a plane mirror. If you stand behind the object 30 cm from the mirror and look at its image, the distance focused for your eye will be [KCET (Engg.) 2001]

(a) 60 cm (b) 20 cm

(c) 40 cm (d) 80 cm

24. An object is at a distance of 0.5 m in front of a plane mirror. Distance between the object and image is [CPMT 2002]

(a) 0.5 m (b) 1 m

(c) 0.25 m (d) 1.5 m

25. A man runs towards a mirror at a speed 15 m/s The speed of the image relative to the man is [Kerala PET 2002]

(a) 15 ms^{-1} (b) 30 ms^{-1}

(c) 35 ms^{-1} (d) 20 ms^{-1}

26. The light reflected by a plane mirror may form a real image [KCET (Engg. & Med.) 2002]

(a) If the rays incident on the mirror are diverging

(b) If the rays incident on the mirror are converging

(c) If the object is placed very close to the mirror

(d) Under no circumstances

27. Two plane mirrors are inclined at an angle of 72^0. The number of images of a point object placed between them will be [KCET (Engg. & Med.)1999;

(a) 2 (b) 3

(c) 4 (d) 5

28. To get three images of a single object, one should have two plane mirrors at an angle of [AIEEE 2003]

(a) 30° (b) 60°

(c) 90° (d) 150°

29. A man of length h requires a mirror, to see his own complete image of length at least equal to [MP PET 2003]

(a) $\frac{h}{4}$ (b) $\frac{h}{3}$

(c) $\frac{h}{2}$ (d) h

30. Two plane mirrors are at $45°$ to each other. If an object is placed between them, then the number of images will be [MP PMT 2003]

(a) 5 (b) 9

(c) 7 (d) 8

31. A man having height 6 m. He observes image of 2 m height erect, then mirror used is [BCECE 2004]

(a) Concave (b) Convex

(c) Plane (d) None of these

32. A light beam is being reflected by using two mirrors, as in a periscope used in submarines. If one of the mirrors rotates by an angle θ, the reflected light will deviate from its original path by the angle [UPSEAT 2004]

(a) 2θ (b) 0^o

(c) θ (d) 4θ

33. Focal length of a plane mirror is [RPMT 2000]

(a) Zero (b) Infinite

(c) Very less (d) Indefinite

34. A ray of light is incident at 50° on the middle of one of the two mirrors arranged at an angle of 60° between them. The ray then touches the second mirror, get reflected back to the first mirror, making an angle of incidence of [MP PET 2005]

(a) 50° (b) 60°

(c) 70° (d) 80°

Spherical Mirror

1. A convex mirror of focal length *f* forms an image which is $\frac{1}{n}$ times the object. The distance of the object from the mirror is

(a) $(n-1)f$ (b) $\left(\frac{n-1}{n}\right)f$

(c) $\left(\frac{n+1}{n}\right)f$ (d) $(n+1)f$

2. A diminished virtual image can be formed only in [MP PMT 2002]

(a) Plane mirror (b) A concave mirror

(c) A convex mirror (d) Concave-parabolic mirror

3. Which of the following could not produce a virtual image

(a) Plane mirror

(b) Convex mirror

(c) Concave mirror

(d) All the above can produce a virtual image

4. An object $5cm$ tall is placed $1m$ from a concave spherical mirror which has a radius of curvature of $20cm$ The size of the image is

(a) $0.11cm$ (b) $0.50cm$

(c) $0.55cm$ (d) $0.60cm$

5. The focal length of a concave mirror is $50cm$. Where an object be placed so that its image is two times and inverted

(a) 75 *cm* (b) 72 *cm*

(c) 63 *cm* (d) 50 *cm*

6. An object of size $7.5cm$ is placed in front of a convex mirror of radius of curvature $25cm$ at a distance of $40cm$. The size of the image should be

(a) $2.3cm$ (b) $1.78cm$

(c) $1cm$ (d) $0.8cm$

7. The field of view is maximum for

(a) Plane mirror (b) Concave mirror

(c) Convex mirror (d) Cylindrical mirror

8. The focal length of a concave mirror is *f* and the distance from the object to the principle focus is *x*. The ratio of the size of the image to the size of the object is [Kerala PET 2005]

(a) $\frac{f+x}{f}$ (b) $\frac{f}{x}$

(c) $\sqrt{\frac{f}{x}}$ (d) $\frac{f^2}{x^2}$

9. Image formed by a convex mirror is [MP PET 1993]

(a) Virtual (b) Real

(c) Enlarged (d) Inverted

10. In a concave mirror experiment, an object is placed at a distance x_1 from the focus and the image is formed at a distance x_2 from the focus. The focal length of the mirror would be

(a) x_1x_2 (b) $\sqrt{x_1x_2}$

(c) $\frac{x_1+x_2}{2}$ (d) $\sqrt{\frac{x_1}{x_2}}$

11. A convex mirror is used to form the image of an object. Then which of the following statements is wrong [CPMT 1973]

(a) The image lies between the pole and the focus

(b) The image is diminished in size

(c) The image is erect

(d) The image is real

12. Given a point source of light, which of the following can produce a parallel beam of light [CPMT 1974; KCET 2005]

(a) Convex mirror

(b) Concave mirror

(c) Concave lens

(d) Two plane mirrors inclined at an angle of $90°$

13. The image formed by a convex mirror of focal length $30cm$ is a quarter of the size of the object. The distance of the object from the mirror is [MP PET 1993]

(a) $30cm$ (b) $90cm$

(c) $120cm$ (d) $60cm$

14. A boy stands straight infront of a mirror at a distance of $30cm$ away from it. He sees his erect image whose height is $\frac{1}{5}th$ of his real height. The mirror he is using is [MP PMT 1993]

(a) Plane mirror (b) Convex mirror

(c) Concave mirror (d) Plano-convex mirror

15. A person sees his virtual image by holding a mirror very close to the face. When he moves the mirror away from his face, the image becomes inverted. What type of mirror he is using

(a) Plane mirror (b) Convex mirror

(c) Concave mirror (d) None of these

16. Which one of the following statements is true

(a) An object situated at the principle focus of a concave lens will have its image formed at infinity

(b) Concave mirror can give diminished virtual image

(c) Given a point source of light, a convex mirror can produce a parallel beam of light

(d) The virtual image formed in a plane mirror can be photographed

17. The relation between the linear magnification m, the object distance u and the focal length f is

(a) $m = \frac{f-u}{f}$ (b) $m = \frac{f}{f-u}$

(c) $m = \frac{f+u}{f}$ (d) $m = \frac{f}{f+u}$

18. While using an electric bulb, the reflection for street lighting should be from

(a) Concave mirror (b) Convex mirror

(c) Cylindrical mirror (d) Parabolic mirror

19. A concave mirror is used to focus the image of a flower on a nearby well $120cm$ from the flower. If a lateral magnification of 16 is desired, the distance of the flower from the mirror should be

(a) $8cm$ (b) $12cm$

(c) $80cm$ (d) $120cm$

20. A virtual image larger than the object can be obtained by [MP PMT 1986]

(a) Concave mirror (b) Convex mirror

(c) Plane mirror (d) Concave lens

21. An object is placed $40cm$ from a concave mirror of focal length $20cm$. The image formed is [MP PET 1986; MP PMT/PET 1998]

(a) Real, inverted and same in size

(b) Real, inverted and smaller

(c) Virtual, erect and larger

(d) Virtual, erect and smaller

22. A virtual image three times the size of the object is obtained with a concave mirror of radius of curvature $36cm$. The distance of the object from the mirror is [MP PET 1986]

(a) $5cm$ (b) $12cm$

(c) $10cm$ (d) $20cm$

23. Radius of curvature of concave mirror is $40cm$ and the size of image is twice as that of object, then the object distance is [AFMC 1995]

(a) $60cm$ (b) $20cm$

(c) $40cm$ (d) $30cm$

24. All of the following statements are correct except [Manipal MEE 1995]

(a) The magnification produced by a convex mirror is always less than one

(b) A virtual, erect, same-sized image can be obtained using a plane mirror

(c) A virtual, erect, magnified image can be formed using a concave mirror

(d) A real, inverted, same-sized image can be formed using a convex mirror

25. If an object is placed $10cm$ infront of a concave mirror of focal length $20cm$, the image will be [MP PMT 1995]

(a) Diminished, upright, virtual

(b) Enlarged, upright, virtual

(c) Diminished, inverted, real

(d) Enlarged, upright, real

26. Which of the following form(s) a virtual and erect image for all positions of the object [IIT-JEE 1996]

(a) Convex lens (b) Concave lens

(c) Convex mirror (d) Concave mirror

27. A convex mirror has a focal length f. A real object is placed at a distance f in front of it from the pole produces an image at [MP PET 1986]

(a) Infinity (b) f

(c) $f/2$ (d) $2f$

28. An object $1cm$ tall is placed $4cm$ infront of a mirror. In order to produce an upright image of $3cm$ height one needs a

(a) Convex mirror of radius of curvature $12cm$

(b) Concave mirror of radius of curvature $12cm$

(c) Concave mirror of radius of curvature $4cm$

(d) Plane mirror of height $12cm$

29. Match List I with List II and select the correct answer using the codes given below the lists : [SCRA 1998]

List I	List II
(Position of the object)	(Magnification)
(I) An object is placed at focus before a convex mirror	(A) Magnification is $-\infty$
(II) An object is placed at centre of curvature before a concave mirror	(B) Magnification is 0.5
(III) An object is placed at focus before a concave mirror	(C) Magnification is $+1$
(IV) An object is placed at centre of curvature before a convex mirror	(D) Magnification is – 1
	(E) Magnification is 0.33

Codes :

(a) I-B, II-D, III-A, IV-E (b) I-A, II-D, III-C, IV-B

(c) I-C, II-B, III-A, IV-E (d) I-B, II-E, III-D, IV-C

30. A concave mirror gives an image three times as large as the object placed at a distance of $20cm$ from it. For the image to be real, the focal length should be [SCRA 1998; JIPMER 2000]

(a) $10cm$ (b) $15cm$

(c) $20cm$ (d) $30cm$

31. The minimum distance between the object and its real image for concave mirror is [RPMT 1999]

(a) f (b) $2f$

(c) $4f$ (d) Zero

32. An object is placed at $20cm$ from a convex mirror of focal length $10\,cm$. The image formed by the mirror is [JIPMER 1999]

(a) Real and at $20\,cm$ from the mirror

(b) Virtual and at $20\,cm$ from the mirror

(c) Virtual and at $20/3\,cm$ from the mirror

(d) Real and at $20/3\,cm$ from the mirror

33. A point object is placed at a distance of $10\,cm$ and its real image is formed at a distance of $20\,cm$ from a concave mirror. If the object is moved by $0.1\,cm$ towards the mirror, the image will shift by about [MP PMT 2000]

(a) $0.4cm$ away from the mirror

(b) $0.4cm$ towards the mirror

(c) $0.8cm$ away from the mirror

(d) $0.8cm$ towards the mirror

34. Under which of the following conditions will a convex mirror of focal length f produce an image that is erect, diminished and virtual [AMU (Engg.) 2001]

(a) Only when $2f > u > f$ (b) Only when $u = f$

(c) Only when $u < f$ (d) Always

35. The focal length of a convex mirror is 20 *cm* its radius of curvature will be [MP PMT 2001]

(a) 10 *cm* (b) 20 *cm*

(c) 30 *cm* (d) 40 *cm*

36. A concave mirror of focal length 15 *cm* forms an image having twice the linear dimensions of the object. The position of the object when the image is virtual will be

(a) 22.5 *cm* (b) 7.5 *cm*

(c) 30 *cm* (d) 45 *cm*

37. A point object is placed at a distance of 30 *cm* from a convex mirror of focal length 30*cm*. The image will form at [JIPMER 2002]

(a) Infinity

(b) Focus

(c) Pole

(d) 15 *cm* behind the mirror

38. An object 2.5 *cm* high is placed at a distance of 10 *cm* from a concave mirror of radius of curvature 30 *cm* The size of the image is [BVP 2003]

(a) 9.2 *cm* (b) 10.5 *cm*

(c) 5.6 *cm* (d) 7.5 *cm*

39. For a real object, which of the following can produced a real image

(a) Plane mirror (b) Concave lens

(c) Convex mirror (d) Concave mirror

40. An object of length 6 *cm* is placed on the principle axis of a concave mirror of focal length f at a distance of $4f$. The length of the image will be [MP PET 2003]

(a) 2 *cm* (b) 12 *cm*

(c) 4 *cm* (d) 1.2 *cm*

41. Convergence of concave mirror can be decreased by dipping in

(a) Water (b) Oil

(c) Both (d) None of these

42. What will be the height of image when an object of 2 *mm* is placed on the axis of a convex mirror at a distance 20 *cm* of radius of curvature 40 *cm* [Orissa PMT 2004]

(a) 20 *mm* (b) 10 *mm*

(c) 6 *mm* (d) 1 *mm*

43. Image formed by a concave mirror of focal length 6 *cm*, is 3 times of the object, then the distance of object from mirror is [RPMT 2000]

(a) – 4 *cm* (b) 8 *cm*

(c) 6 *cm* (d) 12 *cm*

44. A concave mirror of focal length f (in air) is immersed in water ($\mu = 4/3$). The focal length of the mirror in water will be

(a) f (b) $\frac{4}{3}f$

(c) $\frac{3}{4}f$ (d) $\frac{7}{3}f$

Refraction of Light at Plane Surfaces

1. To an observer on the earth the stars appear to twinkle. This can be ascribed to [CPMT 1972, 74; AFMC 1995]

(a) The fact that stars do not emit light continuously

(b) Frequent absorption of star light by their own atmosphere

(c) Frequent absorption of star light by the earth's atmosphere

(d) The refractive index fluctuations in the earth's atmosphere

2. The ratio of the refractive index of red light to blue light in air is

(a) Less than unity

(b) Equal to unity

(c) Greater than unity

(d) Less as well as greater than unity depending upon the experimental arrangement

3. The refractive index of a piece of transparent quartz is the greatest for [MP PET 1985, 94]

(a) Red light (b) Violet light

(c) Green light (d) Yellow light

4. The refractive index of a certain glass is 1.5 for light whose wavelength in vacuum is 6000 Å. The wavelength of this light when it passes through glass is [NCERT 1979; CBSE PMT 1993; MP PET 1985, 89] [Orissa JEE 2003]

(a) 4000 Å (b) 6000 Å

(c) 9000 Å (d) 15000 Å

5. When light travels from one medium to the other of which the refractive index is different, then which of the following will change [MP PMT 1986; AMU 2001; BVP 2003]

(a) Frequency, wavelength and velocity

(b) Frequency and wavelength

(c) Frequency and velocity

(d) Wavelength and velocity

6. A light wave has a frequency of 4×10^{14} Hz and a wavelength of 5×10^{-7} meters in a medium. The refractive index of the medium is [MP PMT 1989]

(a) 1.5 (b) 1.33
(c) 1.0 (d) 0.66

7. How much water should be filled in a container 21 *cm* in height, so that it appears half filled when viewed from the top of the container (given that ${}_a\mu_\omega = 4/3$) [MP PMT 1989]

(a) 8.0 *cm* (b) 10.5 *cm*
(c) 12.0 *cm* (d) None of the above

8. Light of different colours propagates through air

(a) With the velocity of air
(b) With different velocities
(c) With the velocity of sound
(d) Having the equal velocities

9. Monochromatic light is refracted from air into the glass of refractive index μ. The ratio of the wavelength of incident and refracted waves is [JIPMER 2000; MP PMT 1996, 2003]

(a) $1:\mu$ (b) $1:\mu^2$
(c) $\mu:1$ (d) $1:1$

10. A monochromatic beam of light passes from a denser medium into a rarer medium. As a result [CPMT 1972]

(a) Its velocity increases (b) Its velocity decreases
(c) Its frequency decreases (d) Its wavelength decreases

11. Refractive index for a material for infrared light is [CPMT 1984]

(a) Equal to that of ultraviolet light
(b) Less than for ultraviolet light
(c) Equal to that for red colour of light
(d) Greater than that for ultraviolet light

12. The index of refraction of diamond is 2.0, velocity of light in diamond in *cm/second* is approximately [CPMT 1975; MNR 1987; UPSEAT 2000]

(a) 6×10^{10} (b) 3.0×10^{10}
(c) 2×10^{10} (d) 1.5×10^{10}

13. A beam of light propagating in medium *A* with index of refraction *n* (*A*) passes across an interface into medium *B* with index of refraction *n*(*B*). The angle of incidence is greater than the angle of refraction; *v*(*A*) and *v*(*B*) denotes the speed of light in *A* and *B*. Then which of the following is true

(a) $v(A) > v(B)$ and $n(A) > n(B)$
(b) $v(A) > v(B)$ and $n(A) < n(B)$
(c) $v(A) < v(B)$ and $n(A) > n(B)$
(d) $v(A) < v(B)$ and $n(A) < n(B)$

14. A rectangular tank of depth 8 meter is full of water ($\mu = 4/3$), the bottom is seen at the depth [MP PMT 1987]

(a) 6 *m* (b) 8/3 *m*
(c) 8 *cm* (d) 10 *cm*

15. A vessel of depth 2d *cm* is half filled with a liquid of refractive index μ_1 and the upper half with a liquid of refractive index μ_2. The apparent depth of the vessel seen perpendicularly is

(a) $d\left(\frac{\mu_1\mu_2}{\mu_1+\mu_2}\right)$ (b) $d\left(\frac{1}{\mu_1}+\frac{1}{\mu_2}\right)$
(c) $2d\left(\frac{1}{\mu_1}+\frac{1}{\mu_2}\right)$ (d) $2d\left(\frac{1}{\mu_1\mu_2}\right)$

16. A beam of light is converging towards a point I on a screen. A plane glass plate whose thickness in the direction of the beam = t, refractive index = μ, is introduced in the path of the beam. The convergence point is shifted by [MNR 1987]

(a) $t\left(1-\frac{1}{\mu}\right)$ away (b) $t\left(1+\frac{1}{\mu}\right)$ away
(c) $t\left(1-\frac{1}{\mu}\right)$ nearer (d) $t\left(1+\frac{1}{\mu}\right)$ nearer

17. Light travels through a glass plate of thickness *t* and having refractive index *n*. If *c* is the velocity of light in vacuum, the time taken by the light to travel this thickness of glass is [NCERT 1976; MP PET 1994; CBSE PMT 1996; KCET 1994; MP PMT 1999, 2001]

(a) $\frac{t}{nc}$ (b) tnc
(c) $\frac{nt}{c}$ (d) $\frac{tc}{n}$

18. When a light wave goes from air into water, the quality that remains unchanged is its [AMU 1995; MNR 1985, 95; KCET 1993; CPMT 1990, 97; MP PET 1991, 2000, 02; UPSEAT 1999, 2000; AFMC 1993, 98, 2003; RPET 1996, 2000, 03; RPMT 1999, 2000; DCE 2001; BHU 2001]

(a) Speed (b) Amplitude
(c) Frequency (d) Wavelength

19. Light takes 8 *min* 20 *sec* to reach from sun on the earth. If the whole atmosphere is filled with water, the light will take the time (${}_a\mu_w = 4/3$)

(a) 8 *min* 20 *sec* (b) 8 *min*
(c) 6 *min* 11 *sec* (d) 11 *min* 6 *sec*

20. The length of the optical path of two media in contact of length d_1 and d_2 of refractive indices μ_1 and μ_2 respectively, is

(a) $\mu_1 d_1 + \mu_2 d_2$ (b) $\mu_1 d_2 + \mu_2 d_1$
(c) $\frac{d_1 d_2}{\mu_1\mu_2}$ (d) $\frac{d_1+d_2}{\mu_1\mu_2}$

21. Immiscible transparent liquids A, B, C, D and E are placed in a rectangular container of glass with the liquids making layers according to their densities. The refractive index of the liquids are shown in the adjoining diagram. The container is illuminated from the side and a small piece of glass having refractive index 1.61 is

gently dropped into the liquid layer. The glass piece as it descends downwards will not be visible in [CPMT 1986]

A	1.51
B	1.53
C	1.61
D	1.52
E	1.65

(a) Liquid *A* and *B* only

(b) Liquid *C* only

(c) Liquid *D* and *E* only

(d) Liquid *A, B, D* and *E*

22. The refractive indices of glass and water *w.r.t.* air are 3/2 and 4/3 respectively. The refractive index of glass *w.r.t.* water will be

[MNR 1990; JIPMER 1997, 2000; MP PET 2000]

(a) 8/9 (b) 9/8

(c) 7/6 (d) None of these

23. If ${}_i\mu_j$ represents refractive index when a light ray goes from medium *i* to medium *j*, then the product ${}_2\mu_1 \times {}_3\mu_2 \times {}_4\mu_3$ is equal to [CBSE PMT 1990]

(a) ${}_3\mu_1$ (b) ${}_3\mu_2$

(c) $\frac{1}{{}_1\mu_4}$ (d) ${}_4\mu_2$

24. The wavelength of light diminishes μ times ($\mu = 1.33$ for water) in a medium. A diver from inside water looks at an object whose natural colour is green. He sees the object as

[CPMT 1990; MNR 1998]

(a) Green (b) Blue

(c) Yellow (d) Red

25. Ray optics fails when

(a) The size of the obstacle is 5 *cm*

(b) The size of the obstacle is 3 *cm*

(c) The size of the obstacle is less than the wavelength of light

(d) (a) and (b) both

26. When light travels from air to water and from water to glass, again from glass to CO_2 gas and finally through air. The relation between their refractive indices will be given by

(a) ${}_an_w \times {}_wn_{gl} \times {}_{gl}n_{gas} \times {}_{gas}n_a = 1$

(b) ${}_an_w \times {}_wn_{gl} \times {}_{gas}n_{gl} \times {}_{gl}n_a = 1$

(c) ${}_an_w \times {}_wn_{gl} \times {}_{gl}n_{gas} = 1$

(d) There is no such relation

27. For a colour of light the wavelength for air is 6000 *Å* and in water the wavelength is 4500 *Å*. Then the speed of light in water will be

(a) $5. \times 10^{14}\ m/s$ (b) 2.25×10^{8} *m/s*

(c) 4.0×10^{8} *m/s* (d) Zero

28. A ray of light travelling inside a rectangular glass block of refractive index $\sqrt{2}$ is incident on the glass–air surface at an angle of incidence of 45°. The refractive index of air is 1. Under these conditions the ray [CPMT 1972]

(a) Will emerge into the air without any deviation

(b) Will be reflected back into the glass

(c) Will be absorbed

(d) Will emerge into the air with an angle of refraction equal to 90°

29. If ε_0 and μ_0 are respectively, the electric permittivity and the magnetic permeability of free space, ε and μ the corresponding quantities in a medium, the refractive index of the medium is

[IIT-JEE 1982; MP PET 1995; CBSE PMT 1997]

(a) $\sqrt{\frac{\mu\varepsilon}{\mu_0\varepsilon_0}}$ (b) $\frac{\mu\varepsilon}{\mu_0\varepsilon_0}$

(c) $\sqrt{\frac{\mu_0\varepsilon_0}{\mu\varepsilon}}$ (d) $\sqrt{\frac{\mu\mu_0}{\varepsilon\varepsilon_0}}$

30. A beam of monochromatic blue light of wavelength 4200Å in air travels in water ($\mu = 4/3$). Its wavelength in water will be

(a) 2800 *Å* (b) 5600 *Å*

(c) 3150 *Å* (d) 4000 *Å*

31. If μ_0 be the relative permeability and K_0 the dielectric constant of a medium, its refractive index is given by

[MNR 1995]

(a) $\frac{1}{\sqrt{\mu_0 K_0}}$ (b) $\frac{1}{\mu_0 K_0}$

(c) $\sqrt{\mu_0 K_0}$ (d) $\mu_0 K_0$

32. If the speed of light in vacuum is $C\ m/\sec$, then the velocity of light in a medium of refractive index 1.5

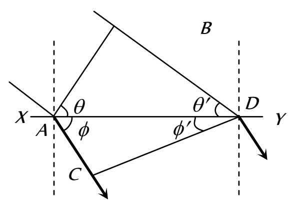
[NCERT 1977; MP PMT 1984; CPMT 2002]

(a) Is 1.5 × *C* (b) Is *C*

(c) Is $\frac{C}{1.5}$ (d) Can have any velocity

33. In the adjoining diagram, a wavefront *AB*, moving in air is incident on a plane glass surface *XY*. Its position *CD* after refraction through a glass slab is shown also along with the normals drawn at *A* and *D*. The refractive index of glass with respect to air ($\mu = 1$) will be equal to

[CPMT 1988; DPMT 1999]



(a) $\frac{\sin\theta}{\sin\theta'}$

(b) $\frac{\sin\theta}{\sin\phi'}$

(c) $\frac{\sin\phi'}{\sin\theta}$

(d) $\frac{AB}{CD}$

34. When light enters from air to water, then its

[MP PMT 1994; MP PET 1996]

(a) Frequency increases and speed decreases

(b) Frequency is same but the wavelength is smaller in water than in air

(c) Frequency is same but the wavelength in water is greater than in air

(d) Frequency decreases and wavelength is smaller in water than in air

35. On a glass plate a light wave is incident at an angle of 60°. If the reflected and the refracted waves are mutually perpendicular, the refractive index of material is

[MP PMT 1994; Haryana CEE 1996; KCET 1994; 2000]

(a) $\frac{\sqrt{3}}{2}$ (b) $\sqrt{3}$

(c) $\frac{3}{2}$ (d) $\frac{1}{\sqrt{3}}$

36. Refractive index of glass is $\frac{3}{2}$ and refractive index of water is $\frac{4}{3}$. If the speed of light in glass is 2.00×10^8 m/s, the speed in water will be **[MP PMT 1994; RPMT 1997]**

(a) 2.67×10^8 *m/s* (b) 2.25×10^8 *m/s*

(c) 1.78×10^8 *m/s* (d) 1.50×10^8 *m/s*

37. Monochromatic light of frequency 5×10^{14} *Hz* travelling in vacuum enters a medium of refractive index 1.5. Its wavelength in the medium is

[MP PET/ PMT 1995; Pb. PET 2003]

(a) 4000 $Å$ (b) 5000 $Å$

(c) 6000 $Å$ (d) 5500 $Å$

38. Light of wavelength is 7200 Å in air. It has a wavelength in glass ($\mu = 1.5$) equal to **[DCE 1999]**

(a) 7200 $Å$ (b) 4800 $Å$

(c) 10800 $Å$ (d) 7201.5 $Å$

39. Which of the following is *not* a correct statement **[MP PET 1997]**

(a) The wavelength of red light is greater than the wavelength of green light

(b) The wavelength of blue light is smaller than the wavelength of orange light

(c) The frequency of green light is greater than the frequency of blue light

(d) The frequency of violet light is greater than the frequency of blue light

40. Which of the following is a *correct* relation **[MP PET 1997]**

(a) ${}_a\mu_r = {}_a\mu_w \times {}_r\mu_\omega$ (b) ${}_a\mu_r \times {}_r\mu_w = {}_w\mu_a$

(c) ${}_a\mu_r \times {}_r\mu_a = 0$ (d) ${}_a\mu_r / {}_w\mu_r = {}_a\mu_w$

41. The time taken by sunlight to cross a 5 *mm* thick glass plate ($\mu = 3/2$) is **[MP PMT/PET 1998; BHU 2005]**

(a) 0.25×10^{-10} *s* (b) 0.167×10^{-7} *s*

(c) 2.5×10^{-10} *s* (d) 1.0×10^{-10} *s*

42. The distance travelled by light in glass (refractive index =1.5) in a nanosecond will be **[MP PET 1999]**

(a) 45 *cm* (b) 40 *cm*

(c) 30 *cm* (d) 20 *cm*

43. When light is refracted from air into glass

[IIT 1980; CBSE PMT 1992; MP PET 1999; MP PMT 1999; RPMT 1997, 2000, 03; MH CET 2004]

(a) Its wavelength and frequency both increase

(b) Its wavelength increases but frequency remains unchanged

(c) Its wavelength decreases but frequency remains unchanged

(d) Its wavelength and frequency both decrease

44. A mark at the bottom of a liquid appears to rise by 0.1 *m*. The depth of the liquid is 1 *m*. The refractive index of the liquid is

(a) 1.33 (b) $\frac{9}{10}$

(c) $\frac{10}{9}$ (b) 1.5

45. A man standing in a swimming pool looks at a stone lying at the bottom. The depth of the swimming pool is *h*. At what distance from the surface of water is the image of the stone formed (Line of vision is normal; Refractive index of water is *n*)

(a) h/n (b) n/h

(c) h (d) hn

46. On heating a liquid, the refractive index generally

[KCET 1994]

(a) Decreases

(b) Increases or decreases depending on the rate of heating

(c) Does not change

(d) Increases

47. If $\hat{i}$ denotes a unit vector along incident light ray, $\hat{r}$ a unit vector along refracted ray into a medium of refractive index μ and $\hat{n}$ unit vector normal to boundary of medium directed towards incident medium, then law of refraction is

[EAMCET (Engg.) 1995]

(a) $\hat{i}\,.\,\hat{n} = \mu(\hat{r}\,.\,\hat{n})$ (b) $\hat{i}\times\hat{n} = \mu(\hat{n}\times\hat{r})$

(c) $\hat{i}\times\hat{n} = \mu(\hat{r}\times\hat{n})$ (d) $\mu(\hat{i}\times\hat{n}) = \hat{r}\times\hat{n}$

48. The bottom of a container filled with liquid appear slightly raised because of **[RPMT 1997]**

(a) Refraction (b) Interference

(c) Diffraction (d) Reflection

49. The speed of light in air is 3×10^8 m/s. What will be its speed in diamond whose refractive index is 2.4

[KCET 1993]

(a) 3×10^8 m/s (b) 332 m/s

(c) 1.25×10^8 *m/s* (d) 7.2×10^8 m/s

50. Time taken by the sunlight to pass through a window of thickness 4 mm whose refractive index is 1.5 is

[CBSE PMT 1993]

(a) 2×10^{-8} *sec* (b) 2×10^{8} *sec*

(c) 2×10^{-11} *sec* (d) 2×10^{11} *sec*

51. Ray optics is valid, when characteristic dimensions are [CBSE PMT 1994; CPMT 2001]

(a) Of the same order as the wavelength of light

(b) Much smaller than the wavelength of light

(c) Of the order of one millimetre

(d) Much larger than the wavelength of light

52. The refractive index of water is 1.33. What will be the speed of light in water [CBSE PMT 1996; KCET 1998]

(a) 3×10^{8} m/s (b) 2.25×10^{8} m/s

(c) 4×10^{8} m/s (d) 1.33×10^{8} *m/s*

53. The time required to pass the light through a glass slab of 2 *mm* thick is ($\mu_{glass}=1.5$) [AFMC 1997; MH CET 2002, 04]

(a) 10^{-5} s (b) 10^{-11} s

(c) 10^{-9} s (d) 10^{-13} s

54. The refractive index of water with respect to air is 4 / 3 and the refractive index of glass with respect to air is 3/2. The refractive index of water with respect to glass is [BHU 1997; JIPMER 2000]

(a) $\frac{9}{8}$ (b) $\frac{8}{9}$

(c) $\frac{1}{2}$ (d) 2

55. Electromagnetic radiation of frequency *n*, wavelength λ, travelling with velocity *v* in air, enters a glass slab of refractive index μ. The frequency, wavelength and velocity of light in the glass slab will be respectively [CBSE PMT 1997]

(a) $\frac{n}{\mu},\frac{\lambda}{\mu},\frac{v}{\mu}$ (b) $n,\frac{\lambda}{\mu},\frac{v}{\mu}$

(c) $n,\lambda,\frac{v}{\mu}$ (d) $\frac{n}{\mu},\ \frac{\lambda}{\mu},v$

56. What is the time taken (in *seconds*) to cross a glass of thickness 4 *mm* and μ = 3 by light [BHU 1998; Pb. PMT 1999, 2001; MH CET 2000; MP PET 2001]

(a) 4×10^{-11} (b) 2×10^{-11}

(c) 16×10^{-11} (d) 8×10^{-10}

57. A plane glass slab is kept over various coloured letters, the letter which appears least raised is [J & K CET 2004; BHU 1998, 05]

(a) Blue (b) Violet

(c) Green (d) Red

58. A ray of light is incident on the surface of separation of a medium at an angle 45° and is refracted in the medium at an angle 30°. What will be the velocity of light in the medium [AFMC 1998; MH CET (Med.) 1999]

(a) 1.96×10^{8} *m/s* (b) 2.12×10^{8} m/s

(c) 3.18×10^{8} m/s (d) 3.33×18^{8} m/s

59. Absolute refractive indices of glass and water are $\frac{3}{2}$ and $\frac{4}{3}$. The ratio of velocity of light in glass and water will be [UPSEAT 1999]

(a) 4 : 3 (b) 8 : 7

(c) 8 : 9 (d) 3 : 4

60. The ratio of thickness of plates of two transparent mediums *A* and *B* is 6 : 4. If light takes equal time in passing through them, then refractive index of *B* with respect to *A* will be [UPSEAT 1999]

(a) 1.4 (b) 1.5

(c) 1.75 (d) 1.33

61. The refractive index of water and glass with respect to air is 1.3 and 1.5 respectively. Then the refractive index of glass with respect to water is [MH CET (Med.) 1999]

(a) $\frac{2.6}{1.5}$ (b) $\frac{1.5}{2.6}$

(c) $\frac{1.3}{1.5}$ (d) $\frac{1.5}{1.3}$

62. A tank is filled with benzene to a height of 120 *mm*. The apparent depth of a needle lying at a bottom of the tank is measured by a microscope to be 80 *mm*. The refractive index of benzene is

(a) 1.5 (b) 2.5

(c) 3.5 (d) 4.5

63. Each quarter of a vessel of depth *H* is filled with liquids of the refractive indices n_1, n_2, n_3 and n_4 from the bottom respectively. The apparent depth of the vessel when looked normally is

(a) $\frac{H(n_1+n_2+n_3+n_4)}{4}$ (b) $\frac{H\left(\frac{1}{n_1}+\frac{1}{n_2}+\frac{1}{n_3}+\frac{1}{n_4}\right)}{4}$

(c) $\frac{(n_1+n_2+n_3+n_4)}{4H}$ (d) $\frac{H\left(\frac{1}{n_1}+\frac{1}{n_2}+\frac{1}{n_3}+\frac{1}{n_4}\right)}{2}$

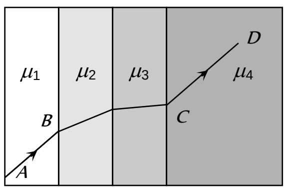
64. A ray of light passes through four transparent media with refractive indices $\mu_1.\mu_2\mu_3$, and μ_4 as shown in the figure. The surfaces of all media are parallel. If the emergent ray *CD* is parallel to the incident ray *AB*, we must have [IIT-JEE (Screening) 2001]

(a) $\mu_1=\mu_2$

(b) $\mu_2=\mu_3$

(c) $\mu_3=\mu_4$

(d) $\mu_4=\mu_1$



65. The reason of seeing the Sun a little before the sunrise is [MP PMT 2001; Orissa JEE 2003]

(a) Reflection of the light (b) Refraction of the light

(c) Scattering of the light (d) Dispersion of the light

66. An under water swimmer is at a depth of 12 *m* below the surface of water. A bird is at a height of 18 *m* from the surface of water, directly above his eyes. For the swimmer the bird appears to be at a distance from the surface of water equal to (Refractive Index of water is 4/3)

[KCET (Engg.) 2001]

(a) 24 *m* (b) 12 *m*

(c) 18 *m* (d) 9 *m*

67. The optical path of a monochromatic light is same if it goes through 4.0 *cm* of glass or 4.5 *cm* of water. If the refractive index of glass is 1.53, the refractive index of the water is

[UPSEAT 2002]

(a) 1.30 (b) 1.36

(c) 1.42 (d) 1.46

68. Which of the following statement is true **[Orissa JEE 2002]**

(a) Velocity of light is constant in all media

(b) Velocity of light in vacuum is maximum

(c) Velocity of light is same in all reference frames

(d) Laws of nature have identical form in all reference frames

69. A ray of light is incident on a transparent glass slab of refractive index 1.62. The reflected and the refracted rays are mutually perpendicular. The angle of incidence is

[MP PET 2002]

(a) 58.3° (b) 50°

(c) 35° (d) 30°

70. A microscope is focussed on a coin lying at the bottom of a beaker. The microscope is now raised up by 1 *cm*. To what depth should the water be poured into the beaker so that coin is again in focus ? (Refractive index of water is $\frac{4}{3}$)

[BHU 2003]

(a) 1 *cm* (b) $\frac{4}{3}$ *cm*

(c) 3 *cm* (d) 4 *cm*

71. Velocity of light in glass whose refractive index with respect to air is 1.5 is 2×10^8 *m/s* and in certain liquid the velocity of light found to be 2.5×10^8 *m/s*. The refractive index of the liquid with respect to air is **[CPMT 1978; MP PET/PMT 1988]**

(a) 0.64 (b) 0.80

(c) 1.20 (d) 1.44

72. Stars are twinkling due to **[CPMT 1997]**

(a) Diffraction (b) Reflection

(c) Refraction (d) Scattering

73. A thin oil layer floats on water. A ray of light making an angle of incidence of 40° shines on oil layer. The angle of refraction of light ray in water is ($\mu_{oil} = 1.45, \mu_{water} = 1.33$)

[MP PMT 1993]

(a) 36 .1° (b) 44.5°

(c) 26. 8° (d) 28.9°

74. An object is immersed in a fluid. In order that the object becomes invisible, it should **[AIIMS 2004]**

(a) Behave as a perfect reflector

(b) Absorb all light falling on it

(c) Have refractive index one

(d) Have refractive index exactly matching with that of the surrounding fluid

75. When light travels from glass to air, the incident angle is θ_1 and the refracted angle is θ_2. The true relation is

[Orissa PMT 2004]

(a) $\theta_1 = \theta_2$ (b) $\theta_1 < \theta_2$

(c) $\theta_1 > \theta_2$ (d) Not predictable

76. Velocity of light in a medium is $1.5 \times 10^8 \, m/s$. Its refractive index will be **[Pb. PET 2000]**

(a) 8 (b) 6

(c) 4 (d) 2

77. The frequency of a light ray is $6 \times 10^{14} \, Hz$. Its frequency when it propagates in a medium of refractive index 1.5, will be

[MP PMT 2000; DPMT 2003; Pb PMT 2003; MH CET 2004]

(a) $1.67 \times 10^{14} \, Hz$ (b) $9.10 \times 10^{14} \, Hz$

(c) $6 \times 10^{14} \, Hz$ (d) $4 \times 10^{14} \, Hz$

78. The refractive indices of water and glass with respect to air are 1.2 and 1.5 respectively. The refractive index of glass with respect to water is **[Pb. PET 2002]**

(a) 0.6 (b) 0.8

(c) 1.25 (d) 1.75

79. The wavelength of sodium light in air is 5890 Å. The velocity of light in air is $3 \times 10^8 \, ms^{-1}$. The wavelength of light in a glass of refractive index 1.6 would be close to

[DCE 2003]

(a) 5890 Å (b) 3681 Å

(c) 9424 Å (d) 15078 Å

80. The mean distance of sun from the earth is $1.5 \times 10^8 \, Km$ (nearly). The time taken by the light to reach earth from the sun is

(a) 0.12 *min* (b) 8.33 *min*

(c) 12.5 *min* (d) 6.25 *min*

81. Refractive index of air is 1.0003. The correct thickness of air column which will have one more wavelength of yellow light (6000 Å) than in the same thickness in vacuum is

[RPMT 1995]

(a) 2 *mm* (b) 2 *cm*

(c) 2 *m* (d) 2 *km*

82. The wavelength of light in air and some other medium are respectively λ_a and λ_m. The refractive index of medium is

[RPMT 2003]

(a) λ_a / λ_m (b) λ_m / λ_a

(c) $\lambda_a \times \lambda_m$ (d) None of these

83. An astronaut in a spaceship see the outer space as

[CPMT 1990, MP PMT 1991; JIPMER 1997]

(a) White (b) Black

(c) Blue (d) Red

84. Speed of light is maximum in

[CPMT 1990; MP PMT 1994; AFMC 1996]

(a) Water (b) Air

(c) Glass (d) Diamond

85. Which one of the following statements is correct

[KCET 1994]

(a) In vacuum, the speed of light depends upon frequency

(b) In vacuum, the speed of light does not depend upon frequency

(c) In vacuum, the speed of light is independent of frequency and wavelength

(d) In vacuum, the speed of light depends upon wavelength

86. If the wavelength of light in vacuum be λ, the wavelength in a medium of refractive index n will be

[UPSEAT 2001; MP PET 2001]

(a) $n\lambda$ (b) $\frac{\lambda}{n}$

(c) $\frac{\lambda}{n^2}$ (d) $n\lambda$

87. In vacuum the speed of light depends upon [MP PMT 2001]

(a) Frequency

(b) Wave length

(c) Velocity of the source of light

(d) None of these

88. A transparent cube of 15 *cm* edge contains a small air bubble. Its apparent depth when viewed through one face is 6 *cm* and when viewed through the opposite face is 4 *cm*. Then the refractive index of the material of the cube is

[CPMT 2004; MP PMT 2005]

(a) 2.0 (b) 2.5

(c) 1.6 (d) 1.5

89. A glass slab of thickness 3 *cm* and refractive index 3/2 is placed on ink mark on a piece of paper. For a person looking at the mark at a distance 5.0 *cm* above it, the distance of the mark will appear to be [Kerala PMT 2005]

(a) 3.0 *cm* (b) 4.0 *cm*

(c) 4.5 *cm* (d) 5.0 *cm*

90. A fish at a depth of 12 *cm* in water is viewed by an observer on the bank of a lake. To what height the image of the fish is raised.

(a) 9 *cm* (b) 12 *cm*

(c) 3.8 *cm* (d) 3 *cm*

Total Internal Reflection

1. A cut diamond sparkles because of its

[NCERT 1974; RPET 1996; AFMC 2005]

(a) Hardness

(b) High refractive index

(c) Emission of light by the diamond

(d) Absorption of light by the diamond

2. A diver in a swimming pool wants to signal his distress to a person lying on the edge of the pool by flashing his water proof flash light

[NCERT 1972]

(a) He must direct the beam vertically upwards

(b) He has to direct the beam horizontally

(c) He has to direct the beam at an angle to the vertical which is slightly less than the critical angle of incidence for total internal reflection

(d) He has to direct the beam at an angle to the vertical which is slightly more than the critical angle of incidence for the total internal reflection

3. Finger prints on a piece of paper may be detected by sprinkling fluorescent powder on the paper and then looking it into

(a) Mercury light (b) Sunlight

(c) Infrared light (d) Ultraviolet light

4. Critical angle of light passing from glass to air is minimum for

(a) Red (b) Green

(c) Yellow (d) Violet

5. The wavelength of light in two liquids '*x*' and '*y*' is 3500 Å and 7000 Å, then the critical angle of x relative to y will be

(a) 60° (b) 45°

(c) 30° (d) 15°

6. A fish is a little away below the surface of a lake. If the critical angle is 49°, then the fish could see things above the water surface within an angular range of θ^o where

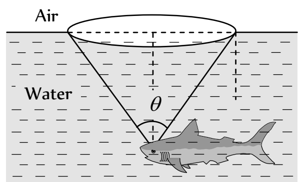
[MP PMT 1986]

(a) $\theta = 49^o$

(b) $\theta = 90^o$

(c) $\theta = 98^o$

(d) $\theta = 24\frac{1^o}{2}$



7. If the critical angle for total internal reflection from a medium to vacuum is 30°, the velocity of light in the medium is

KCET 2000; BCECE 2003; RPMT 2003]

(a) 3×10^8 *m/s* (b) 1.5×10^8 *m/s*

(c) 6×10^8 *m/s* (d) $\sqrt{3}\times10^8$ *m/s*

8. A ray of light is incident at an angle *i* from denser to rare medium. The reflected and the refracted rays are mutually perpendicular. The angle of reflection and the angle of refraction are respectively *r* and *r'*, then the critical angle will be

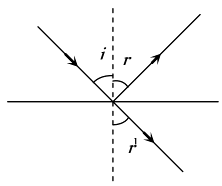
CBSE PMT 1996; MP PMT 1985, 99; Pb. PET 2002]

(a) $\sin^{-1}(\sin r)$

(b) $\sin^{-1}(\tan r')$ [MP PET 2005]

(c) $\sin^{-1}(\tan i)$

(d) $\tan^{-1}(\sin i)$



9. For total internal reflection to take place, the angle of incidence i and the refractive index μ of the medium must satisfy the inequality **[MP PET 1994]**

(a) $\frac{1}{\sin i} < \mu$ (b) $\frac{1}{\sin i} > \mu$

(c) $\sin i < \mu$ (d) $\sin i > \mu$

10. Total internal reflection of light is possible when light enters from

(a) Air to glass (b) Vacuum to air

(c) Air to water (d) Water to air

11. Total internal reflection of a ray of light is possible when the (i_c = critical angle, i = angle of incidence)

[NCERT 1977; MP PMT 1994]

(a) Ray goes from denser medium to rarer medium and $i < i_c$

(b) Ray goes from denser medium to rarer medium and $i > i_c$

(c) Ray goes from rarer medium to denser medium and $i > i_c$

(d) Ray goes from rarer medium to denser medium and $i < i_c$

12. A diver at a depth of 12m in water ($\mu = 4/3$) sees the sky in a cone of semi-vertical angle

[KCET 1999; Pb. PMT 2002; MP PMT 1995, 2003]

(a) $\sin^{-1}(4/3)$ (b) $\tan^{-1}(4/3)$

(c) $\sin^{-1}(3/4)$ (d) 90°

13. Critical angle is that angle of incidence in the denser medium for which the angle of refraction in rarer medium is

[MP PMT 1996]

(a) 0° (b) 57°

(c) 90° (d) 180°

14. The critical angle for diamond (refractive index = 2) is

[MP PET 2003]

(a) About 20° (b) 60°

(c) 45° (d) 30°

15. The reason for shining of air bubble in water is

[MP PET 1997; KCET 1999]

(a) Diffraction of light

(b) Dispersion of light

(c) Scattering of light

(d) Total internal reflection of light

16. With respect to air critical angle in a medium for light of red colour [λ_1] is θ. Other facts remaining same, critical angle for light of yellow colour [λ_2] will be **[MP PET 1999]**

(a) θ (b) More than θ

(c) Less than θ (d) $\frac{\theta\lambda_1}{\lambda_2}$

17. 'Mirage' is a phenomenon due to

[AIIMS 1998; MP PET 2002; AFMC 2003]

(a) Reflection of light

(b) Refraction of light

(c) Total internal reflection of light

(d) Diffraction of light

18. A ray of light travelling in a transparent medium falls on a surface separating the medium from air at an angle of incidence of 45°. The ray undergoes total internal reflection. If n is the refractive index of the medium with respect to air, select the possible value (s) of n from the following

[IIT-JEE 1998]

[CPMT 1973; MP PMT 1994]

(a) 1.3 (b) 1.4

(c) 1.5 (d) 1.6

19. When a ray of light emerges from a block of glass, the critical angle is **[KCET 1994]**

(a) Equal to the angle of reflection

(b) The angle between the refracted ray and the normal

(c) The angle of incidence for which the refracted ray travels along the glass-air boundary

(d) The angle of incidence

20. The phenomenon utilised in an optical fibre is

[KCET 1994; AMU 1995; CBSE PMT 2001; DCE 1999, 2000, 01, 02; AIEEE 2002]

(a) Refraction (b) Interference

(c) Polarization (d) Total internal reflection

21. The refractive index of water is 4 / 3 and that of glass is 5/3. What will be the critical angle for the ray of light entering water from the glass **[RPMT 1996]**

(a) $\sin^{-1}\frac{4}{5}$ (b) $\sin^{-1}\frac{5}{4}$

(c) $\sin^{-1}\frac{1}{2}$ (d) $\sin^{-1}\frac{2}{1}$

22. Total internal reflection is possible when light rays travel

[RPMT 1999]

(a) Air to water (b) Air to glass

(c) Glass to water (d) Water to glass

23. The velocity of light in a medium is half its velocity in air. If ray of light emerges from such a medium into air, the angle of incidence, at which it will be totally internally reflected, is

[Roorkee 1999]

(a) 15° (b 30°

(c) 45° (d) 60°

24. A ray of light propagates from glass (refractive index = 3/2) to water (refractive index = 4/3). The value of the critical angle **[JIPMER 1999; UPSEAT 20**

(a) $\sin^{-1}(1/2)$ (b) $\sin^{-1}\left(\frac{\sqrt{8}}{9}\right)$

(c) $\sin^{-1}(8/9)$ (d) $\sin^{-1}(5/7)$

25. Relation between critical angles of water and glass is

[CBSE PMT 2000; Pb. PET 2000; CPMT 2001]

(a) $C_w > C_g$ (b) $C_w < C_g$

(c) $C_w = C_g$ (d) $C_w = C_g = 0$

26. If critical angle for a material to air is 30°, the refractive index of the material will be **[MP PET 2001]**

(a) 1.0 (b) 1.5

(c) 2.0 (d) 2.5

27. The refractive index of water is 1.33. The direction in which a man under water should look to see the setting sun is

[MP PET 1991; Kerala PET 2002; Pb. PET 2003]

(a) 49° to the horizontal (b) 90° with the vertical
(c) 49° to the vertical (d) Along the horizontal

28. Optical fibres are related with [AFMC 2002]

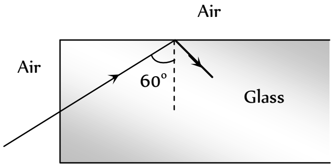
(a) Communication (b) Light
(c) Computer (d) None of these

29. Brilliance of diamond is due to [AIIMS 2002; MP PMT 2003]

(a) Shape (b) Cutting
(c) Reflection (d) Total internal reflection

30. A light ray from air is incident (as shown in figure) at one end of a glass fiber (refractive index $\mu = 1.5$) making an incidence angle of 60° on the lateral surface, so that it undergoes a total internal reflection. How much time would it take to traverse the straight fiber of length 1 *km* [Orissa JEE 2002]

(a) 3.33 μ *sec*
(b) 6.67 μ *sec*
(c) 5.77 μ *sec*
(d) 3.85 μ *sec*



31. Light wave enters from medium 1 to medium 2. Its velocity in 2nd medium is double from 1st. For total internal reflection the angle of incidence must be greater than [CPMT 2002]

(a) 30° (b) 60°
(c) 45° (d) 90°

32. Consider telecommunication through optical fibres. Which of the following statements is not true [AIEEE 2003]

(a) Optical fibres may have homogeneous core with a suitable cladding
(b) Optical fibres can be of graded refractive index
(c) Optical fibres are subject to electromagnetic interference from outside
(d) Optical fibres have extremely low transmission loss

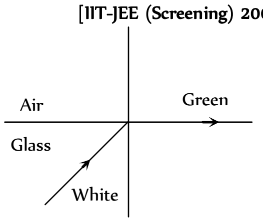
33. The critical angle for a medium is 60^o. The refractive index of the medium is [MP PMT 2004]

(a) $\frac{2}{\sqrt{3}}$ (b) $\frac{\sqrt{2}}{3}$
(c) $\sqrt{3}$ (d) $\frac{\sqrt{3}}{2}$

34. Glass has refractive index μ with respect to air and the critical angle for a ray of light going from glass to air is θ. If a ray of light is incident from air on the glass with angle of incidence θ, the corresponding angle of refraction is [MP PMT 2004]

(a) $\sin^{-1}\left(\frac{1}{\sqrt{\mu}}\right)$ (b) 90^o
(c) $\sin^{-1}\left(\frac{1}{\mu^2}\right)$ (d) $\sin^{-1}\left(\frac{1}{\mu}\right)$

35. White light is incident on the interface of glass and air as shown in the figure. If green light is just totally internally reflected then the emerging ray in air contains [IIT-JEE (Screening) 2004]



(a) Yellow, orange, red
(b) Violet, indigo, blue
(c) All colours
(d) All colours except green

36. Material *A* has critical angle i_A, and material *B* has critical angle $i_B (i_B > i_A)$. Then which of the following is true

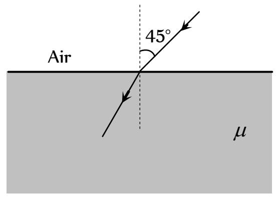
(i) Light can be totally internally reflected when it passes from *B* to *A*
(ii) Light can be totally internally reflected when it passes from *A* to *B*
(iii) Critical angle for total internal reflection is $i_B - i_A$
(iv) Critical angle between *A* and *B* is $\sin^{-1}\left(\frac{\sin i_A}{\sin i_B}\right)$

[UPSEAT 2004]

(a) (i) and (iii) (b) (i) and (iv)
(c) (ii) and (iii) (d) (ii) and (iv)

37. In the figure shown, for an angle of incidence 45^o, at the top surface, what is the minimum refractive index needed for total internal reflection at vertical face [DCE 2002]

(a) $\frac{\sqrt{2}+1}{2}$
(b $\sqrt{\frac{3}{2}}$
(c) $\sqrt{\frac{1}{2}}$
(d) $\sqrt{2}+1$



38. Critical angle for light going from medium (i) to (ii) is θ. The speed of light in medium (i) is *v* then speed in medium (ii) is [DCE 2002]

(a) $v(1-\cos\theta)$ (b $v/\sin\theta$
(c) $v/\cos\theta$ (d) $v(1-\sin\theta)$

39. If light travels a distance *x* in t_1 *sec* in air and 10 *x* distance in t_2 *sec* in a medium, the critical angle of the medium will be

(a) $\tan^{-1}\left(\frac{t_1}{t_2}\right)$ (b) $\sin^{-1}\left(\frac{t_1}{t_2}\right)$
(c) $\sin^{-1}\left(\frac{10t_1}{t_2}\right)$ (d) $\tan^{-1}\left(\frac{10t_1}{t_2}\right)$

40. The critical angle of a medium with respect to air is 45^o. The refractive index of medium is [MH CET 2003]

(a) 1.41 (b) 1.2
(c) 1.5 (d) 2

41. An endoscope is employed by a physician to view the internal parts of a body organ. It is based on the principle of [AIIMS 2004]

(a) Refraction (b) Reflection
(c) Total internal reflection (d) Dispersion

42. A normally incident ray reflected at an angle of 90^o. The value of critical angle is [RPMT 1996]

(a) 45^o (b 90^o

(c) 65^o (d) 43.2^o

43. The phenomena of total internal reflection is seen when angle of incidence is [RPMT 2001]

(a) 90^o (b Greater than critical angle

(c) Equal to critical angle (d) 0^o

44. A fish looking up through the water sees the outside world contained in a circular horizon. If the refractive index of water is $\frac{4}{3}$ and the fish is 12 *cm* below the surface, the radius of this circle in *cm* is

[NCERT 1980; KCET 2002; AIEEE 2005; CPMT 2005]

(a) $36\sqrt{5}$ (b) $4\sqrt{5}$

(c) $36\sqrt{7}$ (d) $36/\sqrt{7}$

45. A point source of light is placed 4 *m* below the surface of water of refractive index 5 / 3. The minimum diameter of a disc which should be placed over the source on the surface of water to cut–off all light coming out of water is

[CBSE PMT 1994; JIPMER 2001, 02]

(a) 2 *m* (b 6 *m*

(c) 4 *m* (d) 3 *m*

46. A fist looking from within water sees the outside world through a circular horizon. If the fish $\sqrt{7}$ *cm* below the surface of water, what will be the radius of the circular horizon

(a) 3.0 *cm* (b) 4.0 *cm*

(c) 4.5 *cm* (d) 5.0 *cm*

Refraction at Curved Surface

1. The radius of curvature for a convex lens is 40 *cm*, for each surface. Its refractive index is 1.5. The focal length will be

[MP PMT 1989]

(a) 40 *cm* (b) 20 *cm*

(c) 80 *cm* (d) 30 *cm*

2. A convex lens of focal length f is placed somewhere in between an object and a screen. The distance between the object and the screen is x. If the numerical value of the magnification produced by the lens is m, , then the focal length of the lens is

(a) $\frac{mx}{(m+1)^2}$ (b) $\frac{mx}{(m-1)^2}$

(c) $\frac{(m+1)^2}{m}x$ (d) $\frac{(m-1)^2}{m}x$

3. A thin lens focal length f_1 and its aperture has diameter *d*. It forms an image of intensity *I*. Now the central part of the aperture upto diameter $\frac{d}{2}$ is blocked by an opaque paper. The focal length and image intensity will change to

[CPMT 1989; MP PET 1997; KCET 1998]

(a) $\frac{f}{2}$ and $\frac{I}{2}$ (b) f and $\frac{I}{4}$

(c) $\frac{3f}{4}$ and $\frac{I}{2}$ (d) f and $\frac{3I}{4}$

4. A lens of power + 2 diopters is placed in contact with a lens of power – 1 diopter. The combination will behave like

(a) A convergent lens of focal length 50 *cm*

(b) A divergent lens of focal length 100 *cm*

(c) A convergent lens of focal length 100 *cm*

(d) A convergent lens of focal length 200 *cm*

5. A convex lens of focal length 40 cm is in contact with a concave lens of focal length 25 cm. The power of combination is

[IIT-JEE 1982; AFMC 1997; CBSE PMT 2000; RPMT 2003]

(a) – 1.5 *D* (b) – 6.5 *D*

(c) + 6.5 *D* (d) + 6.67 *D*

6. Two lenses are placed in contact with each other and the focal length of combination is 80 *cm*. If the focal length of one is 20 *cm*, then the power of the other will be

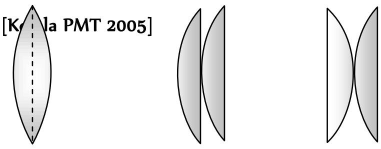
[NCERT 1981]

(a) 1.66 *D* (b) 4.00 *D*

(c) –1.00 *D* (d) – 3.75 *D*

7. Two similar plano-convex lenses are combined together in three different ways as shown in the adjoining figure. The ratio of the focal lengths in three cases will be

[Kerala PMT 2005]



(a) 2 : 2 : 1 (b 1 : 1 : 1

(c) 1 : 2 : 2 (d) 2 : 1 : 1

8. Two lenses of power +12 and – 2 diopters are placed in contact. What will the focal length of combination

[MP PET 1990; MNR 1987;

MH CET (Med.) 2001; UPSEAT 2000; Pb. PMT 2003]

(a) 10 *cm* (b) 12.5 *cm*

(c) 16.6 *cm* (d) 8.33 *cm*

9. A concave and convex lens have the same focal length of 20 cm and are put into contact to form a lens combination. The combination is used to view an object of 5 *cm* length kept at 20 cm from the lens combination. As compared to the object, the image will be

(a) Magnified and inverted

(b) Reduced and erect

(c) Of the same size as the object and erect

(d) Of the same size as the object but inverted

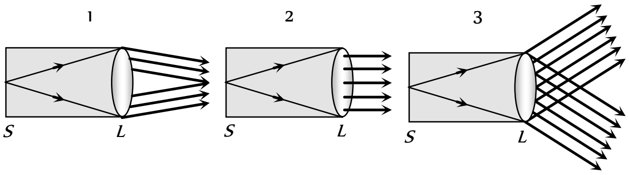
10. If in a plano-convex lens, the radius of curvature of the convex surface is 10 *cm* and the focal length of the lens is 30 *cm*, then the refractive index of the material of lens will be

[CPMT 1986; MNR 1988; MP PMT 2002; UPSEAT 2000]

(a) 1.5 (b) 1.66

(c) 1.33 (d) 3

11. The slit of a collimator is illuminated by a source as shown in the adjoining figures. The distance between the slit *S* and the collimating lens *L* is equal to the focal length of the lens. The correct direction of the emergent beam will be as shown in figure



(a) 1 (b) 3

(c) 2 (d) None of the figures

12. A converging lens is used to form an image on a screen. When upper half of the lens is covered by an opaque screen

[IIT-JEE 1986; SCRA 1994; MP PET 1996; MP PMT 2004; BHU 1998, 05]

(a) Half the image will disappear

(b) Complete image will be formed of same intensity

(c) Half image will be formed of same intensity

(d) Complete image will be formed of decreased intensity

13. A thin convex lens of focal length 10 *cm* is placed in contact with a concave lens of same material and of same focal length. The focal length of combination will be

[CPMT 1972; 1988]

(a) Zero (b) Infinity

(c) 10 *cm* (d) 20 *cm*

14. A convex lens of focal length 84 *cm* is in contact with a concave lens of focal length 12 *cm*. The power of combination (in diopters) is

(a) 25/24 (b) 25/18

(c) – 50/7 (d) + 50/7

15. A convex lens makes a real image 4 *cm* long on a screen. When the lens is shifted to a new position without disturbing the object, we again get a real image on the screen which is 16 *cm* tall. The length of the object must be [MP PET 1991]

(a) 1/4 *cm* (b) 8 *cm*

(c) 12 *cm* (d) 20 *cm*

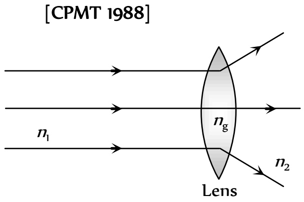
16. A glass convex lens $(\mu_g = 1.5)$ has a focal length of $8\,cm$ when placed in air. What would be the focal length of the lens when it is immersed in water ($\mu_w = 1.33$)

[BHU 1994; MP PMT 1996]

(a) 2 *m* (b) 4 *cm*

(c) 16 *cm* (d) 32 *cm*

17. The ray diagram could be correct [CPMT 1988]



(a) If $n_1 = n_2 = n_g$

(b) If $n_1 = n_2$ and $n_1 < n_g$

(c) If $n_1 = n_2$ and $n_1 > n_g$

(d) Under no circumstances

18. A thin convex lens of refractive index 1.5 has a focal length of 15 *cm* in air. When the lens is placed in liquid of refractive index 4/3 , its focal length will be

[CPMT 1974, 77; MP PMT 1992]

(a) 15 *cm* (b) 10 *cm*

(c) 30 *cm* (d) 60 *cm*

19. A glass lens is placed in a medium in which it is found to behave like a glass plate. Refractive index of the medium will be

(a) Greater than the refractive index of glass

(b) Smaller than the refractive index of glass

(c) Equal to refractive index of glass [CPMT 1986]

(d) No case will be possible from above

20. If I_1 and I_2 be the size of the images respectively for the two positions of lens in the displacement method, then the size of the object is given by [CPMT 1988]

(a) I_1 / I_2 (b) $I_1 \times I_2$

(c) $\sqrt{I_1 \times I_2}$ (d) $\sqrt{I_1 / I_2}$

21. A convex lens of crown glass (n =1.525) will behave as a divergent lens if immersed in [CPMT 1984]

(a) Water (n =1.33)

(b) In a medium of n = 1.525

(c) Carbon disulphide n =1.66

(d) It cannot act as a divergent lens

22. A divergent lens will produce [CPMT 1984]

(a) Always a virtual image

(b) Always real image

(c) Sometimes real and sometimes virtual

(d) None of the above

23. The minimum distance between an object and its real image formed by a convex lens is [CPMT 1973; JIPMER 1997]

(a) 1.5 f (b) 2 f

(c) 2.5 f (d) 4 f

[MP PET 1991]

24. An object is placed at a distance of 20 *cm* from a convex lens of focal length 10 *cm*. The image is formed on the other side of the lens at a distance [CPMT 1971; RPET 2003]

(a) 20 *cm* (b) 10 *cm*

(c) 40 *cm* (d) 30 *cm*

25. Two thin lenses, one of focal length + 60 *cm* and the other of focal length – 20 *cm* are put in contact. The combined focal length is [CPMT 1973, 8

(a) + 15 *cm* (b) – 15 *cm*

(c) + 30 *cm* (d) –30 *cm*

26. A double convex lens of focal length 20 *cm* is made of glass of refractive index 3 / 2. When placed completely in water $({}_a\mu_w = 4/3)$, its focal length will be

[CBSE PMT 1990; MP PMT/PET 1998]

(a) 80 *cm* (b) 15 *cm*

(c) 17.7 *cm* (d) 22.5 *cm*

27. Two thin lenses of focal lengths 20 *cm* and 25 *cm* are placed in contact convex. The effective power of the combination is

[CBSE PMT 1990; RPMT 2001]

(a) 45 *dioptres* (b) 9 *dioptres*

(c) 1/9 *dioptre* (d) 6 *dioptres*

28. An object is placed at a distance of $f/2$ from a convex lens. The image will be [CPMT 1974, 89]

(a) At one of the foci, virtual and double its size

(b) At $3f/2$, real and inverted

(c) At $2f$, virtual and erect

(d) None of these

29. A double convex thin lens made of glass (refractive index μ = 1.5) has both radii of curvature of magnitude 20 *cm*. Incident light rays parallel to the axis of the lens will converge at a distance L such that [MNR 1991; MP PET 1996; UPSEAT 2000; Pb PET 2004]

(a) L = 20 *cm* (b) L = 10 *cm*

(c) L = 40 *cm* (d) L = 20 / 3 *cm*

30. A lens behaves as a converging lens in air and a diverging lens in water. The refractive index of the material is [CPMT 1991; NCERT 1979; BHU 2005]

(a) Equal to unity (b) Equal to 1.33

(c) Between unity and 1.33 (d) Greater than 1.33

31. A biconvex lens forms a real image of an object placed perpendicular to its principal axis. Suppose the radii of curvature of the lens tend to infinity. Then the image would [MP PET 1994]

(a) Disappear

(b) Remain as real image still

(c) Be virtual and of the same size as the object

(d) Suffer from aberrations

32. The radius of curvature of convex surface of a thin plano-convex lens is 15 *cm* and refractive index of its material is 1.6. The power of the lens will be [MP PMT 1994]

(a) $+1\,D$ (b) $-2\,D$

(c) $+3\,D$ (d) $+4\,D$

33. Focal length of a convex lens will be maximum for [MP PMT 1994]

(a) Blue light (b) Yellow light

(c) Green light (d) Red light

34. A lens is placed between a source of light and a wall. It forms images of area A_1 and A_2 on the wall for its two different positions. The area of the source or light is [CBSE PMT 1995]

(a) $\frac{A_1 + A_2}{2}$ (b) $\left[\frac{1}{A_1} + \frac{1}{A_2}\right]^{-1}$

(c) $\sqrt{A_1 A_2}$ (d) $\left[\frac{\sqrt{A_1} + \sqrt{A_2}}{2}\right]^2$

35. Two lenses of power $6D$ and $-2D$ are combined to form a single lens. The focal length of this lens will be [MP PET 2003]

(a) $\frac{3}{2}\,m$ (b $\frac{1}{4}\,m$

(c) $4\,m$ (d) $\frac{1}{8}\,m$

36. A combination of two thin lenses with focal lengths f_1 and f_2 respectively forms an image of distant object at distance 60 *cm* when lenses are in contact. The position of this image shifts by 30 *cm* towards the combination when two lenses are separated by 10 *cm*. The corresponding values of f_1 and f_2 are

(a) $30\ cm, -60\ cm$ (b) $20\ cm, -30\ cm$

(c) $15\ cm, -20\ cm$ (d) $12\ cm, -15\ cm$

37. An achromatic combination of lenses is formed by joining [BHU 1995; Pb. PMT 2000, 04]

(a) 2 convex lenses

(b) 2 concave lenses

(c) 1 convex lens and 1 concave lens

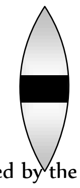
(d) Convex lens and plane mirror

38. A plano convex lens $(f = 20cm)$ is silvered at plane surface. Now f will be [BHU 1995; DPMT 2001; MP PMT 2005]

(a) 20 *cm* (b) 40 *cm*

(c) 30 cm (d) 10 *cm*

39. If the central portion of a convex lens is wrapped in black paper as shown in the figure [Manipal MEE 1995; KCET 2001]



(a) No image will be formed by the remaining portion of the lens

(b) The full image will be formed but it will be less bright

(c) The central portion of the image will be missing

(d) There will be two images each produced by one of the exposed portions of the lens

40. A diminished image of an object is to be obtained on a screen 1.0 *m* from it. This can be achieved by appropriately placing

(a) A convex mirror of suitable focal length

(b) A concave mirror of suitable focal length

(c) A concave lens of suitable focal length

(d) A convex lens of suitable focal length less than 0.25 *m*

41. The focal length of convex lens is 30 *cm* and the size of image is quarter of the object, then the object distance is [AFMC 1995]

(a) 150 *cm* (b) 60 *cm*

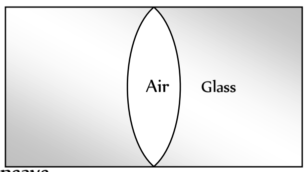
(c) 30 *cm* (d) 40 *cm*

42. A convex lens forms a real image of a point object placed on its principal axis. If the upper half of the lens is painted black, the image will [MP PET 1995]

(a) Be shifted downwards (b) Be shifted upwards

(c) Not be shifted (d) Shift on the principal axis

43. In the figure, an air lens of radii of curvature 10 *cm* (R_1 = R_2 = 10 *cm*) is cut in a cylinder of glass $(\mu = 1.5)$. The focal length and the nature of the lens is [MP PET 1995; Pb. PET 2000]



(a) 15 *cm*, concave

(b) 15 *cm*, convex

(c) ∞, neither concave nor convex

(d) 0, concave

44. A lens (focal length 50 *cm*) forms the image of a distant object which subtends an angle of 1 *milliradian* at the lens. What is the size of the image [MP PMT 1995]

(a) 5 *mm* (b) 1 *mm*

(c) 0.5 *mm* [AIIMS 1995] (d) 0.1 *mm*

45. A convex lens of focal length 12 *cm* is made of glass of $\mu = \frac{3}{2}$. What will be its focal length when immersed in liquid of $\mu = \frac{5}{4}$

(a) 6 *cm* (b) 12 *cm*

(c) 24 *cm* (d) 30 *cm*

46. Two thin lenses of focal lengths f_1 and f_2 are in contact and coaxial. The combination is equivalent to a single lens of power [MP PET 1996, 98; MP PMT 1998; DCE 2000; UP SEAT 2005]

(a) $f_1 + f_2$ (b) $\frac{f_1 f_2}{f_1 + f_2}$

(c) $\frac{1}{2}(f_1 + f_2)$ (d) $\frac{f_1 + f_2}{f_1 f_2}$

47. A plano convex lens is made of glass of refractive index 1.5. The radius of curvature of its convex surface is *R*. Its focal length is

(a) *R*/ 2 (b) *R*

(c) 2*R* (d) 1.5 *R*

48. Two lenses have focal lengths f_1 and f_2 and their dispersive powers are ω_1 and ω_2 respectively. They will together form an achromatic combination if

(a) $\omega_1 f_1 = \omega_2 f_2$ (b) $\omega_1 f_2 + \omega_2 f_1 = 0$

(c) $\omega_1 + f_1 = \omega_2 + f_2$ (d) $\omega_1 - f_1 = \omega_2 - f_2$

49. The dispersive powers of glasses of lenses used in an achromatic pair are in the ratio 5 : 3. If the focal length of the concave lens is 15 *cm*, then the nature and focal length of the other lens would be

(a) Convex, 9 *cm* (b) Concave, 9 *cm*

(c) Convex, 25 *cm* (d) Concave, 25 *cm*

50. A thin double convex lens has radii of curvature each of magnitude 40 *cm* and is made of glass with refractive index 1.65. Its focal length is nearly [MP PMT 1997]

(a) 20 *cm* (b) 31 *cm*

(c) 35 *cm* (d) 50 *cm*

51. The plane surface of a plano-convex lens of focal length *f* is silvered. It will behave as [MP PMT/PET 1998]

(a) Plane mirror

(b) Convex mirror of focal length 2 *f*

(c) Concave mirror of focal length $f/2$

(d) None of the above

52. An equiconvex lens of glass of focal length 0.1 metre is cut along a plane perpendicular to principle axis into two equal parts. The ratio of focal length of new lenses formed is [MP PET 1999; DPMT 2000]

(a) 1 : 1 (b) 1 : 2

(c) 2 : 1 (d) $2 : \frac{1}{2}$

53. A lens of refractive index n is put in a liquid of refractive index n' of focal length of lens in air is f, its focal length in liquid will be

(a) $-\frac{fn'(n-1)}{n'-n}$ (b) $-\frac{f(n'-n)}{n'(n-1)}$

(c) $-\frac{n'(n-1)}{f(n'-n)}$ (d) $\frac{fn'n}{n-n'}$

54. An object of height 1.5 *cm* is placed on the axis of a convex lens of focal length 25 *cm*. A real image is formed at a distance of 75 *cm* from the lens. The size of the image will be

(a) 4.5 *cm* (b) 3.0 *cm*

(c) 0.75 *cm* (d) 0.5 *cm*

55. A symmetric double convex lens is cut in two equal parts by a plane perpendicular to the principal axis. If the power of the original lens was 4 *D*, the power of a cut lens will be [MP PMT 1999]

(a) 2 *D* (b) 3 *D*

(c) 4 *D* (d) 5 *D*

56. A plane convex lens is made of refractive index 1.6. The radius of curvature of the curved surface is 60 *cm*. The focal length of the lens is [CBSE PMT 1999; Pb. PMT 1999; BHU 2001; Very Similar to BHU 2003]

(a) 50 [RPET 2003] (b) 100 *cm*

(c) 200 *cm* (d) 400 *cm*

57. A concave lens of glass, refractive index 1.5, has both surfaces of same radius of curvature *R*. On immersion in a medium of refractive index 1.75, it will behave as a [IIT-JEE 1999]

(a) Convergent lens of focal length 3.5 *R*

(b) Convergent lens of focal length 3.0 *R*

(c) Divergent lens of focal length 3.5 *R*

(d) Divergent lens of focal length 3.0 *R*

58. A convex lens of focal length 0.5 *m* and concave lens of focal length 1 *m* are combined. The power of the resulting lens will be

(a) 1 *D* [MP PET 1997] (b) – 1 *D*

(c) 0.5 *D* (d) – 0.5 *D*

59. A double convex lens is made of glass of refractive index 1.5. If its focal length is 30 cm, then radius of curvature of each of its curved surface is [Bihar CEET 1995]

(a) 10 *cm* (b) 15 *cm*

(c) 18 *cm* (d) None of these

60. A thin lens made of glass of refractive index 1.5 has a front surface + 11 *D* power and back surface – 6 *D*. If this lens is submerged in a liquid of refractive index 1.6, the resulting power of the lens is

(a) – 0.5 *D* (b) + 0.5 *D*

(c) – 0.625 *D* (d) + 0.625 *D*

61. An object is placed first at infinity and then at 20 *cm* from the object side focal plane of the convex lens. The two images thus formed are 5 *cm* apart. The focal length of the lens is

(a) 5 *cm* (b 10 *cm*

(c) 15 *cm* (d) 20 *cm*

62. The distance between an object and the screen is 100 *cm*. A lens produces an image on the screen when placed at either of the positions 40 *cm* apart. The power of the lens is [SCRA 1994]

(a) ≈ 3 *dioptres* (b) ≈ 5 *dioptres*

(c) ≈ 7 *diopters* (d) ≈ 9 *diopters*

63. The image distance of an object placed 10 *cm* in front of a thin lens of focal length + 5 *cm* is [MP PET 1999] [SCRA 1994]

(a) 6.5 *cm* (b) 8.0 *cm*

(c) 9.5 *cm* (d) 10.0 *cm*

64. A achromatic combination is made with a lens of focal length f and dispersive power ω with a lens having dispersive power of 2ω. The focal length of second will be [RPET 1997]

(a) 2 *f* [MP PET 1999] (b) $f/2$

(c) $-f/2$ (d) – 2 *f*

65. A biconvex lens with equal radii curvature has refractive index 1.6 and focal length 10 *cm*. Its radius of curvature will be

(a) 20 *cm* (b) 16 *cm*
(c) 10 *cm* (d) 12 *cm*

66. A convex lens [RPMT 1997]

(a) Converges light rays
(b) Diverges light rays
(c) Form real images always
(d) Always forms virtual images

67. The focal length of a combination of lenses formed with lenses having powers of + 2.50 *D* and – 3.75 *D* will be [RPMT 1997]

(a) – 20 *cm* (b) – 40 *cm*
(c) – 60 *cm* (d) – 80 *cm*

68. Focal length of a converging lens in air is *R*. If it is dipped in water of refractive index 1.33, then its focal length will be around (Refractive index of lens material is 1.5) [RPMT 1997; EAMCET (Med.) 1995]

(a) R (b) $2R$
(c) $4R$ (d) $R/2$

69. Focal length of a convex lens of refractive index 1.5 is 2 *cm*. Focal length of lens when immersed in a liquid of refractive index of 1.25 will be [CBSE PMT 1993]

(a) 10 *cm* (b) 2.5 *cm*
(c) 5 *cm* (d) 7.5 *cm*

70. The focal length of a convex lens depends upon [AFMC 1994]

(a) Frequency of the light ray
(b) Wavelength of the light ray
(c) Both (a) and (b)
(d) None of these

71. If a convex lens of focal length 80 *cm* and a concave lens of focal length 50 *cm* are combined together, what will be their resulting power [CBSE PMT 1996; AFMC 2002]

(a) + 6.5*D* (b) – 6.5 *D*
(c) + 7.5 *D* (d) – 0.75 *D*

72. f_v and f_r are the focal lengths of a convex lens for violet and red light respectively and F_v and F_r are the focal lengths of a concave lens for violet and red light respectively, then

(a) $f_v < f_r$ and $F_v > F_r$ (b $f_v < f_R$ and $F_v < F_r$
(c) $f_c > f_r$ and $F_v > F_r$ (d) $f_v > f_r$ and $F_v < F_r$

73. If a lens is cut into two pieces perpendicular to the principal axis and only one part is used, the intensity of the image [CPMT 1996]

(a) Remains same (b) $\frac{1}{2}$ times
(c) 2 times (d) Infinite

74. A convex lens of focal length f produces an image $\frac{1}{n}$ times than that of the size of the object. The distance of the object from the lens is [BHU 1997; JIPMER 2001, 02]

(a) nf [MP PET 2003] (b) $\frac{f}{n}$
(c) $(n+1)f$ (d) $(n-1)f$

75. Two thin lenses whose powers are +2*D* and –4*D* respectively combine, then the power of combination is [AFMC 1998; CPMT 1996; Very Similar to BHU 2004]

(a) – 2*D* (b) + 2*D*
(c) – 4*D* (d) + 4*D*

76. A substance is behaving as convex lens in air and concave in water, then its refractive index is [BHU 1998]

(a) Smaller than air
(b) Greater than both air and water
(c) Greater than air but less than water
(d) Almost equal to water

77. A concave lens of focal length 20 *cm* placed in contact with a plane mirror acts as a [SCRA 1998]

(a) Convex mirror of focal length 10 *cm*
(b) Concave mirror of focal length 40 *cm*
(c) Concave mirror of focal length 60 *cm*
(d) Concave mirror of focal length 10 *cm*

78. A convex lens is used to form real image of an object on a screen. It is observed that even when the positions of the object and that screen are fixed there are two positions of the lens to form real images. If the heights of the images are 4 *cm* and 9 *cm* respectively, the height of the object is [AMU (Med.) 1999]

(a) 2.25 *cm* (b 6.00 *cm*
(c) 6.50 *cm* (d) 36.00 *cm*

79. A convex lens of power + 6*D* is placed in contact with a concave lens of power – 4*D*. What is the nature and focal length of the combination [AMU (Engg.) 1999]

(a) Concave, 25 *cm* (b) Convex, 50 *cm*
(c) Concave, 20 *cm* (d) Convex, 100 *cm*

80. A double convex lens of glass of μ = 1.5 has radius of curvature of each of its surface is 0.2 *m*. The power of the lens is [CBSE PMT 1996]

(a) + 10 *dioptres* (b) – 10 *dioptres*
(c) – 5 *dioptres* (d) +5 *dioptres*

81. A lens of focal power 0.5 *D* is [JIPMER 1999]

(a) A convex lens of focal length 0.5 *m*
(b) A concave lens of focal length 0.5 *m*
(c) A convex lens of focal length 2 *m*
(d) A concave lens of focal length 2 *m*

82. A lens which has focal length of 4 *cm* and refractive index of 1.4 is immersed in a liquid of refractive index 1.6, then the focal length will be [RPMT 1999]

(a) – 12.8 *cm* (b) 32 *cm*
(c) 12.8 *cm* (d) – 32 *cm*

83. A convex lens has 9 *cm* focal length and a concave lens has – 18 *cm* focal length. The focal length of the combination in contact will be

(a) 9 *cm* (b) – 18 *cm*

(c) – 9 *cm* (d) 18 *cm*

84. A double convex thin lens made of glass of refractive index 1.6 has radii of curvature 15 *cm* each. The focal length of this lens when immersed in a liquid of refractive index 1.63 is

(a) – 407 *cm* (b) 250 *cm*

(c) 125 *cm* (d) 25 *cm*

85. A lens of power + 2 *diopters* is placed in contact with a lens of power – 1 *diopoter*. The combination will behave like

[UPSEAT 2000]

(a) A divergent lens of focal length 50 *cm*

(b) A convergent lens of focal length 50 *cm*

(c) A convergent lens of focal length 100 *cm*

(d) A divergent lens of focal length 100 *cm*

86. Chromatic aberration of lens can be corrected by

[AFMC 2000]

(a) Reducing its aperature

(b) Proper polishing of its two surfaces

(c) Suitably combining it with another lens

(d) Providing different suitable curvature to its two surfaces

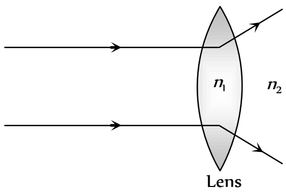
87. The relation between n_1 and n_2, if behaviour of light rays is as shown in figure is [KCET 2000]

(a) $n_1 >> n_2$

(b $n_2 > n_1$

(c) $n_1 > n_2$

(d) $n_1 = n_2$



88. A candle placed 25 *cm* from a lens, forms an image on a screen placed 75 *cm* on the other end of the lens. The focal length and type of the lens should be [KCET 2000]

(a) + 18.75 *cm* and convex lens

(b) – 18.75 *cm* and concave lens

(c) + 20.25 *cm* and convex lens

(d) – 20.25 *cm* and concave lens

89. We combined a convex lens of focal length f_1 and concave lens of focal lengths f_2 and their combined focal length was *F*. The combination of these lenses will behave like a concave lens, if

(a) $f_1 > f_2$ (b) $f_1 < f_2$

(c) $f_1 = f_2$ (d) $f_1 \leq f_2$

90. In a plano-convex lens the radius of curvature of the convex lens is 10 *cm*. If the plane side is polished, then the focal length will be (Refractive index = 1.5)

[CBSE PMT 2000; BHU 2004]

(a) 10.5 *cm* (b 10 *cm*

(c) 5.5 *cm* (d) 5 *cm*

91. The focal length of a convex lens is 10 *cm* and its refractive index is 1.5. If the radius of curvature of one surface is 7.5 *cm*, the radius of curvature of the second surface will be [RPMT 1999]

[MP PMT 2000]

(a) 7.5 *cm* (b) 15.0 *cm*

(c) 75 *cm* (d) 5.0 *cm*

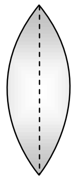
92. A convex lens has a focal length *f*. It is cut into two parts along the dotted line as shown in the figure. The focal length of each part will be [UPSEAT 2000; Pb. PET 2004] [MP PET 2000]

(a) $\frac{f}{2}$

(b) f

(c) $\frac{3}{2}f$

(d) $2f$



93. An object has image thrice of its original size when kept at 8 *cm* and 16 *cm* from a convex lens. Focal length of the lens is

(a) 8 *cm*

(b) 16 *cm*

(c) Between 8 *cm* and 16 *cm*

(d) Less than 8 *cm*

94. The combination of a convex lens (f = 18 *cm*) and a thin concave lens (f = 9 *cm*) is [AMU (Engg.) 2001]

(a) A concave lens (f = 18 *cm*)

(b) A convex lens (f = 18 *cm*)

(c) A convex lens (f = 6 *cm*)

(d) A concave lens (f = 6 *cm*)

95. A convex lens forms a real image of an object for its two different positions on a screen. If height of the image in both the cases be 8 *cm* and 2 *cm*, then height of the object is

[KCET 2000, 01]

(a) 16 *cm* (b) 8 *cm*

(c) 4 *cm* (d) 2 *cm*

96. A convex lens of focal length 25 *cm* and a concave lens of focal length 10 *cm* are joined together. The power of the combination will be [MP PMT 2001]

(a) – 16 *D* (b) + 16 *D*

(c) – 6 *D* (d) + 6 *D*

97. The unit of focal power of a lens is [KCET 2001]

(a) Watt (b) Horse power

(c) Dioptre (d) Lux

98. A thin lens made of glass of refractive index μ = 1.5 has a focal length equal to 12 *cm* in air. It is now immersed in water $\left(\mu = \frac{4}{3}\right)$. Its new focal length is [UPSEAT 2002] [KCET 2000]

(a) 48 *cm* (b) 36 *cm*

(c) 24 *cm* (d) 12 *cm*

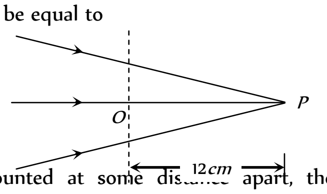
99. Figure given below shows a beam of light converging at point *P*. When a convex lens of focal length 16 *cm* is introduced in the path of the beam at a place *O* shown by dotted line such that *OP* becomes the axis of the lens, the beam converges at a distance *x* from the lens. The value *x* will be equal to

(a) 12 *cm*

(b) 24 *cm*

(c) 36 *cm*

(d) 48 *cm*



100. If two + 5 *D* lenses are mounted at some distance apart, the equivalent power will always be negative if the distance is

[UPSEAT 2002]

(a) Greater than 40 *cm* (b) Equal to 40 *cm*

(c) Equal to 10 *cm* (d) Less than 10 *cm*

101. A convex lens produces a real image *m* times the size of the object. What will be the distance of the object from the lens

[JIPMER 2002]

(a) $\left(\frac{m+1}{m}\right)f$ (b) $(m-1)f$

(c) $\left(\frac{m-1}{m}\right)f$ (d) $\frac{m+1}{f}$

102. A convex lens is made up of three different materials as shown in the figure. For a point object placed on its axis, the number of images formed are [KCET 2002]

(a) 1

(b) 5

(c) 4

(d) 3

103. An object is placed 12 *cm* to the left of a converging lens of focal length 8 *cm*. Another converging lens of 6 *cm* focal length is placed at a distance of 30 *cm* to the right of the first lens. The second lens will produce [KCET 2002]

(a) No image (b) A virtual enlarged image

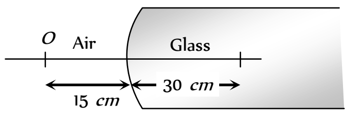
(c) A real enlarged image (d) A real smaller image

104. If convex lens of focal length 80*cm* and a concave lens of focal length 50 *cm* are combined together, what will be their resulting power [AFMC 2002]

(a) + 6.5 *D* (b) – 6.5 *D*

(c) + 7.5 *D* (d) – 0.75 *D*

105. A point object *O* is placed in front of a glass rod having spherical end of radius of curvature 30 *cm*. The image would be formed at



(a) 30 *cm* left

(b) Infinity

(c) 1 *cm* to the right

(d) 18 *cm* to the left

106. The focal length of lens of refractive index 1.5 in air is 30 *cm*. When it is immersed in a liquid of refractive index $\frac{4}{3}$, then its focal length in liquid will be [BHU 2002]

(a) 30 *cm* (b) 60 *cm*

(c) 120 *cm* (d) 240 *cm*

107. Two thin lenses of focal lengths f and f are in contact. The focal length of this combination is [MP PET 2002]

(a) $\frac{f_1 f_2}{f_1 - f_2}$ (b) $\frac{f_1 f_2}{f_1 + f_2}$

(c) $\frac{2 f_1 f_2}{f_1 - f_2}$ (d) $\frac{2 f_1 f_2}{f_1 + f_2}$

108. A convex lens is dipped in a liquid whose refractive index is equal to the refractive index of the lens. Then its focal length will

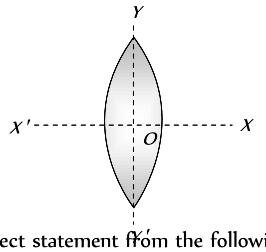
(a) Become infinite

(b) Become small, but non–zero

(c) Remain unchanged

(d) Become zero

109. An equiconvex lens is cut into two halves along (i) *XOX*′ and (ii) *YOY*′ as shown in the figure. Let f, f', f'' be the focal lengths of the complete lens, of each half in case (i), and of each half in case (ii), respectively



Choose the correct statement from the following

[CBSE PMT 2003]

(a) $f' = 2f, f'' = f$ (b) $f' = f, f'' = f$

(c) $f' = 2f, f'' = 2f$ (d) $f' = f, f'' = 2f$

110. The sun makes 0.5° angle on earth surface. Its image is made by convex lens of 50 *cm* focal length. The diameter of the image will be [CPMT 2003]

(a) 5 *mm* (b) 4.36 *mm*

(c) 7 *mm* (d) None of these

111. The chromatic Aberration in lenses becomes due to

[CPMT 2003]

(a) Disimilarity of main axis of rays

(b) Disimilarity of radii of curvature

(c) Variation of focal length of lenses with wavelength

(d) None of these

112. If aperture of lens is halved then image will be [AFMC 2003]

[Orissa JEE 2002]

(a) No effect on size

(b) Intensity of image decreases

(c) Both (a) and (b)

(d) None of these

113. When the convergent nature of a convex lens will be less as compared with air [AFMC 2003]

(a) In water (b) In oil

(c) In both (a) and (b) (d) None of these

114. An achromatic combination of lenses produces

[KCET 1993; JIPMER 1997]

(a) Coloured images

(b) Highly enlarged image

(c) Images in black and white

(d) Images unaffected by variation of refractive index with wavelength

115. In a parallel beam of white light is incident on a converging lens, the colour which is brought to focus nearest to the lens is

(a) Violet (b) Red

(c) The mean colour (d) All the colours together

116. A magnifying glass is to be used at the fixed object distance of 1 *inch*. If it is to produce an erect image magnified 5 *times* its focal length should be [MP PMT 1990]

(a) 0.2 *inch* (b) 0.8 *inch*
(c) 1.25 *inch* (d) 5 *inch*

117. A film projector magnifies a 100 *cm* film strip on a screen. If the linear magnification is 4, the area of magnified film on the screen is CPMT 1977, 91; MP PET 1985, 89; RPMT 2001; BCEC 2005]

(a) 1600 *cm* (b) 400 *cm*
(c) 800 *cm* (d) 200 *cm*

118. An object placed 10 *cm* in front of a lens has an image 20 *cm* behind the lens. What is the power of the lens (in *dioptres*) [MP PMT 1995]

(a) 1.5 (b) 3.0
(c) – 15.0 (d) + 15.0

119. A beam of parallel rays is brought to a focus by a plano-convex lens. A thin concave lens of the same focal length is joined to the first lens. The effect of this is [KCET 2004]

(a) The focal point shifts away from the lens by a small distance
(b) The focus remains undisturbed
(c) The focus shifts to infinity
(d) The focal point shifts towards the lens by a small distance

120. A thin plano-convex lens acts like a concave mirror of focal length 0.2 *m* when silvered from its plane surface. The refractive index of the material of the lens is 1.5. The radius of curvature of the convex surface of the lens will be [KCET 2004]

(a) 0.4 *m* (b 0.2 *m*
(c) 0.1 *m* (d) 0.75 *m*

121. A point object is placed at the center of a glass sphere of radius 6 *cm* and refractive index 1.5. The distance of the virtual image from the surface of the sphere is [IIT-JEE (Screening) 2004]

(a) 2 *cm* (b) 4 *cm*
(c) 6 *cm* (d) 12 *cm*

122. In order to obtain a real image of magnification 2 using a converging lens of focal length 20 *cm*, where should an object be placed [AFMC 2004]

(a) 50 *cm* (b) 30 *cm*
(c) – 50 *cm* (d) – 30 *cm*

123. A plano-convex lens of refractive index 1.5 and radius of curvature 30 *cm* is silvered at the curved surface. Now this lens has been used to form the image of an object. At what distance from this lens an object be placed in order to have a real image of the size of the object [AIEEE 2004]

(a) 20 *cm* (b) 30 *cm*
(c) 60 *cm* (d) 80 *cm*

124. A double convex lens $(R_1 = R_2 = 10\,cm)$ $(\mu = 1.5)$ having focal length equal to the focal length of a concave mirror. The radius of curvature of the concave mirror is [Orssia PMT 2004]

(a) 10 *cm* (b 20 *cm*
(c) 40 *cm* (d) 15 *cm*

125. At what distance from a convex lens of focal length 30 *cm*, an object should be placed so that the size of the image be 1/2 of the object

(a) 30 *cm* (b) 60 *cm*
(c) 15 *cm* (d) 90 *cm*

126. A plano-convex lens is made of refractive index of 1.6. The radius of curvature of the curved surface is 60 *cm*. The focal length of the lens is [NCERT 1980; Pb. PET 2000]

(a) 400 *cm* (b) 200 *cm*
(c) 100 *cm* (d) 50 *cm*

127. The radius of the convex surface of plano-convex lens is 20 *cm* and the refractive index of the material of the lens is 1.5. The focal length of the lens is [CPMT 2004]

(a) 30 *cm* (b) 50 *cm*
(c) 20 *cm* (d) 40 *cm*

128. A combination of two thin convex lenses of focal length 0.3 *m* and 0.1 *m* will have minimum spherical and chromatic aberrations if the distance between them is [UPSEE 2004]

(a) 0.1 *m* (b 0.2 *m*
(c) 0.3 *m* (d) 0.4 *m*

129. A bi-convex lens made of glass (refractive index 1.5) is put in a liquid of refractive index 1.7. Its focal length will [UPSEAT 2004]

(a) Decrease and change sign
(b Increase and change sign
(c) Decrease and remain of the same sign
(d) Increase and remain of the same sign

130. Spherical aberration in a lens [UPSEAT 2004]

(a) Is minimum when most of the deviation is at the first surface
(b) Is minimum when most of the deviation is at the second surface
(c) Is minimum when the total deviation is equally distributed over the two surface
(d) Does not depend on the above consideration

131. The focal lengths of convex lens for red and blue light are 100 *cm* and 96.8 *cm* respectively. The dispersive power of material of lens is [Pb. PET 2003]

(a) 0.325 (b 0.0325
(c) 0.98 (d) 0.968

132. The power of an achromatic convergent lens of two lenses is + 2*D*. The power of convex lens is + 5*D*. The ratio of dispersive power of convex and concave lens will be [Pb. PET 2003]

(a) 5 : 3 (b 3 : 5
(c) 2 : 5 (d) 5 : 2

133. The focal lengths for violet, green and red light rays are f_V, f_G and f_R respectively. Which of the following is the true relationship [BHU 2004; CBS

(a) $f_R < f_G < f_V$ (b $f_V < f_G < f_R$
(c) $f_G < f_R < f_V$ (d) $f_G < f_V < f_R$

134. Two lenses of power + 12 and – 2 diopters are placed in contact. The combined focal length of the combination will be

(a) 8.33 *cm* (b) 1.66 *cm*

(c) 12.5 *cm* (d) 10 *cm*

135. When light rays from the sun fall on a convex lens along a direction parallel to its axis [MP PMT 2004]

(a) Focal length for all colours is the same

(b Focal length for violet colour is the shortest

(c) Focal length for yellow colour is the longest

(d) Focal length for red colour is the shortest

136. A convex lens is in contact with concave lens. The magnitude of the ratio of their focal length is 2/3. Their equivalent focal length is 30 *cm*. What are their individual focal lengths

(a) – 75, 50 (b) – 10, 15

(c) 75, 50 (d) – 15, 10

137. A thin glass (refractive index 1.5) lens has optical power of $-5D$ in air. It's optical power in a liquid medium with refractive index 1.6 will be [AIEEE 2005]

(a) 25 *D* (b) – 25 *D*

(c) 1 *D* (d) None of these

138. The plane faces of two identical plano-convex lenses each having focal length of 40 *cm* are pressed against each other to form a usual convex lens. The distance from this lens, at which an object must be placed to obtain a real, inverted image with magnification one is [NCERT 1980; CPMT 1981; MP PMT 1999; UPSEAT 1999]

(a) 80 *cm* (b 40 *cm*

(c) 20 *cm* (d) 162 *cm*

139. If two lenses of +5 diopters are mounted at some distance apart, the equivalent power will always be negative if the distance is

(a) Greater than 40 *cm* (b) Equal to 40 *cm*

(c) Equal to 10 *cm* (d) Less than 10 *cm*

140. A concave lens and a convex lens have same focal length of 20 *cm* and both put in contact this combination is used to view an object 5 *cm* long kept at 20 *cm* from the lens combination. As compared to object the image will be [CPMT 2005]

(a) Magnified and inverted

(b Reduced and erect

(c) Of the same size and erect

(d) Of the same size and inverted

141. The focal length of the field lens (which is an achromatic combination of two lenses) of telescope is 90 *cm*. The dispersive powers of the two lenses in the combination are 0.024 and 0.036. The focal lengths of two lenses are [CPMT 2005]

(a) 30 *cm* and 60 *cm* (b 30 *cm* and – 45 *cm*

(c) 45 *cm* and 90 *cm* (d) 15 *cm* and 45 *cm*

142. A combination of two thin lenses of the same material with focal lengths f_1 and f_2, arranged on a common axis minimizes chromatic aberration, if the distance between them is

(a) $\frac{(f_1+f_2)}{4}$ (b) $\frac{(f_1+f_2)}{2}$

(c) (f_1+f_2) (d) $2(f_1+f_2)$

143. If the focal length of a double convex lens for red light is f_R, its focal length for the violet light is [EAMCET 2005]

(a) f_R (b) Greater than f_R

(c) Less than f_R (d) $2f_R$

144. A thin equiconvex lens is made of glass of refractive index 1.5 and its focal length is 0.2 *m*, if it acts as a concave lens of 0.5 *m* focal length when dipped in a liquid, the refractive index of the liquid is

(a) $\frac{17}{8}$ (b) $\frac{15}{8}$

(c) $\frac{13}{8}$ (d) $\frac{9}{8}$

145. The dispersive power of the material of lens of focal length 20 *cm* is 0.08. The longitudinal chromatic aberration of the lens is

(a) 0.08 *cm* (b) 0.08/20 *cm*

(c) 1.6 *cm* (d) 0.16 *cm*

[IIT-JEE (Screening) 2005]

Prism Theory & Dispersion of Light

1. Which source is associated with a line emission spectrum [MP PET/PMT 1988; CBSE PMT 1993]

(a) Electric fire (b) Neon street sign

(c) Red traffic light (d) Sun

2. Formula for dispersive power is (where symbols have their usual meanings) [MP PMT/PET 1988]

or

If the refractive indices of crown glass for red, yellow and violet colours are respectively μ_r, μ_y and μ_v, then the dispersive power of this glass would be [MP PMT 1996]

(a) $\frac{\mu_v-\mu_y}{\mu_r-1}$ (b) $\frac{\mu_v-\mu_r}{\mu_y-1}$

(c) $\frac{\mu_v-\mu_r}{\mu_y-\mu_r}$ [BCECE 2005] (d) $\frac{\mu_v-\mu_r}{\mu_y}-1$

3. The critical angle between an equilateral prism and air is 45°. If the incident ray is perpendicular to the refracting surface, then

(a) After deviation it will emerge from the second refracting surface

(b) It is totally reflected on the second surface and emerges out perpendicularly from third surface in air

(c) It is totally reflected from the second and third refracting surfaces and finally emerges out from the first surface

(d) It is totally reflected from all the three sides of prism and never emerges out

4. When white light passes through a glass prism, one gets spectrum on the other side of the prism. In the emergent beam, the ray which is deviating least is or

Deviation by a prism is lowest for [MP PMT 1997]

(a) Violet ray (b) Green ray

(c) Red ray (d) Yellow ray

5. We use flint glass prism to disperse polychromatic light because light of different colours [EAMCET 2005] [MP PET 1993]

(a) Travel with same speed

(b) Travel with same speed but deviate differently due to the shape of the prism

(c) Have different anisotropic properties while travelling through the prism

(d) Travel with different speeds

6. A prism $(\mu = 1.5)$ has the refracting angle of 30°. The deviation of a monochromatic ray incident normally on its one surface will be (sin 48° 36′ = 0.75)

[MP PMT/PET 1988]

(a) 18° 36′ (b) 20° 30′

(c) 18° (d) 22°1′

7. Fraunhofer lines are obtained in

[CPMT 1973; MP PMT 1989; MP PMT 2004]

(a) Solar spectrum

(b) The spectrum obtained from neon lamp

(c) Spectrum from a discharge tube

(d) None of the above

8. When light rays are incident on a prism at an angle of 45°, the minimum deviation is obtained. If refractive index of the material of prism is $\sqrt{2}$, then the angle of prism will be

[MP PMT 1986]

(a) 30° (b) 40°

(c) 50° (d) 60°

9. A spectrum is formed by a prism of dispersive power 'ω'. If the angle of deviation is 'δ', then the angular dispersion is

[MP PMT 1989]

(a) ω / δ (b) δ / ω

(c) $1/\omega\delta$ (d) $\omega\delta$

10. Light from sodium lamp is passed through cold sodium vapours, the spectrum of transmitted light consists of

[MP PET 1989; RPMT 2001]

(a) A line at 5890 Å (b) A line at 5896 Å

(c) Sodium doublet lines (d) No spectral features

11. Angle of minimum deviation for a prism of refractive index 1.5 is equal to the angle of prism. The angle of prism is (cos 41° = 0.75)

(a) 62° (b) 41°

(c) 82° (d) 31°

12. In the formation of primary rainbow, the sunlight rays emerge at minimum deviation from rain-drop after

[MP PET 1989]

(a) One internal reflection and one refraction

(b) One internal reflection and two refractions

(c) Two internal reflections and one refraction

(d) Two internal reflections and two refractions

13. Dispersive power depends upon [RPMT 1997]

(a) The shape of prism (b) Material of prism

(c) Angle of prism (d) Height of the prism

14. When white light passes through the achromatic combination of prisms, then what is observed

[MP PMT 1989]

(a) Only deviation (b) Only dispersion

(c) Deviation and dispersion (d) None of the above

15. The dispersion for a medium of wavelength λ is *D*, then the dispersion for the wavelength 2λ will be

[MP PET 1989]

(a) *D*/8 (b) *D*/4

(c) *D*/2 (d) *D*

16. The refractive index of a prism for a monochromatic wave is $\sqrt{2}$ and its refracting angle is 60°. For minimum deviation, the angle of incidence will be

[MNR 1998; MP PMT 1989, 92, 2002; CPMT 1993, 2004]

(a) 30° (b) 45°

(c) 60° (d) 75°

17. The ratio of angle of minimum deviation of a prism in air and when dipped in water will be ($_a\mu_g = 3/2$ and $_a\mu_w = 4/3$)

(a) 1/8 (b) 1/2

(c) 3/4 (d) 1/4

18. The respective angles of the flint and crown glass prisms are *A*′ and *A*. They are to be used for dispersion without deviation, then the ratio of their angles *A*′ /*A* will be

[MP PMT 1989]

(a) $-\frac{(\mu_y - 1)}{(\mu_y' - 1)}$ (b) $\frac{(\mu_y' - 1)}{(\mu_y - 1)}$

(c) $(\mu_y' - 1)$ (d) $(\mu_y - 1)$

19. The number of wavelengths in the visible spectrum

[MP PMT 1989]

(a) 4000 (b) 6000

(c) 2000 (d) Infinite

20. The black lines in the solar spectrum during solar eclipse can be explained by [MP PMT 1989]

(a) Planck's law (b) Kirchoff's law

(c) Boltzmann's law (d) Solar disturbances

21. The dispersive power is maximum for the material

(a) Flint glass (b) Crown glass

(c) Mixture of both [MP PET/PMT 1988] (d) None of the above

22. A light ray is incident by grazing one of the face of a prism and after refraction ray does not emerge out, what should be the angle of prism while critical angle is *C*

(a) Equal to 2*C* (b) Less than 2*C*

(c) More than 2*C* (d) None of the above

23. A parallel beam of monochromatic light is incident at one surface of a equilateral prism. Angle of incidence is 55° and angle of emergence is 46°. The angle of minimum deviation will be

(a) Less than 41° (b) Equal to 41°

(c) More than 41° (d) None of the above

24. The spectrum of light emitted by a glowing solid is

(a) Continuous spectrum (b) Line spectrum

(c) Band spectrum (d) Absorption spectrum

25. Light rays from a source are incident on a glass prism of index of refraction μ and angle of prism α. At near normal incidence, the angle of deviation of the emerging rays is

[MP PMT 1993]

(a) $(\mu - 2)\alpha$ (b) $(\mu - 1)\alpha$

(c) $(\mu + 1)\alpha$ (d) $(\mu + 2)\alpha$

26. Which of the following element was discovered by study of Fraunhofer lines

(a) Hydrogen (b) Oxygen

(c) Helium (d) Ozone

27. By placing the prism in minimum deviation position, images of the spectrum

(a) Becomes inverted (b) Becomes broader

(c) Becomes distinct (d) Becomes intensive

28. Our eye is most sensitive for which of the following wavelength

(a) 4500 $\mathring{A}$

(b) 5500 $\mathring{A}$

(c) 6500 $\mathring{A}$

(d) Equally sensitive for all wave lengths of visible spectrum

29. Three prisms of crown glass, each have angle of prism 9° and two prisms of flint glass are used to make direct vision spectroscope. What will be the angle of flint glass prisms if μ for flint is 1.60 and μ for crown glass is 1.53

(a) 11.9° (b) 16.0°

(c) 15.3° (d) 9.11°

30. If the refractive indices of crown glass for red, yellow and violet colours are 1.5140, 1.5170 and 1.5318 respectively and for flint glass these are 1.6434, 1.6499 and 1.6852 respectively, then the dispersive powers for crown and flint glass are respectively

(a) 0.034 and 0.064 (b) 0.064 and 0.034

(c) 1.00 and 0.064 (d) 0.034 and 1.0

31. The minimum temperature of a body at which it emits light is

(a) 1200°C (b) 1000°C

(c) 500°C (d) 200°C

32. Band spectrum is obtained when the source emitting light is in the form of **or**

Band spectrum is characteristic of

[CPMT 1988; MP PET 1994; DCE 2004; MP PET 2005]

(a) Atoms (b Molecules

(c) Plasma (d) None of the above

33. Flint glass prism is joined by a crown glass prism to produce dispersion without deviation. The refractive indices of these for mean rays are 1.602 and 1.500 respectively. Angle of prism of flint prism is 10°, then the angle of prism for crown prism will be

(a) 12°2.4' (b) 12°4'

(c) 1.24° (d) 12°

34. The angle of minimum deviation for a prism is 40° and the angle of the prism is 60°. The angle of incidence in this position will be

[EAMCET (Engg.) 1995; MH CET 1999; CPMT 2000]

(a) 30° (b) 60°

(c) 50° (d) 100°

35. In the position of minimum deviation when a ray of yellow light passes through the prism, then its angle of incidence is

[MP PMT 1989; RPMT 1997]

(a) Less than the emergent angle

(b) Greater than the emergent angle

(c) Sum of angle of incidence and emergent angle is 90°

(d) Equal to the emergent angle

36. A circular disc of which 2/3 part is coated with yellow and 1/3 part is with blue. It is rotated about its central axis with high velocity, then it will be seen as

(a) Green (b) Brown

(c) White (d) Violet

37. The fine powder of a coloured glass is seen as

(a) Coloured (b) White

(c) That of the glass colour (d) Black

38. When a white light passes through a hollow prism, then

[MP PMT 1987]

(a) There is no dispersion and no deviation

(b) Dispersion but no deviation

(c) Deviation but no dispersion

(d) There is dispersion and deviation both

39. The light ray is incidence at angle of 60° on a prism of angle 45°. When the light ray falls on the other surface at 90°, the refractive index of the material of prism μ and the angle of deviation δ are given by [MP PET/PMT 1988] [DPMT 2001]

(a) $\mu = \sqrt{2}\, , \delta = 30^o$ (b) $\mu = 1.5\, , \delta = 15^o$

(c) $\mu = \dfrac{\sqrt{3}}{2}, \delta = 30^o$ (d) $\mu = \sqrt{\dfrac{3}{2}}, \delta = 15^o$

40. In dispersion without deviation

(a) The emergent rays of all the colours are parallel to the incident ray

(b) Yellow coloured ray is parallel to the incident ray

(c) Only red coloured ray is parallel to the incident ray

(d) All the rays are parallel, but not parallel to the incident ray

41. Deviation of 5° is observed from a prism whose angle is small and whose refractive index is 1.5. The angle of prism is

[DPMT 2001]

(a) 7.5° (b) 10°

(c) 5° (d) 3.3°

42. The refractive indices of violet and red light are 1.54 and 1.52 respectively. If the angle of prism is 10°, then the angular dispersion is [MP PMT 1990]

(a) 0.02 (b) 0.2

(c) 3.06 (d) 30.6

43. The angle of minimum deviation measured with a prism is 30° and the angle of prism is 60°. The refractive index of prism material is

(a) $\sqrt{2}$ (b) 2

(c) 3/2 (d) 4/3

44. If the refractive indices of a prism for red, yellow and violet colours be 1.61, 1.63 and 1.65 respectively, then the dispersive power of the prism will be

[MP PET 1991; DPMT 1999]

(a) $\frac{1.65-1.62}{1.61-1}$ (b) $\frac{1.62-1.61}{1.65-1}$

(c) $\frac{1.65-1.61}{1.63-1}$ (d) $\frac{1.65-1.63}{1.61-1}$

45. The minimum deviation produced by a hollow prism filled with a certain liquid is found to be 30°. The light ray is also found to be refracted at angle of 30°. The refractive index of the liquid is

(a) $\sqrt{2}$ (b) $\sqrt{3}$

(c) $\sqrt{\frac{3}{2}}$ (d) $\frac{3}{2}$

46. Minimum deviation is observed with a prism having angle of prism *A*, angle of deviation δ, angle of incidence *i* and angle of emergence *e*. We then have generally

[MP PET 1991]

(a) $i > e$ (b) $i < e$

(c) $i = e$ (d) $i = e = \delta$

47. A thin prism P with angle 4° and made from glass of refractive index 1.54 is combined with another thin prism P' made from glass of refractive index 1.72 to produce dispersion without deviation. The angle of prism P' is

[MP PMT 1991, 92; IIT-JEE 1990; MP PET 1995, 99; UPSEAT 2001; RPMT 2004]

(a) 2.6° (b) 3°

(c) 4° (d) 5.33°

48. An achromatic prism is made by combining two prisms $P_1(\mu_v = 1.523, \mu_r = 1.515)$ and $P_2(\mu_v = 1.666, \mu_r = 1.650)$; where μ represents the refractive index. If the angle of the prism P_1 is 10°, then the angle of the prism P_2 will be

[MP PMT 1991]

(a) 5° (b) 7.8°

(c) 10.6° (d) 20°

49. Angle of a prism is 30° and its refractive index is $\sqrt{2}$ and one of the surface is silvered. At what angle of incidence, a ray should be incident on one surface so that after reflection from the silvered surface, it retraces its path

[MP PMT 1991; UPSEAT 2001; CBSE PMT 2004]

(a) 30° (b) 60°

(c) 45° (d) $\sin^{-1}\sqrt{1.5}$

50. For a material, the refractive indices for red, violet and yellow colour light are respectively 1.52, 1.64 and 1.60. The dispersive power of the material is [MP PMT 1991]

(a) 2 (b) 0.45

(c) 0.2 (d) 0.045

51. Band spectrum is produced by [CPMT 1978]

(a) *H* (b) *He*

(c) H_2 (d) *Na*

52. The band spectra (characteristic of molecular species) is due to emission of radiation [CPMT 1982, 90]

(a) Gaseous state (b) Liquid state

(c) Solid state (d) All of three states

53. Line spectrum was first of all theoretically explained by

(a) Swan (b) Fraunhofer

(c) Kirchoff (d) Bohr

54. The spectrum of iodine gas under white light will be

(a) Only violet

(b) Bright lines [MP PET 1991]

(c) Only red lines

(d) Some black bands in continuous spectrum

55. Continuous spectrum is not due to

(a) Hydrogen flame (b) Electric bulb

(c) Kerosene oil lamp flame (d) Candle flame

56. Fraunhofer lines are produced by

(a) The element present in the photosphere of sun

(b) The elements present in the chromosphere of the sun

(c) The vapour of the element present in the chromosphere of the sun

(d) The carbon dioxide present in the atmosphere

57. A medium is said to be dispersive, if [MP PMT 1990]

(a) Light of different wavelengths propagate at different speeds

(b) Light of different wavelengths propagate at same speed but has different frequencies

(c) Light is gradually bent rather than sharply refracted at an interface between the medium and air

(d) Light is never totally internally reflected

58. A ray of light is incident at an angle of 60° on one face of a prism of angle 30°. The ray emerging out of the prism makes an angle of 30° with the incident ray. The emergent ray is

[EAMCET 1990; MP PMT 1990]

(a) Normal to the face through which it emerges

(b) Inclined at 30° to the face through which it emerges

(c) Inclined at 60° to the face through which it emerges

(d) None of these

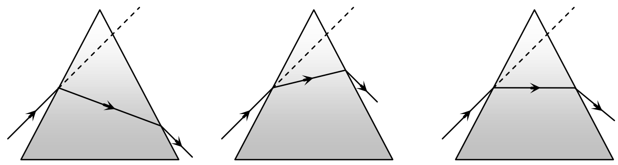
59. In a thin prism of glass (refractive index 1.5), which of the following relations between the angle of minimum deviations δ_m and angle of refraction r will be correct

[MP PMT 1990]

(a) $\delta_m = r$ (b) $\delta_m = 1.5\,r$

(c) $\delta_m = 2r$ (d) $\delta_m = \frac{r}{2}$

60. The figures represent three cases of a ray passing through a prism of angle *A*. The case corresponding to minimum deviation is



(1) (2) (3)

(a) 1 (b) 2

(c) 3 (d) None of these

61. Dispersion can take place for [MP PET 1992]

(a) Transverse waves only but not for longitudinal waves

(b) Longitudinal waves only but not for transverse waves

(c) Both transverse and longitudinal waves

(d) Neither transverse nor longitudinal waves

62. Emission spectrum of CO_2 gas [MP PET 1992]

(a) Is a line spectrum

(b Is a band spectrum

(c) Is a continuous spectrum

(d) Does not fall in the visible region

63. A ray of light passes through an equilateral glass prism in such a manner that the angle of incidence is equal to the angle of emergence and each of these angles is equal to 3/4 of the angle of the prism. The angle of deviation is

[MNR 1988; MP PMT 1999; Roorkee 2000; UPSEAT 2000; MP PET 2005]

(a) 45° (b) 39°

(c) 20° (d) 30°

64. The true statement is

(a) The order of colours in the primary and the secondary rainbows is the same

(b) The intensity of colours in the primary and the secondary rainbows is the same

(c) The intensity of light in the primary rainbow is greater and the order of colours is the same than the secondary rainbow

(d) The intensity of light for different colours in primary rainbow is greater and the order of colours is reverse than the secondary rainbow

65. What will be the colour of sky as seen from the earth, if there were no atmosphere [MP PMT 1992]

(a) Black (b) Blue

(c) Orange (d) Red

66. When light emitted by a white hot solid is passed through a sodium flame, the spectrum of the emergent light will show

[MP PMT 1992]

(a) The D_1 and D_2 bright yellow lines of sodium

(b) Two dark lines in the yellow region

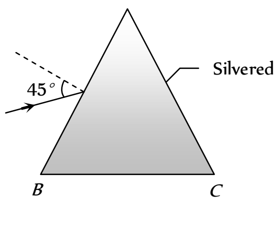
(c) All colours from violet to red

(d) No colours at all

67. A prism ABC of angle 30° has its face AC silvered. A ray of light incident at an angle of 45° at the face AB retraces its path after refraction at face AB and reflection at face AC. The refractive index of the material of the prism is

[MP PMT 1992; EAMCET 2001]

(a) 1.5

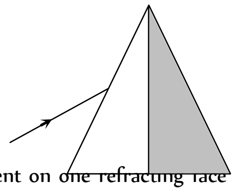


(b) $\frac{3}{\sqrt{2}}$

(c) $\sqrt{2}$

(d) $\frac{4}{3}$

68. A light ray is incident upon a prism in minimum deviation position and suffers a deviation of 34°. If the shaded half of the prism is knocked off, the ray will [MP PMT 1992]



(a) Suffer a deviation of 34°

(b) Suffer a deviation of 68°

(c) Suffer a deviation of 17°

(d) Not come out of the prism

69. A ray of monochromatic light is incident on one refracting face of a prism of angle 75°. It passes through the prism and is incident on the other face at the critical angle. If the refractive index of the material of the prism is $\sqrt{2}$, the angle of incidence on the first face of the prism is

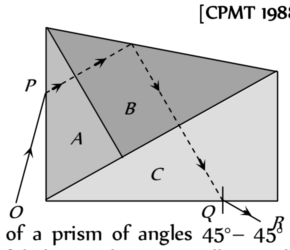
[EAMCET 1983]

(a) 30° (b) 45°

(c) 60° (d) 0°

70. Three glass prisms A, B and C of same refractive index are placed in contact with each other as shown in figure, with no air gap between the prisms. Monochromatic ray of light OP passes through the prism assembly and emerges as QR. The conditions of minimum deviation is satisfied in the prisms

[CPMT 1988]



(a) A and C

(b) B and C

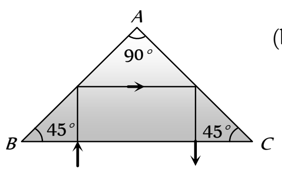
(c) A and B

(d) In all prisms A, B and C

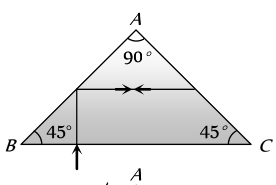
71. The refractive index of a material of a prism of angles 45°– 45° – 90° is 1.5. The path of the ray of light incident normally on the hypotenuse side is shown in

[EAMCET 1985]

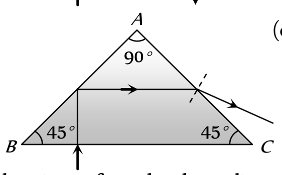
(a)



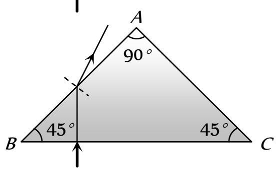
(b)



(c)



(d)



72. At the time of total solar eclipse, the spectrum of solar radiation would be [MP PMT 1990; RPMT 2004]

(a) A large number of dark Fraunhofer lines

(b) A less number of dark Fraunhofer lines

(c) No lines at all

(d) All Fraunhofer lines changed into brilliant colours

73. Angle of deviation (δ) by a prism (refractive index = μ and supposing the angle of prism A to be small) can be given by

(a) $\delta = (\mu - 1)A$ (b) $\delta = (\mu + 1)A$

(c) $\delta = \dfrac{\sin\dfrac{A+\delta}{2}}{\sin\dfrac{A}{2}}$ (d) $\delta = \dfrac{\mu - 1}{\mu + 1}A$

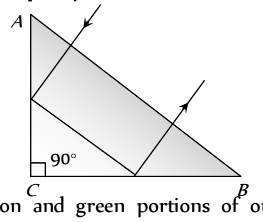
74. Angle of prism is A and its one surface is silvered. Light rays falling at an angle of incidence 2A on first surface return back through the same path after suffering reflection at second silvered surface. Refractive index of the material of prism is

(a) 2 sin A (b) 2 cos A

(c) $\frac{1}{2}\cos A$ (d) $\tan A$

75. A ray of light incident normally on an isosceles right angled prism travels as shown in the figure. The least value of the refractive index of the prism must be

[Manipal MEE 1995; BHU 2003]



(a) $\sqrt{2}$

(b) $\sqrt{3}$

(c) 1.5

(d) 2.0

76. When seen in green light, the saffron and green portions of our National Flag will appear to be [Manipal MEE 1995]

(a) Black

(b) Black and green respectively

(c) Green

(d) Green and yellow respectively

77. At sun rise or sunset, the sun looks more red than at mid-day because [AFMC 1995; Similar to DCE 2003]

(a) The sun is hottest at these times

(b) Of the scattering of light

(c) Of the effects of refraction

(d) Of the effects of diffraction

78. Line spectrum contains information about [MP PET 1995]

(a) The atoms of the prism

(b) The atoms of the source

(c) The molecules of the source

(d) The atoms as well as molecules of the source

79. Missing lines in a continuous spectrum reveal

[MP PET 1995]

(a) Defects of the observing instrument

(b) Absence of some elements in the light source

(c) Presence in the light source of hot vapours of some elements

(d) Presence of cool vapours of some elements around the light source

80. A source emits light of wavelength 4700Å, 5400 Å and 6500 Å. The light passes through red glass before being tested by a spectrometer. Which wavelength is seen in the spectrum

[MP PMT 1995]

(a) 6500 Å (b) 5400 Å

(c) 4700 Å (d) All the above

81. A ray passes through a prism of angle 60° in minimum deviation position and suffers a deviation of 30°. What is the angle of incidence on the prism [MP PMT 1994]

[MP PMT 1995; Pb. PMT 2001; RPMT 2003]

(a) 30° (b) 45°

(c) 60° (d) 90°

82. When light of wavelength λ is incident on an equilateral prism kept in its minimum deviation position, it is found that the angle of deviation equals the angle of the prism itself. The refractive index of the material of the prism for the wavelength λ is, then [AIIMS 1995]

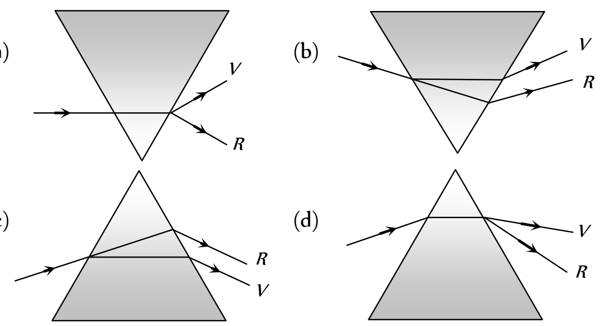
(a) $\sqrt{3}$ (b) $\frac{\sqrt{3}}{2}$

(c) 2 (d) $\sqrt{2}$

83. Which of the following diagrams, shows correctly the dispersion of white light by a prism

[NSEP 1994; MP PET 1996]

(a) (b) (c) (d)



84. A neon sign does not produce

[MP PET 1996; UPSEAT 2004]

(a) Line spectrum

(b) An emission spectrum

(c) An absorption spectrum

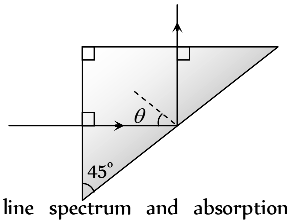
(d) Photons

85. The refractive index of flint glass for blue F line is 1.6333 and red C line is 1.6161. If the refractive index for yellow D line is 1.622, the dispersive power of the glass is

(a) 0.0276 (b) 0.276

(c) 2.76 (d) 0.106

86. A triangular prism of glass is shown in the figure. A ray incident normally to one face is totally reflected, if $\theta = 45^o$. The index of refraction of glass is [AIEEE 2004]



(a) Less than 1.41

(b) Equal to 1.41

(c) Greater than 1.41

(d) None of the above

87. The wavelength of emission line spectrum and absorption line spectrum of a substance are related as

(a) Absorption has larger value

(b) Absorption has smaller value

(c) They are equal

(d) No relation

88. White light is passed through a prism whose angle is 5°. If the refractive indices for rays of red and blue colour are respectively 1.64 and 1.66, the angle of deviation between the two colours will be

(a) 0.1 *degree* (b) 0.2 *degree*

(c) 0.3 *degree* (d) 0.4 *degree*

89. From which source a continuous emission spectrum and a line absorption spectrum are simultaneously obtained [MP PMT 1997]

(a) Bunsen burner flame

(b) The sun

(c) Tube light

(d) Hot filament of an electric bulb

90. A thin prism P_1 with angle 6° and made from glass of refractive index 1.54 is combined with another thin prism P of refractive index 1.72 to produce dispersion without deviation. The angle of prism P_2 will be [MP PMT 1999]

(a) 5° 24′ (b) 4° 30′

(c) 6° (d) 8°

91. If the refractive index of a material of equilateral prism is $\sqrt{3}$, then angle of minimum deviation of the prism is [CBSE PMT 1999; Pb. PMT 2004; MH CET 2004]

(a) 30° (b) 45°

(c) 60° (d) 75°

92. The splitting of white light into several colours on passing through a glass prism is due to [CPMT 1999]

(a) Refraction (b) Reflection

(c) Interference (d) Diffraction

93. A white screen illuminated by green and red light appears to be

(a) Green (b) Red

(c) Yellow (d) White

94. Dark lines on solar spectrum are due to [EAMCET (Engg.) 1995]

(a) Lack of certain elements

(b) Black body radiation

(c) Absorption of certain wavelengths by outer layers

(d) Scattering

95. Line spectra are due to [EAMCET (Med.) 1995]

(a) Hot solids

(b) Atoms in gaseous state

(c) Molecules in gaseous state

(d) Liquid at low temperature

96. The path of a refracted ray of light in a prism is parallel to the base of the prism only when the [SCRA 1994]

(a) Light is of a particular wavelength

(b) Ray is incident normally at one face

(c) Ray undergoes minimum deviation

(d) Prism is made of a particular type of glass

97. For a medium, refractive indices for violet, red and yellow are 1.62, 1.52 and 1.55 respectively, then dispersive power of medium will be [RPET 1997]

(a) 0.65 (b) 0.22

(c) 0.18 [MP PET 1997] (d) 0.02

98. Two lenses having $f_1 : f_2 = 2 : 3$ has combination to make no dispersion. Find the ratio of dispersive power of glasses used

(a) 2 : 3 (b) 3 : 2

(c) 4 : 9 (d) 9 : 4

99. If refractive index of red, violet and yellow lights are 1.42, 1.62 and 1.50 respectively for a medium. Its dispersive power will be

(a) 0.4 (b) 0.3

(c) 0.2 (d) 0.1

100. A ray is incident at an angle of incidence i on one surface of a prism of small angle A and emerges normally from the opposite surface. If the refractive index of the material of the prism is μ , the angle of incidence i is nearly equal to [CBSE PMT 1992]

(a) A / μ (b) $A / 2\mu$

(c) μA (d) $\mu A / 2$

101. Fraunhofer spectrum is a [KCET 1993, 94; RPET 1997; MP PET 1997, 2001; JIPMER 2000; AIIMS 2001]

(a) Line absorption spectrum

(b) Band absorption spectrum

(c) Line emission spectrum

(d) Band emission spectrum

102. The angle of a prism is 60° and its refractive index is $\sqrt{2}$. The angle of minimum deviation suffered by a ray of light in passing through it is [MP PET 2003]

[KCET 1994; RPMT 1997]

(a) About 20° (b) 30°

(c) 60° (d) 45°

103. Colour of the sky is blue due to [CPMT 1996, 99; AFMC 1993; AIIMS 1999; AIEEE 2002; BCECE 2003; BHU 2004]

(a) Scattering of light (b) Total internal reflection

(c) Total emission (d) None of the above

104. Which of the following spectrum have all the frequencies from high to low frequency range [CPMT 1996]

(a) Band spectrum (b) Continuous spectrum

(c) Line spectrum (d) Discontinuous spectrum

105. Stars are not visible in the day time because [JIPMER 1997]

(a) Stars hide behind the sun

(b) Stars do not reflect sun rays during day

(c) Stars vanish during the day

(d) Atmosphere scatters sunlight into a blanket of extreme brightness through which faint stars cannot be visible

106. Which of the following colours suffers maximum deviation in a prism [KCET 1998; DPMT 2000]

(a) Yellow (b) Blue
(c) Green (d) Orange

107. If a thin prism of glass is dipped into water then minimum deviation (with respect to air) of light produced by prism will be left $\left({}_a\mu_g = \frac{3}{2} \text{ and } {}_a\mu_w = \frac{4}{3}\right)$ [UPSEAT 1999]

(a) $\frac{1}{2}$ (b) $\frac{1}{4}$
(c) 2 (d) $\frac{1}{5}$

108. The refractive indices for the light of violet and red colours of any material are 1.66 and 1.64 respectively. If the angle of prism made of this material is 10°, then angular dispersion will be

(a) 0.20° (b) 0.10°
(c) 0.40° (d) 1°

109. The refractive index of the material of the prism for violet colour is 1.69 and that for red is 1.65. If the refractive index for mean colour is 1.66, the dispersive power of the material of the prism

(a) 0.66 (b) 0.06
(c) 0.65 (d) 0.69

110. The deviation caused in red, yellow and violet colours for crown glass prism are 2.84°, 3.28° and 3.72° respectively. The dispersive power of prism material is [KCET (Engg.) 1999]

(a) 0.268 (b) 0.368
(c) 0.468 (d) 0.568

111. Dispersion of light is due to [DCE 1999]

(a) Wavelength (b) Intensity of light
(c) Density of medium (d) None of these

112. A prism of refracting angle 60° is made with a material of refractive index μ. For a certain wavelength of light, the angle of minimum deviation is 30°. For this, wavelength the value of refractive index of the material is [CPMT 1999, MH CET 2000]

(a) 1.231 (b) 1.820
(c) 1.503 (d) 1.414

113. Which of the prism is used to see infrared spectrum of light [RPMT 2000]

(a) Rock Salt (b) Nicol
(c) Flint (d) Crown

114. When white light enters a prism, it gets split into its constituent colours. This is due to [DCE 2000]

(a) High density of prism material
(b) Because μ is different for different λ
(c) Diffraction of light
(d) Velocity changes for different frequencies

115. The dispersive powers of crown and flint glasses are 0.02 and 0.04 respectively. In an achromatic combination of lenses the focal length of flint glass lens is 40 *cm*. The focal length of crown glass lens will be [DCE 2000]

(a) – 20 *cm* (b) + 20 *cm*
(c) – 10 *cm* (d) + 10 *cm*

116. When a ray of light is incident normally on one refracting surface of an equilateral prism (Refractive index of the material of the prism = 1.5 [EAMCET (Med.) 2000]

(a) Emerging ray is deviated by 30°
(b) Emerging ray is deviated by 45°
(c) Emerging ray just grazes the second refracting surface
(d) The ray undergoes total internal reflection at the second refracting surface

117. Consider the following two statements A and B and identify the correct choice in the given answers [EAMCET (Engg.) 2000]

A : Line spectra is due to atoms in gaseous state
B : Band spectra is due to molecules

(a) Both A and B are false
(b) A is true and B is false [UPSEAT 1999]
(c) A is false and B is true
(d) Both A and B are true

118. Under minimum deviation condition in a prism, if a ray is incident at an angle 30°, the angle between the emergent ray and the second refracting surface of the prism is [UPMT 1999] [EAMCET (Engg.) 2000]

(a) 0° (b) 30°
(c) 45° (d) 60°

119. The angle of prism is 5° and its refractive indices for red and violet colours are 1.5 and 1.6 respectively. The angular dispersion produced by the prism is [MP PMT 2000]

(a) 7.75° (b) 5°
(c) 0.5° (d) 0.17°

120. If the refractive angles of two prisms made of crown glass are 10° and 20° respectively, then the ratio of their colour deviation powers will be [KCET 1999; AFMC 2001]

(a) 1 : 1 (b) 2 : 1
(c) 4 : 1 (d) 1 : 2

121. The nature of sun's spectrum is [MP PET 2000; MP PMT 2001]

(a) Continuous spectrum with absorption lines
(b) Line spectrum
(c) The spectrum of the helium atom
(d) Band spectrum

122. A ray of light is incident normally on one of the face of a prism of angle 30° and refractive index $\sqrt{2}$. The angle of deviation will be [KCET 2001]

(a) 26° (b) 0°
(c) 23° (d) 15°

123. For a prism of refractive index 1.732, the angle of minimum deviation is equal to the angle of the prism. The angle of the prism is [CBSE PMT 2001]

(a) 80° (b) 70°

(c) 60° (d) 50°

124. The spectrum obtained from an electric lamp or red hot heater is

(a) Line spectrum (b) Band spectrum

(c) Absorption spectrum (d) Continuous spectrum

125. When a glass prism of refracting angle 60° is immersed in a liquid its angle of minimum deviation is 30°. The critical angle of glass with respect to the liquid medium is [EAMCET 2001]

(a) 42° (b) 45°

(c) 50° (d) 52°

126. Three prisms 1, 2 and 3 have the prism angle $A = 60°$, but their refractive indices are respectively 1.4, 1.5 and 1.6. If $\delta_1, \delta_2, \delta_3$ be their respective angles of deviation then

[MP PMT 2001]

(a) $\delta_3 > \delta_2 > \delta_1$ (b) $\delta_1 > \delta_2 > \delta_3$

(c) $\delta_1 = \delta_2 = \delta_3$ (d) $\delta_2 > \delta_1 > \delta_3$

127. Which one of the following alternative is FALSE for a prism placed in a position of minimum deviation [MP PET 2001]

(a) $i_1 = i_2$ (b) $r_1 = r_2$

(c) $i_1 = r_1$ (d) All of these

128. In the visible region the dispersive powers and the mean angular deviations for crown and flint glass prisms are ω, ω' and d, d' respectively. The condition for getting deviation without dispersion when the two prisms are combined is

[EAMCET 2001]

(a) $\sqrt{\omega d} + \sqrt{\omega' d'} = 0$ (b) $\omega' d + \omega d' = 0$

(c) $\omega d + \omega' d' = 0$ (d) $(\omega d)^2 + (\omega' d')^2 = 0$

129. A ray of light passes through the equilateral prism such that angle of incidence is equal to the angle of emergence if the angle of incidence is 45°. The angle of deviation will be

[Pb. PMT 2002]

(a) 15° (b) 75°

(c) 60° (d) 30°

130. The solar spectrum during a complete solar eclipse is

[Kerala PET 2002]

(a) Continuous (b) Emission line

(c) Dark line (d) Dark band

131. Why sun has elliptical shape on the time when rising and sun setting ? It is due to [AFMC 2002]

(a) Refraction (b) Reflection

(c) Scattering (d) Dispersion

132. In the formation of a rainbow light from the sun on water droplets undergoes [CBSE PMT 2000; Orissa JEE 2002; MP PET 2003; KCET 2004]

(a) Dispersion only

(b) Only total internal reflection

(c) Dispersion and total internal reflection

(d) None of these

[BHU 2001; Pb. PET 2003]

133. The Cauchy's dispersion formula is [AIIMS 2002]

(a) $n = A + B\lambda^{-2} + C\lambda^{-4}$ (b) $n = A + B\lambda^{2} + C\lambda^{-4}$

(c) $n = A + B\lambda^{-2} + C\lambda^{4}$ (d) $n = A + B\lambda^{2} + C\lambda^{4}$

134. A prism of refractive index μ and angle A is placed in the minimum deviation position. If the angle of minimum deviation is A, then the value of A in terms of μ is

[EAMCET 2003]

(a) $\sin^{-1}\left(\frac{\mu}{2}\right)$ (b) $\sin^{-1}\sqrt{\frac{\mu-1}{2}}$

(c) $2\cos^{-1}\left(\frac{\mu}{2}\right)$ (d) $\cos^{-1}\left(\frac{\mu}{2}\right)$

135. A given ray of light suffers minimum deviation in an equilateral prism P. Additional prisms Q and R of identical shape and material are now added to P as shown in the figure. The ray will suffer

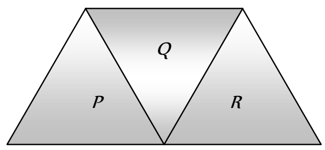
[IIT-JEE (Screening) 2001; KCET 2003]

(a) Greater deviation

(b) Same deviation

(c) No deviation

(d) Total internal reflection



136. In the given figure, what is the angle of prism

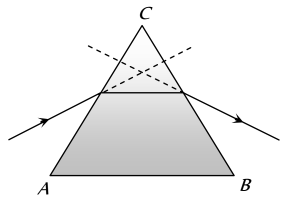
[Orissa JEE 2003]

(a) A

(b) B

(c) C

(d) D



137. A prism of refractive index $\sqrt{2}$ has a refracting angle of 60°. At what angle a ray must be incident on it so that it suffers a minimum deviation [BHU 2003; MP PMT 2005]

(a) 45° (b) 60°

(c) 90° (d) 180°

138. A convex lens, a glass slab, a glass prism and a solid sphere all are made of the same glass, the dispersive power will be

[CPMT 1986]

(a) In the glass slab and prism

(b) In the lens and solid sphere

(c) Only in prism

(d) In all the four

139. A parallel beam of white light falls on a convex lens. Images of blue, yellow and red light are formed on other side of the lens at a distance of 0.20 m, 0.205 m and 0.214 m respectively. The dispersive power of the material of the lens will be

(a) 619/1000 (b) 9/200

(c) 14/205 (d) 5/214

140. The refractive index of the material of the prism for violet colour is 1.69 and that for red is 1.65. If the refractive index for mean colour is 1.66, the dispersive power of the material of the prism [JIPMER 1999]

(a) 0.66 (b 0.06

(c) 0.65 (d) 0.69

141. If the angle of prism is 60^o and the angle of minimum deviation is 40^o, the angle of refraction will be [MP PMT 2004]

(a) 30^o (b) 60^o

(c) 100^o (d) 120^o

142. The refractive index of a particular material is 1.67 for blue light, 1.65 for yellow light and 1.63 for red light. The dispersive power of the material is .... [KCET 2004]

(a) 0.0615 (b) 0.024

(c) 0.031 (d) 1.60

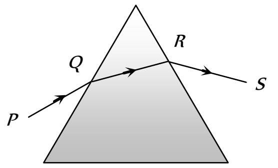
143. A ray of light is incident on an equilateral glass prism placed on a horizontal table. For minimum deviation which of the following is true [IIT-JEE (Screening) 2004]

(a) *PQ* is horizontal

(b) *QR* is horizontal

(c) *RS* is horizontal

(d) Either *PQ* or *RS* is horizontal



144. A beam of light composed of red and green ray is incident obliquely at a point on the face of rectangular glass slab. When coming out on the opposite parallel face, the red and green ray emerge from [CBSE PMT 2004]

(a) Two points propagating in two different directions

(b) Two points propagating in two parallel directions

(c) One point propagating in two different directions

(d) One point propagating in the same directions

145. White light is passed through a prism .... colour shows minimum deviation [Orissa PMT 2004]

(a) Red (b) Violet

(c) Yellow (d) Green

146. A ray of monochromatic light suffers minimum deviation of 38^o while passing through a prism of refracting angle 60^o. Refractive index of the prism material is [Pb. PET 2001]

(a) 1.5 (b) 1.3

(c) 0.8 (d) 2.4

147. A ray incident a 15^o on one refracting surface of a prism of angle 60^o, suffers a deviation of 55^o. What is the angle of emergence [DCE 2002]

(a) 95^o (b) 45^o

(c) 30^o (d) None of these

148. The spectrum obtained from a sodium vapour lamp is an example of [MH CET 2003]

(a) Absorption spectrum (b) Emission spectrum

(c) Continuous spectrum (d) Band spectrum

149. The sky would appear red instead of blue if [DCE 2004]

(a) Atmospheric particles scatter blue light more than red light

(b) Atmospheric particles scatter all colours equally

(c) Atmospheric particles scatter red light more than the blue light

(d) The sun was much hotter

150. Sir C.V. Raman was awarded Nobel Prize for his work connected with which of the following phenomenon of radiation

(a) Scattering (b) Diffraction

(c) Interference (d) Polarisation

151. In absorption spectrum of *Na* the missing wavelength (*s*) are [BCECE 2005]

(a) 589 *nm* (b) 589.6 *nm*

(c) Both (d) None of these

Human Eye and Lens Camera

1. A far sighted man who has lost his spectacles, reads a book by looking through a small hole (3-4 *mm*) in a sheet of paper. The reason will be [CPMT 1977]

(a) Because the hole produces an image of the letters at a longer distance

(b) Because in doing so, the focal length of the eye lens is effectively increased

(c) Because in doing so, the focal length of the eye lens is effectively decreased

(d) None of these

2. For a normal eye, the least distance of distinct vision is [CPMT 1984]

(a) 0.25 *m* (b) 0.50 *m*

(c) 25 *m* (d) Infinite

3. For the myopic eye, the defect is cured by [CPMT 1990; KCET (Engg.) 2000]

(a) Convex lens (b) Concave lens

(c) Cylindrical lens (d) Toric lens

4. Lens used to remove long sightedness (hypermetropia) is

or

A person suffering from hypermetropia requires which type of spectacle lenses [MP PMT 1995]

(a) Concave lens (b) Plano-concave lens

(c) Convexo-concave lens (d) Convex lens

5. Substance on the choroid is

(a) Japan black (b) Nigrim pigment

(c) Carbon black (d) Platinum black

6. Astigmatism (for a human eye) can be removed by using [CPMT 1972; MP PET/PMT 1988; CBSE PMT 1990]

(a) Concave lens (b) Convex lens

(c) Cylindrical lens (d) Prismatic lens

7. Circular part in the centre of retina is called [MP PET/PMT 1988]

(a) Blind spot (b) Yellow spot

(c) Red spot (d) None of the above

8. Image formed on the retina is [CPMT 1983; AFMC 2005]

(a) Real and inverted (b) Virtual and erect

(c) Real and erect (d) Virtual and inverted

9. If there had been one eye of the man, then

(a) Image of the object would have been inverted

(b) Visible region would have decreased

(c) Image would have not been seen three dimensional

(d) (b) and (c) both

10. A person cannot see distinctly at the distance less than one metre. Calculate the power of the lens that he should use to read a book at a distance of 25 *cm* [CPMT 1977; MP PET 1985, 88; MP PMT 1990]

(a) + 3.0 *D* (b) + 0.125 *D*

(c) – 3.0 *D* (d) + 4.0 *D*

11. How should people wearing spectacles work with a microscope

(a) They cannot use the microscope at all

(b) They should keep on wearing their spectacles

(c) They should take off spectacles

(d) (b) and (c) is both way

12. A man who cannot see clearly beyond 5 *m* wants to see stars clearly. He should use a lens of focal length [MP PET/PMT 1988; Pb. PET 2003]

(a) – 100 *m* (b) + 5 *m*

(c) – 5 *m* (d) Very large

13. A man can see only between 75 *cm* and 200 *cm*. The power of lens to correct the near point will be

(a) + 8/3 *D* (b) + 3 *D*

(c) – 3 *D* (d) – 8/3 *D*

14. Image is formed for the short sighted person at [AFMC 1988]

(a) Retina (b) Before retina

(c) Behind the retina (d) Image is not formed at all

15. A man can see the objects upto a distance of one metre from his eyes. For correcting his eye sight so that he can see an object at infinity, he requires a lens whose power is

or

A man can see upto 100 *cm* of the distant object. The power of the lens required to see far objects will be [MP PMT 1993, 2003]

(a) + 0.5 *D* (b) + 1.0 *D*

(c) + 2.0 *D* (d) – 1.0 *D*

16. A man can see the object between 15 *cm* and 30 *cm*. He uses the lens to see the far objects. Then due to the lens used, the near point will be at

(a) $\frac{10}{3}$ *cm* (b) 30 *cm*

(c) 15 *cm* (d) $\frac{100}{3}$ *cm*

17. The far point of a myopia eye is at 40 *cm*. For removing this defect, the power of lens required will be [MP PMT 1987]

(a) 40 *D* (b) – 4 *D*

(c) – 2.5 *D* (d) 0.25 *D*

18. A man suffering from myopia can read a book placed at 10 *cm* distance. For reading the book at a distance of 60 *cm* with relaxed vision, focal length of the lens required will be [MP PMT 1989]

(a) 45 *cm* (b) – 20 *cm*

(c) – 12 *cm* (d) 30 *cm*

19. If the distance of the far point for a myopia patient is doubled, the focal length of the lens required to cure it will become

(a) Half

(b) Double

(c) The same but a convex lens

(d) The same but a concave lens

20. A presbyopic patient has near point as 30 *cm* and far point as 40 *cm*. The dioptric power for the corrective lens for seeing distant objects is

(a) 40 *D* (b) 4 *D*

(c) – 2.5 *D* (d) 0.25 *D*

21. An imaginary line joining the optical centre of the eye lens and the yellow point is called as

(a) Principal axis (b) Vision axis

(c) Neutral axis (d) Optical axis

22. The light when enters the human eye experiences most of the refraction while passing through

(a) Cornea (b) Aqueous humour

(c) Vitrous humour (d) Crystalline lens

23. The impact of an image on the retina remains for

(a) 0.1 *sec* (b) 0.5 *sec*

(c) 10 *sec* (d) 15 *sec*

24. A person is suffering from myopic defect. He is able to see clear objects placed at 15 *cm*. What type and of what focal length of lens he should use to see clearly the object placed 60 *cm* away

(a) Concave lens of 20 *cm* focal length

(b) Convex lens of 20 *cm* focal length

(c) Concave lens of 12 *cm* focal length

(d) Convex lens of 12 *cm* focal length

25. The sensation of vision in the retina is carried to the brain by

(a) Ciliary muscles (b) Blind spot

(c) Cylindrical lens (d) Optic nerve

26. When the power of eye lens increases, the defect of vision is produced. The defect is known as

(a) Shortsightedness (b) Longsightedness

(c) Colourblindness (d) None of the above

27. A man is suffering from colour blindness for green colour. To remove this defect, he should use goggles of

(a) Green colour glasses (b) Red colour glasses

(c) Smoky colour glasses (d) None of the above

28. In human eye the focussing is done by [CPMT 1983]

(a) To and fro movement of eye lens

(b) To and fro movement of the retina

(c) Change in the convexity of the lens surface

(d) Change in the refractive index of the eye fluids

29. A short sighted person can see distinctly only those objects which lie between 10 *cm* and 100 *cm* from him. The power of the spectacle lens required to see a distant object is

[MP PET 1992]

(a) + 0.5 *D* (b) – 1.0 *D*

(c) – 10 *D* (d) + 4.0 *D*

30. A person can see clearly only upto a distance of 25 *cm*. He wants to read a book placed [MP PET 1989] at a distance of 50 *cm*. What kind of lens does he require for his spectacles and what must be its power

(a) Concave, – 1.0 *D* (b) Convex, + 1.5 *D*

(c) Concave, – 2.0 *D* (d) Convex, + 2.0 *D*

31. The human eye has a lens which has a [MP PET 1994]

(a) Soft portion at its centre

(b) Hard surface

(c) Varying refractive index

(d) Constant refractive index

32. A man with defective eyes cannot see distinctly object at the distance more than 60 *cm* from his eyes. The power of the lens to be used will be [MP PMT 1994]

(a) + 60 *D* (b) – 60 *D*

(c) – 1.66 *D* (d) $\frac{1}{1.66}D$

33. A person's near point is 50 *cm* and his far point is 3 *m*. Power of the lenses he requires for

(i) reading and

(ii) for seeing distant stars are [MP PMT 1994]

(a) – 2 *D* and 0.33 *D* (b) 2 *D* and – 0.33 *D*

(c) – 2 *D* and 3 *D* (d) 2 *D* and – 3 *D*

34. A person wears glasses of power – 2.5 *D*. The defect of the eye and the far point of the person without the glasses are respectively [MP PMT 1991]

(a) Farsightedness, 40 *cm* (b) Nearsightedness, 40 *cm*

(c) Astigmatism, 40 *cm* (d) Nearsightedness, 250 *cm*

35. Myopia is due to [AFMC 1996]

(a) Elongation of eye ball

(b) Irregular change in focal length

(c) Shortening of eye ball

(d) Older age

36. A person is suffering from the defect astigmatism. Its main reason is

(a) Distance of the eye lens from retina is increased

(b) Distance of the eye lens from retina is decreased

(c) The cornea is not spherical

(d) Power of accommodation of the eye is decreased

37. A person cannot see objects clearly beyond 2.0 *m*. The power of lens required to correct his vision will be

[MP PMT/PET 1998; JIPMER 2000; KCET 2000; Pb. PET 2001]

(a) + 2.0 *D* (b) – 1.0 *D*

(c) + 1.0 *D* (d) – 0.5 *D*

38. The resolving limit of healthy eye is about

[MP PET 1999; RPMT 1999; AIIMS 2001]

(a) $1'$ or $\left(\frac{1}{60}\right)^{\circ}$ (b) $1''$

(c) 1^{o} (d) $\frac{1}{60}''$

39. When objects at different distances are seen by the eye, which of the following remains constant [MP PMT 1999]

(a) The focal length of the eye lens

(b) The object distance from the eye lens

(c) The radii of curvature of the eye lens

(d) The image distance from the eye lens

40. A person wears glasses of power – 2.0 *D*. The defect of the eye and the far point of the person without the glasses will be

(a) Nearsighted, 50 *cm* (b) Farsighted, 50 *cm*

(c) Nearsighted, 250 *cm* (d) Astigmatism, 50 *cm*

41. An eye specialist prescribes spectacles having a combination of convex lens of focal length 40 *cm* in contact with a concave lens of focal length 25 *cm*. The power of this lens combination in diopters is

[IIT 1997 Cancelled; DPMT 2000]

(a) + 1.5 (b) – 1.5

(c) + 6.67 (d) – 6.67

42. Match the List *I* with the List *II* from the combinations shown

(I)	Presbiopia	(A)	Sphero-cylindrical lens
(II)	Hypermetropia	(B)	Convex lens of proper power may be used close to the eye
(III)	Astigmatism	(C)	Concave lens of suitable focal length
(IV)	Myopia	(D)	Bifocal lens of suitable focal length

(a) I-A; II-C; III-B; IV-D (b) I-B; II-D; III-C; IV-A

(c) I-D; II-B; III-A; IV-C (d) I-D; II-A; III-C; IV-B

43. Near and far points of a human eye are

[EAMCET (Med.) 1995; MP PET 2001; BCECE 2004]

(a) 0 and 25 *cm* (b) 0 and ∞

(c) 25 *cm* and 100 *cm* (d) 25 *cm* and ∞

44. Two parallel pillars are 11 *km* away from an observer. The minimum distance between the pillars so that they can be seen separately will be [RPET 1997; RPMT 2000]

(a) 3.2 *m* (b) 20.8 *m*

(c) 91.5 *m* (d) 183 *m*

45. Retina of eye acts like .... of camera [AFMC 2003]

(a) Shutter (b) Film

(c) Lens (d) None of these

46. The hyper-metropia is a [CBSE PMT 2000]

(a) Short-side defect (b) Long- side defect

(c) Bad vision due to old age (d) None of these

47. Amount of light entering into the camera depends upon

[DCE 2000]

(a) Focal length of the objective lens

(b) Product of focal length and diameter of the objective lens

(c) Distance of the object from camera

(d) Aperture setting of the camera

48. A man cannot see clearly the objects beyond a distance of 20 *cm* from his eyes. To see distant objects clearly he must use which kind of lenses and of what focal length

[MP PMT 2000]

(a) 100 *cm* convex (b) 100 *cm* concave

(c) 20 *cm* convex (d) 20 *cm* concave

49. A person uses spectacles of power +2*D*. He is suffering from

[MP PMT 1999] [MP PET 2000]

(a) Short sightedness or myopia

(b) Long sightedness or hypermetropia

(c) Presbyopia

(d) Astigmatism

50. To remove myopia (short sightedness) a lens of power 0.66 *D* is required. The distant point of the eye is approximately

[MP PMT 2001]

(a) 100 *cm* (b) 150 *cm*

(c) 50 *cm* (d) 25 *cm*

51. A person suffering from [ISM Dhanbad 1994] 'presbyopia' (myopia and hyper metropia both defects) should use [MP PET 2001]

(a) A concave lens

(b) A convex lens

(c) A bifocal lens whose lower portion is convex

(d) A bifocal lens whose upper portion is convex

52. A person who can see things most clearly at a distance of 10 *cm*. Requires spectacles to enable to him to see clearly things at a distance of 30 *cm*. What should be the focal length of the spectacles

[BHU 2003; CPMT 2004; PM PMT 2005]

(a) 15 *cm* (Concave) (b) 15 *cm* (Convex)

(c) 10 *cm* (d) 0

53. Far points of myopic eye is 250 *cm*, then the focal length of the lens to be used will be [DPMT 2002]

(a) – 250 *cm* (b) – 250/9 *cm*

(c) + 250 *cm* (d) + 250/9 *cm*

54. A man can see clearly up to 3 *metres*. Prescribe a lens for his spectacles so that he can see clearly up to 12 *metres*

[DPMT 2002]

(a) – 3/4 *D* (b) 3 *D*

(c) – 1/4 *D* (d) – 4 *D*

55. A satisfactory photographic print is obtained when the exposure time is 10 *sec* at a distance of 2 *m* from a 60 *cd* lamp. The time of exposure required for the same quality print at a distance of 4 *m* from a 120 *cd* lamp is

[Kerala PMT 2002]

(a) 5 *sec* (b) 10 *sec*

(c) 15 *sec* (d) 20 *sec*

56. A person can not see the objects clearly placed at a distance more than 40 *cm*. He is advised to use a lens of power

[DCE 2002; MP PMT 2002, 03]

(a) – 2.5 *D* (b) + 2.5 *D*

(c) – 6.25 *D* (d) + 1.5 *D*

57. A person uses a lens of power + 3*D* to normalise vision. Near point of hypermetropic eye is [CPMT 2002]

(a) 1 *m* (b) 1.66 *m*

(c) 2 *m* (d) 0.66 *m*

58. A defective eye cannot see close objects clearly because their image is formed [MP PET 2003]

(a) On the eye lens
(b) Between eye lens and retina
(c) On the retina
(d) Beyond retina

59. Image formed on retina of eye is proportional to [RPMT 2001]

(a) Size of object (b) Area of object
(c) $\frac{\text{Size of object}}{\text{Size of image}}$ (d) $\frac{\text{size of image}}{\text{size of object}}$

60. A student can distinctly see the object upto a distance 15 *cm*. He wants to see the black board at a distance of 3 *m*. Focal length and power of lens used respectively will be [Pb. PMT 2003]

(a) $-4.8\,cm, -3.3\,D$ (b) $-5.8\,cm, -4.3\,D$
(c) $-7.5\,cm, -6.3\,D$ (d) $-15.8\,cm, -6.3\,D$

61. A camera objective has an aperture diameter *d*. If the aperture is reduced to diameter $d/2$, the exposure time under identical conditions of light should be made [Kerala PMT 2004]

(a) $\sqrt{2}$ fold (b) 2 fold
(c) $2\sqrt{2}$ fold (d) 4 fold

62. The light gathering power of a camera lens depends on [DCE 2003]

(a) Its diameter only
(b) Ratio of focal length and diameter
(c) Product of focal length and diameter
(d) Wavelength of light used

63. The exposure time of a camera lens at the $\frac{f}{2.8}$ setting is $\frac{1}{200}$ second. The correct time of exposure at $\frac{f}{5.6}$ is [DCE 2003]

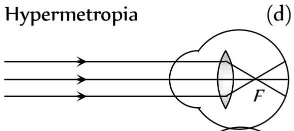
(a) 0.4 *sec* (b) 0.02 *sec*
(c) 0.002 *sec* (d) 0.04 *sec*

64. Ability of the eye to see objects at all distances is called [AFMC 2005]

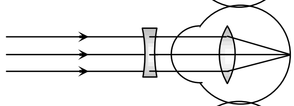
(a) Binocular vision (b) Myopia
(c) Hypermetropia (d) Accommodation

65. [KCET 2005]

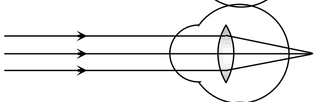
1.



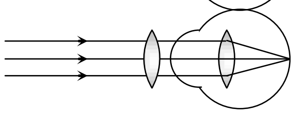
2.



3.



4.



Identify the wrong description of the above figures

(a) 1 represents far-sightedness
(b) 2 correction for short sightedness
(c) 3 represents far sightedness
(d) 4 correction for far-sightedness

Microscope and Telescope

1. The focal lengths of the objective and eye-lens of a microscope are 1 *cm* and 5 *cm* respectively. If the magnifying power for the relaxed eye is 45, then the length of the tube is

(a) 30 *cm* (b) 25 *cm*
(c) 15 *cm* (d) 12 *cm*

2. In a compound microscope magnification will be large, if the focal length of the eye piece is [CPMT 1984]

(a) Large (b) Smaller
(c) Equal to that of objective (d) Less than that of objective

3. The focal length of the objective lens of a compound microscope is [CPMT 198

(a) Equal to the focal length of its eye piece
(b) Less than the focal length of eye piece
(c) Greater than the focal length of eye piece
(d) Any of the above three

4. Microscope is an optical instrument which

(a) Enlarges the object
(b) Increases the visual angle formed by the object at the eye
(c) Decreases the visual angle formed by the object at the eye
(d) Brings the object nearer

5. Magnifying power of a simple microscope is (when final image is formed at D = 25 *cm* from eye) [MP PET 1996; BVP 2003]

(a) $\frac{D}{f}$ (b) $1+\frac{D}{f}$
(c) $1+\frac{f}{D}$ (d) $1-\frac{D}{f}$

6. If in compound microscope m_1 and m_2 be the linear magnification of the objective lens and eye lens respectively, then magnifying power of the compound microscope will be [CPMT 1985; KCET 1994]

(a) $m_1 - m_2$ (b) $\sqrt{m_1 + m_2}$
(c) $(m_1 + m_2)/2$ (d) $m_1 \times m_2$

7. For which of the following colour, the magnifying power of a microscope will be maximum

(a) White colour (b) Red colour
(c) Violet colour (d) Yellow colour

8. The length of the compound microscope is 14 *cm*. The magnifying power for relaxed eye is 25. If the focal length of eye lens is 5 *cm*, then the object distance for objective lens will be

(a) 1.8 *cm* (b) 1.5 *cm*
(c) 2.1 *cm* (d) 2.4 *cm*

9. If the focal length of objective and eye lens are 1.2 *cm* and 3 *cm* respectively and the object is put 1.25 *cm* away from the objective lens and the final image is formed at infinity. The magnifying power of the microscope is

(a) 150 (b) 200
(c) 250 (d) 400

10. The focal length of objective and eye lens of a microscope are 4 *cm* and 8 *cm* respectively. If the least distance of distinct vision is 24 *cm* and object distance is 4.5 *cm* from the objective lens, then the magnifying power of the microscope will be

(a) 18 (b) 32

(c) 64 (d) 20

11. When the length of a microscope tube increases, its magnifying power [MNR 1986]

(a) Decreases (b) Increases

(c) Does not change (d) May decrease or increase

12. In a compound microscope, if the objective produces an image I_o and the eye piece produces an image I_e, then [MP PET 1990]

(a) I_o is virtual but I_e is real

(b) I_o is real but I_e is virtual

(c) I_o and I_e are both real

(d) I_o and I_e are both virtual

13. The magnifying power of a simple microscope can be increased, if we use eye-piece of [MP PMT 1986]

(a) Higher focal length (b) Smaller focal length

(c) Higher diameter (d) Smaller diameter

14. An electron microscope is superior to an optical microscope in

(a) Having better resolving power

(b) Being easy to handle

(c) Low cost

(d) Quickness of observation

15. The magnifying power of a microscope with an objective of 5 *mm* focal length is 400. The length of its tube is 20 *cm*. Then the focal length of the eye-piece is [MP PMT 1991]

(a) 200 *cm* (b) 160 *cm*

(c) 2.5 *cm* (d) 0.1 *cm*

16. The maximum magnification that can be obtained with a convex lens of focal length 2.5 *cm* is (the least distance of distinct vision is 25 *cm*) [MP PET 2003]

(a) 10 (b) 0.1

(c) 62.5 (d) 11

17. When the object is self-luminous, the resolving power of a microscope is given by the expression

(a) $\frac{2\mu\sin\theta}{1.22\,\lambda}$ (b) $\frac{\mu\sin\theta}{\lambda}$

(c) $\frac{2\mu\cos\theta}{1.22\,\lambda}$ (d) $\frac{2\mu}{\lambda}$

18. The power of two convex lenses *A* and *B* are 8 *diopters* and 4 *diopters* respectively. If they are to be used as a simple microscope, the magnification of

(a) *B* will be greater than *A*

(b) *A* will be greater than *B*

(c) The information is incomplete

(d) None of the above

19. Finger prints are observed by the use of

(a) Telescope (b) Microscope

(c) Gallilean telescope (d) Concave lens

20. To produce magnified erect image of a far object, we will be required along with a convex lens, is [MNR 1983]

(a) Another convex lens (b) Concave lens

(c) A plane mirror (d) A concave mirror

21. In order to increase the magnifying power of a compound microscope [JIPMER 1986; MP PMT 1997]

(a) The focal lengths of the objective and the eye piece should be small

(b) Objective should have small focal length and the eye piece large

(c) Both should have large focal lengths

(d) The objective should have large focal length and eye piece should have small

22. If the focal length of the objective lens is increased then [MP PMT 1994]

(a) Magnifying power of microscope will increase but that of telescope will decrease

(b) Magnifying power of microscope and telescope both will increase

(c) Magnifying power of microscope and telescope both will decrease

(d) Magnifying power of microscope will decrease but that of telescope will increase

23. The magnification produced by the objective lens and the eye lens of a compound microscope are 25 and 6 respectively. The magnifying power of this microscope is [CPMT 1984] [Manipal MEE 1995; DPMT 2002]

(a) 19 (b) 31

(c) 150 (d) $\sqrt{150}$

24. The focal lengths of the objective and the eye-piece of a compound microscope are 2.0 *cm* and 3.0 *cm* respectively. The distance between the objective and the eye-piece is 15.0 *cm*. The final image formed by the eye-piece is at infinity. The two lenses are thin. The distances in *cm* of the object and the image produced by the objective measured from the objective lens are respectively [IIT 1995]

(a) 2.4 and 12.0 (b) 2.4 and 15.0

(c) 2.3 and 12.0 (d) 2.3 and 3.0

25. Resolving power of a microscope depends upon [MP PET 1995]

(a) The focal length and aperture of the eye lens

(b) The focal lengths of the objective and the eye lens

(c) The apertures of the objective and the eye lens

(d) The wavelength of light illuminating the object

26. The objective lens of a compound microscope produces magnification of 10. In order to get an overall magnification of 100 when image is formed at 25 *cm* from the eye, the focal length of the eye lens should be

(a) 4 *cm* (b) 10 *cm*

(c) $\frac{25}{9}$ *cm* (d) 9 *cm*

27. A person using a lens as a simple microscope sees an

(a) Inverted virtual image

(b) Inverted real magnified image

(c) Upright virtual image

(d) Upright real magnified image

28. Least distance of distinct vision is 25 *cm*. Magnifying power of simple microscope of focal length 5 *cm* is [EAMCET (Engg.) 1995; Pb. PMT 1999]

(a) 1 / 5 (b) 5

(c) 1 / 6 (d) 6

29. The objective of a compound microscope is essentially

[SCRA 1998]

(a) A concave lens of small focal length and small aperture

(b) Convex lens of small focal length and large aperture

(c) Convex lens of large focal length and large aperture

(d) Convex lens of small focal length and small aperture

30. Resolving power of a microscope depends upon [DCE 1999]

(a) Wavelength of light used, directly

(b) Wavelength of light used, inversely

(c) Frequency of light used

(d) Focal length of objective

31. In a compound microscope cross-wires are fixed at the point [EAMCET (Engg.) 2000]

(a) Where the image is formed by the objective

(b) Where the image is formed by the eye-piece

(c) Where the focal point of the objective lies

(d) Where the focal point of the eye-piece lies

32. In a compound microscope, the focal lengths of two lenses are 1.5 *cm* and 6.25 *cm* an object is placed at 2 *cm* form objective and the final image is formed at 25 *cm* from eye lens. The distance between the two lenses is [EAMCET (Med.) 2000]

(a) 6.00 *cm* (b) 7.75 *cm*

(c) 9.25 *cm* (d) 11.00 *cm*

33. The length of the tube of a microscope is 10 *cm*. The focal lengths of the objective and eye lenses are 0.5 *cm* and 1.0 *cm*. The magnifying power of the microscope is about [MP PMT 2000]

(a) 5 (b) 23

(c) 166 (d) 500

34. In a compound microscope, the intermediate image is [IIT-JEE (Screening) 2000; MP PET 2005]

(a) Virtual, erect and magnified

(b) Real, erect and magnified

(c) Real, inverted and magnified

(d) Virtual, erect and reduced

35. The magnifying power of a compound microscope increases when

(a) The focal length of objective lens is increased and that of eye lens is decreased

(b) The focal length of eye lens is increased and that of objective lens is decreased

(c) Focal lengths of both objective and eye-piece are increased

(d) Focal lengths of both objective and eye-piece are decreased

36. If the red light is replaced by blue light illuminating the object in a microscope the resolving power of the microscope

(a) Decreases (b) Increases

(c) Gets halved (d) Remains unchanged

37. The magnifying power of a simple microscope is 6. The focal length of its lens in *metres* will be, if least distance of distinct vision is 25 *cm* [MP PMT 2001]

(a) 0.05 (b) 0.06

(c) 0.25 (d) 0.12

38. Two points separated by a distance of 0.1 *mm* can just be resolved in a microscope when a light of wavelength 6000 Å is used. If the light of wavelength 4800Å is used this limit of resolution becomes

(a) 0.08 *mm* (b) 0.10 *mm*

(c) 0.12 *mm* (d) 0.06 *mm*

39. A compound microscope has two lenses. The magnifying power of one is 5 and the combined magnifying power is 100. The magnifying power of the other lens is [Kerala PMT 2002]

(a) 10 (b) 20

(c) 50 (d) 25

40. The angular magnification of a simple microscope can be increased by increasing [Orissa JEE 2002]

(a) Focal length of lens (b) Size of object

(c) Aperture of lens (d) Power of lens

41. Wavelength of light used in an optical instrument are $\lambda_1 = 4000$ Å and $\lambda_2 = 5000$ Å, then ratio of their respective resolving power (corresponding to λ_1 and λ_2) is [AIEEE 2002]

(a) 16 : 25 (b) 9 : 1

(c) 4 : 5 (d) 5 : 4

42. The separation between two microscopic particles is measured P_A and P_B by two different lights of wavelength 2000 Å and 3000 Å respectively, then [AIEEE 2002]

(a) $P_A > P_B$ (b) $P_A < P_B$

(c) $P_A < 3/2P_B$ (d) $P_A = P_B$

43. The image formed by an objective of a compound microscope is

(a) Virtual and enlarged (b) Virtual and diminished

(c) Real and diminished (d) Real and enlarged

44. An achromatic telescope objective is to be made by combining the lenses of flint and crown glasses. This proper choice is [MP PET 2000]

(a) Convergent of crown and divergent of flint

(b) Divergent of crown and convergent of flint

(c) Both divergent

(d) Both convergent

45. If F_o and F_e are the focal length of the objective and eye-piece respectively of a telescope, then its magnifying power will be [CPMT 1977, 82, 97; SCRA 1994; KCET 1999; Pb. PMT 2000; BHU 2001; DCE 2002; RPMT 2003; BCECE 2003, 04] [DCE 2001]

(a) $F_o + F_e$ (b) $F_o \times F_e$

(c) F_o / F_e (d) $\frac{1}{2}(F_o + F_e)$

46. The magnifying power of a telescope can be increased by [CPMT 1979]

(a) Increasing focal length of the system

(b) Fitting eye piece of high power

(c) Fitting eye piece of low power

(d) Increasing the distance of objects

47. A simple telescope, consisting of an objective of focal length 60 *cm* and a single eye lens of focal length 5 *cm* is focussed on a distant object is such a way that parallel rays comes out from the eye lens. If the object subtends an angle 2° at the objective, the angular width of the image

[CPMT 1979; NCERT 1980; MP PET 1992; JIPMER 1997; UPSEAT 2001]

(a) 10° (b) 24°

(c) 50° (d) $1/6^\circ$

48. The diameter of the objective of the telescope is 0.1 *metre* and wavelength of light is 6000 Å. Its resolving power would be approximately [MP PET 1997]

(a) $7.32\times10^{-6} rad$ (b) $1.36\times10^{6} rad$

(c) $7.32\times10^{-5} rad$ (d) $1.36\times10^{5} rad$

49. A photograph of the moon was taken with telescope. Later on, it was found that a housefly was sitting on the objective lens of the telescope. In photograph

[NCERT 1970; MP PET 1999]

(a) The image of housefly will be reduced

(b) There is a reduction in the intensity of the image

(c) There is an increase in the intensity of the image

(d) The image of the housefly will be enlarged

50. For a telescope to have large resolving power the

[CPMT 1980, 81, 85; MP PET 1994; DCE 2001; AFMC 2005]

(a) Focal length of its objective should be large

(b) Focal length of its eye piece should be large

(c) Focal length of its eye piece should be small

(d) Aperture of its objective should be large

51. An observer looks at a tree of height 15 *m* with a telescope of magnifying power 10. To him, the tree appears

[CPMT 1975]

(a) 10 times taller (b) 15 times taller

(c) 10 times nearer (d) 15 times nearer

52. The focal length of objective and eye lens of a astronomical telescope are respectively 2 *m* and 5 *cm*. Final image is formed at (i) least distance of distinct vision (ii) infinity. The magnifying power in both cases will be [MP PMT/PET 1988]

(a) – 48, – 40 (b) – 40, – 48

(c) – 40, 48 (d) – 48, 40

53. For observing a cricket match, a binocular is preferred to a terrestrial telescope because

(a) The binocular gives the proper three dimensional view

(b) The binocular has shorter length

(c) The telescope does not give erect image

(d) Telescope have chromatic aberrations

54. To increase the magnifying power of telescope (f_o = focal length of the objective and f_e = focal length of the eye lens)

[MP PET/PMT 1988; MP PMT 1992, 94]

(a) f_o should be large and f_e should be small

(b) f_o should be small and f_e should be large

(c) f_o and f_e both should be large

(d) f_o and f_e both should be small

55. Relative difference of focal lengths of objective and eye lens in the microscope and telescope is given as

[MH CET 2001]

(a) It is equal in both (b) It is more in telescope

(c) It is more in microscope (d) It may be more in any one

56. If the telescope is reversed *i.e.* seen from the objective side

(a) Object will appear very small

(b) Object will appear very large

(c) There will be no effect on the image formed by the telescope

(d) Image will be slightly greater than the earlier one

57. The focal length of the objective of a terrestrial telescope is 80 *cm* and it is adjusted for parallel rays, then its magnifying power is 20. If the focal length of erecting lens is 20 *cm*, then full length of telescope will be

(a) 84 *cm* (b) 100 *cm*

(c) 124 *cm* (d) 164 *cm*

58. An astronomical telescope has an angular magnification of magnitude 5 for distant objects. The separation between the objective and the eye piece is 36 *cm* and the final image is formed at infinity. The focal length f_o of the objective and the focal length f_e of the eye piece are

[IIT 1989; MP PET 1995; JIPMER 2000]

(a) f_o = 45 *cm* and f_e = – 9 *cm*

(b) f_o = 7.2 *cm* and f_e = 5 *cm*

(c) f_o = 50 *cm* and f_e = 10 *cm*

(d) f_o = 30 *cm* and f_e = 6 *cm*

59. In an astronomical telescope, the focal lengths of two lenses are 180 *cm* and 6 *cm* respectively. In normal adjustment, the magnifying power will be [MP PET 1990]

(a) 1080 (b) 200

(c) 30 (d) 186

60. The magnifying power of an astronomical telescope for relaxed vision is 16. On adjusting, the distance between the objective and eye lens is 34 *cm*. Then the focal length of objective and eye lens will be respectively [MP PMT 1989]

(a) 17 *cm*, 17 *cm* (b) 20 *cm*, 14 *cm*

(c) 32 *cm*, 2 *cm* (d) 30 *cm*, 4 *cm*

61. In Gallilean telescope, if the powers of an objective and eye lens are respectively +1.25 *D* and – 20 *D*, then for relaxed vision, the length and magnification will be

(a) 21.25 *cm* and 16 (b) 75 *cm* and 20

(c) 75 *cm* and 16 (d) 8.5 *cm* and 21.25

62. The aperture of a telescope is made large, because

[DPMT 1999]

(a) To increase the intensity of image

(b) To decrease the intensity of image

(c) To have greater magnification

(d) To have lesser resolution

63. In Gallilean telescope, the final image formed is

(a) Real, erect and enlarged

(b) Virtual, erect and enlarged

(c) Real, inverted and enlarged

(d) Virtual, inverted and enlarged

64. The magnifying power of a telescope is 9. When it is adjusted for parallel rays, the distance between the objective and the eye-piece is found to be 20 *cm*. The focal length of the two lenses are

(a) 18 *cm*, 2 *cm* (b) 11 *cm*, 9 *cm*

(c) 10 *cm*, 10 *cm* (d) 15 *cm*, 5 *cm*

65. The focal length of the objective and eye piece of a telescope are respectively 60 *cm* and 10 *cm*. The magnitude of the magnifying power when the image is formed at infinity is

(a) 50 (b) 6

(c) 70 (d) 5

66. The magnifying power of an astronomical telescope is 8 and the distance between the two lenses is 54 *cm*. The focal length of eye lens and objective lens will be respectively

[MP PMT 1991; CPMT 1991; Pb. PMT 2001]

(a) 6 *cm* and 48 *cm* (b) 48 *cm* and 6 *cm*

(c) 8 *cm* and 64 *cm* (d) 64 *cm* and 8 *cm*

67. An opera glass (Gallilean telescope) measures 9 *cm* from the objective to the eyepiece. The focal length of the objective is 15 *cm*. Its magnifying power is [DPMT 1988]

(a) 2.5 (b) 2/5

(c) 5/3 (d) 0.4

68. When a telescope is adjusted for parallel light, the distance of the objective from the eye piece is found to be 80 *cm*. The magnifying power of the telescope is 19. The focal lengths of the lenses are

[MP PMT 1992; Very similar to DPMT 2004]

(a) 61 *cm*, 19 *cm* (b) 40 *cm*, 40 *cm*

(c) 76 *cm*, 4 *cm* (d) 50 *cm*, 30 *cm*

69. A reflecting telescope utilizes [CPMT 1983]

(a) A concave mirror (b) A convex mirror

(c) A prism (d) A plano-convex lens

70. The aperture of the objective lens of a telescope is made large so as to [AIEEE 2003; KCET 2003]

(a) Increase the magnifying power of the telescope

(b) Increase the resolving power of the telescope

(c) Make image aberration less

(d) Focus on distant objects

71. On which of the following does the magnifying power of a telescope depends [MP PET 1992]

(a) The focal length of the objective only

(b) The diameter of aperture of the objective only

(c) The focal length of the objective and that of the eye piece

(d) The diameter of aperture of the objective and that of the eye piece

72. Large aperture of telescope are used for

[CPMT 1981; MP PMT 1995; AFMC 2000]

(a) Large image (b) Greater resolution

(c) Reducing lens aberration (d) Ease of manufacture

73. Two convex lenses of focal lengths 0.3 *m* and 0.05 *m* are used to make a telescope. The distance kept between the two is

(a) 0.35 *m* (b) 0.25 *m*

(c) 0.175 *m* (d) 0.15 *m*

74. The diameter of the objective lens of a telescope is 5.0 *m* and wavelength of light is 6000 Å. The limit of resolution of this telescope will be [MP PMT 1994]

(a) 0.03 *sec* (b) 3.03 *sec*

(c) 0.06 *sec* (d) 0.15 *sec*

75. All of the following statements are correct except

[Manipal MEE 1995]

(a) The total length of an astronomical telescope is the sum of the focal lengths of its two lenses

(b) The image formed by the astronomical telescope is always erect because the effect of the combination of the two lenses is divergent [MP PET 1991]

(c) The magnification of an astronomical telescope can be increased by decreasing the focal length of the eye-piece

(d) The magnifying power of the refracting type of astronomical telescope is the ratio of the focal length of the objective to that of the eye-piece

76. A terrestrial telescope is made by introducing an erecting lens of focal length f between the objective and eye piece lenses of an astronomical telescope. This causes the length of the telescope tube to increase by an amount equal to

[KCEE 1996]

(a) f (b) $2f$

(c) $3f$ (d) $4f$

77. The length of an astronomical telescope for normal vision (relaxed eye) (f_o = focal length of objective lens and f_e = focal length of eye lens) is

[EAMCET (Med.) 1995; CPMT 1999; BVP 2003]

(a) $f_o \times f_e$ (b) $\frac{f_o}{f_e}$

(c) $f_o + f_e$ (d) $f_o - f_e$

78. A Gallilean telescope has objective and eye-piece of focal lengths 200 *cm* and 2 *cm* respectively. The magnifying power of the telescope for normal vision is

[MP PMT 1996]

(a) 90 (b) 100

(c) 108 (d) 198

79. In an astronomical telescope, the focal length of the objective lens is 100 *cm* and of eye-piece is 2 *cm*. The magnifying power of the telescope for the normal eye is

[MP PET 1997]

(a) 50 (b) 10

(c) 100 (d) $\frac{1}{50}$

80. When diameter of the aperture of the objective of an astronomical telescope is increased, its [MP PMT 1997]

(a) Magnifying power is increased and resolving power is decreased

(b) Magnifying power and resolving power both are increased

(c) Magnifying power remains the same but resolving power is increased [MNR 1994]

(d) Magnifying power and resolving power both are decreased

81. The focal lengths of the objective and eye lenses of a telescope are respectively 200 *cm* and 5 *cm*. The maximum magnifying power of the telescope will be

[MP PMT/PET 1998; JIPMER 2001, 02]

(a) – 40 (b) – 48

(c) – 60 (d) – 100

82. The minimum magnifying power of a telescope is *M*, If the focal length of its eye lens is halved, the magnifying power will become

(a) *M* / 2 (b) 2 *M*

(c) 3 *M* (d) 4 *M*

83. The astronomical telescope consists of objective and eye-piece. The focal length of the objective is

[AIIMS 1998; BHU 2000]

(a) Equal to that of the eye-piece

(b) Greater than that of the eye-piece

(c) Shorter than that of the eye-piece

(d) Five times shorter than that of the eye-piece

84. Four convergent lenses have focal lengths 100 *cm*, 10 *cm*, 4 *cm* and 0.3 *cm*. For a telescope with maximum possible magnification, we choose the lenses of focal length

[KCET 1994]

(a) 100 *cm*, 0.3 *cm* (b) 10 *cm*, 0.3 *cm*

(c) 10 *cm*, 4 *cm* (d) 100 *cm*, 4 *cm*

85. The focal length of objective and eye-piece of a telescope are 100 *cm* and 5 *cm* respectively. Final image is formed at least distance of distinct vision. The magnification of telescope is

(a) 20 (b) 24

(c) 30 (d) 36

86. A planet is observed by an astronomical refracting telescope having an objective of focal length 16 *m* and an eye-piece of focal length 2 *cm* [IIT-JEE 1992; Roorkee 2000]

(a) The distance between the objective and the eye-piece is 16.02 *m*

(b) The angular magnification of the planet is 800

(c) The image of the planet is inverted

(d) The objective is larger than the eye-piece

87. If tube length of astronomical telescope is 105 *cm* and magnifying power is 20 for normal setting, calculate the focal length of objective

(a) 100 *cm* (b) 10 *cm*

(c) 20 *cm* (d) 25 *cm*

88. The length of a telescope is 36 *cm*. The focal lengths of its lenses can be [Bihar MEE 1995]

(a) 30 *cm*, 6 *cm* (b) – 30 *cm*, – 6 *cm*

(c) 30 *cm*, – 6 *cm* (d) – 30 *cm*, 6 *cm*

89. An astronomical telescope of ten-fold angular magnification has a length of 44 *cm*. The focal length of the objective is

[CBSE PMT 1997]

(a) 4 *cm* (b) 40 *cm*

(c) 44 *cm* (d) 440 *cm*

90. If both the object and image are at infinite distances form a refracting telescope its magnifying power will be equal to

[AMU (Engg.) 1999]

(a) The sum of the focal lengths of the objective and the eyepiece

(b) The difference of the focal lengths of the two lenses

(c) The ratio of the focal length of the objective and eyepiece

(d) The ratio of the focal length of the eyepiece and objective

91. The number of lenses in a terrestrial telescope is

[KCET 1999; MH CET 2003]

(a) Two (b) Three

(c) Four (d) Six

92. The focal lengths of the lenses of an astronomical telescope are 50 *cm* and 5 *cm*. The length of the telescope when the image is formed at the least distance of distinct vision is

[EAMCET (Engg.) 2000]

(a) $45\,cm$ (b) $55\,cm$

(c) $\frac{275}{6}cm$ (d) $\frac{325}{6}cm$

93. The focal lengths of the objective and eye-piece of a telescope are respectively 100 *cm* and 2 *cm*. The moon subtends an angle of 0.5^o at the eye. If it is looked through the telescope, the angle subtended by the moon's image will be

(a) 100^o (b) 50^o

(c) 25^o (d) 10^o

94. The diameter of the objective of a telescope is a, its magnifying power is m and wavelength of light is λ. The resolving power of the telescope is [MP PMT 2000]

(a) $(1.22\lambda)/a$ (b) $(1.22a)/\lambda$

(c) $\lambda m/(1.22a)$ [RPET 1997] (d) $a/(1.22\lambda)$

95. The sun's diameter is $1.4\times10^9\,m$ and its distance from the earth is $10^{11}\,m$. The diameter of its image, formed by a convex lens of focal length $2m$ will be [MP PET 2000]

(a) 0.7 *cm* (b) 1.4 *cm*

(c) 2.8 *cm* (d) Zero (*i.e.* point image)

96. In a terrestrial telescope, the focal length of objective is 90 *cm*, of inverting lens is $5\,cm$ and of eye lens is $6\,cm$. If the final image is at 30 *cm*, then the magnification will be

[DPMT 2001]

(a) 21 (b) 12

(c) 18 [AFMC 1994] (d) 15

97. The resolving power of a telescope depends on

[MP PET 2000, 01; DCE 2003]

(a) Focal length of eye lens

(b) Focal length of objective lens

(c) Length of the telescope

(d) Diameter of the objective lens

98. Four lenses of focal length + 15 *cm*, + 20*cm*, + 150*cm* and + 250 *cm* are available for making an astronomical telescope. To produce the largest magnification, the focal length of the eye-piece should be

[CPMT 2001; AIIMS 2001]

(a) + 15 *cm* (b) + 20 *cm*

(c) +150 *cm* (d) + 250 *cm*

99. In an astronomical telescope, the focal length of objective lens and eye-piece are 150 *cm* and 6 *cm* respectively. In case when final image is formed at least distance of distinct vision. the magnifying power is [KCET 2001]

(a) 20 (b) 30

(c) 60 (d) 15

100. In a laboratory four convex lenses L_1, L_2, L_3 and L_4 of focal lengths 2, 4, 6 and 8 *cm* respectively are available. Two of these lenses form a telescope of length 10 *cm* and magnifying power 4. The objective and eye lenses are

[MP PMT 2001]

(a) L_2, L_3 (b) L_1, L_4

(c) L_3, L_2 (d) L_4, L_1

101. A telescope has an objective of focal length 50 *cm* and an eye piece of focal length 5 *cm*. The least distance of distinct vision is 25 *cm*.

The telescope is focussed for distinct vision on a scale 200 *cm* away. The separation between the objective and the eye-piece is

(a) 75 *cm* (b) 60 *cm*

(c) 71 *cm* (d) 74 *cm*

102. The resolving power of a telescope whose lens has a diameter of 1.22 *m* for a wavelength of 5000 *Å* is [Kerala PMT 2002]

(a) 2×10^5 (b) 2×10^6

(c) 2×10^2 (d) 2×10^4

103. To increase both the resolving power and magnifying power of a telescope [Kerala PET 2002; KCET 2002]

(a) Both the focal length and aperture of the objective has to be increased

(b) The focal length of the objective has to be increased

(c) The aperture of the objective has to be increased

(d) The wavelength of light has to be decreased

104. A Galileo telescope has an objective of focal length $100 cm$ and magnifying power 50. The distance between the two lenses in normal adjustment will be [BHU 2002; Pb. PET 2002]

(a) 96 *cm* (b) 98 *cm*

(c) 102 *cm* (d) 104 *cm*

105. An astronomical telescope has a magnifying power 10. The focal length of eyepiece is 20 *cm*. The focal length of objective is [MP PMT 2002, 03; Pb. PET 2004]

(a) 2 *cm* (b) 200 *cm*

(c) $\frac{1}{2} cm$ (d) $\frac{1}{200} cm$

106. A telescope of diameter 2*m* uses light of wavelength 5000 Å for viewing stars. The minimum angular separation between two stars whose image is just resolved by this telescope is [MP PET 2003]

(a) 4×10^{-4} *rad* (b) 0.25×10^{-6} *rad*

(c) 0.31×10^{-6} *rad* (d) 5.0×10^{-3} *rad*

107. A simple magnifying lens is used in such a way that an image is formed at 25 *cm* away from the eye. In order to have 10 *times* magnification, the focal length of the lens should be

(a) 5 *cm* (b) 2 *cm*

(c) 25 *mm* (d) 0.1 *mm*

108. In a simple microscope, if the final image is located at infinity then its magnifying power is [MP PMT 2004]

(a) $\frac{25}{f}$ (b) $\frac{D}{26}$

(c) $\frac{f}{25}$ (d) $\frac{f}{D+1}$

109. In a compound microscope the objective of f_o and eyepiece of f_e are placed at distance L such that L equals [Kerala PMT 2004]

(a) $f_o + f_e$

(b) $f_o - f_e$

(c) Much greater than f_o or f_e [Kerala PET 2002]

(d) Much less than f_o or f_e

(e) Need not depend either value of focal lengths

110. For a compound microscope, the focal lengths of object lens and eye lens are f_o and f_e respectively, then magnification will be done by microscope when [RPMT 2001]

(a) $f_o = f_e$ (b) $f_o > f_e$

(c) $f_o < f_e$ (d) None of these

111. The angular resolution of a 10 *cm* diameter telescope at a wavelength of 5000 Å is of the order [CBSE PMT 2005]

(a) $10^6 rad$ (b) $10^{-2} rad$

(c) $10^{-4} rad$ (d) $10^{-6} rad$

112. The resolving power of an astronomical telescope is 0.2 seconds. If the central half portion of the objective lens is covered, the resolving power will be [MP PMT 2004]

(a) 0.1 *sec* (b) 0.2 *sec*

(c) 1.0 *sec* (d) 0.6 *sec*

113. An astronomical telescope has objective and eye-piece lens of powers 0.5 *D* and 20 *D* respectively, its magnifying power will be

(a) 8 (b) 20

(c) 30 (d) 40

114. Which of the following is not correct regarding the radio telescope

(a) It can not work at night

(b) It can detect a very faint radio signal

(c) It can be operated even in cloudy weather

(d) It is much cheaper than optical telescope

115. The diameter of objective of a telescope is 1*m*. Its resolving limit for the light of wave length 4538 Å, will be [Pb. PET 2003]

(a) $5.54\times10^{-7} rad$ [MP PET 1990] (b) $2.54\times10^{-4} rad$

(c) $6.54\times10^{-7} rad$ (d) None of these

116. A telescope has an objective lens of focal length 200 *cm* and an eye piece with focal length 2 *cm*. If this telescope is used to see a 50 *meter* tall building at a distance of 2 *km*, what is the height of the image of the building formed by the objective lens

(a) 5 *cm* (b) 10 *cm*

(c) 1 *cm* (d) 2 *cm*

117. Magnification of a compound microscope is 30. Focal length of eye-piece is 5 *cm* and the image is formed at a distance of distinct vision of 25 *cm*. The magnification of the objective lens is

(a) 6 (b) 5

(c) 7.5 (d) 10

118. At Kavalur in India, the astronomers using a telescope whose objective had a diameter of one meter started using a telescope of diameter 2.54 *m*. This resulted in [KCET 2005]

(a) The increase in the resolving power by 2.54 times for the same λ

(b) The increase in the limiting angle by 2.54 times for the same λ

(c) Decrease in resolving power

(d) No effect on the limiting angle

119. A Galileo telescope has an objective of focal length 100 *cm* and magnifying power 50. The distance between the two lenses in normal adjustment will be [BCECE 2005]

(a) 98 *cm* (b) 100 *cm*

(c) 150 *cm* (d) 200 *cm*

120. A compound microscope has an eye piece of focal length 10 *cm* and an objective of focal length 4 *cm*. Calculate the magnification, if an object is kept at a distance of 5 *cm* from the objective so that final image is formed at the least distance vision (20 *cm*)

(a) 12 (b) 11

(c) 10 (d) 13

Photometry

1. If luminous efficiency of a lamp is 2 lumen/watt and its luminous intensity is 42 candela, then power of the lamp is [AFMC 1998]

(a) 62 *W* (b) 76 *W*

(c) 138 *W* (d) 264 *W*

2. An electric bulb illuminates a plane surface. The intensity of illumination on the surface at a point 2*m* away from the bulb is 5×10^{-4} phot (*lumen/cm*). The line joining the bulb to the point makes an angle of 60· with the normal to the surface. The intensity of the bulb in *candela* is [IIT-JEE 1980; CPMT 1991]

(a) $40\sqrt{3}$ (b) 40

(c) 20 (d) 40×10^{-4}

3. In a movie hall, the distance between the projector and the screen is increased by 1% illumination on the screen is [CPMT 1990]

(a) Increased by 1% (b) Decreased by 1%

(c) Increased by 2% (d) Decreased by 2%

4. Correct exposure for a photographic print is 10 *seconds* at a distance of one metre from a point source of 20 *candela*. For an equal fogging of the print placed at a distance of 2 *m* from a 16 *candela* source, the necessary time for exposure is

(a) 100 *sec* (b) 25 *sec*

(c) 50 *sec* (d) 75 *sec*

5. A bulb of 100 *watt* is hanging at a height of one meter above the centre of a circular table of diameter 4 *m*. If the intensity at a point on its rim is I_0, then the intensity at the centre of the table will be [CPMT 1996]

(a) I_0 (b) $2\sqrt{5}I_0$

(c) $2I_0$ (d) $5\sqrt{5}I_0$

6. A movie projector forms an image 3.5*m* long of an object 35 *mm*. Supposing there is negligible absorption of light by aperture then illuminance on slide and screen will be in the ratio of

(a) 100 : 1 (b) 10^4 : 1

(c) 1 : 100 (d) 1 : 10^4

7. A 60 *watt* bulb is hung over the center of a table 4 *m* × 4 *m* at a height of 3 *m*. The ratio of the intensities of illumination at a point on the centre of the edge and on the corner of the table is

(a) $(17/13)^{3/2}$ (b) 2 / 1

(c) 17 / 13 (d) 5 / 4

8. "Lux" is a unit of [Kerala PMT 2001]

(a) Luminous intensity of a source

(b) Illuminance on a surface

(c) Transmission coefficient of a surface

(d) Luminous efficiency of source of light

9. Total flux produced by a source of 1 *cd* is [CPMT 2001] [UP SEAT 2005]

(a) $\frac{1}{4\pi}$ (b) 8π

(c) 4π (d) $\frac{1}{8\pi}$

10. If the luminous intensity of a 100 *W* unidirectional bulb is 100 candela, then total luminous flux emitted from the bulb is

(a) 861 *lumen* (b) 986 *lumen*

(c) 1256 *lumen* (d) 1561 *lumen*

11. The maximum illumination on a screen at a distance of 2 *m* from a lamp is 25 *lux*. The value of total luminous flux emitted by the lamp is [JIMPER 1997]

(a) 1256 *lumen* (b) 1600 *lumen*

(c) 100 *candela* (d) 400 *lumen*

12. A small lamp is hung at a height of 8 feet above the centre of a round table of diameter 16 *feet*. The ratio of intensities of illumination at the centre and at points on the circumference of the table will be [CPMT 1984, 1996]

(a) 1 : 1 (b) 2 : 1

(c) $2\sqrt{2}:1$ (d) 3 : 2

13. Lux is equal to [CPMT 1993]

(a) 1 *lumen/m* (b) 1 *lumen/cm*

(c) 1 *candela/m* (d) 1 *candela/cm*

14. Five *lumen/watt* is the luminous efficiency of a lamp and its luminous intensity is 35 *candela*. The power of the lamp is [CPMT 1992]

(a) 80 *W* (b) 176 *W*

(c) 88 *W* (d) 36 *W*

15. A lamp rated at 100 *cd* hangs over the middle of a round table with diameter 3 *m* at a height of 2 *m*. It is replaced by a lamp of 25 *cd* and the distance to the table is changed so that the illumination at the centre of the table remains as before. The illumination at edge of the table becomes *X* times the original. Then *X* is

(a) $\frac{1}{3}$ (b) $\frac{16}{27}$

(c) $\frac{1}{4}$ (d) $\frac{1}{9}$

16. The distance between a point source of light and a screen which is 60 *cm* is increased to 180 *cm*. The intensity on the screen as compared with the original intensity will be

[CPMT 1982] [CPMT 1888]

(a) (1 / 9) times (b) (1 / 3) times

(c) 3 times (d) 9 times

17. A source of light emits a continuous stream of light energy which falls on a given area. Luminous intensity is defined as [CPMT 1986]

(a) Luminous energy emitted by the source per second

(b) Luminous flux emitted by source per unit solid angle

(c) Luminous flux falling per unit area of a given surface

(d) Luminous flux coming per unit area of an illuminated surface

18. Venus looks brighter than other stars because [MNR 1985]

(a) It has higher density than other stars

(b) It is closer to the earth than other stars

(c) It has no atmosphere

(d) Atomic fission takes place on its surface

19. To prepare a print the time taken is 5 *sec* due to lamp of 60 watt at 0.25 *m* distance. If the distance is increased to 40 *cm* then what is the time taken to prepare the similar print [CPMT 1982]

(a) 3.1 *sec* (b) 1 *sec*

(c) 12.8 *sec* (d) 16 *sec*

20. A lamp is hanging 1 *m* above the centre of a circular table of diameter 1*m*. The ratio of illuminaces at the centre and the edge is

(a) $\frac{1}{2}$ (b) $\left(\frac{5}{4}\right)^{\frac{3}{2}}$

(c) $\frac{4}{3}$ (d) $\frac{4}{5}$

21. Two stars situated at distances of 1 and 10 light years respectively from the earth appear to possess the same brightness. The ratio of their real brightness is [NCERT 1981]

(a) 1 : 10 (b) 10 : 1

(c) 1 : 100 (d) 100 : 1

22. The intensity of direct sunlight on a surface normal to the rays is I_0. What is the intensity of direct sunlight on a surface, whose normal makes an angle of 60° with the rays of the sun

(a) I_0 (b) $I_0\left(\frac{\sqrt{3}}{2}\right)$

(c) $\frac{I_0}{2}$ (d) $2I_0$

23. Inverse square law for illuminance is valid for [CPMT 1978]

(a) Isotropic point source (b) Cylindrical source

(c) Search light (d) All types of sources

24. 1% of light of a source with luminous intensity 50 *candela* is incident on a circular surface of radius 10 *cm*. The average illuminance of surface is

(a) 100 *lux* (b) 200 *lux*

(c) 300 *lux* (d) 400 *lux*

25. Two light sources with equal luminous intensity are lying at a distance of 1.2 *m* from each other. Where should a screen be placed between them such that illuminance on one of its faces is four times that on another face

(a) 0.2 *m* (b) 0.4 *m*

(c) 0.8 *m* (d) 1.6 *m*

26. Two lamps of luminous intensity of 8 *Cd* and 32 *Cd* respectively are lying at a distance of 1.2 *m* from each other. Where should a screen be placed between two lamps such that its two faces are equally illuminated due to two sources

(a) 10 *cm* from 8 *Cd* lamp (b) 10 *cm* from 32*Cd* lamp

(c) 40 *cm* from 8 *Cd* lamp (d) 40 *cm* from 32 *Cd* lamp

27. A lamp is hanging along the axis of a circular table of radius *r*. At what height should the lamp be placed above the table, so that the illuminance at the edge of the table is $\frac{1}{8}$ of that at its center

(a) $\frac{r}{2}$ (b) $\frac{r}{\sqrt{2}}$

(c) $\frac{r}{3}$ (d) $\frac{r}{\sqrt{3}}$

[NCERT 1982]

28. A point source of 100 *candela* is held 5*m* above a sheet of blotting paper which reflects 75% of light incident upon it. The illuminance of blotting paper is

(a) 4 *phot* (b) 4 *lux*

(c) 3 *phot* (d) 3 *lux*

29. A lamp is hanging at a height 40 *cm* from the centre of a table. If its height is increased by 10 *cm* the illuminance on the table will decrease by

(a) 10 % (b) 20%

(c) 27% (d) 36%

30. Which has more luminous efficiency

(a) A 40 *W* bulb (b) A 40 *W* fluorescent tube

(c) Both have same (d) Cannot say

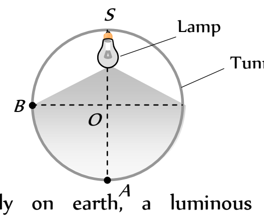
31. An electric lamp is fixed at the ceiling of a circular tunnel as shown is figure. What is the ratio the intensities of light at base *A* and a point *B* on the wall

(a) 1 : 2 [CPMT 1981]

(b) $2 : \sqrt{3}$

(c) $\sqrt{3} : 1$

(d) $1 : \sqrt{2}$



32. When sunlight falls normally on earth, a luminous flux of 1.57×10^5 $lumen/m^2$ is produced on earth. The distance of earth from sun is 1.5×10^8 *Km*. The luminous intensity of sun in candela will be

(a) 3.53×10^{27} (b) 3.53×10^{25}

(c) 3.53×10^{29} (d) 3.53×10^{21}

33. In the above problem, the luminous flux emitted by sun will be

(a) 4.43×10^{25} *lm* (b) 4.43×10^{26} *lm*

(c) 4.43×10^{27} *lm* (d) 4.43×10^{28} *lm*

34. A screen receives 3 *watt* of radiant flux of wavelength 6000 Å. One lumen is equivalent to $1.5\times10^{-3}watt$ of monochromatic light of wavelength 5550 Å. If relative luminosity for 6000 Å is 0.685 while that for 5550 Å is 1.00, then the luminous flux of the source is

(a) $4\times10^{3}lm$ (b) $3\times10^{3}lm$

(c) $2\times10^{3}lm$ (d) $1.37\times10^{3}lm$

35. A point source of 3000 *lumen* is located at the centre of a cube of side length $2m$. The flux through one side is

(a) 500 *lumen* (b) 600 *lumen*

(c) 750 *lumen* (d) 1500 *lumen*

36. Light from a point source falls on a small area placed perpendicular to the incident light. If the area is rotated about the incident light by an angle of 60°, by what fraction will the illuminance change

(a) It will be doubled (b) It will be halved

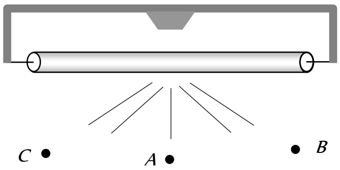
(c) It will not change (d) It will become one-fourth

37. A point source of light moves in a straight line parallel to a plane table. Consider a small portion of the table directly below the line of movement of the source. The illuminance at this portion varies with its distance *r* from the source as

(a) $E \propto \frac{1}{r}$ (b) $E \propto \frac{1}{r^2}$

(c) $E \propto \frac{1}{r^3}$ (d) $E \propto \frac{1}{r^4}$

38. Figure shows a glowing mercury tube. The illuminances at point *A*, *B* and *C* are related as



(a) $B > C > A$

(b) $A > C > B$

(c) $B = C > A$

(d) $B = C < A$

39. The relative luminosity of wavelength 600 *nm* is 0.6. Find the radiant flux of 600 *nm* needed to produce the same brightness sensation as produced by 120 *W* of radiant flux at 555 *nm*

(a) 50 *W* (b) 72 *W*

(c) $120 \times (0.6)^2 W$ (d) 200 *W*

40. Find the luminous intensity of the sun if it produces the same illuminance on the earth as produced by a bulb of 10000 *candela* at a distance 0.3 *m*. The distance between the sun and the earth is $1.5 \times 10^{11} m$

(a) $25 \times 10^{22} cd$ (b) $25 \times 10^{18} cd$

(c) $25 \times 10^{26} cd$ (d) $25 \times 10^{36} cd$

41. A lamp is hanging at a height of 4*m* above a table. The lamp is lowered by 1*m*. The percentage increase in illuminace will be

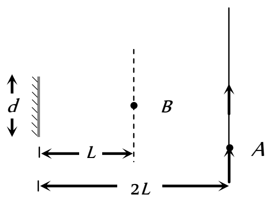
(a) 40 % (b) 64%

(c) 78% (d) 92%

CT Critical Thinking

Objective Questions

1. A point source of light *B* is placed at a distance *L* in front of the centre of a mirror of width *d* hung vertically on a wall. A man walks in front of the mirror along a line parallel to the mirror at a distance 2*L* from it as shown. The greatest distance over which he can see the image of the light source in the mirror is



(a) *d*/2

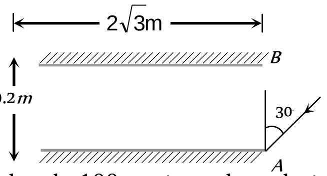
(b) *d*

(c) 2*d*

(d) 3*d*

2. Two plane mirrors. *A* and *B* are aligned parallel to each other, as shown in the figure. A light ray is incident at an angle of $30°$ at a point just inside one end of *A*. The plane of incidence coincides with the plane of the figure. The maximum number of times the ray undergoes reflections (including the first one) before it emerges out is

[IIT-JEE (Screening) 2002]



(a) 28

(b) 30

(c) 32

(d) 34

3. A concave mirror of focal length $100 cm$ is used to obtain the image of the sun which subtends an angle of $30°$. The diameter of the image of the sun will be

(a) $1.74 cm$ (b) $0.87 cm$

(c) $0.435 cm$ (d) $100 cm$

4. A square of side $3 cm$ is placed at a distance of $25 cm$ from a concave mirror of focal length $10 cm$. The centre of the square is at the axis of the mirror and the plane is normal to the axis. The area enclosed by the image of the square is

(a) $4 cm^2$ (b) $6 cm^2$

(c) $16 cm^2$ (d) $36 cm^2$

5. A short linear object of length l lies along the axis of a concave mirror of focal length *f* at a distance u from the pole of the mirror. The size of the image is approximately equal to [IIT-JEE 1988; BHU 2003; CPMT 2

(a) $l\left(\frac{u-f}{f}\right)^{1/2}$ (b) $l\left(\frac{u-f}{f}\right)^2$

(c) $l\left(\frac{f}{u-f}\right)^{1/2}$ (d) $l\left(\frac{f}{u-f}\right)^2$

6. A thin rod of length $f/3$ lies along the axis of a concave mirror of focal length f. One end of its magnified image touches an end of the rod. The length of the image is

[MP PET 1995]

(a) f (b) $\frac{1}{2} f$

(c) $2f$ (d) $\frac{1}{4} f$

7. A ray of light falls on the surface of a spherical glass paper weight making an angle α with the normal and is refracted in the medium at an angle β. The angle of deviation of the emergent ray from the direction of the incident ray

[IIT-JEE (Screening) 2000] [NCERT 1982]

(a) $(\alpha - \beta)$ (b) $2(\alpha - \beta)$

(c) $(\alpha - \beta)/2$ (d) $(\beta - \alpha)$

8. Light enters at an angle of incidence in a transparent rod of refractive index *n*. For what value of the refractive index of the material of the rod the light once entered into it will not leave it through its lateral face whatsoever be the value of angle of incidence

[CBSE PMT 1998]

(a) $n > \sqrt{2}$ (b) $n = 1$

(c) $n = 1.1$ (d) $n = 1.3$

9. A glass hemisphere of radius 0.04 m and *R.I.* of the material 1.6 is placed centrally over a cross mark on a paper (i) with the flat face; (ii) with the curved face in contact with the paper. In each case the cross mark is viewed directly from above. The position of the images will be

[ISM Dhanbad 1994]

(a) (i) 0.04 *m* from the flat face; (ii) 0.025 *m* from the flat face

(b) (i) At the same position of the cross mark; (ii) 0.025 *m* below the flat face

(c) (i) 0.025 *m* from the flat face; (ii) 0.04 *m* from the flat face

(d) For both (i) and (ii) 0.025 *m* from the highest point of the hemisphere

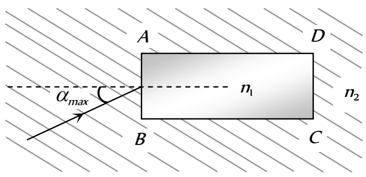
10. One face of a rectangular glass plate 6 *cm* thick is silvered. An object held 8 *cm* in front of the first face, forms an image 12 *cm* behind the silvered face. The refractive index of the glass is

(a) 0.4 (b) 0.8

(c) 1.2 (d) 1.6

11. A rectangular glass slab *ABCD*, of refractive index n_1, is immersed in water of refractive index n_2 $(n_1 > n_2)$. A ray of light in incident at the surface *AB* of the slab as shown. The maximum value of the angle of incidence α_{max}, such that the ray comes out only from the other surface *CD* is given by

[IIT-JEE (Screening) 2000]

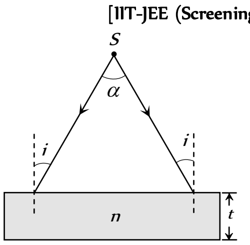


(a) $\sin^{-1}\left[\frac{n_1}{n_2}\cos\left(\sin^{-1}\frac{n_2}{n_1}\right)\right]$ (b) $\sin^{-1}\left[n_1\cos\left(\sin^{-1}\frac{1}{n_2}\right)\right]$

(c) $\sin^{-1}\left(\frac{n_1}{n_2}\right)$ (d) $\sin^{-1}\left(\frac{n_2}{n_1}\right)$

12. A diverging beam of light from a point source *S* having divergence angle α, falls symmetrically on a glass slab as shown. The angles of incidence of the two extreme rays are equal. If the thickness of the glass slab is *t* and the refractive index *n*, then the divergence angle of the emergent beam is

[IIT-JEE (Screening) 2000]



(a) Zero

(b) α

(c) $\sin^{-1}(1/n)$

(d) $2\sin^{-1}(1/n)$

13. A concave mirror is placed at the bottom of an empty tank with face upwards and axis vertical. When sunlight falls normally on the mirror, it is focussed at distance of 32 *cm* from the mirror. If the tank filled with water $\left(\mu = \frac{4}{3}\right)$ upto a height of 20 *cm*, then the sunlight will now get focussed at

[UPSEAT 2002]

(a) 16 *cm* above water level

(b) 9 *cm* above water level

(c) 24 *cm* below water level

(d) 9 *cm* below water level

14. An air bubble in sphere having 4 *cm* diameter appears 1 *cm* from surface nearest to eye when looked along diameter. If μ = 1.5, the distance of bubble from refracting surface is

[CPMT 2002]

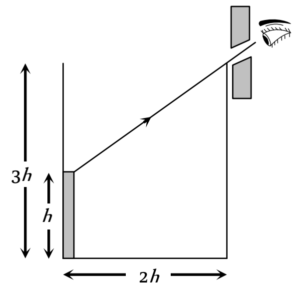
(a) 1.2 *cm* (b) 3.2 *cm*

(c) 2.8 *cm* (d) 1.6 *cm*

15. An observer can see through a pin–hole the top end of a thin rod of height *h*, placed as shown in the figure. The beaker height is 3*h* and its radius *h*. When the beaker is filled with a liquid up to a height 2*h*, he can see the lower end of the rod. Then the refractive index of the liquid is

[CPMT 1999]

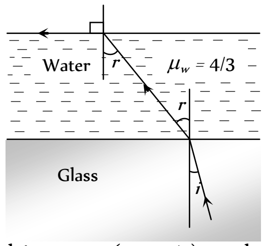
[IIT-JEE (Screening) 2002]



(a) 5/2 (b) $\sqrt{(5/2)}$

(c) $\sqrt{(3/2)}$ (d) 3/2

16. A ray of light is incident at the glass–water interface at an angle *i*, it emerges finally parallel to the surface of water, then the value of μ_g would be **[IIT-JEE (Screening) 2003]**



(a) (4/3) sin *i*

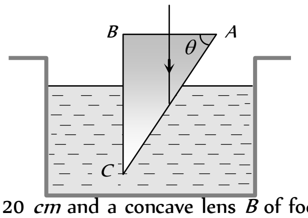
(b) 1/sin *i*

(c) 4/3

(d) 1

17. A glass prism (μ = 1.5) is dipped in water (μ = 4/3) as shown in figure. A light ray is incident normally on the surface *AB*. It reaches the surface BC after totally reflected, if

[IIT JEE 1981; MP PMT 1997]



(a) sin θ ≥ 8/9

(b) 2/3 < sin θ < 8/9

(c) sin θ ≤ 2/3

(d) It is not possible

18. A convex lens *A* of focal length 20 *cm* and a concave lens *B* of focal length 5 *cm* are kept along the same axis with the distance *d* between them. If a parallel beam of light falling on *A* leaves *B* as a parallel beam, then distance *d* in *cm* will be

(a) 25 (b) 15

(c) 30 (d) 50

19. Diameter of a plano–convex lens is 6 *cm* and thickness at the centre is 3 *mm*. If the speed of light in the material of the lens is 2 × 10 *m/sec*, the focal length of the lens is [CPMT 1989]

(a) 15 *cm* (b) 20 *cm*

(c) 30 *cm* (d) 10 *cm*

20. A point object *O* is placed on the principal axis of a convex lens of focal length 20 *cm* at a distance of 40 cm to the left of it. The diameter of the lens is 10 *cm*. If the eye is placed 60 *cm* to the right of the lens at a distance *h* below the principal axis, then the maximum value of *h* to see the image will be

(a) 0 (b) 5 *cm*

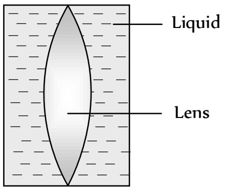
(c) 2.5 *cm* (d) 10 *cm*

21. A luminous object is placed at a distance of 30 *cm* from the convex lens of focal length 20 *cm*. On the other side of the lens, at what distance from the lens a convex mirror of radius of curvature 10 *cm* be placed in order to have an upright image of the object coincident with it [CBSE PMT 1998; JIPMER 2001, 02]

(a) 12 *cm* (b) 30 *cm*

(c) 50 *cm* (d) 60 *cm*

22. Shown in the figure here is a convergent lens placed inside a cell filled with a liquid. The lens has focal length + 20 *cm* when in air and its material has refractive index 1.50. If the liquid has refractive index 1.60, the focal length of the system is [NSEP 1994; DPMT 2000]



(a) + 80 *cm*

(b) – 80 *cm*

(c) – 24 *cm*

(d) –100 *cm*

23. A hollow double concave lens is made of very thin transparent material. It can be filled with air or either of two liquids L_1 and L_2 having refractive indices n_1 and n_2 respectively ($n_2 > n_1 > 1$). The lens will diverge a parallel beam of light if it is filled with

(a) Air and placed in air

(b) Air and immersed in L_1

(c) L_1 and immersed in L_2

(d) L_2 and immersed in L_1

24. The object distance *u*, the image distance *v* and the magnification *m* in a lens follow certain linear relations. These are

(a) $\frac{1}{u}$ versus $\frac{1}{v}$ (b) *m* versus *u*

(c) *u* versus *v* (d) *m* versus *v*

25. Which one of the following spherical lenses does not exhibit dispersion? The radii of curvature of the surfaces of the lenses are as given in the diagrams [IIT-JEE (Screening) 2002]

(a) 
$R_1 \neq R_2$

(b) 
(c) 
(d) 
26. The size of the image of an object, which is at infinity, as formed by a convex lens of focal length 30*cm* is 2 *cm*. If a concave lens of focal length 20 *cm* is placed between the convex lens and the image at a distance of 26 *cm* from the convex lens, calculate the new size of the image [MP PMT 1999] [IIT-JEE (Screening) 2003]

(a) 1.25 *cm* (b) 2.5 *cm*

(c) 1.05 *cm* (d) 2 *cm*

27. An achromatic prism is made by crown glass prism $(A_c = 19^o)$ and flint glass prism $(A_F = 6^o)$. If ${}^C\mu_v = 1.5$ and ${}^F\mu_v = 1.66$, then resultant deviation for red coloured ray will be

(a) 1.04° (b) 5°

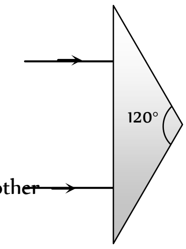
(c) 0.96° (d) 13.5°

28. The refracting angle of prism is *A* and refractive index of material of prism is $\cot\frac{A}{2}$. The angle of minimum deviation is

(a) 180°– 3A (b) 180° + 2A

(c) 90° –A (d) 180° – 2A

29. An isosceles prism of angle 120° has a refractive index of 1.44. Two parallel monochromatic rays enter the prism parallel to each other in air as shown. The rays emerging from the opposite faces



[IIT-JEE (Screening) 2000]

(a) Are parallel to each other

(b) Are diverging

(c) Make an angle $2\sin^{-1}(0.72)$ with each other

(d) Make an angle $2\{\sin^{-1}(0.72) - 30^o\}$ with each other

30. A ray of light is incident on the hypotenuse of a right-angled prism after travelling parallel to the base inside the prism. If μ is the refractive index of the material of the prism, the maximum value of the base angle for which light is totally reflected from the hypotenuse is [Roorkee 2000] [EAMCET 2003]

(a) $\sin^{-1}\left(\frac{1}{\mu}\right)$ (b) $\tan^{-1}\left(\frac{1}{\mu}\right)$

(c) $\sin^{-1}\left(\frac{\mu-1}{\mu}\right)$ (d) $\cos^{-1}\left(\frac{1}{\mu}\right)$

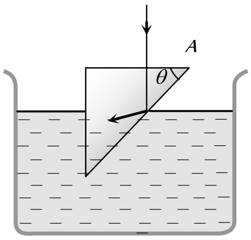
31. The refractive index of the material of the prism and liquid are 1.56 and 1.32 respectively. What will be the value of θ for the following refraction [BHU 2003; CPMT 2004]

(a) $\sin\theta \geq \dfrac{13}{11}$

(b) $\sin\theta \geq \dfrac{11}{13}$

(c) $\sin\theta \geq \dfrac{\sqrt{3}}{2}$

(d) $\sin\theta \geq \dfrac{1}{\sqrt{2}}$



32. A spherical surface of radius of curvature *R* separates air (refractive index 1.0) from glass (refractive index 1.5). The centre of curvature is in the glass. A point object *P* placed in air is found to have a real image *Q* in the glass. The line *PQ* cuts the surface at a point *O*, and PO = OQ. The distance *PO* is equal to

(a) 5 *R* (b) 3 *R*

(c) 2 *R* (d) 1.5 *R*

33. A plano-convex lens when silvered in the plane side behaves like a concave mirror of focal length 30*cm*. However, when silvered on the convex side it behaves like a concave mirror of focal length 10 *cm*. Then the refractive index of its material will be

(a) 3.0 (b) 2.0

(c) 2.5 (d) 1.5

34. A ray of light travels from an optically denser to rarer medium. The critical angle for the two media is *C*. The maximum possible deviation of the ray will be

[KCET (Engg./Med.) 2002]

(a) $\left(\dfrac{\pi}{2} - C\right)$ (b) $2C$

(c) $\pi - 2C$ (d) $\pi - C$

35. An astronaut is looking down on earth's surface from a space shuttle at an altitude of $400\,km$. Assuming that the astronaut's pupil diameter is $5\,mm$ and the wavelength of visible light is $500\,nm$. The astronaut will be able to resolve linear object of the size of about [AIIMS 2003]

(a) 0.5 *m* (b) $5\,m$

(c) 50 *m* (d) 500 *m*

36. The average distance between the earth and moon is 38.6×10^{4} *km*. The minimum separation between the two points on the surface of the moon that can be resolved by a telescope whose objective lens has a diameter of 5 *m* with $\lambda = 6000\,\AA$ is

(a) 5.65 *m* (b) 28.25 *m*

(c) 11.30 *m* (d) 56.51 *m*

37. The distance of the moon from earth is $3.8\times10^{5}\,km$. The eye is most sensitive to light of wavelength 5500 Å. The separation of two points on the moon that can be resolved by a 500 *cm* telescope will be [AMU (Med.) 2002]

(a) 51 *m* (b) 60 *m*

(c) 70 *m* (d) All the above

38. A small source of light is to be suspended directly above the centre of a circular table of radius *R*. What should be the height of the light source above the table so that the intensity of light is maximum at the edges of the table compared to any other height of the source

(a) $\dfrac{R}{2}$ (b) $\dfrac{R}{\sqrt{2}}$

(c) R (d) $\sqrt{2}R$

39. A light source is located at P_1 as shown in the figure. All sides of the polygon are equal. The intensity of illumination at P_2 is I_0. What will be the intensity of illumination at P_3

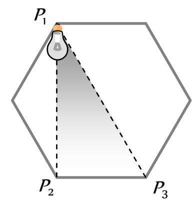
[IIT JEE 1998; DPMT 2000]

(a) $\dfrac{3\sqrt{3}}{8}I_0$

(b) $\dfrac{I_0}{8}$

(c) $\dfrac{3}{8}I_0$

(d) $\dfrac{\sqrt{3}}{8}I_0$



[BHU 1997; UPSEAT 1995]

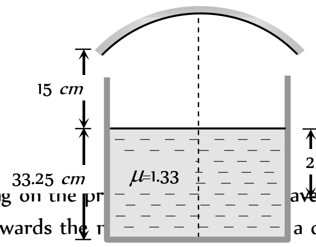
40. A container is filled with water (μ = 1.33) upto a height of 33.25 *cm*. A concave mirror is placed 15 *cm* above the water level and the image of an object placed at the bottom is formed 25 *cm* below the water level. The focal length of the mirror is

(a) 10

(b) 15

(c) 20

(d) 25



41. A point object is moving on the pr... ave mirror of focal length $24cm$ towards th... r... a distance of $60cm$ from the mirror, its velocity is $9cm/sec$. What is the velocity of the image at that instant

[MP PMT 1997]

(a) $5cm/sec$ towards the mirror

(b) $4cm/sec$ towards the mirror

(c) $4cm/sec$ away from the mirror

(d) $9cm/sec$ away from the mirror

[MP PMT 1993]

42. A concave mirror is placed on a horizontal table with its axis directed vertically upwards. Let O be the pole of the mirror and C its centre of curvature. A point object is placed at C. It has a real image, also located at C. If the mirror is now filled with water, the image will be [IIT-JEE 1998]

(a) Real, and will remain at *C*

(b) Real, and located at a point between *C* and ∞

(c) Virtual and located at a point between *C* and *O*

(d) Real, and located at a point between *C* and *O*

43. The diameter of moon is 3.5×10^3 *km* and its distance from the earth is 3.8×10^5 *km*. If it is seen through a telescope whose focal length for objective and eye lens are 4 *m* and 10 *cm* respectively, then the angle subtended by the moon on the eye will be approximately

[NCERT 1982; CPMT 1991]

(a) 15° (b) 20°

(c) 30° (d) 35°

44. The focal length of an objective of a telescope is 3 *metre* and diameter 15 *cm*. Assuming for a normal eye, the diameter of the pupil is 3 *mm* for its complete use, the focal length of eye piece must be [MP PET 1989]

(a) 6 *cm* (b) 6.3 *cm*

(c) 20 *cm* (d) 60 *cm*

45. We wish to see inside an atom. Assuming the atom to have a diameter of 100 *pm*, this means that one must be able to resolved a width of say 10 *p.m.* If an electron microscope is used, the minimum electron energy required is about

[AIIMS 2004]

(a) 1.5 *KeV* (b) 15 *KeV*

(c) 150 *KeV* (d) 1.5 *KeV*

46. A telescope has an objective lens of 10 *cm* diameter and is situated at a distance of one kilometre from two objects. The minimum distance between these two objects, which can be resolved by the telescope, when the mean wavelength of light is 5000 Å, is of the order of [CBSE PMT 2004]

(a) 0.5 *m* (b) 5 *m*

(c) 5 *mm* (d) 5 *cm*

47. Two point white dots are 1*mm* apart on a black paper. They are viewed by eye of pupil diameter 3 *mm*. Approximately, what is the maximum distance at which dots can be resolved by the eye ? [Take wavelength of light = 500 *nm*]

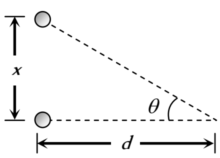
[AIEEE 2005]

(a) 6 *m*

(b) 3 *m*

(c) 5 *m*

(d) 1 *m*



48. A convex lens of focal length 30 *cm* and a concave lens of 10 *cm* focal length are placed so as to have the same axis. If a parallel beam of light falling on convex lens leaves concave lens as a parallel beam, then the distance between two lenses will be

(a) 40 *cm* (b) 30 *cm*

(c) 20 *cm* (d) 10 *cm*

49. A small plane mirror placed at the centre of a spherical screen of radius *R*. A beam of light is falling on the mirror. If the mirror makes *n* revolution. per second, the speed of light on the screen after reflection from the mirror will be

(a) $4\pi nR$ (b) $2\pi nR$

(c) $\frac{nR}{2\pi}$ (d) $\frac{nR}{4\pi}$

50. A room (cubical) is made of mirrors. An insect is moving along the diagonal on the floor such that the velocity of image of insect on two adjacent wall mirrors is 10 *cms*. The velocity of image of insect in ceiling mirror is

(a) 10 *cms* (b) 20 *cms*

(c) $\frac{10}{\sqrt{2}}$ *cms* (d) $10\sqrt{2}$ *cms*

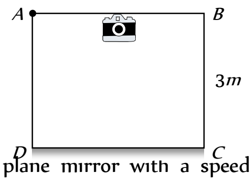
51. Figure shows a cubical room *ABCD* with the wall *CD* as a plane mirror. Each side of the room is 3*m*. We place a camera at the midpoint of the wall *AB*. At what distance should the camera be focussed to photograph an object placed at *A*

(a) 1.5 *m*

(b) 3 *m*

(c) 6 *m*

(d) More than 6 *m*



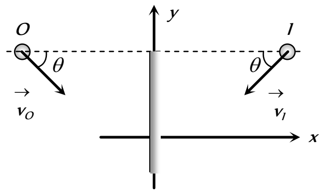
52. If an object moves towards a plane mirror with a speed *v* at an angle θ to the perpendicular to the plane of the mirror, find the relative velocity between the object and the image

(a) v

(b) $2v$

(c) $2v\cos\theta$

(d) $2v\sin\theta$



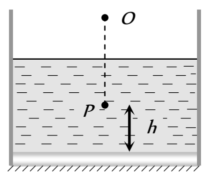
53. A plane mirror is placed at the bottom of the tank containing a liquid of refractive index μ. *P* is a small object at a height *h* above the mirror. An observer *O*-vertically above *P* outside the liquid see *P* and its image in the mirror. The apparent distance between these two will be

(a) $2\mu h$

(b) $\frac{2h}{\mu}$

(c) $\frac{2h}{\mu - 1}$

(d) $h\left(1 + \frac{1}{\mu}\right)$



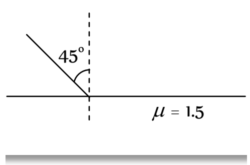
54. One side of a glass slab is silvered as shown. A ray of light is incident on the other side at angle of incidence $i = 45^o$. Refractive index of glass is given as 1.5. The deviation of the ray of light from its initial path when it comes out of the slab is

(a) 90°

(b) 180°

(c) 120°

(d) 45°



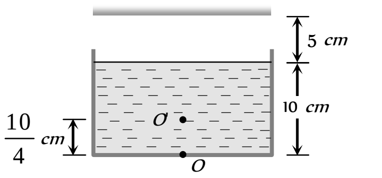
55. Consider the situation shown in figure. Water $\left(\mu_w = \frac{4}{3}\right)$ is filled in a breaker upto a height of 10 *cm*. A plane mirror fixed at a height of 5 *cm* from the surface of water. Distance of image from the mirror after reflection from it of an object *O* at the bottom of the beaker is

(a) 15 *cm*

(b) 12.5 *cm*

(c) 7.5 *cm*

(d) 10 *cm*

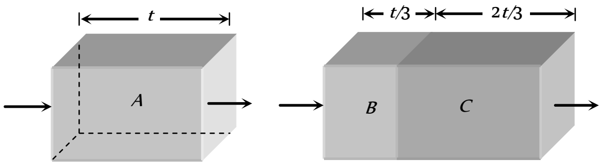


56. A person runs with a speed *u* towards a bicycle moving away from him with speed *v*. The person approaches his image in the mirror fixed at the rear of bicycle with a speed of

(a) $u - v$ (b) $u - 2v$

(c) $2u - v$ (d) $2(u - v)$

57. Two transparent slabs have the same thickness as shown. One is made of material *A* of refractive index 1.5. The other is made of two materials *B* and *C* with thickness in the ratio 1 : 2. The refractive index of *C* is 1.6. If a monochromatic parallel beam passing through the slabs has the same number of waves inside both, the refractive index of *B* is



(a) 1.1 (b) 1.2

(c) 1.3 (d) 1.4

58. An object is placed infront of a convex mirror at a distance of 50 *cm*. A plane mirror is introduced covering the lower half of the convex mirror. If the distance between the object and plane mirror is 30 *cm*, it is found that there is no parallax between the images formed by two mirrors. Radius of curvature of mirror will be

(a) 12.5 *cm* (b) 25 *cm*

(c) $\frac{50}{3}$ *cm* (d) 18 *cm*

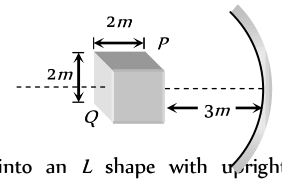
59. A cube of side 2 *m* is placed in front of a concave mirror focal length 1*m* with its face *P* at a distance of 3 *m* and face *Q* at a distance of 5 *m* from the mirror. The distance between the images of face *P* and *Q* and height of images of *P* and *Q* are

(a) 1 *m*, 0.5 *m*, 0.25 *m*

(b) 0.5 *m*, 1 *m*, 0.25 *m*

(c) 0.5 *m*, 0.25 *m*, 1*m*

(d) 0.25 *m*, 1*m*, 0.5 *m*



60. A small piece of wire bent into an *L* shape with upright and horizontal portions of equal lengths, is placed with the horizontal portion along the axis of the concave mirror whose radius of curvature is 10 *cm*. If the bend is 20 *cm* from the pole of the mirror, then the ratio of the lengths of the images of the upright and horizontal portions of the wire is

(a) 1 : 2 (b) 3 : 1

(c) 1 : 3 (d) 2 : 1

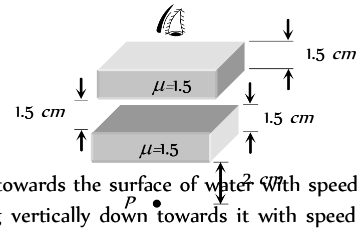
61. The image of point *P* when viewed from top of the slabs will be

(a) 2.0 *cm* above *P*

(b) 1.5 *cm* above *P*

(c) 2.0 *cm* below *P*

(d) 1 *cm* above *P*



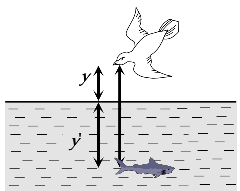
62. A fish rising vertically up towards the surface of water with speed 3 *ms* observes a bird diving vertically down towards it with speed 9 *ms*. The actual velocity of bird is

(a) 4.5 *ms*

(b) 5. *ms*

(c) 3.0 *ms*

(d) 3.4 *ms*



63. A beaker containing liquid is placed on a table, underneath a microscope which can be moved along a vertical scale. The microscope is focussed, through the liquid onto a mark on the table when the reading on the scale is *a*. It is next focussed on the upper surface of the liquid and the reading is *b*. More liquid is added and the observations are repeated, the corresponding readings are *c* and *d*. The refractive index of the liquid is

(a) $\frac{d-b}{d-c-b+a}$ (b) $\frac{b-d}{d-c-b+a}$

(c) $\frac{d-c-b+a}{d-b}$ (d) $\frac{d-b}{a+b-c-d}$

64. Two point light sources are 24 *cm* apart. Where should a convex lens of focal length 9 *cm* be put in between them from one source so that the images of both the sources are formed at the same place

(a) 6 *cm* (b) 9 *cm*

(c) 12 *cm* (d) 15 *cm*

65. There is an equiconvex glass lens with radius of each face as *R* and ${}_a\mu_g = 3/2$ and ${}_a\mu_w = 4/3$. If there is water in object space and air in image space, then the focal length is

(a) 2*R* (b) *R*

(c) 3 *R*/2 (d) R^2

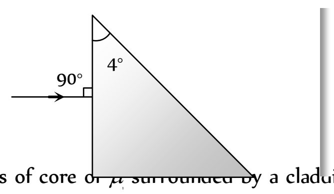
66. A prism having an apex angle 4 and refraction index 1.5 is located in front of a vertical plane mirror as shown in figure. Through what total angle is the ray deviated after reflection from the mirror

(a) 176

(b) 4

(c) 178

(d) 2



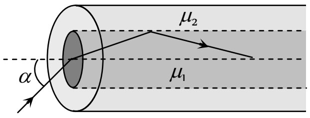
67. An optical fibre consists of core of μ surrounded by a cladding of μ < μ. A beam of light enters from air at an angle α with axis of fibre. The highest α for which ray can be travelled through fibre is

(a) $\cos^{-1}\sqrt{\mu_2^2-\mu_1^2}$

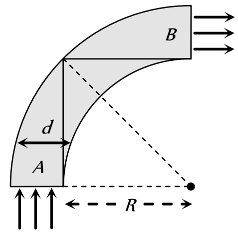
(b) $\sin^{-1}\sqrt{\mu_1^2-\mu_2^2}$

(c) $\tan^{-1}\sqrt{\mu_1^2-\mu_2^2}$

(d) $\sec^{-1}\sqrt{\mu_1^2-\mu_2^2}$



68. A rod of glass (μ = 1.5) and of square cross section is bent into the shape shown in the figure. A parallel beam of light falls on the plane flat surface *A* as shown in the figure. If *d* is the width of a side and *R* is the radius of circular arc then for what maximum value of $\frac{d}{R}$ light entering the glass slab through surface *A* emerges from the glass through *B*



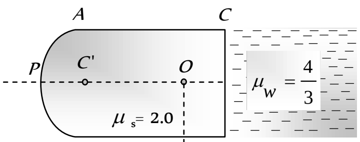
(a) 1.5

(b) 0.5

(c) 1.3

(d) None of these

69. The slab of a material of refractive index 2 shown in figure has curved surface *APB* of radius of curvature 10 *cm* and a plane surface *CD*. On the left of *APB* is air and on the right of *CD* is water with refractive indices as given in figure. An object *O* is placed at a distance of 15 *cm* from pole *P* as shown. The distance of the final image of *O* from *P*, as viewed from the left is



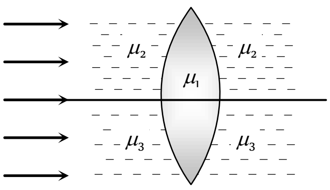
(a) 20 *cm*

(b) 30 *cm*

(c) 40 *cm*

(d) 50 *cm*

70. A double convex lens, lens made of material of refractive index μ_1, is placed inside two liquids of refractive indices μ_2 and μ_3, as shown. $\mu_2 > \mu_1 > \mu_3$. A wide, parallel beam of light is incident on the lens from the left. The lens will give rise to



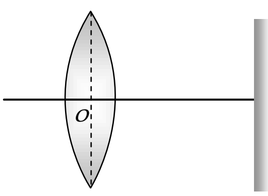
(a) A single convergent beam

(b) Two different convergent beams

(c) Two different divergent beams

(d) A convergent and a divergent beam

71. The distance between a convex lens and a plane mirror is 10 *cm*. The parallel rays incident on the convex lens after reflection from the mirror form image at the optical centre of the lens. Focal length of lens will be



(a) 10 *cm*

(b) 20 *cm*

(c) 30 *cm*

(d) Cannot be determined

72. A compound microscope is used to enlarge an object kept at a distance 0.03*m* from it's objective which consists of several convex lenses in contact and has focal length 0.02*m*. If a lens of focal length 0.1*m* is removed from the objective, then by what distance the eye-piece of the microscope must be moved to refocus the image

(a) 2.5 *cm* (b) 6 *cm*

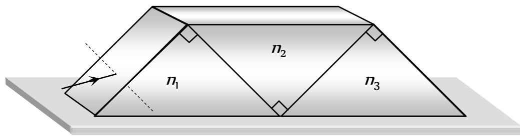
(c) 15 *cm* (d) 9 *cm*

73. If the focal length of the objective lens and the eye lens are 4 *mm* and 25 *mm* respectively in a compound microscope. The length of the tube is 16 *cm*. Find its magnifying power for relaxed eye position

(a) 32.75 (b) 327.5

(c) 0.3275 (d) None of the above

74. Three right angled prisms of refractive indices n_1, n_2 and n_3 are fixed together using an optical glue as shown in figure. If a ray passes through the prisms without suffering any deviation, then



(a) $n_1 = n_2 = n_3$ (b) $n_1 = n_2 \neq n_3$

(c) $1 + n_1 = n_2 + n_3$ (d) $1 + n_2^2 = n_1^2 + n_3^2$

75. In a compound microscope, the focal length of the objective and the eye lens are 2.5 *cm* and 5 *cm* respectively. An object is placed at 3.75 *cm* before the objective and image is formed at the least distance of distinct vision, then the distance between two lenses will be (*i.e.* length of the microscopic tube)

(a) 11.67 *cm* (b) 12.67 *cm*

(c) 13.00 *cm* (d) 12.00 *cm*

76. In a grease spot photometer light from a lamp with dirty chimney is exactly balanced by a point source distance 10 *cm* from the grease spot. On clearing the chimney, the point source is moved 2 *cm* to obtain balance again. The percentage of light absorbed by dirty chimney is nearly

(a) 56% (b) 44%

(c) 36% (d) 64%

77. The separation between the screen and a plane mirror is 2*r*. An isotropic point source of light is placed exactly midway between the mirror and the screen. Assume that mirror reflects 100% of incident light. Then the ratio of illuminances on the screen with and without the mirror is

(a) 10 : 1 (b) 2 : 1

(c) 10 : 9 (d) 9 : 1

78. The separation between the screen and a concave mirror is 2*r*. An isotropic point source of light is placed exactly midway between the mirror and the point source. Mirror has a radius of curvature *r* and reflects 100% of the incident light. Then the ratio of illuminances on the screen with and without the mirror is

(a) 10 : 1 (b) 2 : 1

(c) 10 : 9 (d) 9 : 1

79. The apparent depth of water in cylindrical water tank of diameter 2*R cm* is reducing at the rate of *x cm*/minute when water is being drained out at a constant rate. The amount of water drained in *c.c.* per minute is (n_1 = refractive index of air, n_2 = refractive index of water) **[AIIMS 2005]**

(a) $x \pi R^2 n_1/n_2$ (b) $x \pi R^2 n_2/n_1$

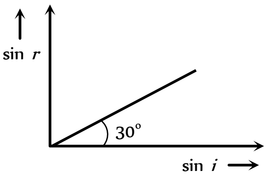
(c) $2 \pi R n_1/n_2$ (d) $\pi R^2 x$

Graphical Questions

1. In an experiment of find the focal length of a concave mirror a graph is drawn between the magnitudes of u and v. The graph looks like [AIIMS 2003]

(a) 
(b) 
(c) 
(d) 
2. As the position of an object (u) reflected from a concave mirror is varied, the position of the image (v) also varies. By letting the u changes from 0 to $+\infty$ the graph between v versus u will be

(a) 
(b) 
(c) 
(d) 
3. When light is incident on a medium at angle i and refracted into a second medium at an angle r, the graph of sin i *vs* sin$r$ is as shown in the graph. From this, one can conclude that



(a) Velocity of light in the second medium is 1.73 times the velocity of light in the I medium

(b) Velocity of light in the I medium is 1.73 times the velocity in the II medium

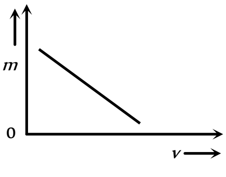
(c) The critical angle for the two media is given by

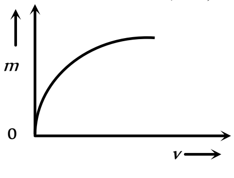
$$\sin i_c = \frac{1}{\sqrt{3}}$$

(d) $\sin i_c = \frac{1}{2}$

4. The graph between the lateral magnification (m) produced by a lens and the distance of the image (v) is given by [MP PMT 1994]

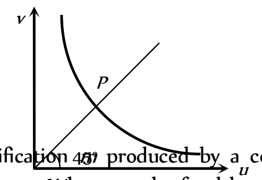
(a) 
(b) 





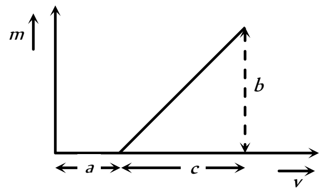
(c) (d)

5. The graph shows variation of v with change in u for a mirror. Points plotted above the point P on the curve are for values of v



(a) Smaller then f
(b) Smaller then $2f$
(c) Larger then $2f$
(d) Larger than f

6. The graph shows how the magnification m produced by a convex thin lens varies with image distance v. What was the focal length of the used [DPMT 1995]



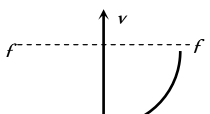
(a) $\frac{b}{c}$
(b) $\frac{b}{ca}$
(c) $\frac{bc}{a}$
(d) $\frac{c}{b}$

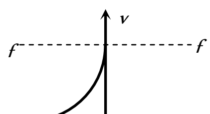
7. Which of the following graphs shows appropriate variation of refractive index μ with wavelength λ

(a) 
(b) 
(c) 
(d) 
8. For a concave mirror, if real image is formed the graph between $\frac{1}{u}$ and $\frac{1}{v}$ is of the form

(a) 
(b) 
(c) 
(d) 
9. The graph between u and v for a convex mirror is

(a) 
(b) 

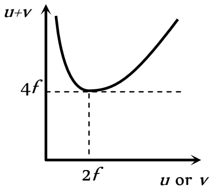




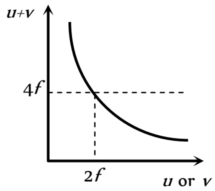
(c) (d)

10. For a convex lens, if real image is formed the graph between $(u + v)$ and u or v is as follows

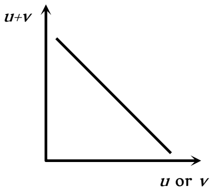
(a)



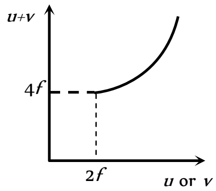
(b)



(c)

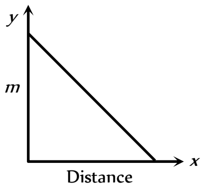


(d)

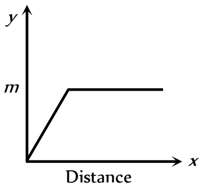


11. Which of the following graphs is the magnification of a real image against the distance from the focus of a concave mirror

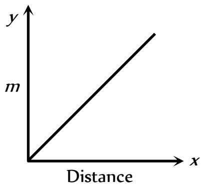
(a)



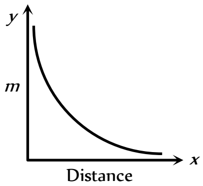
(b)



(c)

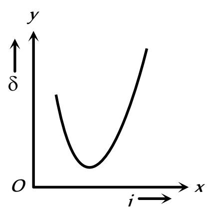


(d)

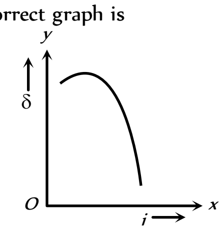


12. A graph is plotted between angle of deviation (δ) and angle of incidence (i) for a prism. The nearly correct graph is

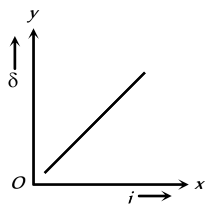
(a)



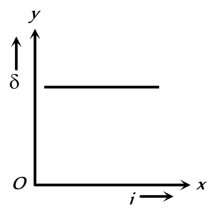
(b)



(c)

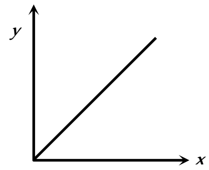


(d)

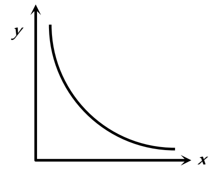


13. If x is the distance of an object from the focus of a concave mirror and y is the distance of image from the focus, then which of the following graphs is correct between x and y

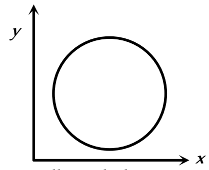
(a)



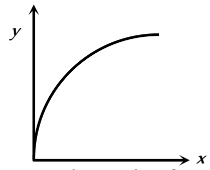
(b)



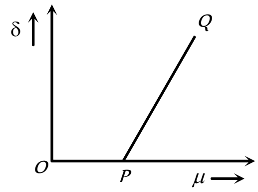
(c)



(d)



14. For a small angled prism, angle of prism A, the angle of minimum deviation (δ) varies with the refractive index of the prism as shown in the graph



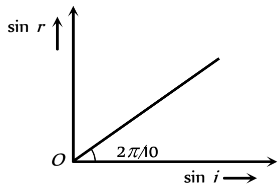
(a) Point P corresponds to $\mu = 1$

(b) Slope of the line $PQ = A/2$

(c) Slope $= A$

(d) None of the above statements is true

15. The graph between sine of angle of refraction (sin r) in medium 2 and sine of angle of incidence (sin i) in medium 1 indicates that (tan 36° $\approx \frac{3}{4}$)



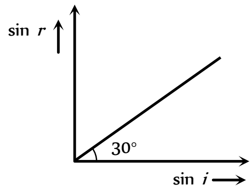
(a) Total internal reflection can take place

(b) Total internal reflection cannot take place

(c) Any of (a) and (b)

(d) Data is incomplete

16. A medium shows relation between i and r as shown. If speed of light in the medium is nc then value of n is



(a) 1.5

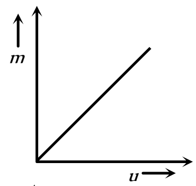
(b) 2

(c) 2

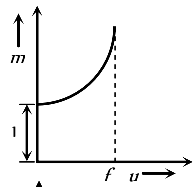
(d) 3

17. For a concave mirror, if virtual image is formed, the graph between m and u is of the form

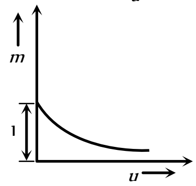
(a)



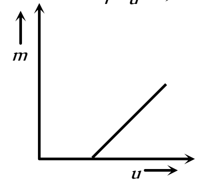
(b)



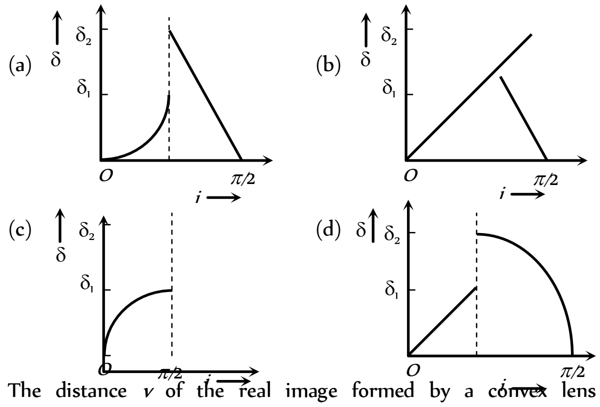
(c)



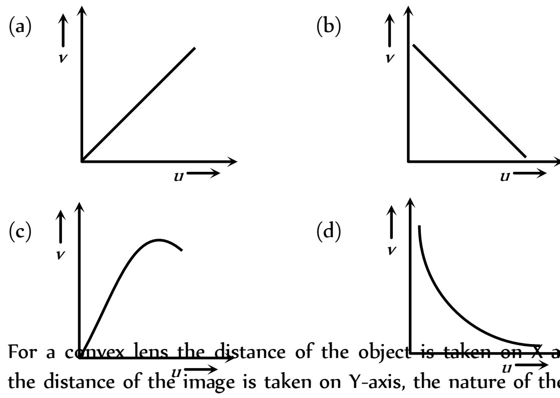
(d)



18. A ray of light travels from a medium of refractive index μ to air. Its angle of incidence in the medium is i, measured from the normal to the boundary, and its angle of deviation is δ. δ is plotted against i which of the following best represents the resulting curve



19. The distance v of the real image formed by a convex lens is measured for various object distance u. A graph is plotted between v and u, which one of the following graphs is correct



20. For a convex lens the distance of the object is taken on X-axis and the distance of the image is taken on Y-axis, the nature of the graph so obtained is [BVP 2003]

(a) Straight line (b) Circle

(c) Parabola (d) Hyperbola

AR Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) *If both assertion and reason are true and the reason is the correct explanation of the assertion.*
(b) *If both assertion and reason are true but reason is not the correct explanation of the assertion.*
(c) *If assertion is true but reason is false.*
(d) *If the assertion and reason both are false.*
(e) *If assertion is false but reason is true.*

1. Assertion : A red object appears dark in the yellow light
   Reason : A red colour is scattered less [AIIMS 2004]

2. Assertion : The stars twinkle while the planets do not.
   Reason : The stars are much bigger in size than the planets.[AIIMS 2003]

3. Assertion : Owls can move freely during night.
   Reason : They have large number of rods on their retina.[AIIMS 2003]

4. Assertion : The air bubble shines in water.
   Reason : Air bubble in water shines due to refraction of light [AIIMS 2002]

5. Assertion : In a movie, ordinarily 24 frames are projected per second from one end to the other of the complete film.
   Reason : The image formed on retina of eye is sustained upto 1/10 second after the removal of stimulus. [AIIMS 2001]

6. Assertion : Blue colour of sky appears due to scattering of blue colour.
   Reason : Blue colour has shortest wave length in visible spectrum. [AIIMS 2001]

7. Assertion : The refractive index of diamond is $\sqrt{6}$ and that of liquid is $\sqrt{3}$. If the light travels from diamond to the liquid, it will totally reflected when the angle of incidence is 30°.
   Reason[BVP 2003] : $\mu = \dfrac{1}{\sin C}$, where μ is the refractive index of diamond with respect to liquid. [AIIMS 2000]

8. Assertion : The setting sun appears to be red.
   Reason : Scattering of light is directly proportional to the wavelength. [AIIMS 2000]

9. Assertion : A double convex lens (μ = 1.5) has focal length 10 *cm*. When the lens is immersed in water (μ = 4/3) its focal length becomes 40 *cm*.
   Reason : $\dfrac{1}{f} = \dfrac{\mu_l - \mu_m}{\mu_m}\left(\dfrac{1}{R_1} - \dfrac{1}{R_2}\right)$ [AIIMS 1999]

10. Assertion : Different colours travel with different speed in vacuum.
    Reason : Wavelength of light depends on refractive index of medium. [AIIMS 1998]

11. Assertion : The colour of the green flower seen through red glass appears to be dark.
    Reason : Red glass transmits only red light. [AIIMS 1997]

12. Assertion : The focal length of the mirror is f and distance of the object from the focus is u, the magnification of the mirror is f/u.
    Reason : Magnification $= \dfrac{\text{Size of image}}{\text{Size of object}}$ [AIIMS 1994]

13. Assertion : If a plane glass slab is placed on the letters of different colours all the letters appear to be raised up to the same height.
    Reason : Different colours have different wavelengths.

14. Assertion : The fluorescent tube is considered better than an electric bulb.
    Reason : Efficiency of fluorescent tube is more than the efficiency of electric bulb.

15. Assertion : The polar caps of earth are cold in comparison to equatorial plane.
    Reason : The radiation absorbed by polar caps is less than the radiation absorbed by equatorial plane.

16. Assertion : The illumination of earth's surface from sun is more at noon than in the morning.

Reason : Luminance of a surface refers to brightness of the surface.

17. Assertion : When an object is placed between two plane parallel mirrors, then all the images found are of equal intensity.

Reason : In case of plane parallel mirrors, only two images are possible.

18. Assertion : The mirrors used in search lights are parabolic and not concave spherical.

Reason : In a concave spherical mirror the image formed is always virtual.

19. Assertion : The size of the mirror affect the nature of the image.

Reason : Small mirrors always forms a virtual image.

20. Assertion : Just before setting, the sun may appear to be elliptical. This happens due to refraction.

Reason : Refraction of light ray through the atmosphere may cause different magnification in mutually perpendicular directions.

21. Assertion : Critical angle of light passing from glass to air is minimum for violet colour.

Reason : The wavelength of blue light is greater than the light of other colours.

22. Assertion : We cannot produce a real image by plane or convex mirrors under any circumstances.

Reason : The focal length of a convex mirror is always taken as positive.

23. Assertion : A piece of red glass is heated till it glows in dark. The colour of glowing glass would be orange.

Reason : Red and orange is complementary colours.

24. Assertion : Within a glass slab, a double convex air bubble is formed. This air bubble behaves like a converging lens.

Reason : Refractive index of air is more than the refractive index of glass.

25. Assertion : The images formed by total internal reflections are much brighter than those formed by mirrors or lenses.

Reason : There is no loss of intensity in total internal reflection.

26. Assertion : The focal length of lens does not change when red light is replaced by blue light.

Reason : The focal length of lens does not depends on colour of light used.

27. Assertion : There is no dispersion of light refracted through a rectangular glass slab.

Reason : Dispersion of light is the phenomenon of splitting of a beam of white light into its constituent colours.

28. Assertion : All the materials always have the same colour, whether viewed by reflected light or through transmitted light.

Reason : The colour of material does not depend on nature of light.

29. Assertion : A beam of white light gives a spectrum on passing through a hollow prism.

Reason : Speed of light outside the prism is different from the speed of light inside the prism.

30. Assertion : By increasing the diameter of the objective of telescope, we can increase its range.

Reason : The range of a telescope tells us how far away a star of some standard brightness can be spotted by telescope.

31. Assertion : For the sensitivity of a camera, its aperture should be reduced.

Reason : Smaller the aperture, image focussing is also sharp.

32. Assertion : If objective and eye lenses of a microscope are interchanged then it can work as telescope.

Reason : The objective of telescope has small focal length.

33. Assertion : The illuminance of an image produced by a convex lens is greater in the middle and less towards the edges.

Reason : The middle part of image is formed by undeflected rays while outer part by inclined rays.

34. Assertion : Although the surfaces of a goggle lens are curved, it does not have any power.

Reason : In case of goggles, both the curved surfaces have equal radii of curvature.

35. Assertion : The resolving power of an electron microscope is higher than that of an optical microscope.

Reason : The wavelength of electron is more than the wavelength of visible light.

36. Assertion : If the angles of the base of the prism are equal, then in the position of minimum deviation, the refracted ray will pass parallel to the base of prism.

Reason : In the case of minimum deviation, the angle of incidence is equal to the angle of emergence.

37. Assertion : Dispersion of light occurs because velocity of light in a material depends upon its colour.

Reason : The dispersive power depends only upon the material of the prism, not upon the refracting angle of the prism.

38. Assertion : An empty test tube dipped into water in a beaker appears silver, when viewed from a suitable direction.

Reason : Due to refraction of light, the substance in water appears silvery.

39. Assertion : Spherical aberration occur in lenses of larger aperture.

Reason : The two rays, paraxial and marginal rays focus at different points.

40. Assertion : It is impossible to photograph a virtual image.

Reason : The rays which appear diverging from a virtual image fall on the camera and a real image is captured.

41. Assertion : The speed of light in a rarer medium is greater than that in a denser medium

Reason : One light year equals to 9.5×10^{12} *km*

[AIIMS 1999]

42. Assertion : The frequencies of incident, reflected and refracted beam of monochromatic light incident from one medium to another are same

Reason : The incident, reflected and refracted rays are coplanar [EAMCET (Engg.) 2000]

43. Assertion : The refractive index of a prism depends only on the kind of glass of which it is made of and the colour of light

Reason : The refractive index of a prism depends upon the refracting angle of the prism and the angle of minimum deviation [AIIMS 2000]

44. Assertion : The resolving power of a telescope is more if the diameter of the objective lens is more.

Reason : Objective lens of large diameter collects more light.[AIIMS

45. Assertion : By roughening the surface of a glass sheet its transparency can be reduced.

Reason : Glass sheet with rough surface absorbs more light.[AIIMS

46. Assertion : Diamond glitters brilliantly.

Reason : Diamond does not absorb sunlight.

[AIIMS 2005]

47. Assertion : The cloud in sky generally appear to be whitish.

Reason : Diffraction due to cloud is efficient in equal measure at all wavelengths. [AIIMS 2005]

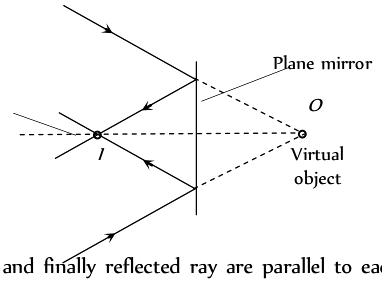
Answers and Solutions

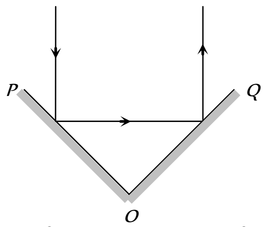
Plane Mirror

1. (d) $\delta = (360 - 2\theta) = (360 - 2 \times 60) = 240^o$

2. (b) When converging beam incident on plane mirror, real image is formed as shown

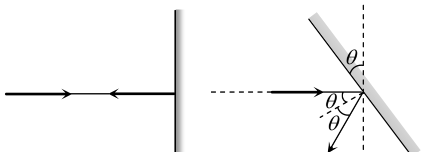


3. (b) Incident ray and finally reflected ray are parallel to each other means $\delta = 180^o$

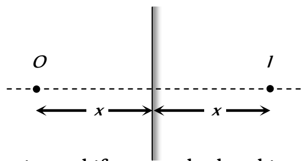


From $\delta = 360 - 2\theta \Rightarrow 180 = 360 - 2\theta \Rightarrow \theta = 90^o$

4. (c, d) By keeping the incident ray is fixed, if plane mirror rotates through an angle θ reflected ray rotates through an angle 2θ.

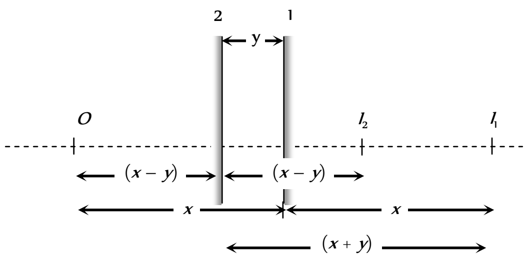


5. (c) Suppose at any instant, plane mirror lies at a distance x from object. Image will be formed behind the mirror at the same distance x.



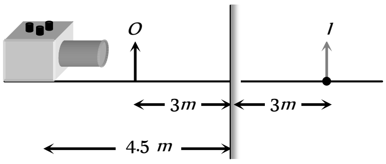
When the mirror shifts towards the object by distance 'y' the image shifts $= x + y - (x - y) = 2y$

So speed of image = 2 × speed of mirror

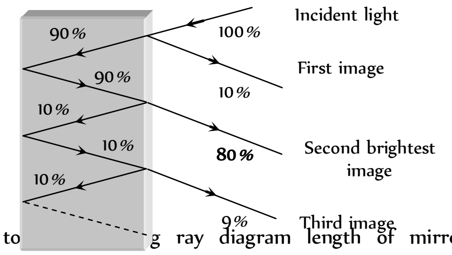


6. (c) Number of images $=\left(\frac{360}{\theta}-1\right)=\left(\frac{360}{60}-1\right)=5$

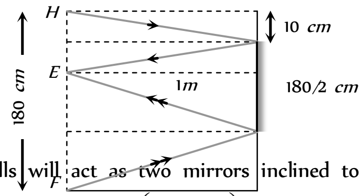
7. (d) F using distance of image = 4.5 m + 3 m = 7.5 m.



8. (b) Several images will be formed but second image will be brightest



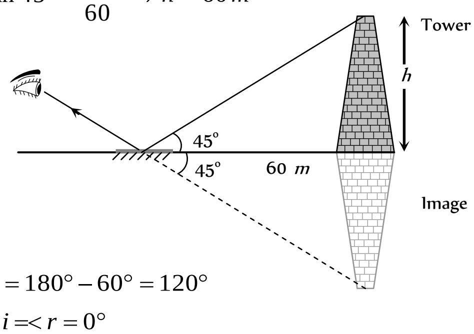
9. (b) According to ray diagram length of mirror $=\frac{1}{2}(10+170)=90\,cm$



10. (c) The walls will act as two mirrors inclined to each other at $90°$ and so will form $\left(\frac{360}{90}-1\right)=4-1$ *i.e.* 3 images of the person. Now these images with person will act as objects for the ceiling mirror and so ceiling mirror will form 4 images further. Therefore total number of images formed $=3+3+1=7$

Note : He can see. 6 images of himself.

11. (b) $\tan 45°=\frac{h}{60}\ \Rightarrow h=60\,m$



12. (d) $\delta=180°-60°=120°$

13. (a) $<i=<r=0°$

14. (c) When light is reflected from denser medium, a phase difference of π always occurs.

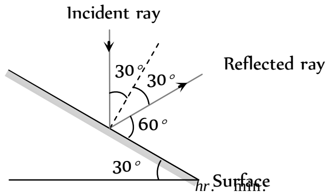
15. (c) Ray after reflection from three mutually perpendicular mirrors becomes anti-parallel.

16. (b) In two images man will see himself using left hand.

17. (c) In plane mirror, size of the image is independent of the angle of incidence.

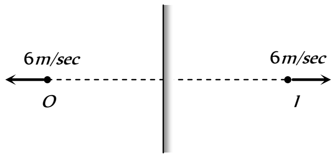
18. (b) Size of image formed by a plane mirror is same as that of the object. Hence its magnification will be 1.

19. (c)



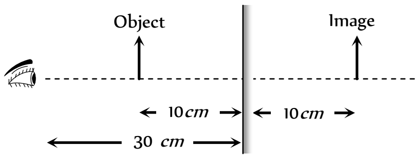
20. (a) Subtract the given time from $11:60$

21. (c) Relative velocity of image $w.r.t.$ object $=6-(-6)=12\,m/\sec$



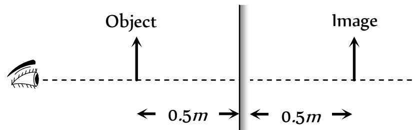
22. (b)

23. (c) See following ray diagram

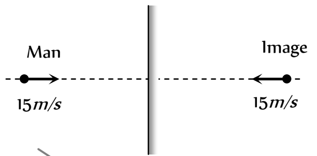


The distance focussed for eye $=30+10=40\,cm$

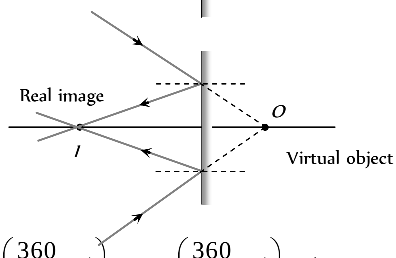
24. (b) Distance between object and image $=0.5+0.5=1\,m$



25. (b) Relative velocity of image $w.r.t.$ man $=15-(-15)=30\ m/s$



26. (b)



27. (c) $n=\left(\frac{360}{\theta}-1\right)\Rightarrow n=\left(\frac{360}{72}-1\right)=4$

28. (c) $n=\left(\frac{360}{\theta}-1\right)\Rightarrow 3=\left(\frac{360}{\theta}-1\right)\Rightarrow \theta=90°$

29. (c)

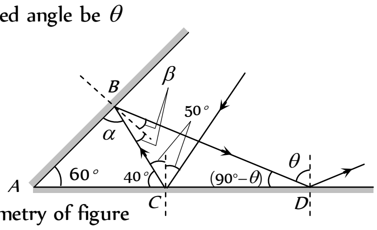
30. (c) $n=\frac{360}{45}-1=7$

31. (b) Diminished, erect image is formed by convex mirror.

32. (a) When a mirror is rotated by an angle θ, the reflected ray deviate from its original path by angle 2θ.

33. (b) $f = \frac{R}{2}$, and $R = \infty$ for plane mirror.

34. (c) Let required angle be θ



From geometry of figure

In Δ ABC; $\alpha = 180° - (60° + 40°) = 80°$

$\Rightarrow \beta = 90° - 80° = 10°$

In Δ ABD; $\angle A = 60°$, $\angle B = (\alpha + 2\beta)$

$= (80 + 2 \times 10) = 100°$ and $\angle D = (90° - \theta)$

$\because \angle A + \angle B + \angle D = 180° \Rightarrow 60° + 100° + (90° - \theta) = 180° \Rightarrow \theta = 70°$

Spherical Mirror

1. (a) $m = +\frac{1}{n} = -\frac{v}{u} \Rightarrow v = -\frac{u}{n}$

By using mirror formula $\frac{1}{f} = \frac{1}{-\frac{u}{n}} + \frac{1}{u} \Rightarrow u = -(n-1)f$

2. (c)

3. (d)

4. (c) $\frac{I}{O} = \frac{f}{(f-u)} \Rightarrow \frac{I}{+5} = \frac{-10}{-10-(-100)} \Rightarrow I = 0.55\ cm$

5. (a) For real image $m = -2$, so by using $m = \frac{f}{f-u}$

$\Rightarrow -2 = \frac{-50}{-50-u} \Rightarrow u = -75\ cm$

6. (b) By using $\frac{I}{O} = \frac{f}{f-u}$

$\Rightarrow \frac{I}{+(7.5)} = \frac{(25/2)}{\left(\frac{25}{2}\right)-(-40)} \Rightarrow I = 1.78\ cm$

7. (c)

8. (b) $\frac{I}{O} = \frac{f}{f-u}$; where $u = f + x$ $\therefore \frac{I}{O} = -\frac{f}{x}$

9. (a) Image formed by convex mirror is virtual for real object placed anywhere.

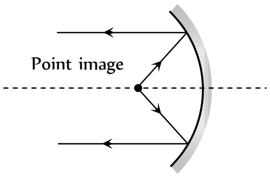
10. (b) Given $u = (f + x_1)$ and $v = (f + x_2)$

The focal length $f = \frac{uv}{u+v} = \frac{(f+x_1)(f+x_2)}{(f+x_1)+(f+x_2)}$

On solving, we get $f^2 = x_1 x_2$ or $f = \sqrt{x_1 x_2}$

11. (d) The image formed by a convex mirror is always virtual.

12. (b) Object should be placed on focus of concave mirror.



13. (b) $m = \frac{f}{(f-u)} \Rightarrow \left(+\frac{1}{4}\right) = \frac{(+30)}{(+30)-u} \Rightarrow u = -90\ cm$

14. (b) Size is $\frac{1}{5}$. It can't be plane and concave mirror, because both conditions are not satisfied in plane or concave mirror. Convex mirror can meet all the requirements.

15. (c) Plane mirror and convex mirror always forms erect images. Image formed by concave mirror may be erect or inverted depending on position of object.

16. (d) Virtual image is seen on the photograph.

17. (b) $\because m = -\frac{v}{u}$ also $\frac{1}{f} = \frac{1}{v} + \frac{1}{u} \Rightarrow \frac{u}{f} = \frac{u}{v} + 1$

$\Rightarrow -\frac{u}{v} = 1 - \frac{u}{f} \Rightarrow \frac{-v}{u} = \frac{f}{f-u}$ so $m = \frac{f}{f-u}$.

18. (b) To make the light diverging as much as possible.

19. (a) Let distance $= u$. Now $\frac{v}{u} = 16$ and $v = u + 120$

$\therefore \frac{120+u}{u} = 16 \Rightarrow 15u = 120 \Rightarrow u = 8\ cm$.

20. (a) Virtual image formed is larger in size in case of concave mirror.

21. (a) Real, inverted and same in size because object is at the centre of curvature of the mirror.

22. (b) Image is virtual so $m = +3$. and $f = \frac{R}{2} = 18\ cm$

So from $m = \frac{f}{f-u} \Rightarrow 3 = \frac{(-18)}{(-18)-u} \Rightarrow u = -12\ cm$.

23. (d) $f = \frac{R}{2} = 20\,cm$, $m = 2$ For real image; $m = -2$,

By using $m = \frac{f}{f-u}$, $-2 = \frac{-20}{-20-u} \Rightarrow u = -30\,cm$

For virtual image; $m = +2$

So, $+2 = \frac{-20}{-20-u} \Rightarrow u = -10\,cm$

24. (d) Convex mirror always forms, virtual, erect and smaller image.

25. (b) When object is placed. Between focus and pole, image formed is erect, virtual and enlarged.

26. (b, c) Convex mirror and concave lens form virtual image for all positions of object.

27. (c) Here focal length $= f$ and $u = -f$

On putting these values in $\frac{1}{f} = \frac{1}{u} + \frac{1}{v}$

$\Rightarrow \frac{1}{f} = -\frac{1}{f} + \frac{1}{v} \Rightarrow v = \frac{f}{2}$

28. (b) Erect and enlarged image can produced by concave mirror.

$\frac{I}{O} = \frac{f}{f-u} \Rightarrow \frac{+3}{+1} = \frac{f}{f-(-4)} \Rightarrow f = -6\,cm$

$\Rightarrow R = 2f = -12\,cm$

29. (a)

30. (b) $m = \frac{f}{f-u} \Rightarrow -3 = \frac{f}{f-(-20)} \Rightarrow f = -15\,cm$

31. (d) When object is kept at centre of curvature. It's real image is also formed at centre of curvature.

32. (c) $u = -20\,cm$, $f = +10\,cm$ also $\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$

$\Rightarrow \frac{1}{+10} = \frac{1}{v} + \frac{1}{(-20)} \Rightarrow v = \frac{20}{3}\ cm$; virtual image.

33. (a) Mirror formula
$\frac{1}{f}=\frac{1}{v}+\frac{1}{u}\Rightarrow\frac{1}{f}=\frac{1}{-20}+\frac{1}{(-10)}\Rightarrow f=\frac{20}{3}\,cm$. If object moves towards the mirror by $0.1\,cm$ then.

$u=(10-0.1)=9.9\,cm$. Hence again from mirror formula

$\frac{1}{-20/3}=\frac{1}{v'}+\frac{1}{-9.9}\Rightarrow v'=20.4\,cm$ i.e. image shifts away from the mirror by $0.4\,cm$.

34. (d) Image formed by convex mirror is always. Erect diminished and virtual.

35. (d) $f=\frac{R}{2}\Rightarrow R=40\,cm$

36. (b) $f=-15\,cm,\ m=+2$ (Positive because image is virtual)

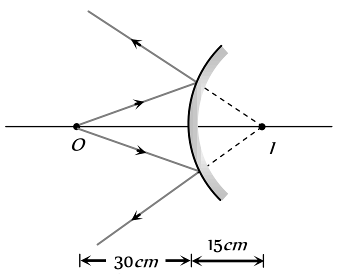
$\because m=-\frac{v}{u}\Rightarrow v=-2u$. By using mirror formula

$\frac{1}{-15}=\frac{1}{(-2u)}+\frac{1}{u}\Rightarrow u=-7.5\,cm$

37. (d) $u=-30\,cm,\ f=+30\,cm$, by using mirror formula

$\frac{1}{f}=\frac{1}{v}+\frac{1}{u}\Rightarrow\frac{1}{+30}=\frac{1}{v}+\frac{1}{(-30)}$

$v=15\,cm$, behind the mirror



38. (d) $R=-30\,cm\Rightarrow f=-15\,cm$

$O=+2.5\,cm,\ u=-10\,cm$

By mirror formula $\frac{1}{-15}=\frac{1}{v}+\frac{1}{(-10)}\Rightarrow v=30\,cm$.

Also $\frac{I}{O}=-\frac{v}{u}\Rightarrow\frac{I}{(+2.5)}=-\frac{30}{(-10)}\Rightarrow I=+7.5\,cm$.

39. (d)

40. (a) $\frac{I}{O}=\frac{f}{f-u}\Rightarrow\frac{I}{+6}=\frac{-f}{-f-(-4f)}\Rightarrow I=-2\,cm$.

41. (d) Convergence (or power) is independent of medium for mirror.

42. (d) $\frac{I}{O}=\frac{f}{f-u}\Rightarrow\frac{I}{2}=\frac{20}{20+20}=\frac{1}{2}\Rightarrow I=1\,mm$

43. (a) $m=\pm 3$ and $f=-6\,cm$

Now $m=\frac{f}{f-u}\Rightarrow\pm 3=\frac{-6}{-6-u}$

For real image $-3=\frac{-6}{-6-u}\Rightarrow u=-8\,cm$

For virtual image $3=\frac{-6}{-6-u}\Rightarrow u=-4\,cm$

44. (a) Focal length of the mirror remains unchanged.

Refraction of Light at Plane Surfaces

1. (d)

2. (a) $\mu_{blue}>\mu_{red}$

3. (b) $\mu\propto\frac{1}{\lambda},\lambda_r>\lambda_v$

4. (a) $\lambda_{medium}=\frac{\lambda_{air}}{\mu}=\frac{6000}{1.5}=4000\,Å$

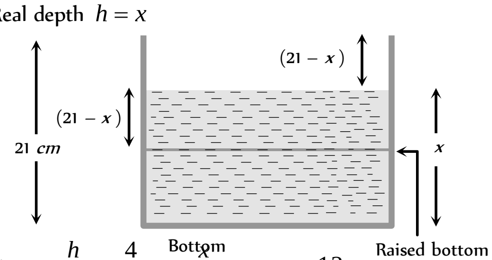
5. (d) Velocity and wavelength change but frequency remains same.

6. (a) $\mu=\frac{c}{v}=\frac{c}{v\lambda}=\frac{3\times10^8}{4\times10^{14}\times5\times10^{-7}}=1.5$

7. (c) To see the container half-filled from top, water should be filled up to height x so that bottom of the container should appear to be raised upto height $(21-x)$.

As shown in figure apparent depth $h'=(21-x)$

Real depth $h=x$



$\therefore\ \mu=\frac{h}{h'}\Rightarrow\frac{4}{3}=\frac{x}{21-x}\Rightarrow x=12\,cm$

8. (d) In vacuum, the speed of light is independent of wave length. Thus vacuum (or air) is a non dispersive medium in which all colours travel with the same speed.

9. (c) $\lambda\propto\frac{1}{\mu}\Rightarrow\frac{\lambda_1}{\lambda_2}=\frac{\mu_2}{\mu_1}=\frac{\mu}{1}$

10. (a) $v\propto\frac{1}{\mu},\mu_{\text{rarer}}<\mu_{\text{denser}}$

11. (b) $\mu\propto\frac{1}{\lambda}$

12. (d) $v=\frac{c}{\mu}=\frac{3\times10^8}{2}=1.5\times10^8\,m/s=1.5\times10^{10}\,cm/s$

13. (b) $\because\ \angle i>\angle r$, it means light ray is going from rarer medium (A) to denser medium.

So $v(A)>v(B)$ and $n(A)<n(B)$

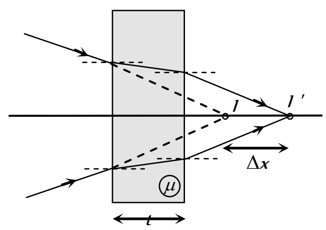
14. (a) $\mu=\frac{h}{h'}\Rightarrow h'=\frac{8}{4/3}=6\,m$

15. (b) $h'=\frac{d_1}{\mu_1}+\frac{d_2}{\mu_2}=d\left(\frac{1}{\mu_1}+\frac{1}{\mu_2}\right)$

16. (a) Normal

shift $\Delta x=\left(1-\frac{1}{\mu}\right)t$

and shift takes place in direction of ray.



17. (c)

$\text{time}=\frac{\text{distance}}{\text{speed}}=\frac{t}{c/x}=\frac{nt}{c}$

18. (c) Let ν' and λ' represents frequency and wavelength of light in medium respectively.

so $\nu' = \frac{v}{\lambda'} = \frac{c/\mu}{\lambda/\mu} = \frac{c}{\lambda} = \nu$

19. (d) $\mu = \frac{c_a}{c_w} = \frac{t_w}{t_a} \Rightarrow t_w = \frac{25}{3} \times \frac{4}{9} = 11\frac{1}{9} = 11\ min\ 6\ sec$

20. (a) Optical path = μt

In medium (1), optical path = $\mu_1 d_1$

In medium (2), optical path = $\mu_2 d_2$

$\therefore$ Total path = $\mu_1 d_1 + \mu_2 d_2$

21. (b) Refractive index of liquid C is same as that of glass piece. So it will not be visible in liquid C.

22. (b) ${}_a\mu_g = \frac{3}{2}$, ${}_a\mu_w = \frac{4}{3}$

$\therefore {}_w\mu_g = \frac{{}_a\mu_g}{{}_a\mu_w} = \frac{3/2}{4/3} = \frac{9}{8}$

23. (c) ${}_2\mu_1 \times {}_3\mu_2 \times {}_4\mu_3 = \frac{\mu_1}{\mu_2} \times \frac{\mu_2}{\mu_3} \times \frac{\mu_3}{\mu_4} = \frac{\mu_1}{\mu_4} = {}_4\mu_1 = \frac{1}{{}_1\mu_4}$

24. (a) Colour of light is determined by its frequency and as frequency does not change, colour will also not change and will remains green.

25. (c) Ray optics fails if the size of the object is of the order of the wavelength.

26. (a) ${}_a n_w \times {}_w n_{gl} \times {}_{gl} n_{gas} \times {}_{gas} n_a = \frac{n_w}{n_a} \times \frac{n_{gl}}{n_w} \times \frac{n_{gas}}{n_{gl}} \times \frac{n_a}{n_{gas}} = 1$

27. (b) $v \propto \lambda \Rightarrow \frac{v_1}{v_2} = \frac{\lambda_1}{\lambda_2}$

$\therefore v_2 = \frac{v_1}{\lambda_1} \times \lambda_2 = 3 \times 10^8 \times \frac{4500}{6000} = 2.25 \times 10^8\ m/s$

28. (d) Since ${}_a\mu_g = \sqrt{2}$, so ${}_g\mu_a = \frac{\sin i}{\sin r} = \frac{1}{\sqrt{2}}$

$\therefore \sin r = 1 \Rightarrow r = 90^o$

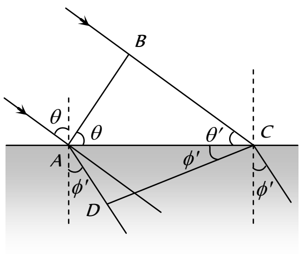
29. (a) $\mu = \frac{c}{v} = \frac{1/\sqrt{\mu_o \varepsilon_o}}{1/\sqrt{\mu\varepsilon}} = \sqrt{\frac{\mu\varepsilon}{\mu_o \varepsilon_o}}$

30. (c) $\mu \propto \frac{1}{\lambda} \Rightarrow \frac{1}{4/3} = \frac{x}{4200} \Rightarrow x = 3150\ Å$

31. (c) $\mu = \sqrt{\frac{\mu\,\varepsilon}{\mu_0 \varepsilon_0}} = \sqrt{\mu_r K}$

32. (c) $\mu = \frac{C}{C_m} \Rightarrow C_m = \frac{C}{1.5}$

33. (b) In the case of refraction if CD is the refracted wave front and v and v are the speed of light in the two media, then in the time the wavelets from B reaches C, the wavelet from A will reach D, such that



$t = \frac{BC}{v_a} = \frac{AD}{v_g} \Rightarrow \frac{BC}{AD} = \frac{v_a}{v_g}$

But in ΔACB, $BC = AC\sin\theta$ .....(ii)

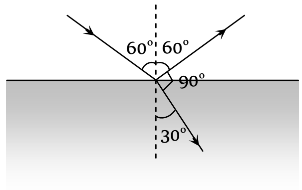
while in ΔACD, $AD = AC\sin\phi'$ .....(iii)

From equations (i), (ii) and (iii) $\frac{v_a}{v_g} = \frac{\sin\theta}{\sin\phi'}$

Also $\mu \propto \frac{1}{v} \Rightarrow \frac{v_a}{v_g} = \frac{\mu_g}{\mu_a} = \frac{\sin\theta}{\sin\phi'} \Rightarrow \mu_g = \frac{\sin\theta}{\sin\phi'}$

34. (b)

35. (b) From figure



$< i = 60^o$, $< r = 30^o$

so $\mu = \frac{\sin 60}{\sin 30} = \sqrt{3}$

36. (b) $\mu \propto \frac{1}{v} \Rightarrow \frac{\mu_g}{\mu_w} = \frac{v_w}{v_g} \Rightarrow \frac{3/2}{4/3} = \frac{v_w}{2 \times 10^8}$

$\Rightarrow v_w = 2.25 \times 10^8\ m/s$

37. (a) $\lambda_m = \frac{\lambda_a}{\mu} = \frac{c}{\nu\mu} = \frac{3 \times 10^8}{5 \times 10^{14} \times 1.5} = 4000\ Å$

38. (b) $\lambda_{glass} = \frac{\lambda_{air}}{\mu} = \frac{7200}{1.5} = 4800\ Å$

39. (c)

40. (d) $\frac{{}_a\mu_r}{{}_w\mu_r} = \frac{\mu_r/\mu_a}{\mu_r/\mu_w} = \frac{\mu_w}{\mu_a} = {}_a\mu_w$

41. (a) $t = \frac{\mu x}{c} = \frac{\frac{3}{2} \times 5 \times 10^{-3}}{3 \times 10^8} = 0.25 \times 10^{-10}\ s$

42. (d) Distance $= v \times t = \frac{c}{\mu} \times t = \frac{3 \times 10^8}{1.5} \times 10^{-9}$

$= 0.2\ m = 20\ cm.$

43. (c) $f \propto \frac{1}{\lambda}$. As $\lambda_b < \lambda_g \Rightarrow f_b > f_g$

44. (c) Real depth = $1\ m$

Apparent depth = $1 - 0.1 = 0.9\ m$

Refractive index $\mu = \frac{\text{Real depth}}{\text{Apparent depth}} = \frac{1}{0.9} = \frac{10}{9}$

45. (a) $\mu = \frac{h}{h'} \Rightarrow h' = \frac{h}{n}$

46. (a) Refractive index $\propto \frac{1}{(\text{Temperatu re})}$

47. (c) Snell's law in vector form is $\hat{i} \times \hat{n} = \mu(\hat{r} \times \hat{n})$

48. (a)

49. (c) $v = \frac{c}{\mu} = \frac{3 \times 10^8}{2.4} = 1.25 \times 10^8\ m/s$

50. (c) Velocity of light in the window

$= \frac{3 \times 10^8}{1.5} ms^{-1} = 2 \times 10^8\ ms^{-1}$

Hence $t = \frac{4\times10^{-3}}{2\times10^{8}} s = 2\times10^{-11} s$

51. (d) Ray optics is valid when size of the objects is much larger than the order of wavelength of light.

52. (b) $v = \frac{c}{\mu} = \frac{3\times10^8}{1.33} = 2.25\times10^8$ *m/s*

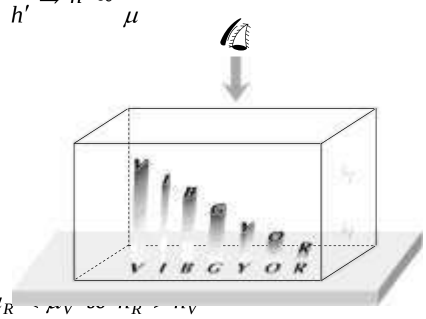
53. (b) $t = \frac{\mu x}{c} = \frac{1.5\times2\times10^{-3}}{3\times10^8} = 10^{-11}$ *sec*

54. (b) ${}_g\mu_w = \frac{\mu_w}{\mu_g} = \frac{4/3}{3/2} = \frac{8}{9}$

55. (b) Frequency does not change with medium but wavelength and velocity decrease with the increase in refractive index.

56. (a) $t = \frac{\mu x}{c} = \frac{3\times4\times10^{-3}}{3\times10^8} = 4\times10^{-11}$ *sec*

57. (d) $\mu = \frac{h}{h'} \Rightarrow h' \propto \frac{1}{\mu}$



$\because \mu_R < \mu_V$ so $h_R > h_V$

i.e. Red colour letter appears least raised.

58. (b) $\mu = \frac{c}{v} = \frac{\sin i}{\sin r} = \frac{\sin 45^o}{\sin 30^o}$

$\Rightarrow v = \frac{3\times10^8}{\sqrt{2}} = 2.12\times10^8\ m/s$

59. (c) $v \propto \frac{1}{\mu} \Rightarrow \frac{v_1}{v_2} = \frac{\mu_2}{\mu_1} \Rightarrow \frac{v_g}{v_w} = \frac{\mu_w}{\mu_g} = \frac{4/3}{3/2} = \frac{8}{9}$

60. (b) Time taken by light to travel distance x through a medium of refractive index μ is

$t = \frac{\mu x}{c} \Rightarrow \frac{\mu_B}{\mu_A} = \frac{x_A}{x_B} = \frac{6}{4} \Rightarrow {}_A\mu_B = \frac{3}{2} = 1.5$

61. (d) ${}_w\mu_g = \frac{{}_a\mu_g}{{}_a\mu_w} = \frac{1.5}{1.3}$

62. (a) $\mu = \frac{\text{Real depth}}{\text{apparent depth}} = \frac{120}{80} = 1.5$

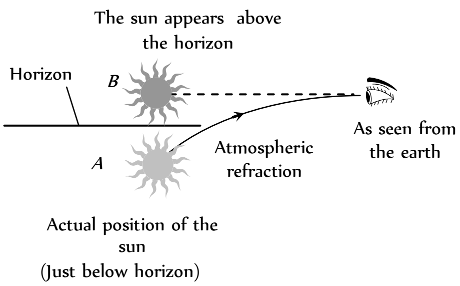
63. (b) Apparent depth of bottom

$= \frac{H/4}{\mu_1} + \frac{H/4}{\mu_2} + \frac{H/4}{\mu_3} + \frac{H/4}{\mu_4}$

$= \frac{H}{4}\left(\frac{1}{\mu_1} + \frac{1}{\mu_2} + \frac{1}{\mu_3} + \frac{1}{\mu_4}\right)$

64. (d) For successive refraction through different media $\mu\sin\theta =$ constant. Here as θ is same in the two extreme media, $\mu_1 = \mu_4$.

65. (b)



66. (a) $\mu = \frac{h'}{h} \Rightarrow h' = \mu h = \frac{4}{3}\times18 = 24\ cm$

67. (b) Optical path $\mu x =$ constant *i.e.* $\mu_1 x_1 = \mu_2 x_2$

$\Rightarrow 1.53\times4 = \mu_2\times4.5 \Rightarrow \mu_2 = 1.36$

68. (b) Velocity of light is maximum in vacuum.

69. (a) $\mu = \tan i \Rightarrow i = \tan^{-1}\mu = \tan^{-1}1.62 = 58.3°$

70. (d) Suppose water is poured up to the height *h*,

So $h\left(1 - \frac{1}{\mu}\right) = 1 \Rightarrow h = 4\ cm$

71. (c) $\mu \propto \frac{1}{v} \Rightarrow \frac{\mu_l}{\mu_g} = \frac{v_g}{v_l} \Rightarrow \frac{\mu_l}{1.5} = \frac{2\times10^8}{2.5\times10^8} \Rightarrow \mu_l = 1.2$

72. (c) Stars twinkle due to variation in *R.I.* of atmosphere.

73. (d) Refraction at air-oil point $\mu_{oil} = \frac{\sin i}{\sin r_1}$

$\therefore \sin r_1 = \frac{\sin 40}{1.45} = 0.443$

Refraction at oil-water point ${}_{oil}\mu_{water} = \frac{\sin r_1}{\sin r}$

$\therefore \frac{1.33}{1.45} = \frac{0.443}{\sin r}$ or $\sin r = \frac{0.443\times1.45}{1.33} \Rightarrow r = 28.9^o$

74. (d) Objects are invisible in liquid of R.I. equal to that of object.

75. (b) When light ray travels from denser to rarer, it deviates away from the normal.

76. (d) $\mu = \frac{c}{v} = \frac{3\times10^8}{1.5\times10^8} = 2.$

77. (c) Frequency remain unchanged.

78. (c) ${}_w\mu_g = \frac{{}_a\mu_g}{{}_a\mu_w} = \frac{1.5}{1.2} = \frac{5}{4} = 1.25$.

79. (b) $\lambda_g = \frac{\lambda_a}{\mu_g} = \frac{5890}{1.6} = 3681\,Å$.

80. (b) $t = \frac{s}{v} = \frac{1.5\times10^8\times10^3}{3\times10^8} = 500\sec = 8.33$ *min.*

81. (a) For vacuum $t = n\lambda_o$ .....(i)

For air $t = (n+1)\lambda_a$ .....(ii)

From equation (i) and (ii)

$t = \frac{\lambda}{\mu - 1} = \frac{6\times10^{-7}}{1.0003 - 1}$ $\left(\mu = \frac{\lambda_o}{\lambda_a}\right)$

$= 2\times10^{-3} m = 2 mm.$

82. (a) $\mu_m = \frac{c}{v} = \frac{n\lambda_a}{n\lambda_m} = \frac{\lambda_a}{\lambda_m}$

83. (b) As no scattering of light occurs. Space appears black.

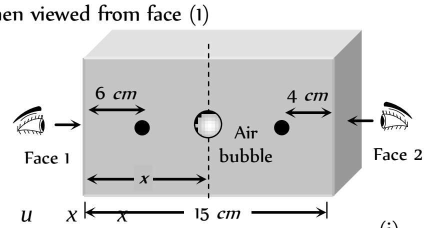
84. (b) $v \propto \frac{1}{\mu}$, μ is smaller for air than water, glass and diamond.

85. (c) In vacuum speed of light is constant and it is equal to 3 × 10[8] *m/sec*

86. (b) $\lambda_{medium} = \frac{\lambda_{vacuum}}{\mu}$

87. (d) In vacuum speed of light is constant and is equal to $3\times10^8 m/s$.

88. (d) When viewed from face (1)



$\mu = \frac{u}{v} = \frac{x}{v} = \frac{x}{6}$ .....(i)

Now when viewed from face (2)

$\mu = \frac{15-x}{v} = \frac{15-x}{4}$ .....(ii)

From equation (i) and (ii) $\mu = \frac{15-6\mu}{4} \Rightarrow \mu = 1.5$.

89. (b) The apparent depth of ink mark

$= \frac{\text{real depth}}{\mu} = \frac{3}{3/2} = 2\,cm$

Thus person views mark at a distance $= 2+2 = 4\,cm$.

90. (d) Apparent rise $= d\left(1 - \frac{1}{{}_a\mu_w}\right) = 12\times\left(1-\frac{3}{4}\right) = 3$ *cm.*

Total Internal Reflection

1. (b) Due to high refractive index its critical angle is very small so that most of the light incident on the diamond is total internally reflected repeatedly and diamond sparkles.

2. (c) When incident angle is greater than critical angle, then total internal reflection takes place and will come back in same medium.

3. (d)

4. (d) ${}_a\mu_g = \frac{1}{\sin C} \Rightarrow \sin C = \frac{1}{{}_a\mu_g}$

As μ for violet colour is maximum, so sin C is minimum and hence critical angle C is minimum for voilet colour.

5. (c) The critical angle C is given by

$\sin C = \frac{n_2}{n_1} = \frac{\lambda_1}{\lambda_2} = \frac{3500}{7000} = \frac{1}{2} \Rightarrow C = 30^o$

6. (c) From figure given in question $\theta = 2c = 98°$.

7. (b) $\mu = \frac{1}{\sin C} = \frac{1}{\sin 30} = 2$

$\therefore v = \frac{3\times10^8}{2} = 1.5\times10^8 m/s$

8. (c) ${}_D\mu_R = \frac{\sin i}{\sin r'} \Rightarrow {}_R\mu_D = \frac{\sin r'}{\sin i} = \frac{1}{\sin C}$

$\Rightarrow \sin C = \frac{\sin i}{\sin(90-r)} = \frac{\sin i}{\cos r} = \frac{\sin i}{\cos i}$ (as $\angle i = \angle r$)

$\Rightarrow \sin C = \tan i \Rightarrow C = \sin^{-1}(\tan i)$

9. (a) For total internal reflection $i > C$

$\Rightarrow \sin i > \sin C \Rightarrow \sin i > \frac{1}{\mu} \Rightarrow \frac{1}{\sin i} < \mu$.

10. (d) For total internal reflection light must travel from denser medium to rarer medium.

11. (b)

12. (c) Semi vertical angle $= C = \sin^{-1}\left(\frac{1}{\mu}\right) = \sin^{-1}\left(\frac{3}{4}\right)$

13. (c)

14. (d) $\mu = \frac{1}{\sin C} \Rightarrow C = \sin^{-1}\left(\frac{1}{2}\right) = 30^o$

15. (d)

16. (c) Critical angle = $\sin^{-1}\left(\frac{1}{\mu}\right)$

$\therefore \theta = \sin^{-1}\left(\frac{1}{\mu_{\lambda_1}}\right)$ and $\theta' = \sin^{-1}\left(\frac{1}{\mu_{\lambda_2}}\right)$

Since $\mu_{\lambda_2} > \mu_{\lambda_1}$, hence $\theta' < \theta$

17. (c)

18. (c, d) For TIR $i > C$

$\Rightarrow$ sin $i >$ sin $C \Rightarrow \sin 45° > \frac{1}{n} \Rightarrow n > \sqrt{2} \Rightarrow n > 1.4$

19. (c)

20. (d)

21. (a) ${}_w\mu_g = \frac{1}{\sin C} \Rightarrow \frac{\mu_g}{\mu_w} = \frac{5/3}{4/3} = \frac{1}{\sin C}$

$\Rightarrow \sin C = \frac{4}{5} \Rightarrow C = \sin^{-1}\left(\frac{4}{5}\right)$

22. (c) Total internal reflection occurs when light ray travels from denser medium to rarer medium.

23. (b) $\mu = \frac{c}{v} \Rightarrow \mu = \frac{c}{c/2} = 2$ also for total internal reflection

$i > c \Rightarrow \sin i \ge \sin c \Rightarrow \sin i \ge \frac{1}{\mu}$

Hence $i \ge \sin^{-1}\left(\frac{1}{\mu}\right)$ or $i \ge 30^o$

24. (c) $C = \sin^{-1}\left(\frac{1}{{}_w\mu_g}\right) = \sin^{-1}\left(\frac{\mu_w}{\mu_g}\right) = \sin^{-1}\left(\frac{8}{9}\right)$

25. (a) $\mu_w < \mu_g \Rightarrow c_w > c_g$.

26. (c) $\mu = \frac{1}{\sin C} = \frac{1}{\sin 30} = 2$

27. (c) Ray from setting sum will be refracted at angle equal to critical angle.

28. (a) Optical fibres are used to send signals from one place to another.

29. (d)

30. (d) When total internal reflection just takes place from lateral surface $i = C$ i.e. $60^o = C$

$\Rightarrow \sin 60^o = \sin C = \frac{1}{\mu} \Rightarrow \mu = \frac{2}{\sqrt{3}}$

Time taken by light to traverse some distance in a medium

$t = \frac{\mu x}{c} = \frac{\frac{2}{\sqrt{3}}\times10^3}{3\times10^8} = 3.85\,\mu$ *sec.*

31. (a) $\frac{\mu_2}{\mu_1} = \frac{v_1}{v_2} = \frac{1}{2} \Rightarrow \frac{\mu_1}{\mu_2} = 2(\mu_1 > \mu_2)$

For total internal reflection ${}_2\mu_1 = \frac{1}{\sin C} \Rightarrow \frac{\mu_1}{\mu_2}$

$= \frac{1}{\sin C} \Rightarrow 2 = \frac{1}{\sin C} \Rightarrow C = 30^o$

So, for total (Internal reflection angle of incidence must be greater than 30°.

32. (c)

33. (a) $\mu = \frac{1}{\sin C} = \frac{1}{\sin 60^o} = \frac{2}{\sqrt{3}}$

34. (c) ${}_a\mu_g = \frac{1}{\sin\theta} \Rightarrow \mu = \frac{1}{\sin\theta}$ .....(i)

Now from Snell's law $\mu = \frac{\sin i}{\sin r} = \frac{\sin\theta}{\sin r}$

$\Rightarrow \sin r = \frac{\sin\theta}{\mu}$ .....(ii)

From equation (i) and (ii)

$\sin r = \frac{1}{\mu^2} \Rightarrow r = \sin^{-1}\left(\frac{1}{\mu^2}\right)$

35. (a) $C = \sin^{-1}\left(\frac{1}{\mu}\right)$ and $\mu \propto \frac{1}{\lambda}$

Yellow, orange and red have higher wavelength than green, so μ will be less for these rays, consequently critical angle for these rays will be high, hence if green is just totally internally reflected then yellow, orange and red rays will emerge out.

36. (d) We know $C = \sin^{-1}\left(\frac{1}{\mu}\right)$

Given critical angle $i_B > i_A$

So $\mu_B < \mu_A$ *i.e.* B is rarer and A is denser.

Hence light can be totally internally reflected when it passes from A to B

Now critical angle for A to B

$C_{AB} = \sin^{-1}\left(\frac{1}{{}_B\mu_A}\right) = \sin^{-1}\left[{}_A\mu_B\right]$

$= \sin^{-1}\left[\frac{\mu_B}{\mu_A}\right] = \sin^{-1}\left[\frac{\sin i_A}{\sin i_B}\right]$

37. (b) At point A, by Snell's law

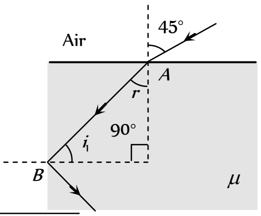
$\mu = \frac{\sin 45}{\sin r} \Rightarrow \sin r = \frac{1}{\mu\sqrt{2}}$ .....(i)

At point B, for total internal reflection $\sin i_1 = \frac{1}{\mu}$

From figure, $i_1 = 90 - r$

$\therefore \sin(90° - r) = \frac{1}{\mu}$

$\Rightarrow \cos r = \frac{1}{\mu}$ .....(ii)



Now $\cos r = \sqrt{1 - \sin^2 r} = \sqrt{1 - \frac{1}{2\mu^2}}$

$= \sqrt{\frac{2\mu^2 - 1}{2\mu^2}}$ .....(iii)

From equation (ii) and (iii) $\frac{1}{\mu} = \sqrt{\frac{2\mu^2 - 1}{2\mu^2}}$

Squaring both side and then solving we get $\mu = \sqrt{\frac{3}{2}}$

38. (b) ${}_2\mu_1 = \frac{1}{\sin\theta} \Rightarrow \frac{\mu_1}{\mu_2} = \frac{1}{\sin\theta} \Rightarrow \frac{v_2}{v_1} = \frac{1}{\sin\theta} \Rightarrow \frac{v_2}{v} = \frac{1}{\sin\theta}$

$\Rightarrow v_2 = \frac{v}{\sin\theta}$

39. (c) From the formula $\sin C = \frac{1}{{}_1\mu_2} \Rightarrow \sin C = {}_2\mu_1$

$= \frac{u_1}{u_2} = \frac{v_2}{v_1} \Rightarrow \sin C = \frac{10x/t_2}{x/t_1}$

$\Rightarrow \sin C = \frac{10\,t_1}{t_2} \Rightarrow C = \sin^{-1}\left(\frac{10\,t_1}{t_2}\right)$

40. (a) $\sin 45^o = \frac{1}{\mu} \Rightarrow \mu = \sqrt{2} = 1.41$

41. (c)

42. (b) Critical angle C is equal to incident angle if ray reflected normally $\therefore C = 90^o$

43. (b)

44. (d) $r = \frac{3h}{\sqrt{7}} = \frac{3 \times 12}{\sqrt{7}} = \frac{36}{\sqrt{7}}$.

45. (b) Here $\sin i = \frac{1}{\mu} = \frac{3}{5}$ and hence $\tan i = \frac{3}{4} = \frac{r}{4}$

This gives $r = 3\,m$, hence diameter = $6m$

46. (a) Radius of horizon circle $= \frac{3h}{\sqrt{7}} = \frac{3\sqrt{7}}{\sqrt{7}} = 3\,cm$.

Refraction at Curved Surface

1. (a) By formula $\frac{1}{f} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$

$= (1.5 - 1)\left(\frac{1}{40} + \frac{1}{40}\right) = 0.5 \times \frac{1}{20} = \frac{1}{40}$

$\therefore f = 40\ cm$

2. (a) $\frac{v}{-u} = -m$ and $v + u = x \Rightarrow u = \frac{x}{1+m}$

$\frac{1}{f} = \frac{1}{v} - \frac{1}{u} \Rightarrow f = \frac{mx}{(m+1)^2}$.

3. (d) $I \propto A^2 \Rightarrow \frac{I_2}{I_1} = \left(\frac{A_2}{A_1}\right)^2 = \frac{\pi r^2 - \frac{\pi r^2}{4}}{\pi r^2} = \frac{3}{4}$

$\Rightarrow I_2 = \frac{3}{4} I_1$ and focal length remains unchanged.

4. (c) $\frac{1}{f}=\frac{1}{f_1}+\frac{1}{f_2}=\frac{P_1}{100}+\frac{P_2}{100}=\frac{1}{100}\Rightarrow f=100\ cm$

$\therefore$ A convergent lens of focal length 100 *cm*.

5. (a) Focal length of the combination can be calculated as

$\frac{1}{F}=\frac{1}{f_1}+\frac{1}{f_2}\Rightarrow\frac{1}{F}=\frac{1}{(+40)}+\frac{1}{(-25)}\quad\Rightarrow F=-\frac{200}{3}cm$

$\therefore P=\frac{100}{F}=\frac{100}{-200/3}=-1.5\ D$

6. (d) $\frac{1}{F}=\frac{1}{f_1}+\frac{1}{f_2}\Rightarrow\frac{1}{80}=\frac{1}{20}+\frac{1}{f_2}\quad\Rightarrow f_2=-\frac{80}{3}cm$

$\therefore$ Power of second lens

$P_2=\frac{100}{f_2}=\frac{100}{-80/3}=-3.75\ D$

7. (b) In each case two plane-convex lens are placed close to each other, and $\frac{1}{F}=\frac{1}{f_1}+\frac{1}{f_2}$.

8. (a) Power of the combination $P=P_1+P_2\quad=12-2=10\,D$

$\therefore$ Focal length of the combination

$F=\frac{100}{P}=\frac{100}{10}=10\,cm$

9. (c) Resultant focal length $=\infty$

$\therefore$ It behaves as a plane slab of glass.

10. (c) $f=\frac{R}{(\mu-1)}\Rightarrow 30=\frac{10}{(\mu-1)}\Rightarrow\mu=1.33$.

11. (c) In case of convex lens if rays are coming from the focus, then the emergent rays after refraction are parallel to principal axis.

12. (d) Because to form the complete image only two rays are to be passed through the lens and moreover, since the total amount of light released by the object is not passing through the lens, therefore image is faint (intensity is decreased).

13. (b) $f=\frac{f_1 f_2}{f_1+f_2}=\frac{10(-10)}{10+(-10)}=\frac{-100}{10-10}=\infty$

14. (c) Focal length of the combination

$\frac{1}{F}=\frac{1}{f_1}+\frac{1}{f_2}=\frac{1}{(+84)}+\frac{1}{(-12)}\Rightarrow F=-14\ cm$

$\therefore P=\frac{100}{F}=\frac{100}{-14}=-\frac{50}{7}D$

15. (b) $O=\sqrt{I_1I_2}=\sqrt{4\times16}=8\,cm$

16. (d) $\frac{f_l}{f_a}=\frac{({}_a\mu_g-1)}{({}_l\mu_g-1)}\Rightarrow\frac{f_w}{f_a}=\frac{(1.5-1)}{\left(\frac{1.5}{1.33}-1\right)}\Rightarrow f_w=32\,cm$

17. (c) If $n_l>n_g$ then the lens will be in more denser medium. Hence its nature will change and the convex lens will behave like a concave lens.

18. (d) $\frac{f_l}{f_a}=\frac{({}_a\mu_g-1)}{({}_l\mu_g-1)}\Rightarrow\frac{f_l}{15}=\frac{(1.5-1)}{\left(\frac{1.5}{4/3}-1\right)}\Rightarrow f_l=60\,cm$

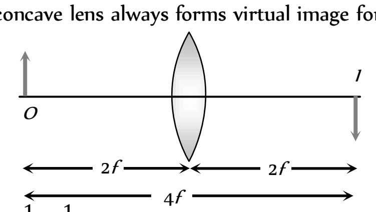
19. (c) $\frac{f_l}{f_a}=\frac{({}_a\mu_g-1)}{({}_l\mu_g-1)}\Rightarrow f_l=\infty$ if ${}_l\mu_g=1\Rightarrow{}_a\mu_l={}_a\mu_g$.

20. (c) $\frac{I_1}{O}=\frac{v}{u}$ and $\frac{I_2}{O}=\frac{u}{v}\Rightarrow O^2=I_1I_2$

21. (c) A lens shows opposite behaviour if $\mu_{\text{medium}}>\mu_{\text{lens}}$

22. (a) A concave lens always forms virtual image for real objects.

23. (d)



24. (a) $\frac{1}{f}=\frac{1}{v}-\frac{1}{u}$ (Given $u=-20\ cm,\ f=10\ cm,\ v=?$)

$\therefore\ \frac{1}{10}=\frac{1}{v}-\frac{1}{(-20)}\Rightarrow v=20\,cm$

25. (d) $\frac{1}{F}=\frac{1}{f_1}+\frac{1}{f_2}=\frac{1}{60}+\frac{1}{(-20)}\Rightarrow F=-30$

26. (a) $f_{\text{water}}=4\times f_{\text{air}}$, air lens is made up of glass.

27. (b) $\frac{1}{F}=\frac{1}{f_1}+\frac{1}{f_2}=\frac{1}{20}+\frac{1}{25}\Rightarrow F=\frac{100}{9}\ cm=\frac{1}{9}\ metre$

$\therefore\ P=\frac{1}{1/9}D=9D$

28. (a) $\frac{1}{f}=\frac{1}{v}-\frac{1}{u}$ (Given $u=\frac{-f}{2}$)

$\Rightarrow\frac{1}{f}=\frac{1}{v}+\left(\frac{1}{f/2}\right)\Rightarrow\frac{1}{v}=\frac{1}{f}-\frac{2}{f}$

$\Rightarrow\frac{1}{v}=\frac{-1}{f}$ and $m=\frac{v}{u}=\frac{f}{f/2}=2$

So virtual at the focus and of double size.

29. (a) $\frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$

Given $R_1=+20cm, R_2=-20\,cm$, $\mu=1.5$

$\Rightarrow f=20\ cm$. Parallel rays converge at focus. So *L=f.*

30. (c) $\mu_{air}<\mu_{lens}<\mu_{water}$ *i.e.,* $1<\mu_{lens}<1.33$

31. (c) $\frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$

For biconvex lens $R_2=-R_1\quad\therefore\ \frac{1}{f}=(\mu-1)\left(\frac{2}{R}\right)$

Given $R=\infty\ \therefore\ f=\infty$, so no focus at real distance.

32. (d) $f=\frac{R}{(\mu-1)}=\frac{15}{(1.6-1)}=25\,cm$

$\therefore P=\frac{100}{f}=\frac{100}{25}=+4\ D$

33. (d) $f\propto\frac{1}{(\mu-1)}$ and $\mu\propto\frac{1}{\lambda}$. Hence $f\propto\lambda$ and $\lambda_r>\lambda_v$

34. (c) $m_1=\frac{A_1}{O}$ and $m_2=\frac{A_2}{O}\quad\Rightarrow m_1m_2=\frac{A_1A_2}{O_2}$

Also it can be proved that $m_1m_2=1$

So $O = \sqrt{A_1 A_2}$

35. (b) Combined power $P = P_1 + P_2 = 6 - 2 = 4D$. So focal length of combination $F = \frac{1}{P} = \frac{1}{4} m$

36. (b) $\frac{1}{60} = \frac{1}{f_1} + \frac{1}{f_2}$ ...(i)

and $\frac{1}{30} = \frac{1}{f_1} + \frac{1}{f_2} - \frac{10}{f_1 f_2}$ ...(ii)

On solving (i) and (ii) $f_1 f_2 = -600$ and $f_1 + f_2 = -10$

Hence $f_1 = 20\ cm$ and $f_2 = -30\ cm$

37. (c) For an achromatic combination $\frac{\omega_1}{f_1} + \frac{\omega_2}{f_2} = 0$

i.e. 1 convex lens and 1 concave lens.

38. (d) $\frac{1}{F} = \frac{2}{f_l} + \frac{1}{f_m} \Rightarrow \frac{1}{F} = \frac{2}{20} + \frac{1}{\infty} \Rightarrow F = 10\ cm$

39. (b) Since aperture of lens reduces so brightness will reduce but their will be no effect on size of image.

40. (d) Convex mirror and concave lens do not form real image. For concave mirror $v > u$, so image will be enlarged, hence only convex lens can be used for the purpose.

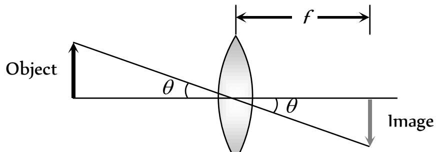
41. (a) $m = \frac{f}{f+u} \Rightarrow -\frac{1}{4} = \frac{30}{30+u} \Rightarrow u = -150\,cm$

42. (c) Covering a portion of lens does not effect position and size of image.

43. (a) $\frac{1}{f} = ({}_g\mu_a - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right) = \left(\frac{2}{3} - 1\right)\left(\frac{2}{10}\right)$

$\Rightarrow f = -15\,cm$, so behaves as concave lens.

44. (c) Size of image = $f\theta = 0.5 \times (1 \times 10^{-3})$ = 0.5 *mm*



45. (d) $\frac{f_l}{f_a} = \frac{({}_a\mu_g - 1)}{({}_l\mu_g - 1)} = \frac{\left(\frac{3}{2} - 1\right)}{\left(\frac{3/2}{5/4} - 1\right)} = \frac{5}{2}$

$\therefore\ f_l = f_a\left(\frac{5}{2}\right) = \frac{12 \times 5}{2} = 30\ cm$

46. (d) $P = \frac{1}{F} = \frac{f_1 + f_2}{f_1 f_2}$

47. (c) $f = \frac{R}{(\mu - 1)} = \frac{R}{(1.5 - 1)} = 2R$

48. (b) For achromatic combination, $\frac{w_1}{f_1} + \frac{w_2}{f_2} = 0$

$\Rightarrow w_1 f_2 + w_2 f_1 = 0$

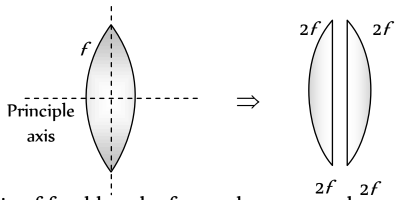
49. (a) $\frac{\omega_1}{\omega_2} = -\frac{f_1}{f_2} \Rightarrow \frac{5}{3} = \frac{-(-15)}{f_2} \Rightarrow f_2 = 9\ cm$

50. (b) $f = \frac{R}{2(\mu - 1)} \Rightarrow f = \frac{40}{2(1.65 - 1)} \approx 31\,cm$

51. (c) Focal length of effective lens

$\frac{1}{F} = \frac{2}{f_l} + \frac{1}{f_m} = \frac{2}{f_l} + \frac{1}{\infty} \Rightarrow F = \frac{f_l}{2}$

52. (a)



Ratio of focal length of new plano convex lenses is 1 : 1

53. (a) $\frac{1}{f} = \left(\frac{n-1}{1}\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$ and $\frac{1}{f'} = \left(\frac{n - n'}{n'}\right)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$

$\therefore\ \frac{f'}{f} = \frac{n-1}{1} \times \frac{n'}{n - n'} \Rightarrow f' = -\frac{fn'(n-1)}{n' - n}$

54. (b) $\frac{I}{O} = \frac{f - v}{f} \Rightarrow \frac{I}{+1.5} = \frac{(25 - 75)}{25} = -2 \Rightarrow I = -3\,cm$

55. (a) $P = P_1 + P_2$, if $P_1 = P_2 = P' \Rightarrow P' = P/2 = 2D.$

56. (b) $f = \frac{R}{(\mu - 1)} = \frac{60}{(1.6 - 1)} = 100\ cm.$

57. (a) $\frac{f_l}{f_a} = \frac{{}_a\mu_g - 1}{{}_l\mu_g - 1} = \frac{1.5 - 1}{\frac{1.5}{1.75} - 1} = -\frac{1.75 \times 0.50}{0.25} = -3.5$

$\therefore f_l = -3.5\ f_a \Rightarrow f_l = +3.5\ R$ $(\because f_a = R)$

Hence on immersing the lens in the liquid, it behaves as a converging lens of focal length 3.5 *R*.

58. (a) $P = P_1 + P_2 = \frac{1}{f_1} + \frac{1}{f_2} = \frac{1}{(0.5)} + \frac{1}{(-1)} = 1\,D$

59. (d) $f = \frac{R}{2(\mu - 1)} \Rightarrow 30 = \frac{R}{2(1.5 - 1)} \Rightarrow R = 30\ cm$

60. (c) Total power $P = P_1 + P_2 = 11 - 6 = 5D$

Also $\frac{f_l}{f_a} = \frac{({}_a\mu_g - 1)}{({}_l\mu_g - 1)} \Rightarrow \frac{P_a}{P_l} = \frac{({}_a\mu_g - 1)}{({}_l\mu_g - 1)}$

$\Rightarrow \frac{5}{P_l} = \frac{(1.5 - 1)}{(1.5/1.6 - 1)} \Rightarrow P_l = -0.625\,D$

61. (b) For first case : $\frac{1}{f} = \frac{1}{v} - \frac{1}{\infty} \Rightarrow f = v$

For second case $\frac{1}{f} = \frac{1}{(f+5)} - \frac{1}{-(f+20)} \Rightarrow f = 10\ cm$

Alternative sol. – $f^2 = x_1 x_2 \Rightarrow f = 10cm.$

62. (b) $f = \frac{D^2 - x^2}{4D}$ (Focal length by displacement method)

$\Rightarrow f = \frac{(100)^2 - (40)^2}{4 \times 40} = 21\ cm$

$\therefore P = \frac{100}{f} = \frac{100}{21} \approx 5\,D$

63. (d) $\frac{1}{f} = \frac{1}{v} - \frac{1}{u} \Rightarrow \frac{1}{+5} = \frac{1}{v} - \frac{1}{(-10)} \Rightarrow v = 10\ cm$

64. (d) $\omega / f = -2\omega / f' \Rightarrow f' = -2f$

65. (d) $f = \frac{R}{2(\mu - 1)} \Rightarrow 10 = \frac{R}{2(1.6 - 1)} \Rightarrow R = 12\ cm$

66. (a)

67. (d) $P = P_1 + P_2 = 2.50 - 3.75 = -1.25D$

So $f = \frac{100}{1.25} = -80\ cm$

68. (c) $\frac{f_l}{f_a} = \frac{{}_a\mu_g - 1}{{}_l\mu_g - 1} \Rightarrow f_l = 4R$

69. (c) $\frac{f_l}{f_a} = \frac{{}_a\mu_g - 1}{{}_l\mu_g - 1} = \frac{{}_a\mu_g - 1}{\frac{{}_a\mu_g}{{}_a\mu_l} - 1} \Rightarrow \frac{f_l}{2} = \frac{1.5 - 1}{\frac{1.5}{1.25} - 1} \Rightarrow f_l = 5\ cm$

70. (b) $f \propto \frac{1}{\mu - 1}$ and $\mu \propto \frac{1}{\lambda}$

71. (d) $P = \frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} = \frac{1}{(+0.8)} + \frac{1}{(-0.5)} = -0.75\ D$

72. (b) According to lens makers formula

$\frac{1}{f} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right) \Rightarrow \frac{1}{f} \propto (\mu - 1)$

Since $\mu_{\text{Red}} < \mu_{\text{violet}} \Rightarrow f_v < f_r$ and $F_v < F_r$

Always keep in mind that whenever you are asked to compare (greater than or less than) *u, v* or *f* you must not apply sign conventions for comparison.

73. (a) Since light transmitting area is same, there is no effect on intensity.

74. (c) $m = \frac{f}{(f + u)} \Rightarrow -\frac{1}{n} = \frac{f}{(f + u)} \Rightarrow u = -(n + 1)f$

75. (a) $P = P_1 + P_2 = 2D - 4D = -2D.$

76. (c)

77. (a) $\frac{1}{F} = \frac{2}{f} + \frac{1}{f_m}$. Here $f_m = \infty$, hence $F = \frac{f}{2} = 10\,cm$

78. (b) $O = \sqrt{I_1 I_2} \Rightarrow O = \sqrt{4 \times 9} = 6\ cm$

79. (b) $P = P_1 + P_2 \Rightarrow P = +6 - 4 = +2\,D$. So focal length

$f = \frac{100}{2} = +50\ cm$, convex lens

80. (d) $f = \frac{R}{2(\mu - 1)} \Rightarrow P = \frac{2(\mu - 1)}{R} = \frac{2(1.5 - 1)}{0.2} = +5\,D$

81. (c) $P = \frac{1}{f} \Rightarrow f = \frac{1}{0.5} = 2m$

82. (a) $\frac{f_l}{f_a} = \left(\frac{{}_a\mu_g - 1}{{}_l\mu_g - 1}\right) \Rightarrow \frac{f_l}{4} = \frac{(1.4 - 1)}{\frac{1.4}{1.6} - 1} \Rightarrow f_l = -12.8\,cm$

83. (d) $\frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} \Rightarrow \frac{1}{F} = \frac{1}{(+18)} \Rightarrow F = 18\,cm$

84. (a) $\frac{f_l}{f_a} = \frac{({}_a\mu_g - 1)}{({}_l\mu_g - 1)}$; $f_a = \frac{R}{2(\mu_g - 1)} = \frac{15}{2(1.6 - 1)} = 12.5$

$\Rightarrow \frac{f_l}{12.5} = \frac{(1.6 - 1)}{\left(\frac{1.6}{1.63} - 1\right)} \Rightarrow f_l = -407.5\ cm$

85. (c) $P = P_1 + P_2 \Rightarrow P = +2 + (-1) = +1D,$

$f = \frac{+100}{P} = \frac{+100}{1} = 100\,cm$

86. (c)

87. (b) Nature of lens changes, if $\mu_{\text{mediume}} > \mu_{\text{lens}}$

88. (a) $u = -25\ cm, v = +75\,cm$

$\Rightarrow \frac{1}{f} = \frac{1}{+75} - \frac{1}{-25} \Rightarrow f = +18.75\ cm$; convex lens.

89. (a) $F = \frac{f_1 f_2}{f_2 - f_1}$, *F* will be negative if $f_1 > f_2$

90. (b) $f = \frac{R}{2(\mu - 1)} = \frac{10}{2(1.5 - 1)} = 10\,cm$

91. (b) $\frac{1}{f} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$

$\Rightarrow \frac{1}{+10} = (1.5 - 1)\left(\frac{1}{+7.5} - \frac{1}{R_2}\right) \Rightarrow R_2 = -15\,cm$

92. (d) $f = \frac{R}{2(\mu - 1)}$, $f' = \frac{R}{(\mu - 1)} \Rightarrow f' = 2f$

93. (c) $m = \pm 3$, using $m = \frac{f}{f + u}$

For virtual image $3 = \frac{f}{f - 8}$ .....(i)

For real image $-3 = \frac{f}{f - 16}$ .....(ii)

Solving (i) and (ii) we get $f = 12\,cm$

94. (a) $\frac{1}{F} = \frac{1}{+18} + \frac{1}{(-9)} \Rightarrow F = -18\ cm$ (*i.e.* concave lens)

95. (c) $O = \sqrt{I_1 I_2} = \sqrt{8 \times 2} = 4cm$

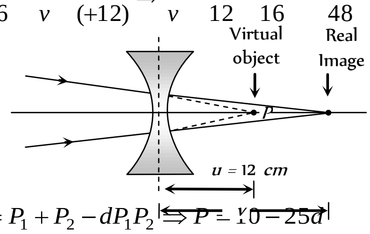
96. (c) $P = \frac{100}{f_1} + \frac{100}{f_2} = \frac{100}{(+25)} + \frac{100}{(-10)} = -6D$

97. (c)

98. (a) $f_w = 4 \times f_a = 4 \times 12 = 48\ cm.$

99. (d) By using lens formula

$\frac{1}{-16} = \frac{1}{v} - \frac{1}{(+12)} \Rightarrow \frac{1}{v} = \frac{1}{12} - \frac{1}{16} = \frac{4 - 3}{48} \Rightarrow v = 48\ cm$



100. (a) $P = P_1 + P_2 - dP_1P_2 \Rightarrow P = 10 - 25d$

$\Rightarrow$ For P to be negative $25d > 10$

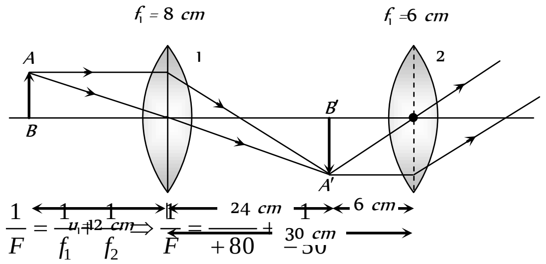
$\Rightarrow\ d > 0.4\,m$ or $d > 40\ cm$

101. (a) $m = \frac{f}{f + u} \Rightarrow -m = \frac{f}{f + u} \Rightarrow u = -\left(\frac{m + 1}{m}\right)f$

102. (d) Number of images = (Number of materials)

103. (c) For lens (1) $\frac{1}{f}=\frac{1}{v}-\frac{1}{u}\Rightarrow\frac{1}{(+8)}=\frac{1}{v}-\frac{1}{(-12)}$

$\Rightarrow v=24\ cm$ *i.e.* Image $A'B'$ is obtained 6 *cm* before the lens 2 or at the focus of lens 2. Hence final image formed by lens 2 will be real enlarged and it is obtained at ∞.



104. (d) $\frac{1}{F}=\frac{1}{f_1}+\frac{1}{f_2}\Rightarrow\frac{1}{F}=\frac{1}{+80}+\frac{1}{-50}$

$\Rightarrow\ F=-\frac{400}{3}\Rightarrow P=\frac{-3}{4}D$

105. (a) By using formula $\frac{\mu_2}{v}-\frac{\mu_1}{u}=\frac{\mu_2-\mu_1}{R}$

$\Rightarrow\frac{1.5}{v}-\frac{1}{(-15)}=\frac{(1.5-1)}{+30}\Rightarrow v=-30\,cm$.

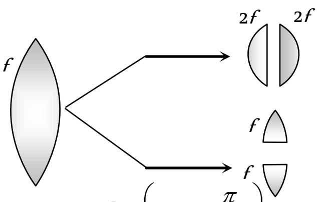
Negative sign shows that, image is obtained on the same side of object *i.e.* towards left.

106. (c) By using $\frac{f_l}{f_a}=\frac{({}_a\mu_g-1)}{({}_l\mu_g-1)}\Rightarrow f_w=4f_a=4\times30=120\ cm.$

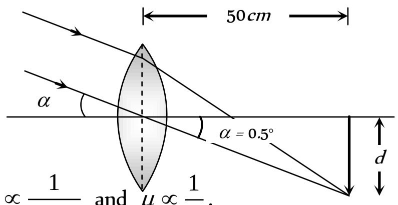
107. (b)

108. (a)

109. (d)



110. (b) Diameter of image $d=\left(0.5\times\frac{\pi}{180}\right)\times500=4.36\ mm$



111. (c) $f\propto\frac{1}{\mu-1}$ and $\mu\propto\frac{1}{\lambda}$.

112. (c) Since intensity $\propto$ (Aperature)², so intensity of image will decrease but no change in the size occurs.

113. (c) In liquids converging ability (power) of convex lens decreases.

114. (d) Since $f\propto\frac{1}{\mu}\propto\lambda$, so voilet colour is focused nearer to the lens.

115. (a) Focal length for voilet is minimum.

116. (c) $m=\frac{v}{u}=5\Rightarrow v=5$ *inch* (Given $u=1$ *inch*)

Using sign convention $u=-1\ inch,\ v=-5\ inch$

$\therefore\frac{1}{f}=\frac{1}{v}-\frac{1}{u}=\frac{1}{-5}-\frac{1}{-1}\Rightarrow f=1.25\ inch$

117. (a) $m_L=4$

$m_A=(m_1)^2$ so that $A'=A_0\times16=1600\ cm^2$

118. (d) $u=-10\ cm,\ v=20\ cm$

$\frac{1}{f}=\frac{1}{v}-\frac{1}{u}=\frac{1}{20}-\left(-\frac{1}{10}\right)=\frac{3}{20}\Rightarrow f=\frac{20}{3}cm$

Now $P=\frac{100}{f}=\frac{100}{20/3}=+15\ D$

119. (c) $\frac{1}{F}=\frac{1}{f_1}+\frac{1}{f_2}$

120. (b) $f=\frac{R}{2(\mu-1)}\Rightarrow R=2f(\mu-1)=2\times0.2(1.5-1)=0.2m.$

121. (c) Using refraction formula $\frac{{}_1\mu_2-1}{R}=\frac{{}_1\mu_2}{v}-\frac{1}{u}$

in given case, medium (1) is glass and (2) is air

So $\frac{{}_g\mu_a-1}{R}=\frac{{}_g\mu_a}{v}-\frac{1}{u}\Rightarrow\frac{\frac{1}{1.5}-1}{-6}=\frac{1}{1.5v}-\frac{1}{-6}$

$\Rightarrow\frac{1-1.5}{-6}=\frac{1}{v}+\frac{1.5}{6}\Rightarrow\frac{0.5}{6}=\frac{1}{v}+\frac{1}{4}$

$\Rightarrow\frac{1}{v}=\frac{1}{12}-\frac{1}{4}=-\frac{2}{12}=-\frac{1}{6}\Rightarrow v=6\ cm.$

122. (d) For real image $m=-2$

$\therefore m=\frac{f}{u+f}\Rightarrow-2=\frac{f}{u+f}=\frac{20}{u+20}\Rightarrow u=-30\ cm.$

123. (a) Focal length of the system (concave mirror)

$F=\frac{R}{2\mu}=\frac{30}{2\times1.5}=10\ cm$

In order to have a real image of the same size of the object, object must be placed at centre of curvature $u=(2f)$.

124. (b) $\frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$

$=(1.5-1)\left(\frac{1}{10}+\frac{1}{10}\right)=\frac{1}{10}\Rightarrow f=10\ cm$

$\therefore$ Radius of curvature of concave mirror $=2f=20\ cm.$

125. (d) $m=-\frac{1}{2}$

$\therefore m=\frac{f}{u+f}\Rightarrow-\frac{1}{2}=\frac{30}{u+30}\Rightarrow u=-90\,cm$

126. (c) $\frac{1}{f}=(\mu-1)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$

$\frac{1}{f}=(1.6-1)\left(\frac{1}{60}-\frac{1}{\infty}\right)=\frac{1}{100}\Rightarrow f=100\,cm$

127. (d) $\frac{1}{F}=(1.5-1)\left(\frac{1}{20}-\frac{1}{\infty}\right)\Rightarrow F=40\,cm$.

128. (b) For minimum spherical and chromatic aberration distance between lenses.

$d = f_1 - f_2 = 0.3 - 0.1 = 0.2\,m$.

129. (b) $\frac{f_l}{f_a} = \frac{{}_a\mu_g - 1}{{}_l\mu_g - 1} = \frac{(1.5-1)\times 1.7}{(1.5-1.7)}$

$\Rightarrow f_l = \frac{0.85}{-0.2} f_a = -4.25 f_a$.

130. (c)

131. (b) $\omega = \frac{f_R - f_V}{f_y} = \frac{f_R - f_V}{\sqrt{f_V f_R}}$

Putting value of f_V and f_R we get $\omega = 0.0325$.

132. (b) $P_1 + P_2 = 2D$ and $P_1 = 5D$, so $P_2 = -3D$

For achromatic combination

$\frac{\omega_1}{\omega_2} = \left(-\frac{p_2}{p_1}\right) = -\left(\frac{-3}{5}\right) = \frac{3}{5}$

133. (b) $f \propto \frac{1}{\mu - 1}$ and $\mu \propto \frac{1}{\lambda}$

134. (d) $P = P_1 + P_2 = +12 - 2 = 10D$

Now $F = \frac{1}{P} = \frac{1}{10} m = 10\,cm$.

135. (b) Focal length for voilet colour is minimum

136. (d) $\frac{f_1}{f_2} = \frac{2}{3}$ .....(i)

$\frac{1}{f_1} - \frac{1}{f_2} = \frac{1}{30}$ .....(ii)

Solving equation (i) and (ii)

$f_2 = -15\,cm$ (Concave)

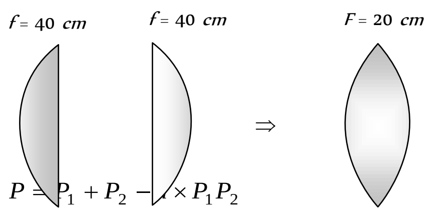
$f_1 = 10\,cm$ (Convex)

137. (d) $\frac{f_l}{f_a} = \frac{({}_a\mu_g - 1)}{({}_l\mu_g - 1)}$

$\Rightarrow \frac{f_l}{f_a} = \frac{{}_a\mu_g - 1}{{}_l\mu_g - 1} = \frac{1.5 - 1}{\frac{1.5}{1.6} - 1} = \frac{0.5 \times 1.6}{-0.1} = -8$

$\Rightarrow P_l = \frac{P_a}{8} = \frac{5}{8}$

138. (b) To obtain, an inverted and equal size image, object must be paced at a distance of $2f$ from lens, *i.e.* 40 *cm* in this case.



139. (a) Using $P = P_1 + P_2 - d \times P_1 P_2$

for equivalent power to be negative

$d \times P_1 P_2 > P_1 + P_2 \Rightarrow d \times 25 > 10$

$\Rightarrow d > \frac{10}{25} m \Rightarrow d > \frac{10 \times 100}{25} \Rightarrow d > 40cm.$

140. (c) Combination of lenses will act as a simple glass plate.

141. (b) For achromatic combination $\frac{f_1}{f_2} = -\frac{\omega_2}{\omega_1} = -\frac{0.036}{0.024} = -\frac{3}{2}$

and $\frac{1}{f_1} - \frac{1}{f_2} = \frac{1}{90}$

solving above equations be get $f_1 = 30cm,\ f_2 = -45cm$

142. (b)

143. (c) $f \propto \frac{1}{\mu - 1}$ and $\mu \propto \frac{1}{\lambda}$.

144. (b) $\frac{f_l}{f_a} = \frac{{}_a\mu_g - 1}{{}_l\mu_g - 1} \Rightarrow \frac{-0.5}{0.2} = \frac{1.5 - 1}{{}_l\mu_g - 1} \Rightarrow {}_l\mu_g - 1 = -0.2$

$\Rightarrow {}_l\mu_g = 0.8 = \frac{4}{5} \Rightarrow \frac{{}_a\mu_g}{{}_a\mu_l} = \frac{4}{5} \Rightarrow \frac{1.5}{{}_a\mu_l} = \frac{4}{5}$

$\Rightarrow {}_a\mu_l = \frac{15}{8}$.

145. (c) Longitudinal chromatic aberration

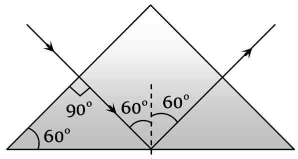
$= \omega f = 0.08 \times 20 = 1.6cm$.

Prism Theory & Dispersion of Light

1. (b) Neon street sign emits light of specific wavelengths.

2. (b)

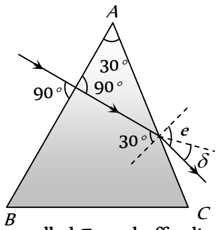
3. (b)



4. (c) $\delta \propto (\mu - 1) \Rightarrow \mu_R$ is least so δ_R is least.

5. (c)

6. (a) For surface $AC\ \frac{1}{\mu} = \frac{\sin 30°}{\sin e} \Rightarrow \sin e = \mu \sin 30°$



$\Rightarrow \sin e = 1.5 \times \frac{1}{2} = 0.75$

$\Rightarrow e = \sin^{-1}(0.75) = 48^o 36'$

From figure $\delta = e - 30^o$

$= 48^o\,36' - 30^o = 18^o 36'$

7. (a) The black lines in solar spectrum are called Fraunhoffer lines.

8. (d) $\frac{\sin\frac{A + \delta m}{2}}{\sin\frac{A}{2}} = \mu$, But $\frac{A + \delta_m}{2} = i = 45^o$

So $\frac{\sin 45^o}{\sin(A/2)} = \sqrt{2} \Rightarrow \frac{1}{2} = \sin\frac{A}{2} \Rightarrow A = 60^o$

9. (d) We know that $\frac{\delta_v - \delta_r}{\delta_{mean}} = \omega$

$\Rightarrow$ Angular dispersion $= \delta_v - \delta_r = \theta = \omega\delta_{mean}$

10. (d) According to Kirchhoff's law, a substance in unexcited state will absorb these wavelength which it emits in de-excitation.

11. (c) By prism formula $n = \frac{\sin\frac{A + A}{2}}{\sin\frac{A}{2}} = \frac{2\sin\frac{A}{2}\cos\frac{A}{2}}{\sin\frac{A}{2}}$

$\therefore \cos\frac{A}{2} = \frac{n}{2} = \frac{1.5}{2} = 0.75 = \cos 41^o \Rightarrow A = 82^o$

12. (b)

13. (b) ω depend only on nature of material.

14. (a) Because achromatic combination has same μ for all wavelengths.

15. (a) $\because \mu = a + \frac{b}{\lambda^2}$ (Cauchy's equation)

and dispersion $D = -\frac{d\mu}{d\lambda} \Rightarrow D = -(-2\lambda^{-3})b = \frac{2b}{\lambda^3}$

$\Rightarrow D \propto \frac{1}{\lambda^3} \Rightarrow \frac{D'}{D} = \left(\frac{\lambda}{\lambda'}\right)^3 = \left(\frac{\lambda}{2\lambda}\right) = \frac{1}{8} \Rightarrow D' = \frac{D}{8}$

16. (b) $\mu = \frac{\sin i}{\sin A/2} \Rightarrow \sqrt{2} = \frac{\sin i}{\sin\left(\frac{60}{2}\right)}$

$\Rightarrow \sqrt{2} \times \sin 30 = \sin i \Rightarrow i = 45^o$

17. (d) $\frac{\delta_w}{\delta_a} = \frac{({}_w\mu_g - 1)}{({}_a\mu_g - 1)} = \frac{\left(\frac{9}{8} - 1\right)}{\left(\frac{3}{2} - 1\right)} = \frac{1}{4}$

18. (a) Since $A(\mu_y - 1) + A'(\mu_{y'} - 1) = 0 \Rightarrow \frac{A'}{A} = -\left(\frac{\mu_y - 1}{\mu_{y'} - 1}\right)$

19. (d)

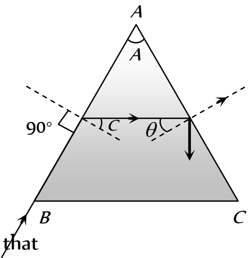
20. (b)

21. (a)

22. (c) From ray diagram

$A = C + \theta$ for TIR at AC

$\theta > C$ so $A > 2C$



23. (a) By the hypothesis, we know that

$i_1 + i_2 = A + \delta \Rightarrow 55^o + 46^o = 60^o + \delta \Rightarrow \delta = 41^o$

But $\delta_m < \delta$, so $\delta_m < 41^o$

24. (a)

25. (b) $\delta_m = (\mu - 1)A$. $A =$ angle of prism.

26. (c)

27. (c)

28. (b)

29. (a) Total deviation = 0

$\delta_1 + \delta_2 + \delta_3 + \delta_4 + \delta_5 = (\mu_1 - 1)A_1 - (\mu_2 - 1)A_2$

$+(\mu_3 - 1)A_3 - (\mu_4 - 1)A_4 + (\mu_5 - 1)A_5 = 0$

$\Rightarrow 2 \times A_2(1.6 - 1) = 3(1.53 - 1)9$

$\Rightarrow A_2 = 3\left(\frac{0.53 \times 9}{1.2}\right) = 11.9^o$

30. (a) The dispersive power for crown glass $\omega = \frac{n_v - n_r}{n_y - 1}$

$= \frac{1.5318 - 1.5140}{(1.5170 - 1)} = \frac{0.0178}{0.5170} = 0.034$

and for flint glass $\omega' = \frac{1.6852 - 1.6434}{(1.6499 - 1)} = 0.064$

31. (c)

32. (b)

33. (a) For dispersion without deviation $\frac{A}{A'} = \left(\frac{\mu'_y - 1}{\mu_y - 1}\right)$

$\therefore \frac{A}{10} = \frac{(1.602 - 1)}{(1.500 - 1)} = \frac{0.602}{0.500} \Rightarrow A = 12°2.4'$

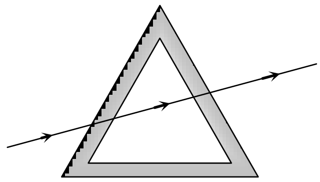
34. (c) $i = \frac{A + \delta_m}{2}$ =50°

35. (d) In minimum deviation position $\angle i = \angle e$

36. (a) Yellow (Primary) + Blue (Primary) = Green (Secondary)

37. (b) All colours are reflected.

38. (a) Effectively there is no deviation or dispersion.

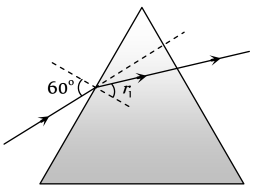


39. (d) From figure it is clear that $\angle e = \angle r_2 = 0$

From $A = r_1 + r_2$

$\Rightarrow r_1 = A = 45^o$

$\therefore \mu = \frac{\sin i}{\sin r_1} = \frac{\sin 60}{\sin 45} = \sqrt{\frac{3}{2}}$



Also from $i + e = A + \delta \Rightarrow 60 + 0 = 45 + \delta \Rightarrow \delta = 15^o$

40. (b) Deviation is zero only for a particular colour, it is generally taken to be yellow.

41. (b) $5 = (\mu - 1)A = (1.5 - 1)A \Rightarrow A = 10^o$

42. (b) $\delta = (\mu_v - \mu_r)A = 0.02 \times 10 = 0.2$

43. (a) $\mu = \frac{\sin\left(\frac{A + \delta_m}{2}\right)}{\sin(A/2)} = \frac{\sin 45^o}{\sin 30^o} = \sqrt{2}$

44. (c) $\omega = \frac{\mu_V - \mu_R}{\mu_Y - 1} = \frac{1.65 - 1.61}{1.63 - 1}$

45. (a) For minimum angle of deviation for a prism

$A = 2r$, $\therefore A = 60^o$

Now $\mu = \frac{\sin\frac{60 + 30}{2}}{\sin\frac{60}{2}} = \frac{\sin 45^o}{\sin 30^o} = \frac{1}{\sqrt{2}} \times \frac{2}{1} = \sqrt{2}$

46. (c) In minimum deviation condition $\angle i = \angle e$, $\angle r_1 = \angle r_2$

47. (b) For dispersion without deviation $\frac{A}{A'} = \frac{(\mu' - 1)}{(\mu - 1)}$

$$\frac{4}{A_F}=\frac{(1.72-1)}{(1.54-1)}=\frac{0.72}{0.54} \text{ or } A_F=\frac{4\times 0.54}{0.72}=3^o$$

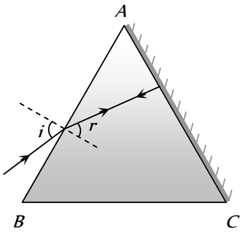
48. (a) $A(\mu_v-\mu_r)+A'(\mu_v'-\mu_r')=0^o \Rightarrow A'=5^o$

49. (c) $A=r+0 \Rightarrow r=30^o$

From Snell's law at surface *AB*

$$\mu=\frac{\sin i}{\sin r}$$

$$\Rightarrow \sqrt{2}=\frac{\sin i}{\sin 30^o} \Rightarrow i=45^o$$



50. (c) $\omega=\frac{1.64-1.52}{1.6-1}=\frac{0.12}{0.6}=0.2$

51. (c) Because band spectrum can be found in case of molecules (generally gas).

52. (a) Solids and liquids give continuous and line spectra. Only gases are known to give band spectra.

53. (d)

54. (d)

55. (a) Hydrogen is molecular, therefore it gives band spectrum but not continuous spectrum.

56. (c)

57. (a) Dispersion take place because the refractive index of medium for different colour is different, for example, red light bends less than violet, refractive index of the material of the prism for red light is less than that for violet light. Equivalently, we can say that red light travels faster than violet light in a glass prism.

58. (a) We know that $\delta=i+e-A \Rightarrow e=\delta+A-i$

$=30^o+30^o-60^o=0^o$

$\therefore$ Emergent ray will be perpendicular to the face.

Therefore it will make an angle of 90° with the face through which it emerges.

59. (a) $\delta_m=(\mu-1)(2r)=(1.5-1)2r=0.5\times 2r=r$

60. (c)

61. (c)

62. (b)

63. (d) Given $i=e=\frac{3}{4}A=\frac{3}{4}\times 60=45^o$

In the position of minimum deviation

$2i=A+\delta_m$ or $\delta_m=2i-A=90-60=30^o$

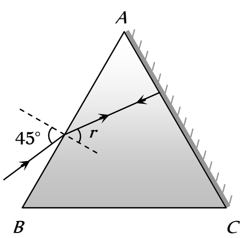
64. (d)

65. (a) Sky appears white due to scattering. In absence of atmosphere no scattering will occur.

66. (b)

67. (c) $A=r+0 \Rightarrow r=30°$

$$\therefore \mu=\frac{\sin i}{\sin r}=\frac{\sin 45°}{\sin 30°}=\sqrt{2}$$



68. (c) By formula $\delta=(n-1)A \Rightarrow 34=(n-1)A$ and in the second position $\delta'=(n-1)\frac{A}{2}$

$$\therefore \frac{34}{\delta'}=\frac{(n-1)A}{(n-1)\frac{A}{2}} \text{ or } \delta'=\frac{34}{2}=17^o$$

69. (b) From figure

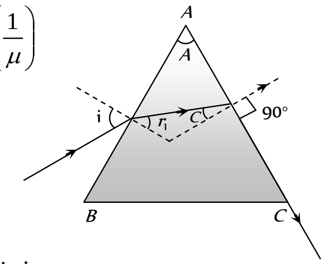
$$A=r_1+c=r_1+\sin^{-1}\left(\frac{1}{\mu}\right)$$

$$\Rightarrow r_1=75-\sin^{-1}\left(\frac{1}{\mu}\right)$$

$\Rightarrow 75-45=30^o$

From Snell's law At *B*

$$\mu=\frac{\sin i}{\sin r_1} \Rightarrow \sqrt{2}=\frac{\sin i}{\sin 30^o} \Rightarrow i=45^o$$



70. (c) In both *A* and *B*, the refracted ray is parallel to the base of prism.

71. (a) According to given conditions TIR must take place at both the surfaces *AB* and *AC*. Hence only option (*a*) is correct.

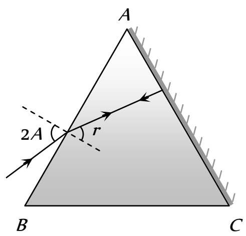
72. (d)

73. (a)

74. (b) $A=r+0$ and $\mu=\frac{\sin i}{\sin r}$

$$\Rightarrow \mu=\frac{\sin 2A}{\sin A}$$

$$=\frac{2\sin A\cos A}{\sin A}=2\cos A$$



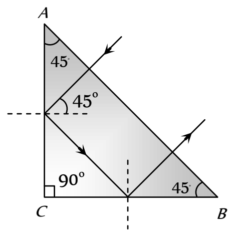
75. (a) From figure it is clear that TIR takes place at surface *AC* and *BC*

i.e. $45^o>C$

$\Rightarrow \sin 45^o>\sin C$

$$\Rightarrow \frac{1}{\sqrt{2}}>\frac{1}{\mu} \Rightarrow \mu>\sqrt{2}$$

Hence $\mu_{\text{least}}=\sqrt{2}$



76. (b)

77. (b) According to Rayleigh's law of scattering, intensity scattered is inversely proportional to the forth power of wavelength. So red is least scattered and sun appears Red.

78. (b)

79. (d)

80. (a) Only red colour will be seen in spectrum.

81. (b) $i=\frac{A+\delta_m}{2}=\frac{60°+30°}{2}=45°$

82. (a) $$\mu=\frac{\sin\left(\frac{A+\delta_m}{2}\right)}{\sin\frac{A}{2}}=\frac{\sin\left(\frac{60°+60°}{2}\right)}{\sin\left(\frac{60°}{2}\right)}=\sqrt{3}$$

83. (b) Because in dispersion of white light, the rays of different colours are not parallel to each other. Also deviation takes place in same direction.

84. (c)

85. (a) $\omega = \frac{\mu_F - \mu_C}{(\mu_D - 1)} = \frac{(1.6333 - 1.6161)}{(1.622 - 1)} = 0.0276$

86. (c) For total internal reflection $\theta > C$

$\Rightarrow \sin\theta > \sin C \Rightarrow \sin\theta > \frac{1}{\mu}$

or $\mu > \frac{1}{\sin\theta} \Rightarrow \mu > \frac{1}{\sin 45^o} \Rightarrow \mu > \sqrt{2} \Rightarrow \mu > 1.41$

87. (c)

88. (a) $\theta = (\mu_v - \mu_r)A = 0.02 \times 5^o = 0.1^o$

89. (b)

90. (b) $\frac{A'}{A} = \frac{(\mu_y - 1)}{(\mu_{y'} - 1)} \Rightarrow \frac{A'}{6} = -\frac{(1.54 - 1)}{(1.72 - 1)}$

$\Rightarrow A' = -4.5^o = 4^o 30'$

91. (c) $\mu = \frac{\sin\left(\frac{A + \delta_m}{2}\right)}{\sin\frac{A}{2}} \Rightarrow \sqrt{3} = \frac{\sin\left(\frac{60° + \delta_m}{2}\right)}{\sin\frac{60°}{2}}$

$\Rightarrow \frac{\sqrt{3}}{2} = \sin\left(30° + \frac{\delta_m}{2}\right) \Rightarrow \delta_m = 60^o$

92. (a) Dispersion is caused due to refraction as μ depends on λ.

93. (c) From colour triangle

94. (c) Due to the absorption of certain wavelengths by the elements in outer layers of sun.

95. (b)

96. (c)

97. (c) $\omega = \frac{\mu_v - \mu_R}{\mu_y - 1} = \frac{1.62 - 1.52}{1.55 - 1} = 0.18$

98. (a) $\frac{\omega_1}{\omega_2} = -\frac{f_1}{f_2} = -\frac{2}{3}$.

99. (a) $\omega = \frac{\mu_V - \mu_R}{\mu_Y - 1} = \frac{1.62 - 1.42}{1.5 - 1} = 0.4$

100. (c) Since the ray emerges normally, therefore $e = 0$.

According to relation $A + \delta = i + e$, we get $i = A + \delta$.

Hence by $\delta = (\mu - 1)A$, we get $i = \mu A$.

101. (a) The atoms in the chromosphere absorb certain wavelengths of light coming from the photosphere. This gives rise to absorption lines.

102. (b) $\mu = \frac{\sin\left(\frac{A + \delta_m}{2}\right)}{\sin\left(\frac{A}{2}\right)} \Rightarrow \sqrt{2}\mu = \frac{\sin\left(\frac{60 + \delta_m}{2}\right)}{\sin\left(\frac{60}{2}\right)}$

$\Rightarrow \sqrt{2} \times \sin 30 = \sin\left(\frac{60 + \delta_m}{2}\right) \Rightarrow \sin 45^o$

$= \sin\left(\frac{60 + \delta_m}{2}\right) \Rightarrow \delta_m = 30^o$

103. (a) Intensity of scattered light $I \propto \frac{1}{\lambda^4}$, since λ_{blue} is least that's why sky looks blue.

104. (b) In continuos spectrum all wavelength are present.

105. (d)

106. (b) Deviation is greater for lower wavelengths.

107. (b) $\frac{\delta_a}{\delta_w} = \frac{({}_a\mu_g - 1)}{({}_w\mu_g - 1)} = \frac{\left(\frac{3}{2} - 1\right)}{\left(\frac{3/2}{4/3} - 1\right)} = 4 \Rightarrow \delta_w = \frac{\delta_a}{4}$

108. (a) $\theta = (\mu_v - \mu_r)A = (1.66 - 1.64) \times 10^o = 0.2^o$

109. (b) $\omega = \frac{(\mu_v - \mu_R)}{(\mu_y - 1)} \Rightarrow \frac{(1.69 - 1.65)}{(1.66 - 1)} = 0.06$

110. (a) $\omega = \frac{\delta_V - \delta_R}{\delta_Y} = \frac{3.72 - 2.84}{3.28} = 0.268$

111. (a)

112. (d) $\mu = \frac{\sin\left(\frac{A + \delta_m}{2}\right)}{\sin\left(\frac{A}{2}\right)} = \frac{\sin\left(\frac{60° + 30°}{2}\right)}{\sin\frac{60°}{2}} = \frac{\sin 45^o}{\sin 30^o} = 1.414$

113. (a) Rock salt prism is used to see infrared radiations.

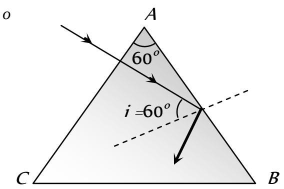
114. (b) For different colours μ changes so deviation of different colour is also different.

115. (a) By using $\frac{\omega_1}{f_1} + \frac{\omega_2}{f_2} = 0 \Rightarrow \frac{0.02}{f_1} + \frac{0.04}{40} = 0$

$f_1 = -20\ cm$

116. (d) Critical angle for the material of prism $C = \sin^{-1}\left(\frac{1}{\mu}\right) = \sin^{-1} = 42^o$

since angle of incidence at surface $AB\,(60^o)$ is greater then the critical angle (42^o) so total internal reflection takes place.



117. (d) Line and band spectrum are also known as atomic and molecular spectra respectively.

118. (d) In minimum deviation $i = e = 30^o$, so angle between emergent ray and second refracting surface is $90^o - 30^o = 60^o$

119. (c) $\theta = (\mu_v - \mu_R)A = (1.6 - 1.5) \times 5 = 0.5^o$

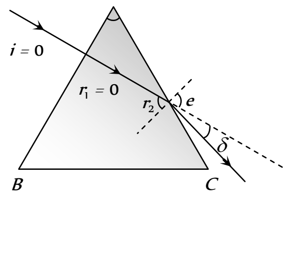
120. (d) $\frac{\delta_1}{\delta_2} = \frac{A_1}{A_2}$

121. (a) Sunlight consists of all the wavelength with some black lines.

122. (d) $A = 30^o, \mu = \sqrt{2}$. As we know

$A = r_1 + r_2 = 0 + r_2 \Rightarrow A = r_2$.

Applying Snell's law for the surface AC



$$\frac{1}{\mu} = \frac{\sin r_2}{\sin e} = \frac{\sin A}{\sin e}$$

$$\Rightarrow \frac{1}{\sqrt{2}} = \frac{\sin 30^o}{\sin e} \Rightarrow e = 45^o$$

$$\delta = e - r_2 = 45^o - 30^o = 15°$$

123. (c) $\mu = \frac{\sin\frac{A+\delta_m}{2}}{\sin\frac{A}{2}} = \frac{\sin\frac{A+A}{2}}{\sin\frac{A}{2}} = \frac{\sin A}{\sin\frac{A}{2}}$

$$= \frac{2\sin\frac{A}{2}\cos\frac{A}{2}}{\sin\frac{A}{2}} = 2\cos\frac{A}{2}$$

So, $\sqrt{3} = 2\cos\frac{A}{2} \Rightarrow \frac{\sqrt{3}}{2} = \cos\frac{A}{2} \Rightarrow A = 60°$

124. (d) Light from lamp or electric heater gives continuos spectrum.

125. (b) $A = 60^o, \delta_m = 30^o$ so $\mu = \frac{\sin\left(\frac{A+\delta_m}{2}\right)}{\sin\left(\frac{A}{2}\right)}$

$$\mu = \frac{\sin\left(\frac{60°+30°}{2}\right)}{\sin\left(\frac{60°}{2}\right)} = \frac{\sin 45°}{\sin 30°} = \sqrt{2}$$

Also $\mu = \frac{1}{\sin C} \Rightarrow C = \sin^{-1}\left(\frac{1}{\mu}\right) \Rightarrow C = 45^o$

126. (a) $\delta \propto (\mu - 1)$

127. (c) In minimum deviation position $\angle i_1 = \angle i_2$ and $\angle r_1 = \angle r_2$.

128. (c) $\theta_{net} = \theta + \theta' = 0 \Rightarrow \omega d + \omega' d' = 0$

(θ = Angular dispersion = $\omega . \delta_y$)

129. (d) $A = 60^o, i = e = 45^o$ By $i + e = A + \delta$

$\Rightarrow 45 + 45 = 60 + \delta \Rightarrow \delta = 30^o$

130. (a) At the time of solar eclipse light received from chromosphere. The bright lines appear exactly at the places where dark lines were there. Hence at the time of solar eclipse continuos spectrum is obtained.

131. (a) In the morning or evening, the sun is at the horizon and refractive index in the atmosphere of the earth decreases with height. Due to this, the light reaching the earth's atmosphere, bends unequally, and the image of the sun get's distorted and it appears elliptical and larger.

132. (c) In Rainbow formation dispersion and TIR both takes place.

133. (a)

134. (c) Given $\delta_m = A$, as $\mu = \frac{\sin\left(\frac{A+\delta_m}{2}\right)}{\sin\left(\frac{A}{2}\right)}$

$$\Rightarrow \mu = \frac{\sin\left(\frac{A+A}{2}\right)}{\sin\left(\frac{A}{2}\right)} = 2\cos\frac{A}{2} \Rightarrow A = 2\cos^{-1}\left(\frac{\mu}{2}\right)$$

135. (b) As the prisms Q and R are of the same material and have identical shape they combine to form a slab with parallel faces. Such a slab does not cause any deviation.

136. (c) Angle of prism is the angle between incident and emergent surfaces.

137. (a) $\mu = \frac{\sin i}{\sin\frac{A}{2}} \Rightarrow \sqrt{2} = \frac{\sin i}{\sin\left(\frac{60}{2}\right)} \Rightarrow i = 45^o$

138. (d) Convex lens, glass slab, prism and glass sphere they all disperse the light.

139. (c) For a lens $f_r - f_v = \omega f_y$

$$\Rightarrow \omega = \frac{f_r - f_v}{f_y} = \frac{0.214 - 0.200}{0.205} = \frac{14}{205}.$$

140. (b) $\omega = \frac{(\mu_v - \mu_R)}{(\mu_y - 1)} \Rightarrow \frac{(1.69 - 1.65)}{(1.66 - 1)} = 0.06$

141. (a) In minimum deviation condition $r = \frac{A}{2} = \frac{60}{2} = 30^o$

142. (a) $\omega = \frac{\mu_v - \mu_r}{\mu_y - 1} = \frac{1.67 - 1.63}{1.65 - 1} = 0.615.$

143. (b) In minimum deviation position refracted ray inside the prism is parallel to the base of the prism.

144. (b) Angle of refraction will be different, due to which red and green emerge from different points and will be parallel.

145. (a) Deviation $\delta \propto \mu \propto \frac{1}{\lambda}$

146. (a) $\mu = \frac{\sin\frac{A+\delta_m}{2}}{\sin\frac{A}{2}} = \frac{\sin\frac{60+38}{2}}{\sin\frac{60}{2}}$

$$= \frac{\sin 49^o}{\sin 30^o} = \frac{0.7547}{0.5} = 1.5.$$

147. (d) Using $\delta = i_1 + i_2 - A \Rightarrow 55 = 15 + i_2 - 60 \Rightarrow i_2 = 100^o$

148. (b) Sodium light gives emission spectrum having two yellow lines.

149. (c) Colour of the sky is highly scattered light (colour).

150. (a)

151. (c)

Human Eye and Lens Camera

1. (c) Man is suffering from hypermetropia. The hole works like a convex lens.

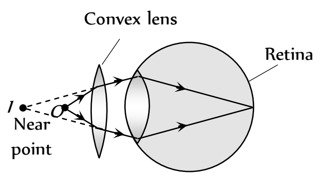
2. (a)

3. (b) In myopia, $u = \infty$, $v = d$ = distance of far point

By $\frac{1}{f} = \frac{1}{v} - \frac{1}{u}$, we get $f = -d$

Since f is negative, hence the lens used is concave.

4. (d) Hypermetropia is removed by convex lens.



5. (b)

6. (c) Cylindrical lens are used for removing astigmatism.

7. (b)

8. (a) Image formed at retina is real and inverted.

9. (d) Visible region decreases, so the depth of image will not be seen.

10. (a) $P = \frac{1}{f} = -\frac{1}{v} + \frac{1}{u} = -\frac{1}{100} + \frac{1}{25} = \frac{3}{100} = +3\,D$

11. (c) If eye is kept at a distance d, then $MP = \frac{L(D-d)}{f_0 f_e}$, MP decreases.

12. (c) For lens u = want's to see = ∞

v = can see = – 5 m

$\therefore$ From $\frac{1}{f} = \frac{1}{v} - \frac{1}{u} \Rightarrow \frac{1}{f} = \frac{1}{-5} - \frac{1}{\infty} \Rightarrow f = -5\,m.$

13. (a) For improving near point, convex lens is required and for this convex lens

$u = -25\ cm,\ v = -75\ cm$

$\therefore \frac{1}{f} = \frac{1}{-75} - \frac{1}{-25} \Rightarrow f = \frac{75}{2} cm$

So power $P = \frac{100}{f} = \frac{100}{75/2} = +\frac{8}{3} D$

14. (b) In short sightedness, the focal length of eye lens decreases, so image is formed before retina.

15. (d) The image of object at infinity should be formed at 100 cm from the eye

$\frac{1}{f} = \frac{1}{\infty} - \frac{1}{100} = -\frac{1}{100}$

So the power $= \frac{-100}{100} = -1\,D$

(Distance is given in cm but $P = \frac{1}{f}$ in *metres*)

16. (b) For improving far point, concave lens is required and for this concave lens $u = \infty,\ v = -30\ cm$

So $\frac{1}{f} = \frac{1}{-30} - \frac{1}{\infty} \Rightarrow f = -30\ cm$

for near point $\frac{1}{-30} = \frac{1}{-15} - \frac{1}{u} \Rightarrow u = -30\ cm$

17. (c) For myopic eye f = – (defected far point)

$\Rightarrow f = -40\,cm \Rightarrow P = \frac{100}{-40} = -2.5\,D$

18. (c) For lens u = want's to see $= -60\,cm$

v = can see $= -10\,cm$

$\therefore \frac{1}{f} = \frac{1}{v} - \frac{1}{u} \Rightarrow \frac{1}{f} = \frac{1}{-10} - \frac{1}{(-60)} \Rightarrow f = -12\,cm$

19. (b) Focal length = – (Detected far point)

20. (c) In this case, for seeing distant objects the far point is 40 cm. Hence the required focal length is

$f = -d$ (distance of far point) = – 40 cm

Power $P = \frac{100}{f} cm = \frac{100}{-40} = -2.5\ D$

21. (b)

22. (a)

23. (a)

24. (a) For viewing far objects, concave lenses are used and for concave lens

u = wants to see $= -60\,cm$; v = can see $= -15\,cm$

so from $\frac{1}{f} = \frac{1}{v} - \frac{1}{u} \Rightarrow f = -20\,cm$.

25. (d)

26. (a) In short sightedness, the focal length of eye lens decreases and so the power of eye lens increases.

27. (d) Colour blindness is a genetic disease and still cannot be cured.

28. (c) Convexity to lens changes by the pressure applied by ciliary muscles.

29. (b) $f = -d = -100\ cm = -1\ m$

$\therefore P = \frac{1}{f} = \frac{1}{-1} = -1\ D$

30. (c) For correcting myopia, concave lens is used and for lens.

u = wants to see $= -50\,cm$

v = can see $= -25\,cm$

From $\frac{1}{f} = \frac{1}{v} - \frac{1}{u} \Rightarrow \frac{1}{f} = \frac{1}{-25} - \frac{1}{(-50)} \Rightarrow f = -50\,cm$

So power $P = \frac{100}{f} = \frac{100}{-50} = -2\,D$

31. (c)

32. (c) $f = -d = -60\ cm$

$\therefore P = \frac{100}{f} = -\frac{100}{60} = -\frac{10}{6} = -1.66\ D$

33. (b) For correcting the near point, required focal length

$f = \frac{50 \times 25}{(50-25)} = 50\,cm$

So power $P = \frac{100}{50} = +2\,D$

For correcting the far point, required focal length

$f = -(\text{defected far point}) = -3\,m$

$\therefore P = -\frac{1}{3} D = -0.33\,D$

34. (b) Negative power is given, so defect of eye is nearsigntedness

Also defected far point $= -f = -\frac{1}{p} = -\frac{100}{(-2.5)} = 40\,cm$

35. (a) In myopia, eye ball may be elongated so, light rays focussed before the retina.

36. (c)

37. (d) $P = \frac{1}{f} = \frac{1}{-(\text{defected far point})} = -\frac{1}{2} = -0.5\,D$

38. (a) Resolving limit of eye is one minute (1′).

39. (d) Because for healthy eye image is always formed at retina.

40. (a) The defect is myopia (nearsightness)

As we know for myopic person f = – (defected far point)

$\Rightarrow$ Defected far point = – $f = -\frac{1}{P} = -\frac{1}{(-2)} = 0.5\,m$

= 50 cm

41. (b) Power of convex lens $P_1 = \frac{100}{40} = 2.5\ D$

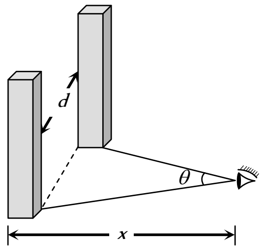
Power of concave lens $P_2 = -\frac{100}{25} = -4\ D$

Now $P = P_1 + P_2 = 2.5\ D - 4\ D = -1.5\ D$

42. (c)

43. (d)

44. (a) As limit of resolution of eye is $\left(\frac{1}{60}\right)^o$, the pillars will be seen distinctly if $\theta > \left(\frac{1}{60}\right)^o$



i.e., $\frac{d}{x} > \left(\frac{1}{60}\right) \times \frac{\pi}{180}$

$\Rightarrow d > \frac{\pi \times x}{60 \times 180}$

$\Rightarrow d > \frac{3.14 \times 11 \times 10^3}{60 \times 180} \Rightarrow d > 3.2\ m$

45. (b)

46. (b)

47. (d)

48. (d) f = – (defected far point) = – 20 cm

49. (b) Power of the lens given positive so defect is hypermetropia.

50. (b) Far point of the eye = focal length of the lens

$= \frac{100}{P} = \frac{100}{0.66} = 151\ cm$

51. (c) A bifocal lens consist of both convex or concave lenses with lower part is convex.

52. (a) For lens u = wants to see = – 30 cm

and v = can see = – 10 cm

$\therefore \frac{1}{f} = \frac{1}{v} - \frac{1}{u} = \frac{1}{-10} - \frac{1}{(-30)} \Rightarrow f = -15\,cm$

53. (a) Focal length = – (far point)

54. (c) For lens u = wants to see = – 12 cm

v = can see = – 3 m

$\therefore P = \frac{1}{f} = \frac{1}{v} - \frac{1}{u} \Rightarrow P = \frac{1}{-3} - \frac{1}{(-12)} = -\frac{1}{4} D$

55. (d) $I_1 D_1^2 t_1 = I_2 D_2^2 t_2$

Here D is constant and $I = \frac{L}{r^2}$

So $\frac{L_1}{r_1^2} \times t_1 = \frac{L_2}{r_2^2} \times t_2 \Rightarrow \frac{60}{(2)^2} \times 10 = \frac{120}{(4)^2} \times t \Rightarrow 20\ sec$

56. (a) $f = -40\ cm$ and $P = \frac{100}{-40} = -2.5\ D$

57. (a) Focal length of the lens $f = \frac{100}{3} cm$

By lens formula $\frac{1}{f} = \frac{1}{v} - \frac{1}{u}$

$\Rightarrow \frac{1}{+100/3} = \frac{1}{v} - \frac{1}{-25} \Rightarrow v = -100\ cm = -1\ m$

58. (d) This is the defect of hypermetropia.

59. (a) For large objects, large image is formed on retina.

60. (d) $v = -15 cm,\ u = -300 cm,$

From lens formula $\frac{1}{f} = \frac{1}{v} - \frac{1}{u}$

$\Rightarrow \frac{1}{f} = \frac{1}{-15} - \frac{1}{-300} = \frac{-19}{300} \Rightarrow f = \frac{-300}{19} = -15.8\,cm$

and power $P = \frac{100}{f} cm = \frac{-100 \times 19}{300} = -6.33\ D.$

61. (d) Time of exposure $\propto \frac{1}{(\text{Aperture})^2}$

62. (a) Light gathering power ∝ Area of lens aperture or d

63. (b) Time of exposure $\propto (f.\text{number})^2 \Rightarrow \frac{t_2}{t_1} = \left(\frac{5.6}{2.8}\right)^2 = 4$

$t_2 = 4\,t_1 = 4 \times \frac{1}{200} = \frac{1}{50}\ sec = 0.02\ sec.$

64. (d)

65. (a)

Microscope and Telescope

1. (c) By using $m_\infty = \frac{(L_\infty - f_o - f_e).D}{f_o f_e}$

$\Rightarrow 45 = \frac{(L_\infty - 1 - 5) \times 25}{1 \times 5} \Rightarrow L_\infty = 15\,cm.$

2. (b) For a compound microscope $m \propto \frac{1}{f_o f_e}$

3. (b) For a compound microscope $f_{objective} < f_{eye\ piece}$

4. (b) In microscope final image formed is enlarged which in turn increases the visual angle.

5. (b)

6. (d) Magnification of a compound microscope is given by

$m = -\frac{v_o}{u_o} \times \frac{D}{u_e} \Rightarrow |m| = m_o \times m_e.$

7. (c) Magnifying power of a microscope $m \propto \frac{1}{f}$

Since $f_{\text{violet}} < f_{\text{red}};\ \therefore m_{\text{violet}} > m_{\text{red}}$

8. (a) $L_\infty = v_o + f_e \Rightarrow 14 = v_o + 5 \Rightarrow v_o = 9\ cm$

Magnifying power of microscope for relaxed eye

$m = \frac{v_o}{u_o} . \frac{D}{f_e}$ or $25 = \frac{9}{u_o} . \frac{25}{5}$ or $u_o = \frac{9}{5} = 1.8\ cm$

9. (b) $m_\infty = -\frac{v_o}{u_o} \times \frac{D}{f_e}$

From $\frac{1}{f_o} = \frac{1}{v_o} - \frac{1}{u_o}$

$\Rightarrow \frac{1}{(+1.2)} = \frac{1}{v_o} - \frac{1}{(-1.25)} \Rightarrow v_o = 30\ cm$

$\therefore |m_\infty| = \frac{30}{1.25} \times \frac{25}{3} = 200$

10. (b) For objective lens $\frac{1}{f_o} = \frac{1}{v_o} - \frac{1}{u_o}$

$\Rightarrow \frac{1}{(+4)} = \frac{1}{v_o} - \frac{1}{(-4.5)} \Rightarrow v_o = 36\ cm$

$\therefore |m_D| = \frac{v_o}{u_o}\left(1 + \frac{D}{f_e}\right) = \frac{36}{4.5}\left(1 + \frac{24}{8}\right) = 32$

11. (a) For a microscope $|m| = \frac{v_o}{u_o} \times \frac{D}{u_e}$ and $L = v_o + u_e$

For a given microscope, with increase in L, u will increase and hence magnifying power (m) will decrease.

12. (b) In compound microscope objective forms real image while eye piece forms virtual image.

13. (b) $m = 1 + \frac{D}{f}$

Smaller the focal length, higher the magnifying power.

14. (a) In electron microscope, electron beam $(\lambda \approx 1\mathring{A})$ is used so it's $R.P.$ is approx. 5000 times more than that of ordinary microscope $(\lambda \approx 5000\mathring{A})$.

15. (c) If nothing is said then it is considered that final image is formed at infinite and $m_\infty = \frac{(L_\infty - f_o - f_e).D}{f_o f_e} \simeq \frac{LD}{f_0 f_e}$

$\Rightarrow 400 = \frac{20 \times 25}{0.5 \times f_e} \Rightarrow f_e = 2.5\ cm.$

16. (d) $m_{\max} = 1 + \frac{D}{f} = 1 + \frac{25}{2.5} = 11$.

17. (a)

18. (b) $m = 1 + \frac{D}{f} = 1 + DP$ (m increases with P)

19. (b)

20. (b) Like Gallilean telescope.

21. (a) $|m| \propto \frac{1}{f_o f_e}$

22. (d) A microscope consists of lens of small focal lengths. A telescope consists of objective lens of large focal length.

23. (c) $m = m_o \times m_e = 25 \times 6 = 150$

24. (a) When final image is formed at infinity,

length of the tube $= v_o + f_e$

$\Rightarrow 15 = v_o + 3 \Rightarrow v_o = 12\ cm$

For objective lens $\frac{1}{f_o} = \frac{1}{v_o} - \frac{1}{u_o}$

$\Rightarrow \frac{1}{(+2)} = \frac{1}{(+12)} - \frac{1}{u_o} \Rightarrow u_o = -2.4\ cm$

25. (d) R.P. of microscope $= \frac{2\mu \sin\theta}{\lambda}$

26. (c) $m = m_o \times m_e \Rightarrow m = m_o \times \left(1 + \frac{D}{f_e}\right)$

$\Rightarrow 100 = 10 \times \left(1 + \frac{25}{f_e}\right) \Rightarrow f_e = \frac{25}{9}\ cm$

27. (c) A simple microscope is just a convex lens with object lying between optical centre and focus of the lens.

28. (d) In general, the simple microscope is used with image at D, hence

$m = 1 + \frac{D}{f} = 1 + \frac{25}{5} = 6$

29. (d)

30. (b) Resolving power of microscope $\propto \frac{1}{\lambda}$

31. (a) Cross wire arrangement is used to make measurements.

32. (d) $L = v_o + u_e = \frac{u_o f_o}{(u_o - f_o)} + \frac{f_e D}{f_e + D}$

$\Rightarrow L = \frac{2 \times 1.5}{(2 - 1.5)} + \frac{6.25 \times 25}{(6.25 + 25)} = 11\ cm$

33. (d) $m \simeq \frac{LD}{f_o f_e} \Rightarrow m = \frac{10 \times 25}{0.5 \times 1} = 500$.

34. (c) Intermediate image means the image formed by objective, which is real, inverted and enlarged.

35. (d) $m \propto \frac{1}{f_o f_e}$

36. (b) R.P. $\propto \frac{1}{\lambda}$; $\lambda_{\text{Blue}} < \lambda_{\text{Red}}$ so $(R.P.)_{\text{Blue}} > (R.P.)_{\text{Red}}$

37. (a) $m = 1 + \frac{D}{f} \Rightarrow 6 = 1 + \frac{25}{f} \Rightarrow f = 5\ cm = 0.05\ m$

38. (a) Resolving limit

$x \propto \lambda \Rightarrow \frac{x_1}{x_2} = \frac{\lambda_1}{\lambda_2} \Rightarrow \frac{0.1}{x_2} = \frac{6000}{4800} \Rightarrow x_2 = 0.08\ mm$

39. (b) $m = m_o \times m_e \Rightarrow 100 = 5 \times m_e \Rightarrow m_e = 20$

40. (d) $m \propto \frac{1}{f} \propto P$

41. (d) R.P. $\propto \frac{1}{\lambda} \Rightarrow \frac{(R.P.)_1}{(R.P.)_2} = \frac{\lambda_2}{\lambda_1} = \frac{5}{4}$

42. (b) Resolving limit (minimum separation) $\propto \lambda$

$\Rightarrow \frac{P_A}{P_B} = \frac{2000}{3000} \Rightarrow P_A < P_B$

43. (d) Similar to Q.No. 34

44. (a) For achromatic telescope objective lens, convergent of crown and divergent of flint is the best combination because $\mu_{\text{crown}} < \mu_{\text{flint}}$

45. (c)

46. (b) Magnifying power of telescope is $\frac{f_o}{f_e}$, so as $\frac{1}{f_e}$ increases, magnifying power increases.

47. (b) Since $m = \frac{f_o}{f_e}$

Also $m = \frac{\text{Anglesubtended by the image}}{\text{Anglesubtended by the object}}$

$\therefore \frac{f_o}{f_e} = \frac{\alpha}{\beta} \Rightarrow \alpha = \frac{f_o \times \beta}{f_e} = \frac{60 \times 2}{5} = 24^o$

48. (d) Resolving power $= \frac{d}{1.22\,\lambda} = \frac{0.1}{1.22 \times 6000 \times 10^{-10}}$

$\cong 1.36 \times 10^5\, radian$

49. (b) Because size of the aperture decreases.

50. (d) Resolving power $\propto$ aperture.

51. (c) Telescope is used to see the distant objects. More magnifying power means more nearer image.

52. (a) When the final image is at the least distance of distinct vision, then

$m = -\frac{f_o}{f_e}\left(1 + \frac{f_e}{D}\right) = \frac{200}{5}\left(1 + \frac{5}{25}\right) = \frac{200 \times 6}{5 \times 5} = -48$

When the final image is at infinity, then

$m = \frac{-f_o}{f_e} = \frac{200}{5} = -40$

53. (a) In terrestrial telescope erecting lens absorbs a part of light, so less constant image. But binocular lens gives the proper three dimensional image.

54. (a) By formula $m = \frac{f_o}{f_e}$

55. (b) In telescope $f_o >> f_e$ as compared to microscope.

56. (a) Because magnification in this case becomes reciprocal of initial magnification.

57. (d) $m = \frac{f_o}{f_e} \Rightarrow \frac{80}{f_e} = 20 \Rightarrow f_e = 4\ cm$

Hence length of terrestrial telescope

$= f_o + f_e + 4f = 80 + 4 + 4 \times 20 = 164\ cm$

58. (d) In this case $|m| = \frac{f_o}{f_e} = 5$ .... (i)

and length of telescope $= f_o + f_e = 36$ .... (ii)

Solving (i) and (ii), we get $f_e = 6\ cm$, $f_o = 30\, cm$.

59. (c) $|m| = \frac{f_o}{f_e} = \frac{180}{6} = 30$

60. (c) Same as Q. No. 58.

61. (c) $f_o = \frac{1}{1.25} = 0.8\, m$ and $f_e = \frac{1}{-20} = -0.05\, m$

$\therefore |L_\infty| = |f_o| - |f_e| = 0.8 - 0.05 = 0.75\, m = 75\, cm$

and $|m_\infty| = \frac{f_o}{f_e} = \frac{0.8}{0.05} = 16$

62. (a) For greater aperture of lens, light passing through lens is more and so intensity of image increases.

63. (b)

64. (a) Same as Q. No. 58.

65. (b) $m = \frac{f_o}{f_e} = \frac{60}{10} = 6$.

66. (a) $f_o + f_e = 54$ and $\frac{f_o}{f_e} = m = 8 \Rightarrow f_o = 8 f_e$

$\Rightarrow 8 f_e + f_e = 54 \Rightarrow f_e = \frac{54}{9} = 6$

$\Rightarrow f_o = 8 f_e = 8 \times 6 = 48$

67. (a) $f_o - f_e = 9\ cm$ and $f_e = f_o - 9 = 15 - 9 = 6\ cm$

$\Rightarrow m = \frac{f_o}{f_e} = \frac{15}{6} = 2.5$

68. (c) $f_o + f_e = 80$ and $\frac{f_o}{f_e} = 19 \Rightarrow f_o = 76$ and $f_e = 4\ cm$.

69. (a)

70. (b) $R.P. \propto \frac{D}{\lambda}$

71. (c) $m = \frac{f_o}{f_e}\left(1 + \frac{f_e}{D}\right)$

72. (b) Resolving power $\propto$ Aperture

73. (a) If final image is formed at infinity, then the distance between the two lenses of telescope is equal to length of tube $= f_o + f_e = 0.3 + 0.05 = 0.35\ m$

74. (a) Limit of resolution $= \frac{1.22\,\lambda}{a} \times \frac{180}{\pi}$ (in degree)

$= \left(\frac{1.22 \times (6000 \times 10^{-10})}{5} \times \frac{180}{\pi}\right)^o = 0.03\ sec$

75. (b) Final image formed by astronomical telescope is inverted not erect.

76. (d)

77. (c)

78. (b) For normal vision (relaxed eye), the image is formed at infinity. Hence the magnifying power of Gallilean telescope $= \frac{f_o}{f_e} = \frac{200}{2} = 100$.

79. (a) $m = -\frac{f_o}{f_e} = -\frac{100}{2} = -50$.

80. (c)

81. (b) Magnifying power of astronomical telescope

$m = -\frac{f_o}{f_e}\left(1 + \frac{f_e}{D}\right) = -\frac{200}{5}\left(1 + \frac{5}{25}\right) = -48$.

82. (b) $m \propto \frac{1}{f_e}$

83. (b) $f_0 > f_e$ for telescope.

84. (a) $m = -\frac{f_0}{f_e}$.

85. (b) $|m| = \frac{f_o}{f_e}\left(1 + \frac{f_e}{D}\right) = \frac{100}{5}\left(1 + \frac{5}{25}\right) = 24$

86. (a, b, c, d)

87. (a) $|m| = \frac{f_o}{f_e} = 20$ and $L = f_o + f_e = 105 \Rightarrow f_o = 100\ cm$

88. (a) Total length $L = f_o + f_e$ and both lenses are convex.

89. (b) $L = f_o + f_e = 44$ and $|m| = \frac{f_o}{f_e} = 10$

This gives $f_o = 40\ cm$

90. (c) In case of a telescope if object and final image are at infinity then $m = \frac{f_o}{f_e}$

91. (b) Three lenses are $\rightarrow$ objective, eye piece and erecting lens.

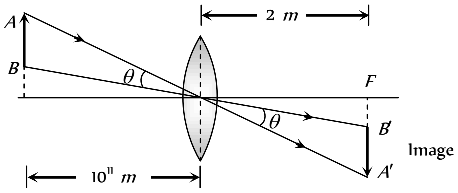
92. (d) Length of the telescope when final image is formed at least distance of distinct vision is

$$L = f_o + u_e = f_o + \frac{f_e D}{f_e + D} = 50 + \frac{5 \times 25}{5 + 25} = \frac{325}{6}\ cm$$

93. (c) $\frac{\beta}{\alpha} = \frac{f_o}{f_e} \Rightarrow \frac{\beta}{0.5^o} = \frac{100}{2} \Rightarrow \beta = 25^o$

94. (d)

95. (c) $\theta = \frac{AB}{10^{11}} = \frac{A'B'}{2} \Rightarrow A'B' = \frac{2 \times 1.4 \times 10^9}{10^{11}} = 2.8\ cm$



96. (c) $m = \frac{f_o}{f_e}\left(1 + \frac{f_e}{D}\right) \Rightarrow m = \frac{90}{6}\left(1 + \frac{6}{30}\right) \Rightarrow m = 18$

97. (d) Resolving power of telescope $= \frac{d}{1.22\ \lambda}$

98. (a) For largest magnification focal length of eye lens should be least.

99. (b) $m = \frac{f_o}{f_e}\left(1 + \frac{f_e}{D}\right) = \frac{150}{6}\left(1 + \frac{6}{25}\right) = 30$.

100. (d) To make telescope of higher magnifying power, f_o should be large and f_e should be least.

101. (c) $f_o = 50\ cm,\ f_e = 5\ cm,\ D = 25\ cm$ and $u_o = 200\ cm.$

Separation between the objective and the eye lens is

$$L = \frac{u_o f_o}{(u_o - f_o)} + \frac{f_e D}{(f_e + D)} = \frac{200 \times 50}{(200 - 50)} + \frac{5 \times 25}{(5 + 25)} = 71\ cm$$

102. (b) Resolving power $= \frac{d}{1.22\ \lambda} = \frac{1.22}{1.22 \times 5000 \times 10^{-10}} = 2 \times 10^6$

103. (a)

104. (b) By using $m = \frac{f_o}{f_e} \Rightarrow f_e = \frac{100}{50} = 2\ cm$

Also $L = f_o - f_e = 100 - 2 = 98\ cm$

105. (b) $m = \frac{f_o}{f_e} \Rightarrow 10 = \frac{f_o}{20} \Rightarrow f_o = 200\ cm$

106. (c) Minimum angular separation $\Delta\theta = \frac{1}{R.P.} = \frac{1.22\ \lambda}{d}$

$$= \frac{1.22 \times 5000 \times 10^{-10}}{2} = 0.3 \times 10^{-6}\ rad$$

107. (c) $m = 1 + \frac{D}{f_e} \Rightarrow 10 = 1 + \frac{25}{f_e} \Rightarrow f_e = \frac{25}{9} \simeq 25\ mm$

108. (a) $\frac{D}{F}$ or $\frac{25}{F}$

109. (c) $L = v_0 + u_e$ and $v_0 >> f_0,\ u_e \simeq f_e$

110. (c) Magnification will be done by compound microscope only when $f_o < f_e$

111. (d) Angular resolution $d\theta = \frac{1.22\ \lambda}{a}$

$$= \frac{1.22 \times 5000 \times 10 \times 10^{-10}}{10 \times 10^{-2}} = 6.1 \times 10^{-6}\ rad.$$

112. (a) Resolving power $= \frac{a}{1.22\ \lambda}$

113. (d) $M = \frac{f_o}{f_e} = \frac{P_e}{P_o} = \frac{20}{0.5} = 40$.

114. (a) Radio, waves can pass through dust, clouds, fog, etc, in a radio, telescope. It can detect very faint radio signal due to enormous size of its reflector. So it can be used at night and even in cloudy weather.

115. (a) Resolving limit

$$d\theta = \frac{1.22\ \lambda}{a} = \frac{1.22 \times 4538 \times 10^{-10}}{1} = 5.54 \times 10^{-7}\ rad.$$

116. (a) Magnification of objective lens $m = \frac{I}{O} = \frac{v_0}{u_0} = \frac{f_0}{u_0}$

$\Rightarrow \frac{I}{50} = \frac{200 \times 10^{-2}}{2 \times 10^3} \Rightarrow I = 5 \times 10^{-2}\ m = 5\ cm.$

117. (b) $m = \frac{v_o}{u_o}\left(1 + \frac{D}{f_e}\right) = m_o\left(1 + \frac{D}{f_e}\right)$

$\Rightarrow 30 = m_o\left(1 + \frac{25}{5}\right) = m_0 \times 6 \Rightarrow m_o = 5$.

118. (a)

119. (a) $m = \frac{f_o}{f_e} \Rightarrow \frac{100}{f_e} = 50 \Rightarrow f_e = 2\ cm$

Normal distance $f_o - f_e = 100 - 2 = 98\ cm.$

120. (a) For objective lens $\frac{1}{f_o} = \frac{1}{v_o} - \frac{1}{u_o}$

$\Rightarrow \frac{1}{v_o} = \frac{1}{f_o} + \frac{1}{u_o} = \frac{1}{4} + \frac{1}{-5} = \frac{1}{20} \Rightarrow v_o = 20 cm$

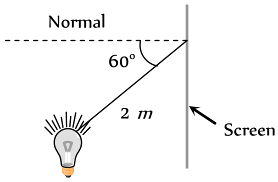
Now $M = \frac{v_o}{u_o}\left(1 + \frac{D}{f_e}\right) = \frac{20}{5}\left(1 + \frac{20}{10}\right) = 12.$

Photometry

1. (d) Luminous flux $= 4\pi\ L = 4 \times 3.14 \times 42 = 528$ *Lumen*

Power of lamp $= \frac{\text{Luminous flux}}{\text{Luminous efficiency}} = \frac{528}{2} = 264\ W$

2. (b) $I = \dfrac{L\cos\theta}{r^2}$



$\Rightarrow L = \dfrac{I \times r^2}{\cos\theta}$

$= \dfrac{5\times10^{-4}\times10^4\times2^2}{\cos 60^\circ} = 40\ Candela$

3. (d) $I = \dfrac{L}{r^2} \Rightarrow \dfrac{dI}{I} = -\dfrac{2dr}{r}$ ($\because L$ = constant)

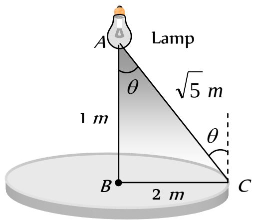
$\Rightarrow \dfrac{dI}{I}\times100 = -\dfrac{2\times dr}{r}\times100 = -2\times1 = -2\%$

4. (c) For equal fogging $I_2 \times t_2 = I_1 \times t_1$

$\Rightarrow \dfrac{L_2}{r_2^2}\times t_2 = \dfrac{L_1}{r_1^2}\times t_1 \Rightarrow \dfrac{16}{4}\times t_2 = \dfrac{20}{1}\times10$

$\Rightarrow t_2 = 50\ \text{sec}.$

5. (d) The illuminance at B



$I_B = \dfrac{L}{1^2}$ ....(i)

and illuminance at point C

$I_C = \dfrac{L\cos\theta}{(\sqrt5)^2} = \dfrac{L}{(\sqrt5)^2}\times\dfrac{1}{\sqrt5}$

$\Rightarrow I_C = \dfrac{L}{5\sqrt5}$ ...... (ii)

From equation (i) and (ii) $I_B = 5\sqrt5\ I_0$

6. (b) $I \propto \dfrac{1}{r^2}$ so,

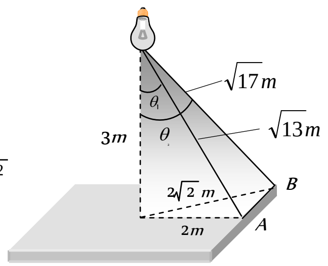
$$\frac{\text{Illuminance on slide}}{\text{Illuminance on screen}} = \frac{(\text{Length of image on screen})^2}{(\text{Length of object on slide})^2}$$

$= \left(\dfrac{3.5\ m}{35\ mm}\right)^2 = 10^4 : 1$

7. (a) The illuminance at A is

$I_A = \dfrac{L}{(\sqrt{13})^2}\times\cos\theta_1 = \dfrac{L}{13}\times\dfrac{3}{\sqrt{13}} = \dfrac{3L}{(13)^{3/2}}$

The illuminance at B is



$I_B = \dfrac{L}{(\sqrt{17})^2}\times\cos\theta_2$

$= \dfrac{L}{17}\times\dfrac{3}{\sqrt{17}} = \dfrac{3L}{(17)^{3/2}}$

$\therefore \dfrac{I_A}{I_B} = \left(\dfrac{17}{13}\right)^{3/2}$

8. (b)

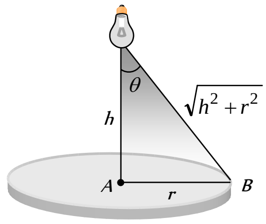
9. (c) Luminous intensity $L = \dfrac{\phi}{4\pi} \Rightarrow 1 = \dfrac{\phi}{4\pi} \Rightarrow \phi = 4\pi.$

10. (c) $\phi = 4\pi L = 4\times3.14\times100 = 1256$ *lumen.*

11. (a) $I = \dfrac{L}{r^2} \Rightarrow L = I.r^2 = 22\times2^2 = 100$

Now $\phi = 4\pi L = 4\times3.14\times100 = 1256$ *lumen.*

12. (c) Illuminance at A,



$I_A = \dfrac{L}{h^2}$

Illuminance at B,

$I_B = \dfrac{L}{\sqrt{(h^2+r^2)^2}}\cos\theta$

$= \dfrac{Lh}{(r^2+h^2)^{3/2}}$

$\therefore \dfrac{I_A}{I_B} = \left(1+\dfrac{r^2}{h^2}\right)^{3/2} = \left(1+\dfrac{8^2}{8^2}\right)^{3/2} = 2^{3/2} = 2\sqrt2 : 1$

13. (c) $I = \dfrac{L}{r^2}$

14. (c) Efficiency of light source

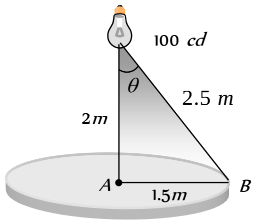
$\eta = \dfrac{\phi}{p}$ ..... (i)

and $L = \dfrac{\phi}{4\pi}$ ..... (ii)

From equation (i) and (ii)

$\Rightarrow p = \dfrac{4\pi L}{\eta} = \dfrac{4\pi\times35}{5} \approx 88\ W.$

15. (a) Case I

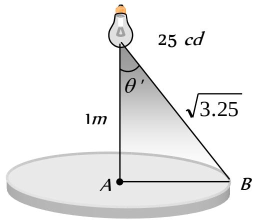


$I_A = \dfrac{100}{2^2} = 25\ cd$

and $I_B = \dfrac{100}{(2.5)^2}\cos\theta$

$= \dfrac{100}{2.5^2}\times\dfrac{2}{2.5} = \dfrac{200}{(2.5)^3}$

Case II,



$I'_B = X\,I_B = \dfrac{25}{(3.25)^{3/2}}$

so $\dfrac{I'_B}{I_B} = \dfrac{25}{200}\times\dfrac{(2.5)^3}{(3.25)^{3/2}}$

$\Rightarrow X = 1/3$

16. (a) $I \propto \dfrac{1}{r^2} \Rightarrow \dfrac{I_2}{I_1} = \dfrac{r_1^2}{r_2^2} = \dfrac{60^2}{180^2} = \dfrac{1}{9}$

17. (b)

18. (b) $I \propto \dfrac{1}{r^2}$

19. (c) To develop a print a fix amount of energy is required. Total light energy incident on photo print

$I\times A\,t = \dfrac{L}{r^2}A\,t \Rightarrow \dfrac{L_1}{r_1^2}A_1t_1 = \dfrac{L_2}{r_2^2}A_2t_2$

$\Rightarrow \dfrac{t_1}{r_1^2} = \dfrac{t_2}{r_2^2}$ ($\because L_1 = L_2$ and $A_1 = A_2$)

$$\Rightarrow t_2 = \frac{r_2^2}{r_1^2}.t_1 = \left(\frac{0.40}{0.25}\right) 2 \times 5 = 12.8 \; sec.$$

20. (b) $\frac{I_{centre}}{I_{edge}} = \frac{(r^2+h^2)^{3/2}}{h^3} = \frac{\left(1+\frac{1}{4}\right)^{3/2}}{1^3} = \left(\frac{5}{4}\right)^{3/2}$

21. (c) $I = \frac{L}{r^2} \Rightarrow \frac{L_1}{r_1^2} = \frac{L_2}{r_2^2}$ (I is same)

$$\Rightarrow \frac{L_1}{L_2} = \frac{r_1^2}{r_2^2} = \left(\frac{1}{10}\right)^2 = 1:100.$$

22. (c) $I_\theta = I_o \cos\theta = I_o \cos 60^o = \frac{I_o}{2}$

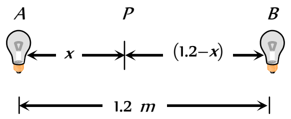
23. (a)

24. (b) $\phi = 4\pi L = 200\,\pi$ *lumen.*

so $I = \frac{\phi}{100\,A} = \frac{200\,\pi}{100 \times \pi r^2} = \frac{2}{(0.1)^2} = 200$ *lux.*

25. (b,c) According to the problem

$\frac{I_A}{x^2} = 4\frac{I_B}{(1.2-x)^2}$

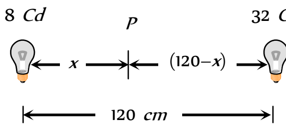


$$\Rightarrow \frac{1}{x^2} = \frac{4}{(1.2-x)^2}$$

$$\Rightarrow \frac{1}{x} = \frac{2}{1.2-x} \Rightarrow x = 0.4\,m \text{ and } 1.2 - x = 0.8\,m.$$

26. (c) $I = \frac{L}{r^2} \Rightarrow \frac{L_1}{L_2} = \frac{r_1^2}{r_2^2}$

or $\frac{8}{x^2} = \frac{32}{(120-x)^2}$



Solving it we get $x = 40\,cm$.

27. (d) $\frac{I_{center}}{I_{edge}} = \frac{(r^2+h^2)^{3/2}}{h^3}$

$$\Rightarrow 8 = \frac{(r^2+h^2)^{3/2}}{h^3} \Rightarrow 2h = (r^2+h^2)^{1/2}$$

$$\Rightarrow 4h^2 = r^2 + h^2 \Rightarrow 3h^2 = r^2 \Rightarrow h = \frac{r}{\sqrt{3}}$$

28. (b) $I = \frac{L}{r^2} = \frac{100}{5^2} = 4$ *Lux.*

29. (d) $I_1 = \frac{L}{r_1^2} = \frac{L}{1600}$ and $I_2 = \frac{L}{2500}$

$\therefore$ % decease in illuminance

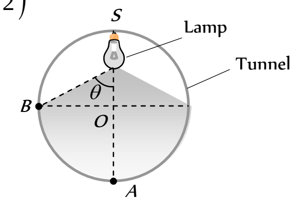
$$= \frac{I_1 - I_2}{I_1} \times 100 = \left(1 - \frac{1600}{2500}\right) \times 100 = \frac{900}{2500} \times 100 = 36$$

30. (b)

31. (d) $I_A = \frac{L}{(2r)^2}$ and $I_B = \frac{L}{(r\sqrt{2})^2}\cos\theta$

$$= \frac{L}{2r^2}.\frac{r}{r\sqrt{2}} = \frac{L}{2\sqrt{2}\,r^2}$$

$$\therefore \frac{I_A}{I_B} = \frac{2\sqrt{2}}{4} = \frac{1}{\sqrt{2}}$$



32. (a) $I = \frac{L}{r^2} \Rightarrow L = 1.57 \times 10^5 \times (1.5 \times 10^{11})^2 = 3.53 \times 10^{27}\; Cd$

33. (d) $\phi = 4\pi L = 4 \times 3.14 \times 3.53 \times 10^{27} = 4.43 \times 10^{28}$ *lumen.*

34. (d) $\phi = \frac{3}{1.5 \times 10^{-3}} \times 0.685 = 1.37 \times 10^3$ *lumen*

35. (a) $\phi_{surface} = \frac{3000}{6} = 500$ *lumen.*

36. (c) Rotation of area about incident light doesn't change the inclination of the light ray on the area.

37. (c) $I = \frac{Lh}{r^3}$

38. (d) By the symmetry of the rays and location of the points.

39. (d) If η is the luminous efficiency of the bulb then.

luminous flux by 120 *watt* at 555 *nm* $= \eta \times 120$

Let bulb of P watt at 600 *nm* produces the same luminous flux as by 120 *watt* at 555 *nm* then

$$\eta \times 120 = \eta P \times 0.6 \Rightarrow P = \frac{120}{0.6} = 200 \; watt.$$

40. (c) Illuminance produce by the sun $= \frac{L}{(1.5 \times 10^{11})^2}$

Illuminance produce by the bulb $= \frac{10000}{(0.3)^2}$

According to problem $\frac{L}{(1.5 \times 10^{11})^2} = \frac{10000}{(0.3)^2}$

$$\Rightarrow L = \frac{2.25 \times 10^{22} \times 10^4}{9 \times 10^{-2}} = 25 \times 10^{26}\, Cd$$

41. (c) $I_1 = \frac{L}{r_1^2} = \frac{L}{16}$ and $I_2 = \frac{L}{r_2^2} = \frac{L}{9}$

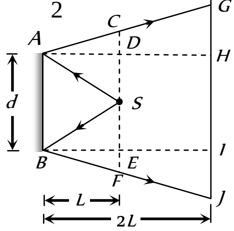
% increase in illuminance

$$= \frac{I_2 - I_1}{I} \times 100 = \left(\frac{16}{9} - 1\right) \times 100 \approx 78\%$$

Critical Thinking Questions

1. (d) According to the following ray diagram $HI = AB = d$

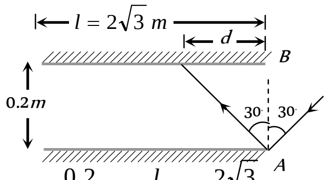
and $DS = CD = \frac{d}{2}$



$\because AH = 2AD \Rightarrow GH = 2CD = \frac{2d}{2} = d$

Similarly $IJ = d$ so $GJ = GH + HI + IJ = d + d + d = 3d$

2. (b) From the following ray diagram

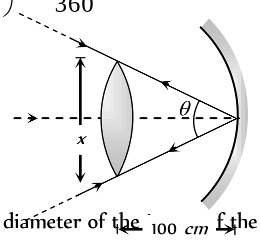


$d = 0.2\tan 30° = \frac{0.2}{\sqrt{3}} \Rightarrow \frac{l}{d} = \frac{2\sqrt{3}}{0.2/\sqrt{3}} = 30$

Therefore maximum number of reflections are 30.

3. (b) The angle subtended by the image of the sun at the mirror

$= 30' = \left(\frac{1}{2}\right)^o = \frac{\pi}{360}\ rad$



If x be the diameter of the [illegible]f the sun, then

$\frac{\text{Arc}}{\text{Radius}} = \frac{x}{100} = \frac{1}{2}.\frac{2\pi}{360} = \frac{\pi}{360} \Rightarrow x = \frac{100\pi}{360} = 0.87\ cm$

4. (a) $m = \frac{I}{O} = \frac{f}{u-f} = \frac{10}{25-10} = \frac{10}{15} = \frac{2}{3}$

$m^2 = \frac{A_i}{A_o} \Rightarrow A_i = m^2 \times A_o = \left(\frac{2}{3}\right)^2 \times (3)^2 = 4\ cm^2$

5. (d) From mirror formula $\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$ .....(i)

Differentiating equation (i), we obtain

$0 = -\frac{1}{v^2}dv - \frac{1}{u^2}du \Rightarrow dv = -\left(\frac{v}{u}\right)^2 du$ .....(ii)

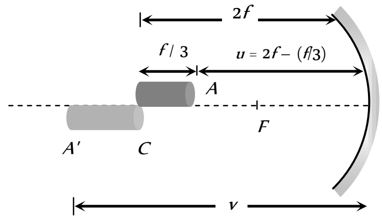
Also from equation (i) $\frac{v}{u} = \frac{f}{u-f}$ .....(iii)

From equation (ii) and (iii) we get $dv = -\left(\frac{f}{u-f}\right)^2 . l$

Therefore size of image is $\left(\frac{f}{u-f}\right)^2 l$.

6. (b) If end A of rod acts an object for mirror then it's image will be A' and if

$u = 2f - \frac{f}{3} = \frac{5f}{3}$ so by using $\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$

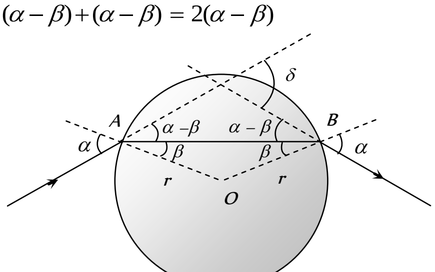


$$\Rightarrow \frac{1}{-f} = \frac{1}{v} + \frac{1}{\frac{-5f}{3}} \Rightarrow v = -\frac{5}{2}f$$

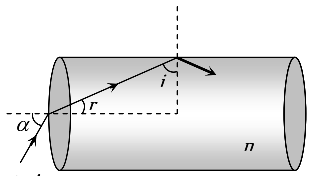
$$\therefore \text{ Length of image } = \frac{5}{2}f - 2f = \frac{f}{2}$$

7. (b) From the following ray diagram it is clear that

$$\delta = (\alpha - \beta) + (\alpha - \beta) = 2(\alpha - \beta)$$



8. (a) From the following figure



$r + i = 90^\circ \Rightarrow i = 90^\circ - r$

For ray not to emerge from curved surface $i > C$

$\Rightarrow \sin i > \sin C \Rightarrow \sin(90^\circ - r) > \sin C \Rightarrow \cos r > \sin C$

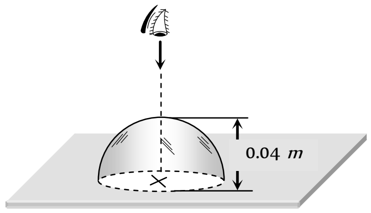
$$\Rightarrow \sqrt{1 - \sin^2 r} > \frac{1}{n} \qquad \left\{\because \sin C = \frac{1}{n}\right\}$$

$$\Rightarrow 1 - \frac{\sin^2 \alpha}{n^2} > \frac{1}{n^2} \Rightarrow 1 > \frac{1}{n^2}(1 + \sin^2 \alpha)$$

$$\Rightarrow n^2 > 1 + \sin^2 \alpha \Rightarrow n > \sqrt{2} \qquad \{\sin i \to 1\}$$

$\Rightarrow$ Least value $= \sqrt{2}$

9. (b) **Case (i)** When flat face is in contact with paper.



$$\frac{\mu_2}{v} - \frac{\mu_1}{u} = \frac{\mu_2 - \mu_1}{R} \quad \text{where}$$

$\mu_2 = R.I.$ of medium in which light rays are going = 1

$\mu_1 = R.I.$ of medium from which light rays are coming = 1.6

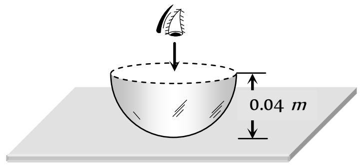
u = distance of object from curved surface = – 0.04 m

R = – 0.04 m.

$$\therefore \frac{1}{v} - \frac{1.6}{(-0.04)} = \frac{1 - 1.6}{(-0.04)} \Rightarrow v = -0.04\,m$$

i.e. the image will be formed at the same position of cross.

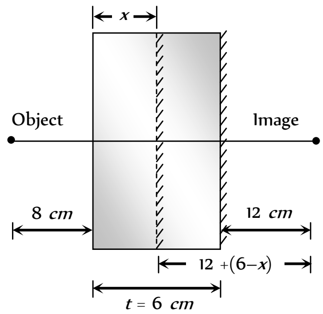
Case (ii) When curved face is in contact with paper



$$\mu = \frac{\text{Real depth }(h)}{\text{Apparent depth }(h')}$$

$$\Rightarrow 1.6 = \frac{0.04}{h'} \Rightarrow h' = 0.025\,m \qquad \text{(Below the flat face)}$$

10. (c) Let x be the apparent position of the silvered surface.

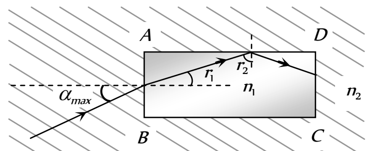


According to property of plane mirror

$x + 8 = 12 + 6 - x \Rightarrow x = 5\ cm$

Also $\mu = \frac{t}{x} \Rightarrow \mu = \frac{6}{5} = 1.2$

11. (a) Ray comes out from CD, means rays after refraction from AB get, total internally reflected at AD



$$\frac{n_1}{n_2} = \frac{\sin\alpha_{max}}{\sin r_1} \Rightarrow \alpha_{max} = \sin^{-1}\left[\frac{n_1}{n_2}\sin r_1\right] \qquad \text{...(i)}$$

Also $r_1 + r_2 = 90^o \Rightarrow r_1 = 90 - r_2 = 90 - C$

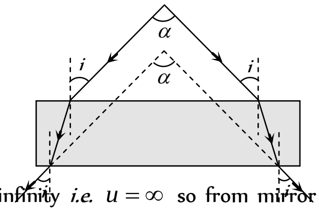
$$\Rightarrow r_1 = 90 - \sin^{-1}\left(\frac{1}{{}_2\mu_1}\right) \Rightarrow r_1 = 90 - \sin^{-1}\left(\frac{n_2}{n_1}\right) \qquad \text{...(ii)}$$

Hence from equation (i) and (ii)

$$\alpha_{max} = \sin^{-1}\left[\frac{n_1}{n_2}\sin\left\{90 - \sin^{-1}\frac{n_2}{n_1}\right\}\right]$$

$$= \sin^{-1}\left[\frac{n_1}{n_2}\cos\left(\sin^{-1}\frac{n_2}{n_1}\right)\right]$$

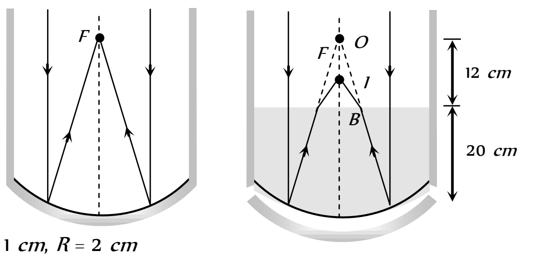
12. (b) Since rays after passing through the glass slab just suffer lateral displacement hence we have angle between the emergent rays as α.



13. (b) Sun is at infinity *i.e.* $u = \infty$ so from mirror formula we have $\frac{1}{f} = \frac{1}{-32} + \frac{1}{(-\infty)} \Rightarrow f = -32\ cm$.

When water is filled in the tank upto a height of 20 *cm*, the image formed by the mirror will act as virtual object for water surface. Which will form it's image at I such that $\frac{\text{Actual height}}{\text{Apperant height}} = \frac{\mu_w}{\mu_a}$ *i.e.* $\frac{BO}{BI} = \frac{4/3}{1}$

$$\Rightarrow BI = BO \times \frac{3}{4} = 12 \times \frac{3}{4} = 9\ cm.$$



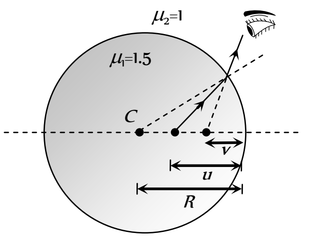
14. (a) $v = 1\ cm$, $R = 2\ cm$

By using

$$\frac{\mu_2}{v} - \frac{\mu_1}{u} = \frac{\mu_2 - \mu_1}{R}$$

$$\frac{1}{-1} - \frac{1.5}{u} = \frac{1-1.5}{-2}$$

$$\Rightarrow u = -1.2\,cm$$

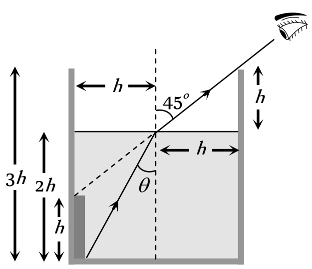


15. (b) The line of sight of the observer remains constant, making an angle of 45° with the normal.

$$\sin\theta = \frac{h}{\sqrt{h^2 + (2h)^2}} = \frac{1}{\sqrt{5}}$$

$$\mu = \frac{\sin 45^o}{\sin\theta}$$

$$= \frac{1/\sqrt{2}}{1/\sqrt{5}} = \sqrt{\left(\frac{5}{2}\right)}$$



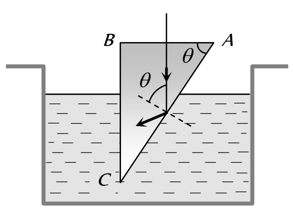
16. (b) For *glass-water* interface ${}_g\mu_w = \frac{\sin i}{\sin r}$ ...(i)

For *water-air* interface ${}_w\mu_a = \frac{\sin r}{\sin 90^o}$ ...(ii)

$$\Rightarrow {}_g\mu_w \times {}_w\mu_a = \frac{\sin i}{\sin r} \times \frac{\sin r}{\sin 90^o} = \sin i$$

$$\Rightarrow \frac{\mu_w}{\mu_g} \times \frac{\mu_a}{\mu_w} = \sin i \Rightarrow \mu_g = \frac{1}{\sin i}$$

17. (a) For TIR at AC



$$\theta > C$$

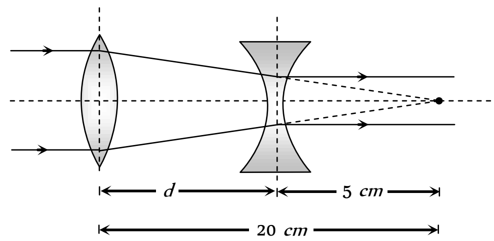
$$\Rightarrow \sin\theta \geq \sin C$$

$$\Rightarrow \sin\theta \geq \frac{1}{{}_w\mu_g}$$

$$\Rightarrow \sin\theta \geq \frac{\mu_w}{\mu_g} \Rightarrow \sin\theta \geq \frac{8}{9}$$

18. (b) From figure it is clear that separation between lenses

$$d = 20 - 5 = 15\,cm$$



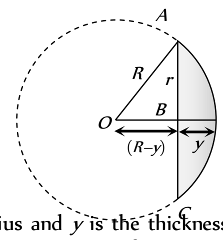
19. (c) According to lens formula $\frac{1}{f} = (\mu - 1)\left[\frac{1}{R_1} - \frac{1}{R_2}\right]$

The lens is plano-convex *i.e.*, $R_1 = R$ and $R_2 = \infty$

Hence $\frac{1}{f} = \frac{\mu - 1}{R} \Rightarrow f = \frac{R}{\mu - 1}$

Speed of light in medium of lens $v = 2 \times 10^8\ m/s$

$$\Rightarrow \mu = \frac{c}{v} = \frac{3 \times 10^8}{2 \times 10^8} = \frac{3}{2} = 1.5$$



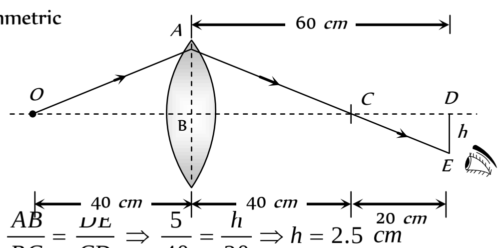
If r is the radius and y is the thickness of lens (at the centre), the radius of curvature R of its curved surface in accordance with the figure is given by

$$R^2 = r^2 + (R - y)^2 \Rightarrow r^2 + y^2 - 2Ry = 0$$

Neglecting y^2; we get $R = \frac{r^2}{2y} = \frac{(6/2)^2}{2 \times 0.3} = 15\ cm$

Hence $f = \frac{15}{1.5 - 1} = 30\ cm$

20. (c) In the following ray diagram Δ's, ABC and CDE are symmetric

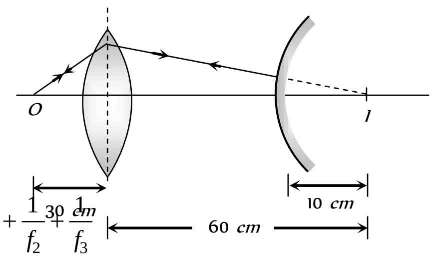


So, $\frac{AB}{BC} = \frac{DE}{CD} \Rightarrow \frac{5}{40} = \frac{h}{20} \Rightarrow h = 2.5\ cm$

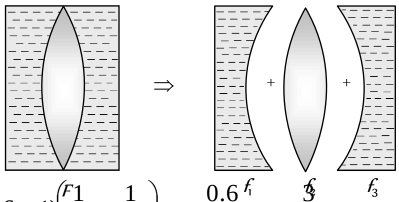
21. (c) For lens $u = 30\ cm$, $f = 20\,cm$, hence by using

$$\frac{1}{f} = \frac{1}{v} - \frac{1}{u} \Rightarrow \frac{1}{+20} = \frac{1}{v} - \frac{1}{-30} \Rightarrow v = 60\ cm$$

The final image will coincide the object, if light ray falls normally on convex mirror as shown. From figure it is seen clear that separation between lens and mirror is 60 – 10 = 50 *cm*.



22. (d) $\frac{1}{F}=\frac{1}{f_1}+\frac{1}{f_2}+\frac{1}{f_3}$



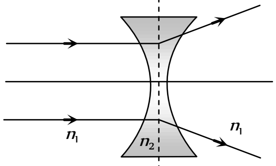
$$\frac{1}{f_1}=(1.6-1)\left(\frac{1}{\infty}-\frac{1}{20}\right)=-\frac{0.6}{20}=-\frac{3}{100} \quad ...(i)$$

$$\frac{1}{f_2}=(1.5-1)\left(\frac{1}{20}-\frac{1}{-20}\right)=\frac{1}{20} \quad ...(ii)$$

$$\frac{1}{f_3}=(1.6-1)\left(\frac{1}{-20}-\frac{1}{\infty}\right)=-\frac{3}{100} \quad ...(iii)$$

$$\Rightarrow \frac{1}{F}=-\frac{3}{100}+\frac{1}{20}-\frac{3}{100}\Rightarrow F=-100\ cm$$

23. (d) $\frac{1}{f}=\left(\frac{n_2}{n_1}-1\right)\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$ where n_2 and n_1 are the refractive indices of the material of the lens and of the surroundings respectively. For a double concave lens, $\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$ is always negative.



Hence f is negative only when $n_2>n_1$

24. (a, d) For a lens $\frac{1}{f}=\frac{1}{v}-\frac{1}{u}\Rightarrow\frac{1}{v}=\frac{1}{u}+\frac{1}{f}$ .....(i)

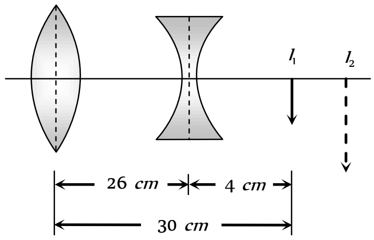
Also $m=\frac{f-v}{f}=1-\frac{v}{f}\Rightarrow m=\left(-\frac{1}{f}\right)v+1$ ....(ii)

On comparing equations (i) and (ii) with $y=mx+c$.

It is clear that relationship between $\frac{1}{v}$ *vs* $\frac{1}{u}$ and *m vs v* is linear.

25. (c) The dispersion produced by a spherical surface depends on it's radius of curvature. Hence, a lens will not exhibit dispersion only if it's two surfaces have equal radii, with one being convex and the other concave.

26. (b) Convex lens will form image I_1 at it's focus which acts like a virtual object for concave lens.



Hence for concave lens $u=+4\,cm$, $f=20\ cm$. So by lens formula $\frac{1}{-20}=\frac{1}{v}-\frac{1}{4}\Rightarrow v=5\,cm$ *i.e.* distance of final image (I_2) from concave lens $v=5\,cm$ by using $\frac{v}{u}=\frac{I}{O}\Rightarrow\frac{5}{4}=\frac{I}{2}\Rightarrow(I_2)=2.5\,cm$

27. (d) For achromatic combination $\omega_C=-\omega_F$

$[(\mu_v-\mu_r)A]_C=-[(\mu_v-\mu_r)A]_F$

$\Rightarrow[\mu_rA]_C+[\mu_rA]_F=[\mu_vA]_C+[\mu_vA]_F$

$=\ 1.5\times19+6\times1.66=38.5$

Resultant $\delta=[(\mu_r-1)Al]_C+[(\mu_r-1)A]_F$

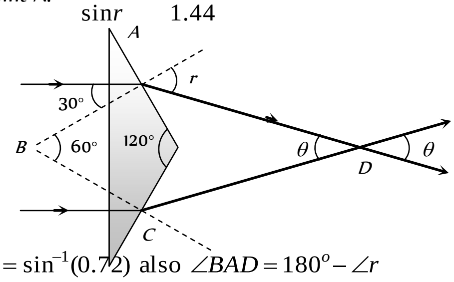
$=\ [\mu_rA]_C+[\mu_rA]_F-(A_C+A_F)=38.5-(19+6)=13.5^o$

28. (d) By using $\mu=\frac{\sin\frac{A+\delta_m}{2}}{\sin\frac{A}{2}}\Rightarrow\cot\frac{A}{2}=\frac{\sin\frac{A+\delta_m}{2}}{\sin\frac{A}{2}}$

$$\Rightarrow\frac{\cos\frac{A}{2}}{\sin\frac{A}{2}}=\frac{\sin\frac{A+\delta_m}{2}}{\sin\frac{A}{2}}$$

$$\Rightarrow\sin\left(90°-\frac{A}{2}\right)=\sin\left(\frac{A+\delta_m}{2}\right)\Rightarrow\delta_m=180-2A$$

29. (d) At point A. $\frac{\sin30^o}{\sin r}=\frac{1}{1.44}$



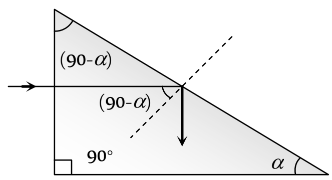
$\Rightarrow r=\sin^{-1}(0.72)$ also $\angle BAD=180^o-\angle r$

In rectangle *ABCD*, ∠ *A* + ∠ *B* + ∠ *C* + ∠ *D* = 360°

$\Rightarrow(180°-r)+60°+(180°-r)+\theta=360°$

$\Rightarrow\theta=2[\sin^{-1}(0.72)-30^o]$

30. (d) If α = maximum value of base angle for which light is totally reflected form hypotenuse.

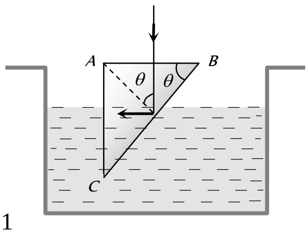


$(90^\circ - \alpha) = C$ = minimum value of angle of incidence at hypotenuse for total internal reflection

$$\sin(90^\circ - \alpha) = \sin C = \frac{1}{\mu} \Rightarrow \cos\alpha = \frac{1}{\mu} \Rightarrow \alpha = \cos^{-1}\left(\frac{1}{\mu}\right)$$

31. (b) For total internal reflection from surface BC

$\theta \geq C \Rightarrow \sin\theta \geq \sin C$



$\Rightarrow \sin\theta \geq \left(\frac{1}{{}_l\mu_g}\right)$

$\Rightarrow \sin\theta \geq \left(\frac{\mu_{\text{Liquid}}}{\mu_{\text{Prism}}}\right)$

$\sin\theta \geq \left(\frac{1.32}{1.56}\right) \Rightarrow \sin\theta \geq \frac{11}{13}$

32. (a) $\frac{\mu_2}{v} - \frac{\mu_1}{u} = \frac{\mu_2 - \mu_1}{R} \Rightarrow \frac{1.5}{+OQ} - \frac{1}{(-OP)} = \frac{(1.5-1)}{+R}$

On putting $OQ = OP,\ OP = 5R$

33. (d) Here $\frac{1}{F} = \frac{2}{f} + \frac{1}{f_m}$

Plano-convex lens silvered on plane side has $f_m = \infty$.

$\therefore \frac{1}{F} = \frac{2}{f} + \frac{1}{\infty} \Rightarrow \frac{1}{30} = \frac{2}{f} \Rightarrow f = 60\ cm$

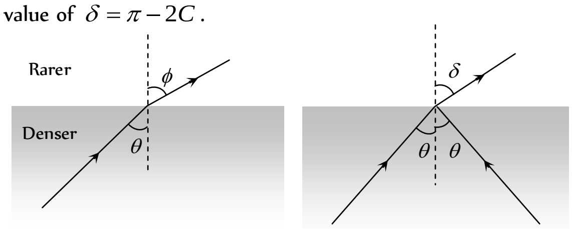
Plano-convex lens silvered on convex side has $f_m = \frac{R}{2}$

$\therefore \frac{1}{F} = \frac{2}{f} + \frac{2}{R} \Rightarrow \frac{1}{10} = \frac{2}{60} + \frac{2}{R} \Rightarrow R = 30\ cm$

Now using $\frac{1}{f} = (\mu - 1)\left(\frac{1}{R}\right)$, we get $\mu = 1.5$

34. (c) When the ray passes into the rarer medium, the deviation is $\delta = \phi - 0$. This can have a maximum value of $\left(\frac{\pi}{2} - C\right)$ for $\theta = C$ and $\phi = \frac{\pi}{2}$.

When total internal reflection occurs, the deviation is $\delta = \pi - 2$, the minimum value of θ being C. The maximum value of $\delta = \pi - 2C$.



35. (c) $\frac{}{r} = \frac{}{d} \rightarrow x = \frac{}{d}$

$$= \frac{1.22 \times 500 \times 10^{-9} \times 400 \times 10^3}{5 \times 10^{-3}} = 50\ m$$

36. (d) Resolving power $= \frac{1.22\ \lambda}{a} = \frac{1.22 \times 6000 \times 10^{-10}}{5}$

Also resolving power $= \frac{d}{D} = \frac{d}{38.6 \times 10^7}$

$\therefore \frac{1.22 \times 6 \times 10^{-7}}{5} = \frac{d}{38.6 \times 10^7}$

$\Rightarrow d = \frac{1.22 \times 6 \times 10^{-7} \times 38.6 \times 10^7}{5} m = 56.51\ m$

37. (a) As limit of resolution

$\Delta\theta = \frac{1}{\text{Resolving Power(RP)}}$; and if x is the distance between points on the surface of moon which is at a distance r from the telescope.

$\Delta\theta = \frac{x}{r}$

So $\Delta\theta = \frac{1}{RP} = \frac{x}{r}$ *i.e.* $x = \frac{r}{RP} = \frac{r}{d/1.22\ \lambda} \Rightarrow x = \frac{1.22\ \lambda r}{d}$

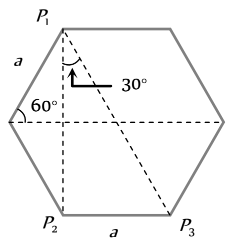
$= \frac{1.22 \times 5500 \times 10^{-10} \times (3.8 \times 10^8)}{500 \times 10^{-2}} = 51\ m$

38. (b) $I_{\text{edge}} = \frac{L\cos\theta}{(h^2 + r^2)} = \frac{Lh}{(h^2 + r^2)^{3/2}}$

For maximum extensity $\frac{dI}{dh} = 0$

Applying this condition have get $h = \frac{r}{\sqrt{2}}$

39. (a) From the geometry of the figure



$p_1 p_2 = 2a\sin 60^o$

so, $I_{P_2} = \frac{L}{p_1 p_2^2}$

$= \frac{L}{(2a\sin 60^o)^2} = \frac{L}{3a^2}$

and $I_{P_3} = \frac{L}{(P_1 P_2^2 + a^2)} \cos 30^o$

$= \frac{L}{[(2a\sin 60^o)^2 + a^2]} \frac{\sqrt{3}}{2} = \frac{\sqrt{3}\ L}{8\ a^2}$

$\Rightarrow I_{P_3} = \frac{3\sqrt{3}}{8} I_{P_2} = \frac{3\sqrt{3}}{8} I_0$

All options are wrong.

40. (c) Distance of object from mirror

$= 15 + \frac{33.25}{4} \times 3 = 39.93\ cm$

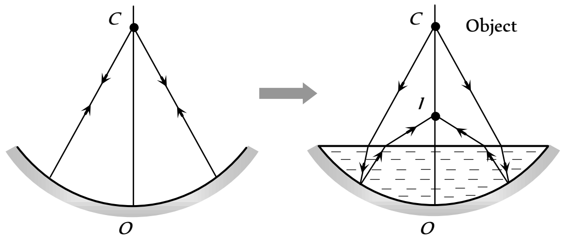
Distance of image from mirror $= 15 + \frac{25}{4} \times 3 = 33.75$

For mirror, $\frac{1}{v} + \frac{1}{u} = \frac{1}{f}$

$\Rightarrow \frac{1}{-33.75} - \frac{1}{39.93} = \frac{1}{f} \Rightarrow f \approx -18.3\ cm.$

41. (c) $v_i = -\left(\frac{f}{f-u}\right)^2 . v_o = -\left(\frac{-24}{-24-(-60)}\right)^2 \times 9 = 4\ cm/sec.$

42. (d) From the following figures it is clear that real image (I) will be formed between C and O



43. (b) $|m| = \frac{f_o}{f_e} = \frac{400}{10} = 40$

Angle subtented by moon on the objective of telescope

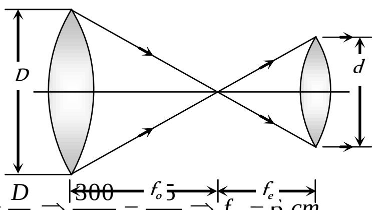
$\propto = \frac{3.5\times 10^3}{3.8\times 10^3} = \frac{3.5}{3.8}\times 10^{-2}\,rad$

Also $|m| = \frac{\beta}{\alpha} \Rightarrow$ Angular size of final image

$\beta = |m|\times\alpha = 40\times\frac{3.5}{3.8}\times 10^{-2} = 0.36\ rad$

$= 0.3\times\frac{180}{\pi} \approx 21^o$

44. (a) Full use of resolving power means whole aperture of objective in use. And for relaxed vision.



$\frac{f_o}{f_e} = \frac{D}{d} \Rightarrow \frac{300}{f_e} = \frac{5}{0.3} \Rightarrow f_e = 6\ cm$

45. (b) Wave length of the electron wave be $10\times 10^{-12}\,m$,

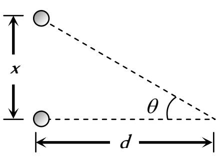
Using $\lambda = \frac{h}{\sqrt{2mE}} \Rightarrow E = \frac{h^2}{\lambda^2\times 2m}$

$= \frac{(6.63\times 10^{-34})^2}{(10\times 10^{-12})^2\times 2\times 9.1\times 10^{-31}}\,Joule$

$= \frac{(6.63\times 10^{-34})^2}{(10\times 10^{-12})^2\times 2\times 9.1\times 10^{-31}\times 1.6\times 10^{-19}}\,eV$

= 15.1 *KeV.*

46. (c) $\theta = \frac{x}{d} = \frac{1.22\lambda}{a}$



$\Rightarrow x = \frac{1.22\times d}{a}$

$= \frac{1.22\times 5000\times 10^{-10}\times 10^3}{10\times 10^{-2}} = 6.1\ mm$

i.e. order will be 5 *mm.*

47. (c) $\frac{1.22\lambda}{a} = \frac{x}{d} \Rightarrow d = \frac{x\times a}{1.22\lambda} = \frac{1\times 10^{-3}\times 3\times 10^{-3}}{1.22\times 500\times 10^{-9}} = 5m$

48. (c) Let distance between lenses be x. As per the given condition, combination behaves as a plane glass plate, having focal length ∞.

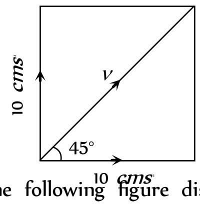
So by using $\frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} - \frac{x}{f_1 f_2}$

$\Rightarrow \frac{1}{\infty} = \frac{1}{+30} + \frac{1}{-10} - \frac{x}{(+30)(-10)} \Rightarrow x = 20\ cm$

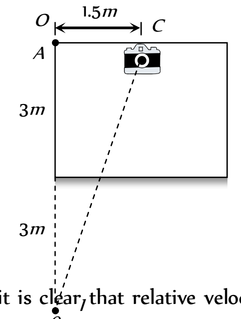
49. (a) When plane mirror rotates through an angle θ, the reflected ray rotates through an angle 2θ. So spot on the screen will make $2n$ revolution per second.

50. (d) $v\cos 45° = 10 \quad v = 10\sqrt{2}\ cms$

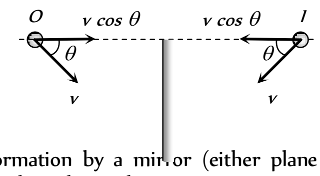
In the ceiling mirror the original velocity will be seen.



51. (d) According to the following figure distance of image I from camera $= \sqrt{(6)^2 + (1.5)^2} = 6.18\,m$



52. (c) From figure it is clear that relative velocity between object and it's image = $2v\cos\theta$



53. (b) Image formation by a mirror (either plane or spherical) does not depend on the medium.

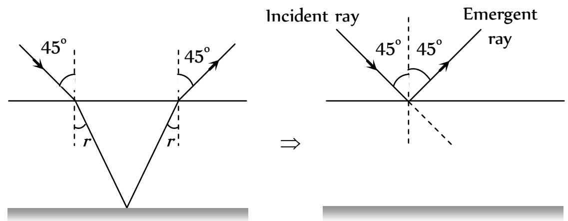
The image of P will be formed at a distance h below the mirror. If d = depth of liquid in the tank.

Apparent depth of $P = x_1 = \frac{d-h}{\mu}$

Apparent depth of the image of $P = x_2 = \frac{d+h}{\mu}$

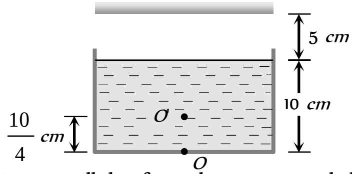
$\therefore$ Apparent distance between P and it's image $= x_2 - x_1 = \frac{2h}{\mu}$

54. (a) From the figure it is clear that the angle between incident ray and the emergent ray is 90°.



55. (b) From figure it is clear that object appears to be raised by $\frac{10}{4}cm\ (2.5\ cm)$

Hence distance between mirror and $O' = 5 + 7.5 = 12.5\ cm$



So final image will be formed at 12.5 *cm* behind the plane mirror.

56. (d) Velocity of approach of man towards the bicycle = $(u - v)$

Hence velocity of approach of image towards man is $2(u - v)$.

57. (c) For *A*

Total number of waves = $\frac{(1.5)t}{\lambda}$ ....(i)

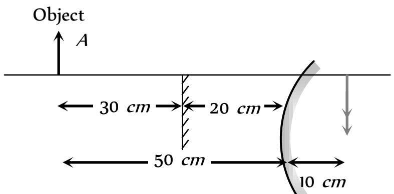
$\because \begin{pmatrix}\text{Total number}\\ \text{of waves}\end{pmatrix} = \left(\frac{\text{optical path length}}{\text{wavelength}}\right)$

For *B* and *C*

Total number of waves = $\frac{n_B\left(\frac{t}{3}\right)}{\lambda} + \frac{(1.6)\left(\frac{2t}{3}\right)}{\lambda}$ ....(ii)

Equating (i) and (ii) $n_B = 1.3$

58. (b) Since there is no parallex, it means that both images (By plane mirror and convex mirror) coinciding each other.



According to property of plane mirror it will form image at a distance of 30 *cm* behind it. Hence for convex mirror $u = -50$ *cm*, $v = +10$ *cm*

By using $\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$ $\Rightarrow \frac{1}{f} = \frac{1}{+10} + \frac{1}{-50} = \frac{4}{50}$

$\Rightarrow f = \frac{25}{2}cm$ $\Rightarrow R = 2f = 25cm.$

59. (d) For surface *P*, $\frac{1}{v_1} = \frac{1}{f} - \frac{1}{u} = 1 - \frac{1}{3} = \frac{2}{3} \Rightarrow v_1 = \frac{3}{2}m$

For surface *Q*, $\frac{1}{v_2} = \frac{1}{f} - \frac{1}{u} = 1 - \frac{1}{5} = \frac{4}{5} \Rightarrow v_2 = \frac{5}{4}m$

$\therefore v_1 - v_2 = 0.25m$

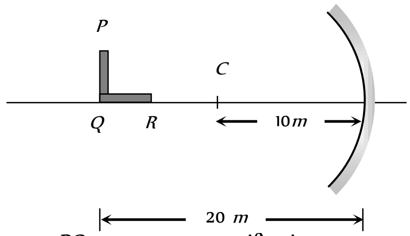
Magnification of $P = \frac{v_1}{u} = \frac{3/2}{3} = \frac{1}{2}$

$\therefore$ Height of $P = \frac{1}{2} \times 2 = 1m$

Magnification of $Q = \frac{v_2}{u} = \frac{5/4}{5} = \frac{1}{4}$

$\therefore$ Height of $Q = \frac{1}{4} \times 2 = 0.5m$

60. (b) Focal length of mirror $f = \frac{R}{2} = \frac{10}{2} = 5cm$



For part PQ : transverse magnification

length of image $L = \left(\frac{f}{f-u}\right) \times L_0$

$= \left(\frac{-5}{-5-(-20)}\right) \times L_0 = \frac{-L_0}{3}$

For part QR : longitudinal magnification

Length of image $L_2 = \left(\frac{f}{f-u}\right)^2 L_0$

$= \left(\frac{-5}{-5-(-20)}\right)^2 \times L_0 = \frac{L_0}{9} \Rightarrow \frac{L_1}{L_2} = \frac{3}{1}$

61. (d) The two slabs will shift the image a distance

$d = 2\left(1 - \frac{1}{\mu}\right)t = 2\left(1 - \frac{1}{1.5}\right)(1.5) = 1\,cm$

Therefore, final image will be 1 *cm* above point *P*.

62. (a) Here optical distance between fish and the bird is

$s = y' + \mu y$

Differentiating *w.r.t* *t* we get $\frac{ds}{dt} = \frac{dy'}{dt} + \frac{\mu dy}{dt}$

$\Rightarrow 9 = 3 + \frac{4}{3}\frac{dy}{dt} \Rightarrow \frac{dy}{dt} = 4.5\ m/\text{sec}$

63. (a) The real depth $= \mu$ (apparent depth)

$\Rightarrow$ In first case, the real depth $h_1 = \mu(b - a)$

Similarly in the second case, the real depth $h_2 = \mu(d - c)$

Since $h_2 > h_1$, the difference of real depths $= h_2 - h_1 = \mu(d - c - b + a)$

Since the liquid is added in second case, $h_2 - h_1 = (d - b)$

$\Rightarrow \mu = \frac{(d-b)}{(d-c-b+a)}$

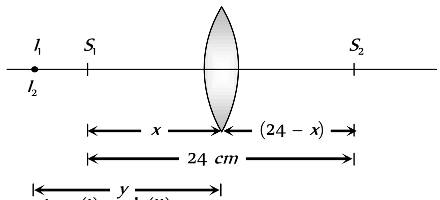
64. (a) The given condition will be satisfied only if one source (*S*) placed on one side such that $u < f$ (*i.e.* it lies under the focus). The other source (*S*) is placed on the other side of the lens such that $u > f$ (*i.e.* it lies beyond the focus).

If S_1 is the object for lens then $\frac{1}{f} = \frac{1}{-y} - \frac{1}{-x}$

$\Rightarrow \frac{1}{y} = \frac{1}{x} - \frac{1}{f}$ .....(i)

If S_2 is the object for lens then

$\frac{1}{f}=\frac{1}{+y}-\frac{1}{-(24-x)} \Rightarrow \frac{1}{y}=\frac{1}{f}-\frac{1}{(24-x)}$ .....(ii)



From equation (i) and (ii)

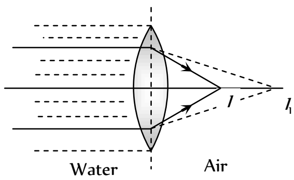
$$\frac{1}{x}-\frac{1}{f}=\frac{1}{f}-\frac{1}{(24-x)} \Rightarrow \frac{1}{x}+\frac{1}{(24-x)}=\frac{2}{f}=\frac{2}{9}$$

$\Rightarrow x^2-24x+108=0$. After solving the equation $x=18\ cm$, 6 *cm*.

65. (c) Consider the refraction of the first surface *i.e.* refraction from rarer medium to denser medium

$$\frac{\mu_2-\mu_1}{R}=\frac{\mu_1}{-u}+\frac{\mu_2}{v_1} \Rightarrow \frac{\left(\frac{3}{2}\right)-\left(\frac{4}{3}\right)}{R}=\frac{\frac{4}{3}}{\infty}+\frac{\frac{3}{2}}{v_1} \Rightarrow v_1=9R$$

Now consider the refraction at the second surface of the lens *i.e.* refraction from denser medium to rarer medium



$$\frac{1-\frac{3}{2}}{-R}=-\frac{\frac{3}{2}}{9R}+\frac{1}{v_2} \Rightarrow v_2=\left(\frac{3}{2}\right)R$$

The image will be formed at a distance of $\frac{3}{2}R$. This is equal to the focal length of the lens.

66. (c) $\delta_{Prism}=(\mu-1)A=(1.5-1)4^o=2^o$

$\therefore\ \delta_{Total}=\delta_{Prism}+\delta_{Mirror}$

$=(\mu-1)A+(180-2i)=2^o+(180-2\times 2)=178^o$

67. (b) Here the requirement is that $i>c$

$\Rightarrow \sin i>\sin c \Rightarrow \sin i>\frac{\mu_2}{\mu_1}$ .....(i)

From Snell's law $\mu_1=\frac{\sin\alpha}{\sin r}$ .....(ii)

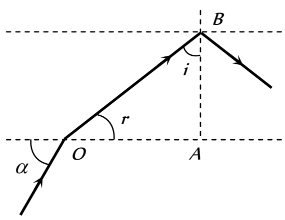
Also in ΔOBA

$r+i=90^o \Rightarrow r=(90-i)$

Hence from equation (ii)

$\sin\alpha=\mu_1\sin(90-i)$

$\Rightarrow \cos i=\frac{\sin\alpha}{\mu_1}$



$\sin i=\sqrt{1-\cos^2 i}=\sqrt{1-\left(\frac{\sin\alpha}{\mu_1}\right)^2}$ .....(iii)

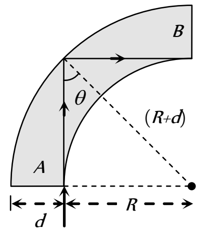
From equation (i) and (iii) $\sqrt{1-\left(\frac{\sin\alpha}{\mu_1}\right)^2}>\frac{\mu_2}{\mu_1}$

$\Rightarrow \sin^2\alpha<(\mu_1^2-\mu_2^2) \Rightarrow \sin\alpha<\sqrt{\mu_1^2-\mu_2^2}$

$\alpha_{max}=\sin^{-1}\sqrt{\mu_1^2-\mu_2^2}$

68. (b) Consider the figure if smallest angle of incidence θ is greater than critical angle then all light will emerge out of *B*

$\Rightarrow \theta\geq\sin^{-1}\left(\frac{1}{\mu}\right) \Rightarrow \sin\theta\geq\frac{1}{\mu}$



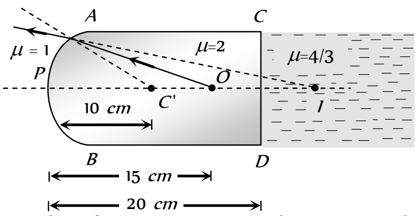
from figure $\sin\theta=\frac{R}{R+d}$

$\Rightarrow \frac{R}{R+d}\geq\frac{1}{\mu} \Rightarrow \left(1+\frac{d}{R}\right)\leq\mu$

$\Rightarrow \frac{d}{R}\leq\mu-1 \Rightarrow \left(\frac{d}{R}\right)_{max}=0.5$

69. (b) In case of refraction from a curved surface, we have

$\frac{\mu_2}{v}-\frac{\mu_1}{u}=\frac{\mu_2-\mu_1}{R} \Rightarrow \frac{1}{v}-\frac{2}{(-15)}=\frac{(1-2)}{-10} \Rightarrow v=-30\ cm.$

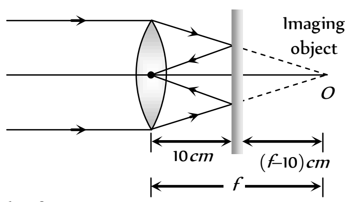


i.e. the curved surface will form virtual image *I* at distance of 30 *cm* from *P*. Since the image is virtual there will be no refraction at the plane surface *CD* (as the rays are not actually passing through the boundary), the distance of final image *I* from *P* will remain 30 *cm*.

70. (d) As $\mu_2>\mu_1$, the upper half of the lens will become diverging.

As $\mu_1>\mu_3$, the lower half of the lens will become converging

71. (b)



From the figure,

Using property of plane mirror

Image distance = Object distance

$f-10=10 \Rightarrow f=20\ cm$

72. (d) If initially the objective (focal length *F*) forms the image at distance *v* then $v_o=\frac{u_o f_o}{u_o-f_o}=\frac{3\times 2}{3-2}=6\ cm$

Now as in case of lenses in contact

$$\frac{1}{F_o}=\frac{1}{f_1}+\frac{1}{f_2}+\frac{1}{f_3}+.....=\frac{1}{f_1}+\frac{1}{F_o'}$$

$$\left\{\text{where } \frac{1}{F_o'}=\frac{1}{f_2}+\frac{1}{f_3}+.....\right\}$$

So if one of the lens is removed, the focal length of the remaining lens system

$$\frac{1}{F_o'}=\frac{1}{F_0}-\frac{1}{f_1}=\frac{1}{2}-\frac{1}{10} \Rightarrow F_o'=2.5\,cm$$

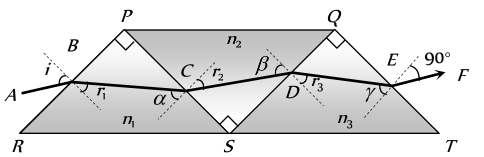
This lens will form the image of same object at a distance v_o' such that $v_o'=\frac{u_oF_o'}{u_o-F_o'}=\frac{3\times 2.5}{(3-2.5)}=15\,cm$

So to refocus the image, eye-piece must be moved by the same distance through which the image formed by the objective has shifted *i.e.* 15 – 6 = 9 *cm*.

73. (b) By using $m_\infty=\frac{(L_\infty-f_o-f_e)D}{f_of_e}$

$=\frac{(16-0.4-2.5)\times 25}{0.4\times 2.5}$ = 327.5

74. (d)



α = 90 – r_1 $\quad\beta$ = 90 – r_2 $\quad\gamma$ = 90 – r_3

At *B*

$\sin i=n_1\sin r_1 \Rightarrow \sin^2 i=n_1^2\sin^2 r_1$ .... (i)

At *C*

$n_1\sin(90-r_1)=n_2\sin r_2 \Rightarrow n_2^2\sin^2 r_2=n_1^2\cos^2 r_1$ ....(ii)

At *D*

$n_2\sin(90-r_2)=n_3\sin r_3 \Rightarrow n_2^2\cos^2 r_2=n_3^2\sin^2 r_3$ ....(iii)

At *E*

$n_3\sin(90-r_3)=(1)\sin(90-1) \Rightarrow \cos^2 i=n_3^2\cos^2 r_3$ ....(iv)

Adding (i), (ii), (iii) and (iv) we get $1+n_2^2=n_1^2+n_3^2$

75. (a) $L_D=v_o+u_e$ and for objective lens $\frac{1}{f_o}=\frac{1}{v_o}-\frac{1}{u_o}$

Putting the values with proper sign convention.

$$\frac{1}{+2.5}=\frac{1}{v_o}-\frac{1}{(-3.75)} \Rightarrow v_o=7.5\,cm$$

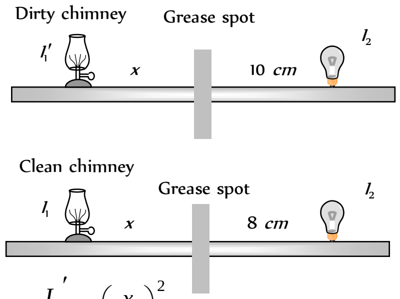
For eye lens $\frac{1}{f_e}=\frac{1}{v_e}-\frac{1}{u_e}$

$$\Rightarrow \frac{1}{+5}=\frac{1}{(-25)}-\frac{1}{u_e} \Rightarrow u_e=-4.16\,cm$$

$\Rightarrow |u_e|=4.16\,cm$

Hence $L_D=7.5+4.16=11.67\,cm$

76. (c) The actual luminous intensity of the lamp is I_1 whereas the intensity is I_1' in the dirty state.

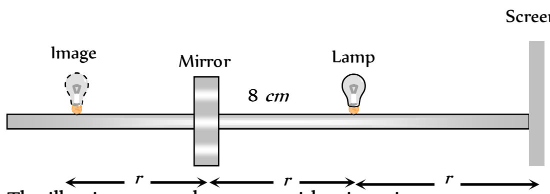


I position, $\frac{I_1'}{I_2}=\left(\frac{x}{10}\right)^2$

II position, $\frac{I_1}{I_2}=\left(\frac{x}{8}\right)^2 \Rightarrow \frac{I_1'}{I_1}=0.64$

$\Rightarrow I_1'=0.64\,I_1$. Thus, % of light absorbed = 36%.

77. (c) The illuminance on the screen without mirror is $I_1=\frac{L}{r^2}$

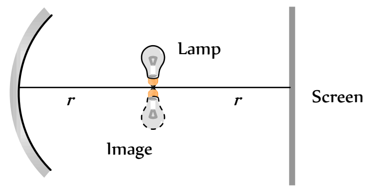


The illuminance on the screen with mirror is

$$I_2=\frac{L}{r^2}+\frac{L}{(3r)^2}=\frac{10}{9}\times\frac{L}{r^2}$$

$$\therefore \frac{I_2}{I_1}=\frac{10}{9}=10:9$$

78. (b) Illuminance on the screen without mirror is $I_1=\frac{L}{r^2}$



Illuminance on the screen with mirror

$$I_2=\frac{L}{r^2}+\frac{L}{r^2}=\frac{2L}{r^2} \Rightarrow \frac{I_2}{I_1}=2:1$$

79. (b) Apparent depth $h'=\frac{h}{_{air}\mu_{liquid}}$

$$\Rightarrow \frac{dh'}{dt}=\frac{1}{_a\mu_w}=\frac{1}{_a\mu_w}\frac{dh}{dt}\Rightarrow x=\frac{1}{_a\mu_w}\frac{dh}{dt}\Rightarrow\frac{dh}{dt}={_a\mu_w}\,x$$

Now volume of water $V=\pi R^2h$

$$\Rightarrow \frac{dV}{dt}=\pi R^2\frac{dh}{dt}=\pi R^2\cdot{_a\mu_w}\,x$$

$$={_a\mu_w}\pi R^2x=\frac{\mu_w}{\mu_a}\pi R^2x=\left(\frac{n_2}{n_1}\right)\pi R^2x$$

Graphical Questions

1. (c) As $u\to f,\ v\to\infty$; $\quad u\to\infty,\ v\to f$

2. (a) At $u = f$, $v = \infty$

At $u = 0$, $v = 0$ (*i.e.* object and image both lies at pole)

Satisfying these two conditions, only option (a) is correct.

3. (b, c) From graph $\tan 30^o = \frac{\sin r}{\sin i} = \frac{1}{{}_1\mu_2}$

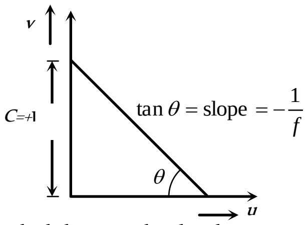
$\Rightarrow {}_1\mu_2 = \sqrt{3} \Rightarrow \frac{\mu_2}{\mu_1} = \frac{v_1}{v_2} = 1.73 \Rightarrow v_1 = 1.73 v_2$

Also from $\mu = \frac{1}{\sin C} \Rightarrow \sin C = \frac{1}{{}_{Rarer}\mu_{Denser}}$

$\Rightarrow \sin C = \frac{1}{{}_1\mu_2} = \frac{1}{\sqrt{3}}$.

4. (c) For a lens $m = \frac{f - v}{f} \Rightarrow m = \left(-\frac{1}{f}\right)v + 1$

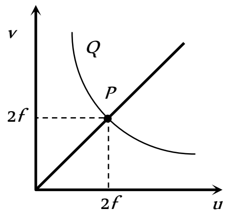
Comparing this equation with $y = mx + c$ (equation of straight line)



5. (c) At P, $u = v$ which happened only when $u = 2f$

At another point Q on the graph (above P)

$v > 2f$



6. (d) For a lens $m = \frac{f - v}{f} = -\frac{1}{f}v + 1$

Comparing it with $y = mx + c$

Slope $= m = -\frac{1}{f}$

From graph, slope of the line $= \frac{b}{c}$

Hence $-\frac{1}{f} = \frac{b}{c} \Rightarrow |f| = \frac{c}{b}$

7. (a) $\mu = A + \frac{B}{\lambda^2}$

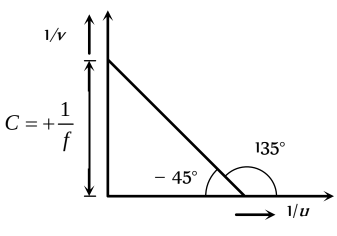
8. (a) Since $\frac{1}{f} = \frac{1}{v} + \frac{1}{u} \Rightarrow \frac{1}{v} = -\frac{1}{u} + \frac{1}{f}$

Putting the sign convention properly

$\frac{1}{(-v)} = \frac{-1}{(-u)} + \frac{1}{(-f)} \Rightarrow \frac{1}{v} = -\frac{1}{u} + \frac{1}{f}$

Comparing this equation with $y = mx + c$

Slope $= m = \tan\theta = -1 \Rightarrow \theta = 135°$ or $-45°$ and intercept $C = +\frac{1}{f}$



9. (a) As u goes from 0 to $-\infty$, v goes from $+0$ to $+f$

10. (a) For convex lens (for real image) $u + v \geq 4f$

For $u = 2f$, v is also equal to $2f$

Hence $u + v = 4f$

11. (d) For concave mirror $m = \frac{f}{f - u}$

For real image $m = -\frac{f}{(u - f)} = -\frac{f}{x}$

$= -\frac{f}{(\text{Distance of object from focus})} \Rightarrow m \propto \frac{1}{x}$.

12. (a) For a prism, as the angle of incidence increases, the angle of deviation first decreases, goes to a minimum value and then increases.

13. (b) From Newton's formula $xy = f^2$. This is the equation of a rectangular hyperbola.

14. (a, c) At P, $\delta = 0 = A(\mu - 1) \Rightarrow \mu = 1$.

Also $\delta_m = (\mu - 1)A = A\mu_m - A$

Comparing it with $y = mx + c$

Slope of the line $= m = A$

15. (b) From graph, slope $= \tan\left(\frac{2\pi}{10}\right) = \frac{\sin r}{\sin i}$

Also ${}_1\mu_2 = \frac{\mu_2}{\mu_1} = \frac{\sin i}{\sin r} = \frac{1}{\tan\left(\frac{2\pi}{10}\right)} = \frac{4}{3} \Rightarrow \mu_2 > \mu_1$

It means that medium 2 is denser medium. So total internal reflection cannot occur.

16. (d) From graph it is clear that $\tan 30^o = \frac{\sin r}{\sin i}$

$\Rightarrow \frac{1}{\sqrt{3}} = \frac{\sin r}{\sin i} = \frac{1}{\mu} \Rightarrow \mu = \sqrt{3}$

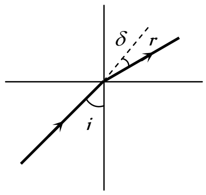
Also $v = \frac{c}{\mu} = nc \Rightarrow n = \frac{1}{\mu} = \frac{1}{\sqrt{3}} = (3)^{-1/2}$

17. (b) In concave mirror, if virtual images are formed, u can have values zero and f

At $u = 0$, $m = \frac{f}{f - u} = \frac{f}{f} = 1$

At $u = f$, $m = \frac{f}{f - u} = -\frac{f}{-f - (-f)} = \infty$

18. (a) The ray of light is refracted at the plane surface. However, since the ray is travelling from a denser to a rarer medium, for an angle of incidence (i) greater then the critical angle (c) the ray will be totally internally reflected.

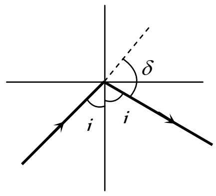


For $i < c$; deviation $\delta = r - i$ with $\frac{1}{\mu} = \frac{\sin i}{\sin r}$

Hence $\delta = \sin^{-1}(\mu \sin i) - i$

This is a non-linear relation. The maximum value of δ is $\delta_1 = \frac{\pi}{2} - c$; where $i = c$ and

$\mu = \frac{1}{\sin c}$



For $i > c$, deviation $\delta = \pi - 2i$

δ decreases linearly with i

$\delta_2 = \pi - 2c = 2\delta_1$

19. (d) For a lens $\frac{1}{f} = \frac{1}{v} - \frac{1}{u}$

If $u = \infty$, $v = f$ and if $u = f$, $v = \infty$

20. (d)

Assertion and Reason

1. (b)
2. (b) The stars twinkle while the planets do not. It is due to variation in density of atmospheric layer. As the stars are very far and giving light continuously to us. So, the light coming from stars is found to change their intensity continuously. Hence they are seen twinkling. Also stars are much bigger in size than planets but it has nothing to deal with twinkling phenomenon.
3. (c) Owls can move freely during night, because they have large number of cones on their retina which help them to see in night.
4. (c) Shining of air bubble in water is on account of total internal reflection.
5. (c) After the removal of stimulus the image formed on retina is sustained up to 1/6 second.
6. (a) Because of smallest wavelength of blue colour it is scattered to large extent than other colours, so the sky appears blue.
7. (e) For total internal reflection the angle of incidence should be greater than the critical angle. As critical angle is approximately 35°. Therefore, total internal reflection is not possible. So, assertion is not true but reason is true.
8. (c) The sun and its surroundings appears red during sunset or sunrise because of scattering of light. The amount of scattered light is inversely proportional to the fourth power of wavelength of light *i.e.* $I \propto \frac{1}{\lambda^4}$
9. (a) Focal length of lens immersed in water is four times the focal length of lens in air. It means

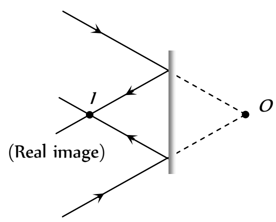
   $f_w = 4f_a = 4 \times 10 = 40\,cm$
10. (e) The velocity of light of different colours (all wavelengths) is same in vacuum and $\mu \propto \frac{1}{\lambda}$.
11. (a) The red glass absorbs the radiations emitted by green flowers; so flower appears black.
12. (a) Magnification produced by mirror $m = \frac{I}{O} = \frac{f}{f-u} = \frac{f}{x}$

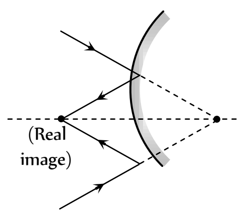
   x is distance from focus.
13. (e) Apparent shift for different coloured letter is $d = h\left(1 - \frac{1}{\mu}\right)$

   $\Rightarrow \lambda_R > \lambda_V$ so $\mu_R < \mu_V$

   Hence $d_R < d_V$ *i.e.* red coloured letter raised least.
14. (a) The efficiency of fluorescent tube is about 50 *lumen/watt*, whereas efficiency of electric bulb is about 12 *lumen/watt*. Thus for same amount of electric energy consumed, the tube gives nearly 4 times more light than the filament bulb.
15. (c) Polar caps receives almost the same amount of radiation as the equatorial plane. For the polar caps angle between sun rays and normal (to polar caps) tends to 90°. As per Lambert's cosine law, $E \propto \cos\theta$, therefore E is zero. For the equatorial plane, $\theta = 0°$, therefore E is maximum. Hence polar caps of earth are so cold. (where E is radiation received).
16. (b) At noon, rays of sun light fall normally on earth. Therefore $\theta = 0°$. According to Lambert's cosine law, $E \propto \cos\theta$, when $\theta = 0°$, $\cos\theta = \cos 0° = 1$ = max. Therefore, E is maximum.
17. (d) When an object is placed between two plane parallel mirrors, then infinite number of images are formed. Images are formed due to multiple reflections. At each reflection, a part of light energy is absorbed. Therefore, distant images get fainter.
18. (c) In search lights, we need an intense parallel beam of light. If a source is placed at the focus of a concave spherical mirror, only paraxial rays are rendered parallel. Due to large aperture of mirror, marginal rays give a divergent beam.

   But in case of parabolic mirror, when source is at the focus, beam of light produced over the entire cross-section of the mirror is a parallel beam.
19. (d) The size of the mirror does not affect the nature of the image except that a bigger mirror forms a brighter image.
20. (a) When the sun is close to setting, refraction will effect the top part of the sun differently from the bottom half. The top half will radiate its image truly, while the bottom portion will send an apparent image. Since the bottom portion of sun is being seen through thicker, more dense atmosphere. The bottom image is being bent intensely and gives the impression of being squashed or "flattened" or elliptical shape.
21. (c) $\mu \propto \frac{1}{\lambda} \propto \frac{1}{C}$. λ_V is least so C is also least. Also the greatest wavelength is for red colour.
22. (e) We can produce a real image by plane or convex mirror.

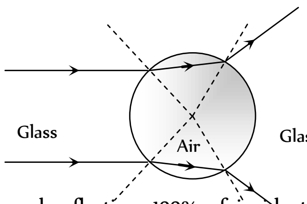




Focal length of convex mirror is taken positive.

23. (d) The colour of glowing red glass in dark will be green as red and green are complimentary colours.

24. (d) The air bubble would behave as a diverging lens, because refractive index of air is less than refractive index of glass. However, the geometrical shape of the air bubble shall resemble a double convex lens.



25. (a) In total internal reflection, 100% of incident light is reflected back into the same medium, and there is no loss of intensity, while in reflection from mirrors and refraction from lenses, there is always some loss of intensity. Therefore images formed by total internal reflection are much brighter than those formed by mirrors or lenses.

26. (d) Focal length of the lens depends upon it's refractive index as $\frac{1}{f} \propto (\mu - 1)$. Since $\mu_b > \mu_r$ so $f_b < f_r$

Therefore, the focal length of a lens decreases when red light is replaced by blue light.

27. (b) After refraction at two parallel faces of a glass slab, a ray of light emerges in a direction parallel to the direction of incidence of white light on the slab. As rays of all colours emerge in the same direction (of incidence of white light), hence there is no dispersion, but only lateral displacement.

28. (d) It is not necessary for a material to have same colour in reflected and transmitted light. A material may reflect one colour strongly and transmit some other colour. For example, some lubricating oils reflect green colour and transmit red. Therefore, in reflected light, they will appear green and in transmitted light, they will appear red.

29. (d) Dispersion of light cannot occur on passing through air contained in a hollow prism. Dispersion take place because the refractive index of medium for different colour is different. Therefore when white light travels from air to air, refractive index remains same and no dispersion occurs.

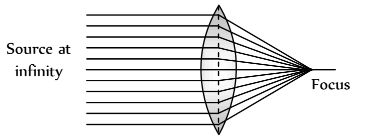
30. (b) The light gathering power (or brightness) of a telescope $\propto$ (diameter)^2. So by increasing the objective diameter even far off stars may produce images of optimum brightness.

31. (c) Very large apertures gives blurred images because of aberrations. By reducing the aperture the clear image is obtained and thus the sensitivity of camera increases.

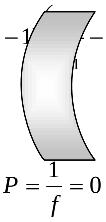
Also the focussing of object at different distance is achieved by slightly altering the separation of the lens from the film.

32. (d) We cannot interchange the objective and eye lens of a microscope to make a telescope. The reason is that the focal length of lenses in microscope are very small, of the order of *mm* or a few *cm* and the difference $(f_o - f_e)$ is very small, while the telescope objective have a very large focal length as compared to eye lens of microscope.

33. (a) Image formed by convex lens



34. (a) The focal length of a lens is given by $\frac{1}{f} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right)$

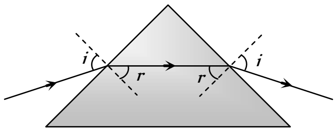


For, goggle, $R_1 = R_2$

$\therefore \ \frac{1}{f} = (\mu - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right) = 0$. Therefore, $P = \frac{1}{f} = 0$

35. (c) The wavelength of wave associated with electrons (de Broglie waves) is less than that of visible light. We know that resolving power is inversely proportional to wavelength of wave used in microscope. Therefore the resolving power of an electron microscope is higher than that of an optical microscope.

36. (a) In case of minimum deviation of a prism $\angle i = \angle e$ so $\angle r_1 = \angle r_2$



37. (b) The velocity of light in a material medium depends upon it's colour (wavelength). If a ray of white light incident on a prism, then on emerging, the different colours are deviated through different angles.

Also dispersive power $\omega = \frac{(\mu_V - \mu_R)}{(\mu_Y - 1)}$

i.e. ω depends upon only μ.

38. (c) The ray of light incident on the water air interface suffers total internal reflections, in that case the angle of incidence is greater than the critical angle. Therefore, if the tube is viewed from suitable direction (so that the angle of incidence is greater than the critical angle), the rays of light incident on the tube undergoes total internal reflection. As a result, the test tube appears as highly polished *i.e.* silvery.

39. (a) In wide beam of light, the light rays of light which travel close to the principal axis are called paraxial rays, while the rays which travel quite away from the principal axis is called marginal rays. In case of lens having large aperture, the behaviour of the paraxial and marginal rays are markedly different from each other. The two types of rays come to focus at different points on the principal axis of the lens, thus the spherical aberration occur. However in case of a lens with small aperture, the two types of rays come to focus quite close to each other.

40. (e)

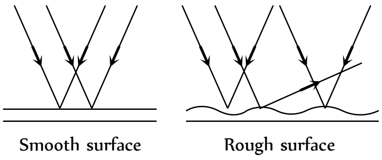
41. (b)

42. (b)

43. (c)

44. (a) Resolving power $=\frac{a}{1.22\lambda}$.

45. (c) When glass surface is made rough then the light falling on it is scattered in different direction due to which its transparency decreases.



46. (b) Diamond glitters brilliantly because light enters in diamond suffers total internal reflection. All the light entering in it comes out of diamond after number of reflections and no light is absorb by it.

47. (c) The clouds consist of dust particles and water droplets. Their size is very large as compared to the wavelength of the incident light from the sun. So there is very little scattering of light. Hence the light which we receive through the clouds has all the colours of light. As a result of this, we receive almost white light. Therefore, the cloud are generally white.

Ray Optics

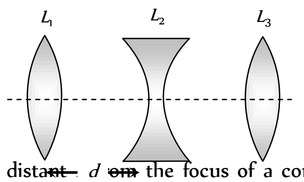
SET Self Evaluation Test - 29

1. In an astronomical telescope in normal adjustment, a straight black line of length L is drawn on the objective lens. The eyepiece forms a real image of this line. The length of this image is l. The magnification of the telescope is

(a) $\frac{L}{l}$ (b) $\frac{L}{l}+1$

(c) $\frac{L}{l}-1$ (d) $\frac{L+l}{L-l}$

2. Three lenses L_1, L_2, L_3 are placed co-axially as shown in figure. Focal length's of lenses are given 30 *cm*, 10 *cm* and 5 *cm* respectively. If a parallel beam of light falling on lens L_1, emerging L_3 as a convergent beam such that it converges at the focus of L_3. Distance between L_1 and L_2 will be



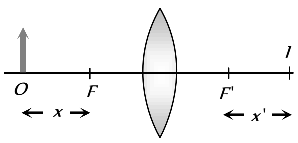
(a) 40 *cm*

(b) 30 *cm*

(c) 20 *cm*

(d) 10 *cm*

3. An object is placed at a point distant d cm the focus of a convex lens and its image is formed at I as shown in the figure. The distances x, x' satisfy the relation



(a) $\frac{x+x'}{2}=f$

(b) $f=xx'$

(c) $x+x'\leq 2f$

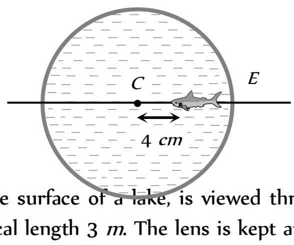
(d) $x+x'\geq 2f$

4. The diameter of the eye-ball of a normal eye is about 2.5 *cm*. The power of the eye lens varies from

(a) 2 *D* to 10 *D* (b) 40 *D* to 32 *D*

(c) 9 *D* to 8 *D* (d) 44 *D* to 40 *D*

5. In a thin spherical fish bowl of radius 10 *cm* filled with water of refractive index 4/3 there is a small fish at a distance of 4 *cm* from the centre C as shown in figure. Where will the image of fish appears, if seen from E



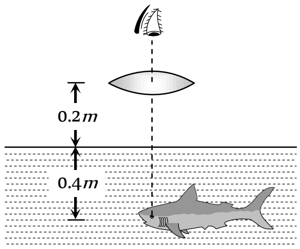
(a) 5.2 *cm*

(b) 7.2 *cm*

(c) 4.2 *cm*

(d) 3.2 *cm*

6. A small fish 0.4 *m* below the surface of a lake, is viewed through a simple converging lens of focal length 3 *m*. The lens is kept at 0.2 *m* above the water surface such that fish lies on the optical axis of the lens. The image of the fish seen by observer will be at $\left(\mu_{water}=\frac{4}{3}\right)$



(a) A distance of 0.2 *m* from the water surface

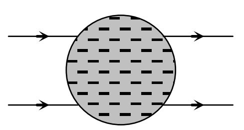
(b) A distance of 0.6 *m* from the water surface

(c) A distance of 0.3 *m* from the water surface

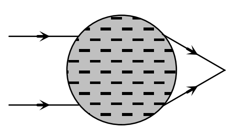
(d) The same location of fish

7. A water drop in air refractes the light ray as

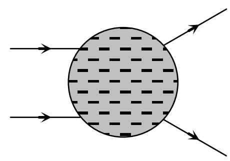
(a)



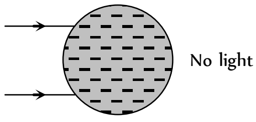
(b)



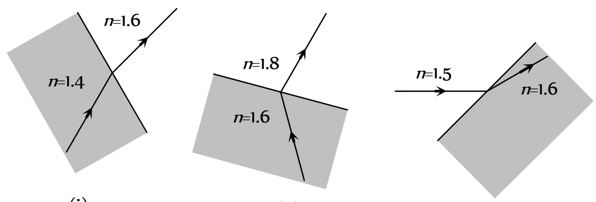
(c)



(d)



8. Which of the following ray diagram show physically possible refraction

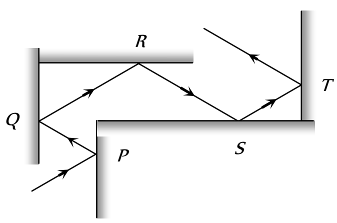


(i) (ii) (iii)

(a) (i) (b) (ii)

(c) (iii) (d) None of these

9. Following figure shows the multiple reflections of a light ray along a glass corridor where the walls are either parallel or perpendicular to one another. If the angle of incidence at point P is 30°, what are the angles of reflection of the light ray at points Q, R, S and T respectively



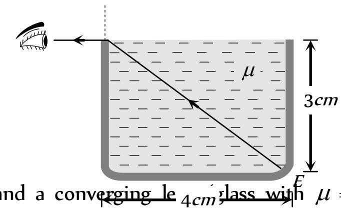
(a) 30°, 30°, 30°, 30°

(b) 30°, 60°, 30°, 60°

(c) 30°, 60°, 60°, 30°

(d) 60°, 60°, 60°, 60°

10. When the rectangular metal tank is filled to the top with an unknown liquid, as observer with eyes level with the top of the tank can just see the corner *E*; a ray that refracts towards the observer at the top surface of the liquid is shown. The refractive index of the liquid will be



(a) 1.2

(b) 1.4

(c) 1.6

(d) 1.9

11. A concave mirror and a converging lens (glass with $\mu = 1.5$) both have a focal length of 3 *cm* when in air. When they are in water $\left(\mu = \frac{4}{3}\right)$, their new focal lengths are

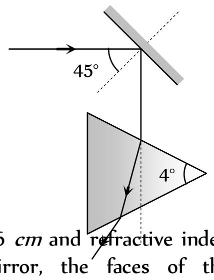
(a) $f_{Lens} = 12\ cm$, $f_{Mirror} = 3cm$

(b) $f_{Lens} = 3\ cm$, $f_{Mirror} = 12cm$

(c) $f_{Lens} = 3\ cm$, $f_{Mirror} = 3cm$

(d) $f_{Lens} = 12\ cm$, $f_{Mirror} = 12cm$

12. A ray of light strikes a plane mirror *M* at an angle of 45° as shown in the figure. After reflection, the ray passes through a prism of refractive index 1.5 whose apex angle is 4°. The total angle through which the ray is deviated is



(a) 90°

(b) 91°

(c) 92°

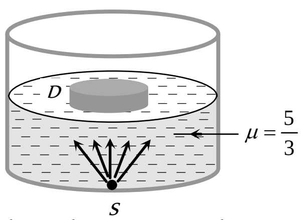
(d) 93°

13. A slab of glass, of thickness 6 *cm* and refractive index 1.5, is placed in front of a concave mirror, the faces of the slab being perpendicular to the principal axis of the mirror. If the radius of curvature of the mirror is 40 *cm* and the reflected image coincides with the object, then the distance of the object from the mirror is

(a) 30 *cm* (b) 22 *cm*

(c) 42 *cm* (d) 28 *cm*

14. A point source of light *S* is placed at the bottom of a vessel containing a liquid of refractive index 5/3. A person is viewing the source from above the surface. There is an opaque disc *D* of radius 1 *cm* floating on the surface of the liquid. The centre of the disc lies vertically above the source *S*. The liquid from the vessel is gradually drained out through a tap. The maximum height of the liquid for which the source cannot be seen at all from above is



(a) 1.50 *cm*

(b) 1.64 *cm*

(c) 1.33 *cm*

(d) 1.86 *cm*

15. A point object is placed mid-way between two plane mirrors distance '*a*' apart. The plane mirror forms an infinite number of images due to multiple reflection. The distance between the *n*th order image formed in the two mirrors is

(a) *na* (b) 2*na*

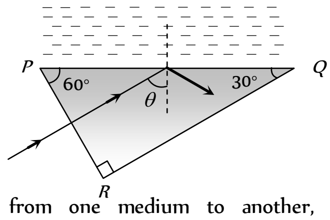
(c) *na*/2 (d) $n^2 a$

16. A convergent beam of light is incident on a convex mirror so as to converge to a distance 12 *cm* from the pole of the mirror. An inverted image of the same size is formed coincident with the virtual object. What is the focal length of the mirror

(a) 24 *cm* (b) 12 *cm*

(c) 6 *cm* (d) 3 *cm*

17. *PQR* is a right angled prism with other angles as 60° and 30°. Refractive index of prism is 1.5. *PQ* has a thin layer of liquid. Light falls normally on the face *PR*. For total internal reflection, maximum refractive index of liquid is



(a) 1.4

(b) 1.3

(c) 1.2

(d) 1.6

18. When a ray is refracted from one medium to another, the wavelength changes from 6000 Å to 4000 Å. The critical angle for the interface will be

(a) $\cos^{-1}\left(\frac{2}{3}\right)$ (b) $\sin^{-1}\left(\frac{2}{\sqrt{3}}\right)$

(c) $\sin^{-1}\left(\frac{2}{3}\right)$ (d) $\cos^{-1}\left(\frac{2}{\sqrt{3}}\right)$

19. Two thin lenses, when in contact, produce a combination of power + 10 *D*. When they are 0.25 *m* apart, the power reduces to + 6*D*. The focal lengths of the lenses (in *m*) are

(a) 0.125 and 0.5 (b) 0.125 and 0.125

(c) 0.5 and 0.75 (d) 0.125 and 0.75

20. The plane faces of two identical plano convex lenses, each with focal length *f* are pressed against each other using an optical glue to form a usual convex lens. The distance from the optical centre at which an object must be placed to obtain the image same as the size of object is

(a) $\frac{f}{4}$ (b) $\frac{f}{2}$

(c) *f* (d) 2 *f*

21. A parallel beam of light emerges from the opposite surface of the sphere when a point source of light lies at the surface of the sphere. The refractive index of the sphere is

(a) $\frac{3}{2}$ (b) $\frac{5}{3}$

(c) 2 (d) $\frac{5}{2}$

22. A ray of light makes an angle of 10° with the horizontal above it and strikes a plane mirror which is inclined at an angle θ to the horizontal. The angle θ for which the reflected ray becomes vertical is

(a) 40° (b) 50°

(c) 80° (d) 100°

23. A thin rod of $5cm$ length is kept along the axis of a concave mirror of $10cm$ focal length such that its image is real and magnified and one end touches the rod. Its magnification will be

(a) 1 (b) 2

(c) 3 (d) 4

24. A telescope using light having wavelength 5000 Å and using lenses of focal 2.5 and 30 *cm*. If the diameter of the aperture of the objective is 10 *cm*, then the resolving limit and magnifying power of the telescope is respectively

(a) $6.1\times10^{-6} rad$ and 12

(b) $5.0\times10^{-6} rad$ and 12

(c) $6.1\times10^{-6} rad$ and 8.3×10^{-2}

(d) $5.0\times10^{-6} rad$ and 8.3×10^{-2}

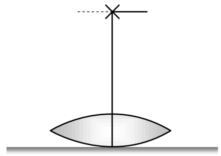
25. A lens when placed on a plane mirror then object needle and its image coincide at 15 *cm*. The focal length of the lens is

(a) 15 *cm*

(b) 30 *cm*

(c) 20 *cm*

(d) ∞



Answers and Solutions

(SET -29)

1. (a) Here we treat the line on the objective as the object and the eyepiece as the lens.

Hence $u = -(f_o + f_e)$ and $f = f_e$

Now $\frac{1}{v} - \frac{1}{-(f_o+f_e)} = \frac{1}{f_e}$

Solving we get $v = \frac{(f_o+f_e)f_e}{f_o}$

Magnification $= \left|\frac{v}{u}\right| = \frac{f_e}{f_o} = \frac{\text{Image size}}{\text{Object size}} = \frac{l}{L}$

∴ Magnification of telescope in normal adjustment

$= \frac{f_o}{f_e} = \frac{L}{l}$

2. (c) According to the problem, combination of L_1 and L_2 act a simple glass plate. Hence according to formula $\frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} - \frac{d}{f_1 f_2}$

$$\frac{1}{f_1} + \frac{1}{f_2} - \frac{d}{f_1 f_2} = 0 \Rightarrow \frac{1}{f_1} + \frac{1}{f_2} = \frac{d}{f_1 f_2}$$

$\Rightarrow \frac{1}{30}-\frac{1}{10}=\frac{d}{30\times -10} \Rightarrow \frac{-20}{30\times 10}=-\frac{d}{30\times 10}$

$\Rightarrow d = 20\,cm$

3. (d) From the figure for real image formation

$x + x' + 2f \geq 4f \Rightarrow x + x' \geq 2f.$

4. (d) An eye sees distant objects with full relaxation

So $\frac{1}{2.5\times 10^{-2}}-\frac{1}{-\infty}=\frac{1}{f}$ or $P=\frac{1}{f}=\frac{1}{25\times 10^{-2}}=40D$

An eye sees an object at 25 *cm* with strain

So $\frac{1}{2.5\times 10^{-2}}-\frac{1}{-25\times 10^{-2}}=\frac{1}{f}$

or $P=\frac{1}{f}=40+4=44D$

5. (a) By using $\frac{\mu_2}{v}-\frac{\mu_1}{u}=\frac{\mu_2-\mu_1}{R}$

where $\mu_1=\frac{4}{3}$, $\mu_2=1$, $u=-6\,cm$, $v=?$

On putting values $v=-5.2\,cm$

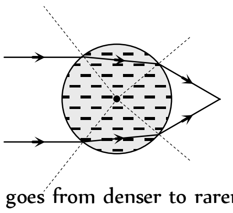
6. (d) Apparent distance of fish from lens $u=0.2+\frac{h}{\mu}$

$=0.2+\frac{0.4}{4/3}=0.5\,m$

From $\frac{1}{f}=\frac{1}{v}-\frac{1}{u} \Rightarrow \frac{1}{(+3)}=\frac{1}{v}-\frac{1}{(-0.5)}$ $v=-0.6\,m$

The image of the fish is still where the fish is 0.4 *m* below the water surface.

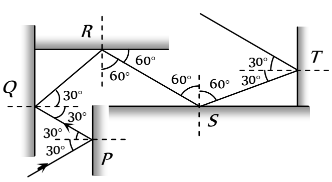
7. (b) A water drop in air behaves as converging lens.



8. (a) When light ray goes from denser to rarer medium (*i.e.* more μ to less μ) it deviates away from the normal while if light ray goes from rarer to denser medium (*i.e.* less μ more μ) it bend towards the normal.

This property is satisfying by the ray diagram (i) only.

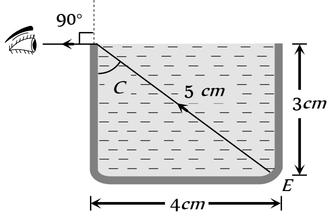
9. (c)



10. (a) Light ray is going from liquid (Denser) to air (Rarer) and angle of refraction is 90^o, so angle of incidence must be equal to critical angle

from figure

$\sin C=\frac{4}{5}$



Also $\mu=\frac{1}{\sin C}=\frac{5}{4}=1.2$

11. (a) Focal length of lens will increase by four times (*i.e.* 12 *cm)* while focal length of mirror will not affected by medium.

12. (c) $\delta_{\text{net}}=\delta_{\text{mirror}}+\delta_{\text{prism}}$

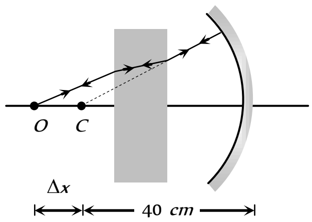
$=(180-2i)+(\mu-1)A$

$=(180-2\times 45)+(1.5-1)\times 4=92^o$

13. (c) $\Delta x=\left(1-\frac{1}{\mu}\right)t$

$=\left(1-\frac{1}{1.5}\right)\times 6$

= 2 *cm.*



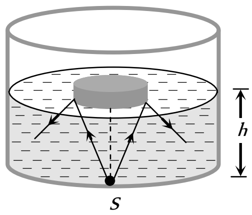
Distance of object from mirror = 42 *cm.*

14. (c) Suppose the maximum height of the liquid is *h* for which the source is not visible.

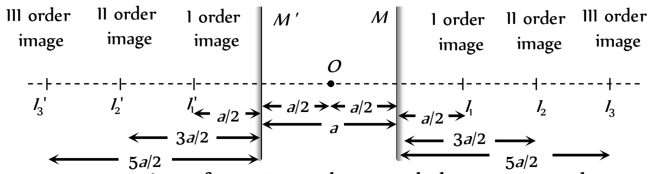
Hence radius of the disc

$r=\frac{h}{\sqrt{\mu^2-1}}$

$1=\frac{h}{\sqrt{\left(\frac{5}{3}\right)^2-1}} \Rightarrow h=1.33\,cm$



15. (b)

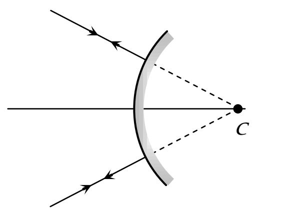


From above figure it can be proved that separation between *n*th order image formed in the two mirrors = $2na$

16. (c) Here object and image are at the same position so this position must be centre of curvature

$\therefore$ R = 12 *cm*

$\Rightarrow f=\frac{R}{2}$



17. (b) For *TIR* at *PQ* ; $\theta < C$

From geometry of figure $\theta=60$ *i.e.* $60>C$

$\Rightarrow \sin 60 > \sin C$

$\Rightarrow \frac{\sqrt{3}}{2} > \frac{\mu_{Liquid}}{\mu_{\text{Prism}}} \Rightarrow \mu_{Liquid} < \frac{\sqrt{3}}{2}\times \mu_{\text{Prism}}$

$\Rightarrow \mu_{Liquid} < \frac{\sqrt{3}}{2}\times 1.5 \Rightarrow \mu_{Liquid} < 1.3$.

18. (c) $_1\mu_2 = \frac{1}{\sin C} \Rightarrow \frac{\mu_2}{\mu_1} = \frac{\lambda_1}{\lambda_2} = \frac{1}{\sin C}$

$\Rightarrow \frac{6000}{4000} = \frac{1}{\sin C} \Rightarrow C = \sin^{-1}\left(\frac{2}{3}\right)$

19. (a) When lenses are in contact

$P = \frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} \Rightarrow 10 = \frac{1}{f_1} + \frac{1}{f_2}$ ..... (i)

When they are distance d apart

$P' = \frac{1}{F'} = \frac{1}{f_1} + \frac{1}{f_2} - \frac{d}{f_1 f_2} \Rightarrow 6 = \frac{1}{f_1} + \frac{1}{f_2} - \frac{0.25}{f_1 f_2}$ ..... (ii)

From equation (i) and (ii) $f_1 f_2 = \frac{1}{16}$ ..... (iii)

From equation (i) and (iii) $f_1 + f_2 = \frac{5}{8}$ ..... (iv)

Also $(f_1 - f_2)^2 = (f_1 + f_2)^2 - 4 f_1 f_2$

Hence $(f_1 - f_2)^2 = \left(\frac{5}{8}\right)^2 - 4 \times \frac{1}{16} = \frac{9}{64}$

$\Rightarrow f_1 - f_2 = \frac{3}{8}$ ..... (v)

On solving (iv) and (v) $f_1 = 0.5\,m$ and $f_2 = 0.125\,m$

20. (c) Two plano-convex lens of focal length *f*, when combined will give rise to a convex lens of focal length $f/2$.

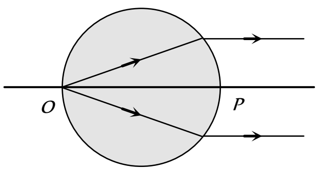
The image will be of same size if object is placed at $2f$ *i.e.* at a distance *f* from optical centre.

21. (c) Considering pole at *P*, we have

$\frac{\mu_2}{v} - \frac{\mu_1}{u} = \frac{\mu_2 - \mu_1}{R}$

$\Rightarrow \frac{1}{\infty} - \frac{\mu}{(-2R)} = \frac{1-\mu}{(-R)}$

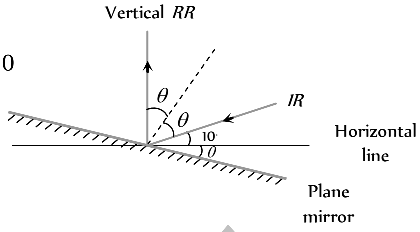
$\Rightarrow \frac{\mu}{2R} = \frac{1-\mu}{(-R)} \Rightarrow \mu = 2$



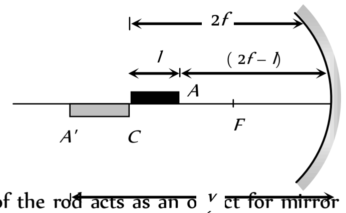
22. (a) From figure

$\theta + \theta + 10 = 90$

$\Rightarrow \theta = 40^o$



23. (b)



End *A* of the rod acts as an object for mirror and *A*′ will be its image so $u = 2f - l = 20 - 5 = 15\ cm$

$\because \frac{1}{f} = \frac{1}{v} + \frac{1}{u} \Rightarrow \frac{1}{-10} = \frac{1}{v} - \frac{1}{15} \Rightarrow v = -30\ cm$.

Now $m = \frac{\text{Length of image}}{\text{Length of object}} = \frac{(30-20)}{5} = 2$

24. (a) $m = \frac{f_0}{f_e} = \frac{30}{2.5} = 12$

Resolving limit $= \frac{1.22\,\lambda}{a} = \frac{1.22 \times (5000 \times 10^{-10})}{0.1}$

$= 6.1 \times 10^{-6}\,rad$

25. (a) When the object is placed at focus the rays are parallel. The mirror placed normal sends them back. Hence image is formed at the object itself as illustrated in figure.

Wave Optics

Newton's Corpuscular Theory

(1) Newton thought that light is made up of tiny, light and elastic particles called corpuscles which are emitted by a luminous body.

(2) The corpuscles travel with speed equal to the speed of light in all directions in straight lines.

(3) The corpuscles carry energy with them. When they strike retina of the eye, they produce sensation of vision.

(4) The corpuscles of different colour are of different sizes (red corpuscles larger than blue corpuscles).

(5) The corpuscular theory explains that light carry energy and momentum, light travels in a straight line, Propagation of light in vacuum, Laws of reflection and refraction

(6) The corpuscular theory fails to explain interference, diffraction and polarization.

(7) A major prediction of the corpuscular theory is that the speed of light in a denser medium is more than the speed of light in a rarer medium. The truth is that the speed of the light is smaller in a denser medium. Therefore, the Newton's corpuscular theory is wrong.

Huygen's Wave Theory

(1) Wave theory of light was given by Christian Huygen. According to this, a luminous body is a source of disturbance in a hypothetical medium ether. This medium pervades all space.

(2) It is assumed to be transparent and having zero inertia. The disturbance from the source is propagated in the form of waves through the space.

(3) The waves carry energy and momentum. Huygen assumed that the waves were longitudinal. Further when polarization was discovered, then to explain it, light waves were, assumed to be transverse in nature by Fresnel.

(4) This theory explains successfully, the phenomenon of interference and diffraction apart from other properties of light.

(5) The Huygen's theory fails to explain photo-electric effect, Compton's effect *etc*.

(6) The wave theory introduces the concept of wavefront.

Wavefront

(1) Suggested by Huygens

(2) The locus of all particles in a medium, vibrating in the same phase is called Wave Front (WF)

(3) The direction of propagation of light (ray of light) is perpendicular to the WF.

(4) Every point on the given wave front acts as a source of new disturbance called secondary wavelets which travel in all directions with the velocity of light in the medium.

(5) A surface touching these secondary wavelets tangentially in the forward direction at any instant gives the new wave front at that instant. This is called secondary wave front

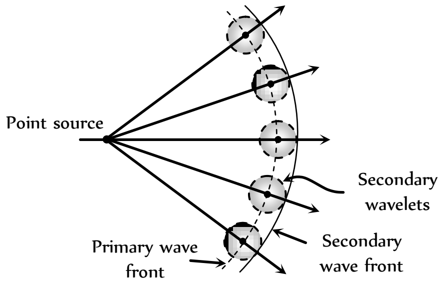

Fig. 30.1

Table 30.1 : Different types of wavefront

Type of wavefront	Intensity	Amplitude
Spherical 	$I \propto \frac{1}{r^2}$	$A \propto \frac{1}{r}$

Cylindrical 	$I \propto \frac{1}{r}$	$A \propto \frac{1}{\sqrt{r}}$
Plane 	$I \propto r^0$	$A \propto r^0$

Reflection and Refraction of Wavefront

Reflection

$BC = AD$

and $\angle i = \angle r$

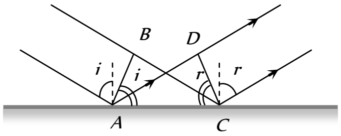

Fig. 30.2

Refraction

$$\frac{BC}{AD} = \frac{v_1}{v_2} = \frac{\sin i}{\sin r} = \frac{\mu_2}{\mu_1}$$

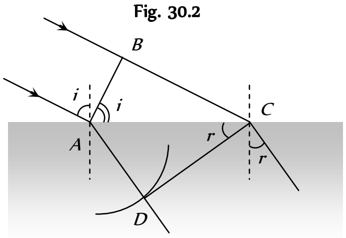

Fig. 30.3

Super Position of Waves

When two or more than two waves superimpose over each other at a common particle of the medium then the resultant displacement (y) of the particle is equal to the vector sum of the displacements (y_1 and y_2) produced by individual waves. *i.e.* $\vec{y} = \vec{y}_1 + \vec{y}_2$

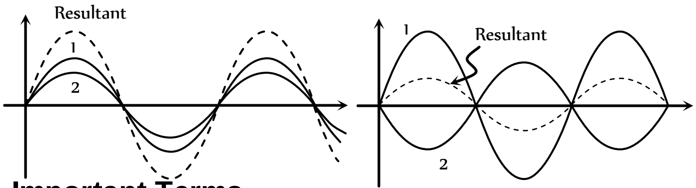

Fig. 30.4

Important Terms

(1) **Phase :** The argument of sine or cosine in the expression for displacement of a wave is defined as the phase. For displacement $y = a \sin \omega t$; term ωt = phase or instantaneous phase.

(2) **Phase difference (ϕ) :** The difference between the phases of two waves at a point is called phase difference *i.e.* if $y_1 = a_1 \sin \omega t$ and $y_2 = a_2 \sin(\omega t + \phi)$ so phase difference = ϕ

(3) **Path difference (Δ) :** The difference in path length's of two waves meeting at a point is called path difference between the waves at that point. Also $\Delta = \frac{\lambda}{2\pi} \times \phi$

(4) **Time difference (*T.D.*) :** Time difference between the waves meeting at a point is ***T.D.*** $= \frac{T}{2\pi} \times \phi$

Resultant Amplitude and Intensity

Let us consider two waves that have the same frequency but have a certain fixed (constant) phase difference between them. Their super position shown below

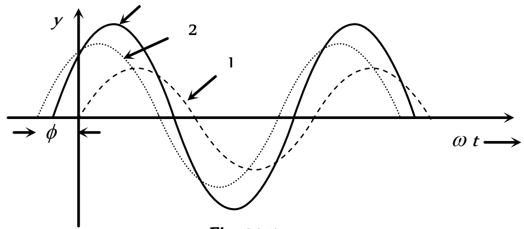

Fig. 30.5

Let the two waves are

$y_1 = a_1 \sin \omega t$ and $y_2 = a_2 \sin(\omega t + \phi)$

where $a_1, a_2 =$ Individual amplitudes,

ϕ = Phase difference between the waves at an instant when they are meeting a point.

(1) **Resultant amplitude :** The resultant wave can be written as $y = A \sin(\omega t + \theta)$

where A = resultant amplitude $= \sqrt{a_1^2 + a_2^2 + 2a_1 a_2 \cos \varphi}$

(2) **Resultant intensity :** As we know intensity $\propto$ (Amplitude)^2

$\Rightarrow \quad I_1 = ka_1^2, I_2 = ka_2^2$ and $I = kA^2$ (k is a proportionality constant). Resultant intensity $I = I_1 + I_2 + 2\sqrt{I_1 I_2} \cos \phi$

For two identical source $I_1 = I_2 = I_0 \Rightarrow I = I_0 + I_0 + 2\sqrt{I_0 I_0} \cos \phi$

$= 4I_0 \cos^2 \frac{\phi}{2}$ $\qquad$ $[1 + \cos\theta = 2\cos^2 \frac{\theta}{2}]$

Coherence

The phase relationship between two light waves can very from time to time and from point to point in space. The property of definite phase relationship is called coherence.

(1) **Temporal coherence :** In a light source a light wave (photon) is produced when an excited atom goes to the ground state and emits light.

(i) The duration of this transition is about 10^{-9} to 10^{-10} *sec.* Thus the emitted wave remains sinusoidal for this much time. This time is known as coherence time (τ_c).

(ii) Definite phase relationship is maintained for a length $L = c\tau_c$ called coherence length. For neon λ = 6328 Å, $\tau_c \approx 10^{-10}$ *sec* and L = 0.03 *m.*

For cadmium λ = 6438 Å, $\tau_c = 10^{-9}$ *sec* and L = 0.3 *m*

For Laser $\tau_c = 10^{-5}$ *sec* and L = 3 *km*

(iii) The spectral lines width $\Delta\lambda$ is related to coherence length L and coherence time τ. $\Delta\lambda \approx \frac{\lambda^2}{c\tau_c}$ or $\Delta\lambda \approx \frac{\lambda^2}{L}$

(2) **Spatial coherence :** Two points in space are said to be spatially coherence if the waves reaching there maintains a constant phase difference

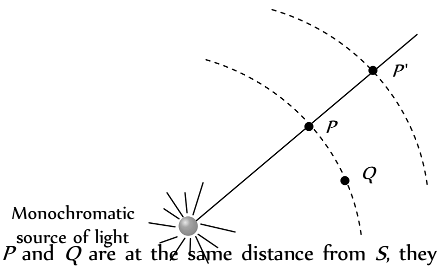

Fig. 30.6

Points P and Q are at the same distance from S, they will always be having the same phase. Points P and P' will be spatially coherent if the distance between P and P' is much less than the coherence length *i.e.* $PP' << c\tau_c$

(3) **Methods of obtaining coherent sources :** Two coherent sources are produced from a single source of light by two methods (i) By division of wavefront and (ii) By division of amplitude

(i) **Division of wave front :** The wave front emitted by a narrow source is divided in two parts by reflection, refraction or diffraction.

The coherent sources so obtained are imaginary. There produced in Fresnel's biprism, Llyod's mirror Youngs' double slit *etc.*

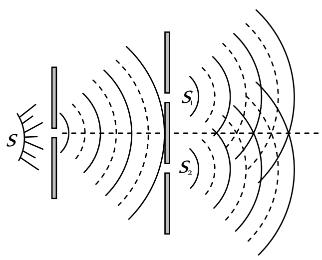

Fig. 30.7

(ii) **Division of amplitude :** In this arrangement light wave is partly reflected (50%) and partly transmitted (50%) to produced two light rays.

The amplitude of wave emitted by an extend source of light is divided in two parts by partial reflection and partial refraction.

The coherent sources obtained are real and are obtained in Newton's rings, Michelson's interferrometer, colours in thin films.

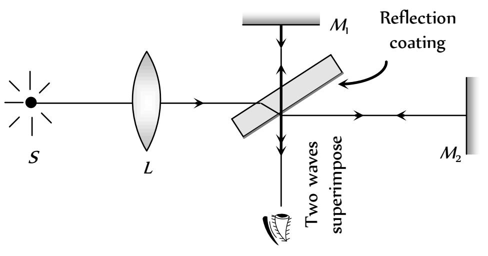

Fig. 30.8

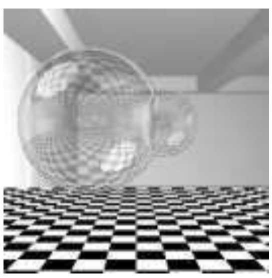
Interference of Light

When two waves of exactly same frequency (coming from two coherent sources) travels in a medium, in the same direction simultaneously then due to their superposition, at some points intensity of light is maximum while at some other points intensity is minimum. This



phenomenon is called Interference of light. It is of following two types

(1) **Constructive interference :** When the waves meets a point with same phase, constructive interference is obtained at that point (*i.e.* maximum light)

(i) Phase difference between the waves at the point of observation $\phi = 0^o$ or $2n\pi$

(ii) Path difference between the waves at the point of observation $\Delta = n\lambda$ (*i.e.* even multiple of $\lambda/2$)

(iii) Resultant amplitude at the point of observation will be maximum $A_{max} = a_1 + a_2$

If $a_1 = a_2 = a_0 \Rightarrow A_{\max} = 2a_0$

(iv) Resultant intensity at the point of observation will be maximum

$$I_{\max} = I_1 + I_2 + 2\sqrt{I_1 I_2} = \left(\sqrt{I_1} + \sqrt{I_2}\right)^2$$

If $I_1 = I_2 = I_0 \Rightarrow I_{\max} = 4I_0$

(2) **Destructive interference :** When the wave meets a point with opposite phase, destructive interference is obtained at that point (*i.e.* minimum light)

(i) Phase difference $\phi = 180^o$ or $(2n-1)\pi$; n = 1, 2, ...

or $(2n+1)\pi$; $n = 0,1,2.....$

(ii) Path difference $\Delta = (2n-1)\frac{\lambda}{2}$ (*i.e.* odd multiple of $\lambda/2$)

(iii) Resultant amplitude at the point of observation will be minimum $A_{\min} = a_1 - a_2$

If $a_1 = a_2 \Rightarrow A_{\min} = 0$

(iv) Resultant intensity at the point of observation will be minimum

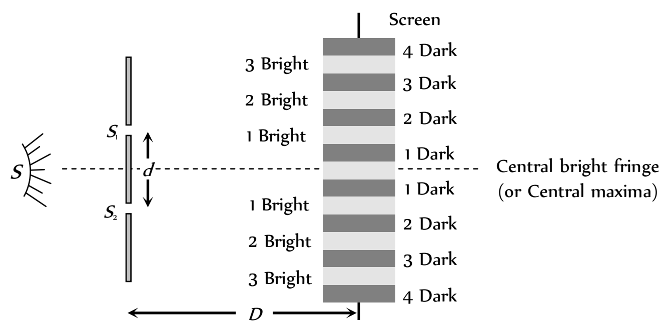
$$I_{\min} = I_1 + I_2 - 2\sqrt{I_1 I_2} = \left(\sqrt{I_1} - \sqrt{I_2}\right)^2$$

If $I_1 = I_2 = I_0 \Rightarrow I_{\min} = 0$

(3) **Super position of waves of random phase difference :** When two waves (or more waves) having random phase difference between them super impose, then no interference pattern is produced. Then the resultant intensity is just the sum of the two intensities. $I = I_1 + I_2$

Young's Double Slit Experiment (YDSE)

Monochromatic light (single wavelength) falls on two narrow slits S_1 and S_2 which are very close together acts as two coherent sources, when waves coming from two coherent sources (S_1, S_2) superimposes on each other, an interference pattern is obtained on the screen. In YDSE alternate bright and dark bands obtained on the screen. These bands are called Fringes.



d = Distance between slits
D = Distance between slits and screen
λ = Wavelength of monochromatic light emitted from source

(1) Central fringe is always bright, because at central position $\phi = 0^o$ or $\Delta = 0$

(2) The fringe pattern obtained due to a slit is more bright than that due to a point.

(3) If the slit widths are unequal, the minima will not be complete dark. For very large width uniform illumination occurs.

(4) If one slit is illuminated with red light and the other slit is illuminated with blue light, no interference pattern is observed on the screen.

(5) If the two coherent sources consist of object and it's reflected image, the central fringe is dark instead of bright one.

Useful Results

(1) **Path difference :** Path difference between the interfering waves meeting at a point P on the screen is given by

$\Delta = \Delta_i + \Delta_f$; where Δ_i = initial path difference between the waves before the slits and Δ_f = path difference between the waves after emerging from the slits. In this case $\Delta_i = 0$ (Commonly used condition). So

$$\Delta = \Delta_f = \frac{xd}{D} = d \sin\theta$$

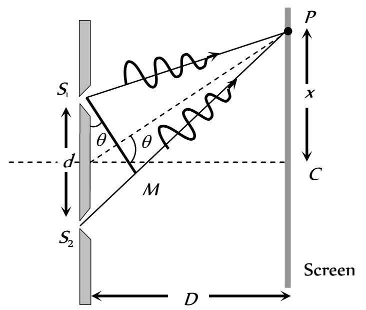


Fig. 30.10

where x is the position of point P from central maxima.

For maxima at P: $\Delta = n\lambda$; where n = 0, ± 1, ± 2, ...

and For minima at P: $\Delta = \frac{(2n-1)\lambda}{2}$; where n = ± 1, ± 2, ...

(2) **Location of fringe :** Position of n^{th} bright fringe from central maxima $x_n = \frac{n\lambda D}{d} = n\beta$; $n = 0, 1, 2 ....$

Position of n^{th} dark fringe from central maxima

$$x_n = \frac{(2n-1)\lambda D}{2d} = \frac{(2n-1)\beta}{2} \; ; \; n = 1, 2, 3 ....$$

(3) **Fringe width (β) :** The separation between any two consecutive bright or dark fringes is called fringe width. In *YDSE* all fringes are of equal width. Fringe width $\beta = \frac{\lambda D}{d}$.

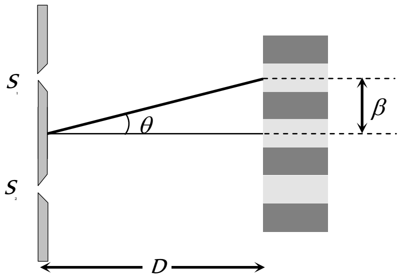

Fig. 30.11

and angular fringe width $\theta = \frac{\lambda}{d} = \frac{\beta}{D}$

(4) In YDSE, if n_1 fringes are visible in a field of view with light of wavelength λ_1 , while n_2 with light of wavelength λ_2 in the same field, then $\boldsymbol{n_1\lambda_1 = n_2\lambda_2}$.

(5) **Separation (Δx) between fringes**

(i) Between n^{th} bright and m^{th} bright fringes $(n > m)$

$$\Delta x = (n - m)\beta$$

(ii) Between n^{th} bright and m^{th} dark fringe

(a) If $n > m$ then $\Delta x = \left(n - m + \frac{1}{2}\right)\beta$

(b) If $n < m$ then $\Delta x = \left(m - n - \frac{1}{2}\right)\beta$

(6) **Identification of central bright fringe :** To identify central bright fringe, monochromatic light is replaced by white light. Due to overlapping central maxima will be white with red edges. On the other side of it we shall get a few coloured band and then uniform illumination.

If the whole YDSE set up is taken in another medium then λ changes so β changes

e.g. in water $\lambda_w = \frac{\lambda_a}{\mu_w} \Rightarrow \beta_w = \frac{\beta_a}{\mu_w} = \frac{3}{4}\beta_a$

Condition for Observing Interference

(1) The initial phase difference between the interfering waves must remain constant. Otherwise the interference will not be sustained.

(2) The frequency and wavelengths of two waves should be equal. If not the phase difference will not remain constant and so the interference will not be sustained.

(3) The light must be monochromatic. This eliminates overlapping of patterns as each wavelength corresponds to one interference pattern.

(4) The amplitudes of the waves must be equal. This improves contrast with $I_{max} = 4I_0$ and $I_{min} = 0$.

(5) The sources must be close to each other. Otherwise due to small fringe width $\left(\beta \propto \frac{1}{d}\right)$ the eye can not resolve fringes resulting in uniform illumination.

Shifting of Fringe Pattern in YDSE

If a transparent thin film of mica or glass is put in the path of one of the waves, then the whole fringe pattern gets shifted towards the slit in front of which glass plate is placed.

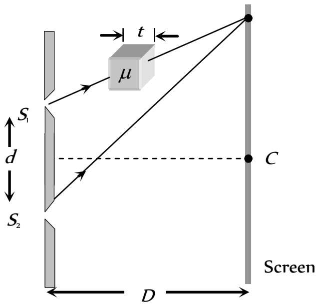

Fig. 30.12

(1) $\text{Fringe shift} = \frac{D}{d}(\mu-1)t = \frac{\beta}{\lambda}(\mu-1)t$

(2) Additional path difference $= (\mu-1)t$

(3) If shift is equivalent to n fringes then $n = \frac{(\mu-1)t}{\lambda}$ or $t = \frac{n\lambda}{(\mu-1)}$

(4) Shift is independent of the order of fringe (*i.e.* shift of zero order maxima = shift of n order maxima.

(5) Shift is independent of wavelength.

Fringe Visibility (*V*)

With the help of visibility, knowledge about coherence, fringe contrast an interference pattern is obtained.

$V = \frac{I_{max} - I_{min}}{I_{max} + I_{min}} = 2\frac{\sqrt{I_1 I_2}}{(I_1 + I_2)}$ If $I_{min} = 0$, $V = 1$ (maximum) *i.e.*, fringe visibility will be best.

Also if $I_{max} = 0, V = -1$ and If $I_{max} = I_{min}, V = 0$

Missing Wavelength in Front of One Slit in YDSE

Suppose P is a point of observation infront of slit S_1 as shown

Missing wavelength at P

$$\lambda = \frac{d^2}{(2n-1)D}$$

By putting $n = 1, 2, 3....$

Missing wavelengths are

$$\lambda = \frac{d^2}{D}, \frac{d^2}{3D}, \frac{d^2}{5D}....$$

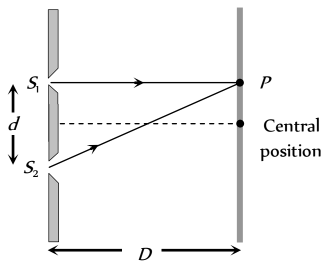

Fig. 30.13

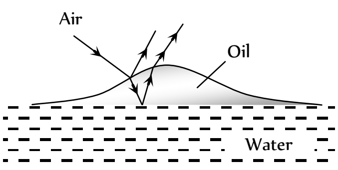
Interference in Thin Films

Interference effects are commonly observed in thin films when their thickness is comparable to wavelength of incident light (If it is too thin as compared to wavelength of light it appears dark and if it is too thick, this will result in uniform illumination of film). Thin layer of oil on water surface and soap bubbles shows various colours in white light due to interference of waves reflected from the two surfaces of the film.



Oil film on water surface

Fig. 30.14

In thin films interference takes place between the waves reflected from it's two surfaces and waves refracted through it.

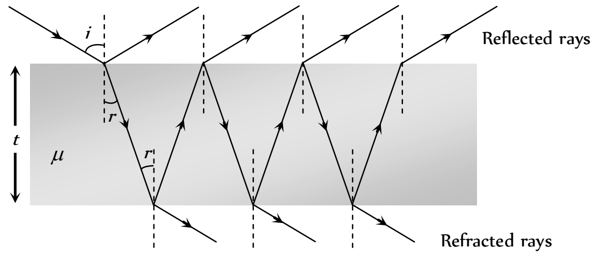


Fig. 30.15

(1) **Interference in reflected light :** Condition of constructive interference (maximum intensity)

$$\Delta = 2\mu\, t\cos r = (2n-1)\frac{\lambda}{2}.$$

For normal incidence $r = 0$ so $2\mu t = (2n-1)\frac{\lambda}{2}$

Condition of destructive interference (minimum intensity)

$\Delta = 2\mu t\cos r = (2n)\frac{\lambda}{2}$. For normal incidence $2\mu t = n\lambda$

(2) **Interference in refracted light :** Condition of constructive interference (maximum intensity)

$\Delta = 2\mu t\cos r = (2n)\frac{\lambda}{2}$. For normal incidence $2\mu t = n\lambda$

Condition of destructive interference (minimum intensity)

$$\Delta = 2\mu t\cos r = (2n-1)\frac{\lambda}{2}$$

For normal incidence $2\mu t = (2n-1)\frac{\lambda}{2}$

Lloyd's Mirror

A plane glass plate (acting as a mirror) is illuminated at almost grazing incidence by a light from a slit S_1. A virtual image S_2 of S_1 is formed closed to S_1 by reflection and these two act as coherent sources. The expression giving the fringe width is the same as for the double slit, but the fringe system differs in one important respect.

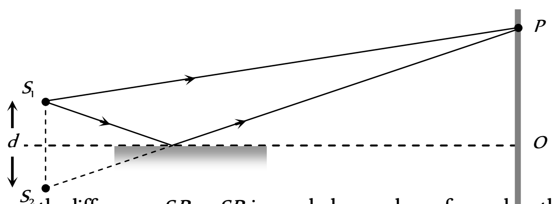

Fig. 30.16

The path difference $S_1P - S_2P$ is a whole number of wavelengths, the fringe at P is dark not bright. This is due to 180° phase change which occurs when light is reflected from a denser medium. At grazing incidence a fringe is formed at O, where the geometrical path difference between the direct and reflected waves is zero and it follows that it will be dark rather than bright.

Thus, whenever there exists a phase difference of a π between the two interfering beams of light, conditions of maximas and minimas are interchanged, *i.e.*, $\Delta x = n\lambda$ (for minimum intensity)

and $\Delta x = (2n-1)\lambda/2$ (for maximum intensity)

Fresnel's Biprims

(1) It is an optical device of producing interference of light Fresnel's biprism is made by joining base to base two thin prism of very small angle

(2) Acute angle of prism is about 1/2° and obtuse angle of prism is about 179°.

(3) When a monochromatic light source is kept in front of biprism two coherent virtual source S_1 and S_2 are produced.

(4) Interference fringes are found on the screen placed behind the biprism interference fringes are formed in the limited region which can be observed with the help eye piece.

(5) Fringe width is measured by a micrometer attached to the eye piece. Fringes are of equal width and its value is $\beta = \frac{\lambda D}{d}$

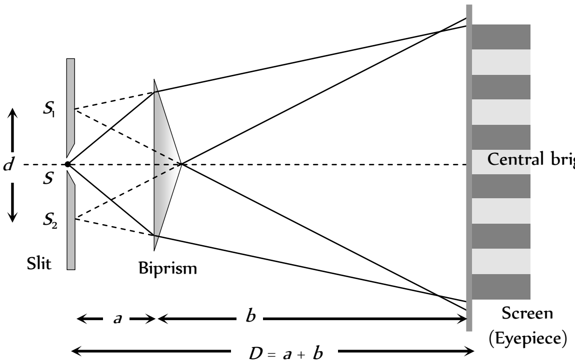

Fig. 30.17

(6) Let the separation between S_1 and S_2 be d and the distance of slits and the screen from the biprism be a and b respectively *i.e.* $D = (a + b)$. If angle of prism is α and refractive index is μ then $d = 2a(\mu - 1)\alpha$

$$\therefore \quad \lambda = \frac{\beta[2a(\mu-1)\alpha]}{(a+b)} \quad \Rightarrow \quad \beta = \frac{(a+b)\lambda}{2a(\mu-1)\alpha}$$

(7) If a convex lens is mounted between the biprism and eye piece. There will be two positions of lens when the sharp images of coherent sources will be observed in the eyepiece. The separation of the images in the two positions are measured. Let these be d_1 and d_2 then $d = \sqrt{d_1 d_2}$

$$\therefore \ \lambda = \frac{\beta d}{D} = \frac{\beta\sqrt{d_1 d_2}}{(a+b)}.$$

Newton's Rings

(1) If we place a plano-convex lens on a plane glass surface, a thin film of air is formed between the curved surface of the lens and plane glass plate.

(2) If we allow monochomatic light to fall normally on the surface of lens, then circular interference fringes of radius r can be seen in the reflected light. This circular fringes are called Newton rings.

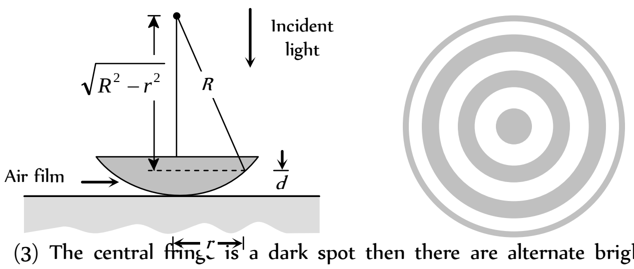

Fig. 30.18

(3) The central fringe is a dark spot then there are alternate bright and dark fringes (Ring shape).

(4) Radius of n^{th} dark ring $r_m \simeq \sqrt{n\lambda R}$

$n = 0, 1, 2, \ldots\ldots$, R = Radius of convex surface

(5) Radius of n^{th} bright ring $r_n = \sqrt{\left(n + \frac{1}{2}\right)\lambda R}$

(6) If a liquid of ref index μ is introduced between the lens and glass plate, the radii of dark ring would be $r_n = \sqrt{\frac{n\lambda R}{\mu}}$

(7) Newton's ring arrangement is used of determining the wavelength of monochromatic light. For this the diameter of n^{th} dark ring (D_n) and $(n + p)^{th}$ dark ring (D_{n+p}) are measured then

$$D_{(n+p)}^2 = 4(n+p)\lambda R \text{ and } D_n^2 = 4n\lambda R \quad \Rightarrow \quad \lambda = \frac{D_{n+p}^2 - D_n^2}{4pR}$$

Doppler's Effect of Light

The phenomenon of apparent change in frequency (or wavelength) of the light due to relative motion between the source of light and the observer is called Doppler's effect.

If $\nu =$ actual frequency, $\nu' =$ Apparent frequency, v = speed of source *w.r.t* stationary observer, c = speed of light

(1) **Source of light moves towards the stationary observer :** When a light source is moving towards an observer with a relative velocity v then the apparent frequency (ν') is greater than the actual frequency (ν) of light. Thus apparent wavelength (λ') is lesser the actual wavelength (λ).

$$\nu' = \nu\sqrt{\frac{(1+v/c)}{(1-v/c)}} \text{ and } \lambda' = \lambda\sqrt{\frac{(1-v/c)}{(1+v/c)}}$$

For $v << c$:

(i) Apparent frequency $\nu' = \nu\left(1 + \frac{v}{c}\right)$ and

(ii) Apparent wavelength $\lambda' = \lambda\left(1 - \frac{v}{c}\right)$

(iii) Doppler's shift : Apparent wavelength < actual wavelength,

So spectrum of the radiation from the source of light shifts towards the violet end of spectrum. This is called violet shift

Doppler's shift $\Delta\lambda = \lambda.\frac{v}{c}$

(iv) The fraction decrease in wavelength $= \frac{\Delta\lambda}{\lambda} = \frac{v}{c}$

(2) **Source of light moves away from the stationary observer :** In this case $\nu' < \nu$ and $\lambda' > \lambda$

$$\nu' = \nu\sqrt{\frac{(1-v/c)}{(1+v/c)}} \text{ and } \lambda' = \lambda\sqrt{\frac{(1+v/c)}{(1-v/c)}}$$

For $v << c$:

(i) Apparent frequency $\nu' = \nu\left(1 - \frac{v}{c}\right)$ and

(ii) Apparent wavelength $\lambda' = \lambda\left(1 + \frac{v}{c}\right)$

(iii) Doppler's shift : Apparent wavelength > actual wavelength,

So spectrum of the radiation from the source of light shifts towards the red end of spectrum. This is called red shift

Doppler's shift $\Delta\lambda = \lambda . \frac{v}{c}$

(iv) The fractional increase in wavelength $= \frac{\Delta\lambda}{\lambda} = \frac{v}{c}$.

(3) **Doppler broadening :** For a gas in a discharge tube, atoms are moving randomly in all directions. When spectrum of light emitted from these atoms is analyzed, then due to Doppler effect (because some atoms are moving towards detector, some atoms are moving away from detector), the frequency of a spectral line is not observed as having one value, but is spread over a range

$$\pm\Delta\nu = \pm\frac{v}{c}\nu, \quad \pm\Delta\lambda = \pm\frac{v}{c}\lambda$$

This broadens the spectral line by an amount $(2\Delta\lambda)$. It is called Doppler broadening. The Doppler broadening is proportional to *v*, which in turn is proportional to $\sqrt{T}$, where T is the temperature in Kelvin.

(4) **Radar :** Radar is a system for locating distant object by means of reflected radio waves, usually of microwave frequencies. Radar is used for navigation and guidance of aircraft, ships *etc*.,.

Radar employs the Doppler effect to distinguish between stationary and moving targets. The change in frequency between transmitted and received waves is measured. If v is the velocity of the approaching target, then the change in frequency is

$\Delta\nu = \frac{2v}{c}\nu$. (The factor of 2 arises due to refection of waves). For a receding target $\Delta\nu = -\frac{2v}{c}\nu$. (The minus sign indicates decrease in frequency).

(5) **Applications of Doppler effect**

(i) Determination of speed of moving bodies (aeroplane, submarine etc) in RADAR and SONAR.

(ii) Determination of the velocities of stars and galaxies by spectral shift.

(iii) Determination of rotational motion of sun.

(iv) Explanation of width of spectral lines.

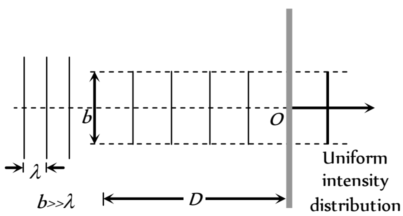
(v) Tracking of satellites.

(vi) In medical sciences in echo cardiogram, sonography *etc*.

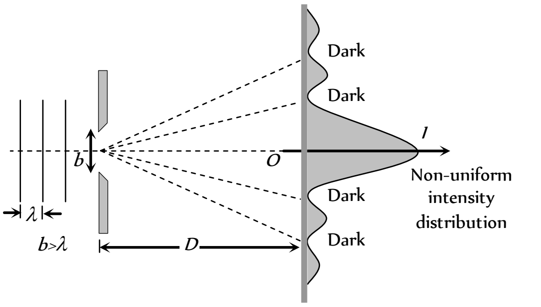
Diffraction of Light

The phenomenon of diffraction was first discovered by Girmaldi. It's experimental study was done by Newton's and young. The theoretical explanation was first given by Fresnel's.

(1) The phenomenon of bending of light around the corners of an obstacle/aperture of the size of the wave length of light is called diffraction.



(A) Size of the slit is very large compared to wavelength



(B) Size of the slit is comparable to wavelength

(2) The phenomenon resulting from the superposition of secondary wavelets originating from different parts of the same wave front is define as diffraction of light.

(3) Diffraction is the characteristic of all types of waves.

(4) Greater the wave length of wave higher will be it's degree of diffraction.

Types of Diffraction

(1) **Fresnel diffraction :** If either source or screen or both are at finite distance from the diffracting device (obstacle or aperture), the diffraction is called Fresnel type.

Common examples : Diffraction at a straight edge, narrow wire or small opaque disc *etc*.

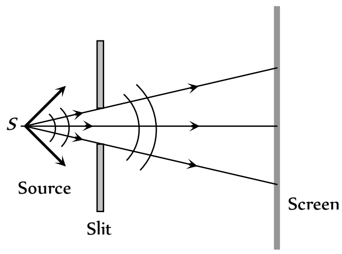


Fig. 30.20

(2) **Fraunhofer diffraction :** In this case both source and screen are effectively at infinite distance from the diffracting device.

Common examples : Diffraction at single slit, double slit and diffraction grating.

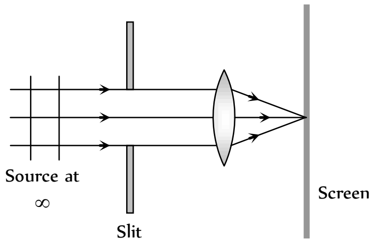

Fig. 30.21

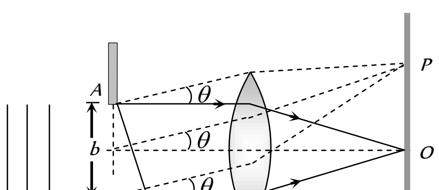
Diffraction at Single Slit (Fraunhoffer Diffraction)

Suppose a plane wave front is incident on a slit *AB* (of width b). Each and every part of the expose part of the plane wave front (i.e. every part of the slit) acts as a source of secondary wavelets spreading in all directions. The diffraction is obtained on a screen placed at a large distance. (In practice, this condition is achieved by placing the screen at the focal plane of a converging lens placed just after the slit).



(1) The diffraction pattern consists of a central bright fringe (central maxima) surrounded by dark and bright lines (called secondary minima and maxima).

(2) At point *O* on the screen, the central maxima is obtained. The wavelets originating from points A and B meets in the same phase at this point, hence at *O*, intensity is maximum.

(3) **Secondary minima :** For obtaining *n* secondary minima at P on the screen, path difference between the diffracted waves $\Delta = b\sin\theta = n\lambda$

(i) Angular position of *n* secondary minima $\sin\theta \approx \theta = \frac{n\lambda}{b}$

(ii) Distance of *n* secondary minima from central maxima

$x_n = D.\theta = \frac{n\lambda D}{b} = \frac{n\lambda f}{b}$; where *D* = Distance between slit and screen. $f \approx D$ = Focal length of converging lens.

(4) **Secondary maxima :** For *n* secondary maxima at *P* on the screen.

Path difference $\Delta = b\sin\theta = (2n+1)\frac{\lambda}{2}$; where *n* = 1, 2, 3 .....

(i) Angular position of *n* secondary maxima

$$\sin \approx \theta \approx \frac{(2n+1)\lambda}{2b}$$

(ii) Distance of *n* secondary maxima from central maxima

$$x_n = D.\theta = \frac{(2n+1)\lambda D}{2b} = \frac{(2n+1)\lambda f}{2b}$$

(5) **Central maxima :** The central maxima lies between the first minima on both sides.

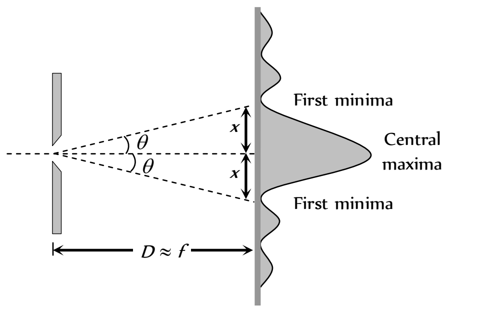


Fig. 30.23

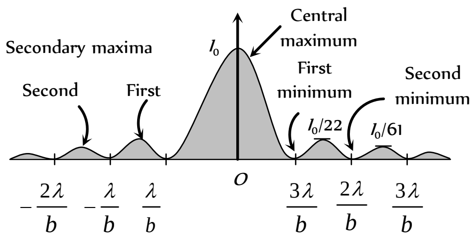
(i) The Angular width *d* central maxima = $2\theta = \frac{2\lambda}{b}$

(ii) Linear width of central maxima $= 2x = 2D\theta = 2f\theta = \frac{2\lambda f}{b}$

(6) **Intensity distribution :** If the intensity of the central maxima is I_0 then the intensity of the first and second secondary maxima are found to be $\frac{I_0}{22}$ and $\frac{I_0}{61}$. Thus diffraction fringes are of unequal width and unequal intensities.



(i) The mathematical expression for in intensity distribution on the screen is given by

$I = I_0\left(\frac{\sin\alpha}{\alpha}\right)^2$ where α is just a convenient connection between the angle θ that locates a point on the viewing screening and light intensity *I*.

ϕ = Phase difference between the top and bottom ray from the slit width *b*.

Also $\alpha = \frac{1}{2}\phi = \frac{\pi b}{\lambda}\sin\theta$

(ii) As the slit width increases (relative to wavelength) the width of the control diffraction maxima decreases; that is, the light undergoes less flaring by the slit. The secondary maxima also decreases in width (and becomes weaker).

(iii) If $b >> \lambda$, the secondary maxima due to the slit disappear; we then no longer have single slit diffraction.

(iv) When the slit width is reduced by a factor of 2, the amplitude of the wave at the centre of the screen is reduced by a factor of 2, so the intensity at the centre is reduced by a factor of 4.

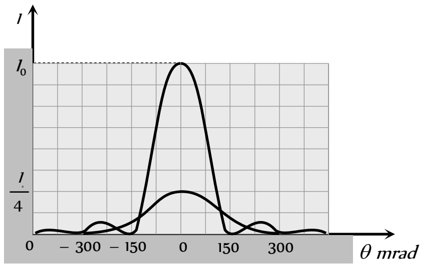


Fig. 30.25

Diffraction Gratings

One of the most useful tools in the study of light and of objects that emit and absorbs light is the diffraction grating.

(1) this device consists parallel slits of equal width and equal spacing called rulings, perhaps as many as several thousand per *mm*.

(2) The separation (*d*) between rulings is called grating spacing. (If *N*-rulings occupy a total width ω, then $d = \frac{\omega}{N}$)

(3) For light ray emerging from each slit at an angle θ, there is a path difference $d\sin\theta$, between each ray the one directly above. The *d* is called the grating element

$d = a + e$

where *a* = width of the slit

e = opaque part

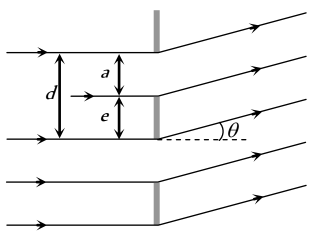

Fig. 30.26

(4) The condition for formation of bright fringe is $d \sin\theta = n\lambda$, where n = 0, 1, 2, ... is called the order of diffraction.

Fresnel's Half Period Zone (HPZ)

According to Fresnel's the entire wave front can be divided into a large number of parts of zones which are known as Fresnel's half period zones (HPZ's).

The resultant effect at any point on screen is due to the combined effect of all the secondary waves from the various zones.

Suppose ABCD is a plane wave front. We desire to find it's effect at point P consider a sphere of radius $\left(d+\frac{\lambda}{2}\right)$ with centre at P, then this sphere will cut the wave front in a circle (circle 1). This circular zone is called Fresnel's first (I) HPZ.

A sphere of radius $b+2\left(\frac{\lambda}{2}\right)$ with centre at P will cut the wave front in circle 2, the annular region between circle 2 and circle 1 is called second (II) HPZ.

The peripheral area enclosed between the n circle and $(n-1)^{th}$ circle is defined as n HPZ.

(1) **Radius of HPZ :** For n HPZ, it is given by

$$r_n = \sqrt{nd\lambda} \Rightarrow r_n \propto \sqrt{\lambda}$$

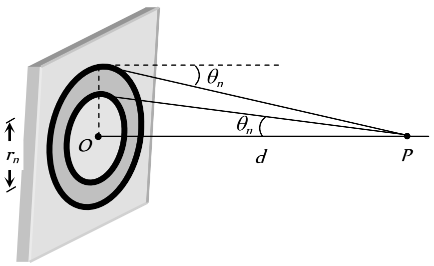

Fig. 30.28

(2) **Area of HPZ :** Area of n HPZ is given by

A_n = Area of n circle – Area of $(n-1)^{th}$ circle

$$= \pi(r_n^2 - r_{n-1}^2) = \pi d\lambda$$

(3) **Mean distance of the observation point P from n HPZ :** $d_n = \frac{r_n + r_{n-1}}{2} = b + \frac{(2n-1)\lambda}{4}$

(4) **Phase difference between the HPZ :** phase difference between the wavelets originating from two consecutive HPZ's and reaching the point P is π (or path difference is $\frac{\lambda}{2}$, time difference is $\frac{T}{2}$).

The phase difference between any two even or old number HPZ is 2π.

(5) **Amplitude of HPZ :** The amplitude of light at point P due to n HPZ is $R_n \propto \frac{A_n}{d_n}(1+\cos\theta_n)$; where A_n = Area of n HPZ, d_n = Mean distance of n HPZ

$(1+\cos\theta_n)$ = Obliquity factor.

On increasing the value of n, the value of R_n gradually goes on decreasing i.e. $R_1 > R_2 > R_3 > R_4 > ....\ .. > R_{n-1} > R_n$

(6) **Resultant Amplitude :** The wavelets from two consecutive HPZ's meets in opposite phase at P.

Hence Resultant amplitude at P

$$R = R_1 - R_2 + R_3 - R_4 + ...(-1)^{n-1} R_n$$

When $n = \infty$, then $R_{n-1} = R_n = 0$, therefore $R = \frac{R_1}{2}$

i.e. For large number of HPZ, the amplitude of light at point P due to whole wave front is half the amplitude due to first HPZ.

The ratio of amplitudes due to consecutive HPZ's is constant and is less than 1

$$\frac{R_n}{R_{n-1}} .... \frac{R_5}{R_4} = \frac{R_4}{R_3} = \frac{R_3}{R_2} = \frac{R_2}{R_1} = k \quad \text{(where } k < 1\text{)}$$

(7) **Resultant Intensity :** Intensity $\propto$ (amplitude)^2

For $n = \infty$, $I \propto \frac{R_1^2}{4} \propto \frac{I_1}{4}$

i.e. the resultant intensity due to whole wave front is $\frac{1}{4}th$ the intensity due to first HPZ.

Diffraction Due to a Circular Disc

When a disc is placed in the path of a light beam, then diffraction pattern is formed on the screen.

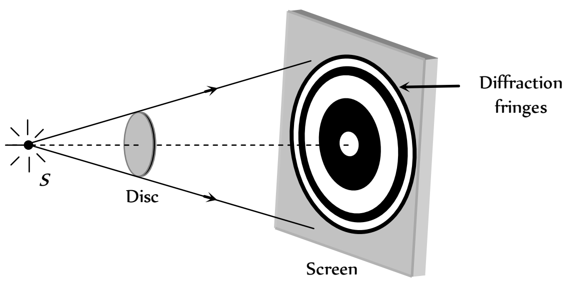

Fig. 30.29

(1) At the centre of the circular shadow of disc, there occurs a bright spot. This spot is called Fresnel's spot or Poisson's spot.

(2) The intensity of bright spot decreases, when the size of the disc is increased or when the screen is moved towards the disc.

(3) Circular alternate bright and dark fringes are formed around the bright spot with fringe width in decreasing order.

(4) Let r be the radius of the disc, d is the distance between screen and the disc and λ is the wavelength of light used.

If n HPZ are covered by disc then $nd\lambda = \pi r^2 \Rightarrow n = \frac{r^2}{d\lambda}$

(5) If the disc obstruct only first HPZ, the resultant amplitude at the central point $R = -R_2 + R_3 + ... \approx -\frac{R_2}{2}$.

So intensity is $\frac{kR_2^2}{4}$ which is slightly less than the intensity $\frac{k\,R_1^2}{4}$ due to whole wave front, when no obstacle is placed.

(6) The intensity at bright spot is given by $I = k\left[\frac{R_{n+1}}{2}\right]^2$

where n = Number of obstructed HPZ's

Diffraction Due to a Circular Aperture

When a circular aperture is placed in the path of a light beam, then following diffraction pattern is formed on the screen.

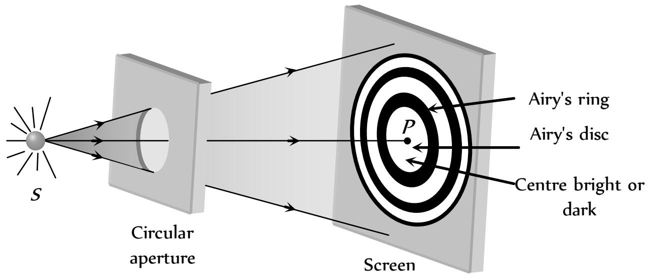

Fig. 30.30

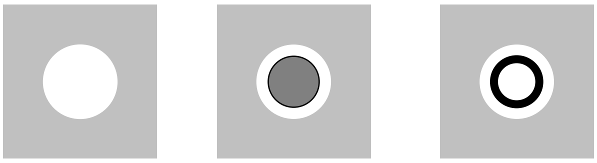
(1) If only one HPZ is allowed by the aperture then the resultant amplitude at P would be R_1 which is twice the value of amplitude for the unobstructed wave front. The intensity would there fore be $4I$, where I represents the intensity at point P, due to unobstructed wave front.

(2) If the first two HPZ's are permitted by aperture than the resultant intensity at the centre point P will be very small (as $R_1 - R_2 \approx 0$). In this case the diffraction pattern consist of a bright circle of light with a dark spot.

(3) In general if number of HPZ's (n) passing through aperture is odd, then the central point will be bright and if n is even, central point will be dark.



(A) n=1, r^2=$b\lambda$ bright centre (B) n=2, r^2=2$b\lambda$ dark centre (C) n=3, r^2=3$b\lambda$ bright centre

Fig. 30.31

(4) The central bright disc is known as Airy's disc.

(5) In the non axial region bright and dark diffraction rings are obtained. The intensity of bright diffraction rings gradually goes on decreasing whereas that of dark diffraction goes on increasing.

(6) The first dark ring obtained around the central bright disc is known as Airy's ring.

Zone Plate

It is a diffracting device used to experimentally demonstrate the diffraction effect.

(1) It is formed on a glass plate by drawing a number of concentric circles on it whose radii are in the ratio of

$\sqrt{1} : \sqrt{2} : \sqrt{3}.........\ .i.e.\, r \propto \sqrt{n}$

For some specific distance from this plate the circles coincides with the HPZ's of the Fresnel's theory. (Alternate zones are made opaque).

(2) **Positive zone plate :** When odd zones are kept transparent to the light and even zones are made opaque, then it is called positive zone plate.

The resultant amplitude due to this zone plate in

$R = R_1 + R_3 + R_5 + ...\ >> \frac{R_1}{2}$

Thus, intensity of light tremendously increases.

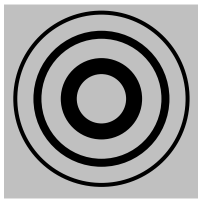


Fig. 30.32

(3) **Negative zone plate :** when even zones are kept transparent to light and odd zones are made opaque, then it is called negative zone plate.

The resultant amplitude due to this zone plate is

$R = R_2 + R_4 + R_6 + ...\ >> \frac{R_1}{2}$

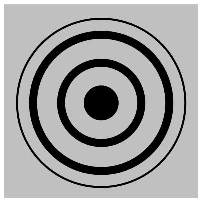

Fig. 30.33

(4) Zone plate behaves like a convex lens. For a plane wave front the image of source is formed at distance d *i.e.* d is equal to the principle focal length or first focal length $f_1 = d = \frac{r^2}{\lambda}$

(5) Multiple focii of zone plate are given by $f_p = \frac{r^2}{(2p-1)\lambda}$ where p = 1, 2, 3,......... represents the order of focii

(6) If the radius of n circle on zone plate is r_n then in terms of r_n.

Principal focal length $f_1 = \frac{r_n^2}{n\lambda}$

Other focal length $f_p = \frac{r_n^2}{(2p-1)n\lambda}$

(7) If a is the distance of the source from the zone plate then the distance b of the point where maximum intensity is observes is given by $\frac{1}{a} + \frac{1}{b} = \frac{n\lambda}{r_n^2}$

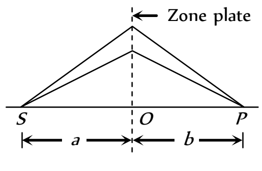

Fig. 30.34

Polarisation of Light

Light propagates as transverse EM waves. The magnitude of electric field is much larger as compared to magnitude of magnetic field. We generally prefer to describe light as electric field oscillations.

(1) **Unpolarised light :** In ordinary light (light from sun, bulb *etc.*) the electric field vectors are distributed in all directions in a light is called unpolarised light. The oscillation of propagation of light wave. This resolved into horizontal and vertical component.

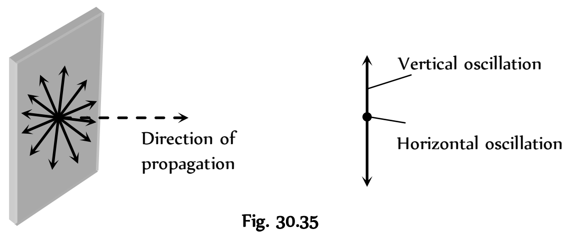

Fig. 30.35

(2) **Polarised light :** The phenomenon of limiting the vibrating of electric field vector in one direction in a plane perpendicular to the direction of propagation of light wave is called polarization of light.

(i) The plane in which oscillation occurs in the polarised light is called plane of oscillation.

(ii) The plane perpendicular to the plane of oscillation is called plane of polarisation.

(iii) Light can be polarised by transmitting through certain crystals such as tourmaline or polaroids.

(3) **Polaroids :** It is a device used to produce the plane polarised light. It is based on the principle of selective absorption and is more effective than the tourmaline crystal. or

It is a thin film of ultramicroscopic crystals of quinine idosulphate with their optic axis parallel to each other.

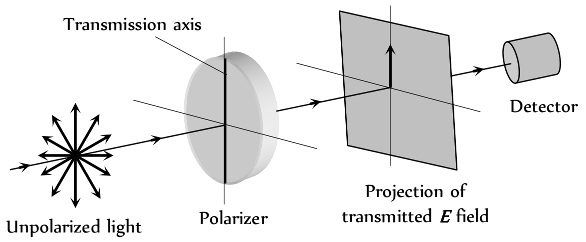

Fig. 30.36

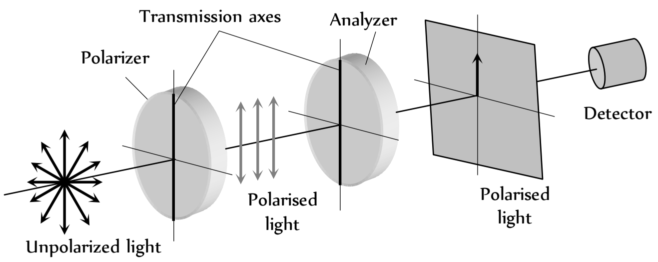
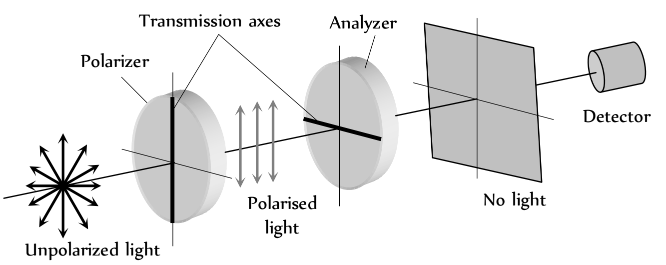
(i) Polaroids allow the light oscillations parallel to the transmission axis pass through them.

(ii) The crystal or polaroid on which unpolarised light is incident is called polariser. Crystal or polaroid on which polarised light is incident is called analyser.



(A) Transmission axes of the polariser and analyser are parallel to each other, so whole of the polarised light passes through analyser



(B) Transmission axis of the analyser is perpendicular to the polariser, hence no light passes through the analyser

Fig. 30.37

(4) **Malus law :** This law states that the intensity of the polarised light transmitted through the analyser varies as the square of the cosine of the angle between the plane of transmission of the analyser and the plane of the polariser.

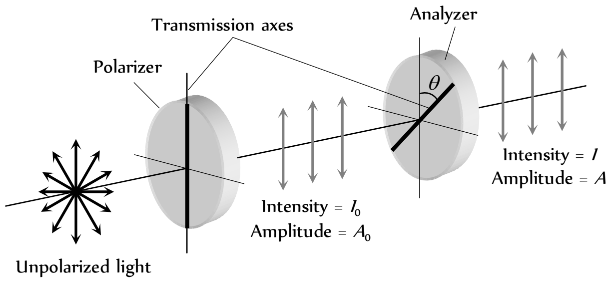


Fig. 30.38

(i) $I = I_0 \cos^2\theta$ and $A^2 = A_0^2\cos^2\theta \Rightarrow A = A_0\cos\theta$

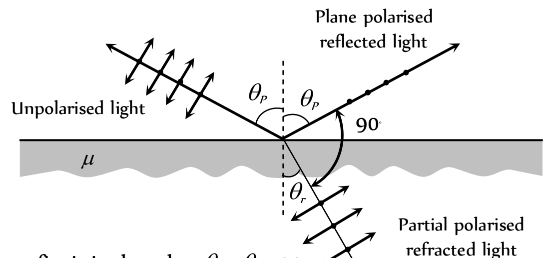
If $\theta = 0^o$, $I = I_0$, $A = A_0$, If $\theta = 90^o$, $I = 0$, $A = 0$

(ii) If $I_i =$ Intensity of unpolarised light.

So $I_0 = \dfrac{I_i}{2}$ *i.e.* if an unpolarised light is converted into plane polarised light (say by passing it through a Polaroid or a Nicol-prism), its intensity becomes half. and $I = \dfrac{I_i}{2}\cos^2\theta$

Methods of Producing Polarised Light

(1) **Polarisation by reflection :** Brewster discovered that when a beam of unpolarised light is reflected from a transparent medium (refractive index $=\mu$), the reflected light is completely plane polarised at a certain angle of incidence (called the angle of polarisation θ_p).



From fig. it is clear that $\theta_p + \theta_r = 90^\circ$

Also $\mu = \tan\theta_p$ Brewster's law

Fig. 30.39

(i) For $i < \theta_p$ or $i > \theta_p$

Both reflected and refracted rays becomes partially polarised

(ii) For glass $\theta_P \approx 57^o$, for water $\theta_P \approx 53^o$

(2) **By Dichroism :** Some crystals such as tourmaline and sheets of iodosulphate of quinine have the property of strongly absorbing the light with vibrations perpendicular to a specific direction (called transmission axis) transmitting the light with vibrations parallel to it. This selective absorption of light is called dichroism.

(3) **By double refraction :** In certain crystals, like calcite, quartz and tourmaline *etc*, incident unpolarized light splits up into two light beams of equal intensities with perpendicular polarization.

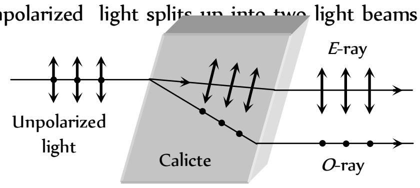


Fig. 30.40

(i) One of the ray is ordinary ray (*O*-ray) it obey's the Snell's law. Another ray's extra ordinary ray (*E*-ray) it doesn't obey's the Snell's law.

(ii) Along a particular direction (fixed in the crystal, the two velocities (velocity of *O*-ray v_o and velocity of *E*-ray v_e) are equal; this direction is known as the optic axis of the crystal (crystal's known as uniaxial crystal). Optic axis is a direction and not any line in crystal.

(iii) In the direction, perpendicular to the optic axis for negative crystal (calcite) $v_e > v_o$ and $\mu_e < \mu_o$.

For positive crystal $v_e < v_o$, $\mu_e > \mu_o$.

(4) **Nicol prism :** Nicol prism is made up of calcite crystal and in it *E*-ray is isolated from *O*-ray through total internal reflection of *O*-ray at canada balsam layer and then absorbing it at the blackened surface as shown in fig.

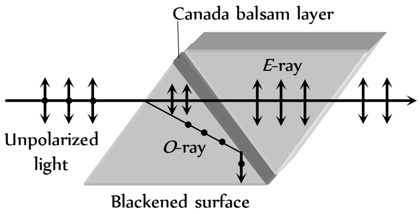

Fig. 30.41

The refractive index for the *O*-ray is more that for the *E*-ray. The refractive index of Canada balsam lies between the refractive indices of calcite for the *O*-ray and *E*-ray

(5) **By Scattering :** It is found that scattered light in directions perpendicular to the direction of incident light is completely plane polarised while transmitted light is unpolarised. Light in all other directions is partially polarised.

(6) **Optical activity and specific rotation :** When plane polarised light passes through certain substances, the plane of polarisation of the light is rotated about the direction of propagation of light through a certain angle. This phenomenon is called optical activity or optical rotation and the substances optically active.

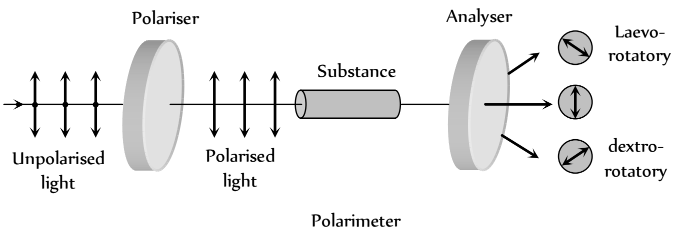

Fig. 30.42

If the optically active substance rotates the plane of polarisation clockwise (looking against the direction of light), it is said to be *dextro-rotatory* or *right-handed.* However, if the substance rotates the plane of polarisation anti-clockwise, it is called *laevo-rotatory* or *left-handed.*

The optical activity of a substance is related to the asymmetry of the molecule or crystal as a whole, *e.g.*, a solution of cane-sugar is dextro-rotatory due to asymmetrical molecular structure while crystals of quartz are dextro or laevo-rotatory due to structural asymmetry which vanishes when quartz is fused.

Optical activity of a substance is measured with help of polarimeter in terms of 'specific rotation' which is defined as the rotation produced by a solution of length 10 *cm* (1 *dm*) and of unit concentration (*i.e.* 1 *g*/cc) for a given wavelength of light at a given temperature. *i.e.* $[\alpha]_{t^o C}^{\lambda} = \dfrac{\theta}{L \times C}$

where θ is the rotation in length L at concentration C.

(7) **Applications and uses of polarisation**

(i) By determining the polarising angle and using Brewster's law, *i.e.* $\mu = \tan\theta$, refractive index of dark transparent substance can be determined.

(ii) It is used to reduce glare.

(iii) In calculators and watches, numbers and letters are formed by liquid crystals through polarisation of light called liquid crystal display (LCD).

(iv) In CD player polarised laser beam acts as needle for producing sound from compact disc which is an encoded digital format.

(v) It has also been used in recording and reproducing three-dimensional pictures.

(vi) Polarisation of scattered sunlight is used for navigation in solar-compass in polar regions.

(vii) Polarised light is used in optical stress analysis known as 'photoelasticity'.

(viii) Polarisation is also used to study asymmetries in molecules and crystals through the phenomenon of 'optical activity'.

(ix) A polarised light is used to study surface of nucleic acids (DNA, RNA)

Electromagnetic Waves

A changing electric field produces a changing magnetic field and vice versa which gives rise to a transverse wave known as electromagnetic wave. The time varying electric and magnetic field are mutually perpendicular to each other and also perpendicular to the direction of propagation of this wave.

The electric vector is responsible for the optical effects of an EM wave and is called the *light vector*.

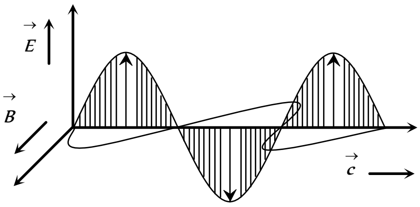

Fig. 30.43

(1) $\vec{E}$ and $\vec{B}$ always oscillates in phase.

(2) $\vec{E}$ and $\vec{B}$ are such that $\vec{E} \times \vec{B}$ is always in the direction of propagation of wave.

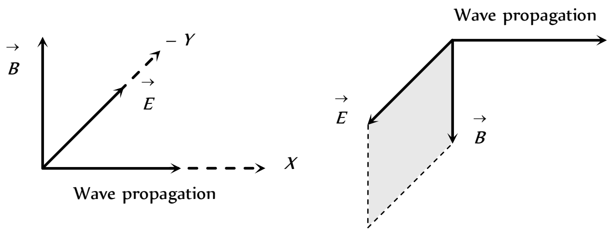

Fig. 30.44

(3) The EM wave propagating in the positive *x*-direction may be represented by

$$E = E_y = E_0 \sin (kx - \omega t)$$

$$B = B_z = B_0 \sin (kx - \omega t)$$

where E (or E_y), B (or B_z) are the instantaneous values of the fields, E_0, B_0 are amplitude of the fields and K = angular wave number $= \dfrac{2\pi}{\lambda}$.

Maxwell's Contribution

(1) **Ampere's Circuital law :** According to this law the line integral of magnetic field along any closed path or circuit is μ_0 times the total current threading the closed circuit *i.e.,* $\oint \vec{B}.\vec{dl} = \mu_0 i$

(2) **Inconsistency of Ampere's law :** Maxwell explained that Ampere's law is valid only for steady current or when the electric field does not change with time. To see this inconsistency consider a parallel plate capacitor being charged by a battery. During the charging time varying current flows through connecting wires.

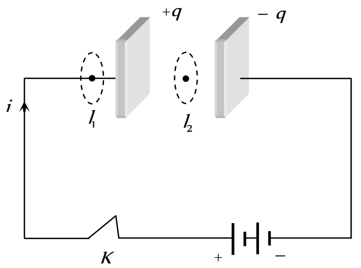

Fig. 30.45

Applying Ampere's law for loop l_1 and l_2 $\oint_{l_1} \vec{B}.\vec{dl} = \mu_0 i$

But $\oint_{l_2} \vec{B}.\vec{dl} = 0$ (Since no current flows through the region between the plates). But practically it is observed that there is a magnetic field between the plates. Hence Ampere's law fails

i.e. $\oint_{l_1} \vec{B}.\vec{dl} \neq \mu_0 i$.

(3) **Modified Ampere's Circuital law or Ampere- Maxwell's Circuital law :** Maxwell assumed that some sort of current must be flowing between the capacitor plates during charging process. He named it displacement current. Hence modified law is as follows

$$\oint \vec{B}.\vec{dl} = \mu_0(i_c + i_d) \text{ or } \oint \vec{B}.\vec{dl} = \mu_0(i_c + \varepsilon_0 \frac{d\phi_E}{dt})$$

where i_c = conduction current = current due to flow of charges in a conductor and

i_d = Displacement current = $\varepsilon_0 \frac{d\phi_E}{dt}$ = current due to the changing electric field between the plates of the capacitor

(4) **Maxwell's equations**

(i) $\oint_s \vec{E}.\vec{ds} = \frac{q}{\varepsilon_0}$ (Gauss's law in electrostatics)

(ii) $\oint_s \vec{B}.\vec{ds} = 0$ (Gauss's law in magnetism)

(iii) $\oint \vec{B}.\vec{dl} = -\frac{d\phi_B}{dt}$ (Faraday's law of EMI)

(iv) $\oint \vec{B}\ \vec{dl} = \mu_o(i_c + \varepsilon_o \frac{d\phi_E}{dt}$ (Maxwell- Ampere's Circuital law)

History of EM Waves

(1) **Maxwell :** Was the first to predict the EM wave.

(2) **Hertz :** Produced and detected electromagnetic waves experimentally at wavelengths of 6 *m*.

(3) **J.C. Bose :** Produced EM waves of wavelength ranging from 5*mm* to 25 *mm*.

(4) **Marconi :** Successfully transmitted the EM waves up to a few *kilometer*. Marconi discovered that if one of the spark gap terminals is connected to an antenna and the other terminal is Earthed, the electromagnetic waves radiated could go upto several kilometers.

Experimental Setup for Producing EM Waves

Hertz experiment based on the fact that a oscillating charge is accelerating continuously, it will radiate electromagnetic waves continuously. In the following figure

(1) The metallic plates (P_1 and P_2) acts as a capacitor.

(2) The wires connecting spheres S_1 and S_2 to the plates provide a low inductance.

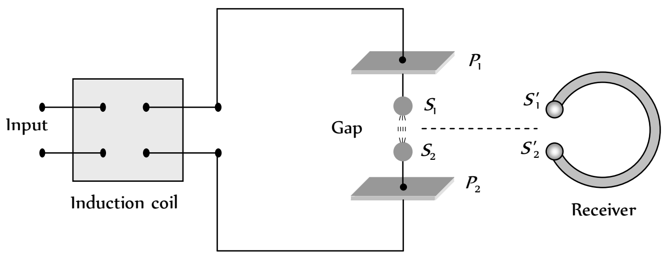

Fig. 30.46

(3) When a high voltage is applied across metallic plates these plates get discharged by sparking across the narrow gap. The spark will give rise to oscillations which in turn send out electromagnetic waves. Frequency of these wave is given by $\nu = \frac{1}{2\pi\sqrt{LC}}$

The succession of sparks send out a train of such waves which are received by the receiver.

Source, Production and Nature of EM Waves

(1) A charge oscillating harmonically is a source of EM waves of same frequency.

(2) A simple *LC* oscillator and energy source can produce waves of desired frequency $\left(\nu = \frac{1}{2\pi\sqrt{LC}}\right)$.

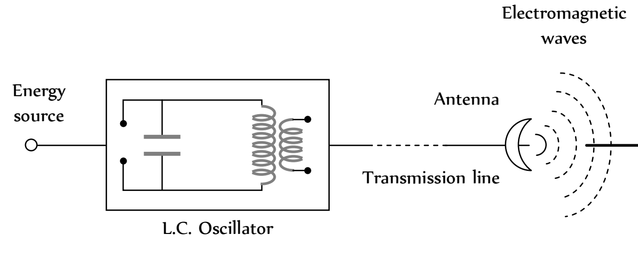

Fig. 30.47

(3) The EM Waves are transverse in nature. They do not require any material medium for their propagation.

Properties of EM Waves

(1) **Speed :** In free space it's speed

$$c = \frac{1}{\sqrt{\mu_0\varepsilon_0}} = \frac{E_0}{B_0} = 3 \times 10^8 m/s.$$

In medium $v = \frac{1}{\sqrt{\mu\varepsilon}}$; where μ_0 = Absolute permeability, ε = Absolute permittivity.

(2) **Energy :** The energy in an EM waves is divided equally between the electric and magnetic fields.

Energy density of electric field $u_e = \frac{1}{2}\varepsilon_0 E^2$, Energy density of magnetic field $u_B = \frac{1}{2}\frac{B^2}{\mu_0}$

The total energy per unit volume is $u = u_e + u_m = \frac{1}{2}\varepsilon_0 E^2 + \frac{1}{2}\frac{B^2}{\mu_0}$.

Also $u_{av} = \frac{1}{2}\varepsilon_0 E_0^2 = \frac{B_0^2}{2\mu_0}$

(3) **Intensity (*I*) :** The energy crossing per unit area per unit time, perpendicular to the direction of propagation of EM wave is called intensity.

i.e. $I = \frac{\text{Total EM energy}}{\text{Surface area} \times \text{Time}} = \frac{\text{Total energy density} \times \text{Volume}}{\text{Surface area} \times \text{Time}}$

$\Rightarrow I = u_{av} \times c = \frac{1}{2}\varepsilon_0 E_0^2 c = \frac{1}{2}\frac{B_0^2}{\mu_0}.c\,\frac{Watt}{m^2}$.

(4) **Momentum :** EM waves also carries momentum, if a portion of EM wave of energy *u* propagating with speed *c*, then linear momentum $= \frac{\text{Energy}(u)}{\text{Speed }(c)}$

If wave incident on a completely absorbing surface then momentum delivered $p = \frac{u}{c}$. If wave incident on a totally reflecting surface then momentum delivered $-p = \frac{2u}{c}$.

(5) **Poynting vector** $(\vec{S})$. **:** In EM waves, the rate of flow of energy crossing a unit area is described by the Poynting vector.

(i) It's unit is $Watt/m^2$ and $\vec{S} = \frac{1}{\mu_o}(\vec{E} \times \vec{B}) = c^2\varepsilon_0(\vec{E} \times \vec{B})$.

(ii) Because in EM waves $\vec{E}$ and $\vec{B}$ are perpendicular to each other, the magnitude of $\vec{S}$ is $|\vec{S}| = \frac{1}{\mu_0}E\,B\sin 90^o = \frac{EB}{\mu_0} = \frac{E^2}{\mu C}$.

(iii) The direction of $\vec{S}$ does not oscillate but it's magnitude varies between zero and a maximum $\left(S_{\max} = \frac{E_0 B_0}{\mu_0}\right)$ each quarter of a period.

(iv) Average value of poynting vector is given by

$$\overline{S} = \frac{1}{2\mu_0}E_0 B_0 = \frac{1}{2}\varepsilon_0 E_0^2 c = \frac{cB_0^2}{2\mu_0}$$

The direction of the poynting vector $\vec{S}$ at any point gives the wave's direction of travel and direction of energy transport the point.

(6) **Radiation pressure :** Is the momentum imparted per second pre unit area. On which the light falls.

For a perfectly reflecting surface $P_r = \frac{2S}{c}$; *S* = Poynting vector; *c* = Speed of light

For a perfectly absorbing surface $P_a = \frac{S}{c}$.

(7) **Wave impedance (*Z*) :** The medium offers hindrance to the propagation of wave. Such hindrance is called wave impedance and it is given by $Z = \sqrt{\frac{\mu}{\varepsilon}} = \sqrt{\frac{\mu_r}{\varepsilon_r}}\sqrt{\frac{\mu_0}{\varepsilon_0}}$

For vacuum or free space $Z = \sqrt{\frac{\mu_0}{\varepsilon_0}} = 376.6\,\Omega$.

EM Spectrum

The whole orderly range of frequencies/wavelengths of the EM waves is known as the EM spectrum.

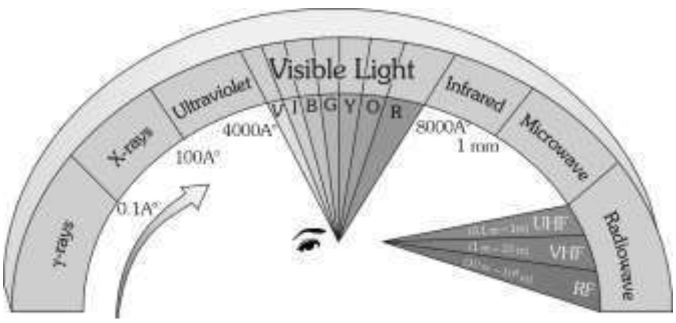

Fig. 30.48

Table 30.2 : Uses of EM spectrum

Radiation	Uses
γ-rays	Gives informations on nuclear structure, medical treatment *etc.*
X-rays	Medical diagnosis and treatment study of crystal structure, industrial radiograph.
UV- rays	Preserve food, sterilizing the surgical instruments, detecting the invisible writings, finger prints etc.
Visible light	To see objects
Infrared rays	To treat, muscular strain for taking photography during the fog, haze etc.
Micro wave and radio wave	In radar and telecommunication.

Earth's Atmosphere

The gaseous envelope surrounding the earth is called it's atmosphere. The atmosphere contains 78% N_2, 21% O_2, and traces of other gases (like helium, krypton, CO_2 etc.)

(1) **Division of earth's atmosphere :** Earth atmosphere has been divided into regions as shown.

(i) Troposphere : In this region, the temperature decreases with height from 290 *K* to 220 *K*.

(ii) Stratosphere : The temperature of stratosphere varies from 220 *K* to 200 *K*.

(iii) Mesosphere : In this region, the temperature falls to 180 *K*.

(iv) Ionosphere : Ionosphere is partly composed of charged particles, ions and electrons, while the rest of the atmosphere contains neutral molecules.

(v) Ozone layer absorbs most of the ultraviolet rays emitted by the sun.

(vi) Kennelly heaviside layer lies at about 110km from the earth's surface. In this layer concentration of electron is very high.

(vii) The ionosphere plays a vital role in the radio communication.

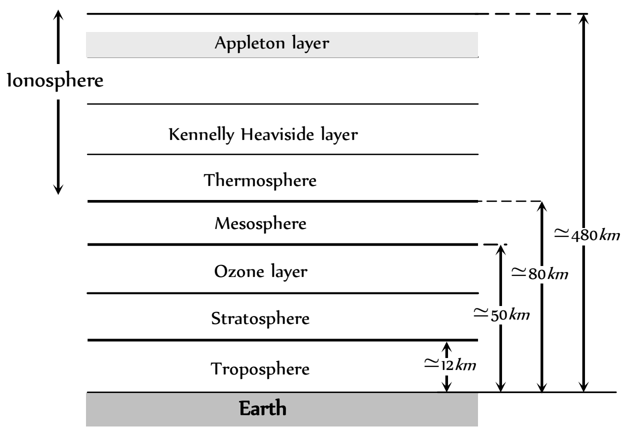

Fig. 30.49

(2) **Green house effect :** The warming of earth's atmosphere due to the infrared radiations reflected by low lying clouds and carbon dioxide in the atmosphere of earth is called green house effect.

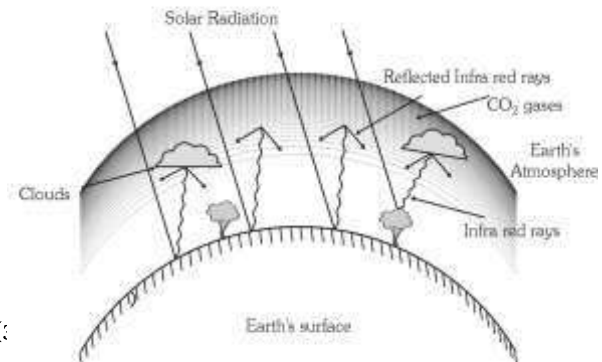

Fig. 30.50

(3

(i) **Radio waves classification**

(a) Very low frequency (VLF) $\rightarrow$ 10 KHz to 30 KHz

(b) Low frequency (LF) $\rightarrow$ 30 KHz to 300 KHz

(c) Medium frequency (MF) or medium wave (MW) $\rightarrow$ 300 KHz to 3000 KHz

(d) High frequency (HF) or short wave (SW) $\rightarrow$ 3 MHz to 30 MHz

(e) Very high frequency (VHF) $\rightarrow$ 30 MHz to 300 MHz

(f) Ultra high frequency (UHF) $\rightarrow$ 300 MHz to 3000 MHz

(g) Super high frequency or micro waves $\rightarrow$ 3000 MHz to 300, 000 MHz

(ii) **Amplitude modulated transmission :** Radio waves having frequency less than or equal to 30 MHz form an amplitude modulation band (or AM band). The signals can be transmitted from one place to another place on earth's surface in two ways

(a) Ground wave propagation : The radio waves following the surface of the earth are called ground waves.

(b) Sky wave propagation : The amplitude modulated radio waves which are reflected back by the ionosphere are called sky waves.

(iii) **Frequency modulated (FM) transmission :** Radio waves having frequencies between 80 MHz and 200 MHz form a frequency modulated bond. T.V. signals are normally frequency modulated.

(4) **T.V. Signals**

(i) T.V. signals are normally frequency modulated. So T.V. signals can be transmitted by using tall antennas.

(ii) Distance covered by the T.V. signals $d = \sqrt{2hR}$

(h = Height of the antenna, R = Radius of earth)

(iii) Area covered $A = \pi d^2 = 2\pi hR$

(iv) Population covered = Area × Population density.

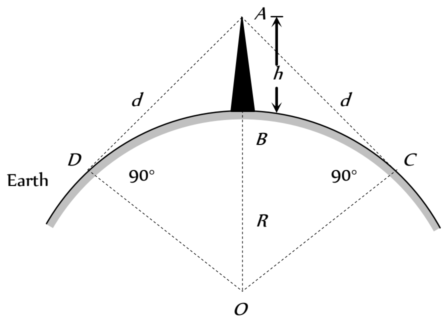

Fig. 30.51

Tips & Tricks

✍ In interference redistribution of energy takes place in the form of maxima and minima.

✍ Average intensity : $I_{av} = \frac{I_{max} + I_{min}}{2} = I_1 + I_2 = a_1^2 + a_2^2$

✍ Ratio of maximum and minimum intensities :

$$\frac{I_{max}}{I_{min}} = \left(\frac{\sqrt{I_1} + \sqrt{I_2}}{\sqrt{I_1} - \sqrt{I_2}}\right)^2 = \left(\frac{\sqrt{I_1 / I_2} + 1}{\sqrt{I_1 / I_2} - 1}\right)^2$$

$$= \left(\frac{a_1 + a_2}{a_1 - a_2}\right)^2 = \left(\frac{a_1 / a_2 + 1}{a_1 / a_2 - 1}\right)^2 \text{ also } \sqrt{\frac{I_1}{I_2}} = \frac{a_1}{a_2} = \left(\frac{\sqrt{\frac{I_{max}}{I_{min}}} + 1}{\sqrt{\frac{I_{max}}{I_{min}}} - 1}\right)$$

✍ If two waves having equal intensity $(I_1 = I_2 = I)$ meets at two locations P and Q with path difference Δ_1 and Δ_2 respectively then the ratio of resultant intensity at point P and Q will be

$$\frac{I_P}{I_Q} = \frac{\cos^2 \frac{\phi_1}{2}}{\cos^2 \frac{\phi_2}{2}} = \frac{\cos^2\left(\frac{\pi\Delta_1}{\lambda}\right)}{\cos^2\left(\frac{\pi\Delta_2}{\lambda}\right)}$$

✍ The angular thickness of fringe width is defined as $\delta = \frac{\beta}{D} = \frac{\lambda}{d}$, which is independent of the screen distance *D*.

✍ Central maxima means the maxima formed with zero optical path difference. It may be formed anywhere on the screen.

✍ All the wavelengths produce their central maxima at the same position.

✍ The wave with smaller wavelength from its maxima before the wave with longer wavelength.

✍ The first maxima of violet colour is closest and that for the red colour is farthest.

✍ Fringes with blue light are thicker than those for red light.

✍ In an interference pattern, whatever energy disappears at the minimum, appears at the maximum.

✍ In YDSE, the nth maxima always comes before the nth minima.

✍ In YDSE, the ratio $\frac{I_{\max}}{I_{\min}}$ is maximum when both the sources have same intensity.

✍ For two interfering waves if initial phase difference between them is ϕ and phase difference due to path difference between them is ϕ. Then total phase difference will be

$$\phi = \phi_0 + \phi' = \phi_0 + \frac{2\pi}{\lambda}\Delta .$$

✍ Sometimes maximm number of maximas or minimas are asked in the question which can be obtained on the screen. For this we use the fact that value of sin θ (or cos θ) can't be greater than 1. For example in the first case when the slits are vertical

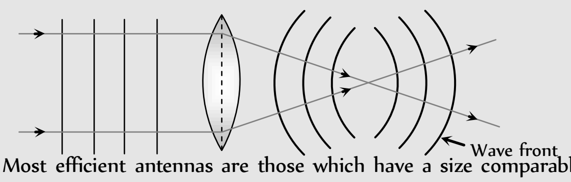
$$\sin\theta = \frac{n\lambda}{d} \qquad \text{(for maximum intensity)}$$

$$\because \quad \sin\theta \ngtr 1 \quad \therefore \quad \frac{n\lambda}{d} \ngtr 1 \qquad \text{or} \qquad n \ngtr \frac{d}{\lambda}$$

Suppose in some question d/λ comes out say 4.6, then total number of maximuas on the screen will be 9. Corresponding to $n = 0, \pm 1, \pm 2, \pm 3$ and ± 4.

✍ ***Shape of wave front***

If rays are parallel, wave front is plane. If rays are converging wave front is spherical of decreasing radius. If rays are diverging wave front is spherical of increasing radius.



✍ Most efficient antennas are those which have a size comparable to the wavelength of the of electromagnetic wave they emit or receive.

✍ A substance (like calcite quartz) which exhibits different properties in different direction is called an anisotopic substance.

Ordinary Thinking

Objective Questions

Wave Nature and Interference of Light

1. By corpuscular theory of light, the phenomenon which can be explained is
(a) Refraction (b) Interference
(c) Diffraction (d) Polarisation

2. According to corpuscular theory of light, the different colours of light are due to
(a) Different electromagnetic waves
(b) Different force of attraction among the corpuscles
(c) Different size of the corpuscles
(d) None of the above

3. Huygen's conception of secondary waves [CPMT 1975]
(a) Allow us to find the focal length of a thick lens
(b) Is a geometrical method to find a wavefront
(c) Is used to determine the velocity of light
(d) Is used to explain polarisation

4. The idea of the quantum nature of light has emerged in an attempt to explain [CPMT 1990]
(a) Interference
(b) Diffraction
(c) Radiation spectrum of a black body
(d) Polarisation

5. Two coherent sources of light can be obtained by [MH CET 2001]
(a) Two different lamps
(b) Two different lamps but of the same power
(c) Two different lamps of same power and having the same colour
(d) None of the above

6. By Huygen's wave theory of light, we cannot explain the phenomenon of [CPMT 1989; AFMC 1993, 99; MP PET 1995, 2003; RPMT 2003; BCECE 2003; Pb PMT 2004]
(a) Interference (b) Diffraction
(c) Photoelectric effect (d) Polarisation

7. The phenomenon of interference is shown by [MNR 1994; MP PMT 1997; AIIMS 1999, 2000; JIPMER 2000; UPSEAT 1994, 2000]
(a) Longitudinal mechanical waves only
(b) Transverse mechanical waves only
(c) Electromagnetic waves only
(d) All the above types of waves

8. Two coherent monochromatic light beams of intensities I and $4I$ are superposed. The maximum and minimum possible intensities in the resulting beam are [IIT-JEE 1988; RPMT 1995; AIIMS 1997; MP PMT 1997; MP PET 1999; BHU 2002; KCET 2000, 05]
(a) $5I$ and I (b) $5I$ and $3I$
(c) $9I$ and I (d) $9I$ and $3I$

9. Light appears to travel in straight lines since [RPMT 1997; CPMT 1987, 89, 90, 2001; AIIMS 1998, 2002; KCET 2002; BHU 2002; DCE 2003]
(a) It is not absorbed by the atmosphere
(b) It is reflected by the atmosphere
(c) Its wavelength is very small
(d) Its velocity is very large

10. The idea of secondary wavelets for the propagation of a wave was first given by [Orissa PMT 2004]
(a) Newton (b) Huygen
(c) Maxwell (d) Fresnel

11. By a monochromatic wave, we mean [AFMC 1995]
(a) A single ray
(b) A single ray of a single colour
(c) Wave having a single wavelength
(d) Many rays of a single colour

12. The similarity between the sound waves and light waves is [KCET 1994]
(a) Both are electromagnetic waves
(b) Both are longitudinal waves
(c) Both have the same speed in a medium
(d) They can produce interference

13. The ratio of intensities of two waves is 9 : 1. They are producing interference. The ratio of maximum and minimum intensities will be MP PET 1999; AMU (Engg.) 1999; AIIMS 2000]
(a) 10 : 8 (b) 9 : 1
(c) 4 : 1 (d) 2 : 1

14. A wave can transmit ...... from one place to another [CPMT 1984]
(a) Energy (b) Amplitude
(c) Wavelength (d) Matter

15. If the ratio of intensities of two waves is 1 : 25, then the ratio of their amplitudes will be [CPMT 1984]
(a) 1 : 25 (b) 5 : 1
(c) 26 : 24 (d) 1 : 5

16. Two identical light sources S_1 and S_2 emit light of same wavelength λ. These light rays will exhibit interference if [MP PMT 1993]
(a) Their phase differences remain constant
(b) Their phases are distributed randomly
(c) Their light intensities remain constant
(d) Their light intensities change randomly

17. Wave nature of light follows because [MP PMT 1993]
(a) Light rays travel in a straight line
(b) Light exhibits the phenomena of reflection and refraction
(c) Light exhibits the phenomenon of interference

(d) Light causes the phenomenon of photoelectric effect

18. If L is the coherence length and c the velocity of light, the coherent time is [MP PMT 1996]

(a) cL (b) $\frac{L}{c}$

(c) $\frac{c}{L}$ (d) $\frac{1}{Lc}$

19. If the amplitude ratio of two sources producing interference is 3 : 5, the ratio of intensities at maxima and minima is

[MP PMT 1996]

(a) 25 : 16 (b) 5 : 3

(c) 16 : 1 (d) 25 : 9

20. Colours of thin films result from

[CPMT 1972, 83, 96; RPMT 1997; DCE 2002; AIIMS 2005]

or

On a rainy day, a small oil film on water show brilliant colours. This is due to [MP PET 2004]

(a) Dispersion of light (b) Interference of light

(c) Absorption of light (d) Scattering of light

21. For constructive interference to take place between two monochromatic light waves of wavelength λ, the path difference should be [MNR 1992; UPSEAT 2001]

(a) $(2n-1)\frac{\lambda}{4}$ (b) $(2n-1)\frac{\lambda}{2}$

(c) $n\lambda$ (d) $(2n+1)\frac{\lambda}{2}$

22. Two sources of waves are called coherent if

[NCERT 1984; MNR 1995; RPMT 1996, 97; CPMT 1997; UPSEAT 1995, 2000; Orissa JEE 2002; RPET 2003; MP PMT 1996, 2004]

(a) Both have the same amplitude of vibrations

(b) Both produce waves of the same wavelength

(c) Both produce waves of the same wavelength having constant phase difference

(d) Both produce waves having the same velocity

23. Soap bubble appears coloured due to the phenomenon of

[AFMC 1995, 97; RPET 1997; CBSE PMT 1999; Pb PET 2001]

(a) Interference (b) Diffraction

(c) Dispersion (d) Reflection

24. Which of the following statements indicates that light waves are transverse [MP PMT 1995; AFMC 1996]

(a) Light waves can travel in vacuum

(b) Light waves show interference

(c) Light waves can be polarized

(d) Light waves can be diffracted

25. If two light waves having same frequency have intensity ratio 4 : 1 and they interfere, the ratio of maximum to minimum intensity in the pattern will be

[BHU 1995; MP PMT 1995; DPMT 1999; CPMT 2003]

(a) 9 : 1 (b) 3 : 1

(c) 25 : 9 (d) 16 : 25

26. Evidence for the wave nature of light cannot be obtained from

(a) Reflection (b) Doppler effect

(c) Interference (d) Diffraction

27. Two light sources are said to be coherent if they are obtained from

(a) Two independent point sources emitting light of the same wavelength

(b) A single point source

(c) A wide source

(d) Two ordinary bulbs emitting light of different wavelengths

28. Wavelength of light of frequency $100 Hz$ [CBSE PMT 1999]

(a) $2\times10^{6} m$ (b) $3\times10^{6} m$

(c) $4\times10^{6} m$ (d) $5\times10^{6} m$

29. Two waves having intensity in the ratio 25 : 4 produce interference. The ratio of the maximum to the minimum intensity is

(a) 5 : 2 (b) 7 : 3

(c) 49 : 9 (d) 9 : 49

30. Wavefront means [RPMT 1997, 98]

(a) All particles in it have same phase

(b) All particles have opposite phase of vibrations

(c) Few particles are in same phase, rest are in opposite phase

(d) None of these

31. Wavefront of a wave has direction with wave motion

[RPMT 1997]

(a) Parallel (b) Perpendicular

(c) Opposite (d) At an angle of θ

32. Which one of the following phenomena is not explained by Huygen's construction of wavefront [CBSE PMT 1992]

(a) Refraction (b) Reflection

(c) Diffraction (d) Origin of spectra

33. Interference was observed in interference chamber when air was present, now the chamber is evacuated and if the same light is used, a careful observer will see

[CBSE PMT 1993; DPMT 2000; BHU 2002]

(a) No interference

(b) Interference with bright bands

(c) Interference with dark bands

(d) Interference in which width of the fringe will be slightly increased

34. The ratio of intensities of two waves are given by 4 : 1. The ratio of the amplitudes of the two waves is

[CBSE PMT 1993]

(a) 2 : 1 (b) 1 : 2

(c) 4 : 1 (d) 1 : 4

35. For the sustained interference of light, the necessary condition is that the two sources should

[DPMT 1996; RPMT 1998, 2003]

(a) Have constant phase difference

(b) Be narrow

(c) Be close to each other

(d) Of same amplitude

36. If the ratio of amplitude of two waves is 4 : 3, then the ratio of maximum and minimum intensity is [AFMC 1997]

(a) 16 : 18 (b) 18 : 16

(c) 49 : 1 (d) 94 : 1

37. Which of the following is conserved when light waves interfere

(a) Intensity (b) Energy

(c) Amplitude (d) Momentum

38. Intensity of light depends upon [RPMT 1999]

(a) Velocity (b) Wavelength

(c) Amplitude (d) Frequency

39. Ray diverging from a point source from a wave front that is

[RPET 2000]

(a) Cylindrical (b) Spherical

(c) Plane (d) Cubical

40. Ratio of amplitude of interfering waves is 3 : 4. Now ratio of their intensities will be [RPET 2000]

(a) $\frac{16}{9}$ (b) 49 : 1

(c) $\frac{9}{16}$ (d) None of these

41. Two coherent sources have intensity in the ratio of $\frac{100}{1}$. Ratio of (intensity) max/(intensity) min is [RPET 2000]

(a) $\frac{1}{100}$ (b) $\frac{1}{10}$

(c) $\frac{10}{1}$ (d) $\frac{3}{2}$

42. If two waves represented by $y_1 = 4\sin\omega t$ and $y_2 = 3\sin\left(\omega t + \frac{\pi}{3}\right)$ interfere at a point, the amplitude of the resulting wave will be about [MP PMT 2000]

(a) 7 (b) 6

(c) 5 (d) 3.5

43. The two waves represented by $y_1 = a\sin(\omega t)$ and $y_2 = b\cos(\omega t)$ have a phase difference of [MP PMT 2000]

(a) 0 (b) $\frac{\pi}{2}$

(c) π (d) $\frac{\pi}{4}$

44. In a wave, the path difference corresponding to a phase difference of ϕ is [MP PET 2000]

(a) $\frac{\pi}{2\lambda}\phi$ (b) $\frac{\pi}{\lambda}\phi$

(c) $\frac{\lambda}{2\pi}\phi$ (d) $\frac{\lambda}{\pi}\phi$

45. Two coherent sources of intensities, I_1 and I_2 produce an interference pattern. The maximum intensity in the interference pattern will be[UPSEAT 2001; MP PET 2001]

(a) $I_1 + I_2$ (b) $I_1^2 + I_2^2$

(c) $(I_1 + I_2)^2$ (d) $(\sqrt{I_1} + \sqrt{I_2})^2$

46. Newton postulated his corpuscular theory on the basis of

[UPSEAT 2001; KCET 2001]

(a) Newton's rings

(b) Colours of thin films

(c) Rectilinear propagation of light

[MNR 1998]

(d) Dispersion of white light

47. The dual nature of light is exhibited by

[KCET 1999; AIIMS 2001; BHU 2001; MH CET 2003; BCECE 2004]

(a) Photoelectric effect

(b) Refraction and interference

(c) Diffraction and reflection

(d) Diffraction and photoelectric effect

48. Two beams of light having intensities I and $4I$ interfere to produce a fringe pattern on a screen. The phase difference between the beams is $\frac{\pi}{2}$ at point A and π at point B. Then the difference between the resultant intensities at A and B is

[IIT JEE (Screening) 2001]

(a) $2I$ (b) $4I$

(c) $5I$ (d) $7I$

49. Coherent sources are those sources for which [RPET 2001]

(a) Phase difference remain constant

(b) Frequency remains constant

(c) Both phase difference and frequency remains constant

(d) None of these

50. Wave nature of light is verified by [RPET 2001]

(a) Interference (b) Photoelectric effect

(c) Reflection (d) Refraction

51. Two waves are represented by the equations $y_1 = a\sin\omega t$ and $y_2 = a\cos\omega t$. The first wave [MP PMT 2001]

(a) Leads the second by π

(b) Lags the second by π

(c) Leads the second by $\frac{\pi}{2}$

(d) Lags the second by $\frac{\pi}{2}$

52. Light waves producing interference have their amplitudes in the ratio 3 : 2. The intensity ratio of maximum and minimum of interference fringes is [EAMCET 2001]

(a) 36 : 1 (b) 9 : 4

(c) 25 : 1 (d) 6 : 4

53. Laser beams are used to measure long distance because

[DCE 2001]

(a) They are monochromatic

(b) They are highly polarised

(c) They are coherent

(d) They have high degree of parallelism

54. Two coherent sources of different intensities send waves which interfere. The ratio of maximum intensity to the minimum intensity is 25. The intensities of the sources are in the ratio

(a) 25 : 1 (b) 5 : 1

(c) 9 : 4 (d) 25 : 16

55. The frequency of light ray having the wavelength 3000 Å is [DPMT 2002]

(a) 9×10^{13} *cycles/sec* (b) 10^{15} *cycles/sec*

(c) 90 *cycles/sec* (d) 3000 *cycles/sec*

56. Two waves have their amplitudes in the ratio 1 : 9. The maximum and minimum intensities when they interfere are in the ratio

(a) $\frac{25}{16}$ (b) $\frac{16}{26}$

(c) $\frac{1}{9}$ (d) $\frac{9}{1}$

57. Huygen's principle of secondary wavelets may be used to [KCET 2002]

(a) Find the velocity of light in vacuum

(b) Explain the particle behaviour of light

(c) Find the new position of the wavefront

(d) Explain photoelectric effect

58. What is the path difference of destructive interference [AIIMS 2002]

(a) $n\lambda$ (b) $n(\lambda + 1)$

(c) $\frac{(n+1)\lambda}{2}$ (d) $\frac{(2n+1)\lambda}{2}$

59. If an interference pattern have maximum and minimum intensities in 36 : 1 ratio then what will be the ratio of amplitudes

(a) 5 : 7 (b) 7 : 4

(c) 4 : 7 (d) 7 : 5

60. Intensities of the two waves of light are *I* and 4*I*. The maximum intensity of the resultant wave after superposition is

(a) 5 *I* (b) 9 *I*

(c) 16 *I* (d) 25 *I*

61. As a result of interference of two coherent sources of light, energy is [MP PMT 2002; KCET 2003]

(a) Increased

(b) Redistributed and the distribution does not vary with time

(c) Decreased

(c) Redistributed and the distribution changes with time

62. To demonstrate the phenomenon of interference, we require two sources which emit radiation [AIEEE 2003]

(a) Of the same frequency and having a define phase relationship

(b) Of nearly the same frequency

(c) Of the same frequency

(d) Of different wavelengths

63. When a beam of light is used to determine the position of an object, the maximum accuracy is achieved if the light is [AIIMS 2003]

(a) Polarised (b) Of longer wavelength

(c) Of shorter wavelength (d) Of high intensity

64. If the distance between a point source and screen is doubled, then intensity of light on the screen will become [UPSEAT 2002]

[RPET 1997; RPMT 1999]

(a) Four times (b) Double

(c) Half (d) One-fourth

65. Huygen wave theory allows us to know [AFMC 2004]

(a) The wavelength of the wave

(b) The velocity of the wave

(c) The amplitude of the wave

(d) The propagation of wave fronts [KCET 2002]

66. The wave theory of light was given by [J & K CET 2004; KCET 2005]

(a) Maxwell (b) Planck

(c) Huygen (d) Young

67. The phase difference between incident wave and reflected wave is 180° when light ray [RPMT 1998, 2001]

(a) Enters into glass from air

(b) Enters into air from glass

(c) Enters into glass from diamond

(d) Enters into water from glass

68. Which of the following phenomena can explain quantum nature of light [RPMT 2001]

(a) Photoelectric effect (b) Interference

(c) Diffraction (d) Polarisation

69. Which of the following is not a property of light [AFMC 2005]

(a) It requires a material medium for propagation [AFMC 2002]

(b) It can travel through vacuum

(c) It involves transportation of energy

(d) It has finite speed [MP PET 2002]

70. What causes changes in the colours of the soap or oil films for the given beam of light [AFMC 2005]

(a) Angle of incidence (b) Angle of reflection

(c) Thickness of film (d) None of these

71. Select the right option in the following [KCET 2005]

(a) Christian Huygens a contemporary of Newton established the wave theory of light by assuming that light waves were transverse

(b) Maxwell provided the compelling theoretical evidence that light is transverse wave

(c) Thomas Young experimentally proved the wave behaviour of light and Huygens assumption

(d) All the statements give above, correctly answers the question "what is light"

72. Two waves of intensity *I* undergo Interference. The maximum intensity obtained is [BHU 2005]

(a) *I* / 2 (b) *I*

(c) 2*I* (d) 4*I*

Young's Double Slit Experiment

1. Young's experiment establishes that [CPMT 1972; MP PET 1994, 98; MP PMT 1998]
   (a) Light consists of waves
   (b) Light consists of particles
   (c) Light consists of neither particles nor waves
   (d) Light consists of both particles and waves

2. In the interference pattern, energy is
   (a) Created at the position of maxima
   (b) Destroyed at the position of minima
   (c) Conserved but is redistributed
   (d) None of the above

3. Monochromatic green light of wavelength $5 \times 10^{-7} m$ illuminates a pair of slits 1 *mm* apart. The separation of bright lines on the interference pattern formed on a screen 2 *m* away is
   (a) 0.25 *mm* (b) 0.1 *mm*
   (c) 1.0 *mm* (d) 0.01 *mm*

4. In Young's double slit experiment, if the slit widths are in the ratio 1 : 9, then the ratio of the intensity at minima to that at maxima will be [MP PET 1987]
   (a) 1 (b) 1/9
   (c) 1/4 (d) 1/3

5. In Young's double slit interference experiment, the slit separation is made 3 fold. The fringe width becomes [CPMT 1982, 89]
   (a) 1/3 *times* (b) 1/9 *times*
   (c) 3 *times* (d) 9 *times*

6. In a certain double slit experimental arrangement interference fringes of width 1.0 *mm* each are observed when light of wavelength 5000 Å is used. Keeping the set up unaltered, if the source is replaced by another source of wavelength 6000 Å, the fringe width will be [CPMT 1988]
   (a) 0.5 *mm* (b) 1.0 *mm*
   (c) 1.2 *mm* (d) 1.5 *mm*

7. Two coherent light sources S_1 and S_2 (λ= 6000 Å) are 1*mm* apart from each other. The screen is placed at a distance of 25 *cm* from the sources. The width of the fringes on the screen should be
   (a) 0.015 *cm* (b) 0.025 *cm*
   (c) 0.010 *cm* (d) 0.030 *cm*

8. The figure shows a double slit experiment *P* and *Q* are the slits. The path lengths *PX* and *QX* are $n\lambda$ and $(n+2)\lambda$ respectively, where *n* is a whole number and λ is the wavelength. Taking the central fringe as zero, what is formed at *X*

   (a) First bright
   (b) First dark
   (c) Second bright
   (d) Second dark

9. In Young's double slit experiment, one of the slit is closed fully, then in the interference pattern
   (a) A bright slit will be observed, no interference pattern will exist
   (b) The bright fringes will become more bright
   (c) The bright fringes will become fainter
   (d) None of the above

10. In Young's double slit experiment, a glass plate is placed before a slit which absorbs half the intensity of light. Under this case
   (a) The brightness of fringes decreases
   (b) The fringe width decreases
   (c) No fringes will be observed
   (d) The bright fringes become fainter and the dark fringes have finite light intensity

11. In Young's experiment, the distance between the slits is reduced to half and the distance between the slit and screen is doubled, then the fringe width [IIT 1981; MP PMT 1994; RPMT 1997; KCET 2000; CPMT 2003; AMU (Engg.) 2000; DPMT 2003; UPSEAT 2000, 04; Kerala PMT 2004]
   (a) Will not change (b) Will become half
   (c) Will be doubled [CPMT 1977; DPMT 1999] (d) Will become four times

12. The maximum intensity of fringes in Young's experiment is *I*. If one of the slit is closed, then the intensity at that place becomes I_0. Which of the following relation is true ? [NCERT 1982; MP PMT 1994, 99; BHU 1998; RPMT 1996; RPET 1999; AMU (Engg.) 1999]
   (a) $I = I_0$
   (b) $I = 2I_0$
   (c) $I = 4I_0$
   (d) There is no relation between *I* and I_0

13. In the Young's double slit experiment, the ratio of intensities of bright and dark fringes is 9. This means that [IIT 1982]
   (a) The intensities of individual sources are 5 and 4 units respectively
   (b) The intensities of individual sources are 4 and 1 units respectively
   (c) The ratio of their amplitudes is 3
   (d) The ratio of their amplitudes is 2

14. An oil flowing on water seems coloured due to interference. For observing this effect, the approximate thickness of the oil film should be [DPET 1987; JIPMER 1997; RPMT 2002, 04]
   (a) 100 Å (b) 10000 Å
   (c) 1 *mm* [CPMT 1990] (d) 1 *cm*

15. The Young's experiment is performed with the lights of blue (λ = 4360 Å) and green colour (λ = 5460 Å), If the distance of the 4th fringe from the centre is *x*, then [CPMT 1987]
   (a) *x* (Blue) = *x* (Green) (b) *x* (Blue)> *x* (Green)
   (c) *x* (Blue) < *x* (Green) (d) $\frac{x(Blue)}{x(Green)} = \frac{5460}{4360}$

16. In the Young's double slit experiment, the spacing between two slits is 0.1 *mm*. If the screen is kept at a distance of 1.0 *m* from the slits and the wavelength of light is 5000 Å, then the fringe width is [MP PMT 1993; R
   (a) 1.0 *cm* (b) 1.5 *cm*
   (c) 0.5 *cm* (d) 2.0 *cm*

17. In Young's double slit experiment, if *L* is the distance between the slits and the screen upon which interference pattern is observed, *x* is

the average distance between the adjacent fringes and d being the slit separation. The wavelength of light is given by

(a) $\frac{xd}{L}$ (b) $\frac{xL}{d}$

(c) $\frac{Ld}{x}$ (d) $\frac{1}{Ldx}$

18. In a Young's double slit experiment, the central point on the screen is [MP PMT 1996]

(a) Bright (b) Dark

(c) First bright and then dark (d) First dark and then bright

19. In a Young's double slit experiment, the fringe width is found to be 0.4 *mm*. If the whole apparatus is immersed in water of refractive index 4/3 without disturbing the geometrical arrangement, the new fringe width will be [CBSE PMT 1990]

(a) 0.30 *mm* (b) 0.40 *mm*

(c) 0.53 *mm* (d) 450 *micron*

20. Young's experiment is performed in air and then performed in water, the fringe width [CPMT 1990; MP PMT 1994; RPMT 1997; Kerala PMT 2004]

(a) Will remain same (b) Will decrease

(c) Will increase (d) Will be infinite

21. In double slits experiment, for light of which colour the fringe width will be minimum [MP PMT 1994]

(a) Violet (b) Red

(c) Green (d) Yellow

22. In Young's experiment, light of wavelength 4000 Å is used to produce bright fringes of width 0.6 *mm*, at a distance of 2 meters. If the whole apparatus is dipped in a liquid of refractive index 1.5, then fringe width will be [MP PMT 1994]

(a) 0.2 *mm* (b) 0.3 *mm*

(c) 0.4 *mm* (d) 1.2 *mm*

23. In Young's double slit experiment, the phase difference between the light waves reaching third bright fringe from the central fringe will be (λ =6000 Å) [MP PMT 1994]

(a) Zero (b) 2π

(c) 4π (d) 6π

24. In Young's double slit experiment, if the widths of the slits are in the ratio 4 : 9, the ratio of the intensity at maxima to the intensity at minima will be [Manipal MEE 1995]

(a) 169 : 25 (b) 81 : 16

(c) 25 : 1 (d) 9 : 4

25. In Young's double slit experiment when wavelength used is 6000 Å and the screen is 40 *cm* from the slits, the fringes are 0.012 *cm* wide. What is the distance between the slits [MP PMT 1995; Pb PET 2002]

(a) 0.024 *cm* (b) 2.4 *cm*

(c) 0.24 *cm* (d) 0.2 *cm*

26. In two separate set - ups of the Young's double slit experiment, fringes of equal width are observed when lights of wavelengths in the ratio 1 : 2 are used. If the ratio of the slit separation in the two cases is 2 : 1, the ratio of the distances between the plane of the slits and the screen in the two set - ups is [MP PET 1993]

(a) 4 : 1 (b) 1 : 1

(c) 1 : 4 (d) 2 : 1

27. In an interference experiment, the spacing between successive maxima or minima is [MP PET 1996]

(a) $\frac{\lambda d}{D}$ (b) $\frac{\lambda D}{d}$

(c) $\frac{dD}{\lambda}$ (d) $\frac{\lambda d}{4D}$

(Where the symbols have their usual meanings)

28. If yellow light in the Young's double slit experiment is replaced by red light, the fringe width will [MP PMT 1996]

(a) Decrease

(b) Remain unaffected

(c) Increase

(d) First increase and then decrease

29. In Young's double slit experiment, the fringe width is $1 \times 10^{-4}\,m$ if the distance between the slit and screen is doubled and the distance between the two slit is reduced to half and wavelength is changed from $6.4 \times 10^{7}\,m$ to $4.0 \times 10^{-7}\,m$, the value of new fringe width will be

(a) $0.15 \times 10^{-4}\,m$ (b) $2.0 \times 10^{-4}\,m$

(c) $1.25 \times 10^{-4}\,m$ (d) $2.5 \times 10^{-4}\,m$

30. In Young's experiment, one slit is covered with a blue filter and the other (slit) with a yellow filter. Then the interference pattern

(a) Will be blue (b) Will be yellow

(c) Will be green (d) Will not be formed

31. Two sources give interference pattern which is observed on a screen, D distance apart from the sources. The fringe width is $2w$. If the distance D is now doubled, the fringe width will

(a) Become $w/2$ (b) Remain the same

(c) Become w (d) Become $4w$

32. In double slit experiment, the angular width of the fringes is 0.20° for the sodium light (λ =5890 Å). In order to increase the angular width of the fringes by 10%, the necessary change in the wavelength is [MP PMT 1997]

(a) Increase of 589 Å (b) Decrease of 589 Å

(c) Increase of 6479 Å (d) Zero

33. In a biprism experiment, by using light of wavelength 5000 Å, 5 *mm* wide fringes are obtained on a screen 1.0 *m* away from the coherent sources. The separation between the two coherent sources is

(a) 1.0 *mm* (b) 0.1 *mm*

(c) 0.05 *mm* (d) 0.01 *mm*

34. The slits in a Young's double slit experiment have equal widths and the source is placed symmetrically relative to the slits. The intensity at the central fringes is I. If one of the slits is closed, the intensity at this point will be

[MP PMT 1999; Orissa JEE 2004; Kerala PET 2005]

(a) I (b) $I/4$

(c) $I/2$ (d) $4I$

35. A thin mica sheet of thickness $2\times10^{-6}\,m$ and refractive index $(\mu = 1.5)$ is introduced in the path of the first wave. The wavelength of the wave used is 5000 Å. The central bright maximum will shift [CPMT 1999]

(a) 2 fringes upward (b) 2 fringes downward

(c) 10 fringes upward (d) None of these

36. In a Young's double slit experiment, the fringe width will remain same, if (D = distance between screen and plane of slits, d = separation between two slits and λ = wavelength of light used)

(a) Both λ and D are doubled

(b) Both d and D are doubled

(c) D is doubled but d is halved

(d) λ is doubled but d is halved

37. In Young's double slit experiment, the slits are 0.5 *mm* apart and interference pattern is observed on a screen placed at a distance of 1.0 *m* from the plane containing the slits. If wavelength of the incident light is 6000 Å, then the separation between the third bright fringe and the central maxima is

(a) 4.0 *mm* (b) 3.5 *mm*

(c) 3.0 *mm* (d) 2.5 *mm*

38. In Young's double slit experiment, 62 fringes are seen in visible region for sodium light of wavelength 5893 Å. If violet light of wavelength 4358 Å is used in place of sodium light, then number of fringes seen will be [RPET 1997]

(a) 54 (b) 64

(c) 74 (d) 84

39. In Young's double slit experiment, angular width of fringes is 0.20° for sodium light of wavelength 5890 Å. If complete system is dipped in water, then angular width of fringes becomes

(a) 0.11° (b) 0.15°

(c) 0.22° (d) 0.30°

40. In Young's double slit experiment, the distance between the slits is 1 *mm* and that between slit and screen is 1 meter and 10th fringe is 5 *mm* away from the central bright fringe, then wavelength of light used will be [RPMT 1997]

(a) 5000 Å (b) 6000 Å

(c) 7000 Å (d) 8000 Å

41. In Young's double slit experiment, carried out with light of wavelength λ = 5000 Å, the distance between the slits is 0.2 *mm* and the screen is at 200 *cm* from the slits. The central maximum is at x =0. The third maximum (taking the central maximum as zeroth maximum) will be at x equal to

[CBSE PMT 1992; MH CET 2002]

(a) 1.67 *cm* (b) 1.5 *cm*

(c) 0.5 *cm* (d) 5.0 *cm*

42. In a Young's experiment, two coherent sources are placed 0.90 *mm* apart and the fringes are observed one metre away. If it produces the second dark fringe at a distance of 1 *mm* from the central fringe, the wavelength of monochromatic light used would be

[CBSE PMT 1992; KCET 2004]

(a) $60\times10^{-4}\,cm$ (b) $10\times10^{-4}\,cm$

(c) $10\times10^{-5}\,cm$ (d) $6\times10^{-5}\,cm$

43. In Young's double slit experiment, the distance between the two slits is 0.1 *mm* and the wavelength of light used is $4\times10^{-7}\,m$. If the width of the fringe on the screen is 4 *mm*, the distance between screen and slit is

[Bihar CMEET 1995]

(a) 0.1 *mm* (b) 1 *cm*

(c) 0.1 *cm* (d) 1 *m*

44. In Young's double slit experiment, the distance between sources is 1 *mm* and distance between the screen and source is 1 *m*. If the fringe width on the screen is 0.06 *cm*, then λ = [Bihar MEE 1995]

(a) 6000 Å (b) 4000 Å

(c) 1200 Å (d) 2400 Å

45. In Young's double slit experiment, a mica slit of thickness t and refractive index μ is introduced in the ray from the first source S. By how much distance the fringes pattern will be displaced [RPMT 1996, 97; JIPM

[AMU 1995]

(a) $\frac{d}{D}(\mu-1)t$ (b) $\frac{D}{d}(\mu-1)t$

(c) $\frac{d}{(\mu-1)D}$ (d) $\frac{D}{d}(\mu-1)$

46. In Young's double slit experiment using sodium light (λ = 5898 Å), 92 fringes are seen. If given colour (λ = 5461 Å) is used, how many fringes will be seen

[CPMT 1989; RPET 1996; JIPMER 2001, 02]

(a) 62 (b) 67

(c) 85 (d) 99

47. If a torch is used in place of monochromatic light in Young's experiment what will happens [RPET 1997]

[MH CET 1999; KCET 1999]

(a) Fringe will appear for a moment then it will disappear

(b) Fringes will occur as from monochromatic light

(c) Only bright fringes will appear

(d) No fringes will appear

48. When a thin metal plate is placed in the path of one of the interfering beams of light [KCET 1999]

(a) Fringe width increases (b) Fringes disappear

(c) Fringes become brighter (d) Fringes becomes blurred

49. In Young's experiment, the distance between slits is 0.28 *mm* and distance between slits and screen is 1.4 *m*. Distance between central bright fringe and third bright fringe is 0.9 *cm*. What is the wavelength of used light [KCET 1999]

(a) 5000 Å (b) 6000 Å

(c) 7000 Å (d) 9000 Å

50. Two parallel slits 0.6 *mm* apart are illuminated by light source of wavelength 6000 Å. The distance between two consecutive dark fringes on a screen 1 *m* away from the slits is

(a) 1 *mm* (b) 0.01 *mm*

(c) 0.1 *m* (d) 10 *m*

51. In young's double slit experiment with a source of light of wavelength 6320Å, the first maxima will occur when

[Roorkee 1999]

(a) Path difference is 9480 Å

(b) Phase difference is 2π radian

(c) Path difference is 6320 Å

(d) Phase difference is π radian

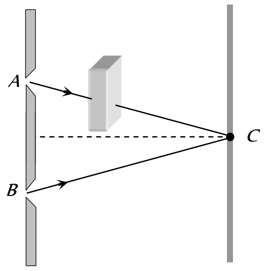
52. If a transparent medium of refractive index $\mu = 1.5$ and thickness $t = 2.5 \times 10^{-5}$ *m* is inserted in front of one of the slits of Young's Double Slit experiment, how much will be the shift in the interference pattern? The distance between the slits is 0.5 *mm* and that between slits and screen is 100 *cm*

(a) 5 *cm* (b) 2.5 *cm*

(c) 0.25 *cm* (d) 0.1 *cm*

53. In Young's experiment, monochromatic light is used to illuminate the two slits *A* and *B*. Interference fringes are observed on a screen placed in front of the slits. Now if a thin glass plate is placed normally in the path of the beam coming from the slit

[UPSEAT 1993, 2000; AIIMS 1999, 2004]



(a) The fringes will disappear

(b) The fringe width will increase

(c) The fringe width will increase

(d) There will be no change in the fringe width but the pattern shifts

54. The fringe width in Young's double slit experiment increases when

[MP PMT 2000]

(a) Wavelength increases

(b) Distance between the slits increases

(c) Distance between the source and screen decreases

(d) The width of the slits increases

55. In a double slit experiment, instead of taking slits of equal widths, one slit is made twice as wide as the other. Then in the interference pattern [IIT-JEE (Screening) 2000]

(a) The intensities of both the maxima and the minima increase

(b) The intensity of maxima increases and the minima has zero intensity

(c) The intensity of maxima decreases and that of the minima increases

(d) The intensity of maxima decreases and the minima has zero intensity

56. Two slits, 4 *mm* apart, are illuminated by light of wavelength 6000 Å. What will be the fringe width on a screen placed 2*m* from the slits [MP PET 2000]

(a) 0.12 *mm* (b) 0.3 *mm*

(c) 3.0 *mm* (d) 4.0 *mm*

57. In the Young's double slit experiment, for which colour the fringe width is least [UPSEAT 2001, MP PET 2001]

(a) Red (b) Green

(c) Blue (d) Yellow

58. In a Young's double slit experiment, the separation of the two slits is doubled. To keep the same spacing of fringes, the distance *D* of the screen from the slits should be made [JIPMER 1999]

[MNR 1998; AMU (Engg.) 2001]

(a) $\frac{D}{2}$ (b) $\frac{D}{\sqrt{2}}$

(c) $2D$ (d) $4D$

59. Young's double slit experiment is performed with light of wavelength 550 *nm*. The separation between the slits is 1.10 *mm* and screen is placed at distance of 1 *m*. What is the distance between the consecutive bright or dark fringes

[Pb. PMT 2000]

(a) 1.5 *mm* (b) 1.0 *mm*

(c) 0.5 *mm* (d) None of these

60. In Young's experiment, the ratio of maximum to minimum intensities of the fringe system is 4 : 1. The amplitudes of the coherent sources are in the ratio [AIIMS 1999]

[RPMT 1996; MP PET 2000; RPET 2001; MP PMT 2001]

(a) 4 : 1 (b) 3 : 1

(c) 2 : 1 (d) 1 : 1

61. An interference pattern was made by using red light. If the red light changes with blue light, the fringes will become

[BHU 2001]

(a) Wider (b) Narrower

(c) Fainter (d) Brighter

62. If a white light is used in Young's double slit experiments then a very large number of coloured fringes can be seen

[KCET 2001]

(a) With first order violet fringes being closer to the central white fringes

(b) First order red fringes being closer to the central white fringes

(c) With a central white fringe

(d) With a central black fringe

63. In a Young's double slit experiment, 12 fringes are observed to be formed in a certain segment of the screen when light of wavelength 600 *nm* is used. If the wavelength of light is changed to 400 *nm*, number of fringes observed in the same segment of the screen is given by [IIT-JEE (Screening) 2001]

(a) 12 (b) 18

(c) 24 (d) 30

64. In the Young's double slit experiment with sodium light. The slits are 0.589 *m* a part. The angular separation of the third maximum from the central maximum will be (given $\lambda = 589$ *mm*)

(a) $\sin^{-1}(0.33 \times 10^{8})$ (b) $\sin^{-1}(0.33 \times 10^{-6})$

(c) $\sin^{-1}(3 \times 10^{-8})$ (d) $\sin^{-1}(3 \times 10^{-6})$

65. In Young's double slit experiment, the distance between the two slits is made half, then the fringe width will become

[RPMT 1999; BHU 2002]

(a) Half (b) Double

(c) One fourth (d) Unchanged

66. In Young's double slit experiment, the central bright fringe can be identified [KCET 2002]

(a) By using white light instead of monochromatic light

(b) As it is narrower than other bright fringes

(c) As it is wider than other bright fringes

(d) As it has a greater intensity than the other bright fringes

67. In Young's double slit experiment, the wavelength of the light used is doubled and distance between two slits is half of initial distance, the resultant fringe width becomes [AIEEE 2002]

(a) 2 *times* (b) 3 *times*
(c) 4 *times* (d) 1/2 *times*

68. In a Young's double slit experiment, the source illuminating the slits is changed from blue to violet. The width of the fringes

(a) Increases (b) Decreases
(c) Becomes unequal (d) Remains constant

69. In Young's double slit experiment, the intensity of light coming from the first slit is double the intensity from the second slit. The ratio of the maximum intensity to the minimum intensity on the interference fringe pattern observed is [KCET 2002]

(a) 34 (b) 40
(c) 25 (d) 38

70. If the sodium light in Young's double slit experiment is replaced by red light, the fringe width will [MP PMT 2002]

(a) Decrease
(b) Increase
(c) Remain unaffected
(d) First increase, then decrease

71. In Young's double slit experiment the wavelength of light was changed from 7000 Å to 3500 Å. While doubling the separation between the slits which of the following is not true for this experiment [Orissa JEE 2002]

(a) The width of the fringes changes
(b) The colour of bright fringes changes
(c) The separation between successive bright fringes changes
(d) The separation between successive dark fringes remains unchanged

72. When a thin transparent plate of thickness t and refractive index μ is placed in the path of one of the two interfering waves of light, then the path difference changes by [MP PMT 2002]

(a) $(\mu+1)t$ (b) $(\mu-1)t$
(c) $\frac{(\mu+1)}{t}$ (d) $\frac{(\mu-1)}{t}$

73. In Young's double-slit experiment, an interference pattern is obtained on a screen by a light of wavelength 6000 Å, coming from the coherent sources S_1 and S_2. At certain point P on the screen third dark fringe is formed. Then the path difference $S_1P - S_2P$ in microns is [EAMCET 2003]

(a) 0.75 (b) 1.5
(c) 3.0 (d) 4.5

74. In a Young's double slit experiment, the slit separation is 1 *mm* and the screen is 1 *m* from the slit. For a monochromatic light of wavelength 500 *nm*, the distance of 3rd minima from the central maxima is [Orissa JEE 2003]

(a) 0.50 *mm* (b) 1.25 *mm*
(c) 1.50 *mm* (d) 1.75 *mm*

75. In Young's double-slit experiment the fringe width is β. If entire arrangement is placed in a liquid of refractive index n, the fringe width becomes [KCET 2003]

(a) $\frac{\beta}{n+1}$ (b) $n\beta$
(c) $\frac{\beta}{n}$ (d) $\frac{\beta}{n-1}$

76. In an interference experiment, third bright fringe is obtained at a point on the screen with a light of 700 *nm*. What should be the wavelength of the light source in order to obtain 5th bright fringe at the same point [KCET 2002] [KCET 2003]

(a) 500 *nm* (b) 630 *nm*
(c) 750 *nm* (d) 420 *nm*

77. If the separation between slits in Young's double slit experiment is reduced to $\frac{1}{3}rd$, the fringe width becomes n times. The value of n is [MP PET 2003]

(a) 3 (b) $\frac{1}{3}$
(c) 9 (d) $\frac{1}{9}$

78. A double slit experiment is performed with light of wavelength 500 *nm*. A thin film of thickness 2 μm and refractive index 1.5 is introduced in the path of the upper beam. The location of the central maximum will [AIIMS 2003]

(a) Remain unshifted
(b) Shift downward by nearly two fringes
(c) Shift upward by nearly two fringes
(d) Shift downward by 10 fringes

79. The two slits at a distance of 1 *mm* are illuminated by the light of wavelength $6.5\times10^{-7}\,m$. The interference fringes are observed on a screen placed at a distance of 1*m*. The distance between third dark fringe and fifth bright fringe will be [NCERT 1982; MP PET 1995; BVP 2003]

(a) 0.65 *mm* (b) 1.63 *mm*
(c) 3.25 *mm* (d) 4.88 *mm*

80. In a Young's double-slit experiment the fringe width is 0.2 *mm*. If the wavelength of light used is increased by 10% and the separation between the slits is also increased by 10%, the fringe width will be

(a) 0.20 *mm* (b) 0.401 *mm*
(c) 0.242 *mm* (d) 0.165 *mm*

81. Two coherent sources of intensity ratio 1 : 4 produce an interference pattern. The fringe visibility will be [J & K CET 2004]

(a) 1 (b) 0.8
(c) 0.4 (d) 0.6

82. In Young's double slit experiment the amplitudes of two sources are 3*a* and a respectively. The ratio of intensities of bright and dark fringes will be [J & K CET 2004]

(a) 3 : 1 (b) 4 : 1
(c) 2 : 1 (d) 9 : 1

83. In Young's double slit experiment, distance between two sources is 0.1 *mm*. The distance of screen from the sources is 20 *cm*. Wavelength of light used is 5460 Å. Then angular position of the first dark fringe is [DCE 2002]

(a) 0.08° (b) 0.16°

(c) 0.20° (d) 0.313°

84. In a Young's double slit experiment, the slit separation is 0.2 *cm*, the distance between the screen and slit is 1*m*. Wavelength of the light used is 5000 Å. The distance between two consecutive dark fringes (in *mm*) is

[DCE 2004]

(a) 0.25 (b) 0.26

(c) 0.27 (d) 0.28

85. A light of wavelength 5890 Å falls normally on a thin air film. The minimum thickness of the film such that the film appears dark in reflected light [Pb. PMT 2003]

(a) $2.945 \times 10^{-7} m$ (b) $3.945 \times 10^{-7} m$

(c) $4.95 \times 10^{-7} m$ (d) $1.945 \times 10^{-7} m$

86. In Young's double slit experiment, a minimum is obtained when the phase difference of super imposing waves is

[MH CET 2004]

(a) Zero (b) $(2n-1)\pi$

(c) $n\pi$ (d) $(n+1)\pi$

87. In Fresnel's biprism $(\mu = 1.5)$ experiment the distance between source and biprism is 0.3 *m* and that between biprism and screen is 0.7*m* and angle of prism is 1°. The fringe width with light of wavelength 6000 Å will be

[RPMT 2002]

(a) 3 *cm* (b) 0.011 *cm*

(c) 2 *cm* (d) 4 *cm*

88. In Young double slit experiment, when two light waves form third minimum, they have [RPMT 2003]

(a) Phase difference of 3π (b) Phase difference of $\frac{5\pi}{2}$

(c) Path difference of 3λ (d) Path difference of $\frac{5\lambda}{2}$

89. In Fresnel's biprism experiment, on increasing the prism angle, fringe width will [RPMT 2003]

(a) Increase

(b) Decrease

(c) Remain unchanged

(d) Depend on the position of object

90. If prism angle $\alpha = 1°$, $\mu = 1.54$, distance between screen and prism $(b) = 0.7\,m$, distance between prism and source $a = 0.3\,m$, $\lambda = 180\pi\ nm$ then in Fresnal biprism find the value of β (fringe width) [RPMT 2002]

(a) $10^{-4} m$ (b) $10^{-3} mm$

(c) $10^{-4} \times \pi m$ (d) $\pi \times 10^{-3} m$

91. If Fresnel's biprism experiment as held in water inspite of air, then what will be the effect on fringe width [RPMT 1997, 98]

(a) Decrease (b) Increase

(c) No effect (d) None of these

92. What is the effect on Fresnel's biprism experiment when the use of white light is made [RPMT 1998]

(a) Fringe are affected

(b) Diffraction pattern is spread more

(c) Central fringe is white and all are coloured

(d) None of these

93. What happens to the fringe pattern when the Young's double slit experiment is performed in water instead or air then fringe width

(a) Shrinks (b) Disappear

(c) Unchanged (d) Enlarged

94. In Young's doubled slit experiment, the separation between the slit and the screen increases. The fringe width

[BCECE 2005]

(a) Increases (b) Decreases

(c) Remains unchanged (d) None of these

95. In Young's double slit experiment, the aperture screen distance is 2*m*. The fringe width is 1 *mm*. Light of 600 *nm* is used. If a thin plate of glass (μ = 1.5) of thickness 0.06 *mm* is placed over one of the slits, then there will be a lateral displacement of the fringes by

(a) 0 *cm* (b) 5 *cm*

(c) 10 *cm* (d) 15 *cm*

96. In which of the following is the interference due to the division of wave front [UPSEAT 2005]

(a) Young's double slit experiment

(b) Fresnel's biprism experiment

(c) Lloyd's mirror experiment

(d) Demonstration colours of thin film

97. Two slits are separated by a distance of 0.5 *mm* and illuminated with light of $\lambda = 6000$ Å. If the screen is placed 2.5 *m* from the slits. The distance of the third bright image from the centre will be

(a) 1.5 *mm* (b) 3 *mm*

(c) 6 *mm* (d) 9 *mm*

Doppler's Effect of Light

1. The observed wavelength of light coming from a distant galaxy is found to be increased by 0.5% as compared with that coming from a terrestrial source. The galaxy is

[MP PMT 1993, 2003]

(a) Stationary with respect to the earth

(b) Approaching the earth with velocity of light

(c) Receding from the earth with the velocity of light

(d) Receding from the earth with a velocity equal to $1.5 \times 10^{6} m/s$

2. A star producing light of wavelength 6000 Å moves away from the earth with a speed of 5 *km/sec*. Due to Doppler effect the shift in wavelength will be $(c = 3 \times 10^{8} m/\sec)$

[MP PMT 1990]

(a) 0.1 Å (b) 0.05 Å

(c) 0.2 Å (d) 1 Å

3. If the shift of wavelength of light emitted by a star is towards violet, then this shows that star is

[RPET 1996; RPMT 1999]

(a) Stationary

(b) Moving towards earth

(c) Moving away from earth

(d) Information is incomplete

4. Assuming that universe is expanding, if the spectrum of light coming from a star which is going away from earth is tested, then in the wavelength of light

(a) There will be no change

(b) The spectrum will move to infrared region

(c) The spectrum will seems to shift to ultraviolet side

(d) None of the above

5. Doppler's effect in sound in addition to relative velocity between source and observer, also depends while source and observer or both are moving. Doppler effect in light depend only on the relative velocity of source and observer. The reason of this is

(a) Einstein mass - energy relation

(b) Einstein theory of relativity

(c) Photoelectric effect

(d) None of these

6. A rocket is moving away from the earth at a speed of $6 \times 10^7 m/s$. The rocket has blue light in it. What will be the wavelength of light recorded by an observer on the earth (wavelength of blue light = 4600 Å)

(a) 4600 Å (b) 5520 Å

(c) 3680 Å (d) 3920 Å

7. A spectral line λ = 5000 Å in the light coming from a distant star is observed as a 5200 Å. What will be recession velocity of the star

(a) $1.15 \times 10^7 cm/\sec$ (b) $1.15 \times 10^7 m/\sec$

(c) $1.15 \times 10^7 km/\sec$ (d) 1.15 *km/sec*

8. The apparent wavelength of the light from a star moving away from the earth is 0.01% more than its real wavelength. Then the velocity of star is **[CPMT 1979]**

(a) 60 *km/sec* (b) 15 *km/sec*

(c) 150 *km/sec* (d) 30 *km/sec*

9. A star emits light of 5500 Å wavelength. Its appears blue to an observer on the earth, it means **[DPMT 2002]**

(a) Star is going away from the earth

(b) Star is stationary

(c) Star is coming towards earth

(d) None of the above

10. The velocity of light emitted by a source *S* observed by an observer *O*, who is at rest with respect to *S* is *c*. If the observer moves towards *S* with velocity *v*, the velocity of light as observed will be

(a) $c + v$ (b) $c - v$

(c) c (d) $\sqrt{1 - \frac{v^2}{c^2}}$

11. In the context of Doppler effect in light, the term 'red shift' signifies

(a) Decrease in frequency

(b) Increase in frequency

(c) Decrease in intensity

(d) Increase in intensity

12. The sun is rotating about its own axis. The spectral lines emitted from the two ends of its equator, for an observer on the earth, will show **[MP PMT 1994]**

(a) Shift towards red end

(b) Shift towards violet end

(c) Shift towards red end by one line and towards violet end by other

(d) No shift

13. A star is moving away from the earth with a velocity of 100 *km/s*. If the velocity of light is $3 \times 10^8 m/s$ then the shift of its spectral line of wavelength 5700 Å due to Doppler's effect will be **[MP PET/PMT 1988]**

(a) 0.63 Å (b) 1.90 Å

(c) 3.80 Å (d) 5.70 Å

14. If a source of light is moving away from a stationary observer, then the frequency of light wave appears to change because of

(a) Doppler's effect

(b) Interference

(c) Diffraction

(d) None of these

15. A star emitting radiation at a wavelength of 5000 Å is approaching earth with a velocity of $1.5 \times 10^6 m/s$. The change in wavelength of the radiation as received on the earth, is

(a) 25 Å (b) Zero

(c) 100 Å (d) 2.5 Å

16. A star emitting light of wavelength 5896 Å is moving away from the earth with a speed of 3600 *km / sec*. The wavelength of light observed on earth will

[MP PET 1995, 2002]

(a) Decrease by 5825.25 Å

(b) Increase by 5966.75 Å

(c) Decrease by 70.75 Å

(d) Increase by 70.75 Å

($c = 3 \times 10^8 m/\sec$ is the speed of light)

17. A star moves away from earth at speed 0.8 *c* while emitting light of frequency $6 \times 10^{14} Hz$. What frequency will be observed on the earth (in units of 10^{14} *Hz*) (*c* = speed of light) **[NCERT 1980]**

(a) 0.24 (b) 1.2

(c) 30 (d) 3.3

18. A light source approaches the observer with velocity 0.8 *c*. The doppler shift for the light of wavelength 5500 Å is

[MP PET 1996]

(a) 4400 Å (b) 1833 Å

(c) 3167 Å (d) 7333 Å

19. Light coming from a star is observed to have a wavelength of 3737 Å, while its real wavelength is 3700 Å. The speed of the star relative to the earth is [Speed of light $3\times10^8 m/s$] **[MP PET 1997]**

(a) $3\times10^5 m/s$ (b) $3\times10^6 m/s$

(c) $3.7\times10^7 m/s$ (d) $3.7\times10^6 m/s$

20. In the spectrum of light of a luminous heavenly body the wavelength of a spectral line is measured to be 4747 Å while actual wavelength of the line is 4700 Å. The relative velocity of the heavenly body with respect to earth will be (velocity of light is $3\times10^8 m/s$)

(a) $3\times10^5 m/s$ moving towards the earth

(b) $3\times10^5 m/s$ moving away from the earth

(c) $3\times10^6 m/s$ moving towards the earth

(d) $3\times10^6 m/s$ moving away from the earth

21. The wavelength of light observed on the earth, from a moving star is found to decrease by 0.05%. Relative to the earth the star is

(a) Moving away with a velocity of $1.5\times10^5 m/s$

(b) Coming closer with a velocity of $1.5\times10^5 m/s$

(c) Moving away with a velocity of $1.5\times10^4 m/s$

(d) Coming closer with a velocity of $1.5\times10^4 m/s$

22. A star is going away from the earth. An observer on the earth will see the wavelength of light coming from the star **[MP PMT 1999]**

(a) Decreased

(b) Increased

(c) Neither decreased nor increased

(d) Decreased or increased depending upon the velocity of the star

23. A star is moving towards the earth with a speed of 4.5×10^6 *m/s*. If the true wavelength of a certain line in the spectrum received from the star is 5890 Å, its apparent wavelength will be about $[c=3\times10^8 m/s]$ **[MP PMT 1999]**

(a) 5890 Å (b) 5978 Å

(c) 5802 Å (d) 5896 Å

24. Due to Doppler's effect, the shift in wavelength observed is 0.1 Å for a star producing wavelength 6000 Å. Velocity of recession of the star will be

(a) 2.5 *km/s* (d) 10 *km/s*

(c) 5 *km/s* (d) 20 *km/s*

25. A rocket is going away from the earth at a speed of 10^6 *m/s* If the wavelength of the light wave emitted by it be 5700 Å, what will be its Doppler's shift **[RPMT 1996]**

(a) 200 Å (b) 19 Å

(c) 20 Å (d) 0.2 Å

26. A rocket is going away from the earth at a speed 0.2*c*, where *c* = speed of light. It emits a signal of frequency $4\times10^7 Hz$. What will be the frequency observed by an observer on the earth

(a) $4\times10^6 Hz$ (b) $3.2\times10^7 Hz$

(c) $3\times10^6 Hz$ (d) $5\times10^7 Hz$

27. If a star is moving towards the earth, then the lines are shifted towards **[AIIMS 1997]**

(a) Red (b) Infrared

(c) Blue (d) Green

28. When the wavelength of light coming from a distant star is measured it is found shifted towards red. Then the conclusion is **[MP PMT/PET 1998]**

(a) The star is approaching the observer

(b) The star recedes away from earth

(c) There is gravitational effect on the light

(d) The star remains stationary

29. A heavenly body is receding from earth such that the fractional change in λ is 1, then its velocity is **[DCE 2000]**

(a) C **[MP PMT/PET 1998]** (b) $\frac{3C}{5}$

(c) $\frac{C}{5}$ (d) $\frac{2C}{5}$

30. The 6563 Å line emitted by hydrogen atom in a star is found to be red shifted by 5 Å. The speed with which the star is receding from the earth is **[Pb. PMT 2002]**

(a) 17.29×10^9 *m/s* (b) 4.29×10^7 *m/s*

(c) 3.39×10^5 *m/s* (d) 2.29×10^5 *m/s*

31. Three observers *A*, *B* and *C* measure the speed of light coming from a source to be v_A, v_B and v_C. The observer *A* moves towards the source, the observer *C* moves away from the source with the same speed. The observer *B* stays stationary. the surrounding space is vacuum every where. Then **[KCET 2002]**

(a) $v_A > v_B > v_C$ (b) $v_A < v_B < v_C$

(c) $v_A = v_B = v_C$ (d) $v_A = v_B > v_C$

32. Light from the constellation Virgo is observed to increase in wavelength by 0.4%. With respect to Earth the constellation is

(a) Moving away with velocity 1.2×10^6 *m/s*

(b) Coming closer with velocity 1.2×10^6 *m/s*

(c) Moving away with velocity 4×10^6 *m/s*

(d) Coming closer with velocity 4×10^6 *m/s*

33. It is believed that the universe is expanding and hence the distant stars are receding from us. Light from such a star will show

(a) Shift in frequency towards longer wavelengths

(b) Shift in frequency towards shorter wavelength

(c) No shift in frequency but a decrease in intensity

(d) A shift in frequency sometimes towards longer and sometimes towards shorter wavelengths

Diffraction of Light

1. A slit of width *a* is illuminated by white light. For red light (λ = 6500 Å), the first minima is obtained at $\theta = 30^o$. Then the value of *a* will be [MP PMT 1987; CPMT 2002]

(a) 3250 Å (b) $6.5 \times 10^{-4} mm$

(c) 1.24 *microns* (d) $2.6 \times 10^{-4} cm$

2. The light of wavelength 6328 Å is incident on a slit of width 0.2 *mm* perpendicularly, the angular width of central maxima will be [MP PMT 1987; Pb. PMT 2002]

(a) 0.36^o (b) 0.18^o

(c) 0.72^o (d) 0.09^o

3. The bending of beam of light around corners of obstacles is called [NCERT 1990; AFMC 1995; RPET 1997; RPMT 1997; CPMT 1999; JIPMER 2000]

(a) Reflection (b) Diffraction

(c) Refraction (d) Interference

4. The penetration of light into the region of geometrical shadow is called [CPMT 1999; JIPMER 2000]

(a) Polarisation (b) Interference

(c) Diffraction (d) Refraction

5. A slit of size 0.15 *cm* is placed at 2.1 *m* from a screen. On illuminated it by a light of wavelength 5×10^{-5} *cm*. The width of central maxima will be [RPMT 1999]

(a) 70 *mm* (b) 0.14 *mm*

(c) 1.4 *mm* (d) 0.14 *cm*

6. A diffraction is obtained by using a beam of red light. What will happen if the red light is replaced by the blue light [KCET 2000; BHU 2001]

(a) Bands will narrower and crowd full together

(b) Bands become broader and further apart

(c) No change will take place

(d) Bands disappear

7. What will be the angle of diffracting for the first minimum due to Fraunhoffer diffraction with sources of light of wave length 550 *nm* and slit of width 0.55 *mm*

(a) 0.001 *rad* (b) 0.01 *rad*

(c) 1 *rad* (d) 0.1 *rad*

8. Angular width (β) of central maximum of a diffraction pattern on a single slit does not depend upon [DCE 2000; 01]

(a) Distance between slit and source

(b) Wavelength of light used

(c) Width of the slit

(d) Frequency of light used

9. A single slit of width 0.20 *mm* is illuminated with light of wavelength 500 *nm*. The observing screen is placed 80 *cm* from the slit. The width of the central bright fringe will be [AMU (Med.) 2002]

(a) 1 *mm* (b) 2 *mm*

(c) 4 *mm* (d) 5 *mm*

10. Yellow light is used in single slit diffraction experiment with slit width 0.6 *mm*. If yellow light is replaced by *X*-rays then the pattern will reveal [IIT-JEE (Screening) 1999; MP PMT 2002; KCET 2003]

(a) That the central maxima is narrower

(b) No diffraction pattern

(c) More number of fringes

(d) Less number of fringes

11. Which statement is correct for a zone plate and a lens [RPMT 2002]

(a) Zone plate has multi focii whereas lens has one

(b) Zone plate has one focus whereas lens has multiple focii

(c) Both are correct

(d) Zone plate has one focus whereas a lens has infinite

12. In Fresnel diffraction, if the distance between the disc and the screen is decreased, the intensity of central bright spot will

(a) Increase (b) Decrease

(c) Remain constant (d) None of these

13. A plane wavefront $(\lambda = 6 \times 10^{-7} m)$ falls on a slit $0.4\,mm$ wide. A convex lens of focal length $0.8\,m$ placed behind the slit focusses the light on a screen. What is the linear diameter of second maximum [RPMT 2001]

(a) $6\,mm$ (b) $12\,mm$

(c) $3\,mm$ (d) $9\,mm$

14. A zone plate of focal length $60\,cm$, behaves as a convex lens, If wavelength of incident light is $6000\ \mathring{A}$, then radius of first half period zone will be [RPMT 2001]

(a) $36 \times 10^{-8} m.$ (b) $6 \times 10^{-8} m.$

(c) $\sqrt{6} \times 10^{-8} m.$ (d) $6 \times 10^{-4} m.$

15. Radius of central zone of circular zone plate is $2.3\,mm.$ Wavelength of incident light is $5893\ \mathring{A}.$ Source is at a distance of $6\,m.$ Then the distance of first image will be [RPMT 2001] [Pb. PMT 2001]

(a) $9\,m$ (b) $12\,m$

(c) $24\,m$ (d) $36\,m$

16. Red light is generally used to observe diffraction pattern from single slit. If blue light is used instead of red light, then diffraction pattern [RPMT 2001; BCECE 2005; CPMT 2005]

(a) Will be more clear (b) Will contract

(c) Will expanded (d) Will not be visualized

17. In the experiment of diffraction at a single slit, if the slit width is decreased, the width of the central maximum [KCET 2001]

(a) Increases in both Fresnel and Fraunhofer diffraction

(b) Decreases both in Fresnal and Fraunhofer diffraction

(c) Increases in Fresnel diffraction but decreases in Fraunhofer diffraction

(d) Decreases in Fresnel diffraction but increases is Fraunofer diffraction.

18. Conditions of diffraction is [RPET 2001]

(a) $\frac{a}{\lambda} = 1$ (b) $\frac{a}{\lambda} >> 1$

(c) $\frac{a}{\lambda} << 1$ (d) None of these

19. Light of wavelength $589.3\,nm$ is incident normally on the slit of width $0.1\,mm$. What will be the angular width of the central diffraction maximum at a distance of $1\,m$ from the slit

(a) $0.68°$ (b) $1.02°$

(c) $0.34°$ (d) None of these

20. The phenomenon of diffraction of light was discovered by [KCET 2000]

(a) Hygens (b) Newton

(c) Fresnel (d) Grimaldi

21. The radius r of half period zone is proportional to [RPMT 1998, 2002]

(a) $\sqrt{n}$ (b) $\frac{1}{\sqrt{n}}$

(c) n^2 (d) $\frac{1}{n}$

22. In a diffraction pattern by a wire, on increasing diameter of wire, fringe width [RPMT 1998]

(a) Decreases

(b) Increases

(c) Remains unchanged

(d) Increasing or decreasing will depend on wavelength

23. What will be the angular width of central maxima in Fraunhoffer diffraction when light of wavelength $6000\,Å$ is used and slit width is $12 \times 10^{-5}\,cm$. [RPMT 2004]

(a) 2 *rad* (b) 3 *rad*

(c) 1 *rad* (d) 8 *rad*

24. When a compact disc is illuminated by a source of white light. Coloured 'lanes' are observed. This is due to [DCE 2003; AIIMS 2004]

(a) Dispersion (b) Diffraction

(c) Interference (d) Refraction

25. The diffraction effect can be observed in [J & K CET 2004]

(a) Only sound waves

(b) Only light waves

(c) Only ultrasonic waves

(d) Sound as well as light waves

26. If we observe the single slit Fraunhofer diffraction with wavelength λ and slit width *e*, the width of the central maxima is 2θ. On decreasing the slit width for the same λ [UPSEAT 2004]

(a) θ increases

(b) θ remains unchanged

(c) θ decreases

(d) θ increases or decreases depending on the intensity of light

27. When light is incident on a diffraction grating the zero order principal maximum will be [KCET 2004]

(a) One of the component colours

(b) Absent

(c) Spectrum of the colours

(d) White

28. A beam of light of wavelength 600 *nm* from a distant source falls on a single slit 1 *mm* wide and the resulting diffraction pattern is observed on a screen 2 *m* away. The distance between the first dark fringes on either side of the central bright fringe is [IIT-JEE 1994; KCET 2004]

(a) 1.2 *mm* (b) 1.2 *cm*

(c) 2.4 *cm* [BHU (Med.) 1999] (d) 2.4 *mm*

29. In order to see diffraction the thickness of the film is [J&K CEE 2001]

(a) 100 Å (b) 10,000 Å

(c) 1 *mm* (d) 1 *cm*

30. Diffraction effects are easier to notice in the case of sound waves than in the case of light waves because [RPET 1978; KCET 1994, 2000]

(a) Sound waves are longitudinal

(b) Sound is perceived by the ear

(c) Sound waves are mechanical waves

(d) Sound waves are of longer wavelength

31. Direction of the first secondary maximum in the Fraunhofer diffraction pattern at a single slit is given by (*a* is the width of the slit) [KCET 1999]

(a) $a\sin\theta = \frac{\lambda}{2}$ (b) $a\cos\theta = \frac{3\lambda}{2}$

(c) $a\sin\theta = \lambda$ (d) $a\sin\theta = \frac{3\lambda}{2}$

32. A parallel monochromatic beam of light is incident normally on a narrow slit. A diffraction pattern is formed on a screen placed perpendicular to the direction of incident beam. At the first maximum of the diffraction pattern the phase difference between the rays coming from the edges of the slit is

(a) 0 (b) $\frac{\pi}{2}$

(c) π (d) 2π

33. Diffraction and interference of light suggest [CPMT 1995; RPMT 1998]

(a) Nature of light is electro-magnetic

(b) Wave nature

(c) Nature is quantum

(d) Nature of light is transverse

34. A light wave is incident normally over a slit of width $24 \times 10^{-5}\,cm$. The angular position of second dark fringe from the central maxima is 30°. What is the wavelength of light

(a) 6000 Å (b) 5000 Å

(c) 3000 Å (d) 1500 Å

35. A parallel beam of monochromatic light of wavelength 5000 Å is incident normally on a single narrow slit of width 0.001 *mm*. The light is focused by a convex lens on a screen placed on the focal plane. The first minimum will be formed for the angle of diffraction equal to [CBSE PMT 1993]

(a) 0° (b) 15°

(c) 30° (d) 60°

36. The condition for observing Fraunhofer diffraction from a single slit is that the light wavefront incident on the slit should be

(a) Spherical (b) Cylindrical

(c) Plane (d) Elliptical

37. To observe diffraction the size of an obstacle [CPMT 1982]

(a) Should be of the same order as wavelength

(b) Should be much larger than the wavelength

(c) Have no relation to wavelength

(d) Should be exactly $\frac{\lambda}{2}$

38. In the far field diffraction pattern of a single slit under polychromatic illumination, the first minimum with the wavelength λ_1 is found to be coincident with the third maximum at λ_2. So

(a) $3\lambda_1 = 0.3\lambda_2$ (b) $3\lambda_1 = \lambda_2$

(c) $\lambda_1 = 3.5\lambda_2$ (d) $0.3\lambda_1 = 3\lambda_2$

39. Light of wavelength λ = 5000 $Å$ falls normally on a narrow slit. A screen placed at a distance of 1 *m* from the slit and perpendicular to the direction of light. The first minima of the diffraction pattern is situated at 5 *mm* from the centre of central maximum. The width of the slit is

(a) 0.1 *mm* (b) 1.0 *mm*

(c) 0.5 *mm* (d) 0.2 *mm*

40. The width of the *n* *HPZ* will be

(a) $\sqrt{nb\lambda}$ (b) $\sqrt{b\lambda}\,[\sqrt{n} - \sqrt{n-1}]$

(c) $(\sqrt{n} - \sqrt{n-1})$ (d) $\frac{\sqrt{b\lambda}}{[\sqrt{n} - \sqrt{n-1}]}$

41. A single slit of width *a* is illuminated by violet light of wavelength 400 *nm* and the width of the diffraction pattern is measured as *y*. When half of the slit width is covered and illuminated by yellow light of wavelength 600 *nm*, the width of the diffraction pattern is

(a) The pattern vanishes and the width is zero

(b) $y/3$

(c) 3*y*

(d) None of these

Polarization of Light

1. A polariser is used to [CPMT 1999]

(a) Reduce intensity of light

(b) Produce polarised light

(c) Increase intensity of light

(d) Produce unpolarised light

2. Light waves can be polarised as they are

[CBSE PMT 1993; KCET 1994; AFMC 1997; J & K CET 2002; CPMT 2005]

(a) Transverse (b) Of high frequency

(c) Longitudinal (d) Reflected

3. Through which character we can distinguish the light waves from sound waves [CBSE PMT 1990; RPET 2000, 02]

(a) Interference (b) Refraction

(c) Polarisation [MP PMT 1987] (d) Reflection

4. The angle of polarisation for any medium is 60°, what will be critical angle for this [UPSEAT 1999]

(a) $\sin^{-1}\sqrt{3}$ (b) $\tan^{-1}\sqrt{3}$

(c) $\cos^{-1}\sqrt{3}$ (d) $\sin^{-1}\frac{1}{\sqrt{3}}$

5. The angle of incidence at which reflected light is totally polarized for reflection from air to glass (refraction index *n*) is

(a) $\sin^{-1}(n)$ (b) $\sin^{-1}\left(\frac{1}{n}\right)$

(c) $\tan^{-1}\left(\frac{1}{n}\right)$ (d) $\tan^{-1}(n)$

6. Which of following can not be polarised [Kerala PMT 2001]

(a) Radio waves (b) Ultraviolet rays

(c) Infrared rays (d) Ultrasonic waves

7. A polaroid is placed at 45° to an incoming light of intensity I_0. Now the intensity of light passing through polaroid after polarisation would be [CPMT 1995]

(a) I_0 (b) $I_0/2$

(c) $I_0/4$ (d) Zero

8. Plane polarised light is passed through a polaroid. On viewing through the polaroid we find that when the polariod is given one complete rotation about the direction of the light, one of the following is observed [MNR 1993]

(a) The intensity of light gradually decreases to zero and remains at zero

(b) The intensity of light gradually increases to a maximum and remains at maximum

(c) There is no change in intensity

(d) The intensity of light is twice maximum and twice zero

9. Out of the following statements which is not correct

[KCET 2005] [CPMT 1991]

(a) When unpolarised light passes through a Nicol's prism, the emergent light is elliptically polarised

(b) Nicol's prism works on the principle of double refraction and total internal reflection

(c) Nicol's prism can be used to produce and analyse polarised light

(d) Calcite and Quartz are both doubly refracting crystals

10. A ray of light is incident on the surface of a glass plate at an angle of incidence equal to Brewster's angle ϕ. If μ represents the refractive index of glass with respect to air, then the angle between reflected and refracted rays is

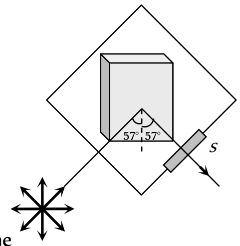
[CPMT 1989]

(a) $90 + \phi$ (b) $\sin^{-1}(\mu\cos\phi)$

(c) 90° (d) $90^o - \sin^{-1}(\sin\phi/\mu)$

11. Figure represents a glass plate placed vertically on a horizontal table with a beam of unpolarised light falling on its surface at the polarising angle of 57° with the normal. The electric vector in the reflected light on screen *S* will vibrate with respect to the plane of incidence in a

[CPMT 1988]



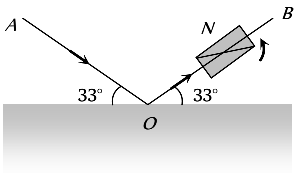
(a) Vertical plane

(b) Horizontal plane

(c) Plane making an angle of 45° with the vertical

(d) Plane making an angle of 57° with the horizontal

12. A beam of light *AO* is incident on a glass slab $(\mu = 1.54)$ in a direction as shown in figure. The reflected ray *OB* is passed through a Nicol prism on viewing through a Nicole prism, we find on rotating the prism that [CPMT 1986]



(a) The intensity is reduced down to zero and remains zero

(b) The intensity reduces down some what and rises again

(c) There is no change in intensity

(d) The intensity gradually reduces to zero and then again increases

13. Polarised glass is used in sun glasses because [CPMT 1981]

(a) It reduces the light intensity to half an account of polarisation

(b) It is fashionable

(c) It has good colour

(d) It is cheaper

14. In the propagation of electromagnetic waves the angle between the direction of propagation and plane of polarisation is

(a) 0° (b) 45°

(c) 90° (d) 180°

15. The transverse nature of light is shown by [CPMT 1972, 74, 78; RPMT 1999; AFMC 2001; AIEEE 2002; MP PET 2004; MP PMT 2000, 04; UPSEAT 2005]

(a) Interference of light (b) Refraction of light

(c) Polarisation of light (d) Dispersion of light

16. A calcite crystal is placed over a dot on a piece of paper and rotated, on seeing through the calcite one will be see

[CPMT 1971]

(a) One dot

(b) Two stationary dots

(c) Two rotating dots

(d) One dot rotating about the other

17. A light has amplitude *A* and angle between analyser and polariser is 60°. Light is reflected by analyser has amplitude

[UPSEAT 2001]

(a) $A\sqrt{2}$ (b) $A/\sqrt{2}$

(c) $\sqrt{3}A/2$ (d) $A/2$

18. When light is incident on a doubly refracting crystal, two refracted rays-ordinary ray (*O*-ray) and extra ordinary ray (*E*-ray) are produced. Then [KCET 2001]

(a) Both *O*-ray and *E*-ray are polarised perpendicular to the plane of incidence

(b) Both *O*-ray and *E*-ray are polarised in the plane of incidence

(c) *E*-ray is polarised perpendicular to the plane of incidence and *O*-ray in the plane of incidence

(d) *E*-ray is polarised in the plane of incidence and *O*-ray perpendicular to the plane of incidence

19. Light passes successively through two polarimeters tubes each of length 0.29*m*. The first tube contains dextro rotatory solution of concentration 60kgm^{-3} and specific rotation 0.01$rad\,m^2 kg^{-1}$. The second tube contains laevo rotatory solution of concentration 30kg/m^3 and specific rotation 0.02 $rad\,m^2 kg^{-1}$. The net rotation produced is[KCET 2002]

(a) 15° (b) 0°

(c) 20° (d) 10°

20. V_o and V_E represent the velocities, μ_o and μ_E the refractive indices of ordinary and extraordinary rays for a doubly refracting crystal. Then [KCET 2002]

(a) $V_o \ge V_E,\ \mu_o \le \mu_E$ if the crystal is calcite

(b) $V_o \le V_E,\ \mu_o \le \mu_E$ if the crystal is quartz

(c) $V_o \le V_E,\ \mu_o \ge \mu_E$ if the crystal is calcite

(d) $V_o \ge V_E,\ \mu_o \ge \mu_E$ if the crystal is quartz

21. Polarising angle for water is 53°4'. If light is incident at this angle on the surface of water and reflected, the angle of refraction is

(a) 53°4' (b) 126°56'

(c) 36°56' (d) 30°4'

22. When a plane polarised light is passed through an analyser and analyser is rotated through 90°, the intensity of the emerging light

(a) Varies between a maximum and minimum

(b) Becomes zero

(c) Does not vary [CPMT 1978]

(d) Varies between a maximum and zero

23. Consider the following statements *A* to *B* and identify the correct answer

A. Polarised light can be used to study the helical surface of nucleic acids.

B. Optics axis is a direction and not any particular line in the crystal [EAMCET (Med.) 2003]

(a) A and B are correct

(b) A and B are wrong

(c) A is correct but B is wrong

(d) A is wrong but B is correct

24. Two Nicols are oriented with their principal planes making an angle of 60°. The percentage of incident unpolarized light which passes through the system is

(a) 50% (b) 100%

(c) 12.5% (d) 37.5%

25. Unpolarized light falls on two polarizing sheets placed one on top of the other. What must be the angle between the characteristic directions of the sheets if the intensity of the final transmitted light is one-third the maximum intensity of the first transmitted beam

(a) 75° (b) 55°

(c) 35° (d) 15°

26. Unpolarized light of intensity 32 Wm passes through three polarizers such that transmission axes of the first and second polarizer makes and angle 30° with each other and the transmission axis of the last polarizer is crossed with that of the first. The intensity of final emerging light will be

(a) 32 Wm (b) 3 Wm

(c) 8 Wm (d) 4 Wm

27. In the visible region of the spectrum the rotation of the place of polarization is given by $\theta = a + \frac{b}{\lambda^2}$. The optical rotation produced by a particular material is found to be 30° *per mm* at $\lambda = 5000$ Å and 50° *per mm* at $\lambda = 4000$Å. The value of constant a will be

(a) $+\frac{50°}{9}$ *per mm* (b) $-\frac{50°}{9}$ *per mm*

(c) $+\frac{9°}{50}$ *per mm* (d) $-\frac{9°}{50}$ *per mm*

28. When an unpolarized light of intensity I_0 is incident on a polarizing sheet, the intensity of the light which does not get transmitted is [AIEEE 2005]

(a) Zero (b) I_0

(c) $\frac{1}{2}I_0$ (c) $\frac{1}{4}I_0$

29. Refractive index of material is equal to tangent of polarising angle. It is called [AFMC 2005]

(a) Brewster's law (b) Lambert's law

(c) Malus's law (d) Bragg's law

30. In case of linearly polarized light, the magnitude of the electric field vector: [AIIMS 2005]

(a) Does not change with time

(b) Varies periodically with time

(c) Increases and decreases linearly with time

(d) Is parallel to the direction of propagation

31. When unpolarised light beam is incident from air onto glass (n = 1.5) at the polarising angle [KCET 2005]

(a) Reflected beam is polarised 100 percent

(b) Reflected and refracted beams are partially polarised

(c) The reason for (a) is that almost all the light is reflected

(d) All of the above

32. An optically active compound [DCE 2005]

(a) Rotates the plane polarised light

(b) Changing the direction of polarised light

(c) Do not allow plane polarised light to pass through

(d) None of the above

33. When the angle of incidence on a material is 60°, the reflected light is completely polarized. The velocity of the refracted ray inside the material is (in ms) [Kerala PMT 2005]

(a) 3×10^8 (b) $\left(\frac{3}{\sqrt{2}}\right)\times10^8$

(c) $\sqrt{3}\times10^8$ (d) 0.5×10^8

34. Two polaroids are placed in the path of unpolarized beam of intensity I_0 such that no light is emitted from the second polaroid. If a third polaroid whose polarization axis makes an angle θ with the polarization axis of first polaroid, is placed between these polaroids then the intensity of light emerging from the last polaroid will be [UPSEAT 200

(a) $\left(\frac{I_0}{8}\right)\sin^2 2\theta$ (b) $\left(\frac{I_0}{4}\right)\sin^2 2\theta$

(c) $\left(\frac{I_0}{2}\right)\cos^4\theta$ (d) $I_0\cos^4\theta$

35. For the study of the helical structure of nucleic acids, the property of electromagnetic radiation generally used is [EAMCET 2005]

(a) Reflection (b) Interference

(c) Diffraction (d) Polarization

EM Waves

1. Which of the following statement is wrong [NCERT 1976]

(a) Infrared photon has more energy than the photon of visible light

(b) Photographic plates are sensitive to ultraviolet rays

(c) Photographic plates can be made sensitive to infrared rays

(d) Infrared rays are invisible but can cast shadows like visible light rays

2. Pick out the longest wavelength from the following types of radiations [CBSE PMT 1990]

(a) Blue light (b) γ-rays

(c) X-rays (d) Red light

3. Wave which cannot travel in vacuum is [MP PMT 1994]

(a) X-rays (b) Infrasonic

(c) Ultraviolet (d) Radiowaves

4. Light is an electromagnetic wave. Its speed in vacuum is given by the expression [CBSE PMT 1993; MP PMT 1994; RPMT 1999; MP PET 2001; Kerala PET 2001; AIIMS 2002]

(a) $\sqrt{\mu_o\varepsilon_o}$ (b) $\sqrt{\frac{\mu_o}{\varepsilon_o}}$

(c) $\sqrt{\frac{\varepsilon_o}{\mu_o}}$ (d) $\frac{1}{\sqrt{\mu_o\varepsilon_o}}$

5. The range of wavelength of the visible light is [MP PMT 2000; MP PET 2002]

(a) 10 Å to 100 Å (b) 4,000 Å to 8,000 Å

(c) 8,000 Å to 10,000 Å (d) 10,000 Å to 15,000 Å

6. Which radiation in sunlight, causes heating effect [AFMC 2001]

(a) Ultraviolet (b) Infrared

(c) Visible light (d) All of these

7. Which of the following represents an infrared wavelength

[CPMT 1975; MP PET/PMT 1988]

(a) 10^{-4} *cm* (b) 10^{-5} *cm*

(c) 10^{-6} *cm* (d) 10^{-7} *cm*

8. The wavelength of light visible to eye is of the order of [CPMT 1982, 84]

(a) 10^{-2} *m* (b) 10^{-10} *m*

(c) 1 *m* (d) 6×10^{-7} *m*

9. The speed of electromagnetic wave in vacuum depends upon the source of radiation [Kerala PMT 2004]

(a) Increases as we move from γ-rays to radio waves

(b) Decreases as we move from γ-rays to radio waves

(c) Is same for all of them

(d) None of these

10. Which of the following radiations has the least wavelength [AIEEE 2003]

(a) γ -rays (b) β-rays

(c) α-rays (d) *X*-rays

11. The maximum distance upto which TV transmission from a TV tower of height *h* can be received is proportional to [AIIMS 2003]

(a) $h^{1/2}$ (b) *h*

(c) *h* (d) h^2

12. Which of the following are not electromagnetic waves [AIEEE 2002; CBSE PMT 2003]

(a) Cosmic rays (b) Gamma rays

(c) β-rays (d) *X*-rays

13. Ozone is found in [DPMT 2002]

(a) Stratosphere (b) Ionosphere

(c) Mesosphere (d) Troposphere

14. The electromagnetic waves travel with a velocity [J & K CET 2002]

(a) Equal to velocity of sound

(b) Equal to velocity of light

(c) Less than velocity of light

(d) None of these

15. The ozone layer absorbs [Kerala PET 2002]

(a) Infrared radiations (b) Ultraviolet radiations

(c) *X*-rays (d) γ-rays

16. Electromagnetic radiation of highest frequency is [Kerala PMT 2002]

(a) Infrared radiations (b) Visible radiation

(c) Radio waves (d) γ-rays

17. Which of the following shows green house effect [CBSE PMT 2002]

(a) Ultraviolet rays (b) Infrared rays

(c) *X*-rays (d) None of these

18. Which of the following waves have the maximum wavelength [AFMC 2002]

(a) *X*-rays (b) I.R. rays

(c) UV rays (d) Radio waves

19. Electromagnetic waves are transverse in nature is evident by [AIEEE 2002]

(a) Polarization (b) Interference

(c) Reflection (d) Diffraction

20. If $\vec{E}$ and $\vec{B}$ are the electric and magnetic field vectors of E.M. waves then the direction of propagation of E.M. wave is along the direction of [CBSE PMT 1992, 2002; DCE 2002, 05]

(a) $\vec{E}$ (b) $\vec{B}$

(c) $\vec{E}\times\vec{B}$ (d) None of these

21. Biological importance of Ozone layer is [CBSE PMT 2001]

(a) It stops ultraviolet rays

(b) Ozone rays reduce green house effect

(c) Ozone layer reflects radio waves

(d) Ozone layer controls O_2 / H_2 radio in atmosphere

22. What is ozone hole [AFMC 2001]

(a) Hole in the ozone layer

(b) Formation of ozone layer

(c) Thinning of ozone layer in troposphere

(d) Reduction in ozone thickness in stratosphere

23. Which rays are not the portion of electromagnetic spectrum [Haryana CEET 2000]

(a) *X*-rays (b) Microwaves

(c) α-rays (d) Radio waves

24. Radio wave diffract around building although light waves do not. The reason is that radio waves [AMU 2000]

(a) Travel with speed larger than *c*

(b) Have much larger wavelength than light

(c) Carry news

(d) Are not electromagnetic waves

25. The frequencies of *X*-rays, γ-rays and ultraviolet rays are respectively *a*, *b* and *c*. Then [CBSE PMT 2000]

(a) $a < b, b > c$ (b) $a > b, b > c$

(c) $a > b, b < c$ (d) $a < b, b < c$

26. Radio waves and visible light in vacuum have [KCET 2000]

(a) Same velocity but different wavelength

(b) Continuous emission spectrum

(c) Band absorption spectrum

(d) Line emission spectrum

27. Energy stored in electromagnetic oscillations is in the form of [Haryana CEET 2000; AFMC 1994]

(a) Electrical energy (b) Magnetic energy

(c) Both (a) and (b) (d) None of these

28. Heat radiations propagate with the speed of [AMU 2000]

(a) α-rays (b) β-rays

(c) Light waves (d) Sound waves

29. If a source is transmitting electromagnetic wave of frequency $8.2 \times 10^6\ Hz$, then wavelength of the electromagnetic waves transmitted from the source will be [DPMT 1999]

(a) 36.6 m (b) 40.5 m

(c) 42.3 m (d) 50.9 m

30. In an apparatus, the electric field was found to oscillate with an amplitude of 18 V/m. The magnitude of the oscillating magnetic field will be [Pb. PMT 1999]

(a) $4 \times 10^{-6}\ T$ (b) $6 \times 10^{-8}\ T$

(c) $9 \times 10^{-9}\ T$ (d) $11 \times 10^{-11}\ T$

31. According to Maxwell's hypothesis, a changing electric field gives rise to [AIIMS 1998]

(a) An e.m.f. (b) Electric current

(c) Magnetic field (d) Pressure radiant

32. In an electromagnetic wave, the electric and magnetising fields are $100\ V m^{-1}$ and $0.265\ A m^{-1}$. The maximum energy flow is

(a) $26.5\ W/m^2$ (b) $36.5\ W/m^2$

(c) $46.7\ W/m^2$ (d) $765\ W/m^2$

33. The 21 cm radio wave emitted by hydrogen in interstellar space is due to the interaction called the hyperfine interaction is atomic hydrogen. the energy of the emitted wave is nearly

(a) 10^{-17} *Joule* (b) 1 *Joule*

(c) 7×10^{-8} *Joule* (d) 10^{-24} *Joule*

34. TV waves have a wavelength range of 1-10 *meter*. Their frequency range in *MHz* is [KCET 1998]

(a) 30-300 (b) 3-30

(c) 300-3000 (d) 3-3000

35. Maxwell's equations describe the fundamental laws of [CPMT 1996]

(a) Electricity only (b) Magnetism only

(c) Mechanics only (d) Both (a) and (b)

36. The oscillating electric and magnetic vectors of an electromagnetic wave are oriented along [CBSE PMT 1994]

(a) The same direction but differ in phase by 90°

(b) The same direction and are in phase

(c) Mutually perpendicular directions and are in phase

(d) Mutually perpendicular directions and differ in phase by 90°

37. In which one of the following regions of the electromagnetic spectrum will the vibrational motion of molecules give rise to absorption [SCRA 1994]

(a) Ultraviolet (b) Microwaves

(c) Infrared (d) Radio waves

38. An electromagnetic wave travels along z-axis. Which of the following pairs of space and time varying fields would generate such a wave

(a) E_x, B_y (b) E_y, B_x

(c) E_z, B_x (d) E_y, B_z

39. Which of the following rays has the maximum frequency [CBSE PMT 1994]

(a) Gamma rays (b) Blue light

(c) Infrared rays (d) Ultraviolet rays

40. A signal emitted by an antenna from a certain point can be received at another point of the surface in the form of [CPMT 1993]

(a) Sky wave (b) Ground wave

(c) Sea wave (d) Both (a) and (b)

41. Approximate height of ozone layer above the ground is [CBSE PMT 1991]

(a) 60 to 70 km (b) 59 km to 80 km

(c) 70 km to 100 km (d) 100 km to 200 km

42. The electromagnetic waves do not transport [Pb. PET 1991]

(a) Energy (b) Charge

(c) Momentum [Pb. PMT 1997, 98] (d) Information

43. A plane electromagnetic wave is incident on a material surface. If the wave delivers momentum p and energy E, then

(a) $p = 0, E = 0$ (b) $p \neq 0, E \neq 0$

(c) $p \neq 0, E = 0$ (d) $p = 0, E \neq 0$

44. An electromagnetic wave, going through vacuum is described by [CBSE PMT 1998] $E = E_0 \sin(kx - \omega t)$. Which of the following is independent of wavelength

(a) k (b) ω

(c) k/ω (d) $k\omega$

45. An electromagnetic wave going through vacuum is described by $E = E_0 \sin(kx - \omega t)$; $B = B_0 \sin(kx - \omega t)$. Which of the following equation is true

(a) $E_0 k = B_0 \omega$ (b) $E_0 \omega = B_0 k$

(c) $E_0 B_0 = \omega k$ (d) None of these

46. An LC resonant circuit contains a 400 pF capacitor and a 100 μH inductor. It is set into oscillation coupled to an antenna. The wavelength of the radiated electromagnetic waves is

(a) 377 mm (b) 377 *metre*

(c) 377 cm (d) 3.77 cm

47. A radio receiver antenna that is 2 m long is oriented along the direction of the electromagnetic wave and receives a signal of intensity $5 \times 10^{-16}\ W/m^2$. The maximum instantaneous potential difference across the two ends of the antenna is

(a) 1.23 μV (b) 1.23 mV

(c) 1.23 V (d) 12.3 mV

48. Television signals broadcast from the moon can be received on the earth while TV broadcast [CBSE PMT 1994] from Delhi cannot be received at places about 100 km distant from Delhi. This is because

(a) There is no atmosphere around the moon

(b) Of strong gravity effect on TV signals

(c) TV signals travel straight and cannot follow the curvature of the earth

(d) There is atmosphere around the earth

49. A TV tower has a height of 100 *m*. The average population density around the tower is 1000 per *km*. The radius of the earth is 6.4×10^6 *m*. the population covered by the tower is

(a) 2×10^6 (b) 3×10^6

(c) 4×10^6 (d) 6×10^6

50. The wavelength 21 *cm* emitted by atomic hydrogen in interstellar space belongs to

(a) Radio waves (b) Infrared waves

(c) Microwaves (d) γ-rays

51. Which scientist experimentally proved the existence of electromagnetic waves [AFMC 2004]

(a) Sir J.C. Bose (b) Maxwell

(c) Marconi (d) Hertz

52. An electromagnetic wave of frequency $\nu = 3.0\ MHz$ passes from vacuum into a dielectric medium with permitivity $\varepsilon = 4.0$. Then

(a) Wavelength is doubled and the frequency remains unchanged

(b) Wavelength is doubled and frequency becomes half

(c) Wavelength is halved and frequency remains unchanged

(d) Wavelength and frequency both remain unchanged

53. Frequency of a wave is $6\times10^{15}\,Hz$. The wave is [Orissa PMT 2004]

(a) Radiowave (b) Microwave

(c) X-ray (d) None of these

54. The region of the atmosphere above troposphere is known as

(a) Lithosphere (b) Uppersphere

(c) Ionosphere (d) Stratosphere

55. Which of the following electromagnetic waves have minimum frequency [Pb PET 2000]

(a) Microwaves (b) Audible waves

(c) Ultrasonic waves (d) Radiowaves

56. Which one of the following have minimum wavelength [Pb PET 2001]

(a) Ultraviolet rays (b) Cosmic rays

(c) *X*-rays (d) $\gamma-$rays

57. Radiations of intensity $0.5\ W/m^2$ are striking a metal plate. The pressure on the plate is [DCE 2004]

(a) $0.166\times10^{-8}\ N/m^2$ (b) $0.332\times10^{-8}\ N/m^2$

(c) $0.111\times10^{-8}\ N/m^2$ (d) $0.083\times10^{-8}\ N/m^2$

58. Electromagnetic waves travel in a medium which has relative permeability 1.3 and relative permittivity 2.14. Then the speed of the electromagnetic wave in the medium will be

(a) $13.6\times10^6\ m/s$ (b) $1.8\times10^2\ m/s$

(c) $3.6\times10^8\ m/s$ (d) $1.8\times10^8\ m/s$

59. The intensity of gamma radiation from a given source is *I*. On passing through 36 *mm* of lead, it is reduced to $\frac{I}{8}$. The thickness of lead which will reduce the intensity to $\frac{I}{2}$ will be [AIEEE 2005]

(a) 18 *mm* (b) 12 *mm*

(c) 6 *mm* (d) 9 *mm*

60. If λ_v, λ_r and λ_m represent the wavelength of visible light *x*-rays and microwaves respectively, then [CBSE PMT 2005]

(a) $\lambda_m > \lambda_x > \lambda_v$ (b) $\lambda_v > \lambda_m > \lambda_y$

(c) $\lambda_m > \lambda_v > \lambda_v$ (d) $\lambda_v > \lambda_x > \lambda_m$

61. For skywave propagation of a 10 *MHz* signal, what should be the minimum electron density in ionosphere [AFMC 2005]

(a) $\sim 1.2\times10^{12}m^{-3}$ (b) $\sim 10^6 m^{-3}$

(c) $\sim 10^{14}m^{-3}$ (d) $\sim 10^{22}m^{-3}$

62. The pressure exerted by an electromagnetic wave of intensity *I* (*watts*/*m*) on a nonreflecting surface is [*c* is the velocity of light]

(a) Ic (b) Ic^2

(c) I/c (d) I/c^2

63. Infrared radiation was discovered in 1800 by [AIEEE 2004] [KCET 2005]

(a) William Wollaston (b) William Herschel

(c) Wilhelm Roentgen (d) Thomas Young

64. Which of the following is electromagnetic wave [BCECE 2005]

(a) *X*-rays and light waves

(b) Cosmic rays and sound waves

(c) Beta rays and sound waves

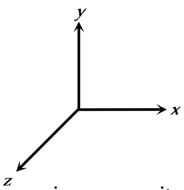
(d) Alpha rays and sound waves

65. Which one of the following is not electromagnetic in nature [Kerala PMT 2005] [BCECE 2004]

(a) *X*-rays (b) Gamma rays

(c) Cathode rays (d) Infrared rays

66. Light wave is travelling along y-direction. If the corresponding $\vec{E}$ vector at any time is along the x-axis, the direction of $\vec{B}$ vector at that time is along [UPSEAT 2005]



(a) *y*-axis

(b) *x*-axis

(c) + *z*-axis

(d) − *z* axis

67. If *c* is the speed of electromagnetic waves in vacuum, its speed in a medium of dielectric constant *K* and relative permeability μ_r is [MH CET 2003]

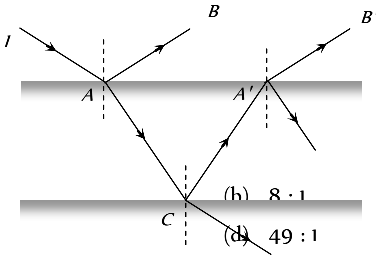
(a) $v = \frac{1}{\sqrt{\mu_r K}}$ (b) $v = c\sqrt{\mu_r K}$

(c) $v = \frac{c}{\sqrt{\mu_r K}}$ (d) $v = \frac{K}{\sqrt{\mu_r C}}$

Critical Thinking

Objective Questions

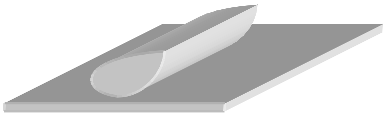
1. A ray of light of intensity I is incident on a parallel glass-slab at a point A as shown in fig. It undergoes partial reflection and refraction. At each reflection 25% of incident energy is reflected. The rays AB and $A'B'$ undergo interference. The ratio I_{max} / I_{min} is



(a) 4 : 1 (b) 8 : 1

(c) 7 : 1 (d) 49 : 1

2. A thin slice is cut out of a glass cylinder along a plane parallel to its axis. The slice is placed on a flat glass plate as shown. The observed interference fringes from this combination shall be



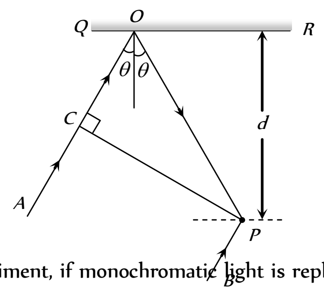
(a) Straight

(b) Circular

(c) Equally spaced

(d) Having fringe spacing which increases as we go outwards

3. In the adjacent diagram, CP represents a wavefront and AO & BP, the corresponding two rays. Find the condition on θ for constructive interference at P between the ray BP and reflected ray OP



(a) $\cos\theta = 3\lambda/2d$

(b) $\cos\theta = \lambda/4d$

(c) $\sec\theta - \cos\theta = \lambda/d$

(d) $\sec\theta - \cos\theta = 4\lambda/d$

4. In Young's double slit experiment, if monochromatic light is replaced by white light

[AIIMS 2001; Kerala PET 2000; KCET 2004]

(a) All bright fringes become white

(b) All bright fringes have colours between violet and red

(c) Only the central fringe is white, all other fringes are coloured

(d) No fringes are observed

5. In Young's double slit experiment, if the two slits are illuminated with separate sources, no interference pattern is observed because

(a) There will be no constant phase difference between the two waves

(b) The wavelengths are not equal

(c) The amplitudes are not equal

(d) None of the above

6. In Young's double slit experiment, white light is used. The separation between the slits is b. The screen is at a distance d ($d >> b$) from the slits. Some wavelengths are missing exactly in front of one slit. These wavelengths are

[IIT 1984; AIIMS 1995]

(a) $\lambda = \dfrac{b^2}{d}$ (b) $\lambda = \dfrac{2b^2}{d}$

(c) $\lambda = \dfrac{b^2}{3d}$ (d) $\lambda = \dfrac{2b^2}{3d}$

[IIT 1990]

7. In a Young's double slit experiment the source S and the two slits A and B are vertical with slit A above slit B. The fringes are observed on a vertical screen K. The optical path length from S to B is increased very slightly (by introducing a transparent material of higher refractive index) and the optical path length from S to A is not changed, as a result the fringe system on K moves

(a) Vertically downwards slightly

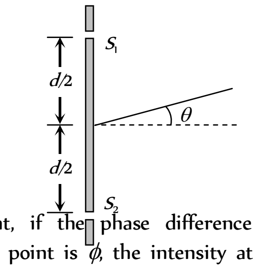
(b) Vertically upwards slightly

(c) Horizontally, slightly to the left

(d) Horizontally, slightly to the right

[IIT-JEE (Screening)1999]

8. In an interference arrangement similar to Young's double slit experiment, the slits S_1 and S_2 are illuminated with coherent microwave sources each of frequency 10^6 Hz. The sources are synchronized to have zero phase difference. The slits are separated by distance d = 150 m. The intensity $I(\theta)$ is measured as a function of θ, where θ is defined as shown. If I_0 is maximum intensity, then $I(\theta)$ for $0 \le \theta \le 90^o$ is given by



(a) $I(\theta) = I_0$ for $\theta = 0^o$

(b) $I(\theta) = I_0 / 2$ for $\theta = 30^o$

(c) $I(\theta) = I_0 / 4$ for $\theta = 90^o$

(d) $I(\theta)$ is constant for all values of θ

[IIT-JEE (Screening) 2003]

9. In the Young's double slit experiment, if the phase difference between the two waves interfering at a point is ϕ, the intensity at that point can be expressed by the expression

[MP PET 1998; MP PMT 2003]

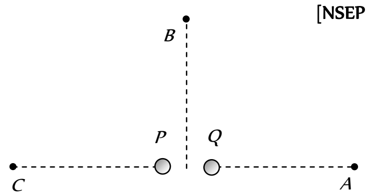
(a) $I = \sqrt{A^2 + B^2 \cos^2 \phi}$ (b) $I = \dfrac{A}{B}\cos\phi$

(c) $I = A + B\cos\dfrac{\phi}{2}$ (d) $I = A + B\cos\phi$

Where A and B depend upon the amplitudes of the two waves.

10. Figure here shows P and Q as two equally intense coherent sources emitting radiations of wavelength 20 m. The separation PQ is 5.0 m and phase of P is ahead of the phase of Q by 90°. A, B and C are three distant points of observation equidistant from the mid-point of PQ. The intensity of radiations at A, B, C will bear the ratio

[NSEP 1994]



(a) 0 : 1 : 4

(b) 4 : 1 : 0

(c) 0 : 1 : 2

(d) 2 : 1 : 0

11. In Young's double slit experiment, the intensity on the screen at a point where path difference is λ is K. What will be the intensity at the point where path difference is $\lambda / 4$

[RPET 1996]

(a) $\dfrac{K}{4}$ (b) $\dfrac{K}{2}$

(c) K (d) Zero

12. When one of the slits of Young's experiment is covered with a transparent sheet of thickness 4.8 *mm*, the central fringe shifts to a position originally occupied by the 30th bright fringe. What should be the thickness of the sheet if the central fringe has to shift to the position occupied by 20th bright fringe

(a) 3.8 *mm* (b) 1.6 *mm*

(c) 7.6 *mm* (d) 3.2 *mm*

13. In the ideal double-slit experiment, when a glass-plate (refractive index 1.5) of thickness t is introduced in the path of one of the interfering beams (wavelength λ), the intensity at the position where the central maximum occurred previously remains unchanged. The minimum thickness of the glass-plate is [IIT-JEE (Screening) 2002]

(a) 2λ (b) $\frac{2\lambda}{3}$

(c) $\frac{\lambda}{3}$ (d) λ

14. The time period of rotation of the sun is 25 days and its radius is $7\times10^8 m$. The Doppler shift for the light of wavelength 6000 Å emitted from the surface of the sun will be [MP PMT 1994]

(a) 0.04 Å (b) 0.40 Å

(c) 4.00 Å (d) 40.0 Å

15. In hydrogen spectrum the wavelength of H_α line is 656 *nm* whereas in the spectrum of a distant galaxy, H_α line wavelength is 706 *nm*. Estimated speed of the galaxy with respect to earth is [IIT-JEE 1999; UPSEAT 2003]

(a) $2\times10^8 m/s$ (b) $2\times10^7 m/s$

(c) $2\times10^6 m/s$ (d) $2\times10^5 m/s$

16. A rocket is going towards moon with a speed *v*. The astronaut in the rocket sends signals of frequency ν towards the moon and receives them back on reflection from the moon. What will be the frequency of the signal received by the astronaut (Take *v*<<*c*) [RPMT 1996; DPMT 2000]

(a) $\frac{c}{c-v}\nu$ (b) $\frac{c}{c-2v}\nu$

(c) $\frac{2v}{c}\nu$ (d) $\frac{2c}{v}\nu$

17. The periodic time of rotation of a certain star is 22 days and its radius is 7×10^8 *metres*. If the wavelength of light emitted by its surface be 4320 Å, the Doppler shift will be (1 day = 86400 *sec*) [MP PET 2001]

(a) 0.033 Å (b) 0.33 Å

(c) 3.3 Å (d) 33 Å

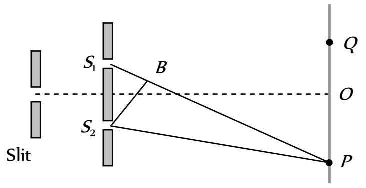
18. In a two slit experiment with monochromatic light fringes are obtained on a screen placed at some distance from the sits. If the screen is moved by $5\times10^{-2}m$ towards the slits, the change in fringe width is $3\times10^{-5}m$. If separation between the slits is $10^{-3}m$, the wavelength of light used is

[Roorkee 1992]

(a) 6000 *Å* (b) 5000 *Å*

(c) 3000 *Å* (d) 4500 *Å*

19. In the figure is shown Young's double slit experiment. Q is the position of the first bright fringe on the right side of O. P is the 11th fringe on the other side, as measured from Q. If the wavelength of the light used is $6000\times10^{-10}m$, then S_1B will be equal to [KCET 2002]



(a) $6\times10^{-6}m$

(b) $6.6\times10^{-6}m$

(c) $3.138\times10^{-7}m$

(d) $3.144\times10^{-7}m$

20. In Young's double slit experiment, the two slits act as coherent sources of equal amplitude A and wavelength λ. In another experiment with the same set up the two slits are of equal amplitude A and wavelength λ but are incoherent. The ratio of the intensity of light at the mid-point of the screen in the first case to that in the second case is

[IIT-JEE 1986; RPMT 2002]

(a) 1 : 2 (b) 2 : 1

(c) 4 : 1 (d) 1 : 1

21. Four light waves are represented by

(i) $y = a_1 \sin\omega t$ (ii) $y = a_2 \sin(\omega t+\phi)$

(iii) $y = a_1 \sin 2\omega t$ (iv) $y = a_2 \sin 2(\omega t+\phi)$

Interference fringes may be observed due to superposition of

(a) (i) and (ii) (b) (i) and (iii)

(c) (ii) and (iv) (d) (iii) and (iv)

22. In Young's double slit experiment the *y*-coordinates of central maxima and 10th maxima are 2 *cm* and 5 *cm* respectively. When the YDSE apparatus is immersed in a liquid of refractive index 1.5 the corresponding *y*-coordinates will be

(a) 2 *cm*, 7.5 *cm*

(b) 3 *cm*, 6 *cm*

(c) 2 *cm*, 4 *cm*

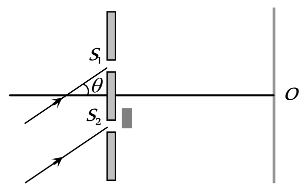
(d) 4/3 *cm*, 10/3 *cm*

23. The maximum intensity in Young's double slit experiment is I_0. Distance between the slits is $d = 5\lambda$, where λ is the wavelength of monochromatic light used in the experiment. What will be the intensity of light in front of one of the slits on a screen at a distance $D = 10\,d$

(a) $\frac{I_0}{2}$ (b) $\frac{3}{4}I_0$

(c) I_0 (d) $\frac{I_0}{4}$

24. A monochromatic beam of light falls on YDSE apparatus at some angle (say θ) as shown in figure. A thin sheet of glass is inserted in front of the lower slit S_2. The central bright fringe (path difference = 0) will be obtained



(a) At O

(b) Above O

(c) Below O

(d) Anywhere depending on angle θ, thickness of plate t and refractive index of glass μ

25. In Young's double slit experiment how many maximas can be obtained on a screen (including the central maximum) on both sides of the central fringe if $\lambda = 2000\,Å$ and $d = 7000\,Å$

(a) 12 (b) 7

(c) 18 (d) 4

26. In a Young's double slit experiment, the slits are 2 mm apart and are illuminated with a mixture of two wavelength $\lambda_0 = 750nm$ and $\lambda = 900nm$. The minimum distance from the common central bright fringe on a screen $2m$ from the slits where a bright fringe from one interference pattern coincides with a bright fringe from the other is

(a) 1.5 mm (b) 3 mm

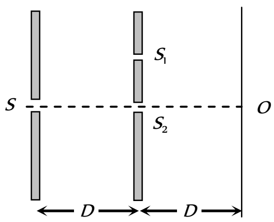
(c) 4.5 mm (d) 6 mm

27. A flake of glass (refractive index 1.5) is placed over one of the openings of a double slit apparatus. The interference pattern displaces itself through seven successive maxima towards the side where the flake is placed. if wavelength of the diffracted light is $\lambda = 600nm$, then the thickness of the flake is

(a) 2100 nm (b) 4200 nm

(c) 8400 nm (d) None of these

28. Two ideal slits S_1 and S_2 are at a distance d apart, and illuminated by light of wavelength λ passing through an ideal source slit S placed on the line through S_2 as shown. The distance between the planes of slits and the source slit is D. A screen is held at a distance D from the plane of the slits. The minimum value of d for which there is darkness at O is



(a) $\sqrt{\frac{3\lambda D}{2}}$

(b) $\sqrt{\lambda D}$

(c) $\sqrt{\frac{\lambda D}{2}}$

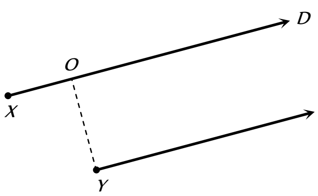
(d) $\sqrt{3\lambda D}$

29. In a double slit arrangement fringes are produced using light of wavelength 4800 $Å$. One slit is covered by a thin plate of glass of refractive index 1.4 and the other with another glass plate of same thickness but of refractive index 1.7. By doing so the central bright shifts to original fifth bright fringe from centre. Thickness of glass plate is

(a) 8 μm (b) 6 μm

(c) 4 μm (d) 10 μm

30. Two point sources X and Y emit waves of same frequency and speed but Y lags in phase behind X by $2\pi l$ radian. If there is a maximum in direction D the distance XO using n as an integer is given by



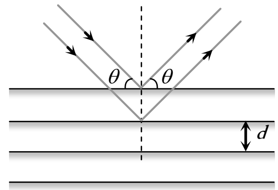
(a) $\frac{\lambda}{2}(n - l)$

(b) $\lambda(n + l)$

(c) $\frac{\lambda}{2}(n + l)$

(d) $\lambda(n - l)$

31. A beam with wavelength λ falls on a stack of partially reflecting planes with separation d. The angle θ that the beam should make with the planes so that the beams reflected from successive planes may interfere constructively is (where n =1, 2, ...)



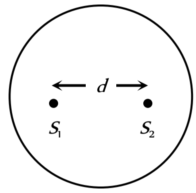
(a) $\sin^{-1}\left(\frac{n\lambda}{d}\right)$

(b) $\tan^{-1}\left(\frac{n\lambda}{d}\right)$

(c) $\sin^{-1}\left(\frac{n\lambda}{2d}\right)$

(d) $\cos^{-1}\left(\frac{n\lambda}{2d}\right)$

32. Two coherent sources separated by distance d are radiating in phase having wavelength λ. A detector moves in a big circle around the two sources in the plane of the two sources. The angular position of n = 4 interference maxima is given as



(a) $\sin^{-1}\frac{n\lambda}{d}$

(b) $\cos^{-1}\frac{4\lambda}{d}$

(c) $\tan^{-1}\frac{d}{4\lambda}$

(d) $\cos^{-1}\frac{\lambda}{4d}$

33. Two coherent sources S_1 and S_2 are separated by a distance four times the wavelength λ of the source. The sources lie along y axis whereas a detector moves along + x axis. Leaving the origin and far off points the number of points where maxima are observed is

(a) 2 (b) 3

(c) 4 (d) 5

34. A circular disc is placed in front of a narrow source. When the point of observation is at a distance of 1 $meter$ from the disc, then the disc covers first HPZ. The intensity at this point is I_0. The intensity at a point distance 25 cm from the disc will be

(a) $I_1 = 0.531I_0$ (b) $I_1 = 0.053I_0$

(c) $I_1 = 53I_0$ (d) $I_1 = 5.03I_0$

35. A wavefront presents one, two and three HPZ at points A, B and C respectively. If the ratio of consecutive amplitudes of HPZ is 4 : 3, then the ratio of resultant intensities at these point will be

(a) 169 : 16 : 256 (b) 256 : 16 : 169

(c) 256 : 16 : 196 (d) 256 : 196 : 16

36. A circular disc is placed in front of a narrow source. When the point of observation is 2 m from the disc, then it covers first HPZ. The intensity at this point is I. When the point of observation is 25 cm from the disc then intensity will be

(a) $\left(\frac{R_6}{R_2}\right)^2 I$ (b) $\left(\frac{R_7}{R_2}\right)^2 I$

(c) $\left(\frac{R_8}{R_2}\right)^2 I$ (d) $\left(\frac{R_9}{R_2}\right)^2 I$

37. In a single slit diffraction of light of wavelength λ by a slit of width e, the size of the central maximum on a screen at a distance b is

(a) $2b\lambda + e$ (b) $\frac{2b\lambda}{e}$

(c) $\frac{2b\lambda}{e} + e$ (d) $\frac{2b\lambda}{e} - e$

38. Angular width of central maxima in the Fraunhoffer diffraction pattern of a slit is measured. The slit is illuminated by light of wavelength 6000 Å. When the slit is illuminated by light of another wavelength, the angular width decreases by 30%. The wavelength of this light will be

(a) 6000 Å (b) 4200 Å

(c) 3000 Å (d) 1800 Å

39. In a single slit diffraction experiment first minimum for red light (660 *nm*) coincides with first maximum of some other wavelength λ'. The value of λ' is

(a) 4400 Å (b) 6600 Å

(c) 2000 Å (d) 3500 Å

40. The ratio of intensities of consecutive maxima in the diffraction pattern due to a single slit is

(a) 1 : 4 : 9 (b) 1 : 2 : 3

(c) $1 : \frac{4}{9\pi^2} : \frac{4}{25\pi^2}$ (d) $1 : \frac{1}{\pi^2} : \frac{9}{\pi^2}$

41. Light is incident normally on a diffraction grating through which the first order diffraction is seen at 32°. The second order diffraction will be seen at

(a) 48°

(b) 64°

(c) 80°

(d) There is no second order diffraction in this case

42. White light may be considered to be a mixture of waves with λ ranging between 3900 Å and 7800 Å. An oil film of thickness 10,000 Å is examined normally by reflected light. If μ = 1.4, then the film appears bright for

(a) 4308 Å, 5091 Å, 6222 Å

(b) 4000 Å, 5091 Å, 5600 Å

(c) 4667 Å, 6222 Å, 7000 Å

(d) 4000 Å, 4667 Å, 5600 Å, 7000Å

43. Among the two interfering monochromatic sources *A* and *B*; *A* is ahead of *B* in phase by 66°. If the observation be taken from point *P*, such that *PB* – *PA* = λ/4. Then the phase difference between the waves from *A* and *B* reaching *P* is

(a) 156° (b) 140°

(c) 136° (d) 126°

44. The ratio of the intensity at the centre of a bright fringe to the intensity at a point one-quarter of the distance between two fringe from the centre is

(a) 2 (b) 1/2

(c) 4 (d) 16

45. A parallel plate capacitor of plate separation 2 *mm* is connected in an electric circuit having source voltage 400 *V*. if the plate area is 60 *cm*, then the value of displacement current for 10^{-6} sec will be

(a) 1.062 *amp* (b) 1.062×10^{-2} *amp*

(c) 1.062×10^{-3} *amp* (d) 1.062×10^{-4} *amp*

46. A long straight wire of resistance *R*, radius *a* and length *l* carries a constant current *I*. The Poynting vector for the wire will be

(a) $\frac{IR}{2\pi a l}$ (b) $\frac{IR^2}{al}$

(c) $\frac{I^2R}{al}$ (d) $\frac{I^2R}{2\pi a l}$

47. In an electromagnetic wave, the amplitude of electric field is 1 *V/m*. the frequency of wave is 5×10^{14} Hz. The wave is propagating along *z*-axis. The average energy density of electric field, in *Joule/m*, will be

(a) 1.1×10^{-11} (b) 2.2×10^{-12}

(c) 3.3×10^{-13} (d) 4.4×10^{-14}

48. A laser beam can be focussed on an area equal to the square of its wavelength *A He-Ne* laser radiates energy at the rate of 1*mW* and its wavelength is 632.8 *nm*. The intensity of focussed beam will be

(a) 1.5×10^{13} W/m^2 (b) 2.5×10^{9} W/m^2

(c) 3.5×10^{17} W/m^2 (d) None of these

49. A lamp emits monochromatic green light uniformly in all directions. The lamp is 3% efficient in converting electrical power to electromagnetic waves and consumes 100 *W* of power. The amplitude of the electric field associated with the electromagnetic radiation at a distance of 10*m* from the lamp will be

(a) 1.34 *V/m* (b) 2.68 *V/m*

(c) 5.36 *V/m* (d) 9.37 *V/m*

50. A point source of electromagnetic radiation has an average power output of 800 *W*. The maximum value of electric field at a distance 4.0 *m* from the source is

(a) 64.7 *V/m* (b) 57.8 *V/m*

(c) 56.72 *V/m* (d) 54.77 *V/m*

51. A wave is propagating in a medium of electric dielectric constant 2 and relative magnetic permeability 50. The wave impedance of such a medium is

(a) 5 Ω (b) 376.6 Ω

(c) 1883 Ω (d) 3776 Ω

52. A plane electromagnetic wave of wave intensity 6 *W/m* strikes a small mirror area 40 *cm*, held perpendicular to the approaching wave. The momentum transferred by the wave to the mirror each second will be

(a) $6.4 \times 10^{-7} kg - m/s^2$ (b) $4.8 \times 10^{-8} kg - m/s^2$

(c) $3.2 \times 10^{-9} kg - m/s^2$ (d) $1.6 \times 10^{-10} kg - m/s^2$

53. Specific rotation of sugar solution is 0.01 SI units. 200 kgm^{-3} of impure sugar solution is taken in a polarimeter tube of length 0.25m and an optical rotation of 0.4*rad* is observed. The percentage of purity of sugar is the sample is

[KCET 2004]

(a) 80% (b) 89%

(c) 11% (d) 20%

54. A 20 *cm* length of a certain solution causes right-handed rotation of 38°. A 30*cm* length of another solution causes left-handed rotation of 24°. The optical rotation caused by 30*cm* length of a mixture of the above solutions in the volume ratio 1 : 2 is

(a) Left handed rotation of 14°

(b) Right handed rotation of 14°

(c) Left handed rotation of 3°

(d) Right handed rotation of 3°

55. A beam of natural light falls on a system of 6 polaroids, which are arranged in succession such that each polaroid is turned through 30° with respect to the preceding one. The percentage of incident intensity that passes through the system will be

(a) 100% (b) 50%

(c) 30% (d) 12%

56. A beam of plane polarized light falls normally on a polarizer of cross sectional area $3\times10^{-4} m^2$. Flux of energy of incident ray in 10^{-3} *W*. The polarizer rotates with an angular frequency of 31.4 *rad/sec*. The energy of light passing through the polarizer per revolution will be

(a) 10^{-4} *Joule* (b) 10^{-3} *Joule*

(c) 10^{-2} *Joule* (d) 10^{-1} *Joule*

57. In a YDSE bi-chromatic light of wavelengths 400 *nm* and 560 *nm* are used. The distance between the slits is 0.1 *mm* and the distance between the plane of the slits and the screen is 1*m*. The minimum distance between two successive regions of complete darkness is

[IIT JEE (Screening) 2004]

(a) 4 *mm* (b) 5.6 *mm*

(c) 14 *mm* (d) 28 *mm*

58. The maximum number of possible interference maxima for slit-separation equal to twice the wavelength in Young's double-slit experiment is **[AIEEE 2004]**

(a) Infinite (b) Five

(c) Three (d) Zero

59. The *k* line of singly ionised calcium has a wavelength of 393.3 *nm* as measured on earth. In the spectrum of one of the observed galaxies, this spectral line is located at 401.8 *nm*. The speed with which the galaxy is moving away from us, will be

[Pb. PET 2003]

(a) 6480 *km/s* (b) 3240 *km/s*

(c) 4240 *km/sec* (d) None of these

60. A Young's double slit experiment uses a monochromatic source. The shape of the interference fringes formed on a screen is

[AIEEE 2005]

(a) Straight line (b) Parabola

(c) Hyperbola (d) Circle

61. If I_0 is the intensity of the principal maximum in the single slit diffraction pattern, then what will be its intensity when the slit width is doubled **[AIEEE 2005]**

(a) I_0 (b) $\frac{I_0}{2}$

(c) $2I_0$ (d) $4\,I_0$

62. In Young's double slit experiment intensity at a point is (1/4) of the maximum intensity. Angular position of this point is

[IIT-JEE (Screening) 2005]

(a) $\sin^{-1}(\lambda/d)$ (b) $\sin^{-1}(\lambda/2d)$

(c) $\sin^{-1}(\lambda/3d)$ (d) $\sin^{-1}(\lambda/4d)$

63. A beam of electron is used in an *YDSE* experiment. The slit width is d. When the velocity of electron is increased, then

[IIT-JEE (Screening) 2005]

(a) No interference is observed

(b) Fringe width increases

[KCET 2001]

(c) Fringe width decreases

(d) Fringe width remains same

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : When a light wave travels from a rarer to a denser medium, it loses speed. The reduction in speed imply a reduction in energy carried by the light wave.
   Reason : The energy of a wave is proportional to velocity of wave.
2. Assertion : A narrow pulse of light is sent through a medium. The pulse will retain its shape as it travels through the medium.
   Reason : A narrow pulse is made of harmonic waves with a large range of wavelengths.
3. Assertion : No interference pattern is detected when two coherent sources are infinitely close to each other.
   Reason : The fringe width is inversely proportional to the distance between the two slits.
4. Assertion : Newton's rings are formed in the reflected system. When the space between the lens and the glass plate is filled with a liquid of refractive index greater than that of glass, the central spot of the pattern is dark.
   Reason : The reflection is Newton's ring cases will be from a denser to a rarer medium and the two interfering rays are reflected under similar conditions. **[AIIMS 1998]**
5. Assertion : The film which appears bright in reflected system will appear dark in the transmitted light and vice-versa.
   Reason : The conditions for film to appear bright or dark in reflected light are just reverse to those in the transmitted light.
6. Assertion : For best contrast between maxima and minima in the interference pattern of Young's double slit experiment, the intensity of light emerging out of the two slits should be equal.
   Reason : The intensity of interference pattern is proportional to square of amplitude.
7. Assertion : In Young's double slit experiment, the fringes become indistinct if one of the slits is covered with cellophane paper.
   Reason : The cellophane paper decrease the wavelength of light.
8. Assertion : The unpolarised light and polarised light can be distinguished from each other by using polaroid.
   Reason : A polaroid is capable of producing plane polarised beams of light.
9. Assertion : Nicol prism is used to produce and analyse plane polarised light.
   Reason : Nicol prism reduces the intensity of light to zero.
10. Assertion : In everyday life the Doppler's effect is observed readily for sound waves than light waves.

Reason : Velocity of light is greater than that of sound. **[AIIMS 1995]**

11. Assertion : In Young's experiment, the fringe width for dark fringes is different from that for white fringes.

Reason : In Young's double slit experiment the fringes are performed with a source of white light, then only black and bright fringes are observed. **[AIIMS 2001]**

12. Assertion : Coloured spectrum is seen when we look through a muslin cloth.

Reason : It is due to the diffraction of white light on passing through fine slits. **[AIIMS 2002]**

13. Assertion : When a tiny circular obstacle is placed in the path of light from some distance, a bright spot is seen at the centre of shadow of the obstacle.

Reason : Destructive interference occurs at the centre of the shadow. **[AIIMS 2002]**

14. Assertion : Thin films such as soap bubble or a thin layer of oil on water show beautiful colours when illuminated by white light.

Reason : It happens due to the interference of light reflected from the upper surface of the thin film. **[AIIMS 2002]**

15. Assertion : Microwave communication is preferred over optical communication.

Reason : Microwaves provide large number of channels and band width compared to optical signals. **[AIIMS 2003]**

16. Assertion : Corpuscular theory fails in explaining the velocities of light in air and water.

Reason : According to corpuscular theory, light should travel faster in denser medium than, in rarer medium. **[AIIMS 1998]**

17. Assertion : Interference pattern is made by using blue light instead of red light, the fringes becomes narrower.

Reason : In Young's double slit experiment, fringe width is given by relation $B = \frac{\lambda D}{d}$.

[AIIMS 1999]

18. Assertion : The cloud in sky generally appear to be whitish.

Reason : Diffraction due to clouds is efficient in equal measure at all wavelengths. **[AIIMS 2005]**

19. Assertion : Television signals are received through sky-wave propagation.

Reason : The ionosphere reflects electromagnetic waves of frequencies greater than a certain critical frequency. **[AIIMS 2005]**

20. Assertion : It is necessary to use satellites for long distance T.V. transmission.

Reason : The television signals are low frequency signals.

21. Assertion : The electrical conductivity of earth's atmosphere decrease with altitude.

Reason : The high energy particles (*i.e.* γ-rays and cosmic rays) coming from outer space and entering our earth's atmosphere causes ionisation of the atoms of the gases present there and the pressure of gases decreases with increase in altitude.

22. Assertion : Only microwaves are used in radar.

Reason : Because microwaves have very small wavelength.

23. Assertion : In Hertz experiment, the electric vector of radiation produced by the source gap is parallel to the gap.

Reason : Production of sparks between the detector gap is maximum when it is placed perpendicular to the source gap.

24. Assertion : For cooking in a microwave oven, food is always kept in metal containers.

Reason : The energy of microwave is easily transferred to the food in metal container.

25. Assertion : *X*-ray astronomy is possible only from satellites orbiting the earth.

Reason : Efficiency of *X*-rays telescope is large as compared to any other telescope.

26. Assertion : Short wave bands are used for transmission of ratio waves to a large distance

Reason : Short waves are reflected by ionosphere

[AIIMS 1994]

27. Assertion : Ultraviolet radiation are of higher frequency waves are dangerous to human being.

Reason : Ultraviolet radiation are absorbed by the atmosphere **[AIIMS 1995]**

28. Assertion : Environmental damage has increased the amount of ozone in the atmosphere.

Reason : Increase of ozone increases the amount of ultraviolet radiation on earth. **[AIIMS 1996]**

29. Assertion : Radio waves can be polarised.

Reason : Sound waves in air are longitudinal in nature.

[AIIMS 1998]

30. Assertion : The earth without atmosphere would be inhospitably cold.

Reason : All heat would escape in the absence of atmosphere. **[AIIMS 2002]**

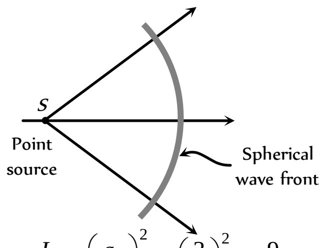
Answers and Solutions

Wave Nature and Interference of Light

1. (a) Corpuscular theory explains refraction of light.
2. (c) According to Corpuscular theory different colour of light are due to different size of Corpuscules.
3. (b)
4. (c) According to Plank's hypothesis, black bodies emits radiations in the form of photons.
5. (d) The coherent source cannot be obtained from two different light sources.
6. (c) Huygen's wave theory fails to explain the particle nature of light (*i.e.* photoelectric effect)
7. (d) Interference is shown by transverse as well as mechanical waves.
8. (c) $I_{max} = (\sqrt{I_1} + \sqrt{I_2})^2 = (\sqrt{I} + \sqrt{4I})^2 = 9I$

   $I_{min} = (\sqrt{I_1} - \sqrt{I_2})^2 = (\sqrt{I} - \sqrt{4I})^2 = I$
9. (c)
10. (b) The idea of secondary wavelets is given by Huygen.
11. (c) Monochromatic wave means of single wavelength not the single colour.
12. (d) Sound wave and light waves both shows interference.
13. (c) $\frac{I_{max}}{I_{min}} = \left(\frac{\sqrt{\frac{I_1}{I_2}}+1}{\sqrt{\frac{I_1}{I_2}}-1}\right)^2 = \left(\frac{\sqrt{\frac{9}{1}}+1}{\sqrt{\frac{9}{1}}-1}\right) = \frac{4}{1}$
14. (a) A wave can transmit energy from one place to another.
15. (d) $\frac{I_1}{I_2} = \frac{1}{25}$; $\therefore \frac{a_1^2}{a_2^2} = \frac{1}{25} \Rightarrow \frac{a_1}{a_2} = \frac{1}{5}$
16. (a) For interference phase difference must be constant.
17. (c) Interference is explained by wave nature of light.
18. (b) Coherent time $= \frac{\text{Coherence length}}{\text{Velocity of light}} = \frac{L}{c}$
19. (c) $\frac{a_1}{a_2} = \frac{3}{5}$

    $\therefore \frac{I_{max}}{I_{min}} = \frac{(a_1+a_2)^2}{(a_1-a_2)^2} = \frac{(3+5)^2}{(3-5)^2} = \frac{16}{1}$
20. (b) Colour's of thin film are due to interference of light.
21. (c) For constructive interference path difference is even multiple of $\frac{\lambda}{2}$.
22. (c) Two coherent source must have a constant phase difference otherwise they can not produce interference.
23. (a) Phenomenon of interference of light takes place.
24. (c) Transverse waves can be polarised.
25. (a) $\frac{I_{max}}{I_{min}} = \left(\frac{\sqrt{\frac{I_1}{I_2}}+1}{\sqrt{\frac{I_1}{I_2}}-1}\right)^2 = \left(\frac{\sqrt{\frac{4}{1}}+1}{\sqrt{\frac{4}{1}}-1}\right)^2 = \frac{9}{1}$
26. (a) Reflection phenomenon is shown by both particle and wave nature of light.
27. (b) When two sources are obtained from a single source, the wavefront is divided into two parts. These two wavefronts acts as if they emanated from two sources having a fixed phase relationship.
28. (b) $\lambda = \frac{c}{\nu} = \frac{3\times10^8}{100} = 3\times10^6 m$
29. (c) $\frac{I_{max}}{I_{min}} = \left(\frac{\sqrt{\frac{I_1}{I_2}}+1}{\sqrt{\frac{I_1}{I_2}}-1}\right)^2 = \left(\frac{\sqrt{\frac{25}{4}}+1}{\sqrt{\frac{25}{4}}-1}\right)^2 = \frac{49}{9}$
30. (a) Wavefront is the locus of all the particles which vibrates in the same phase.
31. (b) Direction of wave is perpendicular to the wavefront.
32. (d) Origin of spectra is not explained by Huygen's theory.
33. (d) The refractive index of air is slightly more than 1. When chamber is evacuated, refractive index decreases and hence the wavelength increases and fringe width also increases.
34. (a) $I \propto a^2 \Rightarrow \frac{a_1}{a_2} = \left(\frac{4}{1}\right)^{1/2} = \frac{2}{1}$
35. (a) The essential condition for sustained interference is constancy of phase difference.
36. (c) $\frac{I_{max}}{I_{min}} = \left(\frac{\frac{a_1}{a_2}+1}{\frac{a_1}{a_2}-1}\right)^2 = \left(\frac{\frac{4}{3}+1}{\frac{4}{3}-1}\right)^2 = \frac{49}{1}$
37. (b) Energy is conserved in the interference of light.
38. (c) $I \propto a^2$
39. (b)



40. (c) $I \propto a^2 \Rightarrow \frac{I_1}{I_2} = \left(\frac{a_1}{a_2}\right)^2 = \left(\frac{3}{4}\right)^2 = \frac{9}{16}$
41. (d) $\frac{I_1}{I_2} = \frac{100}{1}$

Now $\frac{I_{max}}{I_{min}} = \left(\frac{\sqrt{\frac{I_1}{I_2}}+1}{\sqrt{\frac{I_1}{I_2}}-1}\right)^2 = \left(\frac{\sqrt{100}+1}{\sqrt{100}-1}\right)^2 = \frac{121}{81} \approx \frac{3}{2}$

42. (b) $\phi = \pi/3, a_1 = 4, a_2 = 3$

So, $A = \sqrt{a_1^2 + a_2^2 + 2a_1.a_2 \cos\phi} \Rightarrow A \approx 6$

43. (b) $y_1 = a\sin\omega t$, and $y_2 = b\cos\omega t = b\sin\left(\omega t + \frac{\pi}{2}\right)$

So phase difference $\phi = \pi/2$

44. (c) For 2π phase difference $\rightarrow$ Path difference is λ

$\therefore$ For ϕ phase difference $\rightarrow$ Path difference is $\frac{\lambda}{2\pi}\times\phi$

45. (d) Resultant intensity $I_R = I_1 + I_2 + 2\sqrt{I_1 I_2}\cos\phi$

For maximum I_R, $\phi = 0^o$

$\Rightarrow I_R = I_1 + I_2 + 2\sqrt{I_1 I_2} = \left(\sqrt{I_1} + \sqrt{I_2}\right)^2$

46. (c) Newton first law of motion states that every particle travels in a straight line with a constant velocity unless disturbed by an external force. So the corpuscles travels in straight lines.

47. (d) Diffraction shows the wave nature of light and photoelectric effect shows particle nature of light.

48. (b) At point *A*, resultant intensity

$I_A = I_1 + I_2 = 5I$; and at point *B*

$I_B = I_1 + I_2 + 2\sqrt{I_1 I_2}\cos\pi = 5I + 4I$

$I_B = 9I$ so $I_B - I_A = 4I$.

49. (c)

50. (a) Photoelectric effect varifies particle nature of light. Reflection and refraction varifies both particle nature and wave nature of light.

51. (d) $y_1 = a\sin\omega t, y_2 = a\cos\omega t = a\sin\left(\omega t + \frac{\pi}{2}\right)$

52. (c) $\frac{I_{max}}{I_{min}} = \left(\frac{\frac{a_1}{a_2}+1}{\frac{a_1}{a_2}-1}\right)^2 = \frac{25}{1}$

53. (d) Laser beams are perfectly parallel. So that they are very narrow and can travel a long distance without spreading. This is the feature of laser while they are monochromatic and coherent these are characteristics only.

54. (c) $\frac{I_{max}}{I_{min}} = \left(\frac{\sqrt{\frac{I_1}{I_2}}+1}{\sqrt{\frac{I_1}{I_2}}-1}\right)^2 \Rightarrow \frac{I_1}{I_2} = \frac{9}{4}$

55. (b) $\nu = \frac{c}{\lambda} = \frac{3\times10^8}{3000\times10^{-10}} = 10^{15}$ *cycles/sec*

56. (a) $\frac{I_{max}}{I_{min}} = \left(\frac{\frac{a_1}{a_2}+1}{\frac{a_1}{a_2}-1}\right)^2 = \left(\frac{\frac{1}{9}+1}{\frac{1}{9}-1}\right)^2 = \left(\frac{5}{4}\right)^2 = \frac{25}{16}$.

57. (c)

58. (d) For destructive interference path difference is odd multiple of $\frac{\lambda}{2}$.

59. (d) $\frac{I_{max}}{I_{min}} = \left(\frac{\frac{a_1}{a_2}+1}{\frac{a_1}{a_2}-1}\right)^2 \Rightarrow \frac{a_1+a_2}{a_1-a_2} = 6$

$\frac{a_2}{a_1} = 7:5$

60. (b) $I_{max} = I_1 + I_2 + 2\sqrt{I_1 I_2}$

So, $I_{max} = I + 4I + 2\sqrt{I.4I} = 9I$

61. (b) In interference energy is redistribution.

62. (a) For interference frequency must be same and phase difference must be constant.

63. (c) When a beam of light is used to determine the position of an object, the maximum accuracy is achieved if the light is of shorter wavelength, because

$\text{Accuracy} \propto \frac{1}{\text{Wavelength}}$

64. (d) Intensity $\propto \frac{1}{(\text{Distance})^2}$

65. (d) Huygen's theory explains propagation of wavefront.

66. (c) Wave theory of light is given by Huygen.

67. (a) When light reflect from denser surface phase change of π occurs.

68. (a) Photoelectric effect explain the quantum nature of light while interference, diffraction and polarization explain the wave nature of light.

69. (a) Light is electromagnetic in nature it does not require any material medium for its propagation.

70. (c) For viewing interference in oil films or soap bubble, thickness of film is of the order of wavelength of light.

71. (b)

72. (d) For maximum intensity $\phi = 0°$

$\therefore I = I_1 + I_2 + 2\sqrt{I_1 I_2}\cos\phi = I + I + 2\sqrt{II}\cos 0° = 4I$

Young's Double Slit Experiment

1. (a)

2. (c) In interference of light the energy is transferred from the region of destructive interference to the region of constructive interference. The average energy being always equal to the sum of the energies of the interfering waves. Thus the phenomenon of interference is in complete agreement with the law of conservation of energy.

3. (c) $\beta = \frac{\lambda D}{d} = \frac{5\times10^{-7}\times 2}{10^{-3}} m = 10^{-3} m = 1.0\ mm$.

4. (c) Slit width ratio = 1 : 9
Since slit width ratio is the ratio of intensity and intensity ∝ (amplitude)

$\therefore I_1 : I_2 = 1:9$

$\Rightarrow a_1^2 : a_2^2 = 1:9 \Rightarrow a_1 : a_2 = 1:3$

$I_{\max} = (a_1+a_2)^2,\ I_{\min} = (a_1-a_2)^2 \Rightarrow \frac{I_{\min}}{I_{\max}} = \frac{1}{4}$

5. (a) $\beta \propto \frac{1}{d} \Rightarrow$ If d becomes thrice, then β become becomes $\frac{1}{3}$ times.

6. (c) $\frac{\beta_1}{\beta_2} = \frac{\lambda_1}{\lambda_2}$ or $\frac{1.0}{\beta_2} = \frac{5000}{6000}$ or $\beta_2 = \frac{6000}{5000} = 1.2\ mm$.

7. (a) $\beta = \frac{6000\times10^{-10}\times 25\times10^{-2}}{10^{-3}}$

$= 150000\times10^{-9} = 0.15\times10^{-3} m = 0.015\ cm$.

8. (c) For brightness, path difference $= n\lambda = 2\lambda$
So second is bright.

9. (a) If one of slit is closed then interference fringes are not formed on the screen but a fringe pattern is observed due to diffraction from slit.

10. (d)

11. (d) $\beta = \frac{\lambda D}{d} \Rightarrow$ If D becomes twice and d becomes half so β becomes four times.

12. (c) Suppose slit width's are equal, so they produces waves of equal intensity say I'. Resultant intensity at any point $I_R = 4\,I'\cos^2\phi$ where ϕ is the phase difference between the waves at the point of observation.

For maximum intensity $\phi = 0^o \Rightarrow I_{\max} = 4I' = I$ ...(i)

If one of slit is closed, Resultant intensity at the same point will be I' only *i.e.* $I' = I_O$ ...(ii)

Comparing equation (i) and (ii) we get

$I = 4I_O$

13. (b, d) $\frac{I_{\max}}{I_{\min}} = 9 \Rightarrow \left(\frac{a_1+a_2}{a_1-a_2}\right)^2 = 9 \Rightarrow \frac{a_1+a_2}{a_1-a_2} = 3$

$\Rightarrow \frac{a_1}{a_2} = \frac{3+1}{3-1} \Rightarrow \frac{a_1}{a_2} = 2$. Therefore $I_1 : I_2 = 4:1$

14. (b)

15. (c) Distance of n bright fringe $y_n = \frac{n\lambda D}{d}$ *i.e.* $y_n \propto \lambda$

$\therefore \frac{x_{n_1}}{x_{n_2}} = \frac{\lambda_1}{\lambda_2} \Rightarrow \frac{x(\text{Blue})}{x(\text{Green})} = \frac{4360}{5460}$

∴ x (Green) > x (Blue).

16. (c) $\beta = \frac{\lambda D}{d} = \frac{5000\times10^{-10}\times 1}{0.1\times10^{-3}} m = 5\times10^{-3} m = 0.5\ cm$.

17. (a) We know that fringe width $\beta = \frac{D\lambda}{d}$

$\therefore x = \frac{L\lambda}{d} \Rightarrow \lambda = \frac{xd}{L}$

18. (a) In the normal adjustment of young's, double slit experiment, path difference between the waves at central location is always zero, so maxima is obtained at central position.

19. (a) $\beta = \frac{\lambda D}{d};\ \therefore B \propto \lambda$

$\frac{\lambda'}{\lambda} = \frac{0.4}{4/3} \Rightarrow \lambda' = 0.3\ mm$.

20. (b) $\beta \propto \lambda,\ \therefore \lambda \propto \frac{1}{\mu}$

21. (a) $\beta \propto \lambda,\ \therefore \lambda_v =$ minimum.

22. (c) $\beta_{\text{medium}} = \frac{\beta_{\text{air}}}{\mu} = \frac{0.6}{1.5} = 0.4\ mm$.

23. (d) $\because n = 3,\ \therefore 2n\pi = 2\times 3\pi = 6\pi$

24. (c) Slit width ratio $= 4:9$; hence $I_1 : I_2 = 4:9$

$\therefore \frac{a_1^2}{a_2^2} = \frac{4}{9} \Rightarrow \frac{a_1}{a_2} = \frac{2}{3}$

$\therefore \frac{I_{\max}}{I_{\min}} = \frac{(a_1+a_2)^2}{(a_1-a_2)^2} = \frac{25}{1}$

25. (d) $\beta = \frac{\lambda D}{d} \Rightarrow d = \frac{\lambda D}{\beta} = \frac{6000\times10^{-10}\times(40\times10^{-2})}{0.012\times10^{-2}} = 0.2\,cm$.

26. (a) As $\beta = \frac{D\lambda}{d} \Rightarrow \frac{\beta_1}{\beta_2} = \left(\frac{D_1}{D_2}\right)\left(\frac{\lambda_1}{\lambda_2}\right)\left(\frac{d_2}{d_1}\right)$

$\Rightarrow 1 = \left(\frac{D_1}{D_2}\right)\times\left(\frac{1}{2}\right)\times\left(\frac{1}{2}\right) \Rightarrow \frac{D_1}{D_2} = \frac{4}{1}$

27. (b)

28. (c) Fringe width $(\beta) = \frac{D\lambda}{d} \Rightarrow \beta \propto \lambda$

As $\lambda_{\text{red}} > \lambda_{\text{yellow}}$, hence fringe width will increase.

29. (d) $\beta = \frac{\lambda D}{d} \Rightarrow \frac{\beta_2}{\beta_1} = \frac{\lambda_2 D_2 d_1}{\lambda_1 D_1 d_2} \Rightarrow \beta_2 = 2.5\times10^{-4} m$.

30. (d) For interference, λ of both the waves must be same.

31. (d) $\beta \propto D$

32. (a) $\theta = \frac{\lambda}{d}$; θ can be increased by increasing λ, so here λ has to be increased by 10%

i.e., % Increase $= \frac{10}{100}\times 5890 = 589\mathring{A}$

33. (b) $d = \frac{D\lambda}{\beta} = \frac{1\times5\times10^{-7}}{5\times10^{-3}} = 10^{-4} m = 0.1\ mm$.

34. (b) If intensity of each wave is I, then initially at central position $I_o = 4I$. when one of the slit is covered then intensity at central position will be I only *i.e.*, $\frac{I_o}{4}$.

35. (a) Shift $= \frac{\beta}{\lambda}(\mu-1)\,t = \frac{\beta}{(5000\times10^{-10})}(1.5)\times2\times10^{-6} = 2\beta$

i.e., 2 fringes upwards.

36. (b) $\beta = \dfrac{\lambda D}{d}$

37. (b) Separation n^{th} bright fringe and central maxima is $x_n = \dfrac{n\lambda D}{d}$

So, $x_3 = \dfrac{3 \times 6000 \times 10^{-10} \times 1}{0.5 \times 10^{-3}} = 3.5\, mm.$

38. (d) $n_1\lambda_1 = n_2\lambda_2 \Rightarrow 62 \times 5893 = n_2 \times 4358 \Rightarrow n_2 = 84.$

39. (b) Angular fringe width $\theta = \dfrac{\lambda}{d} \Rightarrow \theta \propto \lambda$

$\lambda_w = \dfrac{\lambda_a}{\mu_w}$

So $\theta_w = \dfrac{\theta_{air}}{\mu_w} = \dfrac{0.20}{\frac{4}{3}} = 0.15°$

40. (a) By using $x_n = \dfrac{n\lambda D}{d}$

$\Rightarrow (5 \times 10^{-3}) = \dfrac{10 \times \lambda \times 1}{(1 \times 10^{-3})} \Rightarrow \lambda = 5 \times 10^{-7} m = 5000\, Å$

41. (b) Distance of third maxima from central maxima is $x = \dfrac{3\lambda D}{d} = \dfrac{3 \times 5000 \times 10^{-10} \times (200 \times 10^{-2})}{0.2 \times 10^{-3}} = 1.5\, cm.$

42. (d) Distance of n^{th} dark fringe from central fringe

$x_n = \dfrac{(2n-1)\lambda D}{2d}$

$\therefore x_2 = \dfrac{(2 \times 2 - 1)\lambda D}{2d} = \dfrac{3\lambda D}{2d}$

$\Rightarrow 1 \times 10^{-3} = \dfrac{3 \times \lambda \times 1}{2 \times 0.9 \times 10^{-3}} \Rightarrow \lambda = 6 \times 10^{-5}\, cm$

43. (d) $\beta = \dfrac{\lambda D}{d} \Rightarrow (4 \times 10^{-3}) = \dfrac{4 \times 10^{-7} \times D}{0.1 \times 10^{-3}} \Rightarrow D = 1m$

44. (a) $\beta = \dfrac{\lambda D}{d} \Rightarrow (0.06 \times 10^{-2}) = \dfrac{\lambda \times 1}{1 \times 10^{-3}} \Rightarrow \lambda = 6000\, Å$

45. (b)

46. (d) $(n_1\lambda_1 = n_2\lambda_2)$ $\dfrac{n_1}{n_2} = \dfrac{\lambda_2}{\lambda_1} \Rightarrow \dfrac{n_1}{92} = \dfrac{5898}{5461} \Rightarrow n_1 = 99$

47. (d) If we use torch light in place of monochromatic light then overlapping of fringe pattern take place. Hence no fringe will appear.

48. (b)

49. (b) Position of 3rd bright fringe $x_3 = \dfrac{3D\lambda}{d}$

$\Rightarrow \lambda = \dfrac{x_3 d}{3D} = \dfrac{(0.9 \times 10^{-2}) \times (0.28 \times 10^{-3})}{3 \times 1.4} = 6000 Å$

50. (a) Distance between two consecutive

Dark fringes $= \dfrac{\lambda D}{d} = \dfrac{6000 \times 10^{-10} \times 1}{0.6 \times 10^{-3}}$

$= 1 \times 10^{-3} m = 1\, mm.$

51. (b, c) For maxima, path difference $\Delta = n\lambda$

So for $n = 1$, $\Delta = \lambda = 6320 Å$

52. (b) Shift in the fringe pattern $x = \dfrac{(\mu - 1)t.D}{d}$

$= \dfrac{(1.5 - 1) \times 2.5 \times 10^{-5} \times 100 \times 10^{-2}}{0.5 \times 10^{-3}} = 2.5\, cm.$

53. (d) In the presence of thin glass plate, the fringe pattern shifts, but no change in fringe width.

54. (a) $\beta = \dfrac{\lambda D}{d} \Rightarrow \beta \propto \lambda$

55. (a) In interference between waves of equal amplitudes *a*, the minimum intensity is zero and the maximum intensity is proportional to $4a^2$. For waves of unequal amplitudes *a* and *A* ($A > a$), the minimum intensity is non zero and the maximum intensity is proportional to $(a + A)^2$, which is greater than $4a^2$.

56. (b) $\beta = \dfrac{\lambda D}{d} = \dfrac{6000 \times 10^{-10} \times 2}{4 \times 10^{-3}} = 3 \times 10^{4} m = 0.3\, mm$

57. (c) $\beta \propto \lambda$

58. (c) $\beta = \dfrac{\lambda D}{d}$

59. (c) Distance between consecutive bright fringes or dark fringes $= \beta$

$\beta = \dfrac{\lambda D}{d} = \dfrac{550 \times 10^{-9} \times 1}{1.1 \times 10^{-3}} = 500 \times 60^{-6} = 0.5\, mm$

60. (b) $\dfrac{I_{max}}{I_{min}} = \dfrac{\left(\dfrac{a_1}{a_2} + 1\right)^2}{\left(\dfrac{a_1}{a_2} - 1\right)^2} = \dfrac{4}{1} \Rightarrow \dfrac{a_1}{a_2} = \dfrac{3}{1}$

61. (b) $\beta = \dfrac{\lambda D}{d} \Rightarrow \beta \propto \lambda$

62. (c)

63. (b) $n_1\lambda_1 = n_2\lambda_2 \Rightarrow n_2 = n_1 \times \dfrac{\lambda_1}{\lambda_2} = 12 \times \dfrac{600}{400} = 18$

64. (d) Using relation, $d\sin\theta = n\lambda \Rightarrow \sin\theta = \dfrac{n\lambda}{d}$

For $n = 3$, $\sin\theta = \dfrac{3\lambda}{d} = \dfrac{3 \times 589 \times 10^{-9}}{0.589}$

$= 3 \times 10^{-6}$ or $\theta = \sin^{-1}(3 \times 10^{-6})$

65. (b) $\beta \propto \dfrac{1}{d}$

66. (a) When white light is used, central fringe will be white with red edges, and on either side of it, we shall get few coloured bands and then uniform illumination.

67. (c) $\beta \propto \dfrac{\lambda}{d}$

68. (b) $\beta \propto \lambda$

69. (a) $\dfrac{I_{max}}{I_{min}} = \left(\dfrac{\sqrt{\dfrac{I_1}{I_2}} + 1}{\sqrt{\dfrac{I_1}{I_2}} - 1}\right)^2 = \left(\dfrac{\sqrt{2} + 1}{\sqrt{2} - 1}\right)^2 \approx 34$; (given $I_1 = 2I_2$)

70. (b) $B \propto \lambda$

71. (d) $\beta \propto \dfrac{\lambda}{d}$

72. (b)

73. (b) For dark fringe at P

$$S_1P - S_2P = \Delta = (2n-1)\lambda/2$$

Here $n = 3$ and $\lambda = 6000$

So, $\Delta = \dfrac{5\lambda}{2} = 5 \times \dfrac{6000}{2} = 15000 Å = 1.5\ micron$

74. (b) Distance of n^{th} minima from central bright fringe

$$x_n = \frac{(2n-1)\lambda D}{2d}$$

For $n=3$ *i.e.* 3^{rd} minima

$$x_3 = \frac{(2\times 3-1)\times 500\times 10^{-9}\times 1}{2\times 1\times 10^{-3}}$$

$$= \frac{5\times 500\times 10^{-6}}{2} = 1.25\times 10^{-3} m = 1.25\ mm.$$

75. (c) $\beta = \dfrac{\lambda D}{d}$ and $\lambda \propto \dfrac{1}{\mu}$

76. (d) $n_1\lambda_1 = n_2\lambda_2 \Rightarrow 3\times 700 = 5\times \lambda_2 \Rightarrow \lambda_2 = 420\ nm$

77. (a) $\beta \propto \dfrac{\lambda}{d}$ as $d \to \dfrac{d}{3}$ so $\beta \to 3\beta\ \therefore\ n = 3$

78. (c) If shift is equal to n fringes width, then

$$n = \frac{(\mu-1)t}{\lambda} = \frac{(1.5-1)\times 2\times 10^{-6}}{500\times 10^{-9}} = \frac{1}{500}\times 10^3 = 2$$

Since a thin film is introduced in upper beam. So shift will be upward.

79. (b) Distance between n^{th} Bright fringe and m^{th} dark fringe $(n > m)$

$$\Delta x = \left(n - m + \frac{1}{2}\right)\beta = \left(5 - 3 + \frac{1}{2}\right)\times \frac{6.5\times 10^{-7}\times 1}{1\times 10^{-3}}$$

$= 1.63\ mm$

80. (a) $\beta = \dfrac{\lambda D}{d}$; If λ and d both increase by 10%, there will be no change in fringe width (β).

81. (b) $\dfrac{I_1}{I_2} = \dfrac{1}{4} \Rightarrow I_1 = k$ and $I_2 = 4k$

$\therefore$ Fringe visibility $V = \dfrac{2\sqrt{I_1 I_2}}{(I_1 + I_2)} = \dfrac{2\sqrt{k\times 4k}}{(k+4k)} = 0.8$

82. (b) $\dfrac{I_{max}}{I_{min}} = \left(\dfrac{a_1 + a_2}{a_1 - a_2}\right)^2 = \left(\dfrac{3a + a}{3a - a}\right)^2 = \dfrac{4}{1}$

83. (d) Angular position of first dark fringe

$$\theta = \frac{\lambda}{d} = \frac{5460\times 10^{-10}}{0.1\times 10^{-3}} \times \frac{180}{\pi}\ \text{(in degree)}$$

$= 0.313°$

84. (a) Distance between two consecutive dark fringes $\beta = \dfrac{\lambda D}{d}$

$$= \frac{5000\times 10^{-10}\times 1}{0.2\times 10^{-2}} = 0.25\ mm.$$

85. (a) If thin film appears dark

$2\mu t \cos r = n\lambda$ for normal incidence $r = 0^o$

$\Rightarrow 2\ \mu\ t = n\lambda \Rightarrow t = \dfrac{n\lambda}{2\mu}$

$\Rightarrow t_{min} = \dfrac{\lambda}{2\mu} = \dfrac{5890\times 10^{-10}}{2\times 1} = 2.945\times 10^{-7} m$.

86. (b) In case of destructive interference (minima) phase difference is odd multiple of π.

87. (b) $\beta = \dfrac{(a+b)\lambda}{2a(\mu-1)\alpha}$

where a = distance between source and biprism = 0.3 m

b = distance between biprism and screen = 0.7 m.

α = Angle of prism = 1°, μ = 1.5, λ = 6000 × 10^{-10} m

Hence, $\beta = \dfrac{(0.3+0.7)\times 6\times 10^{-7}}{2\times 0.3(1.5-1)\times (1^o \times \dfrac{\pi}{180})}$

= 1.14 × 10^{-4} m = 0.0114 cm.

88. (d) For minima, path difference $\Delta = (2n-1)\dfrac{\lambda}{2}$

For third minima $n = 3 \Rightarrow \Delta = (2\times 3 - 1)\dfrac{\lambda}{2} = \dfrac{5\lambda}{2}$

89. (b) Fringe width $(\beta) \propto \dfrac{1}{\text{prism Angle}(\alpha)}$

90. (a) By using $\beta = \dfrac{(a+b)\lambda}{2a(\mu-1)\alpha} = \dfrac{(0.3+0.7)\times 180\pi\times 10^{-9}}{2\times 0.3(1.54-1)\times\left(1\times\dfrac{\pi}{180}\right)}$

$= 10^{-4} m$

91. (a) $\because\ \beta \propto \lambda \Rightarrow \lambda_w < \lambda_a$ so $\beta_w < \beta_a$

92. (c) With white light, the rays reaching the centre has zero path difference. So we get white fringe at the centre and coloured near the central fringe.

93. (a) $\beta_{water} = \dfrac{\beta_{air}}{\mu_w}$

94. (a) $\beta = \dfrac{\lambda D}{d}$

95. (b) Lateral displacement of fringes = $\dfrac{\beta}{\lambda}(\mu-1)t$

$$= \frac{1\times 10^{-3}}{600\times 10^{-9}}(1.5-1)\times 0.06\times 10^{-3} = \frac{1}{20} m = 5\ cm.$$

96. (b)

97. (d) Distance of the n^{th} bright fringe from the centre $x_n = \dfrac{n\lambda D}{d}$

$$\Rightarrow x_3 = \frac{3\times 6000\times 10^{-10}\times 2.5}{0.5\times 10^{-3}} = 9\times 10^{-3} m = 9\ mm.$$

Doppler's Effect of Light

1. (d) $\dfrac{\Delta\lambda}{\lambda} = \dfrac{v}{c}$, Now $\Delta\lambda = \dfrac{0.5}{100}\lambda \Rightarrow \dfrac{\Delta\lambda}{\lambda} = \dfrac{0.5}{100}$

$$\therefore v = \frac{0.5}{100}\times c = \frac{0.5}{100}\times 3\times 10^8 = 1.5\times 10^6 m/s$$

Increase in λ indicates that the star is receding.

2. (a) Doppler's shift is given by

$$\Delta\lambda = \frac{v\lambda}{c} = \frac{5000 \times 6000}{3 \times 10^8} = 0.1\mathring{A}$$

3. (b) Shifting towards ultraviolet region shows that Apparent wavelength decreased. Therefore the source is moving towards the earth.

4. (b) Due to expansion of universe, the star will go away from the earth thereby increasing the observed wavelength. Therefore the spectrum will shift to the infrared region.

5. (b) With reference to this theory the velocity of the observer is neglected *w.r.t.* the light velocity.

6. (b) $\frac{\Delta\lambda}{\lambda} = \frac{v}{c} = \frac{6 \times 10^7}{3 \times 10^8} = 0.2$

$$\Delta\lambda = \lambda' - \lambda = 0.2\lambda \Rightarrow \lambda' = 1.2\lambda = 1.2 \times 4600 = 5520\mathring{A}$$

7. (b) $\Delta\lambda = 5200 - 5000 = 200\mathring{A}$

Now $\frac{\Delta\lambda}{\lambda'} = \frac{v}{c} \Rightarrow v = \frac{c\Delta\lambda}{\lambda'} = \frac{3 \times 10^8 \times 200}{5000}$

$$= 1.2 \times 10^7 \, m/\sec \approx 1.15 \times 10^7 \, m/\sec$$

8. (d) $\frac{\Delta\lambda}{\lambda} = \frac{v}{c} \Rightarrow v = \frac{c}{\lambda}\Delta\lambda = \frac{c}{\lambda}(\lambda' - \lambda) = c \times \frac{0.01}{100}$

$$= 3 \times 10^4 \, m/s = 30 \, km/\sec$$

9. (c) Blue radiations have the wavelength around 4600 $\overset{o}{A}$. It shows that apparent wavelength is smaller than the real wavelength. It means that the star is proceeding towards earth.

10. (c)

11. (a)

12. (c)

13. (b) $\Delta\lambda = \lambda\frac{v}{c} = 5700 \times \frac{100 \times 10^3}{3 \times 10^8} = 1.90\mathring{A}$

14. (a) According to Doppler's effect, wherever there is a relative motion between source and observer, the frequency observed is different from that given out by source.

15. (a) $\Delta\lambda = \lambda.\frac{v}{c} = \frac{1.5 \times 10^6}{3 \times 10^8} \times 5000 = 25\mathring{A}$

16. (d) $\Delta\lambda = \frac{v}{c}\lambda = \frac{3600 \times 10^3}{3 \times 10^8} \times 5896 = 70.75\mathring{A}$

So the increased wavelength of light is observed.

17. (b) Observed frequency $\nu' = \nu\left(1 - \frac{v}{c}\right)$

$$\Rightarrow \nu' = 6 \times 10^{14}\left(1 - \frac{0.8\,c}{c}\right) = 1.2 \times 10^{14}\,Hz$$

18. (c) According to Doppler's principle $\lambda' = \lambda\sqrt{\frac{1 - v/c}{1 + v/c}}$ for $v = c$

$$\lambda' = 5500\sqrt{\frac{(1 - 0.8)}{1 + 0.8}} = 1833.3$$

$\therefore$ Shift = 5500 – 1833.3 = 3167 Å

19. (b) $\Delta\lambda = \lambda\frac{v}{c}$

$$\Rightarrow (3737 - 3700) = 3700 \times \frac{v}{3 \times 10^8} \Rightarrow v = 3 \times 10^6 \, m/s$$

20. (d) $\Delta\lambda = \frac{v_s}{c}\lambda \Rightarrow v_s = \frac{\Delta\lambda.c}{\lambda} = \frac{47 \times 3 \times 10^8}{4700}$

$= 3 \times 10^6 \, m/s$ away from earth

21. (b) $\frac{\Delta\lambda}{\lambda} = \frac{v}{c} \Rightarrow \frac{0.05}{100} = \frac{v}{3 \times 10^8} \Rightarrow v = 1.5 \times 10^5 \, m/s$

(Since wavelength is decreasing, so star coming closer)

22. (b)

23. (c) $\lambda' = \lambda\left(1 - \frac{v}{c}\right) = 5890\left(1 - \frac{4.5 \times 10^6}{3 \times 10^8}\right) \approx 5802$Å

24. (c) $\frac{\Delta\lambda}{\lambda} = \frac{v}{c} \therefore v = \frac{\Delta\lambda}{\lambda}c = \frac{0.1}{6000} \times 3 \times 10^5 \, km/s = 5 \, km/s$

25. (b) $\frac{\Delta\lambda}{\lambda} = \frac{v}{c} \Rightarrow \Delta\lambda = \frac{5700 \times 10^6}{3 \times 10^3} = 19\mathring{A}$

26. (b) $\nu' = \nu\left(1 - \frac{v}{c}\right) = 4 \times 10^7\left(1 - \frac{0.2c}{c}\right) = 3.2 \times 10^7 \, Hz$

27. (c) When the source and observer approach each other, apparent frequency increases and hence wavelength decreases.

28. (b)

29. (a) $\frac{\Delta\lambda}{\lambda} = \frac{v}{c} \Rightarrow 1 = \frac{v}{c} \Rightarrow v = c$

30. (d) $\frac{\Delta\lambda}{\lambda} = \frac{v}{c} \Rightarrow v = \frac{\Delta\lambda}{\lambda}.c = \frac{5}{6563} \times (3 \times 10^8) = 2.29 \times 10^5$ *m/sec*

31. (c)

32. (a) Using $\frac{\Delta\lambda}{\lambda} = \frac{v}{c} \Rightarrow v = \frac{\Delta\lambda}{\lambda}c$

$\Rightarrow v = 0.004 \times 3 \times 10^8 = 1.2 \times 10^6$ *m/sec*

33. (a)

Diffraction of Light

1. (c) For first minima $\theta = \frac{\lambda}{a}$ or $a = \frac{\lambda}{\theta}$

$\therefore a = \frac{6500 \times 10^{-8} \times 6}{\pi}$ (As $30^\circ = \frac{\pi}{6}$ radian)

$= 1.24 \times 10^{-4} \, cm = 1.24$ microns

2. (a) The angular half width of the central maxima is given by $\sin\theta = \frac{\lambda}{a} \Rightarrow \theta = \frac{6328 \times 10^{-10}}{0.2 \times 10^{-3}}$ *rad*

$= \frac{6328 \times 10^{-10} \times 80}{0.2 \times 10^{-3} \times \pi}$ *degree* = 0.18°

Total width of central maxima $= 2\theta = 0.36^o$

3. (b)

4. (c) It is caused due to turning of light around corners.

5. (c) Width of central maxima $= \frac{2\lambda D}{d}$

$$= \frac{2 \times 2.1 \times 5 \times 10^{-7}}{0.15 \times 10^{-2}} = 1.4 \times 10^{-3} m = 1.4 \, mm$$

6. (a) Band width $\propto \lambda$,

$\because \lambda_{blue} < \lambda_{red}$, hence for blue light the diffraction bands becomes narrower and crowded together.

7. (a) Using $d\sin\theta = n\lambda$, for n =1

$$\sin\theta = \frac{\lambda}{d} = \frac{550\times10^{-9}}{0.55\times10^{-3}} = 10^{-3} = 0.001\,rad$$

8. (a) For single slit diffraction pattern $d\sin\theta = \lambda$ (d = slit width)

Angular width = $2\theta = 2\sin^{-1}\left(\frac{\lambda}{d}\right)$

It is independent of D *i.e.* distance between screen and slit

9. (c) Width of central bright fringe.

$$= \frac{2\lambda D}{d} = \frac{2\times500\times10^{-9}\times80\times10^{-2}}{0.20\times10^{-3}} = 4\times10^{-3}m = 4mm.$$

10. (b) Diffraction is obtained when the slit width is of the order of wavelength of EM waves (or light). Here wavelength of X-rays (1-100 Å) is very-very lesser than slit width (0.6 *mm*). Therefore no diffraction pattern will be observed.

11. (a) Multiple focii of zone plate given by $f_p = \frac{r_n^2}{(2p-1)\lambda}$, where $p = 1, 2, 3......$

12. (b) $A = n\pi d\lambda \Rightarrow nd = \frac{A}{\pi\lambda}$ = constant $\Rightarrow n \propto \frac{1}{d}$ (n = number of blocked HPZ) on decreasing d, n increases, hence intensity decreases.

13. (a) For secondary maxima $d\sin\theta = \frac{5\lambda}{2}$

$$\Rightarrow d\theta = d.\frac{x}{D(\approx f)} = \frac{5\lambda}{2}$$

$$\Rightarrow 2x = \frac{5\lambda f}{d} = \frac{5\times0.8\times10^{-7}}{4\times10^{-4}} = 6\times10^{-3}m = 6mm$$

14. (d) By using $f_p = \frac{r^2}{(2p-1)\lambda}$

For first HPZ $r = \sqrt{f_p\lambda} = \sqrt{0.6\times6000\times10^{-10}}$

$= 6\times10^{-4}m.$

15. (a) $f_1 = \frac{r^2}{\lambda} = \frac{(2.3\times10^{-3})^2}{5893\times10^{-10}} = 9\,m.$

16. (b) $\lambda_{Blue} < \lambda_{Red}$. Therefore fringe pattern will contract because fringe width $\propto \lambda$

17. (a)

18. (a) For diffraction size of the obstacle must be of the order of wavelength of wave *i.e.* $a \approx \lambda$

19. (a) Angular width of central maxima

$$= \frac{2\lambda}{d} = \frac{2\times589.3\times10^{-9}}{0.1\times10^{-3}}rad = 0.0117\times\frac{180}{\pi} = 0.68°$$

20. (d)

21. (a) $r_n = \sqrt{nd\lambda} \Rightarrow r_n \propto \sqrt{n}$

22. (a) $\beta = \frac{\lambda.D}{d}$ w here D = distance of screen from wire, d = diameter of wire

23. (c) Angular width $= \frac{2\lambda}{d} = \frac{2\times6000\times10^{-10}}{12\times10^{-5}\times10^{-2}} = 1\,rad.$

24. (b)

25. (d)

26. (a) $2\theta = \frac{2\lambda}{d}$ (where d = slit width)

As d decreases, θ increases.

27. (d)

28. (d) Distance between the first dark fringes on either side of central maxima = width of central maxima $= \frac{2\lambda D}{d} =$

$\frac{2\times600\times10^{-9}\times2}{1\times10^{-3}}$ = 2.4 *mm.*

29. (b) Thickness of the film must be of the order of wavelength of light falling on film (*i.e.* visible light)

30. (d)

31. (d) For n secondary maxima path difference

$$d\sin\theta = (2n+1)\frac{\lambda}{2} \Rightarrow a\sin\theta = \frac{3\lambda}{2}$$

32. (d) The phase difference (ϕ) between the wavelets from the top edge and the bottom edge of the slit is $\phi = \frac{2\pi}{\lambda}(d\sin\theta)$ where d is the slit width. The first minima of the diffraction pattern occurs at $\sin\theta = \frac{\lambda}{d}$ so $\phi = \frac{2\pi}{\lambda}\left(d\times\frac{\lambda}{d}\right) = 2\pi$

33. (b)

34. (a) For second dark fringe $d\sin\theta = 2\lambda$

$$\Rightarrow 24\times10^{-5}\times10^{-2}\times\sin30 = 2\lambda$$

$$\Rightarrow \lambda = 6\times10^{-7}\,m = 6000\,Å$$

35. (c) For the first minima $d\sin\theta = \lambda$

$$\Rightarrow \sin\theta = \frac{\lambda}{d} \Rightarrow \theta = \sin^{-1}\left(\frac{5000\times10^{-10}}{0.001\times10^{-3}}\right) = 30^o$$

36. (c)

37. (a)

38. (c) Position of first minima = position of third maxima *i.e.*, $\frac{1\times\lambda_1 D}{d} = \frac{(2\times3+1)}{2}\frac{\lambda_2 D}{d} \Rightarrow \lambda_1 = 3.5\lambda_2$

39. (a) Position of nth minima $x_n = \frac{n\lambda D}{d}$

$$\Rightarrow 5\times10^{-3} = \frac{1\times5000\times10^{-10}\times1}{d}$$

$$\Rightarrow d = 10^{-4}\,m = 0.1\,mm.$$

40. (b) Width of n HPZ $B_n = r_n - r_{n-1}$

$r_n = \sqrt{nb\lambda}$, $r_{n-1} = \sqrt{(n-1)b\lambda}$

$B_n = \sqrt{nb\lambda} - \sqrt{(n-1)b\lambda} = \sqrt{b\lambda}\,[\sqrt{n} - \sqrt{(n-1)}]$

41. (c) In single slit experiment,

Width of central maxima (y) = $2\lambda D/d$

$$\Rightarrow \frac{y'}{y} = \frac{\lambda'}{d'}\times\frac{d}{\lambda} = \frac{600}{d/2}\times\frac{d}{400} \Rightarrow y' = 3y.$$

Polarisation of Light

1. (b) Polariser produced prolarised light.
2. (a) Only transverse waves can be polarised.
3. (c) Polarisation is not shown by sound waves.
4. (d) By using $\mu = \tan\theta_p \Rightarrow \mu = \tan 60 = \sqrt{3}$,

also $C = \sin^{-1}\left(\frac{1}{\mu}\right) \Rightarrow C = \sin^{-1}\left(\frac{1}{\sqrt{3}}\right)$

5. (d) $\mu = \tan\theta_p \Rightarrow \theta_p = \tan^{-1} n$
6. (d) Ultrasonic waves are longitudinal waves.
7. (b) $I = I_0 \cos^2\theta = I_0 \cos^2 45 = \frac{I_0}{2}$
8. (d)
9. (a) It magnitude of light vector varies periodically during it's rotation, the tip of vector traces an ellipse and light is said to be elliptically polarised. This is not in nicol prism.
10. (c) At polarizing angle, the reflected and refracted rays are mutually perpendicular to each other.
11. (a) When unpolarised light is made incident at polarising angle, the reflected light is plane polarised in a direction perpendicular to the plane of incidence.

Therefore $\vec{E}$ in reflected light will vibrate in vertical plane with respect to plane of incidence.

12. (d) In the arrangement shown, the unpolarised light is incident at polarising angle of 90° – 33° = 57°. The reflected light is thus plane polarised light. When plane polarised light is passed through Nicol prism (a polariser or analyser), the intensity gradually reduces to zero and finally increases.
13. (a)
14. (a) A plane which contains $\vec{E}$ and the propagation direction is called the plane of polarization.
15. (c)
16. (d) Light suffers double refraction through calcite.
17. (d) The amplitude will be $A\cos 60^o = A/2$
18. (d)
19. (b) Rotation produced $\theta = Slc$

Net rotation produced $\theta = \theta_1 - \theta_2 = l(S_1c_1 - S_2c_2)$

= 0.29 × [0.01 × 60 – 0.02 × 30] = 0

20. (c) In double refraction light rays always splits into two rays (*O*-ray & *E*-ray). *O*-ray has same velocity in all direction but *E*-ray has different velocity in different direction.

For calcite $\mu_e < \mu_o \Rightarrow v_e > v_o$

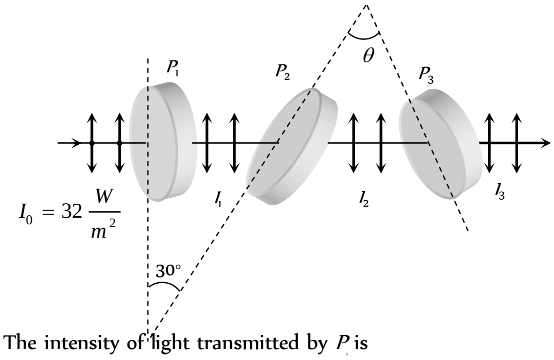
For quartz $\mu_e > \mu_o \Rightarrow v_o > v_e$

21. (c) $\theta_P + r = 90^\circ$ or $r = 90 - \theta_p$ = 90° – 53°4' = 36°56'.
22. (d)
23. (a)
24. (c) Intensity of polarized light from first polarizer $= \frac{100}{2} = 50$

$I = 50\cos^2 60^\circ = \frac{50}{4} = 12.5$

25. (b) $I' = \frac{I}{2}\cos^2\theta = \frac{I}{6}$ or $\cos\theta = \frac{1}{\sqrt{3}}$ $\therefore$ $\theta = 55°$
26. (b) Angle between P_1 and P_2 = 30° (given)

Angle between P_2 and P_3 = θ = 90° – 30° = 60°



The intensity of light transmitted by P_1 is

$I_1 = \frac{I_0}{2} = \frac{32}{2} = 16\frac{W}{m^2}$

According to Malus law the intensity of light transmitted by P_2

is $I_2 = I_1\cos^2 30^\circ = 16\left(\frac{\sqrt{3}}{2}\right)^2 = 12\frac{W}{m^2}$

Similarly intensity of light transmitted by P_3 is

$I_3 = I_2\cos^2\theta = 12\cos^2 60^\circ = 12\left(\frac{1}{2}\right)^2 = 3\frac{W}{m^2}$

27. (b) $\theta = a + \frac{b}{\lambda^2}$

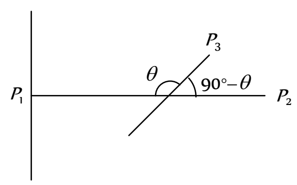
$30 = a + \frac{b}{(5000)^2}$ and $50 = a + \frac{b}{(4000)^2}$

Solving for a, we get $a = -\frac{50^\circ}{9}$ *per mm*

28. (c) If an unpolarised light is converted into plane polarised light by passing through a polaroid, it's intensity becomes half.
29. (a)
30. (b) The magnitude of electric field vector varies periodically with time because it is the form of electromagnetic wave.
31. (a) According to Brewster's law, when a beam of ordinary light (i.e. unpolarised) is reflected from a transparent medium (like glass), the reflected light is completely plane polarised at certain angle of incidence called the angle of polarisation.
32. (a) When the plane-polarised light passes through certain substance, the plane of polarisation of the light is rotated about the direction of propagation of light through a certain angle.
33. (c) From Brewster's law $\mu = \tan i_p \Rightarrow \frac{c}{v} = \tan 60^\circ = \sqrt{3}$

$\Rightarrow v = \frac{c}{\sqrt{3}} = \frac{3\times 10^8}{\sqrt{3}} = \sqrt{3}\times 10^8$ *m/sec.*

34. (a) No light is emitted from the second polaroid, so P_1 and P_2 are perpendicular to each other



Let the initial intensity of light is I_0 . So Intensity of light after transmission from first polaroid = $\frac{I_0}{2}$.

Intensity of light emitted from P_3 $I_1 = \frac{I_0}{2}\cos^2\theta$

Intensity of light transmitted from last polaroid *i.e.* from $P_2 = I_1\cos^2(90^o - \theta) = \frac{I_0}{2}\cos^2\theta.\sin^2\theta$

$= \frac{I_0}{8}(2\sin\theta\cos\theta)^2 = \frac{I_0}{8}\sin^2 2\theta$.

35. (d)

EM Waves

1. (a)

2. (d) $\lambda_{Red} > \lambda_{Blue} > \lambda_{X-ray} > \lambda_\gamma$

3. (b) Infrasonic waves are mechanical waves.

4. (d) $\mu_0 = 4\pi\times10^{-7}, \varepsilon_0 = 8.85\times10^{-12}\frac{N\text{-}m^2}{C^2}$

so $c = \frac{1}{\sqrt{\mu_0\varepsilon_0}} = 3\times10^8\frac{meter}{sec}$.

5. (b) Wavelength of visible spectrum is 3900 Å – 7800 Å.

6. (b) Infrared causes heating effect.

7. (a)

8. (d)

9. (c) Speed of EM waves in vacuum = $\frac{1}{\sqrt{\mu_0\in_0}}$ =constant

10. (a) $\lambda_{\gamma-rays} < \lambda_{x-rays} < \lambda_{\alpha-rays} < \lambda_{\beta-rays}$.

11. (a) Distance covered by T.V. signals = $\sqrt{2hR}$

$\Rightarrow$ maximum distance $\propto h$

12. (c) β-rays are beams of fast electrons.

13. (a)

14. (b) Velocity of EM waves = $\frac{1}{\sqrt{\mu_0\in_0}}$ $3\times10^8 m/s$ =velocity of light

15. (b) Ozone layer absorbs most of the *UV* rays emitted by sun.

16. (d) $\nu_{\gamma-rays} > \nu_{\text{visible radiation}} > \nu_{\text{Infrared}} > \nu_{\text{Radio waves}}$

17. (b) Infrared radiations reflected by low lying clouds and keeps the earth warm.

18. (d) $\lambda_{Radiowaves} > \lambda_{UV\ rays} > \lambda_{J\ Rays} > \lambda_{X-rays}$

19. (a) Polarization is shown by only transverse waves.

20. (c) EM waves travels with perpendicular to *E* and *B*. Which are also perpendicular to each other $\vec{v} = \vec{E}\times\vec{B}$

21. (a)

22. (d) Ozone hole is depletion of ozone layer in stratosphere because of gases like CFC'S etc.

23. (c)

24. (b)

25. (a) $\nu_{\gamma-rays} > \nu_{X-rays} > \nu_{UV-rays}$

26. (a) In vacuum velocity of all EM waves are same but their wavelengths are different.

27. (c)

28. (c)

29. (a) $\lambda = \frac{c}{\nu} = \frac{3\times10^8}{8.2\times10^6} = 36.5\ m$

30. (b) $c = \frac{E}{B} \Rightarrow B = \frac{E}{c} = \frac{18}{3\times10^8} = 6\times10^{-8}T$.

31. (c) According to the Maxwell's EM theory, the EM waves propagation contains electric and magnetic field vibration in mutually perpendicular direction. Thus the changing of electric field give rise to magnetic field.

32. (a) Here $E_0 = 100\ V/m,\ B_0 = 0.265\ A/m$.

$\therefore$ Maximum rate of energy flow $S = E_0\times B_0$

$= 100\times.265 = 26.5\frac{W}{m^2}$

33. (d) $E = \frac{hc}{\lambda} = \frac{6.6\times10^{-34}\times3\times10^8}{21\times10^{-2}} = 0.94\times10^{-24} \approx 10^{-24}J$

34. (a) $\nu = \frac{C}{\lambda} \Rightarrow \nu_1 = \frac{3\times10^8}{1} = 3\times10^8 Hz = 300\ MHz$

and $\nu_2 = \frac{3\times10^8}{10} = 3\times10^7 Hz = 30 MHz$

35. (d)

36. (c) $\vec{E}$ and $\vec{B}$ are mutually perpendicular to each other and are in phase i.e. they become zero and minimum at the same place and at the same time.

37. (b) Molecular spectra due to vibrational motion lie in the microwave region of EM-spectrum. Due to Kirchhoff's law in spectroscopy the same will be absorbed.

38. (a) E_x and B_y would generate a plane EM wave travelling in *z*-direction. $\vec{E}$, $\vec{B}$ and $\vec{k}$ form a right handed system $\vec{k}$ is along z-axis. As $\hat{i}\times\hat{j} = \hat{k}$

$\Rightarrow E_x\hat{i}\times B_y\hat{j} = C\hat{k}$ *i.e.* *E* is along *x*-axis and *B* is along *y-axis.*

39. (a) $\nu_{\gamma-rays} > \nu_{UV\text{-rays}} > \nu_{\text{Blue light}} > \nu_{\text{Infrared rays}}$

40. (d) Ground wave and sky wave both are amplitude modulated wave and the amplitude modulated signal is transmitted by a transmitting antenna and received by the receiving antenna at a distance place.

41. (a)

42. (b) EM waves transport energy, momentum and information but not charge. EM waves are uncharged

43. (b) EM waves carry momentum and hence can exert pressure on surfaces. They also transfer energy to the surface so $p \neq 0$ and $E \neq 0$.

44. (c) The angular wave number $k = \frac{2\pi}{\lambda}$; where λ is the wave length. The angular frequency is $w = 2\pi\nu$.

The ratio $\frac{k}{\omega} = \frac{2\pi/\lambda}{2\pi\nu} = \frac{1}{\nu\pi} = \frac{1}{c}$ = constant

45. (a) $\frac{E_0}{B_0} = C$. also $k = \frac{2\pi}{\lambda}$ and $\omega = 2\pi\nu$

These relation gives $E_0K = B_0\omega$

46. (b) $\nu = \frac{1}{2\pi\sqrt{LC}}$ and $\lambda = \frac{C}{\nu}$

47. (a) $I = \frac{1}{2}\varepsilon_0 C E_0^2$

$\Rightarrow E_0 = \sqrt{\frac{2I}{\varepsilon_0 C}} = \sqrt{\frac{2 \times 5 \times 10^{-16}}{8.85}} = 0.61 \times 10^{-6}\ \frac{V}{m}$

Also $E_0 = \frac{V_0}{d} \Rightarrow V_0 = E_0 d = 0.61 \times 10^{-6} \times 2 = 1.23 \mu V$

48. (c)

49. (c) Population covered = $2\pi hR \times$ Population density

$= 2\pi \times 100 \times 6.4 \times 10^{6} \times \frac{1000}{(10^3)^2} = 4 \times 10^{6}$

50. (a)

51. (c)

52. (c) Refractive index $= \sqrt{\frac{\mu\varepsilon}{\mu_0\varepsilon_0}}$

Here μ is not specified so we can consider $\mu = \mu_0$

then refractive index $= \sqrt{\frac{\varepsilon}{\varepsilon_0}} = 2$

$\therefore$ Speed and wavelength of wave becomes half and frequency remain unchanged.

53. (d)

54. (d)

55. (b)

56. (b)

57. (a) Intensity or power per unit area of the radiations $P = fv \Rightarrow$

$f = \frac{P}{v} = \frac{0.5}{3 \times 10^8} = 0.166 \times 10^{-8}\ N/m^2$

58. (d) $v = \frac{c}{\sqrt{\mu_r \varepsilon_r}} = \frac{3 \times 10^8}{\sqrt{1.3 \times 2.14}} = 1.8 \times 10^8\ m/sec$

59. (b) $I' = I e^{-\mu x} \Rightarrow x = \frac{1}{\mu}\log_e \frac{I}{I'}$ (where I = original intensity, I' = changed intensity)

$36 = \frac{1}{\mu}\log_e \frac{I}{I/8} = \frac{3}{\mu}\log_e 2$ ....(i)

$x = \frac{1}{\mu}\log_e \frac{I}{I/2} = \frac{1}{\mu}\log_e 2$ .....(ii)

From equation (i) and (ii), $x = 12\ mm$.

60. (c) $\lambda_m > \lambda_v > \lambda_x$

61. (a) If maximum electron density of the ionosphere is N_{max} per m^3 then the critical frequency f_c is given by $f_c = 9(N_{max})^{1/2}$.

$\Rightarrow 1 \times 10^6 = 9(N)^{1/2} \Rightarrow N = 1.2 \times 10^{12}\ m^{-3}$

62. (c)

63. (b)

64. (a)

65. (c)

66. (d) Direction of wave propagation is given by $\vec{E} \times \vec{B}$.

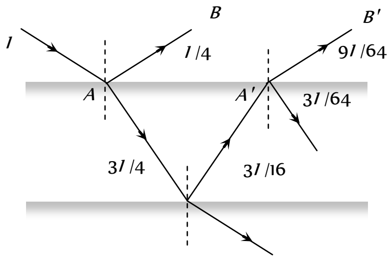
67. (c) Speed of light of vacuum $c = \frac{1}{\sqrt{\mu_0\varepsilon_0}}$ and in another medium

$v = \frac{1}{\sqrt{\mu\varepsilon}}$

$\therefore \frac{c}{v} = \sqrt{\frac{\mu\varepsilon}{\mu_0\varepsilon_0}} = \sqrt{\mu_r K} \Rightarrow v = \frac{c}{\sqrt{\mu_r K}}$

Critical Thinking Questions

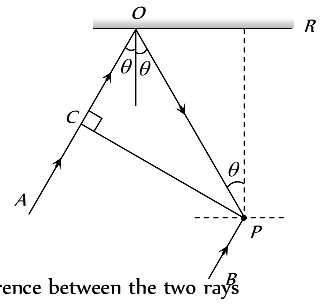
1. (d) From figure $I_1 = \frac{I}{4}$ and $I_2 = \frac{9I}{64}$ $\Rightarrow \frac{I_2}{I_1} = \frac{9}{16}$



By using $\frac{I_{max}}{I_{min}} = \left(\frac{\sqrt{\frac{I_2}{I_1}}+1}{\sqrt{\frac{I_2}{I_1}}-1}\right) = \left(\frac{\sqrt{\frac{9}{16}}+1}{\sqrt{\frac{9}{16}}-1}\right) = \frac{49}{1}$

2. (a) The cylindrical surface touches the glass plate along a line parallel to axis of cylinder. The thickness of wedge shaped film increases on both sides of this line. Locus of equal path difference are the lines running parallel to the axis of the cylinder. Hence straight fringes are obtained.

3. (b) $\because PR = d \Rightarrow PO = d\sec\theta$ and $CO = PO\cos 2\theta$ $= d\sec\theta\cos 2\theta$ is



Path difference between the two rays

$\Delta = CO + PO = (d\sec\theta + d\sec\theta\cos 2\theta)$

Phase difference between the two rays is

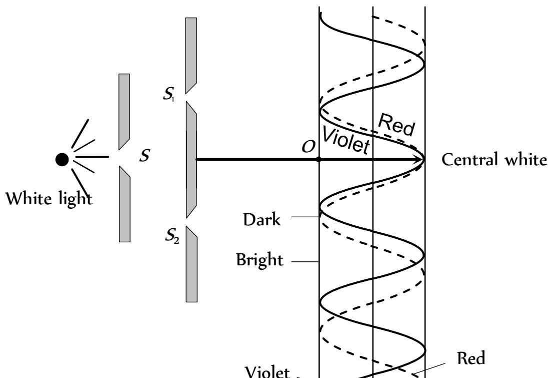
$\phi = \pi$ (One is reflected, while another is direct)

Therefore condition for constructive interference should be $\Delta = \frac{\lambda}{2}, \frac{3\lambda}{2}$ ......

or $d\sec\theta(1+\cos 2\theta) = \frac{\lambda}{2}$

or $\frac{d}{\cos\theta}(2\cos^2\theta) = \frac{\lambda}{2} \Rightarrow \cos\theta = \frac{\lambda}{4d}$

4. (c) In young's double slit experiment, if white light is used in place of monochromatic light, then the central fringe is white and some coloured fringes around the central fringe are formed.



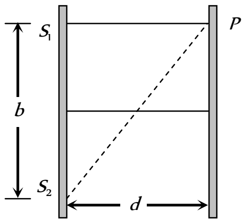
Since $\beta_{red} > \beta_{violet}$ etc., the bright fringe of violet colour forms first and that of the red forms later.

It may be noted that, the inner edge of the dark fringe is red, while the outer edge is violet. Similarly, the inner edge of the bright fringe is violet and the outer edge is red.

5. (a) In conventional light source, light comes from a large number of independent atoms, each atom emitting light for about 10^{-9} *sec i.e.* light emitted by an atom is essentially a pulse lasting for only 10^{-9} *sec*. Light coming out from two slits will have a fixed phase relationship only for 10^{-9} *sec*. Hence any interference pattern formed on the screen would last only for 10^{-9} *sec*, and then the pattern will change. The human eye can notice intensity changes which last at least for a tenth of a second and hence we will not be able to see any interference pattern. In stead due to rapid changes in the pattern, we will only observe a uniform intensity over the screen.

6. (a,c) Path difference between the rays reaching infront of slit S_1 is.

$S_1P - S_2P = (b^2 + d^2)^{1/2} - d$



For distructive interference at P

$S_1P - S_2P = \frac{(2n-1)\lambda}{2}$

i.e., $(b^2 + d^2)^{1/2} - d = \frac{(2n-1)\lambda}{2}$

$\Rightarrow d\left(1+\frac{b^2}{d^2}\right)^{1/2} - d = \frac{(2n-1)\lambda}{2}$

$\Rightarrow d\left(1+\frac{b^2}{2d^2}+......\right) - d = \frac{(2n-1)\lambda}{2}$

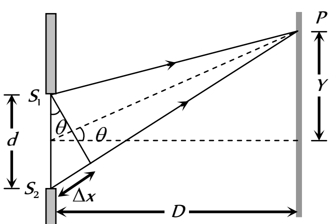
(Binomial Expansion)

$\Rightarrow \frac{b}{2d} = \frac{(2n-1)\lambda}{2} \Rightarrow \lambda = \frac{b^2}{(2n-1)d}$

For $n = 1, 2$......... .., $\lambda = \frac{b^2}{d}, \frac{b^2}{3d}$

7. (a)

8. (a,b) For microwave $\lambda = \frac{c}{f} = \frac{3\times 10^8}{10^6} = 300\ m$



As $\Delta x = d\sin\theta$

Phase difference $\phi = \frac{2\pi}{\lambda}$ (Path difference)

$= \frac{2\pi}{\lambda}(d \sin\theta) = \frac{2\pi}{300}(150 \sin\theta) = \pi \sin\theta$

$I_R = I_1 + I_2 + 2\sqrt{I_1 I_2} \cos\phi$

Here $I_1 = I_2$ and $\phi = \pi \sin\theta$

$\therefore I_R = 2I_1[1 + \cos(\pi \sin\theta)] = 4I_1 \cos^2\left(\frac{\pi \sin\theta}{2}\right)$

I will be maximum when $\cos^2\left(\frac{\pi \sin\theta}{2}\right) = 1$

$\therefore (I_R)_{\max} = 4I_1 = I_o$

Hence $I = I_o \cos^2\left(\frac{\pi \sin\theta}{2}\right)$

If $\theta = 0$, then $I = I_o \cos\theta = I_o$

If $\theta = 30°$, then $I = I_o \cos^2(\pi/4) = I_o/2$

If $\theta = 90^o$, then $I = I_o \cos^2(\pi/2) = 0$

9. (d) $I = a_1^2 + a_2^2 + 2a_1a_2 \cos\phi$

Put $a_1^2 + a_2^2 = A$ and $a_1a_2 = B;\ \therefore I = A + B\cos\phi$

10. (d) Since P is ahead of Q by 90° and path difference between P and Q is $\lambda/4$. Therefore at A, phase difference is zero, so intensity is $4I$. At C it is zero and at B, the phase difference is 90°, so intensity is $2I$.

11. (b) By using phase difference $\phi = \frac{2\pi}{\lambda}(\Delta)$

For path difference λ, phase difference $\phi_1 = 2\pi$ and for path difference $\lambda/4$, phase difference $\phi_2 = \pi/2$.

Also by using $I = 4I_0 \cos^2\frac{\phi}{2} \Rightarrow \frac{I_1}{I_2} = \frac{\cos^2(\phi_1/2)}{\cos^2(\phi_2/2)}$

$\Rightarrow \frac{K}{I_2} = \frac{\cos^2(2\pi/2)}{\cos^2\left(\frac{\pi/2}{2}\right)} = \frac{1}{1/2} \Rightarrow I_2 = \frac{K}{2}$.

12. (d) If shift is equivalent to n fringes then

$n = \frac{(\mu-1)t}{\lambda} \Rightarrow n \propto t \Rightarrow \frac{t_2}{t_1} = \frac{n_2}{n_1} \Rightarrow t_2 = \frac{n_2}{n_1} \times t$

$t_2 = \frac{20}{30} \times 4.8 = 3.2\ mm$.

13. (a) According to given condition

$(\mu - 1)t = n\lambda$ for minimum t, $n = 1$

So, $(\mu - 1)t_{\min} = \lambda$

$t_{\min} = \frac{\lambda}{\mu - 1} = \frac{\lambda}{1.5 - 1} = 2\lambda$

14. (a) $\Delta\lambda = \lambda\frac{v}{c}$ and $v = r\omega$

$v = 7 \times 10^8 \times \frac{2\pi}{25 \times 24 \times 3600}$, $c = 3 \times 10^8\ m/s$

$\therefore \Delta\lambda = 0.04 Å$

15. (b) $v = \frac{c\Delta\lambda}{\lambda} = \frac{3 \times 10^8 \times (706 - 656)}{656} = \frac{1500}{656} \times 10^7$

$= 2 \times 10^7\ m/s$

16. (b) In this case, we can assume as if both the source and the observer are moving towards each other with speed v. Hence $\nu' = \frac{c - u_o}{c - u_s}\nu = \frac{c - (-v)}{c - v}\nu = \frac{c + v}{c - v}\nu$

$= \frac{(c + v)(c - v)}{(c - v)^2}\nu = \frac{c^2 - v^2}{c^2 + v^2 - 2vc}\nu$

Since $v << c$, therefore $\nu' = \frac{c^2}{c^2 - 2vc} = \frac{c}{c - 2v}\nu$

17. (a) $\Delta\lambda = \lambda.\frac{v}{c}$ where $v = r\omega = r \times \left(\frac{2\pi}{T}\right)$

$\therefore \Delta\lambda = \frac{4320 \times 7 \times 10^8 \times 2 \times 3.14}{3 \times 10^8 \times 22 \times 86400} = 0.033 Å$

18. (a) $\beta = \frac{\lambda D}{d} \Rightarrow \beta \propto D$

$\Rightarrow \frac{\beta_1}{\beta_2} = \frac{D_1}{D_2} \Rightarrow \frac{\beta_1 - \beta_2}{\beta_2} = \frac{D_1 - D_2}{D_2} \Rightarrow \frac{\Delta\beta}{\Delta D} = \frac{\beta_2}{D_2} = \frac{\lambda_2}{d_2}$

$= \lambda_2 = \frac{3 \times 10^{-5}}{5 \times 10^{-2}} \times 10^{-3} = 6 \times 10^{-7}\ m = 6000 Å$

19. (a) P is the position of 11th bright fringe from Q. From central position O, P will be the position of 10th bright fringe.

Path difference between the waves reaching at $P = SB = 10\ \lambda = 10 \times 6000 \times 10^{-10} = 6 \times 10^{-6}\ m$.

20. (b) Resultant intensity $I = I_1 + I_2 + 2\sqrt{I_1 I_2} \cos\phi$

At central position with coherent source (and $I_1 = I_2 = I_0$

$I_{con} = 4I_0$ ... (i)

In case of incoherent at a given point, ϕ varies randomly with time so $(\cos\phi)_{av} = 0$

$\therefore\ I_{Incoh} = I_1 + I_2 = 2I_0$ ... (ii)

Hence $\frac{I_{coh}}{I_{Incoh}} = \frac{2}{1}$.

21. (a, d) These waves are of same frequencies and they are coherent

22. (c) Fringe width $\beta \propto \lambda$. Therefore, λ and hence β decreases 1.5 times when immersed in liquid. The distance between central maxima and 10th maxima is 3 cm in vacuum. When immersed in liquid it will reduce to 2 cm. Position of central maxima will not change while 10th maxima will be obtained at $y = 4cm$.

23. (a) Suppose P is a point infront of one slit at which intensity is to be calculated from figure it is clear that $x = \frac{d}{2}$. Path difference between the waves reaching at P

$$\Delta = \frac{xd}{D} = \frac{\left(\frac{d}{2}\right)d}{10d} = \frac{d}{20} = \frac{5\lambda}{20} = \frac{\lambda}{4}$$

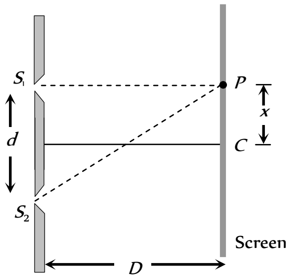
Hence corresponding phase difference

$$\phi = \frac{2\pi}{\lambda} \times \frac{\lambda}{4} = \frac{\pi}{2}$$

Resultant intensity at P

$$I = I_{max}\cos^2\frac{\phi}{2}$$

$$= I_0\cos^2\left(\frac{\pi}{4}\right) = \frac{I_0}{2}$$



24. (d) If $d\sin\theta = (\mu - 1)t$, central fringe is obtained at O

If $d\sin\theta > (\mu - 1)t$, central fringe is obtained above O and

If $d\sin\theta < (\mu - 1)t$, central fringe is obtained below O.

25. (b) For maximum intensity on the screen

$$d\sin\theta = n\lambda \Rightarrow \sin\theta = \frac{n\lambda}{d} = \frac{n(2000)}{7000} = \frac{n}{3.5}$$

Since maximum value of $\sin\theta$ is 1

So $n = 0, 1, 2, 3,$ only. Thus only seven maximas can be obtained on both sides of the screen.

26. (c) From the given data, note that the fringe width (β) for $\lambda_1 = 900\,nm$ is greater than fringe width (β) for $\lambda_2 = 750\,nm$. This means that at though the central maxima of the two coincide, but first maximum for $\lambda_1 = 900\,nm$ will be further away from the first maxima for $\lambda_2 = 750\,nm$, and so on. A stage may come when this mismatch equals β, then again maxima of $\lambda_1 = 900\,nm$, will coincide with a maxima of $\lambda_2 = 750\,nm$, let this correspond to n order fringe for λ. Then it will correspond to $(n+1)^{th}$ order fringe for λ.

Therefore $\frac{n\lambda_1 D}{d} = \frac{(n+1)\lambda_2 D}{d}$

$$\Rightarrow n \times 900 \times 10^{-9} = (n+1)750 \times 10^{-9} \Rightarrow n = 5$$

Minimum distance from

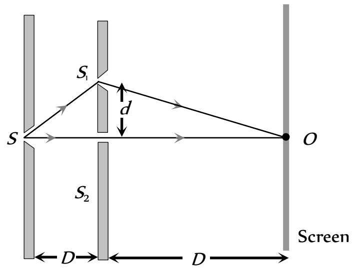
Central maxima $= \frac{n\lambda_1 D}{d} = \frac{5 \times 900 \times 10^{-9} \times 2}{2 \times 10^{-3}}$

$$= 45 \times 10^{-4}\,m = 4.5\,mm$$

27. (c) Shift $= \frac{\beta}{\lambda}(\mu - 1)t$

$$\Rightarrow 7\beta = \frac{\beta}{\lambda}(\mu - 1)t \Rightarrow t = \frac{7\lambda}{(\mu - 1)} = \frac{7 \times 600}{(1.5 - 1)} = 8400\,nm.$$

28. (c) Path difference between the waves reaching at P, $\Delta = \Delta_1 + \Delta_2$



where $\Delta_1 =$ Initial path difference

$\Delta_2 =$ Path difference between the waves after emerging from slits.

$$\Delta_1 = SS_1 - SS_2 = \sqrt{D^2 + d^2} - D$$

and $\Delta_2 = S_1O - S_2O = \sqrt{D^2 + d^2} - D$

$$\therefore\ \Delta = 2\left\{(D^2 + d^2)^{\frac{1}{2}} - D\right\} = 2\left\{(D^2 + \frac{d^2}{2D}) - D\right\}$$

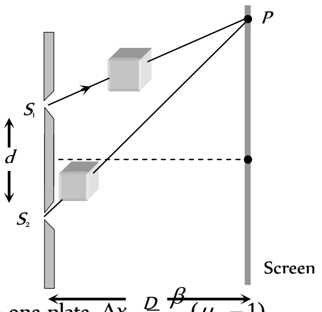
$$= \frac{d^2}{D} \qquad \text{(From Binomial expansion)}$$

For obtaining dark at O, Δ must be equals to $(2n-1)\frac{\lambda}{2}$ *i.e.*

$$\frac{d^2}{D} = (2n-1)\frac{\lambda}{2} \Rightarrow d\sqrt{\frac{(2n-1)\lambda D}{2}}$$

For minimum distance $n = 1$ so $d = \sqrt{\frac{\lambda D}{2}}$

29. (a) Shift $\Delta x = \frac{\beta}{\lambda}(\mu - 1)t$



Shift due to one plate $\Delta x_1 = \frac{\beta}{\lambda}(\mu_1 - 1)$

Shift due to another path $\Delta x_2 = \frac{\beta}{\lambda}(\mu_2 - 1)t$

Net shift $\Delta x = \Delta x_2 - \Delta x_1 = \frac{\beta}{\lambda}(\mu_2 - \mu_1)t$ .....(i)

Also it is given that $\Delta x = 5\beta$ .....(ii)

Hence $5\beta = \frac{\beta}{\lambda}(\mu_1 - \mu_2)t$

$$\Rightarrow t = \frac{5\lambda}{(\mu_2 - \mu_1)} = \frac{5 \times 4800 \times 10^{-10}}{(1.7 - 1.4)} = 8 \times 10^{-6}\,m = 8\,\mu m.$$

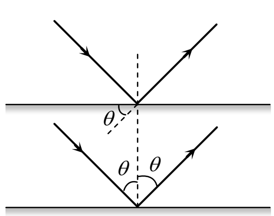
30. (b) For maxima $2\pi n = \frac{2\pi}{\lambda}(XO) - 2\pi l$

or $\frac{2\pi}{\lambda}(XO) = 2\pi(n + l)$ or $(XO) = \lambda(n + l)$

31. (c) Path difference $= 2d\sin\theta$

$\therefore$ For constructive interference

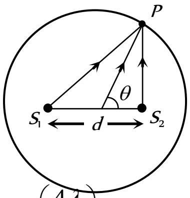
$$2d\sin\theta = n\lambda$$



$\Rightarrow \theta = \sin^{-1}\left(\frac{n\lambda}{2d}\right)$

32. (b) Here path difference at a point P on the circle is given by

$\Delta x = d\cos\theta$ ..... (i)



For maxima at P

$\Delta x = n\lambda$ ..... (ii)

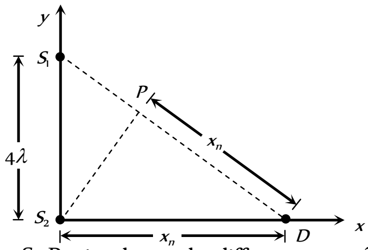
From equation (i) and (ii)

$n\lambda = d\cos\theta \Rightarrow \theta \cos^{-1}\left(\frac{n\lambda}{d}\right) = \cos^{-1}\left(\frac{4\lambda}{d}\right)$

33. (b) From ΔS_1S_2D,

$(S_1D)^2 = (S_1S_2)^2 + (S_2D)^2$

$(S_1P + PD)^2 = (S_1S_2)^2 + (S_2D)^2$



Here S_1P is the path difference $= n\lambda$ for maximum intensity.

$\therefore (n\lambda + x_n)^2 = (4\lambda)^2 + (x_n)^2$

or $x_n = \frac{16\lambda^2 - n^2\lambda^2}{2n\lambda}$

Then $x_1 = \frac{16\lambda^2 - \lambda^2}{2\lambda} = 7.5\,\lambda$

$x_2 = \frac{16\lambda^2 - 4\lambda^2}{4\lambda} = 3\lambda$

$x_3 = \frac{16\lambda^2 - 9\lambda^2}{6\lambda} = \frac{7}{6}\lambda$

$x_4 = 0$.

$\therefore$ Number of points for maxima becomes 3.

34. (a) $I_0 = R^2 = \frac{R_2^2}{4}$

Number of *HPZ* covered by the disc at $b = 25\,cm$

$n_1b_1 = n_2b_2$

$n_2 = \frac{n_1b_1}{b_2} + \frac{1\times 1}{0.25} = 4$

Hence the intensity at this point is

$I = R'^2 = \left(\frac{R_5}{2}\right)^2 = \left(\frac{R_5}{R_4}\times\frac{R_4}{R_3}\times\frac{R_3}{R_2}\right)^2 \times \left(\frac{R_2}{2}\right)^2$

or $1 = [0.9]^6$

$I_1 = 0.531\, I_0$

Hence the correct answer will be (a).

35. (b) $I_A = R_1^2$

$I_B = (R_1 - R_2)^2 = R_1^2\left(1 - \frac{R_2}{R_1}\right)^2 = R_1^2\left(1 - \frac{3}{4}\right)^2 = \frac{R_1^2}{16}$

$I_C = (R_1 - R_2 + R_3)^2 = R_1^2\left(1 - \frac{R_2}{R_1} + \frac{R_3}{R_1}\right)^2$

$= R_1^2\left(1 - \frac{R_2}{R_1} + \frac{R_3}{R_2}\times\frac{R_2}{R_1}\right)^2$

$= R_1^2\left(1 - \frac{3}{4} + \frac{3}{4}\times\frac{3}{4}\right)^2 = \left(\frac{13}{16}\right)^2 R_1^2 = \frac{169}{256}R_1^2$

$\therefore I_A : I_B : I_C = R_1^2 : \frac{R_1^2}{16} : \frac{169}{256}R_1^2 = 256 : 16 : 169$

36. (d) $I = \frac{R_2^2}{4}$ given $n_1b_1 = n_2b_2 \Rightarrow 1\times 200 = n_2 \times 25$

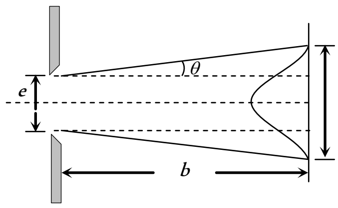
$\therefore n_2 = 8\ HPZ$

$\therefore I = \left(\frac{R_9}{2}\right)^2$

$= \left(\frac{R_9}{R_8}\times\frac{R_8}{R_7}\times\frac{R_7}{R_6}\times\frac{R_6}{R_5}\times\frac{R_5}{R_4}\times\frac{R_4}{R_3}\times\frac{R_3}{R_2}\times\frac{R_2}{R_2}\right)^2$

$= \left(\frac{R_9}{R_2}\right)^2 I$

37. (c) The direction in which the first minima occurs is θ (say). Then $e\sin\theta = \lambda$ or $e\theta = \lambda$ or, $\theta = \frac{\lambda}{e}$ ($\because \theta = \sin\theta$ when θ small)



Width of the central maximum $= 2b\theta + e = 2b.\frac{\lambda}{e} + e$

38. (b) Angular width $\beta = \frac{2\lambda}{d} \Rightarrow \beta \propto \lambda$

$\Rightarrow \frac{\beta_1}{\beta_2} = \frac{\lambda_1}{\lambda_2} \Rightarrow \frac{\beta}{\frac{70}{100}\beta} = \frac{6000}{\lambda_2} \Rightarrow \lambda_2 = 4200\,Å$

39. (a) In a single slit diffraction experiment, position of minima is given by $d\sin\theta = n\lambda$

So for first minima of red $\sin\theta = 1\times\left(\frac{\lambda_R}{d}\right)$

and as first maxima is midway between first and second minima, for wavelength λ', its position will be

$$d\sin\theta' = \frac{\lambda' + 2\lambda'}{2} \Rightarrow \sin\theta' = \frac{3\lambda'}{2d}$$

According to given condition $\sin\theta = \sin\theta'$

$$\Rightarrow \lambda' = \frac{2}{3}\lambda_R \text{ so } \lambda' = \frac{2}{3}\times 6600 = 440\,nm = 4400\,Å$$

40. (c) $I = I_0\left[\frac{\sin\alpha}{\alpha}\right]^2$, where $\alpha = \frac{\phi}{2}$

For n^{th} secondary maxima $d\sin\theta = \left(\frac{2n+1}{2}\right)\lambda$

$$\Rightarrow \alpha = \frac{\phi}{2} = \frac{\pi}{\lambda}[d\sin\theta] = \left(\frac{2n+1}{2}\right)\pi$$

$$\therefore\ I = I_0\left[\frac{\sin\left(\frac{2n+1}{2}\right)\pi}{\left(\frac{2n+1}{2}\right)\pi}\right]^2 = \frac{I_0}{\left\{\frac{(2n+1)}{2}\pi\right\}^2}$$

So $I_0 : I_1 : I_2 = I_0 : \frac{4}{9\pi^2}I_0 : \frac{4}{25\pi^2}I_0$

$$= 1 : \frac{4}{9\pi^2} : \frac{4}{25\pi^2}$$

41. (d) For a grating $(e+d)\sin\theta_n = n\lambda$

where $(e+d) =$ grating element

$$\sin\theta_n = \frac{n\lambda}{(e+d)}$$

For $n = 1$, $\sin\theta_1 = \frac{\lambda}{(e+d)} = \sin 32°$

This is more than 0.5. Now $\sin\theta_2$ will be more than 2×0.5, which is not possible.

42. (a) The film appears bright when the path difference $(2\mu t\cos r)$ is equal to odd multiple of $\frac{\lambda}{2}$

i.e. $2\mu t\cos r = (2n-1)\,\lambda/2$ where $n = 1, 2, 3$ .....

$$\therefore\ \lambda = \frac{4\mu t\cos r}{(2n-1)}$$

$$= \frac{4\times 1.4\times 10{,}000\times 10^{-10}\times\cos 0}{(2n-1)} = \frac{56000}{(2n-1)}Å$$

$\therefore\ \lambda = 56000\,Å$ $18666\,Å$, $8000\,Å$, $6222\,Å$, $5091\,Å$, $4308\,Å$, $3733\,Å$.

The wavelength which are not within specified range are to be refracted.

43. (a) Total phase difference

= Initial phase difference + Phase difference due to path

$$= 66° + \frac{360°}{\lambda}\times\Delta x = 66° + \frac{360°}{\lambda}\times\frac{\lambda}{4} = 66° + 90 = 156°$$

44. (a) $I = 4I_0\cos^2\frac{\phi}{2}$

At central position $I_1 = 4I_0$ ......(i)

Since the phase difference between two successive fringes is 2π, the phase difference between two points separated by a distance equal to one quarter of the distance between the two, successive fringes is equal to $\delta = (2\pi)\left(\frac{1}{4}\right) = \frac{\pi}{2}$ radian

$$\Rightarrow I_2 = 4I_0\cos^2\left(\frac{\frac{\pi}{2}}{2}\right) = 2I_0 \quad ......(ii)$$

Using (i) and (ii), $\frac{I_1}{I_2} = \frac{4I_0}{2I_0} = 2$

45. (b) $I_D = \varepsilon_0\frac{d\phi_E}{dt} = \varepsilon_0\frac{EA}{t} = \varepsilon_0\left(\frac{V}{d}\right).\frac{A}{t}$.

$$= \frac{8.85\times 10^{-12}\times 400\times 60\times 10^{-4}}{10^{-3}\times 10^{-6}} = 1.602\times 10^{-2}\,amp$$

46. (d) Electric field $E = \frac{V}{l} = \frac{iR}{l}$ (R = Resistance of wire)

Magnetic field at the surface of wire $B = \frac{\mu_0 i}{2\pi a}$ (a = radius of wire)

Hence poynting vector, directed radially inward is given by

$$S = \frac{EB}{\mu_0} = \frac{iR}{\mu_0 l}.\frac{\mu_0 i}{2\pi a} = \frac{i^2R}{2\pi a l}$$

47. (b) Average energy density of electric field is given by

$$u_e = \frac{1}{2}\varepsilon_0 E^2 = \frac{1}{2}\varepsilon_0\left(\frac{E_0}{\sqrt{2}}\right)^2 = \frac{1}{4}\varepsilon_0 E_0^2$$

$$= \frac{1}{4}\times 8.85\times 10^{-12}(1)^2 = 2.2\times 10^{-12}\,J/m^3.$$

48. (b) Area through which the energy of beam passes

$$= (6.328\times 10^{-7}) = 4\times 10^{-13}\,m^2$$

$$\therefore\ I = \frac{P}{A} = \frac{10^{-3}}{4\times 10^{-13}} = 2.5\times 10^9\,W/m^2$$

49. (a) $S_{av} = \frac{1}{2}\varepsilon_0 cE_0^2 = \frac{P}{4\pi R^2}$

$$\Rightarrow E_0 = \sqrt{\frac{P}{2\pi R^2\varepsilon_0 C}}$$

$$= \sqrt{\frac{3}{2\times 3.14\times 100\times 8.85\times 10^{-12}\times 3\times 10^8}}$$

= 1.34 V/m

50. (d) Intensity of EM wave is given by

$$I = \frac{P}{4\pi R^2} = v_{av}.c = \frac{1}{2}\varepsilon_0 E_0^2\times c$$

$$\Rightarrow E_0 = \sqrt{\frac{P}{2\pi R^2 \varepsilon_0 c}}$$

$$= \sqrt{\frac{800}{2\times 3.14\times (4)^2\times 8.85\times 10^{-12}\times 3\times 10^8}}$$

$= 54.77\ \frac{V}{m}$

51. (c) Wave impedance $Z = \sqrt{\frac{\mu_r}{\varepsilon_r}} \times \sqrt{\frac{\mu_0}{\varepsilon_0}}$

$$= \sqrt{\frac{50}{2}} \times 376.6 = 1883\,\Omega$$

52. (d) Momentum transferred in one second

$$p = \frac{2U}{c} = \frac{2S_{av}A}{c} = \frac{2\times 6\times 40\times 10^{-4}}{3\times 10^8}$$

$= 1.6\times 10^{-10}$ *kg-m/s*.

53. (a) Specific rotation

$$(\alpha) = \frac{\theta}{l\,c} \Rightarrow c = \frac{\theta}{\alpha l} = \frac{0.4}{0.01\times 0.25} = 160\ kg/m^3$$

Now percentage purity of sugar solution

$$= \frac{160}{200}\times 100 = 80\%$$

54. (d) As $\theta \propto l$

Volume ratio 1 : 2 in a tube of length 30 *cm* means 10 *cm* length of first solution and 20 *cm* length of second solution .

Rotation produced by 10 *cm* length of first solution

$$\theta_1 = \frac{38°}{20}\times 10 = 19°$$

Rotation produced by 20*cm* length of second solution

$$\theta_2 = -\frac{24°}{30}\times 20 = -16°$$

$\therefore$ Total rotation produced = 19° – 16° = 3°

55. (d) If I is the final intensity and I_0 is the initial intensity then

$$I = \frac{I_0}{2}(\cos^2 30°)^5 \quad \text{or} \quad \frac{I}{I_0} = \frac{1}{2}\times\left(\frac{\sqrt{3}}{2}\right)^{10} = 0.12$$

56. (a) Using Matus law, $I = I_0 \cos^2\theta$

As here polariser is rotating *i.e.* all the values of θ are possible.

$$I_{av} = \frac{1}{2\pi}\int_0^{2\pi} I\,d\theta = \frac{1}{2\pi}\int_0^{2\pi} I_0\cos^2\theta\,d\theta$$

On integration we get $I_{av} = \frac{I_0}{2}$

where $I_0 = \frac{\text{Energy}}{\text{Area}\times\text{Time}} = \frac{p}{A} = \frac{10^{-3}}{3\times 10^{-4}} = \frac{10}{3}\ \frac{Watt}{m^2}$

$$\therefore I_{av} = \frac{1}{2}\times\frac{10}{3} = \frac{5}{3}\,Watt$$

and Time period $T = \frac{2\pi}{\omega} = \frac{2\times 3.14}{31.4} = \frac{1}{5}\,sec$

$\therefore$ Energy of light passing through the polariser per revolution

$$= I_{av}\times\text{Area}\times T = \frac{5}{3}\times 3\times 10^{-4}\times\frac{1}{5} = 10^{-4}\ J.$$

57. (d) Let *n*th minima of 400 *nm* coincides with *m*th minima of 560 *nm* then

$$(2n-1)400 = (2m-1)560 \Rightarrow \frac{2n-1}{2m-1} = \frac{7}{5} = \frac{14}{10} = \frac{21}{15}$$

i.e. 4th minima of 400 *nm* coincides with 3rd minima of 560 *nm*.

The location of this minima is

$$= \frac{7(1000)(400\times 10^{-6})}{2\times 0.1} = 14\,mm$$

Next, 11th minima of 400 *nm* will coincide with 8th minima of 560 *nm*

Location of this minima is

$$= \frac{21(1000)(400\times 10^{-6})}{2\times 0.1} = 42\,mm$$

$\therefore$ Required distance = 28 *mm*

58. (b) For maxima $\Delta = d\sin\theta = n\lambda$

$$\Rightarrow 2\lambda\sin\theta = n\lambda \Rightarrow \sin\theta = \frac{n}{2}$$

since value of sin θ can not be greater 1.

$\therefore$ n = 0, 1, 2

Therefore only five maximas can be obtained on both side of the screen.

59. (a) $\frac{\Delta\lambda}{\lambda} = \frac{v}{c} \Rightarrow \frac{(401.8-393.3)}{393.3} = \frac{v}{3\times 10^8}$

$\Rightarrow v = 6.48\times 10^6$ *m/s* = 6480 *km/sec*.

60. (c) The interference fringes for two slits are hyperbolic.

61. (d) If you divide the original slit into N strips and represents the light from each strip, when it reaches the screen, by a phasor, then at the central maximum in the diffraction pattern you add N phasors, all in the same direction and each with the same amplitude. The intensity is therefore N. If you double the slit width, you need $2N$ phasors, if they are each to have the amplitude of the each to have the amplitude of the phasors you used for the narrow slit. The intensity at the central maximum is proportional to $(2N)^2$ and is, therefore, four times the intensity for the narrow slit.

62. (c) $I = 4I_0\cos^2(\phi/2) \Rightarrow \phi = 2\pi/3$

$\Rightarrow \Delta x\times(2\pi/\lambda) = 2\pi/3 = \lambda/3$

sin $\theta = \Delta x/d \Rightarrow$ sin $\theta = \lambda/3d$

63. (b) Momentum of the electron will increase. So the wavelength ($\lambda = h/p$)of electrons will decrease and fringe width decreases as $\beta \propto \lambda$.

Assertion and Reason

1. (d) When a light wave travel from a rarer to a denser medium it loses speed, but energy carried by the wave does not depend on its speed. Instead, it depends on the amplitude of wave.

2. (e) A narrow pulse is made of harmonic waves with a large range of wavelength. As speed of propagation is different for different wavelengths, the pulse cannot retain its shape while travelling through the medium.

3. (b) When d is negligibly small, fringe width β which is proportional to $1/d$ may become too large. Even a single fringe may occupy the whole screen. Hence the pattern cannot be detected.

4. (a) The central spot of Newton's rings is dark when the medium between plano convex lens and plane glass is rarer than the medium of lens and glass. The central spot is dark because the phase change of π is introduced between the rays reflected from surfaces of denser to rarer and rarer to denser media.

5. (a) For reflected system of the film, the maxima or constructive interference is $2\mu t\cos r = \frac{(2n-1)\lambda}{2}$ while the maxima for transmitted system of film is given by equation $2\mu t\cos r = n\lambda$

where t is thickness of the film and r is angle of reflection.

From these two equations we can see that condition for maxima in reflected system and transmitted system are just opposite.

6. (b) When intensity of light emerging from two slits is equal, the intensity at minima,

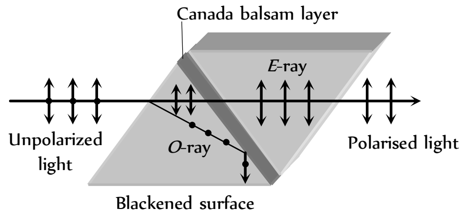
$$I_{\min} = \left(\sqrt{I_a} - \sqrt{I_b}\right)^2 = 0, \text{ or absolute dark.}$$

It provides a better contrast.

7. (c) When one of slits is covered with cellophane paper, the intensity of light emerging from the slit is decreased (because this medium is translucent). Now the two interfering beam have different intensities or amplitudes. Hence intensity at minima will not be zero and fringes will become indistinct.

8. (a) When a polaroid is rotated in the path of unpolarised light, the intensity of light transmitted from polaroid remains undiminished (because unpolarised light contains waves vibrating in all possible planes with equal probability). However, when the polaroid is rotated in path of plane polarised light, its intensity will vary from maximum (when the vibrations of the plane polarised light are parallel to the axis of the polaroid) to minimum (when the direction of the vibrations becomes perpendicular to the axis of the crystal). Thus using polaroid we can easily verify that whether the light is polarised or not.

9. (c) The nicol prism is made of calcite crystal. When light is passed through calcite crystal, it breaks up into two rays (i) the ordinary ray which has its electric vector perpendicular to the principal section of the crystal and (ii) the extra ordinary ray which has its electric vector parallel to the principal section. The nicol prism is made in such a way that it eliminates one of the two rays by total internal reflection, thus produces plane polarised light. It is generally found that the ordinary ray is eliminated and only the extra ordinary ray is transmitted through the prism. The nicol prism consists of two calcite crystal cut at – 68° with its principal axis joined by a glue called Canada balsam.



10. (b) Doppler's effect is observed readily in sound wave due to larger wavelengths. The same is not the case with light due to shorter wavelength in every day life.

11. (d) In Young's experiments fringe width for dark and white fringes are same while in Young's double slit experiment when a white light as a source is used, the central fringe is white around which few coloured fringes are observed on either side.

12. (a) It is quite clear that the coloured spectrum is seen due to diffraction of white light on passing through fine slits made by fine threads in the muslin cloth.

13. (c) As the waves diffracted from the edges of circular obstacle, placed in the path of light interfere constructively at the centre of the shadow resulting in the formation of a bright spot.

14. (c) The beautiful colours are seen on account of interference of light reflected from the upper and the lower surfaces of the thin films.

15. (a) Microwave communication is preferred over optical communication because microwaves provide large number of channels and wider band width compared to optical signals as information carrying capacity is directly proportional to band width. So, wider the band width, greater the information carrying capacity.

16. (a)

17. (a) $\beta = \frac{\lambda D}{d}$

18. (c) The clouds consists of dust particles and water droplets. Their size is very large as compared to the wavelength of the incident light from the sun. So there is very little scattering of light. Hence the light which we receive through the clouds has all the colours of light. As a result of this, we receive almost white light. Therefore, the cloud are generally white.

19. (d) In sky wave propagation, the radio waves having frequency range 2 *MHz* to 30 *MHz* are reflected back by the ionosphere. Radio waves having frequency nearly greater than 30 *MHz* penetrates the inosphere and is not reflected back by the ionosphere. The TV signal having frequency greater than 30 *MHz* therefore cannot be propagated through sky wave propagation.

In case of sky wave propagation, critical frequency is defined as the highest frequency is returned to the earth by the considered layer of the ionosphere after having sent straight to it. Above this frequency, a wave will penetrate the inosphere and is not reflected by it.

20. (c) The television signals being of high frequency are not reflected by the ionosphere. So the T.V. signals are broadcasted by tall antenna to get large coverage, but for transmission over large distance satellites are needed. That is way, satellites are used for long distance T.V. transmission.

21. (e) We know, with increase in altitude, the atmospheric pressure decreases. The high energy particles (*i.e.* γ-rays and cosmic rays) coming from outer space and entering out earth's atmosphere cause ionisation of the atoms of the gases present there. The ionising power of these radiation decreases rapidly as they approach to earth, due to increase in number of collisions with the gas atoms. It is due to this reason the electrical conductivity of earth's atmosphere increase with altitude.

22. (a) In a radar, a beam signal is needed in particular direction which is possible if wavelength of wave is very small. Since the wavelength of microwaves is a few millimeter, hence they are used in radar.

23. (c) Hertz experimentally observed that the production of spark between the detector gap is maximum when it is placed parallel to source gap. This means that the electric vector of radiation produced by the source gap is parallel to the two gaps *i.e.,* in the direction perpendicular to the direction of propagation of the radiation.

24. (d) The atoms of the metallic container are set into forced vibrations by the microwaves. Hence, energy of the microwaves is not efficiently transferred to the metallic container. Hence food in metallic containers cannot be cooked in microwave oven. Normally in microwave oven the energy of waves is transferred to the kinetic energy of the molecules. This raises the temperature of any food.

25. (c) The earth's atmosphere is transparent to visible light and radio waves, but absorbs *X*-rays. Therefore *X*-rays telescope cannot be used on earth surface.

26. (b) Short wave (wavelength 30 *km* to 30 *cm*). These waves are used for radio transmission and for general communication purpose to a longer distance from ionosphere.

27. (b) The wavelength of these waves ranges between 4000 Å to 100 Å that is smaller wavelength and higher frequency. They are absorbed by atmosphere and convert oxygen into ozone. They cause skin diseases and they are harmful to eye and cause permanent blindness.

28. (d) Ozone layer in the stratosphere helps in protecting life of organism from ultraviolet radiation on earth. Ozone layer is depleted due to of several factors like use of chlorofluoro carbon (CFC) which is the cause of environmental damages.

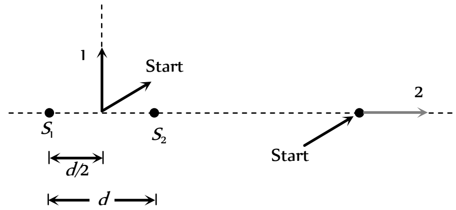
29. (b) Radio waves can be polarised becomes they are transverse in nature. Sound waves in air are longitudinal in nature.

30. (a) In the absence of atmosphere, all the heat will escape from earth's surface which will make earth in hospitably cold.

Wave Optics

SET Self Evaluation Test - 30

1. Following figure shows sources S_1 and S_2 that emits light of wavelength λ in all directions. The sources are exactly in phase and are separated by a distance equal to 1.5λ. If we start at the indicated start point and travel along path 1 and 2, the interference produce a maxima all along



(a) Path 1 (b) Path 2

(c) Any path (d) None of these

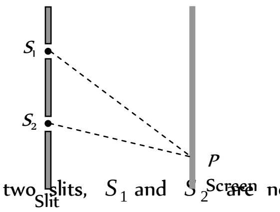
2. In a Young's double slit experimental arrangement shown here, if a mica sheet of thickness t and refractive index μ is placed in front of the slit S_1, then the path difference $(S_1P - S_2P)$

(a) Decreases by $(\mu - 1)t$

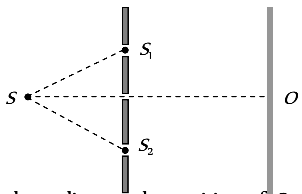
(b) Increases by $(\mu - 1)t$

(c) Does not change

(d) Increases by μt



3. In the set up shown in Fig the two slits, S_1 and S_2 are not equidistant from the slit S. The central fringe at O is then



(a) Always bright

(b) Always dark

(c) Either dark or bright depending on the position of S

(d) Neither dark nor bright.

4. The intensity ratio of two coherent sources of light is p. They are interfering in some region and produce interference pattern. Then the fringe visibility is

(a) $\frac{1+p}{2\sqrt{p}}$ (b) $\frac{2\sqrt{p}}{1+p}$

(c) $\frac{p}{1+p}$ (d) $\frac{2p}{1+p}$

5. Three waves of equal frequency having amplitudes $10\mu m$, $4\mu m$, $7\mu m$ arrive at a given point with successive phase difference of $\frac{\pi}{2}$, the amplitude of the resulting wave in μm is given by

(a) 4 (b) 5

(c) 6 (d) 7

6. Four different independent waves are represented by

(i) $y_1 = a_1 \sin\omega t$ (ii) $y_2 = a_2 \sin 2\omega t$

(iii) $y_3 = a_3 \cos\omega t$ (iv) $y_4 = a_4 \sin\left(\omega t + \frac{\pi}{3}\right)$

With which two waves interference is possible

(a) In (i) and (iii) (b) In (i) and (iv)

(c) In (iii) and (iv) (d) Insufficient data to predict.

7. A beam of light consisting of two wavelengths 650 *nm* and 520 *nm* is used to illuminate the slit of a Young's double slit experiment. Then the order of the bright fringe of the longer wavelength that coincide with a bright fringe of the shorter wavelength at the least distance from the central maximum is

(a) 1 (b) 2

(c) 3 (d) 4

8. Two identical radiators have a separation of $d = \lambda/4$ where λ is the wavelength of the waves emitted by either source. The initial phase difference between the sources is $\pi/4$. Then the intensity on the screen at a distant point situated at an angle $\theta = 30°$ from the radiators is (here I_o is intensity at that point due to one radiator alone)

(a) I_o (b) $2I_o$

(c) $3I_o$ (d) $4I_o$

9. In Young's double slit experiment, the $8th$ maximum with wavelength λ_1 is at a distance d_1 from the central maximum and the $6th$ maximum with a wavelength λ_2 is at a distance d_2. Then (d_1/d_2) is equal to

(a) $\frac{4}{3}\left(\frac{\lambda_2}{\lambda_1}\right)$ (b) $\frac{4}{3}\left(\frac{\lambda_1}{\lambda_2}\right)$

(c) $\frac{3}{4}\left(\frac{\lambda_2}{\lambda_1}\right)$ (d) $\frac{3}{4}\left(\frac{\lambda_1}{\lambda_2}\right)$

10. Light of wavelength $500\,nm$ is used to form interference pattern in Young's double slit experiment. A uniform glass plate of refractive index 1.5 and thickness $0.1\,mm$ is introduced in the path of one of the interfering beams. The number of fringes which will shift the cross wire due to this is

(a) 100 (b) 200

(c) 300 (d) 400

11. The two coherent sources of equal intensity produce maximum intensity of 100 units at a point. If the intensity of one of the sources is reduced by 36% by reducing its width then the intensity of light at the same point will be

(a) 90 (b) 89

(c) 67 (d) 81

12. The path difference between two interfering waves of equal intensities at a point on the screen is $\frac{\lambda}{4}$. The ratio of intensity at this point and that at the central fringe will be

(a) 1 : 1 (b) 1 : 2

(c) 2 : 1 (d) 1 : 4

13. In a Young's double slit experiment, I_o is the intensity at the central maximum and β is the fringe width. The intensity at a point *P* distant *x* from the centre will be

(a) $I_o \cos\frac{\pi x}{\beta}$ (b) $4I_o \cos^2\frac{\pi x}{\beta}$

(c) $I_o \cos^2\frac{\pi x}{\beta}$ (d) $\frac{I_o}{4}\cos^2\frac{\pi x}{\beta}$

14. In a Fresnel's diffraction arrangement, the screen is at a distance of 2 meter from a circular aperture. It is found that for light of wavelengths λ_1 and λ_2, the radius of $4th$ zone for λ_1 coincides with the radius of 5 zone for λ_2. Then the ratio $\lambda_1 : \lambda_2$ is

(a) $\sqrt{4/5}$ (b) $\sqrt{5/4}$

(c) $5/4$ (d) $4/5$

15. If *n* represents the order of a half period zone, the area of this zone is approximately proportional to n^m where *m* is equal to

(a) Zero (b) Half

(c) One (d) Two

16. A screen is placed $50\,cm$ from a single slit, which is illuminated with $6000\mathring{A}$ light. If distance between the first and third minima in the diffraction pattern is $3\,mm$, the width of the slit is

(a) $0.1\,mm$ (b) $0.2\,mm$

(c) $0.3\,mm$ (d) $0.4\,mm$

17. In Young's double slit experiment, the fringes are displaced by a distance *x* when a glass plate of one refractive index 1.5 is introduced in the path of one of the beams. When this plate in replaced by another plate of the same thickness, the shift of fringes is $(3/2)x$. The refractive index of the second plate is

(a) 1.75 (b) 1.50

(c) 1.25 (d) 1.00

18. Two waves of equal amplitude and frequency interfere each other. The ratio of intensity when the two waves arrive in phase to that when they arrive $90°$ out of phase is

(a) 1 : 1 (b) $\sqrt{2}$: 1

(c) 2 : 1 (d) 4 : 1

19. In Young's double slit experiment, we get 60 fringes in the field of view of monochromatic light of wavelength $4000\mathring{A}$. If we use monochromatic light of wavelength $6000\mathring{A}$, then the number of fringes obtained in the same field of view is

(a) 60 (b) 90

(c) 40 (d) 1.5

20. A parallel plate capacitor with plate are *A* and seperation between the plates *d*, is charged by a constant current *i*, consider a plane surface of area *A*/2 parallel to the plates and drawn symmetrically between the plates, the displacement current through this area, will be.

(a) i (b) $\frac{i}{2}$

(c) $\frac{i}{4}$ (d) None of these

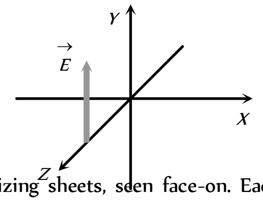
21. The figure here gives the electric field of an EM wave at a certain point and a certain instant. The wave is transporting energy in the negative *z* direction. What is the direction of the magnetic field of the wave at that point and instant

(a) Towards + *X* direction

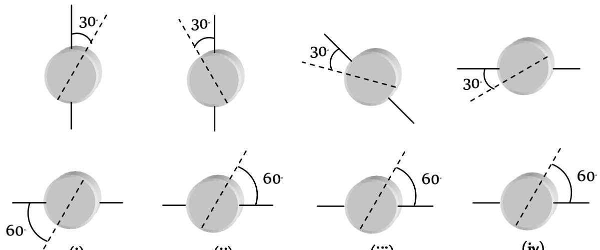
(b) Towards – *X* direction

(c) Towards + *Z* direction

(d) Towards – *Z* direction



22. The figure shows four pairs of polarizing sheets, seen face-on. Each pair is mounted in the path of initially unpolarized light. The polarizing direction of each sheet (indicated by the dashed line) is referenced to either a horizontal *x*-axis or a vertical *y* axis. Rank the pair according to the fraction of the initial intensity that they pass, greatest first



(a) (i) > (ii) > (iii) > (iv) (b) (i) > (iv) > (ii) > (iii)

(c) (i) > (iii) > (ii) > (iv) (d) (iv) > (iii) > (ii) > (i)

23. An astronaut floating freely in space decides to use his flash light as a rocket. He shines a 10 *watt* light beam in a fixed direction so that he acquires momentum in the opposite direction. If his mass is 80 *kg*, how long must he need to reach a velocity of 1 *ms*

(a) 9 *sec* (b) 2.4 × 10 *sec*

(c) 2.4 × 10 *sec* (d) 2.4 × 10 *sec*

Answers and Solutions

(SET -30)

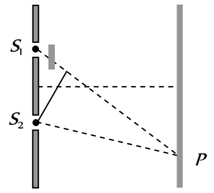
1. (a) At any point along the path 1, path difference between the waves is 0.

Hence maxima is obtained all along the path 1.

At any point along the path 2, path difference is 1.5 λ which is odd multiple of $\frac{\lambda}{2}$, so minima is obtained all along the path 2.

2. (b) Path difference at P $\Delta = (S_1P + (\mu - 1)t) - S_2P$

$= (S_1P - S_2P) + (\mu - 1)t$



3. (c) If path difference $\Delta = (SS_1 + S_1O) - (SS_2 + S_2O) = n\lambda$ n = 0, 1, 2, 3, ... the central fringe at O is a bright fringe and if the path difference $\Delta = \left(n - \frac{1}{2}\right)\lambda$, n = 1, 2, 3, ... the central bright fringe will be a dark fringe.

4. (b) Visibility $V = \frac{I_{max} - I_{min}}{I_{max} + I_{min}} = \frac{2\sqrt{I_1 I_2}}{(I_1 + I_2)}$

$= \frac{2\sqrt{I_1 / I_2}}{\left(\frac{I_1}{I_2} + 1\right)} = \frac{2\sqrt{P}}{(P+1)}$

5. (b) The amplitudes of the waves are

$a_1 = 10\ \mu m$, $a_2 = 4\ \mu m$ and $a_3 = 7\mu m$

and the phase difference between 1st and 2nd wave is $\frac{\pi}{2}$ and that between 2nd and 3rd wave is $\frac{\pi}{2}$. Therefore, phase difference between 1st and 3rd is π. Combining 1st with 3rd, their resultant amplitude is given by

$A_1^2 = a_1^2 + a_3^2 + 2a_1a_3 \cos\phi$

or $A_1 = \sqrt{10^2 + 7^2 + 2\times 10\times 7 \cos\pi} = \sqrt{100 + 49 - 140}$

$= \sqrt{9} = 3\mu m$ in the direction of first.

Now combining this with 2nd wave we have, the resultant amplitude

$A^2 = A_1^2 + a_2^2 + 2A_1a_2 \cos\frac{\pi}{2}$

or $A = \sqrt{3^2 + 4^2 + 2\times 3\times 4 \cos 90^o} = \sqrt{9+16} = 5\mu m$

6. (d) Since the sources are independent, interference will not occur unless they are coherent (such as laser beams *etc*). So, insufficient data to predict.

7. (d) $n\beta_1 = (n+1)\beta_2$

$\Rightarrow \frac{n\times 650\times 10^{-19} D}{d} = \frac{(n+1)\times 520\times 10^{-19}\times D}{d}$

$\Rightarrow n = 4$

8. (b) The intensity at a point on screen is given by

$I = 4I_0 \cos^2(\phi/2)$

where ϕ is the phase difference. In this problem ϕ arises (i) due to initial phase difference of $\pi/4$ and (ii) due to path difference for the observation point situated at $\theta = 30^o$. Thus

$\phi = \frac{\pi}{4} + \frac{2\pi}{\lambda}(d\sin\theta) = \frac{\pi}{4} + \frac{2\pi}{\lambda}.\frac{\lambda}{4}(\sin 30°) = \frac{\pi}{4} + \frac{\pi}{4} = \frac{\pi}{2}$

Thus $\frac{\phi}{2} = \frac{\pi}{4}$ and $I = 4I_0\cos^2(\pi/4) = 2I_0$

9. (b) Position of n^{th} maxima from central maxima is given by $x_n = \frac{n\lambda D}{d}$

$\Rightarrow x_n \propto n\lambda \Rightarrow \frac{d_1}{d_2} = \frac{n_1\lambda_1}{n_2\lambda_2} = \frac{8\lambda_1}{6\lambda_2} = \frac{4}{3}\left(\frac{\lambda_1}{\lambda_2}\right)$

10. (a) The number of fringes shifting is decided by the extra path difference produced by introducing the glass plate. The extra path difference is $(\mu - 1)\ t = n\lambda$

or $(1.5 - 1)\times 0.1\times 10^{-3} = n\times 500\times 10^{-9}$

$\Rightarrow n = 100$

11. (d) Intensity of each source $= I_0 = \frac{100}{4} = 25\,unit$

If the intensity of one of the source is reduced by 36% then

$I_1 = 25\,unit$ and $I_2 = 25 - 25\times\frac{36}{100} = 16\,(unit)$

Hence resultant intensity at the same point will be

$I = I_1 + I_2 + 2\sqrt{I_1I_2} = 25 + 16 + 2\sqrt{25\times 16} = 81\,unit$

12. (b) By using $I = 4I_0\cos^2\left(\frac{\phi}{2}\right) = 4I_0\cos^2\left(\frac{\pi\Delta}{\lambda}\right)$

$\left\{\because \phi = \frac{2\pi}{\lambda}\Delta\right\}$

$\Rightarrow \frac{I_1}{I_2} = \frac{\cos^2\left(\frac{\pi\Delta_1}{\lambda}\right)}{\cos^2\left(\frac{\pi\Delta_2}{\lambda}\right)} = \frac{\cos^2\left(\frac{\pi.\frac{\lambda}{4}}{\lambda}\right)}{\cos^2(0)} = \frac{1}{2}$

13. (c) Path difference at point $P = \frac{xd}{D}$

Phase difference at point $P = \frac{2\pi}{\lambda}\frac{xd}{D} = \frac{2\pi x}{\beta}$

$I_0 = 4I_1$, intensity at point P

$I = I_1 + I_1 + 2I_1\cos\frac{2\pi x}{\beta} = 2I_1\left[1 + \cos\frac{2\pi x}{\beta}\right]$

$= I_0\cos^2\frac{\pi x}{\beta}$

14. (c) It is given that $r_4 = \sqrt{4b\lambda_1}$ and $r_5 = \sqrt{5b\lambda_2}$ are equal. Therefore $\sqrt{4b\lambda_1} = \sqrt{5b\lambda_2}$

or $4b\lambda_1 = 5b\lambda_2$

or $\frac{\lambda_1}{\lambda_2} = \frac{5}{4}$.

15. (a) Area of half period zone is independent of order of zone. Therefore, m is equal to zero in π.

16. (b) Position of n^{th} minima $y_n = \frac{n\lambda D}{d}$

$\Rightarrow (y_3 - y_1) = \frac{\lambda D}{d}(3-1) = \frac{2\lambda D}{d}$

$\Rightarrow 3\times 10^{-3} = \frac{2\times 6000\times 10^{-10}\times 0.5}{d}$

$\Rightarrow d = 0.2\times 10^{-3} m = 0.2\, mm$

17. (b) Fringe shift is given by $x = \frac{(\mu - 1)t\,\beta}{\lambda}$

For first plate, $x = \frac{(\mu_1 - 1)t\,\beta}{\lambda}$

For second plate $\frac{3}{2}x = \frac{(\mu_2 - 1)t\beta}{\lambda}$

$\Rightarrow \left(\frac{\mu_2 - 1}{\mu_1 - 1}\right) = \frac{3}{2} \Rightarrow \left(\frac{\mu_2 - 1}{1.5 - 1}\right) = \frac{3}{2}$

$\Rightarrow \mu_2 = 1.75$

18. (c) Resultant intensity $I = 4I_0\cos^2(\phi/2)$

$\Rightarrow \frac{I_1}{I_2} = \frac{\cos^2(\phi_1/2)}{\cos^2(\phi_2/2)} = \frac{\cos^2 0}{\cos^2(90/2)} = \frac{2}{1}$

19. (c) $n_1\lambda_1 = n_2\lambda_2 \Rightarrow 60\times 4000 = n_2\times 6000 \Rightarrow n_2 = 40$

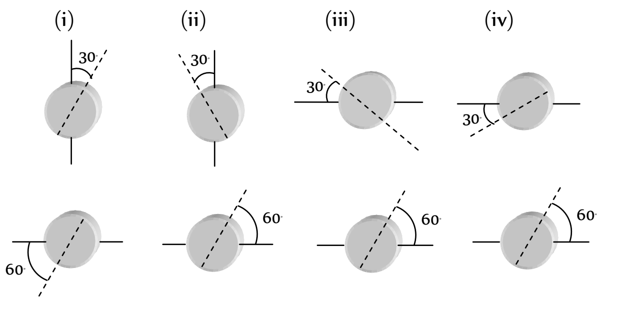
20. (b) Suppose the charge on the capacitor at time t is Q, the electric field between the plates of the capacitor is $E = \frac{Q}{\varepsilon_0 A}$. The flux through the area considered is $\phi_E = \frac{Q}{\varepsilon_0 A}.\frac{A}{2} = \frac{Q}{2\varepsilon_0}$

$\therefore$ The displacement current

$i_d = \varepsilon_0\frac{d\phi_E}{dt} = \varepsilon_0\left(\frac{1}{2\varepsilon_0}\right)\frac{dQ}{dt} = \frac{i}{2}.$

21. (a) The direction of EM wave is given by the direction of $\vec{E}\times\vec{B}$.

22. (b) Final intensity of light is given by Brewster's law $I = I_0\cos^2\theta$; where θ = Angle between transmission axes of polariser and analyser.



Hence decreasing order of intensity is (i) > (iv) > (ii) > (iii)

23. (d) Let it take t sec for astronaut to acquire a velocity of 1 ms^{-1}. Then energy of photons = 10 t

Momentum $= \frac{10t}{C} = 80\times 1$

$t = \frac{80\times 1\times 3\times 10^8}{10} = 2.4\times 10^9\ sec$

***

Chapter 31 Universe

Universe is the limitless expanse of space around us consisting of solar system. star, galaxies *etc*.

Solar System

Solar system is a family of nine planets, satellites, asteroids, comets, meteors, meteorites and dust particles orbiting around the Sun.

(1) **Planets :** Nine planets revolving around the sun in elliptical orbits. In order of increasing distance from Sun, these are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, Neptune and Pluto.

(i) The gravitational pull of the Sun on the planets control their motion.

(ii) There are other heavenly bodies (about 32) which revolve around the planets called satellites (or moons) of the planets.

(iii) A planet does not emit light of its own.

(iv) A planet do not twinkle at night.

(v) The planets are very small in size as compared to stars or Sun.

(vi) The relative positions of planets keep on changing day by day.

(vii) Most of the planets move around the sun from west to east.

(viii) The planets are made of rocks and metals.

(ix) The temperature of planet depends upon its distance from sun.

(2) **Asteroids :** The small pieces of planet revolving around the sun between orbits of Mars and Jupiter are called Asteroids.

(i) Astronomers have identified about 2000 asteroids ranging from the largest 770 *km* diameter to bodies 1.5 *km* in diameter.

Table 31.1 : Some information about planets

Planet	Radius $R \times 10^3$ *km*	Mean distance from sun $\times 10^6$ *km*	Mass as compared to earth	Time of revolution around the sun	Time taken to complete one rotation around its own axis	Number of satellites
Mercury	2.4	57.9	0.055	88 days	59 days	—
Venus	6.1	108.2	0.815	225 days	243 days	—
Earth	6.3	149.6	1	1 Year	23 hrs. 56 min.	1
Mars	3.4	227.9	0.108	1.9 Year	24 hrs. 27 min	2
Jupiter	71.4	778.3	317.9	11.8 Year	9 hrs. 50 min	14
Saturn	60.0	1427	95.2	29.5 Year	10 hrs. 14 min	10 + Ring
Uranus	23.4	2870	14.6	85 Year	10 hrs. 49 min	5 + Ring
Neptune	22.3	4594	17.2	165 Year	15 hrs.	2
Pluto	3.2	5900	0.002	248 Year	6.39 days	—

(ii) The largest asteroids are called Ceres.

(iii) The largest asteroid complete one revolution around the sun in 4.6 years.

(3) **Comets :** These are composed of rock like materials surrounded by large masses of easily vaporisable substances like, ice, water, ammonia and methane.

(i) They revolve around the Sun in highly elliptical orbits.

(ii) Their time period of revolution around the Sun is very large.

(iii) Comets appear to be having a bright head and a long tail while passing close to the Sun and when away from sun generally they show no tail.

(iv) The tail of comet is formed when the comet is passing close to the Sun and the heat of Sun exerts a pressure on the material which gets evaporated due to heat of Sun.

(v) Hally comet was seen in early 1986 and is expected to be seen again in 2062.

(4) **Meteors and meteorites :** Meteors are the smaller pieces of stones and metals which may be produced due to the breaking up of comets while approaching the Sun. When they reach earth's atmosphere due to friction they start buring. They are also called shooting stars.

Sometimes, the large pieces of stones (acting as meteors) do not burn completely and reach the surface of the earth as stony, iron balls resulting in crators on the earth surface. These are called meteorites.

Measurement of Size of Planet

We can measure the size of a planet by measuring the angle subtended by its diameter *AB* at a point on the earth. This angle is called angular diameter of planet. If *d* denotes diameter of planet and *D* its distance from the earth

$$\alpha \simeq \frac{d}{D}$$

or $\quad d \simeq D\alpha$

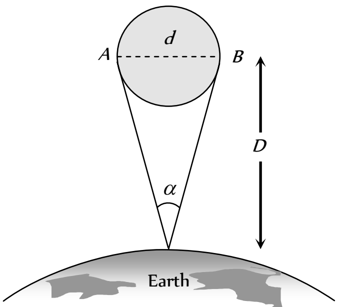


Fig. 31.1

Measurement of Distance of Planet From the Earth

(1) **Parallax method :** The planet *O* is observed from two points P_1 and P_2 on the surface of the earth. The distance between these two points, $P_1P_2 = b$, is called basis. The angle subtended by planet at these two points is called parallax angle or parallactic angle

From figure $\theta \simeq \dfrac{b}{D}$

or $\quad D \simeq \dfrac{b}{\theta}$

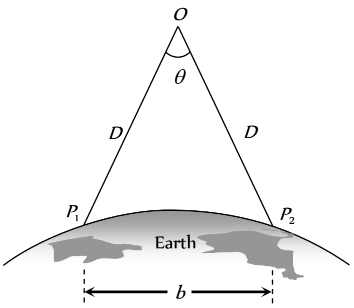

Fig. 31.2

(2) **Copernicus method :** The inferior planets (Mercury and Venus) have nearly circular orbits. Angle between directions of observation from earth to sun and earth to planet is called planet's elongation.

r_{es} = The distance of earth from Sun, r_{ps} = The distance of planet from Sun and r_{pe} = The distance of planet from Earth

The r_{ps} and r_{es} are fixed distances as orbits have been assumed to be circular. During orbital motion of the planet the distance r_{pe} changes. Planet's elongation is maximum when earth and sun subtend an angle 90° at the planet. From figure,

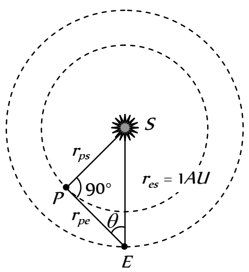

Fig. 31.3

$$\sin\theta = \frac{PS}{ES} = \frac{r_{ps}}{1\,AU}$$

where 1 *AU* = 1.496×10^{11} *m*

Thus $\sin\theta = r_{ps}$, similarly $\cos\theta = \dfrac{PE}{ES} = \dfrac{r_{pe}}{1\,AU} \Rightarrow r_{pe} = \cos\theta$

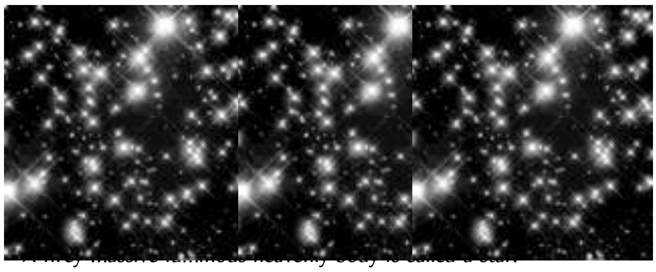
(3) **Kepler's law :** According to Kepler's law the square of time period of planet around sun is proportional to cube of semi-major axis of the orbit of planet around sun *i.e.* $\dfrac{a^3}{T^2} = \text{constant}$, if a_1 and a_2 are semi-major axes of planets 1 and 2 and T_1 and T_2 their respective periods of revolution, then

$$\frac{a_1^3}{T_1^2} = \frac{a_2^3}{T_2^2} \quad \text{or} \quad a_2 = \left(\frac{T_2}{T_1}\right)^{2/3} a_1$$

For circular orbits a_1 and a_2 represent the radii of orbits.

(4) **Spectroscopic method :** In this method, photograph of two different planets P_1 and P_2 are taken on similar photographic plates from one place of the earth. Let I_1 and I_2 be the intensities of the images of these two planets. If R_1 and R_2 be the distances of these planets from the earth then $\dfrac{I_1}{I_2} = \dfrac{R_2^2}{R_1^2}$ ($\because$ intensity at a point is inversely proportional to the square of the distance)

Stars



(1) **Some features**

(i) Stars twinkle at night.

(ii) Stars are countless in number ; about 10^{22} in a universe.

(iii) Stars are very big in size but they appear small because they are very far off.

(iv) The relative positions of stars do not change day by day.

(v) Stars appear to be moving from west to east.

(vi) The temperature of stars is very high.

(vii) The Sun is the nearest star to the earth. Its light reaches the earth in 8.3 minutes.

(viii) After Sun the next nearest star to earth is Alpha centuri. Its distance is 4.3 light year from earth.

(ix) Other bright stars in the sky are known as Spica (Chitra), Arcturus (Swati), Polaris (Dhruva), Sirius (Vydha), Canopus (Agasti) *etc.*

(x) The temperature of a star is estimated from the colour of its light received on earth. The blue coloured star is at higher temperature than red coloured star.

(2) **Constellation :** Many of the stars appear to be bunched together in groups. These groups are called constellations.

(i) The Great-bear (Saptarishi), Taurus (Vrishabha) Aries (Mesha) *etc.* are the other constellations near the north and south celestial poles.

(ii) According to modern astronomy there are 88 constellations in the sky.

(3) **Brightness of star :** Brightness of stars is represented through system of magnitudes. Magnitude of star is the measure of its brightness when observed from earth.

(i) Hipporacus, a Greek astronomer divided the stars (visible with naked eye) into six magnitude classes. Brightness goes on decreasing as the magnitude increases. A first magnitude star is about 100 times as bright as a sixth magnitude star. Decrease in magnitude number by one increases brightness by ratio $100^{1/5} = 2.5119$. In general

$$\frac{\text{The brightness of star in } n^{\text{th}} \text{ magnitude class}}{\text{The brightness of star in } (n+m)^{\text{th}} \text{ magnitude class}} = (2.512)^m$$

(ii) If two stars have magnitudes m_1 and m_2 ($m_2 > m_1$) and brightness l_1 and l_2($l_2 < l_1$), then $\frac{l_1}{l_2} = 100^{(m_2 - m_1)/5}$

Taking logarithm to base 10 of both sides, we get

$$(m_2 - m_1) = -2.5 \log \frac{l_2}{l_1}$$

(iii) For a star of zero magnitude $m_1 = 0$, $l_1 = l_0$, $m_2 = m$ and $l_2 = l$.

$$\Rightarrow m = 2.5 \log \frac{l_0}{l}$$

(iv) The star vega is of zero magnitude and of brightness $l_0 = 2.52 \times 10^{-8} W/m^2$.

(v) A star having negative magnitude is brighter; *e.g.*, a star having magnitude – 5 will be 100 times more bright than a star of zero magnitude.

(4) **Absolute luminosity :** The total energy radiated into space per second from the surface of a star is called absolute luminosity of the star. The absolute luminosity of the Sun is $\approx 3.9 \times 10^{26} J/sec$.

(5) **Birth of a star :** Star dust and gases present in interstellar space come closer together with a gravitational force in the form of a cloud.

(i) When the cloud is quite big, due to compression cloud heats up and starts radiating

(ii) At this temperature, fusion of hydrogen atom into helium atom takes place and a star is said to have come into existence.

(iii) This process result in the release of energy, which keeps the star shining for millions of years.

(6) **Death of a star :** When large number of hydrogen atoms of a star are converted into *He*, the core of star begins to contract and other layers begin to expand. At this stage star appears red, the stage is called Red Giant.

(i) Now a violet explosion occurs in star. This is called nova or super nova explosion.

(ii) Due to explosion, the outer layers are thrown back into interstellar leaving behind the core of the star. This is known as **death of the star**.

The core of the star may further end up into one of the following three dead bodies (stellar dead materials) :

(a) White dwarf (b) Neutron star (c) Black hole

(a) **White dwarf :** When the original mass of the star is less than $2M_s$ (M_s being solar mass), the core of the star tends to die as White dwarf. It was theoretically discovered by S. Chandrasekhar in1930 and is known as **Chandrasekhar limit**. As the core keeps on emitting heat and light for millions of year, it colour changes from white to yellow, then to red finally it becomes black. Now this becomes invisible for ever.

(c) **Neutron star :** When the original mass of the star is lies between $2M_s$ *and* $5M_s$ the core of the star tends to finish up as neutron star. In such a case, when super nova explosion occurs, the core of the star is compressed and electrons and protons combine to form neutrons. Due to this reason, this is called as neutron star. It is found to have a radius of about 10 *km*.

(7) **Black hole :** When the original mass of the star is more than 5*M*, then on supernova explosion, the core continues suffering compression indefinitely due to recoil. This gives rise to a black hole. The mass of the black hole is greater than the mass of the Sun but its size is very small. Due to this fact, the gravitational pull of black hole is very strong. This is the reason that the photon of radiation emitted by it cannot escape from its surface. On the other hand, a photon approaching a black hole is swallowed by it. Hence it is called a black hole.

The black hole is said to have been formed if the star of mass *M* has contracted within a radius *r* which is given by $r \le \frac{2GM}{c^2}$

Sun

The Sun called the centre of the solar system, is a star nearest to the earth.

(1) **Properties of the Sun**

(i) It's average distance from earth is 1.49×10^8 *km* = 1 *AU*

(ii) It's mass is 1.99×10^{30} *kg*

(iii) It's mean diameter is 1.392×10^6 *km*

(iv) The density of the Sun varies from 10^{-4} kg/m^3 at the surface to 10^4 kg/m^3 at the centre. It's mean density is 1410 $kg\ m^{-3}$.

(v) The pressure at the centre of the Sun is about 2×10^6 N/m^2.

(vi) Light takes 8 minute to reach earth from the Sun.

(vii) 70% of Sun's mass is H_2, 28% *He* and 2% Lithium or Uranium.

(viii) The Sun is also called Yellow Dwarf.

(2) **Structure of Sun :** The Sun structure consist of four parts : Photosphere (*P*), Reversing layer (*R*), Chromosphere (*CH*) and Corona (*C*).

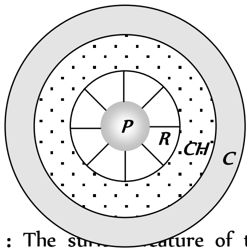


Fig. 36.4

(3) **Solar activity :** The surface feature of the Sun are called Solar activity. This can be classified as follows

(i) **Sun spots :** These are dark spots on the surface of sun associated with strong magnetic fields. The sun spots move across Sun slowly, so there numbers vary over a cycle of 11 year called Sun spot cycle. After every eleven year activity of sun spots tends to be maximum. Movements of sun spots have revealed the time period of rotation of sun on its own axis as about 25 days.

(ii) **Faculae :** These are bright patches near Sun spots.

(iii) **Granules :** Small granules form a covering over photosphere.

(iv) **Flares :** Sudden increase in magnetic activity is called flare. During these flares Sun emits streams of protons, α-particles and electrons.

(v) **Spicules :** Bright spikes emerging from chromosphere are termed spicules. Spicules are source of large number of charged particles into the corona.

(vi) **Prominences :** Surface of photosphere is covered by rising clouds called prominences.

(vii) **Filaments :** These are thin markings on the photosphere.

(4) **Solar constant (S) :** Energy falling in one second on the unit area of the earth's surface held normal to Sun's rays is called solar constant. It is given by $S = \frac{\sigma T^4 R^2}{r^2} = 1.388 \times 10^3 W/m^2$

where σ = Stefan's constant

= 5.68×10^{-8} S.I. unit

T = Surface temperature of Sun

R = Radius of Sun

r = Radius of Earth's orbit

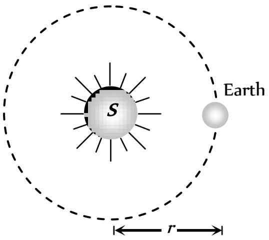

Fig. 31.5

(5) **Solar Luminosity (L) :** It is defined as the amount of energy emitted by the Sun per second in all directions.

$$L_s = (4\pi r^2)S = 3.9 \times 10^{26} W$$

(6) **Temperature of Sun (T) :** The surface temperature of the Sun is given by $T = \left(\frac{r}{R}\right)^{1/2}\left(\frac{S}{\sigma}\right)^{1/4}$

(7) **Mass of the Sun (M) :** Let M be the mass of sun and m be the mass of a planet moving around it, then as gravitational force of attraction between them supplies the necessary centripetal force

$$F = \frac{GMm}{r^2} = \frac{mv^2}{r} \Rightarrow \text{Mass of Sun } M = \frac{v^2 r}{G}$$

$$= \frac{r^2\omega^2 r}{G} = \frac{r^3\omega^2}{G} = \frac{r^3\left(\frac{2\pi}{T}\right)^2}{G} = \frac{4\pi^2 r^3}{GT^2}$$

where $G = 6.67 \times 10^{-11}\ Nm^2\ kg^{-2}$ and r is distance between the sun and planet. T period of revolution of planet around the sun.

If we consider the planet and its satellite, mass of the planet can similarly be found

Stellar Radii, Mass and Spectra

(1) **Stellar radii :** The total energy radiated by the star per second is given by $E = \sigma T^4 \times$ Surface area of the star

$$\Rightarrow E = \sigma T^4 \times 4\pi R^2 \Rightarrow \text{Radius of star } (R) = \left(\frac{E}{4\pi\sigma}\right)^{1/2} T^2$$

Usually, the radius of star is expressed in terms of solar radius $(R_s = 6.95 \times 10^8 m)$. Thus star radius $= \left(\frac{E}{4\pi\sigma}\right)^{1/2} \frac{T^2}{6.95 \times 10^8}$ solar radius.

$\Rightarrow$ The radii of most of the stars lie in the range 0.02 to 220 solar radii.

(2) **Stellar masses :** Let M_1 and M_2 be the masses of two stars revolving about their common centre of mass in circular orbits of radii r_1 and r_2 respectively such that $r_1 + r_2 = r$. Now

$$M_1 + M_2 = \frac{4\pi^2}{G} \times \frac{r^3}{T^2} \quad \text{......(i)}$$

where T is common period of revolution.

If a planet of mass M_1 moves round the Sun of mass M_S, then the mass M_1 can be neglected in comparison with M_S because $M_S >> M_1$. Then equation (i) can be written as

$$M_S = \frac{4\pi^2}{G} \times \frac{r^3}{T^2} \quad \text{.....(ii)}$$

As M_S is constant, it implies that $\frac{r^3}{T^2}$ = constant

which is Kepler's third law.

In binary system, r = 1 AU, T = 1 year and $M_1 + M_2 = 1$ solar mass. Hence equation (i) gives $G = 4\pi^2$

$$\therefore \quad M_1 + M_2 = \frac{r^3}{T^2} \quad \text{..... (iii)}$$

Equation (iii) can be used to find the masses of two stars in binary system.

(3) **Spectra of stars :** The different stars are of different colours and the spectrum of a star is related to its colour, There are seven classes of stellar spectra denoted by letters O, B, A, F, G, K and M. Our sun belongs to G class star.

Table 31.2 : Spectrum of stars

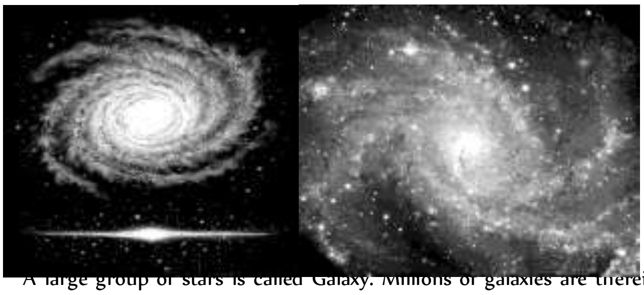
Spectra type	Colour	Surface temp (K)	Description of absorption spectra
O	Dark blue	3×10^4 to 4×10^4	Ionized helium lines
B	Blue	$1.s5 \times 10^4$ to 2.3×10^4	Lines of neutral helium
A	White	9.5×10^3 to 1.1×10^4	Lines of H_2
F	Green	6.5×10^3 to 7.5×10^3	Lines of H_2 and ionised metals
G	Yellow	5800	Lines of ionised Ca, Fe, C
K	Orange	4500	Bands due to hydrocarbons
M	Red	3500	Bands of Titanium oxide

These relationship between the colour of a star and its temperature is expressed by Wien's displacement law. According to this law

$$\lambda_m \propto \frac{1}{T} \quad \text{or} \quad \lambda_m T = b \quad \text{or} \quad T = \frac{b}{\lambda_m}$$; where $b = 2.89 \times 10^{-3}$ *mK*.

So those stars which appear blue (minimum wavelength) such as class *O* and *B*, are very hot and which appear red (maximum wavelength) such as class *M* are less hot.

Galaxies



A large group of stars is called Galaxy. Millions of galaxies are therein the sky. Each galaxy contains about 10^{11} stars.

The Sun and the planets of the solar system belong to the galaxy, called Milky way (Akash Ganga).

(1) **Types of galaxies :** There are two types of galaxies

(i) Normal galaxies, and (ii) Radio-galaxies.

(i) **Normal galaxies :** Besides milky way, there are billions of other galaxies in the universe. All these galaxies are called normal galaxies. There are three types of normal galaxies. (a) Elliptical galaxies (18%), (ii) Spiral galaxies (80%), and (iii) Irregular galaxies (2%).

(a) **Elliptical galaxies :** The galaxies which look like the flat elliptical discs are called elliptical galaxies. These generally consist of red giants, white dwarfs *etc. i.e.*, those stars which are nearing their ends.

(b) **Spiral galaxies :** The galaxies have lens-shaped central portion surrounded by a flat disc. It has two spiral arms which spiral around the central portion.

Example : Milky way and Andromeda.

(c) **Irregular galaxies :** These have no specific form of their own. Irregular galaxies are youngest normal galaxies and are middle aged and elliptical galaxies are quite old galaxies.

(2) **Radio galaxies :** The galaxies which emit electromagnetic radiations in the radio frequency are called radio galaxies. These have been classified as (i) Ordinary radio galaxies (ii) Quasars.

(i) **Ordinary radio galaxies :** A normal optical galaxy (*O*) which has two strong radio sources (R_1 and R_2) occurring symmetrically on either side of it, is called an ordinary radio galaxy. It appears like two ears on the two sides of the face of a person. The radio power output lies in the range 10^{30} to 10^{38} *watt*.

(ii) **Quasars :** Quasars are quasi-stellar radio sources. They are star like in structure and they emit powerful radio waves. They have a radio output of 10^{37} to 10^{38} *watt*. Quasars are farthest objects known. They are millions of light years away from Earth. These seem to be lying at the limit of the universe. They are moving away from Earth with a velocity of about 0.9 times the velocity of light. Their size is much smaller. It is of the order of light days. They form very dense galaxies. The density is also very large and their gravitational field is also very high. The cause of tremendous energy of the quasars is unknown. About 150 quasars have been detected so far.

(3) **Milky way (Akash Ganga) :** It is the name of the galaxy to which our earth belongs. The milky way is the glowing belt of the sky formed by the combined light of a very large number of stars. It is called milky way or Akash Ganga because the light from the various stars together gives the impression of a stream of milk flowing across the sky.

Milky way is a spiral galaxy. Its mass is 150 solar masses

(*i.e.* 3×10^{41} *kg*).

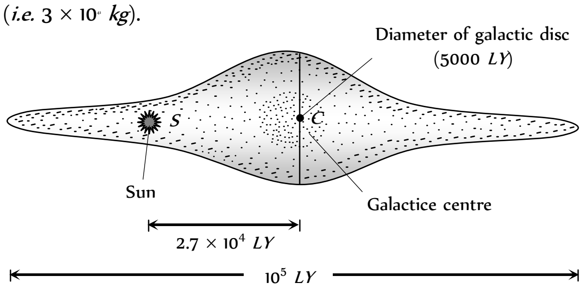


Fig. 31.6

Milky way contains 150 billions sun like stars.

Milky way contains clouds of dust and gases.

Pulsars

As the age of a star increases, its hydrogen content goes on decreasing. Ultimately, the star explodes as a supernova, in the universe. After explosion of a supernova, a variable star is born. It is not an ordinary star. It is the remaining part of a supernova. The variable star is called a pulsar. A pulsar emits electromagnetic waves in pulses and not continuously. The pulses are of very short duration (0.033 *s* to 0.088 *s*). The pulses may lie either in visible region or in radio region. About 50 pulsars have been detected, two in visible region and others in radio region. It is expected that there are about 100 pulsars in the universe.

Evolution of the Universe

Important theories about the origin and evolution of universe are as follows.

(1) **Big Bang theory :** The whole of the matter of the universe was concentrated in a very dense and hot fire ball about 20 billion years ago. An explosion occurred. The matter was broken into pieces in the form of stars and galaxies. The faster moving galaxies have gone farther than the slower ones. A galaxy situated at 20 billion light years is the boundary of the universe.

(2) **Expanding universe theory :** All the galaxies would continue to move away from the Earth and we will have an empty universe because on account of continuous expansion of the universe, more and more galaxies will go beyond the boundary of the universe and will be lost.

The motions of galaxies relative to the earth can be measured by observing the shifts in the wavelengths of their spectra. For distant galaxies these shifts are always toward longer wavelength, so they appear to be receding from us and from each other. Astronomers first assumed that these were Doppler shifts and used a relation between the wavelength λ_0 of light measured now from a source receding at speed v and the wavelength λ_S measured in the rest frame of the source when it was emitted.

$$\lambda_0 = \lambda_S \sqrt{\frac{c+v}{c-v}}$$

For $v << c$, Red shift (or Doppler's shift) $\Delta\lambda = \lambda_S \dfrac{v}{c}$

(3) **Pulsating universe theory :** As the galaxies move away, the expansion of the galaxies would be stopped by the gravitational pull. The galaxies would come so close that again a new explosion would take place. The same sequence will be repeated. Thus, we have alternate expansion and contraction of the universe giving rise to a pulsating universe. This takes place after every 80 billion years.

(4) **Steady state theory :** As the farthest galaxies speed away from each other, new galaxies are born to take their places. The total number of galaxies in the universe remains constant.

It is certain that : (i) The age of the universe is about 20 to 30 billion years. (ii) The most distant galaxy is situated at a distance of two billion light years away from the Earth. (iii) This galaxy is receding away from the Earth with a velocity 0.3 times that of light. (iv) The universe will live for about 100 million years more. Thus, the universe is quite young at present.

Hubble's law

(1) The speed of recession v of a galaxy is proportional to it's distance r from us *i.e.* $v \propto r \Rightarrow v = Hr$ this relation is called Hubble's law.

(2) Here H = An experimental quantity, called Hubble's constant. It's value is 19.3 *mm/sec* for each light year.

(3) Determining H has been a key goal of the Hubble's space telescope.

(4) The quantity $\frac{1}{H}$ has the dimensions of time.

(5) This time is called Hubble's times, which is an estimate of the order of magnitude of time that has elapsed since the Big Bange, and thus of the age of universe.

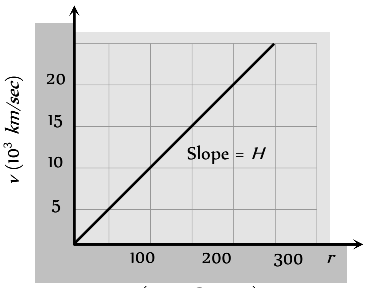

Fig. 31.7

Tips & Tricks

✍ The name black hole is given because it's gravity is so high that it prevents even light to radiate into space.

✍ Visible light is restricted from entering a telescope by dust particles in universe. Therefore range of a telescope is limited. Observation made in visible range are referred to as optical astronomy. Whereas observations made in radio range is called Radio-Astronomy.

✍ **Albedo :** The presence of atmosphere, clouds, *etc.* is acknowledged by a parameter known as albedo. It is the ratio of energy reflected by a planet to that incident on it. Clouds being good reflectors of light, they considerably increase the reflecting power of the planet and hence it's albedo is large. Venus has an albedo of 85% (highest).

✍ Mercury, Pluto and Venus do not have any satellites.

✍ On a clear night 5000 stars can be observed with naked eye.

✍ Closet star is alpha centuri (after the Sun) which is 4.3 light years away.

✍ Astronomy is branch of science which deals with the study of universe.

✍ Study of heavenly bodies is based upon visible light (λ ranging from 4000 Å to 8000 Å) and radio waves (λ ranging from 1 *mm* to 20 *m*).

✍ Hipparchus, a Greek astronomer, divided naked eye stars into six magnitude classes, on the basis of their brightness. The brightest stars were placed in the first magnitude class. Faintest visible stars were put in the sixth magnitude class.

✍ A comet does not have any tail when it is far from the Sun.

✍ **Mercury**

(i) Smallest planet (ii) Closest to the Sun

(iii) Fastest (iv) No atmosphere.

✍ Cygnus is a group of five stars. Which forms a cross like a swan.

✍ The clouds of dusty gas are called nebulae.

Ordinary Thinking

Objective Questions

Universe

1. A study of binary stars is most helpful in [CBSE PMT 1993]

(a) Finding their distances

(b) Finding their temperature

(c) Finding their masses

(d) Verifying Newton's force law of gravitation

2. A group of bright and faint stars is called [AFMC 1994]

(a) Galaxy (b) Comet

(c) Black hole (d) Constellation

3. According to modern astronomers into how many constellations, the whole sky is divided [BHU 1994]

(a) 10 (b) 88

(c) 880 (d) 5000

4. Which of the following theories is the most satisfactory about the origin of the universe [CBSE PMT 1994]

(a) Big Bang theory (b) Pulsating theory

(c) Steady state theory (d) None of these

5. Which of the planet is brightest [BHU 1999]

(a) Mercury (b) Venus

(c) Mars (d) Jupiter

6. A star which appears blue will be [CPMT 1998]

(a) As hot as the sun (b) Cooler than the sun

(c) Very cold indeed (d) Much hotter than the sun

7. Hubble showed that the universe as a whole is expanding and the distant stars are receding from us. The spectral line from a star, when compared with the corresponding line from an source will then show [Haryana CEE 1996]

(a) A shift in frequency towards the red end

(b) A shift in frequency towards the violet end

(c) No shift in frequency at all

(d) A shift in frequency towards the violet end as well as a decrease in intensity

8. The solar constant on the surface of the earth is *S*. What will be its value on the surface of another planet which is about 5.3 *A.U.* away from sun [AMU 1996, 97]

(a) $\frac{S}{5.3}$ (b) $\frac{S}{(5.3)^2}$

(c) 5.3 S (d) $(5.3)^2\ S$

9. CO_2 gas is found in which of the following pairs of the planet [AFMC 1994]

(a) Earth and Mercury (b) Mercury and Saturn

(c) Venus and Saturn (d) Venus and Mars

10. The wavelength of maximum energy, released during an atomic explosion, was $2.93 \times 10^{-10}\ m$. Given that the Wien's constant is $2.93 \times 10^{-3}\ m\ K$, the maximum temperature attained must be of the order of [Haryana CEE 1996]

(a) $10^{-7}\ K$ (b) $10^{7}\ K$

(c) $10^{-13}\ K$ (d) $5.86 \times 10^{7}\ K$

11. Black hole is a [BHU 1995; MH CET 2003]

(a) Hole in the ozone layer of atmosphere

(b) Hole in earth's centre

(c) Highly dense matter available in the atmosphere

(d) Hole in troposphere

12. A planet of mass M has a satellite of mass m, revolving around the planet in a circular orbit of radius r and time period T. The mass (M) of the planet is [AMU 2000]

(a) $\frac{4\pi^2 r^3}{GT^2}$ (b) $\frac{4\pi^2 r^2}{GT^3}$

(c) $\frac{GT^2}{4\pi r^3}$ (d) $\frac{r^3 G}{4\pi T^2}$

13. The age of universe is believed to be [NTSE 1995]

(a) 1 billion years (b) 10 billion years

(c) 10-20 billion years (d) 1000 billion years

14. A planet which is born sister of earth is [AFMC 2000]

(a) Mercury (b) Venus

(c) Mars (d) Jupiter

15. Source of Sun's energy is [CBSE PMT 1992; KCET 1994; AFMC 1998; BHU 2000; DCE 2001]

(a) Burning of hydrogen

(b) Fission reactions involving hydrogen

(c) Fusion reactions involving hydrogen

(d) Some other source

16. Asteroids are [DPMT 2000]

(a) Small planets

(b) Shooting stars

(c) Found in a belt between Earth ad Venus

(d) None of these

17. Sun radiates continuously and maintains its brightness because [MP PMT 1990; JIPMER 1997]

(a) Helium is converted into iron in its core

(b) Of fusion of hydrogen nuclei into helium

(c) Fusion of helium in hydrogen

(d) Burning of carbon, in its core

18. Venus appears brighter than other stars because [MP PMT 1990]

(a) It is heavier than other planets

(b) Its density is more than other planets

(c) It is nearer to earth in comparison to other planets

(d) Nuclear fusion takes place at its surface

19. There is no atmosphere on moon because [MP PMT 1990]

(a) There is no vegetation

(b) The escape velocity at its surface is very low

(c) Diffusion constant of gases is high

(d) There is vacuum in space

20. Which of the following planets have rings around it [MP PMT 1991]

(a) Uranus (b) Mars

(c) Jupiter (d) Saturn

21. Milky way is [MP PMT 1991; Kerala PMT 2001]

(a) A planet of our system

(b) A sun

(c) One of the solar system

(d) One of the enormous galaxies of universe

22. Hubble's law states that the velocity with which the 'milky way' is moving away from the earth is proportional to [MP PMT 1991; Kerala PMT 2004]

(a) Square of the distance of the milky way from the earth

(b) Distance of milky way from the earth

(c) Mass of the milky way

(d) Product of the mass of the milky way and its distance from the earth

23. The hottest planet of solar system is [CBSE PMT 1992]

(a) Mars (b) Mercury

(c) Venus (d) Pluto

24. Towards the centre of sun [MP PMT 1992]

(a) Density decreases

(b) Pressure decreases

(c) Temperature decreases

(d) Density and pressure increases

25. Period of revolution increases in the order of [MP PMT 1992]

(a) Saturn, Uranus, Venus (b) Mars, Saturn, Pluto

(c) Mercury, Neptune, Mars (d) Mars, Jupiter, Venus

26. The length of Milky way is [MP PMT 1992]

(a) 100,000 light years (b) 10,000 light years

(c) 1000 light years (d) 100 light years

27. Which of the nine planets is nearest to sun [CBSE PMT 1992]

(a) Venus (b) Mercury

(c) Mars (d) Jupiter

28. An extremely hot star would appear to be [AMU 1996, 97]

(a) Red (b) Blue

(c) Yellow (d) Orange

29. The sun emits a light with maximum wavelength 510 mm while another star X emits a light with maximum wavelength of 350 nm. What is the ratio of surface temperature of sun and the star X

(a) 2.1 (b) 0.68

(c) 0.46 (d) 1.45

30. A double star is a system of two stars rotating about their centre of mass only under their mutual gravitational attraction. Let the star have mass m and $2m$ and their separation be l. Their time period of rotation about their centre of mass will be proportional to [JIPMER 2000]

(a) $l^{2/3}$ (b) l

(c) $m^{1/2}$ (d) $m^{-1/2}$

31. Hubble's law is related with [AIIMS 2002; Pb. PET 2002]

(a) Comet (b) Speed of galaxy

(c) Black hole (d) Planetary motion

32. 'Albedo' is [Pb. PET 2001; BHU 2001; Kerala PET 2002; AFMC 2002]

(a) Reflecting power of a heavenly body

(b) Transmitive power of a heavenly body

(c) Absorptive power of a heavenly body

(d) Refracting power of a heavenly body

33. According to the pulsating theory the expansion and contraction of the universe repeats after every [TNPCEE 2002]

(a) 11 years (b) 8 billion years
(c) 8 million years (d) 80 billion years

34. Meteors are [TNPCEE 2002]
(a) Small stars
(b) Burnt pieces of comets that fall on earth
(c) Comets without tails
(d) None of these

35. Which of the following helps us in the determination of the temperature of sun [CBSE PMT 2001]
(a) Kirchhoff's law (b) Maxwell Boltzmann law
(c) Planck's law (d) Stefan's law

36. How does the red shift confirms that the universe is expanding
(a) Due to Wien's law (b) Due to Stefan's law
(c) Due to Kirchhoff's law (d) Due to Doppler's effect

37. Two stars P and Q are observed at night. Star P appears reddish while, star Q is white. From this we conclude [Roorkee 1992]
(a) Temperature of Q is higher than that of P
(b) Temperature of Q is lower than that of P
(c) Star Q is at the same distance at that of star P
(d) Star P is farther than star Q

38. Albedo is maximum for [Pb. PET 2000]
(a) Pluto (b) Venus
(c) Earth (d) Mercury

39. When original mass of star is greater than 5 M (M = mass of the sun). The death of this star will give rise to [Pb. PET 2000]
(a) White dwarf (b) Black hole
(c) Quasars (d) Nebula

40. The tail of the comet is due to [Pb. PET 2002]
(a) Vaporisation of water on the comet
(b) Sublimation of vapour in the comet
(c) Cooling of water in the comet
(d) Vaporisation of heat in the comet

41. In our solar system, there is one sun and [BHU 2004]
(a) Seven planets
(b) Nine planets
(c) Eleven planets
(d) Indefinite number of planets

42. Which one of the following planet has the longest day [AFMC 2003]
(a) Venus (b) Mars
(c) Mercury (d) Earth

43. Which one of the following is known as Saptarishi [AFMC 2003]
(a) Orion (b) Ursa major
(c) Ursa minor (d) Scorpion

44. Smaller pieces of heavy stones and metals which on entering earth's atmosphere burns out are [AFMC 2003]
(a) Comets (b) Meteorites
(c) Asteroids (d) All of these

45. In determining the temperature of a distant star, one makes use of
(a) Kirchhoff's law (b) Stefan's law
(c) Wien's displacement law (d) None of these

46. The motion of planets in the solar system is an example of conservation of [DCE 2001, 03]
(a) Mass (b) Momentum
(c) Angular momentum (d) Kinetic energy

47. Mass of earth has been determined through [Kerala (Engg.) 2002]
(a) Use of Kepler's T/R constancy law
(b) Sampling the density of earth's crust and using R
(c) Cavendish's determination of G and using R and 'g' at the surface
[Pb. PMT 1997; AIIMS 2001]
(d) Use of periods of satellites at different heights above earth's surface

48. The galaxies are moving away from each other. It is explained by
(a) White dwarf star (b) Red shift
(c) Neutron star (d) None of these

49. Speed of recession of galaxy is proportional to it's distance [DCE 1999]
(a) Directly (b) Inversely
(c) Exponentially (d) None of these

50. Great bear is a [DCE 1998]
(a) Star (b) Galaxy
(c) Constellation (d) Planet

51. Surface temperature of the sun is of the order of [DCE 1996]
(a) 5000 K (b) 7000 K
(c) 6000 K (d) 12000 K

52. The colour of a star is an indication of its [BCECE 2005]
(a) Weight (b) Distance
(c) Surface temperature (d) Size

53. Which of the following is coldest planet [BCECE 2005]
(a) Mercury (b) Pluto
(c) Earth (d) Venus

54. According to Hubble's law, the redshift (Z) of a receding galaxy and its distance r from earth are related as [AIIMS 2005]
(a) $Z \propto r$ (b) $Z \propto 1/r$
(c) $Z \propto 1/r^2$ (d) $Z \propto r^{3/2}$

55. The condition for a uniform spherical mass m of radius r to be a black hole is [G = gravitational constant and g = acceleration due to gravity] [AIIMS 2005]
(a) $(2Gm/r)^{1/2} \le c$ (b) $(2Gm/r)^{1/2} = c$
(c) $(2Gm/r)^{1/2} \ge c$ (d) $(gm/r)^{1/2} \ge c$

56. Fraunhofer lines of the solar system is an example of [AIIMS 2001]
(a) Emission spectrum
(b) Emission band spectrum
(c) Continuous emission spectrum
(d) Line absorption spectrum

57. The difference in the lengths of a mean solar day and a sidereal day is about [AIIMS 2003]
(a) 1 m[DCE 2003] (b) 4 min

(c) 15 min (d) 56 min

Critical Thinking

Objective Questions

1. A bright star is indicated to have a brightness magnitude of – 5 compared to a star of brightness zero magnitude. It means that this star compared to the reference star of zero brightness is

   (a) 100 times less bright (b) 5 times more bright

   (c) 5 times less bright (d) 100 times more bright

2. The sun revolves around the galaxy with a speed of 250 *km/sec* and it's radius is 3×10^4 light year. The mass of the milky way is

   (a) 3×10^{40} *kg* (b) 3×10^{41} *kg*

   (c) 5×10^{40} *kg* (d) 6×10^{41} *kg*

3. There are certain types of stars called visible stars which undergo periodic change in their light output. If such a star quadruple it's light output, how much does it's magnitude change

   (a) – 1.25 (b) – 1.5

   (c) – 1.75 (d) – 2

4. A particular emission line, detected in the light from a galaxy, has a wavelength $\lambda' = 1.1\lambda$, where λ is the proper wavelength of the line. The galaxy distance from us

   (a) $1.6 \times 10^9 ly$ (b) $0.97 \times 10^9 ly$

   (c) $2.4 \times 10^9 ly$ (d) $1.62 \times 10^{11} ly$

5. Assuming that the dimmest visible star to the naked eye has a magnitude of about 6. Brightness of planet Venus (magnitude = – 4) *w.r.t.* this star is

   (a) 10,000 times brighter (b) 2000 times brighter

   (c) 15000 times brighter (d) 4000 times brighter

6. A galaxy is observed to be moving with a velocity of 8600 *km-sec*. If it is at a distance of 430 million light year from us, Hubble constant and corresponding age of the universe are respectively

   (a) $2 \times 10^{-5} \dfrac{kms^{-1}}{ly}, 1.49 \times 10^{10}\ year$

   (b) $2 \times 10^{-6} \dfrac{kms^{-1}}{ly}, 1.58 \times 10^{3} year$

   (c) $10^6 \dfrac{kms^{-1}}{ly}, 1.49 \times 10^{10} year$

   (d) None of these

7. Consider a binary star system consisting of two stars of masses M_1 and M_2 separated by a distance of 30 AU with a period of revolution equal to 30 years. If one of the two stars is 5 times farther from the centre of mass than the other. The masses of the two stars in terms of solar masses are

   (a) 5, 15 (b) 25, 5

   (c) 25, 10 (d) 7, 25

8. A planet of mass *m* moves in an ellipse around the sun of mass M_S so that its maximum and minimum distances are r_1 and r_2 respectively. The angular momentum of the planet relative to the centre of the sun is

   (a) $\sqrt{\dfrac{2GM_S r_1}{(r_1 + r_2)}}$ (b) $\sqrt{\dfrac{2GM_S m^2 r_1 r_2}{(r_1 + r_2)}}$

   (c) $\sqrt{\dfrac{GM_S r_1 r_2}{(r_1 + r_2)}}$ (d) $\sqrt{\dfrac{2GM_S}{r_1 r_2 (r_1 + r_2)}}$

9. The percentage of Sun's total energy which reaches the earth's surface is

   (a) 10^{-7} % [Kerala PMT 2003] (b) 10^{-6} %

   (c) 10^{-3} % (d) 10^{-2} %

10. Suppose a planet goes around Sun with a linear speed twice as fast that of earth. What will be it's orbit size as compared to that of earth ? (Radius of earth = *R*) [BHU 1993]

    (a) $R/4$ (b) $R/2$

    (c) R (d) $2R$

Assertion & Reason

For AIIMS Aspirants

Read the assertion and reason carefully to mark the correct option out of the options given below:

(a) If both assertion and reason are true and the reason is the correct explanation of the assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
(c) If assertion is true but reason is false.
(d) If the assertion and reason both are false.
(e) If assertion is false but reason is true.

1. Assertion : The stars twinkle while the planets do not.

   Reason : The stars are much bigger in size than the planets.[AIIMS 2003

2. Assertion : A pulsor is a source of radio waves which change in terms of intensity at regular interval of time

   Reason : A pulsor is a rotating neutron star

   [AIIMS 1998, 2002]

3. Assertion : The comet do not obey Kepler's laws of planetary motion

   Reason : The comet do not have elliptical orbit

   [AIIMS 1995]

4. Assertion : A star which appears blue will be much hotter than the sun

   Reason : It is based on Wien's law

5. Assertion : There is no atmosphere on moon

   Reason : Escape velocity at the surface of moon is low.

6. Assertion : Red shift confirms that the universe is expanding

   Reason : Wavelength of red light is maximum in the visible region

7. Assertion : Sun is at the galactic centre C of the milky way

   Reason : All planets of solar system revolve around the sun.

8. Assertion : Moon is seen as it partly reflects the sun light falling on it

   Reason : Moon is a satellite of earth. It does not emit light of its own

9. Assertion : The value of Hubble's constant is 16 km/s

Reason : Hubble's constant means that a galaxy at 1 million light years away is receding at the rate of 16 *km/s*.

Answers and Solutions

Universe

1. (d) A study of binary star is most helpful in verifying Newton's law of gravitation.

2. (d) A group of bright and faint stars is called a constellation

3. (b) The sky is divided into 88 constellations.

4. (a) Big Bang theory is the most satisfactory theory about the origin of universe.

5. (b) Venus is the brightest planet.

6. (d) A star which appears blue will be much hotter than the sun.

7. (a) When distant stars are receding from us, spectral line from the star, when compared to with the corresponding line from source will show red shift *i.e.* a shift in frequency towards the red end.

8. (b) Solar constant is the energy crossing per unit area per sec at earth's distance, area being normal to the sun's rays. Also energy falling is inversely proportional to the square of distance from the source.

$$\therefore\ S' = \frac{S}{(5.3)^2}$$

9. (d) Venus and Mars have both CO_2 present.

10. (b) $\lambda_m T = b \Rightarrow 2.93\times10^{-10}\times T = 2.93\times10^{-3} \Rightarrow T = 10^7\ K$

11. (c) Black hole is highly dense malter in the atmosphere which has very large value of gravitational pull, so that nothing escapes from it.

12. (a) $F = \frac{GMm}{r^2} = mr\omega^2 = mr\left(\frac{2\pi}{T}\right)^2$

$$M = \frac{mr^3 4\pi^2}{GmT^2} = \frac{4\pi^2 r^3}{GT^2}$$

13. (c) The age of universe is believed to be 10-20 billion years.

14. (b) Planet Venus is called Earth's sister.

15. (c) Source of Sun's energy is fusion reactions involving hydrogen.

16. (a) Asteroids are a group of rock pieces moving around the Sun in between Mars and Jupiter. They are believed to be the remains of a large planet which exploded due to gravitative attraction of Sun and that planet, may be called small planets.

17. (b) The energy of the sun is due to fusion of hydrogen nuclei into helium.

18. (c) Venus appears brighter as it is nearest to the earth and the light of sun reflected form sun reaches earth with greater intensity.

19. (b)

20. (d) Saturn only has ring around it.

21. (d) Milky way is one of the enormous galaxies of the universe.

22. (b) According to Hubble's law, $v \propto r$.

23. (b) The hottest planet of solar system is one which is nearest to sun and has no atmosphere.

24. (d) As we move towards the centre of the sun, the density and pressure increases.

25. (b) As $T^2 \propto r^3$ and distance of planet from sun in increasing order is for Mars, Saturn and Pluto.

26. (a) Length of milky way is 10^5 light years.

27. (b) Mercury is the nearest planet to sun.

28. (b) According to Wien's law, $\lambda_m \propto \frac{1}{T}$. It means higher the temperature of a star, the lower is the wavelength of maximum intensity radiation emitted from star which tells the colour of star.

29. (b) As $\lambda \propto \frac{1}{T}$; so $\frac{T_1}{T_2} = \frac{\lambda_2}{\lambda_1} = \frac{350}{510} = 0.68$

30. (d) $\frac{Gm\times 2m}{l^2} = m\times\frac{2l}{3}\frac{4\pi^2}{T^2}$ or $T = \left(\frac{4\pi^2 l^3}{3Gm}\right)^{1/2}$ *i.e.* $T \propto m^{-1/2}$

31. (b) Speed of galaxy is proportional to it's distance from us *i.e.* $U \propto r$. This is Hubble's law

32. (a) Reflecting power of a heavenly body is called albedo.

33. (d)

34. (b) Meteors are burnt piece of comet. When they reach earth's atmosphere, they start burning due to friction.

35. (d) According to Stefan's law $E = \sigma T^4$

36. (d) If the light received from galaxies indicates a shift towards the red end of spectrum of light, it means that the galaxies should be receding away (Doppler's effect). Therefore we conclude that the universe is expanding.

37. (a) The star which appears red is at less temperature, than the star which appears white. Therefore, temperature of *Q* is higher than that of *P*.

38. (b) The albedo (reflection power) is maximum for Venus, because it reflects 85% of incident light. It's value of albedo is 0.85.

39. (b) It is well known that if the mass of the star is more than that of mass of Sun, it explodes after it's red giant stage and dies out giving rise to supernova and a black hole.

40. (a) If a comet approaches the sun, the substances like water *etc.* on the comet, get vaporised due to the heat of Sun, and radiation pressure forces of these vapours move away from the Sun. Hence, it forms the tail of the comet.

41. (b)

42. (a) Venus has the longest day.

43. (b) Ursa major is known as saptarishi.

44. (b)

45. (c) The temperature of stars can be determined by Wiens displacement law which is $\lambda_m . T = \text{constant}$.

46. (c) The motion of planets in the solar system is based on the conservation of angular momentum.

47. (c)

48. (b)

49. (a) Hubble's law state that. Speed of recession (v) $\propto$ distance (r).

50. (c) Great bear is a constellation, which is a group of some stars.

51. (c) Surface temperature of Sun is about 6000 *K*.

52. (c) By using $\lambda_m T = \text{constant}$

53. (b) Because pluto is farthest from Sun.

54. (a) Hubble's law is a statement of a direct correlation between the distance (r) to a galaxy and its recessional velocity as determined by the red shift (Z). It is stated as $Z = Hr$.

55. (c) The criterion for a star to be black hole is

$$\frac{GM}{c^2R} \geq \frac{1}{2} \text{ or, } \sqrt{\frac{2GM}{R}} \geq c.$$

56. (d) Fraunhofer lines are produced by the absorption of rays of the Sun in the atmosphere. When white light from photosphere passes through chromosphere, the vapours and gases present in it absorbs certain wavelengths and produces dark lines (Fraunhofer lines).

57. (b) The difference in the length of mean solar day and a sidereal day is about 4 min.

Critical Thinking Questions

1. (d) Given that magnitude for brightest star = – 5
and magnitude of given star = 0
Now $m_2 - m_1 = 0 - (-5) = 5$
The brightness ratio is given by

$$\frac{l_1}{l_2} = 100^{(m_2 - m_1)/s} = 100^{5/5} = 100$$

So bright star is 100 time bright that the dim star.

2. (b) The mass of galaxy is given by $M = \frac{v^2 r}{G}$

where v = 250 *km/sec* = $250 \times 10^3 \frac{m}{\text{sec}}$

$r = 3 \times 10^4$ *ly* $= 3 \times 10^4 \times 9.46 \times 10^{12}$ *km* $\approx 3 \times 10^{20}$ *m*

$$\therefore m = \frac{(250 \times 10^3)^2 \times (3 \times 10^{20})}{6.6 \times 10^{-11}} \approx 3 \times 10^{41} \text{ kg.}$$

3. (b) $\frac{l_2}{l_1} = 4 \Rightarrow m_2 - m_1 = -2.5 \log\left(\frac{l_2}{l_1}\right) = -2.5 \log 4$

$= -2.5 \times 0.6021 = -1.5$.

4. (a) From Hubble's law $v = Hr$ where H = Hubble's constant = 19.3 *mm/sec-ly* and r = Distance of Galaxy from us.

According to Doppler's effect speed of Galaxy $v = \frac{c\Delta\lambda}{\lambda}$

$$\Rightarrow r = \frac{c\Delta\lambda}{H\lambda} = \frac{c \times 0.1\lambda}{H\lambda} = \frac{0.1 \times 3 \times 10^8}{19.3 \times 3 \times 10^{-3}} = 1.6 \times 10^9 \, ly$$

5. (a) Here, for Venus $m_1 = -4$, for star $m_2 = 6$ using

$$\frac{l_1}{l_2} = 100^{(m_2 - m_1)/5} = 100^{[6-(-4)]/5} = 100^2 = 10{,}000.$$

6. (a) $H = \frac{v}{r} = \frac{8600}{430 \times 10^6} = 2 \times 10^{-5} \frac{kms^{-1}}{ly}$

Age of the universe, $t_0 = \frac{1}{H} = \frac{r}{v}$

Taking $r = 430 \times 10^6$ *ly* $= 430 \times 10^6 \times 9.46 \times 10^{12}$ *km*

$$\Rightarrow t_0 = \frac{430 \times 10^6 \times 9.46 \times 10^{12}}{8600} \text{sec}$$

$$= \frac{430 \times 10^6 \times 9.46 \times 10^{12}}{8600 \times 3600 \times 24 \times 365} = 1.49 \times 10^{10} \, year$$

7. (b) $M_1 + M_2 = \frac{4\pi^2}{G} \cdot \frac{r^3}{T^2}$

If T is measured in years, r in *A.U.* and masses in Solar masses then $G = 4\pi^2$.

$$\therefore M_1 + M_2 = \frac{r^3}{T^2} = \frac{(30)^3}{(30)^2} = 30 \quad \text{.....(i)}$$

Now $r_1 + r_2 = 30 \Rightarrow r_1 + 5r_1 = 60$

$\Rightarrow r_1 = 5$ and $r_2 = 25$

Again $M_1 r_1 = M_2 r_2 \Rightarrow \frac{M_1}{M_2} = 5$ .....(ii)

After solving (i) and (ii) we get $M_1 = 25$ and $M_2 = 5$

8. (b) From conservation of energy

$\frac{1}{2}mv_1^2 - \frac{GM_S m}{r_1} = \frac{1}{2}mv_2^2 - \frac{GM_S m}{r_2}$. Angular momentum is conserved, that is $mv_1 r_1 = mv_2 r_2$

or $v_2 = v_1 \frac{r_1}{r_2} \Rightarrow \frac{1}{2}mv_1^2 - \frac{GM_S m}{r_1} = \frac{1}{2}m\left(\frac{v_1 r_1}{r_2}\right)^2 - \frac{GM_S m}{r_2}$

or $v_1 = \sqrt{\frac{2GM_S r_2}{r_1(r_1 + r_2)}} \Rightarrow L = mv_1 r_1 = \sqrt{\frac{2GM_S m^2 r_1 r_2}{r_1 + r_2}}$

9. (a) If S is the total energy emitted by Sun per second and r is the distance of earth from Sun; then energy reaching earth of radius R per second $= \frac{S}{4\pi r^2} \times 2\pi R^2 = \frac{SR^2}{2r^2}$.

$\therefore$ Percentage of energy reaching earth

$$= \frac{SR^2}{2r^2 S} \times 100 = \frac{(6.4 \times 10^6)^2 \times 100}{2 \times (1.5 \times 10^{11})^2} \simeq 10^{-7}\%$$

10. (a) From Kepler's law $T \propto R^{3/2}$ and also $T = \frac{2\pi R}{v}$

$$\Rightarrow v \propto \frac{1}{R^{1/2}} \Rightarrow \frac{v_1}{v_2} = \left(\frac{R_2}{R_1}\right)^{1/2} \Rightarrow \frac{v_1}{2v_1} = \left(\frac{R_2}{R_1}\right)^{1/2}$$

$$\Rightarrow R_2 = \frac{R_1}{4} = \frac{R}{4}$$

Assertion and Reason

1. (b) Stars twinkles due to variation in density of atmospheric layer. Also stars are much bigger in size than planets but it has nothing to deal with twinkling phenomenon.
2. (b) Pulsar is a source of radio waves which emits pulses of radio waves at short and regular time of intervals.
   Pulsar is formed, due to super nova explosion, when super nova explosion occurs, the core of the star is compressed and electrons and protons combine to form a neutron. Due to this region pulsar is called neutron star.
3. (b) Comets do not revolve around the sun in fixed elliptical orbit like other planets and don't obey Kepler's law for planetary motion.
4. (a) According to Wien's law, $\lambda_m T = b =$ constant. As λ_m for the star is blue, which is less than λ_m for sun, which is yellow, therefore temp. T of star will be much higher than the temperature of the sun.
5. (a) At the surface of moon $v_{rms} > v_{escape}$ hence molecules escape out before reaching their *rms* velocity that's why there is no atmosphere present.
6. (b) Red shift means that wavelength of light received from stars is increasing *i.e.,* apparent frequency is decreasing. Therefore, the stars/galaxies must be receding away. Hence the universe is expanding. Reason is also true, but it does not explain the assertion appropriately.
7. (e) The reason is true, but the assertion is false. Infect, distance of sun of our solar system from galactic centre is 3×10^4 light years.
8. (a) Both the assertion and reason are true and reason is a correct explanation of the assertion.
9. (e) The assertion is not true. Infect, the value of Hubble's constant is 16 km per sec per million light years.

Universe

SET Self Evaluation Test - 31

1. "The universe is expanding" means
   (a) Size of the hole in Ozon layer is increasing
   (b) Universe is expanding into something
   (c) Infinite universe is becoming more infinite
   (d) None of these

2. The galaxy in which we live is
   (a) Spiral galaxy (b) Radio galaxy
   (c) Irregular galaxy (d) None of these

3. The distance of Venus from the sun is 0.72 AU. the orbital period of the Venus is
   (a) 200 days (b) 320 days
   (c) 225 days (d) 325 days

4. Suppose the sun was located at the position occupied by the nearest star, say, alphacenturi 4 light years away. By what factor the solar radiation received per sec per unit area decrease
   (a) 1.5×10^{-6} (b) 1.5×10^{-8}
   (c) 1.5×10^{-9} (d) 1.5×10^{-11}

5. If a galaxy is at a distance 430 million light years from us, determine Hubble's constant. Its speed being $6.48\times10^{6}ms^{-1}$
   (a) 16 kms^{-1} per million light year
   (b) 15 kms^{-1} per million light year
   (c) 14 kms^{-1} per million light year
   (d) None of these

6. The magnitude of two stars A and B are 2.5 and –5 respectively. The brightness ratio of $\frac{B}{A}$ is
   (a) 7.5 (b) 10^{2}
   (c) 10^{3} (d) $10^{7.5}$

7. A body at 1500 K emits maximum energy at a wavelength 20,000 Å. If the Sun emits maximum energy at wavelength 5500 Å, then the temperature of Sun is
   (a) 5454 (b) 4454
   (c) 4550 (d) 5400

8. The hottest type of stars are called
   (a) A type (b) B type
   (c) O type (d) M type

9. Venus appears brighter than other stars because
   (a) It is heavier than other planets
   (b) Its density is more than other planets
   (c) It is nearer to earth in comparison to other planets
   (d) Nuclear fusion takes place at its surface

10. The death of a star results is in a neutron star if the original mass of star in terms of mass of Sun (M) is
    (a) Less than 2M
    (b) Between 2M and 4M
    (c) Greater than 5 M
    (d) Exactly equal to M

11. The tail of a comet points
    (a) Towards the Sun
    (b) Away from the Sun
    (c) In arbitrary
    (d) Away from the earth

12. The angle of maximum elongation for Venus is 47°. The distance of Venus from earth in A.U. is
    (a) 0.68 A.U. (b) 0.86 A.U.
    (c) 1 A.U. (d) 0.73 A.U.

13. The number of stars in our solar system is
    (a) 9 (b) 5
    (c) 1 (d) More than 9

14. If angular diameter of Sun is about 30′ and it's distance from earth is 1.5×10^{11} m, then solar diameter is
    (a) 1.1×10^{7} m
    (b) 1.5×10^{8} m
    (c) 1.4×10^{9} m
    (d) 1.9×10^{11} m

AS Answers and Solutions

(SET -31)

1. (c)

2. (a) The galaxy in which we live is spiral galaxy. Our galaxy Milky way is a spiral galaxy.

3. (c) $\frac{T_2^2}{T_1^2} = \left(\frac{r_2}{r_1}\right)^3$ or $T_2 = T_1\left(\frac{r_2}{r_1}\right)^{3/2} = 1\left(\frac{0.72}{1}\right)^{3/2}$

= 0.62 year or 225 days.

4. (d) $\frac{E_1}{E_2} = \frac{r_2^2}{r_1^2}$ or $\frac{E_2}{E_1} = \frac{r_1^2}{r^2} \Rightarrow \frac{(1.5\times10^{11})^2}{(4\times9.46\times10^{15})^2} = 1.5\times10^{-11}$

where r_1 = Distance of Sun from earth = 1.5×10^{11} m = 1 AU, r_2 = 4 ly = $4 \times 9.46 \times 10^{15}$ m

5. (b) $H = \frac{v}{r} = \frac{6.48\times10^6}{430} = 15.07\, kms^{-1}$ per million light year

6. (c) $m_B - m_A = -2.5\log_{10}\left(\frac{I_B}{I_A}\right)$

$\Rightarrow -5-(2.5) = -2.5\log_{10}\frac{I_B}{I_A} \Rightarrow \log_{10}\frac{I_B}{I_A} = 3$

$\Rightarrow \frac{I_B}{I_A} = 10^3$.

7. (a) According to Wien's displacement law $\lambda_m T$ = constant

or $\lambda_m T = \lambda_m' T'$

or $T' = \frac{\lambda_m}{\lambda_m'}\times T = \frac{20{,}000Å\times1500K}{5500Å} = 5454K.$

8. (c) O type stars are hottest.

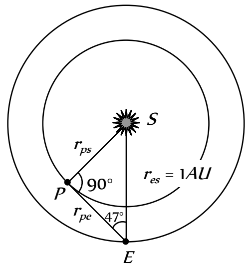
9. (c) Venus appears brighter than other stars because it is nearest to earth than other stars.

10. (b)

11. (b) Tail of comet points away from the sun.

12. (a) The angle formed at earth between earth planet and earth sun direction is called planet's elongation represented by ε, when planet appears farthest from the Sun, the angle subtended by the Sun and earth at the planet is $90°$.

From the geometry of figure



$\frac{r_{PE}}{r_{sE}} = \cos\varepsilon = \cos 47°$

$r_P = r_{sE}\cos 47°$

$= (\cos 47°)\times 1AU = 0.68AU$

Choice (a) is correct

[$\cos 45° = \frac{1}{\sqrt{2}} = 0.707$. As angle increases its cosine decreases $\cos 47°$ can not be 0.86, 0.73 or 1]

13. (c) The number of stars in our solar system in one (our Sun).

14. (c) We know that

$D = r\theta = 1.5\times10^{11}\times\frac{1}{2}\times\frac{\pi}{180°} = 1.4\times10^9 m$

***
